Q.89 In which order, cytokinesis occurs in plants -

(1) Centripetal (2) Centrifugal

(3) Oblique (4) Equatorial

Q.90 Meiosis not occurs in -
(1) Ovule (2) Anther
(3) Microsporangia (4) Shoot tip

Q.91 Which of the two events restore the normal number of chromosomes in life cycle -
(1) Mitosis and Meiosis
(2) Meiosis and fertilisation
(3) Fertlisation and mitosis
(4) Only meiosis

Q.92 Number of meiosis required to produce 100 ovules in angiosperms -
(1) 125 (2) 100
(3) 25 (4) 75

Q.93 Constancy of the chromosome number in sexually producing generation is brought by the process of -
(1) Meiosis (2) Mitosis
(3) Amitosis (4) None

Q.94 Amitosis is characteristic of -
(1) Higher plants (2) Higher animals
(3) Bryophyta (4) Lower organisms

Q.95 Slipping of chiasmata towards the ends of bivalent is called -
(1) Terminalisation (2) Diakinesis
(3) Interkinesis (4) Heteropycnosis

Q.96 Which does not occurs in prophase -
(1) Hydration of chromatin
(2) Dehydration of chromatin
(3) Appearance of chromosome
(4) Disappearance of nuclear memb. and nucleolus

Q.97 During cell cycle, RNA and protein synthesis takes place during -
(1) G_1 and G_2 phase (2) S - Phase
(3) M - phase (4) Cytokinesis

Q.98 In which stage of cell division, number of chromosomes best counted -
(1) Prophase (2) Metaphase
(3) Telophase (4) Interphase

Q.99 Cell division in blue green algae similar to that in -
(A) Bacteria (B) Brown algae
(C) Green algae (D) Higher plants

Q.100 The synaptonemal complex was first observed by -
(1) Moore (1905)
(2) Farmer and moore (1905)
(3) Mosses (1956)
(4) Flemming (1882)

Q.101 A cell is bound to divide, if it has entered-
(1) G_2 : phase (2) G_1 - phase
(3) Prophase (4) S - phase

Q.102 How many Chromosome shall be present in a diploid cell at mitotic anaphase if its egg cell has ten chromosome -
(1) 10 (Ten) (2) 20 (Twenty)
(3) 30 (Thirty) (4) 40 (Forty)

Q.103 If crossing-over occur at two strand stage then percentage of crossing over is -
(1) 50% (2) 60%
(4) 70% (4) 100%

Q.104 Meiosis which occur at the time of spore formation is called -
(1) Zygotic meiosis (2) Haplontic meiosis
(3) Terminal meiosis (4) Intermediate meiosis

Q.105 Chromosome exhibit high level of coiling at which phase of karyokinesis -
(1) Prophase (2) Metaphase
(3) Telophase (4) Interphase

Q.106 The synaptonemal complex appears -
(1) Between homologous chromosomes
(2) In zygotene stage
(3) Composed of DNA + protein
(4) All the above

Q.107 At anaphase - II of meiosis each chromosome contains -
(1) 4 DNA (2) 3 - DNA
(3) 2 - DNA (4) 1 - DNA

Q.108 During cell division chromosome move towards different poles due to -
(1) Centriole (2) Vacuole formation
(3) Microtubules (4) Cytokinesis

Q.109 For studying meiosis the relevant plant material usually fixed around -
(1) 9-10 AM (2) 4.5 AM
(3) 3.5 PM (4) 12 PM

Q.110 Tetrad formation in meiosis occur is -
(1) Leptotene (2) Zygotene
(3) Pachytene (4) Diplotene

Q.111 In Anaphase - I each chromosome composed of -

(1) One chromatid (2) Two chromatid

(3) Four chromatid (4) Many chromatid

Q.112 In meiosis, division of centromere occurs during -

(A) Interphase (B) Anaphase - I

(C) Anaphase - II (D) Metaphase - I

Q.113 In meiosis, nuclear membrane and nucleolus disappear during -

(1) Zygotene (2) Pachytene

(3) Diakinesis (4) Metaphase - I

Q.114 Cell cycle can remain arrested at -

(1) G_1 (2) S

(3) G_2 (4) M

Q.115 Which of the following are mitotic poisons-

(1) Colchicine

(2) Mustard gas and Azides

(3) Cyanides

(4) All the above

Q.116 In cell cycle, which stage is misnomerly called resting phase -

(1) S-phase (2) Telophase

(3) Cytokinesis (4) Interphase

Q.117 Separation of homologous chromosomes during Anaphase - I is called -

(1) Synapsis (2) Disjunction

(3) Nondisjunction (4) Crossing over

Q.118 In tetrad, the number of non cross over chromatids is normally -

(1) Four (2) Two

(3) One (4) None

Q.119 Sporic meiosis occurs in -

(1) Animals (2) Thallophyta

(3) Bryophyta

(4) All plants except thallophyta

Q.120 If a meristematic cell is placed in a medium containing radio active thymidine, radioactivity will be first observed in -

(1) Euchromatin

(2) Hetero chromatin

(3) Both simultaneously

(4) None of the above

Q.121 The metabolism of a cell which decreases during prophase again starts increasing during-

(1) Telophase (2) Anaphase

(3) Metaphase (4) G_1 - phase

Q.122 Synthesis of cycline protein occurs in -

(1) Permanent tissue (2) Meristem

(3) Lignified cells (4) All the types of cell

Q.123 During which stage a diploid cell becomes tetraploid in mitosis -

(1) G_2 (2) Prophase

(3) Metaphase (4) Anaphase

Q.124 If the number of bivalents are 8 in metaphase - I, what shall be the number of chromosomes in daughter cells after meiosis - I and meiosis - II respectively -

(1) 8 and 4 (2) 4 and 4

(3) 8 and 8 (4) 16 and 8

Q.125 Homologous chromosomes shows maximum attraction during -

(1) Leptotene (2) Zygotene

(3) Pachytene (4) Diplotene

Q.126 Ribonuclease, a mitotic poison, inhibits cell cycle in -

(1) Interphase (2) Prophase

(3) Metaphase (4) Anaphase

Q.127 Dinomitosis occurs in -

(1) Procaryotes (2) Mesokaryotes

(3) Eucaryotes (4) Akaryotes

Q.128 Stain for cell division -

(1) Saffranin (2) Aniline blue

(3) PAS (4) Acetocarmine

Q.129 Terminal meiosis occurs in -

(1) Sporocyte (2) Gametocyte

(3) Zygote (4) Gamete

Q.130 How many microspore mother cells are required to produce 80 male gametes in angiosperms -

(1) 10 (2) 20

(3) 40 (4) 80

Q.131 Coiling of chromonema in prophase of mitosis is -

(1) Plectonemic (2) Paranemic

(3) Helical (4) Irregular

Q.132 Chiasmata appears during -
(1) Diakinesis (2) Synaptotene
(3) Diplotene (4) Leptotene

Q.133 In mitosis, the spindle is -
(1) Bipolar (2) Multipolar
(3) Apolar (4) Random

Q.134 Synthesis and storage of ATP molecules required for cell div. takes place in -
(1) Prophase (2) G_1 - Phase
(3) Anaphase (4) G_2 - Phase

Q.135 Each daughter chromosome in anaphase moves towards opposite poles at the speed of 1 μm per minute with the expenditure of energy -
(1) 5 ATP (2) 30 ATP
(3) 38 ATP (4) 200 ATP

Q.136 Cell plate which appears during cytokinesis, ultimately transforms in -
(1) Middle lamella (2) Primary wall
(3) Sec. wall (4) Plasma membrane

Q.137 Chromosomal morphology (Structure) is best observed at -
(1) Prophase (2) Metaphase
(3) Interphase (4) Anaphase

Q.138 In which stage the centromere lie at equator and arms are directed towards poles -
(1) Metaphase of mitosis
(2) Metaphase - I
(3) Metaphase - II
(4) I and 3 both

Q.139 What type of division lead to coenocytic condition -
(1) Cryptomitosis (2) Endomitosis
(3) Free nuclear div. (4) Dino-mitosis

Q.140 Pairing of homologous chromosomes is called -
(1) Disjunction (2) Synapsis
(3) Segregation (4) Polyteny

Q.141 During cytokinesis in plants, which o the following secretes the middle lamella -
(1) Golgibody (2) SER
(3) RER (4) Lysosomes

Q.142 Synapsis found in between -
(1) Nonhomologous chromosome
(2) Homologous chromosome
(3) Nonhomologous and homologous chromosome
(4) Chromatids

Q.143 Longest phase of mitosis is -
(1) Prophase (2) Metaphase
(3) Anaphase (4) Telophase

Q.144 When the prophase chromosome are stained with acetocarmine they take differential staining. This phenomenon is called -
(1) Idiogram (2) Karyotype
(3) Heteropycnosis (4) Satellite

Q.145 Crossing over takes place on -
(1) Two stranded stage
(2) Three stranded stage
(3) One stranded stage
(4) Four stranded state

Q.146 Decision of cell division occurs at -
(1) Starting of G_1 (2) End of G_1
(3) Initial stage of prophase
(4) End of telophase

Q.147 Smallest phase of mitosis is -
(1) Prophase (2) Metaphase
(3) Anaphase (4) Telophase

Q.148 Synthesis of proteins for formation of spindle fibres takes place in -
(1) G_1-phase (2) S-phase
(3) G_2-phase (4) M-phase

Q.149 How many divisions will occur in an isolated tip cell to form 128 cells -
(1) 128 (2) 127
(3) 32 (4) 7

Q.150 Causes of Cancer is -
(1) Fast and uncontrolled cell division by Meiosis
(2) Stop the process which controls cell division in Mitosis
(3) Over growth of daughter cells in telophase and due to failure of cleavage furrows and non separation of cells
(4) Unequal amount of DNA in daughter cells formed by Mitosis

Q.151 The part of a cell that can be seen with and electron microscope, but can't with a light microscope is/are the -
(1) nucleus (2) Golgi bodies
(3) chloroplasts
(4) membrane separating the nucleus from the cytoplasm

Q.152 The organic compound present in traces in living cells can be dectected and isolated by-

(1) centrifugation (2) tracer tecnique

(3) chromatography (4) microscopy

Q.153 Which techique used for separation of immunoglobulins, cellular enzymes and m-RNA-

(1) Ion exchange chromatography

(2) Affinity chromatography

(3) Paper chromatography

(4) None of these

Q.154 1 A° is equal to

(1) 10^{-8} cm (2) 10^{-4} cm

(3) 10^{-6} cm (4) 10^{-3} cm

Q.155 Electron microscope was invented by-

(1) Knoll and Ruska

(2) Rudolph and Kolliker

(3) C.P. Swanson

(4) None of the above

Q.156 Phase contrast microscope is -

(1) based on the scattering of light and using a dark field condenser

(2) used for the study of living cells

(3) related to retardation and thickness of object

(4) the best method for studying non-living ultra structure.

Q.157 The smallest size of a cell which can be seen with unaided eye is -

(1) 1 micron (2) 10 micron

(3) 100 micron (4) 1000 micron

Q.158 A fluorescent microscpe is used -

(1) for increasing resolving power

(2) for obtaining X-ray diffraction pattern of DNA

(3) to study cell and their components in a living state

(4) To localise cell structure stained with fluorochome dyes

Q.159 Fuelgen reaction of DNA is due to -

(1) aldehyde produced by acid hydrolysis

(2) removal of RNA but not DNA

(3) phosphoric acid carbohydrated and nitrogen based

(4) phosporic acid

Q.160 The resolving power of an electron microscope is -

(1) 0.000005 nm (2) 0.0000005 um

(3) 2 μn (4) 0.025 Å

Q.161 Which cell organelle is detected with the help of sudan black :-

(1) Peroxisome (2) Glyoxysome

(3) Sphaerosome (4) Rough E.R.

Q.162 Magnification power of a light compound microscope depends on :-

(1) Power of eye piece lens

(2) Power of objective lens

(3) Source of light

(4) (1) and (2) both

Q.163 Feulgen reaction is used to stain :-

(1) DNA (2) RNA-polymerase

(3) DNA-polymerase (4) (1) and (3) both

Q.164 Microsomes are obtained by -

(1) Vital staining

(2) Sonography

(3) Fractionation of cell by ultrasonic sound waves

(4) X-ray crystallography

Q.165 Which dye is used to stain chromosomes:-

(1) Acetocarmine (2) Haematoxylin

(3) Feulgen (4) All the above

ANSWER KEY

EXERCISE - 2

Q.1 Which of the following is the smallest cell-
(1) Human nerve cells (2) Chlamydomonas
(3) Virus (4) PPLO

Q.2 Which of the following statements is not true-
(1) Animal cells contain ultrascopic chloroplast while plant cells contain microscopic chloroplasts
(2) Animal cells never contain chloroplasts unlike many plant cells
(3) Plant cells have central vacuoles while animal cell do not
(4) Plant cells have cellulosic cell wall while animal cell do not

Q.3 All cells are derived from pre-existing cells" is the famous generalization of-
(1) Schultz (2) Schleiden
(3) Lamarck (4) Virchow

Q.4 Which of the following is true of the carbohydrate portion of the cell membrane-
(1) It contributes to the polycationic charge on the extracellular surface
(2) It is 1% of plasma membrane
(3) It is found primarily in the form of free saccharide groups
(4) It has a symmetric distributions

Q.5 Plasmalemma of animal cells is elastic due to the presence of-
(1) Proteins (2) Lipids
(3) Carbohydrates (4) Microfilaments

Q.6 Movement of solutes across a membrane from a region of higher to a region of lower concentrations is called-
(1) Diffusion (2) Active transport
(3) Osmosis (4) Lysis

Q.7 The most abundant substance of middle lamella is-
(1) Lignin (2) Suberin
(3) Pectin (4) Cutin

Q.8 Cell wall is the secretory product of-
(1) Lysosomes (2) Cytoplasm
(3) Plasmodesmata (4) Middle lamella

Q.9 Nucleoplasm is continuous with cytoplasm through-
(1) Centriole
(2) Endoplasmic reticulum
(3) Golgi apparatus (4) Nuclear pores

Q.10 Role of nucleus in morphological differentiation was discovered in-
(1) Neurospora by Beadle and Tatum
(2) Garden pea by Mendel
(3) Drosophila by Morgan
(4) Acetabularia by Hammerling

Q.11 Which one is not a part of nucleus-
(1) Chromatin (2) Nucleoplasm
(3) Karyosome (4) Centrosome

Q.12 The size of the nucleolus is large where-
(1) Protein synthesis is active
(2) Protein synthesis is less
(3) No protein synthesis occurs
(4) None of the above

Q.13 Aerobic respiration is performed by-
(1) Iysosomes (2) Chloroplast
(3) Mitochondria (4) Glyoxysomes

Q.14 Mitochondria are most abundant in-
(1) Heart muscle (2) Muscles of thigh
(3) Wings of birds (4) None

Q.15 Cytochrome oxidases are found-
(1) On outer wall of mitochondria
(2) In the matrix of mitochondria
(3) In the lysosomes
(4) On cristae of mitochondria

Q.16 Small particles present on inner mitochondrial membrane are called-
(1) Cristae (2) Ergatosomes
(3) Elementary particles
(4) Quantasome

Q.17 Lysosomes containing inactive enzymes are called-
(1) Primary lysosomes
(2) Secondary lysosomes
(3) Residual bodies (4) Autophagosomes

Q.18 Which of the following statements best describes the functional characteristics of lysosomes-

(1) They contain enzymes that lack macromolecular specificity

(2) They function at alkaline pH

(3) Help in dissolving membrane of ovum during fertilization

(4) They function only within the intracellular compartment

Q.19 Lysosomes are called "suicide bags" because they have-

(1) Catabolic enzymes

(2) Food vacuole

(3) Hydrolytic enzymes

(4) Parasitic activity

Q.20 In which of the following cells the endoplasmic reticulum is absent-

(1) Kidney cells (2) Liver cells

(3) Mammalian mature erythrocytes

(4) Mammalian eye cells

Q.21 If cells are broken up and sedimented by centrifugation, the new structures formed in one of the fraction is-

(1) Centrosomes (2) Microsomes

(3) Peroxisomes (4) Lysosomes

Q.22 Which of the following enzyme is characteristic of Golgi complex-

(1) Cytochrome oxidase

(2) Glycosyl transferase

(3) Acid phosphatase (4) Malate synthetase

Q.23 The endoskeleton of the cell is made up of -

(1) Cell wall (2) Cytoplasm

(3) E.R. (4) Mitochondria

Q.24 Match the following

(A) Microtubules - Structural component of cilia

(B) Centrioles - Store hydrolases

(C) Peroxisomes - Stores carbohydrate, fats and proteins in plants

(1) A correct, B and C false

(2) A and C correct, B false

(3) A and B correct, C false

(4) All are false

Q.25 Genome is-

(1) Diploid set of chromosomes

(2) Haploid set of chromosomes

(3) A single chromosome

(4) None of the above

Q.26 The carbohydrates which project out of the lipid bilayer in animal cell membrane are linked to -

(1) Lipids only (2) Proteins only

(3) Peptidoglycan (4) Both lipid & protein

Q.27 In living cells mitochondria can be stained with-

(1) Neutral red (2) Janus green

(3) Crystal violet (4) Aceto-orcein

Q.28 The outer membrane of mitochondria is -

(1) Less permeable (2)Less proteinaceous

(3) Heavier (4) Larger

Q.29 Mitochondrial outputs are -

(1) ADP, CO_2 (2) ATP, O_2

(3) ATP, CO_2, H_2O (4) ATP, CO_2

Q.30 The overcoat of the plasma membrane is the handiwork of -

(1) Golgi complex (2) Lysosomes

(3) Nucleolus (4) Mitochondria

Q.31 Find out the incorrect statement -

(1) The inner mitochondrial membrane possesses succinic dehydrogenase and cytochrome oxidase.

(2) The membrane bound Krebs cycle enzyme is succinic dehydrogenase

(3) Both mitochondrial membrane are ultrastructurally similar

(4) Mitochondrial cristae are sites of oxidation-reduction reaction.

Q.32 Which is an incorrect statement -

(1) Microtubules take part in cell division

(2) Detoxification site in liver cells is in SER

(3) The nucleolus contains DNA homologous to ribosomal RNA

(4) Centrioles are located on the chromosomes

Q.33 Which of the following statements regarding cilia is not correct–

(1) Cilia contain an outer ring of nine microtubules surrounding two microtubules

(2) The organized beating of cilia is controlled by fluxes of Ca^{2+} across the membrane

(3) Cilia are hair-like cellular appendages

(4) Microtubules of cilia are composed of tubulin

Q.34 Selecting the wrong statement from the following–

(1) Both chloroplasts and mitochondria have an internal compartment, the thylakoid space bounded by the thylakoid membrane

(2) Both chloroplasts and mitochondria contain DNA

(3) The chloroplasts are generally much larger than mitochondria

(4) Both chloroplasts and mitochondria contain an inner and an outer membrane

Q.35 All the following statement are correct except–

(1) Peroxisomes are quite common in the photosynthetic cells. Their number can be 70–100 per mesophyll cell wherein they interact with mitochondria and chloroplasts to take part in photorespiration

(2) Glyoxysomes are numerous in the endosperm of wheat

(3) The ER-bound ribosomes synthesise secretory membrane and lysosomal protein

(4) Ribosomes when associated with ER are attached with their 60S sub-unit

Q.36 Why the material should be dry, thin and kept in vacuum in electron microscope–

(1) To get straight beam of electrons

(2) To avoid collision of electrons with atoms of O_2 and N_2

(3) To avoid multiple scattering of electrons

(4) All correct.

Q.37 Electron microscope is better than light microscope because–

(1) It has high magnification

(2) It has high resolution

(3) It gives 2D/3D images

(4) all are correct

Q.38 O^{18} was used in H_2O to prove that O_2 comes from H_2O in photosynthesis by Rube and Kamen. C^{14} was used by Calvin to discover dark reaction. N^{15} is used in the study of–

(1) Chromosome replication

(2) DNA replication

(3) Protein synthesis

(4) C_4 Cycle.

Q.39 A student wants to study metaphasic behaviour of chromosomes. The most suitable tool is–

(1) Phase contrast microscope

(2) X-ray microscope

(3) Cell fractionation

(4) Scanning electron microscope

Q.40 Which of the following is the better explanation of earlier discovery of the "Nucleus" than the "Cell Theory"–

(1) Nucleus is a more important structure than cytoplasm.

(2) Robert Brown had a better microscope.

(3) Nuclei take a darker stain than other parts of a cell.

(4) Nucleus is a visible body while cell theory is an abstract generalization.

Q.41 Choose the correct statement–

(1) Ribosomal subunits are united during protein synthesis.

(2) Ribosomal subuits always remain united.

(3) Ribosomal subunits are united in nucleus during r-RNA synthesis.

(4) All are correct statements.

Q.42 Which of the following observations most strongly support the view that mitochondria have elctron transport system/enzymes–

(1) Mitochondria have a property to concentrate in cells which form locomotory structures.

(2) Disruption of mitochondria yields membrane fragments which are able to synthesize ATP.

(3) Mitochondria have a folded inner membrane.

(4) Acontractile protein capable of utilizing ATP is obtained from mitochondria.

Q.43 What is correct ?
(1) Nucleosomal organisation provides a chromatin fibre about 10 nm in thickness and chromatin fibres further condensed to produce a solenoid of 30 nm diameter.
(2) The solenoid structure further coils to produce a chromatin fibre of 200 nm and then a chromatid of 700 nm diameter.
(3) All the folded loops of chromatin are held to gether
(4) All of the above.

Q.44 The eukaryotic cells are essentially two envelope system because they contain–
(1) Cell wall and plasmamembrane
(2) Plasmamembrane and Nuclear membrane
(3) Plasmamembrane and Tonoplast
(4) Double membrane bound cell organelles

Q.45 Which of the following statement justifies that "the cell is a self-contained unit"–
(1) It independently carries out all fundamental biological processes.
(2) It oxidises food molecules to produce energy and utilises this energy to synthesise complex molecules.
(3) Reproduces with similar hereditary properties.
(4) All of the above.

Q.46 The significance of phospholipid bilayer in plasma membrane is to form–
(1) Water resistant barrier
(2) To allow only carbohydrate substances to pass
(3) Passage for free flow of ions
(4) To allow easy passage of proteins

Q.47 Man and mouse cells are treated with red rhodamine and Green fluorescent dyes separately and then are made to fuse. The resultant cells when kept at 37ºC, the distribution of dye on the surface of cell will be like–

(1)
(2) (3)
(4) 
Q.48 Muramic acid is present in cell walls of -
(1) Bacteria and blue-green algae
(2) Green algae
(3) Yeast (4) All fungi

Q.49 Growth of cell wall during cell elongation takes place by -
(1) Apposition (2) Intussuseption
(3) Both A and B (4) Super position

Q.50 Plasmodesmata are -
(1) Pores in cell wall
(2) Pores in cell membrane
(3) Protoplasmic connections
(4) A and B both

Q.51 Which element mainly occurs in middle lamella-
(1) Ca (2) Mg
(3) Na (4) K

Q.52 Cell membrane is composed of -
(1) Proteins and cellulose
(2) Proteins and phospholipids
(3) Proteins and carbohydrates
(4) Proteins, phospholipids and some carbohydrates

Q.53 Which of the following is main enzyme of plasma membrane -
(1) TPP ase (2) ATP ase
(3) Peptidyl transferase (4) Catalases

Q.54 Percentage of intrinsic proteins in the total proteins of plasma membrane -
(1) 70% (2) 20% (3) 10%
(4) 90%

Q.55 Cell wall was discovered by -
(1) Robert brown (2) Malpighi
(3) Robert Hooke (4) Nageli

Q.56 Cell wall is -
(1) Dead and impermeable
(2) Dead and permeable
(3) Living and impermeable
(4) Living and selective

Q.57 Tonofibrils are characteristic of which junction-
(1) Desmosomes (2) Plasmodesmata
(3) Gap junction (4) Tight junction

Q.58 Torus is composed of -

(1) Suberin (2) Chitin

(3) Cutin (4) Lignin

Q.59 Carbohydrates which present in the cell membrane take part in -

(1) Transport of substance

(2) Cell recognition

(3) Attachement to microfilament

(4) Attachement to microtubules

Q.60 Plasma membrane is fluid structure due to presence of -

(1) Carbohydrate (2) Lipid

(3) Glyco protein (4) Poly saccharide

Q.61 In which cell-surface junction fused membrane reveals five-layered structure -

(1) Pemosomes (2) Zona occludence

(3) Gap-junction (4) Plasmodesmata

Q.62 Which type of cell surface junctions abundantly occur in epithelial tissues -

(1) Nexus (2) Desmosomes

(3) Zona occludence (4) Plasmodesmata

Q.63 Amphipathic molecule in pasma membrane is -

(1) Protein (2) Carbohydrates

(3) Phospholipids (4) All the above

Q.64 The average thickenss of plasma membrane is-

(1) 70 Å (2) 75 – 100 Å

(3) 100 – 150 Å (4) 200 Å

Q.65 Unit membrane model of plasma membrane was proposed by -

(1) Robertson (2) Singer

(3) Denielli (4) Robert Hook

Q.66 Pit membrane of simple pit is formed by -

(1) Secondary cell wall

(2) Middle lamella

(3) Primary cell wall

(4) plasma membrane

Q.67 Term plasmodesmeta was first used by -

(1) Leuwenhock (2) De duve

(3) Strasburger (4) Porter

Q.68 Primary cell wall formed by -

(1) Intussuception

(2) Apposition

(3) Intussusception & lignification

(4) Mineralization

Q.69 Cell wall of prokaryotes is made up of -

(1) Chitin (2) Cellulose

(3) Glucose amine (4) Mucopepitde

Q.70 Butter Sandwich model of plasma membrane was proposed by -

(1) Davson and Danielli

(2) Robertson

(3) Singer and Nicolson

(4) Benson

Q.71 The Singer's Model of Plasma membrane differs from the Robertson's model in the -

(1) Number of lipid layers

(2) Arrangement of proteins

(3) Arrangement of lipid layers

(4) Absence of protein layers

Q.72 Ingestion of solid food by plasma membranes is called -

(1) Endosmosis (2) Pinocytosis

(3) Cytokinesis (4) Phagocytosis

Q.73 In order to find out quickly whether the cells are living one must observe -

(1) Cell sap

(2) Tonoplast

(3) Movement of Cytoplasm

(4) Starch ganules

Q.74 Which one is widely distributed in a cell -

(1) DNA (2) RNA

(3) Plastids (4) Golgi

Q.75 Maximum enzymes are found in -

(1) Lysosomes (2) Mitochondria

(3) Nucleus (4) E.R.

Q.76 Rough E.R. mainly responsible for -

(1) Protein synthesis

(2) Cell wall formation

(3) Lipid synthesis

(4) Cholesterol synthesis

Q.77 Besides producing secretory vescles, the function of golgibody is -
(1) Lysosome formation
(2) Formation of spindle fibers
(3) Formation of E.R.
(4) All the above

Q.78 Mitochondria supply most of the necessary biological energy through -
(1) Breaking down sugars
(2) Reducing NADP
(3) Oxidising substrates of TCA cycle
(4) Breaking down proteins

Q.79 Enzymes for ETS occurs in (mitochondria)-
(1) Matrix
(2) Outer wall
(3) Inner membrane
(4) Between inner & outer wall

Q.80 Which cell organelle secretes zymogen granules-
(1) Lysosomes (2) Golgibody
(3) Smooth E.R. (4) Sphaerosomes

Q.81 Mitochondrial DNA is -
(1) Naked (2) Circular
(3) Double stranded (4) All the above

Q.82 Which structures are responsible for lipid synthisis repectively in plants and animal cells-
(1) Smooth E.R.
(2) Smooth and rough E.R.
(3) Smooth E.R. and peroxisomes
(4) Sphaerosomes and smooth E.R.

Q.83 Lysosomes are not helpful in -
(1) Osteogenesis
(2) Cellular digestion
(3) Metamorphosis in frog
(4) Lipogenesis

Q.84 Digestion of hormonal vesicle by lysosome is called -
(1) Crinophagy (2) Heterophagy
(3) Autophagy (4) Autolysis

Q.85 In mammals, the mitochondrial ribsosomes are-
(1) 55 s (2) 70 s
(3) 80 s (4) 100 s

Q.86 Which of the following provides mechanical support and shape to the cell -
(1) Golgi complex (2) Centrioles
(3) Lomasomes (4) E.R.

Q.87 Mitochondria are site of respiration first reported by Kingsbury and supported by Hogeboom. Mitochondira are related with the oxidation of-
(1) Carbohydrates (2) Fats
(3) Proteins (4) All the above

Q.88 Peptidyl tranferase enzyme found on -
(1) Cytoplasm (2) E.R.
(3) Golgibody (4) Ribosomes

Q.89 Which of the following transport the cell well material from dictyosome -
(1) Microtubles (2) Microfilament
(3) E.R. (4) Microbodies

Q.90 Golgibody is absent in -
(1) Prokaryotes
(2) Mature mammalian R.B.C.
(3) Akaryotes (4) All the above

Q.91 Which cell organelles release oxygen -
(1) Mitochondria (2) Golgi body
(3) Chloroplast (4) Ribosome

Q.92 One of the following is present outside the plasma membrane but inside the cell-wall-
(1) Sphaerosome (2) Peroxisome
(3) Lomasome (4) Golgi body

Q.93 Lysosome containing bone cells are called-
(1) **Osteo blast** (2) Fibro blast
(3) Osteoclast (4) Condrioblast

Q.94 Chemical modification of substance like glycosidation of protein and lipid occur in-
(1) Endoplasmic reticulum
(2) Golgi body
(3) Lysosome (4) Ribosome

Q.95 Most of the cell-organelles are derived from which structure of cell -
(1) Nucleus
(2) Endoplasmic reticulum
(3) Mitochondria
(4) Chloroplast

Q.96 Ribophorin-I and II occur on the surface of-
(1) Rough E.R. (2) Smooth E.R.
(3) Golgi body (4) None

Q.97 At which pH lysosomal enzymes remain active-
(1) pH -5 (2) pH - 7
(3) pH - 8 (4) pH - 10

Q.98 Synthesis of cellulose and hemicellulose take place in -
(1) Micro bodies (2) Smooth E.R.
(3) golgi complex (4) Lysosome

Q.99 Main function of golgi-complex is -
(1) Fermentation
(2) Phosphorylation
(3) Respiration
(4) Packaging of materials for secretion

Q.100 Functional unit of protein synthesis is -
(1) Dictysome (2) Polysome
(3) Peroxisome (4) Lysosome

Q.101 Which of the following is a main source of cellular membranes -
(1) Endoplasmic reticulum
(2) Golgi body
(3) Mitochondria (4) Nucleus

Q.102 Mark the lysosomal stabilizer-
(1) Vitamin -K (2) Vitamin-A
(3) Cortisone (4) Progesterone

Q.103 The nuclear membrane originate from -
(1) E.R. (2) Golgi cisternae
(3) Golgi vesicle (4) Lysosome

Q.104 Which of the following prevents the rupturing of lysosomal membrane -
(1) Cholesterol (2) Vit. A
(3) Testosterone (4) UV - rays

Q.105 Ground substance present inside the mitochondria is called -
(1) Stroma (2) Matrix
(3) Cell sap (4) Cytoplasm

Q.106 The stored food and secretory substances found in the cytoplasm makes -
(1) Cytoplasm (2) Hyaloplasm
(3) Protoplasm (4) Deutoplasm

Q.107 During germination which cell organelle converts fatty acid into soluble carbohydrate-
(1) Peroxisome (2) Glyoxysome
(3) Sphaerosomes (4) Lysosome

Q.108 A single unit membrane organelle is -
(1) Ribosomes (2) Mitochondria
(3) Chloroplast (4) Lysosomes

Q.109 Double layered organelle are -
(1) Ribosomes (2) Mitochondria
(3) Lysosomes (4) Centriole

Q.110 Substance which is synthesized in golgi body is-
(1) Protein (2) Polysaccharides
(3) Fats (4) ATP

Q.111 True Statement about Mitochondria is -
(1) Change in shape and size and division both occur
(2) Do not change shape but division occurs
(3) Do not change shape and size and division not occurs
(4) Change shape but division does not occur

Q.112 E.R. is not related with -
(1) Plasmalemma (2) Golgibody
(3) Mitochondria (4) Nucleus

Q.113 The chlorophyll pigment is readly soluble in-
(1) Water (2) Acids
(3) Alkalies (4) Acetone

Q.114 Enzymes are synthesized on -
(1) Dictyosomes (2) Ribosome
(3) Mitochondria (4) None of the above

Q.115 Which is not true about sphaerosomes -
(1) Involved in photorespiration
(2) Arise from E.R.
(3) Related to fat metbolism
(4) Single membane bound

Q.116 Elaiplasts absent in -
(1) **Potato** (2) **Cocus nucifera**
(3) **Arachis hypogea** (4) **Helianthus**

Q.117 Which ion holds the ribosomal subunits toghether-
(1) Ca^{+2} (2) Mn^{+2}
(3) Mg^{+2} (4) Na^{+}

Q.118 Mitochondria and chloroplast are considered to be endosymbionts of cell because they -

(1) Possess their own nucleic acid

(2) Have capacity of ATP synthesis

(3) Do not reproduce

(4) All the above

Q.119 Peroxysomes contain -

(1) Hydrolytic enzyme

(2) Transferase

(3) Isomerase

(4) Oxidising enzyme (Oxidase)

Q.120 What is the angle between two centriole of a centrosome -

(1) 30º (2) 45º

(3) 60º (4) 90º

Q.121 In which of the following cell centriole is absent-

(1) Epithelial cell (2) Gland cell

(3) Liver cells (4) Nerve cell

Q.122 Ribosomes are -

(1) Positively charged

(2) Negatively charged

(3) Amphoteric (4) Neutral

Q.123 On which concentration of Mg^{+2} ions units of ribosome is combined -

(1) 0.0001 M (2) 0.001 M

(3) 0.01 M (4) 0.10 M

Q.124 Plastids which store fats and oils are called-

(1) Aleuroplast (2) Amyloplast

(3) Etioplast (4) Elaioplast

Q.125 Biogenesis of eucaryotic Ribosomes takes place in -

(1) Mitochondria (2) Chloroplast

(3) Both (1) and(2) (4) Nucleolus

Q.126 Red colour of tomato and chilly is due to-

(1) Lycopene in chloroplast

(2) Xanthophylls in chromoplast

(3) Lycopene in chromoplast

(4) Anthocyanin in leucoplast

Q.127 Anthocyanin pigment occurs in -

(1) Chromoplasts (2) Amyloplasts

(3) Cytoplasm (4) Cell sap

Q.128 Which of the cilia protein is analogous to myosin of muscles -

(1) Tubulin (2) Dynien

(3) Flagellin (4) None of these

Q.129 Blepheroplast is a type of -

(1) Centriole (2) Plastid

(3) Cilia (4) Mitochondria

Q.130 Pericarp and petals contain -

(1) Chloroplast (2) Chromoplast

(3) Leucoplast (4) Etioplast

Q.131 Arrangement of microtubules in centriole is-

(1) 9 + 2 (2) 2 + 9

(3) 11 + 0 (4) 9 + 0

Q.132 Which of the following plastids are helpful in starch formation and storage -

(1) Chromoplast (2) Leucoplasts

(3) Chloroplast (4) Lycopene

Q.133 Which of the following enzymes are found in matrix of peroxisomes -

(1) NADH cytochrome reductase

(2) Glyoxidases and malate dehydrogenase

(3) Acid phosphatases and isocitirc lysase

(4) Catalases and oxidases

Q.134 Sedimentation coefficient of mitoribosomes of higher plants is -

(1) 80s (2) 70s

(3) 65s (4) 55s

Q.135 The Ribosomes are made up of

(1) DNA + Protein (2) RNA + Protein

(3) DNA + RNA (4) None of these

Q.136 Functional unit of Chloroplast is -

(1) Stroma (2) Quantasome

(3) Oxysomes (4) Peroxysomes

Q.137 Nuclear pores are guarded by -

(1) DNA (2) Annulus

(3) Protein (4) None

Q.138 Lampbrush chromosomes are observed in-

(1) insect larva (2) Oocytes

(3) Sperms (4) Sallvary glands

Q.139 Which of the following stimulates balbiani ring formation in polytene chromosomes -

(1) Dynien (2) Juvenile harmone

(3) Ecdyson (4) Histone

Q.140 Small chromosomes which do not produce any detectable phenotypic expression are termed -

(1) Heterochromatic chromosomes

(2) Supernumerary chromosomes

(3) Nonsence chromosomes

(4) Nucleoids

Q.141 Genome is -

(1) Part of chromosome

(2) Half chromosome

(3) Total DNA in cell

(4) A complete set of chromosomes

Q.142 True chromosomes absent in prokaryotes due to the absence of -

(1) Nucleus (2) Nucleolus

(3) Histone (4) All the above

Q.143 A complete set of chromosomes inherited as an unit from one parent is known as -

(1) Karytype (2) Gene pool

(3) Genotype (4) Genome

Q.144 Nucleolus in Eukaryotic cell is -

(1) Nonliving

(2) Visible at metaphase

(3) Bounded by a membrane

(4) The site of packaging of r-RNA with proteins

Q.145 Site of m-RNA syntesis in lampbrush chromosomes is -

(1) Balbiani ring (2) Lateral loops

(3) Dark bands (4) Light bands

Q.146 Which of the following character is not taken into consideration while preparing a karyotype-

(1) Chromosomal length

(2) Arm ratio

(3) Position of sec. constriction

(4) Length of chromonemata

Q.147 The non-sticky chromosomal ends are knwon as-

(1) Chromatids (2) Centromere

(3) Chromomere (4) Telomere

Q.148 Lambrush chromosome contain -

(1) One chromatid (2) Two chromatid

(3) Three chromatid (4) Several chromatid

Q.149 Highest arm ratio occur in which chromosome-

(1) Telocentric (2) Metacentric

(3) Submetacentric (4) Acrocentric

Q.150 Toludene blue specifically stains :-

(1) DNA (2) RNA

(3) Chitin (4) Lignin

Q.151 Which stain is used for electron microscopy-

(1) PAS

(2) Aurantia

(3) Para Rosailin

(4) Osmium tetraoxide

Q.152 Which stain is commonly used in study of cell division :-

(1) Feulgen reaction (2) Acetocarmine

(3) Eosine (4) Saffranine

Q.153 Which one is a vital stain :-

(1) Janus green (2) Methylene blue

(3) Neutral red (4) All the above

Q.154 Which of the following are nuclear stains :-

(1) Aceto Carmine (2) Haematoxylene

(3) Saffranine (4) (1) and (2) both

Q.155 Cell organelles can be separated by method of:-

(1) Autoradiogrphy

(2) Microtomy

(3) Differential centrifugation

(4) X-ray differaction

Q.156 Structure of RNA can be studied by :-

(1) Feulgen

(2) Toludene blue

(3) X-ray crystallography

(4) Chromatography

Q.157 Chlor-zinc iodide (schultz solution) stains:-

(1) Cellulose (2) Protein

(3) Chitin (4) Lipid

Q.158 Light compound microscope with 15 x eye piece lense and 45 x objective lense will have a magnification of -

(1) 2000 (2) 675

(3) 1000 (4) 500

Q.159 Calvin isolated the different chemicals of calvin cycle by :-

(1) Autoradiography (2) Chormatography

(3) Cell fractionation (4) x-ray diffraction

Q.160 In feulgen technique, schiff reagent reacts with -

(1) Phosphate group

(2) CHO group of deoxyribose

(3) Nitrogen bases

(4) Only purine nitrogen base

Q.161 In electron microscope source of light is :-

(1) White light

(2) U.V ray

(3) Electron beam

(4) Green light

Q.162 Ultra sonic sound waves are used in which tecnique of cytology :-

(1) X-ray diffraction

(2) Chromatograpgy

(3) Cell fractionation

(4) Autroradiography

Q.163 In light compound microscope the power of oil immersion lens is :-

(1) 10 X (2) 20 X

(3) 45 X (4) 100 X

Q.164 The best microscope to study ultra structure of cell is :-

(1) Phase contrast microscope

(2) Electron microscope (EM)

(3) Scanning electron microscope (SEM)

(4) Flourescent mcroscope

EXERCISE -3 PREVIOUS YEAR'S QUESTIONS

Q.1 Hydrolytic enzymes are abundantly found in which cell organelles - **[RPMT 2004]**

(1) Ribosome

(2) Lysosome

(3) Oxysome

(4) Endoplasmic reticulum

Q.2 Which of the following is the site of lipid syntesis - **[RPMT 2002]**

(1) Rough ER (2) Smooth ER

(3) Golgi bodies (4) Ribosome

Q.3 Ribosomes are produced in -**[CPMT 2002]**

(1) Nucleolus (2) Cytoplasm

(3) Mitochondria (4) Golgibody

Q.4 Which of the following pair lack the unit membrane - **[RPMT 2002]**

(1) Nucleus & E.R.

(2) Mitochondria & Chloroplast

(3) Ribosome & nucleolus

(4) Golgi body & lysosome

Q.5 Golgybody is concerned with -

(1) Respiration (2) Secretion

(3) Excertion (4) Degradation

Q.6 Which of the following occurs more than one and less than five in achromosome - **[CPMT 2002]**

(1) Chromatid (2) Chromomere

(3) Centromere (4) Telomere

Q.7 The cells without nuclei are present in - **[RPMT 2002]**

(1) Vascular cambium (2) Root hair

(3) Companion cell

(4) Members of seive tube

Q.8 Plant with minimum number of chromosomes is - **[RPMT 2004]**

(1) Haplopappus gracilis

(2) Salix tetrasperma

(3) Poa (4) Cynodon

Q.9 Heteropycnosis is exhibited by -

(1) Autosome **[RPMT 2004]**

(2) Chromatoid body

(3) Nucleolus (4) Sex-chromosome

Q.10 Best material for the study of mitosis in laboratory - **[CPMT 2002]**

(1) Anther (2) Root tip

(3) Leaf tip (4) Ovary

Q.11 Mitosis occurs in - **[RPMT 2002]**

(1) Haploid individuals (2) Diploid individuals

(3) Both (1) & (2) (4) IN bacterial only

Q.12 The number of DNA in chromosome at G_2 state of cell cycle - **[RPMT 2002]**

(1) One (2) Two

(3) Four (4) Eight

Q.13 Which is correct for meiotic metaphase-I **[RPMT 2002]**

(1) Bivalents are arranged at equator

(2) Univalents are arranged at equator

(3) Non-homologus chromosomes forms pair

(4) Spindle fibers are attached at chromomere

Q.14 In which stage of meiosis the chromosome number reduces to half - **[RPMT 2004]**

(1) Anaphase-I (2) Anaphase-II

(3) Telophase-I (4) Telophase-II

Q.15 Chiasmata are formed as a result of - **[RPMT 2004]**

(1) Exchange of parts of paired homologus chromosome

(2) Exchange to part of unpaired non-homologus chromosome

(3) Duplication of parts of paired homologus chromosome

(4) Loss of parts of unpaired non-homologus chromosome

Q.16 If the n = 16 in plant cell then how many possible bivalent in metaphase - I of meiosis- **[RPMT 2007]**

(1) 32 Bivalents (2) 16 Tetravalents

(3) 16 Bivalents (4) 32 Bivalents

Q.17 The main function of lysosome is - **[UTTARANCHAL PMT 2004]**

(1) Sexual reproduction

(2) Extracellular digestion

(2) Intracellular digestion

(4) Both (2) and (3)

Q.18 Which of the following maintains continuity between the water and lipid phases inside and outside the cells -

[UTTARANCHAL PMT 2004]

(1) Cell wall

(2) Lecithin

(3) Cell vacuole

(4) Cell membrane of woody plants

Q.19 The membrane surrounding cell vacuole is called - **[UTTARANCHAL PMT 2004]**

(1) Tonoplast (2) Cell wall

(3) plasma membrane (4) cell membrane

Q.20 The diagrammatic representation of chromosomes is known as - **[UTTARANCHAL PMT 2006]**

(1) idiogram (2) karyotype

(3) holotype (4) homotype

Q.21 Thread like structures that are composed of the nuclear DNA of eukaryotic cells and are the carrier of genetic information. These structures were known as chromosomes. The term "chromosome" was given -

[UTTARANCHAL PMT 2006]

(1) Waldeyer (2) Balbiani

(3) Purkinje (4) Sutton

Q.22 Chromosomes, present in prolonged prophase in the salivary glands of Drosophila are -

[UTTARANCHAL PMT 2006]

(1) Polytene chromosome

(2) B-Chromosomes

(3) Lampbrush chromosome

(4) supenumerary chromosomes

Q.23 Chromosomes at anaphase are of various shapes due to position of -

[UTTARANCHAL PMT 2006]

(1) Setellite (2) Chromonema

(3) Centromere (4) DNA

Q.24 The term 'nucleosome' was given by oudet olins' and olins called these particle as "nu" particles which histone is absent in nucleosome-

[UTTARANCHAL PMT 2006]

(1) H_1 (2) H_2

(3) H_3a (4) H_4

Q.25 Nucleosome given beaded appearance to chromosome. They help in packing of DNA in the chromosomes. A nucleosome has -

[UTTARANCHAL PMT 2006]

(1) about 2 turns of DNA

(2) 8 histone molecules of 4 types (2 mols each of H_2 a, H_2b, H_3 and H_4)

(3) 200 nitrogen base pairs

(4) all of the above

Q.26 Salivary glands chromosome were discovered by Balbiani (1881) from salivary glands of larva of - **[UTTARANCHAL PMT 2006]**

(1) Chironomous (2) Drosophila

(3) Silk worm (4) Lac worm

Q.27 In SAT chromosome, SAT (Satellite) is terminal part of chromosome beyond secondary contriction. It contains -**[UTTARANCHAL PMT 2006]**

(1) DNA (2) RNA

(3) repetitive DNA (4) None of these

Q.28 Material exchange through nucleopores is faciliate by- **[UTTARANCHAL PMT 2006]**

(1) Lamina propria (2) lipid layer

(3) Nucleoplasmin (4) Nucleoles

Q.29 Centriole is -

[UTTARANCHAL PMT 2006]

(1) Microtubuler and membraneless

(2) Absent in Amoeba, red algae, blue-green algae conifers and angiosperm and made up of peripheral Trilet microtubuls

(3) Basically locomotary and their role in spindle formation is secondary

(4) All of the above

Q.30 Association of m-RNA with several ribosomes is called - **[West Bengal 2007]**

(1) Polysome (2) Informosome

(3) Both (1) and (2) (4) None of these

Q.31 G_2 phase comes between -

[West Bengal 2007]

(1) S and M phase (2) G_1 and S phase

(3) S and D phase (4) G_1 and M phase

Q.32 Lampbrush chromosome is found in -

[Wes Bengal 2007]

(1) Oocyte of amphibians

(2) Salivary gland of mosquito

(3) Silk gland of silkworm

(4) None of the above

Q.33 Prokaryotic ribosomes are - **[West Bengal 2007]**

(1) 50s (2) 60s

(3) 70s (4) 80s

Q.34 Mesosomes of prokaryotes perform function similar to - **[West Bengal 2007]**

(1) Mitochondria (2) Peroxysomes

(3) Lysosomes (4) Ribosomes

Q.35 RER is rough bucause of the presence of- **[West Bengal 2007]**

(1) Volutin granules on its

(2) Ribosomes on its surface

(3) Lysosomes on its surface

(4) Mitochondria on its surface

Q.36 Crossing over takes place between - **[West Bengal 2007]**

(1) 2 sister chromatids

(2) 2 non-sister chromatids

(3) 3 homologous chromosomes

(4) 4 non-homologous chromosomes

Q.37 Cellular recognition is fasciliated by components of plasmamembrane. These components are generally - **[West Bengal 2007]**

(1) Protein molecules alone

(2) Lipid molecules alone

(3) Both lipid and protein molecules

(4) Gloycolipids and glycoproteins

Q.38 The significance of meiosis lies in - **[C.G. PMT 2004]**

(1) Maintaining constancy in the number of chromosomes in an organism

(2) Production of genetic variability in the population of species

(3) Reduction of the diploid number of chromosomes to haploid

(4) All of the above

Q.39 Which among the following can be seen only under the electron microscope - **[C.G. PMT 2004]**

(1) Chloroplast (2) Ribosome

(3) Leucoplast (4) Nucleus

Q.40 A mature plant cell has - **[C.G. PMT 2004]**

(1) Cell wall and protoplasm

(2) Protoplasm and vacuole

(3) Vacuole and cell wall

(4) Protoplasm cell wall and vacuole

Q.41 The larger sub-unit in 80 s ribosome is - **[C.G. PMT 2004]**

(1) 50 s (2) 60 s

(3) 40 s (4) zero s

Q.42 Golgi bodies are absent in - **[C.G. PMT 2004]**

(1) Plants (2) Bacteria

(3) Animals (4) Eukaryotic cells

Q.43 Endoplasmic reticulum is more developed in- **[C.G. PMT 2004]**

(1) Green cells (2) Young cells

(3) Mature cells (4) Bacteriophage

Q.44 Mitochondria are related to - **[C.G. PMT 2004]**

(1) Prokaryotic cell (2) Plasmids

(3) Prion (4) Virus

Q.45 The main function of lysosomes is - **[C.G. PMT 2004]**

(1) Digestion (2) Replication

(3) Translation (4) Translocation

Q.46 Which of the following has a single membrane - **[C.G. PMT 2004]**

(1) Ribosome (2) Peroxisome

(3) Nucleus (4) Centrosome

Q.47 L-shaped chromosomes are called - **[C.G. PMT 2004]**

(1) Sex-chromosome (2) Acrocentric

(3) Telocentric (4) Sub-metacentric

Q.48 Pairing of homologous chromosomes takes place in - **[C.G. PMT 2004]**

(1) Pachytene (2) Zygotene

(3) Diplotene (4) None of these

Q.49 How many meiotic divisions will be necessary to produce two hundred pollen grain - **[C.G. PMT 2004]**

(1) 100 (2) 99

(3) 50 (4) 200

Q.50 Who coined the term chromosome - **[C.G. PMT 2004]**

(1) Balbiani (2) Waldeyer

(3) Sutton (4) Purkinje

Q.51 A chromosome having sub-terminal centromere is called - **[C.G. PMT 2004]**

(1) Telocentric (2) Acrocentric

(3) Metacentric (4) Sub-metacentric

Q.52 Which is the character of mitosis - **[C.G. PMT 2005]**

(1) Leptotene (2) Zygotene

(3) Pachytene (4) None of the above

Q.53 How many types of cells are known - **[C.G. PMT 2005]**

(1) One (2) Two

(3) Three (4) Four

Q.54 In which mitosis does-not occur - **[C.G. PMT 2005]**

(1) Green algae (2) Fungi

(3) Bacteria (4) Higher plants

Q.55 A mature plant cell has - **[C.G. PMT 2005]**

(1) Cell wall (2) Vacuole

(3) Protoplasm (4) All of the above

Q.56 Repulsion of homologous chromosomes takes place in - **[C.G. PMT 2005]**

(1) Zygotene (2) Leptotene

(3) Diakinesis (4) Pachytene

Q.57 In eukaryotic cell the type of ribosome is- **[C.G. PMT 2005]**

(1) Only 70 s (2) Only 80 s

(3) 70 s and 80 s both

(4) Only 50 s

Q.58 Synthesis of DNA takes place in - **[C.G. PMT 2005]**

(1) G_1 (2) G_2

(3) S (4) None of these

Q.59 The genetic material of procaryotic cells is called- **[C.G. PMT 2005]**

(1) Nucleus (2) Nucleolus

(3) Nucleoid (4) Centrosome

Q.60 Which organelle of plant cells secrets polysaccharide to make cell walls - **[C.G. PMT 2005]**

(1) Golgi-bodies (2) Lysosome

(3) Mitochondria (4) Chloroplast

Q.61 RNA contains which of the following base, in place of Thymine of DNA - **[C.G. PMT 2005]**

(1) Thymine (2) Uracil

(3) Adenine (4) None of these

Q.62 The main function of lysosomes is in - **[C.G. PMT 2005]**

(1) Only intracellular digestion

(2) Only Extracellular digestion

(3) Both intracellular and extracellular digestion

(4) None

Q.63 Eukaryotic cell has - **[C.G. PMT 2005]**

(1) One chromatin fiber

(2) Definite nucleus

(3) Incipient nucleus

(4) None of these

Q.64 Four daughter cells formed after meiosis are - **[C.G. PMT 2005]**

(1) Genetically similar

(2) Genetically different

(3) Anucleate

(4) Multinucleate

Q.65 The synthesis of lipids and proteins is associated with - **[C.G. PMT 2005]**

(1) Endoplasmic reticulum

(2) Miochondria

(3) Chloroplast

(4) Lysosomes

Q.66 Cell theory was proposed by - **[C.G. PMT 2005]**

(1) Schleiden and Schwann

(2) Watson and Crick

(3) Drawin and Wallace

(4) Mendel and Morgan

Q.67 During meiosis the division of centromere takes place in - **[C.G. PMT 2005]**

(1) First prophase (2) First anaphase

(3) Second metaphase (4) Second anaphase

Q.68 Which one of the following is not found in animal cell - **[C.G. PMT 2005]**

(1) Nucleus (2) Golgi bodies

(3) Chloroplast (4) Mitochondria

Q.69 Unit membrane consists of - **[C.G. PMT 2005]**

(1) Lipid + Sugar + Lipid

(2) Protein + Lipid + Protein

(3) Lipid + Protein + Lipid

(4) Protein

Q.70 Principal constituents of chromosomes are- **[C.G. PMT 2005]**

(1) DNA + Protein (2) DNA

(3) RNA (4) tRNA

Q.71 Shape of chromosome is determined by - **[C.G. PMT 2005]**

(1) Telomere (2) Centromere

(3) Chromomere (4) Centrosome

Q.72 In a bacterial cell the respiratory enzymes are found in - **[C.G. PMT 2005]**

(1) Mitochondria (2) Chondrisome

(3) Mesosome (4) Centrosome

Q.73 The cell wall of Spirogyra is made up of - **[C.G. PMT 2005]**

(1) Cellulose (2) Suberin

(3) Lignin (4) Chitin

Q.74 The main function of Golgi complex is - **[C.G. PMT 2005]**

(1) Translocation (2) Phosphorylation

(3) Glyco-oxidation (4) Fermentation

Q.75 In cell division, spindle fibres are made up of protein - **[Jharkhand 2006]**

(1) Myoglobin (2) Tubulin

(3) Albumin (4) Myosin

Q.76 Bulk of histone proteins synthesized in - **[Jharkhand 2006]**

(1) G_1-phase (2) G_2-phase

(3) S-phase (4) G_0-phase

Q.77 Choose the incorrect match - **[Jharkhand 2006]**

(1) Nucleus : RNA

(2) Lysosome : protein synthesis

(3) Mitochondria : respiration

(4) Cytoskeleton : microtubules

Q.78 Rough endoplasic reticulum is associated with- **[Jharkhand 2006]**

(1) fat synthesis (2) steroid synthesis

(3) protein synthesis (4) all of these

Q.79 Resolving power of electron microscope is- **[Jharkhand 2006]**

(1) 1 μ (2) 10 Å

(3) 100 Å (4) 1000 Å

Q.80 Number of Barr bodies in XXXXY is - **[Jharkhand 2006]**

(1) 1 (2) 2

(3) 3 (4) 4

Q.81 The study related to the structure and function of a cell is called as - **[Jharkhand 2005]**

(1) Physiology (2) Cell biology

(3) Histology (4) Cytology

Q.82 The longest phase of meiosis (I) is - **[Jharkhand 2005]**

(1) metaphse I (2) prophase I

(3) anaphase I (4) telophase I

Q.83 Fluid mosaic model was given by - **[Jharkhand 2006]**

(1) Knoll and Ruska (2) Singer and Ruska

(3) Singer and Nicolson

(4) Bateson and Punnet

Q.84 Colchicine prevents the mitosis of cell at - **[Jharkhand 2006]**

(1) Prophase stage (2) Anaphase stage

(3) Telophase stage (4) Metaphase stage

Q.85 The number of DNA in chromosome at G_2 stage - **[Jharkhand 2006]**

(1) One (2) Two

(3) Four (4) Eight

Q.86 The characteristic of blue-green algae is - **[Jharkhand 2006]**

(1) DNA without histone

(2) Nucleus absent

(3) Nuclear membrane absent

(4) All of the above

Q.87 Cell wall of a cell is removed, the remaining is called - **[Bihar 2005]**

(1) Etioplast (2) Aleuroplast

(3) Amyloplast (4) Protoplast

Q.88 Movement against concentration gradient is called- **[Bihar 2005]**

(1) Osmosis (2) Active transport

(3) Diffusion (4) Passive transport

Q.89 Synapsis occurs in ..... phase of meiosis - **[Bihar 2005]**

(1) Zygotene (2) Diplotene

(3) Pachytene (4) Leptotene

Q.90 Which one is present in both prokaryotic and eukaryotic cell - **[Bihar 2004]**
(1) Ribosome (2) Mitochondria
(3) ER (4) Nucleus

Q.91 Centromere is also called - **[Bihar 2003]**
(1) Chromomere
(2) Secondary constriction
(3) Primary constriction
(4) Chromonema

Q.92 In "singer and Nicolson" model of plasma membrane, the extrinsic proteins are - **[Bihar 2002]**
(1) Tightly associated with intrinsic protein and can be easily separated
(2) Loosely associated with intrinsic protein
(3) Loosely associated with intrinsic protein and can be easily separated
(4) Loosely associated with intrinsic protein and can't be easily separated

Q.93 Ribosomes are associated with -**[Bihar 2002]**
(1) RNA synthesis (2) Protein synthesis
(3) Enzyme mobilisation
(4) DNA synthesis

Q.94 Which organelle is not found in an animal cell - **[Bihar 2001]**
(1) Peroxysome (2) Ribosome
(3) Lysosome (4) None of these

Q.95 Actin fibre is present in - **[Bihar 2001]**
(1) Cilia (2) Flagella
(3) Carbohydrates (4) Microfilaments

Q.96 Meiosis can be observed in - **[Bihar 2006]**
(1) Tapetal cells (2) Megaspores
(3) Micropores (4) Spore mother cells

Q.97 Carrier proteins are involoved in -**[Bihar 2006]**
(1) Transport of enzymes
(2) Water transport
(3) Active transport of ions
(4) Passive transport of gases

Q.98 The recent model for plasma membrane proposed by Singer and Nicolson is - **[Bihar 2005]**
(1) Molecular-lipid model
(2) Lamellar model
(3) Unit membrane model
(4) Fluid mosaic model

Q.99 Significance of meiosis lies in -**[Bihar 2006]**
(1) Reduction of chromosome number to one half
(2) Maintaning constancy of chromosome number during sexual reproduction
(3) Production of genetic variability
(4) All of the above

Q.100 Function of mitochondria is - **[UP CPMT 2002]**
(1) Excretion
(2) Respiration
(3) Digestion
(4) Excretion and respiration

Q.101 Term basal body is associated with development of - **[UP CPMT 2003]**
(1) cilia and flagella (2) cell plate
(3) phragmoplast (4) kinetochore

Q.102 Golgi body originates form - **[UP CPMT 2003]**
(1) lysosome
(2) Endoplasmic reticulum
(3) mitochondria
(4) cell memrane

Q.103 Lipid molecules in plasma membrane are arranged in which manner - **[UP CPMT 2003]**
(1) scattered (2) series
(3) alternate (4) head parallel

Q.104 Structure of nuclear membrane helps in - **[UP CPMT 2003]**
(1) organisation of the spindle
(2) synapsis of homologous chromosome
(3) Nucleo-cytoplasmic exchange of material
(4) anaphasic separation of daughter chromosome

Q.105 Hydrolytic enzymes are stored in - **[UP CPMT 2003]**
(1) Golgi bodies (2) Lysosomes
(3) Endoplasmic reticulum
(4) Mitochondria

Q.106 Ribosome may also called - **[UP CPMT 2002]**
(1) Microsome (2) Dictyosome
(3) Ribonucleoprotein (4) Oxysomes

Q.107 Genes are present in - **[UP CPMT 2003]**
(1) Chromosomes (2) Lamellae
(3) Plasma membrane (4) Mesosomes

Q.108 The cromosome showing L-shaped structure by the presence of centromere is termed as- **[MP PMT 2003]**

(1) Acentric (2) Metacentric

(3) Sub-metacentric (4) Telocentric

Q.109 Chromosomes can be seen best during - **[MP PMT 2003]**

(1) Prophase (2) Metaphse

(3) Anaphase (4) Telophase

Q.110 What will be the gametic chromosome number of a cell, if somatic cell have 40 chromosome - **[MP PMT 2003]**

(1) 10 (2) 20

(3) 30 (4) 40

Q.111 Who coined the term 'cell' - **[MP PMT 2003]**

(1) Purkinje (2) Robert Brown

(3) Robert Hooke (4) Hugo von Mohl

Q.112 In which of the following stage chromosomes are arranged at equatorial plate - **[MP PMT 2003]**

(1) Anaphase (2) Metaphase

(3) Prophase (4) Telophase

Q.113 During mitosis number of chromosomes gets - **[MP PMT 2003]**

(1) Change

(2) No change

(3) May be change if cell is mature

(4) May be change if cell is immature

Q.114 Chromosome having centromere in its middle is- **[MP PMT 2005]**

(1) Acrocentric (2) Telocentric

(3) Metacentric (4) Submetacentric

Q.115 Single membrance bound is -**[MP PMT 2005]**

(1) Lysosome (2) Plastid

(3) Nucleus (4) Mitochondria

Q.116 Which of the following do not possess lipoproteinaceous membrane - **[MP PMT 2006]**

(1) Lysosomes (2) Lomasomes

(3) Ribosomes (4) Sphaerosomes

Q.117 In meiosis chromosome number becomes - **[MP PMT 2006]**

(1) Half of its parent chromosome

(2) Same as that of parent chromosome

(3) One fourth of its parent chromosome

(4) None of the above

Q.118 Centrosome is not present in - **[MP PMT 2003]**

(1) Cells of higher plants

(2) Cells of lower plants

(3) Cells of higher animals

(4) Cells of lower animals

Q.119 Site of protein synthesis is - **[MP PMT 2005]**

(1) Ribosome (2) SER

(3) Golgi bodies (4) Lysosome

Q.120 To study the living cells without staining, which of the following microscopes can be used ? **[PB PMT 2002]**

(1) SEM (2) Flourescent

(3) Phase contrast (4) TEM

Q.121 Molecular biology is the study of :- **[CET Chd. 2002]**

(1) Structure, function and cell reproduction

(2)physio-biochemiccal studies of biomolecules

(3) studying tissues under microscope

(4) metabolic activitity of life

Q.122 The subcelluar components can be separated by - **[CMC Ludhiyann 2002,2003]**

(1) Paper chormatography

(2) autoradiography

(3) gel electrophoresis

(4) differential and density gradient centrifugation

Q.123 The choromosome separation during metaphase can be best studies by - **[CET Chd. 2002,2003]**

(1) phase contrast microscope

(2) TEM

(3) X-ray technique

(4) Scannning electron microscope

Q.124 The techniqe chromatohraphy was developed by - **[BVP Pune 2002]**

(1) Wilkins (2) Georgy Gey

(3) Tswett (4) Zernicks

Q.125 Which of the following dye is used for staining cell organalle, mitochondria ? **[PB PMT 2003]**

(1) Janus Green (2) Saffranin

(3) Azure B (4) Crystal violet

Q.126 In fluid mosaic model of plasma membrane- **[CBSE - 2002]**

(1) Upper layer is non-polar and hydrophilic

(2) Polar layer is hydrophobic

(3) Phospholipids form a bimolecular layer in middle part

(4) Proteins form a middle layer

Q.127 According to widely accepted ''fluid mosaic model'' cell membranes are semi-fluid, where lipids and integral proteins can diffuse randomly. In recent years, this model has been modified in several respects. In this regard, which of the following statements is incorrect- **[CBSE - 2005]**

(1) Proteins can also undergo flip-flop movements in the lipid bilayer

(2) Many proteins remain completely embeded within the lipid bilayer

(3) Proteins in cell membranes can travel within the lipid bilayer

(4) Proteins can remain confined within certain domains of the membranes

Q.128 Which one of the following is not a constituents of cell membrane - **[CBSE 2007]**

(1) Cholesterol (2) Glycolipids

(3) Proline (4) Phospholipids

Q.129 The main organelle involved in modification and routing of newly synthesized proteins to their destinations is - **[CBSE 2005]**

(1) Endoplasmic Reticulum

(2) Lysosome

(3) Mitochondria (4) Chloroplast

Q.130 Chlorophyll in chloroplasts is located in - **[CBSE 2005]**

(1) Grana (2) Pyrenoid

(3) Stroma

(4) Both grana and stroma

Q.131 Which of the following statements regarding mitochondrial membrane is **not** correct ? **[CBSE 2006]**

(1) The outer membrane resembles a sieve

(2) The outer membrane is permeable to all kinds of molecules.

(3) The enzymes of the electron transfer chain are embedded in the outer membrane.

(4) The inner membrane is highly convoluted forming a series of infoldings

Q.132 Polysome is formed by - **[CBSE 2008]**

(1) A ribsome with several subunits

(2) Ribosomes attached to each other in a linear arangement

(3) Several ribsomes attached to a single mRNA

(4) Many ribsonmes attached to a strand of endoplasmic reticulum

Q.133 Vacuole in a plant cell - **[CBSE 2008]**

(1) Lack membrane and contains air

(2) Lacks membrane and contains water and excretory substances

(3) Is membrane-bound and contains stroage protein and lipids

(4) Is membrane-bound and contains water and excretory substances

Q.134 In germinating seeds fatty acids are degraded exclusively in the - **[CBSE - 2008]**

(1) Peroxisomes (2) Mitochondria

(3) Proplastids (4) Glyoxysomes

Q.135 Keeping in viewthe fluid mosaic model for the structure of cell membrane, which one of the following statements is correct with respect to the movment of lipids and proteins from one lipid monolayer to the other (described as flipflop movement) ? **[CBSE - 2008]**

(1) While proteins can flip-flop, lipids can not

(2) Neither lipids, nor proteins can flip-flop

(3) Both lipids and proteins can flip-flop

(4) While lipids can rarely flip-flop, proteins can not

Q.136 Three of the following satements regarding cell organelles are correct while one is wrong. Which one is wrong - **[AIMS 2005]**

(1) Lysomes are double membraned vesicles budded off form golgi appratus and contain digestive enzymes

(2) Endoplasmic reticulum consists of a network of membranous tubules and helps in transport, sytehsis and secretion

(3) Leucoplasts are bound by two membranes lack pigment but contain their own DNA and protein synthesizing machinery

(4) Spharosomes are single membrane bonds and are associated with synthesis and storage of lipids

Q.137 In which one of the following would you expect to find glyoxysomes - **[AIMS 2005]**

(1) Endosperm of wheat

(2) Endosperm of castor

(3) Palisade cells in leaf

(4) Root hairs

Q.138 Which of the following statements regarding cilia is **not** correct - **[CBSE 2006]**

(1) Cilia contain an outer of nine doublet microtubules surrounding two single microtubules

(2) The organized beating of cilia is controlled by fluxes of Ca^{2+} across the membrane

(3) Cilia are hair-like cellular appendages.

(4) Microtubules of cilia are composed of tubulin

Q.139 The contractile protein of skeletal muscle involving ATPase activity is - **[CBSE- 2006]**

(1) α-Actinin (2) Troponin

(3) Tropomyosin (4) Myosin

Q.140 Select the wrong statement from the following- **[CBSE- 2007]**

(1) Both chloroplasts and mitochondria contain an inner and outer membrane

(2) Both chloroplast and mitochondria have an internal compartment, the thylakoid space bounded by the thylakoid membrane.

(3) Both chloroplasts and mitochondria contain DNA

(4) The chloroplasts are generally much larger than mitochondria

Q.141 The telomeres of euaryotic chromosomes consists of short sequences of - **[CBSE 2004]**

(1) Cytosine rich repeats

(2) Adenine rich repeats

(3) Guanine rich repeats

(4) Thymine rich repeats

Q.142 If you are provided with root-tips of onion in your class and are asked to count the chromosomes which of the following stages can your most convnintly look into - **[CBSE 2004]**

(1) Telophase (2) Anaphase

(3) Prophase (4) Metaphase

Q.143 **Protein synthesis in an animal** cell occurs- **[CBSE- 2005]**

(1) On ribosomes present in cytoplasm as well as in mitochondria

(2) On ribosomes present in the nucleolus as well as in cytoplasm

(3) Only on ribosomes attached to the nulecar envelope and endoplasmic reticulum

(4) Only on the ribosomes present in cytosol

Q.144 Telomerase is an enzyme which is a - **[CBSE 2005]**

(1) RNA (2) Ribonucleoprotein

(3) Repetitive DNA (4) Simple protein

Q.145 The length of DNA moelcule greatly exceeds the dimensions of the nucleus in eukaryotic cells. How is the DNA accomodated ? **[CBSE 2007]**

(1) Deletion of non-essential genes

(2) Supper-coiling in nucleosomes

(3) DNase digestion

(4) Through elimination of repetitive DNA

Q.146 Which one of the following preceeds re-formation of the nuclear envelope during M phase of the cell cycle - **[CBSE 2004]**

(1) Transcription from chromosomes and reassembly of the of the nuclear lamina

(2) Formation of the contractile ring and formation of the phragmoplast

(3) Formation of the contractile ring and transcription from chromosome

(4) Decondensation from chromosomes and reassembly of the nuclear lamina

Q.147 Crossing over that results in genetic recombination in higher organisms occurs between - **[CBSE 2004]**

(1) Non-sister chromatids of a bivalent
(2) Two daughter nuclei
(3) Two different bivalents
(4) Sister chromatids of a bivalents

Q.148 In the somatic cell cycle - **[CBSE 2004]**

(1) DNA replication takes place in S-phase
(2) A short interphase is followed by a long mitotic phase
(3) G_2 phase follows mitotic phase
(4) In G_1 phase DNA content is double the amount of DNA present in the orginal cell

Q.149 When synapsis is complete all along the chromosome, the cell is said to have entered a stage called - **[CBSE 2004]**

(1) Zygotene (2) Pachytene
(3) Diplotene (4) Diakinesis

Q.150 Many cells function properly and divide mitotically though they do not have - **[AIIMS 2005]**

(1) Plasma membrane (2) Cytoskeleton
(3) Mitochondria (4) Plastids

Q.151 Centromere is required for - **[AIIMS 2005]**

(1) Movement of chromosomes towards poles
(2) Cytoplasmic cleavage
(3) Crossing over (4) Transcription

Q.152 At what stage of the cell cycle are histone proteins synthesized in a eukaryotic cell - **[CBSE 2005]**

(1) During telophase (2) During S-phase
(3) During G_2-stage of prophase
(4) During entire prophase

Q.153 Plasmodesmata are - **[CBSE 2009]**

(1) Connections between adjacent cells
(2) Lignified cemented layers between cells
(3) Locomotary structures
(4) Membranes connecting the nucleus with plasmalemma

Q.154 Synapsis occurs between - **[CBSE 2009]**

(1) Two homologous chromosomes
(2) A male and a female gamete
(3) mRNA and ribosomes
(4) Spindle fibres and centromere

Q.155 Middle lamella is composed mainly of - **[CBSE 2009]**

(1) Phosphoglycerides
(2) Hemicellulose
(3) Muramic acid
(4) Calcium pectate

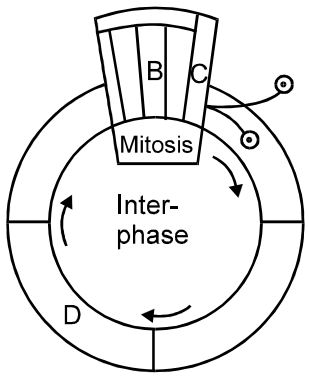
Q.156 Cytoskeleton is made up of - **[CBSE 2009]**

(1) Proteinaceous filaments
(2) Calcium carbonate granules
(3) Callose deposits
(4) Cellulosic microfibrils

Q.157 The cell junctions called tight, adhering and gap junctions are found in - **[CBSE 2009]**

(1) Neural tissue (2) Muscular tissue
(3) Connective tissue (4) Epithelial tissue

Q.158 Given below is a schematic break-up of the phases/stages of cell cycle - **[CBSE 2009]**



Which one of the following is the correct indication of the state/phase in the cell cycle-

(1) A - Cytokinesis (2) B - Metaphse
(3) C - Karyokinesis (4) D-Synthetic phase

Q.159 There is no DNA in - **[CBSE 2009]**

(1) Hair root
(2) An enucleated ovum
(3) Mature RBCs
(4) A mature spermatozoan

Q.160 A student wishes to study the cell structure under a light microscope having **10X** eye piece and **45X** objective. He should illuminate the object by which one of the follwoing colours of light so as to get the best possible resolution? **[CBSE 2005]**

(1) Yellow (2) Grren
(3) Red (4) Blue

Q.161 A major breakthrough in the studies of cell came with the development of electron microscope. This is because **[CBSE 2006]**

(1) electron beam can pass through thick mater als, whereas light microscopy requires thin section.

(2) the electron microscope is more powerful than the light microscope as it uses a beam of electrons which has wavelength much loger than that of photons

(3) the resolution power of the electron microscope is much higher than that of the light microscope

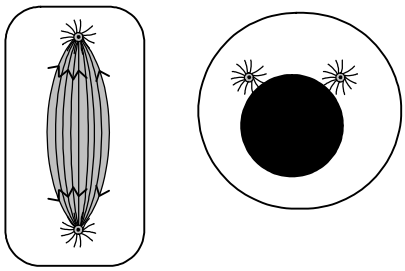
(4) the resolving power of the electron microscope is 200-350 nm as compared to 0.1-0.2 nm for the light microscope

Q.162 During mitosis ER and nucleolus begin to disappear at – **[CBSE 2010]**

(1) Late prophase (2) Early metaphase

(3) Late metaphase (4) Early prophase

Q.163 Which stages of cell division do the following figures A and B represent respectively ? **[CBSE 2010]**



(1) Metaphse - Telophase

(2) Telophase - Metaphse

(3) Late Anaphase - Prophase

(4) Prophase - Anaphase

Q.164 The main area of variuos types of activites of a cell is – **[CBSE 2010]**

(1) Plasma membrane (2) Mitochondrian

(3) Cytoplasm (4) Nucleus

Q.165 Carrier ions like Na^+ facilitate the absorption of substances like – **[CBSE 2010]**

(1) amino acids and glucose

(2) glucose and fatty acids

(3) fatty acids and glycerol

(4) fructose and some amino acids

Q.166 The plasma membrane consists mainly of – **[CBSE 2010]**

(1) phospholipids embedded in a protein bilayer

(2) proteins embedded in a phospholipid bilayer

(3) proteins embedded in a polymer of glucose molecules

(4) proteins embedded in a carbohydrate bilayer

Q.167 An elaborate network of filamentous proteinaceous structures present in the cytoplasm which helps in the maintenance of cell shape is called - **[AIPMT MAINS 2010]**

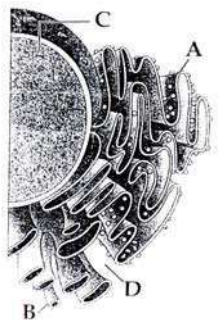
(1) Endosplasmic Reticulum

(2) Plasmalemma

(3) Cytoskeleton

(4) Thylakoid

Q.168 Identify the components labelled A, B, C and D in the diagram below from the list (i) to (viii) given along with – **[AIPMT 2010]**



Components :

(i) Cristae of mitochondria

(ii) Inner membrane of mitochondria

(iii) Cytoplasm

(iv) Smooth endoplasmic reticulum

(v) Rough endoplasmic reticulum

(vi) Mitochondrial matrix

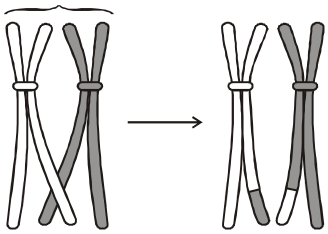
(vii) Cell vacuole

(viii) Nucleus

The correct components are :

	A	B	C	D
(1)	(i)	(iv)	(viii)	(vi)
(2)	(vi)	(v)	(iv)	(vii)
(3)	(v)	(i)	(iii)	(ii)
(4)	(v)	(iv)	(viii)	(iii)

Q.169 Given below is the representation of a certain event at a particular stage of a type of cell division. Which is this stage? **[AIPMT PRE 2012]**



(1) Prophase II during meiosis

(2) Prophase of Mitosis

(3) Both prophase and metaphase of mitosis

(4) Prophase I during meionsis

Q.170 During gamete formation, the enzyme recombinase participates during : **[AIPMT PRE 2012]**

(1) Anaphase - II (2) Prophase - I

(3) Prophase - II (4) Metaphase - I

Q.171 What is true about ribosomes **[AIPMT PRE 2012]**

(1) These are composed of ribonucleic acid and proteins.

(2) These are found only in eukaryotic cells.

(3) These are self-splicing introns of some RNAs.

(4) The prokaryotic ribosomes are 80 S, where "S" stands for sedimentation coefficient.

Q.172 Select the correct statement from the following regarding cell membrane. **[AIPMT PRE 2012]**

(1) Proteins make up 60 to 70% of the cell membrane.

(2) Lipids are arrange in a bilayer with polar heads towards the inner part.

(3) Fluid mosaic model of cell membrane was proposed by Singer and Nicolson

(4) Na + and K^+ ions move across cell membrane by passive transport

Q.173 The correct sequence of cell organelles during photorespiration is : **[AIPMT PRE 2012]**

(1) Chloroplast - Rough Endoplasmic reticulum - Dictyosomes

(2) Chloroplast - mitochondria - peroxisome

(3) Chloroplast - vacuole - peroxisome

(4) Chloroplast - Golgibodies - mitochondria

Following question given below consist of Statement-I and Statement-II. Use the following Key to choose the appropriate answer.

(A) **If both Statement-I and Statement-II are true, and Statement-II is the correct explanation of Statement-I.**

(B) **If both Statement - I and Statement-II are true but Statement-II is not the correct explanation of Statement-I.**

(C) **If Statement-I is true but Statement-II is false.**

(D) **If Statement-I is false but Statement-II is true.**

Q.1 **Statement-I :** RBC membrane is highly flexible.

Statement-II : Amount of external protein in cytoplasmic face of membrane is more.

Q.2 **Statement-I :** Lampbrush chromosomes shows transcripitionally active loops.

Statement-II : Informosomes can be used in future for embryo development.

Q.3 **Statement-I :** Centriole does not form any compartment in a cell.

Statement-II : Centriole is a non-membranous cell organelle.

Q.4 **Statement-I :** Janus green B is a vital stain for locating mitochondria.

Statement-II : Janus green is oxidised by cytochrome a2 present in mitochondria.

Q.5 **Statement-I :** Lysosomes help in digestion of foreign particles in the animal cells.

Statement-II : They have respiratory enzymes.

Q.6 **Statement-I :** Endomitosis does not cause karyokinesis or cytokinesis.

Statement-II : In endomitosis, mitosis occurs within nucleus.

Q.7 **Statement-I :** Synaptonemal complex develops between two synapsed homologous chromosomes.

Statement-II : Mitosis cannot be completed without the synaptonemal complex.

Q.8 **Statement-I :** During anaphase-II, chormatids of a chromosomes separate.

Statement-II : Centromere of a mitotic chromosome divides during anaphase.

Q.9 **Statement-I :** Dictyotene stage occurs in female only.

Statement-II : Gemetogenesis rests for a long period at diplotene stage in female.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

PLANT WATER RELATIONS

INTRODUCTION

- The study of various vital activities and metabolism of plants is know as **Plant physiology.**
- **Stephan Hales** is known as father of plant physiology.
- **J.C. Bose** is known as **Father of Indian Plant physiology.**
- Plants grow in soil and absorb water and minerals, which are available in soil. So that water has great importance for plant. Water forms 80-90% of fresh weight of plant body. The method or technique, in which plant cells obtain water, comes under the heading of **Water relation**.
- To understand the plant water relations, we should know the following process-

DIFFUSION

"The movement of molecules or atoms or ions of a materials from an area of higher concentration to an area of their lower concentration is called diffusion.

- The diffusion is continue till the dynamic equilibrium is established. At this stage the net movement of molecule is equal in both direction.
- The kinetic energy, which is present in the molecules of material is distributed equally in their available space by their nature.

Diffusion rate $\rightarrow$ **Gas > Liquid > Solid**

Diffusion pressure :

"The diffused molecules or ions exert a pressure on the substance or medium in which diffusion take place, known as Diffusion pressure."

- This is developed due to difference in the concentration of molecules of the material. **Diffusion pressure of a pure solvent (1236 atm) is always higher than its solution.**
- Water molecules moves from their higher concentration to the their lower concentration in plants.
- The rate of diffusion decrease with increasing size of molecules.
- The speed and direction of movement of molecules of substances depends upon the concentration of the molecules.
- Due to the difference in the concentration of molecules, diffusion pressure results.
- The potential ability of a substance to diffuse from an area of its greater concentration to an area of less concentration, is called **diffusion pressure**.
- D.P. $\propto$ concentration of substance.

Significance of diffusion :

- Exchange of gases like CO_2, O_2 take place through the diffusion.
- The distribution of hormones in the plants takes place through the diffusion.
- The process of transpiration is a diffusion process. The evaporation of water from the intecellular spaces is linked with diffusion during the transpiration.
- The ions of the minerals may diffused into the plant body.
- The process of **osmosis is a special type of diffusion** of solvent molecules through semi-permeable membrane.

OSMOSIS

"Osmosis is defined as the special diffusion of solvent (water in this context) from the solution of lower concentration to the solution of higher concentration when both the solutions are separated by a semipermeable membrane."

- Osmosis was discovered by **Abbe Nollet.**
- The detailed explanation of osmosis was given by **Traube** and **Duterochat.**
- Passing of **solvent** through the semipermeable membrane is the example of osmosis.
- The water moves into the cell during the osmosis is called **endosmosis.**

  Ex.: Grapes placed in water.
- When the water starts moving out of the cell then it is called **exosmosis.**

  Ex.: Grapes kept in salt solution.

Types of membrane :

The exchange of materials in and out through the membrane is called permeability.

- The membranes are divided in the following types on the basis of permeability :-

(i) Permeable membrane :

Such membranes are **permeable for both - solutes and solvent.** e.g. **cell wall, filter paper.**

(ii) Semipermeable membrane :

Such membranes **allow diffusion of solvent molecules, but do not allow the solutes.** e.g., artificial membrane like **Cellophane** and **Copper ferrocyanide membranes, parchment paper, goat bladder.**

(iii) Selective permeable membrane OR differentially permeable membrane :

Such membranes allow some selective solutes to pass through them along with the solvent molecules. e.g., **Cell membrane, Tonoplast, Organelles membrane.**

- These membranes are permeable for CO_2, N_2 O_2 gases, alcohol, ether and water, but impermeable for polysaccharides and proteins.

(iv) Impermeable membrane : Rubber membrane, Al-foil, Suberised cell wall, cork wall.

Types of Solution :

(i) Isotonic solution :

If solution in which a cell is placed, has equal osmotic concentration to that of cell sap, the outer solution is called **isotonic solution.**

(ii) Hypotonic solution :

If the osmotic concentration of outer solution is lesser than that of the cell sap, the outer solution is called **hypotonic solution.** If a cell is placed in such solution **endosmosis** takes place, results, cell swells up.

(iii) Hypertonic solution :

If the osmotic concentration of a solution is higher than that of the other (cell sap), solution is known as **hypertonic solution.**

- If a cell placed in this type of solution, **exosmosis** takes place. It means water of the cell sap diffused out into the outer solution, resulting cell become flaccid.

  e.g., Grapes placed in higher concentration of sugar solution becomes flaccid (contracts).

Osmotic pressure or O.P. :

- **Osmotic pressure is the pressure developed in a solution when solution and water are separated by semipermeable membrane (given by Pfeffer)**

  or "O.P. of solution is equal to pressure, which required to be applied on a solution in order

to prevent an increase in it's volume due to tendency of solvent to enter in when the two are separated by a semipermeable membrane."

- The osmotic pressure of **pure water is zero. O.P. is due to presence of solute** into the solution.
- The osmotic pressure of solution is directly proportional to the **concentration of solute in** it.
- The osmotic pressure shows maximum variation in the plants cells.
- According to **Hariss** the osmotic pressure is **highest in leaves** and **lowest in roots.**
- The **highest osmotic pressure** is found in the **halophyte** group. **Atriplex confortifolia (202 atm).**
- The **lowest osmotic pressure** is found in aquatic plants or **hydrophytes.**
- **Hydrophytes < Mesophytes < Xerophytes < Halophytes.**
- Generally osmotic pressure is lesser during the night and higher at noon.
- Osmotic pressure of a solution is measured by **osmometer.** O.P. of cell is measured by **incipient plasmolysis.** First osmometer was made by Pfeffer.
- The osmotic pressure can be measured by various methods.

The formula of Vont Hoff for measuring O.P. :

OP = mRT

Here m = Molar concentration

R = Gas constant [0.082 mole/molecules]

T = Absolute temperature

the osmotic pressure of 1 mole. glucose solution at 0ºC-

OP $\Rightarrow$ $1 \times 0.085 \times 273$ $\Rightarrow$ 22.4 atm., for non electrolytes.

The **O.P. of electrolytes** is find out by the following formula-

OP = MRT I

Where I is the constant of ionisation of electrolytes.

- The **osmotic pressure of electrolytes is h**igher than that of non electrolytes.
- For example - solution of 1 M NaCl and 1 M glucose. The molar concentration of both solutions are equal but **O.P. of 1 M NaCl is higher than solution of 1 M glucose.**
- **Water moves from lower O.P. towards the higher O.P.**

Significance of Osmosis / Osmotic Pressure :

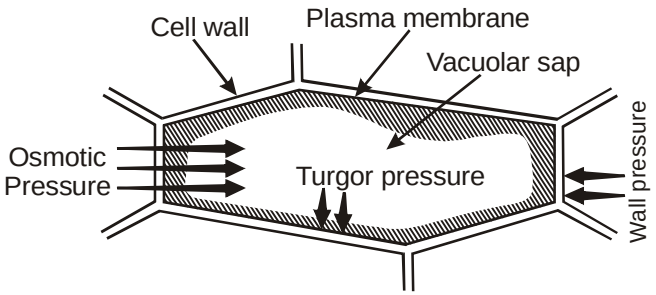
- Water absorption from the soil by the plants.
- Transport of water from cell to cell in plants.
- To maintain turgor pressure.
- Origin of root pressure.
- Opening & Closing of stomata is affected by Osmosis.

TURGOR PRESSURE OR T.P.

"When a cell is immersed in water, then water enter into the cell because osmotic pressure of the cell sap is higher. The cell content press upon the wall or develop a pressure against the cell wall, which is called turgor pressure."

- Turgor pressure is **not applicable for free solution.** This is only applicable for osmotic system of a plant cell. Turgor pressure is also known **hydrostatic pressure.**
- The turgor pressure in encounter balanced by an equal but opposite pressure of the thick cell wall on

the enclosed solution or protoplasm is known as **wall pressure.** It means whatever the amount of pressure exerted inner side on the cytoplasm.



TURGOR PRESSURE

- Therfore, **wall pressure and turgor pressure are equal** to each other but W.P. is inward in direction.

$$\boxed{TP = WP}$$

- Plant cell does not burst, when placed in pure water due to wall pressure, but an animal cell burst when placed in pure water because wall pressure is absent due to absence of cell wall.
  For example the consequence of endosmosis in animal cell can be demonstrated by placing RBCs of human blood in distilled water.
- A **flaccid cell has zero turgor pressure.**
- The **highest value of turgor pressure is found in fully turgid cell** and it is equal to the osmotic pressure. **Fully turgid cell has TP = OP**
- The value of **turgor pressure is normally from zero to in between the osmotic pressure** in plant cell.
- The value of **turgor pressure is assumed as negative (–ve) during the plasmolysis** of the cell.

Significance of T.P. :

- Protoplasm of the cell attached with the cell wall due to turgidity of the cell and cell is in stretched condition. It **maintains the normal shape of the cell** in which physiological processes are going on.
- The **3-D structure of mitochondria, chloroplast and microbodies** is maintained due to turgor pressure, which is essential for their physiological activities.
- Turgor pressure is essential for **maintaining definite shape of delicate organs.**
- Turgor pressure helps in **cell elongation or growth of cell.**
- Plant movement like, **movement of guard cells of stomata, wilting movements and seismonastic movements** etc. depend upon turgor pressure.
- Turgor pressure provides essential power to the plumule to coming out from the soli and help in penetration of radicle into the soil.

DIFFUSION PRESSURE DEFICIT (DPD) OR SUCTION PRESSURE

DPD : The difference between the diffusion pressure of the solution and it's pure solvent at particular temperature and pressure is called **DPD.**

or The DPD of any solution is the difference between the diffusion pressure of the water, which is present in the solution and diffusion pressure of pure water.

- The term **Diffusion Pressure deficit (DPD)** is used by **B.S. Mayer. Renner** named as **Suction Pressure (S.P.)** in cell.
- DPD determines the direction of osmosis and it is the power of absorption of water for the cell (Suction Pressure).
- This is also known as **demand of water** in cell. **DPD ● concentration** of solute.
- The diffusion of water takes place from the region of lower DPD to the region of higher DPD in the process of osmosis.

$$\text{Lower DPD} \xrightarrow[H_2O]{SPM} \text{Higher DPD}$$

- Normally, osmotic pressure is greater than the turgor pressure in a cell. The difference between osmotic pressure and turgor pressure is called **suction pressure** or DPD.

  DPD = OP – TP
- The DPD of any free solution is equal to the osmotic pressure of that solution.

  DPD = OP

(i) DPD in partialy turgid or normal cell :

DPD = OP – TP

(ii) DPD for fully turgid cell :

- When a cell is placed in pure water or hypotonic solution then water enter into the cell, results turgor pressure develop in the cell. The cell starts swelling due to the turgor pressure. Simultaneously, concentration of cell sap decreases due to continuous inflow of water. Therefore OP is goes on decreasing and T.P. increase due to this, when value of TP will be equal to the OP then DPD will be zero.

  At this stage cell becomes fully turgid. Therefore in a fully turgid cell.

  DPD = OP – TP

  When, OP = TP or OP – TP = O

  So that DPD = O

(iii) DPD in flaccid cell :

- If, the cell is in flaccid state then its T.P. or WP would be zero and value of DPD would be equal to O.P.

  TP or WP = O

  Therefore, DPD or S.P. = OP
- If a flaccid cell placed in water then water enters into cell because DPD of the cell sap is higher.

(iv) DPD for plasmolysed cell :

- Sometimes the value of turgor pressure is negative as in plasmolysed cell. In this state

  DPD = OP – TP

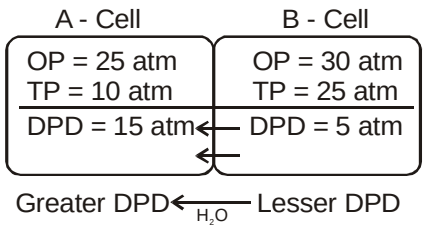
  ∴ [TP = – Ve]

  DPD = OP – [– TP] = OP + TP
- So that the DPD of the plasmolysed cell is greater than osmotic pressure.

  It means - DPD = OP + TP

  Demand of water = Plasmolysed cell > Flaccid cell > Partially turgid cell > Fully turgid cell
- The demand of water in plasmolysed cell is highest.
- It means, when the osmotic pressure and turgor pressure will be equal, then the DPD will be zero. Water will not enter in this type of cell and cell become fully turgid.
- But, when turgor pressure is lesser than the osmotic pressure, in normal cell then some DPD will be definitely present in the cell and water would enters into the cell.

  e.g.,



WATER POTENTIAL OR ψ_w

"The difference between the free energy of molecules of pure water and free energy of the solution is called **water potential** of the system."

- Now a day according to concept of free energy and thermodynamics DPD of a solution is also represented by water potential. (Given by **Taylor** and **Slatyer**)

- The water potential of pure water is maximum the pure water has greater free energy. The free energy, lower down by addition of solute.
- Water always flows from higher water potential to lower water potential.
- Water potential is represented by Greek word ψ (Psi)/ ψ_W and it is measured in **bars** or **Pascal (Pa).** Water potential is equal to DPD, but opposite in sign. Its value is negative.

$\psi_W = \psi_S + \psi_P + \psi_g$ and DPD = O.P. – T.P.

So, $\boxed{\psi_W = -DPD}$

ψ_S = Solute potential = – O.P.

ψ_P = Pressure potential = T.P.

ψ_g, ψ_m is neglesible

- Water potential has following components :

1. Osmostic potential (ψ_s) :

- Osmotic potential or solute potential represents the concentration of the solutes. Water potential (ψ_W) is negative in the presence of solutes. So that osmotic potential is also negative.
- According to thermodynamics, osmotic pressure is called **solute potential** or **osmotic potential.** It is represented by ψ_S and shown by negative sing (–ve) or it is better to say osmotic potential on the basis of free energy.
- Osmotic potential or solute potential measured in bars. (1 Bar = 0.987 atmospheric pressure)
- OP = 22.4 atm => osmotic potential = –22.4 atm. (1 M glucose solution)

2. Pressure potential (ψ_P)

- Turgor pressure is known as **pressure potential.** It is shown by positive sign **(+ve).**
- 1 Bar = 10^6 dynes/sq. cm. or 0.987 atm. (1 megapascal = 10 bars)
- According to this concept their relation is as follows.
  Water potential = Osmotic potential + pressure potential + matric potential
  $\Delta\psi$ or $\psi_W = \psi_S + \psi_P + \psi_m$

$\boxed{\psi_W = \psi_S + \psi_P}$ As ψ_m and ψ_g (Matric potential and gratitational potential) are negligible

$$\boxed{\begin{aligned}\psi_W &= -ve\\ \psi_S &= -ve\\ \psi_P &= +ve\end{aligned}}$$

- According to the above concept the relation of the three phases of the cell by the water potential will be as follows :-

[A] In case of fully turgid cell -

- There is **no flow of water in a fully turgid cell,** because the cell is in equilibrium condition with water which is present out side the cell. So that water potential will be zero at this state. Because osmotic potential and pressure potential are equal in the cell.
- For example - If the value of osmotic potential of a cell is – 10 and pressure potential (ψ_p) is + 10, then water potential will be zero as-

$$\boxed{\begin{aligned}\psi_W &= \psi_S + \psi_P\\ \psi_W &= -10 + 10\\ \psi_W &= 0\end{aligned}}$$

[B] In case of flaccid cell -

- Turgor pressure is zero at this stage. It means pressure potential is zero. If osmotic potential of the cell is – 10 bar then, $\psi_W = \psi_S$

$$\boxed{\begin{aligned}\psi_W &= \psi_S + \psi_P\\ \psi_W &= -10 + 0 \text{ bar}\\ \psi_W &= -10 \text{ bar}\end{aligned}}$$

$\because$ ψ_P = 0 = TP

[C] In Plasmolysed cell-

- The pressure potential (ψ_p) means turgor pressure is negative in this stage. Therefore water potential (ψ_w) of this cell will be more negative [more – ve].
- If the value of osmotic potential is –10 bar of a plasmolysed cell and value of pressure potential is –2 bars then its water potential (ψ_w) will be –12 bars.

$$\psi_W = \psi_S + \psi_P$$
$$\psi_W = -10 + (-2) \text{ bar}$$
$$\psi_W = -12 \text{ bar}$$

- So, this is the conclusion that **water always move from higher water potential towards the lower water potential.**
- For example if the water potential of 'A' cell is –10 bars and water potential of 'B' cell is –12 in two cells, then water will be flow from 'A' cell to the 'B' cell.

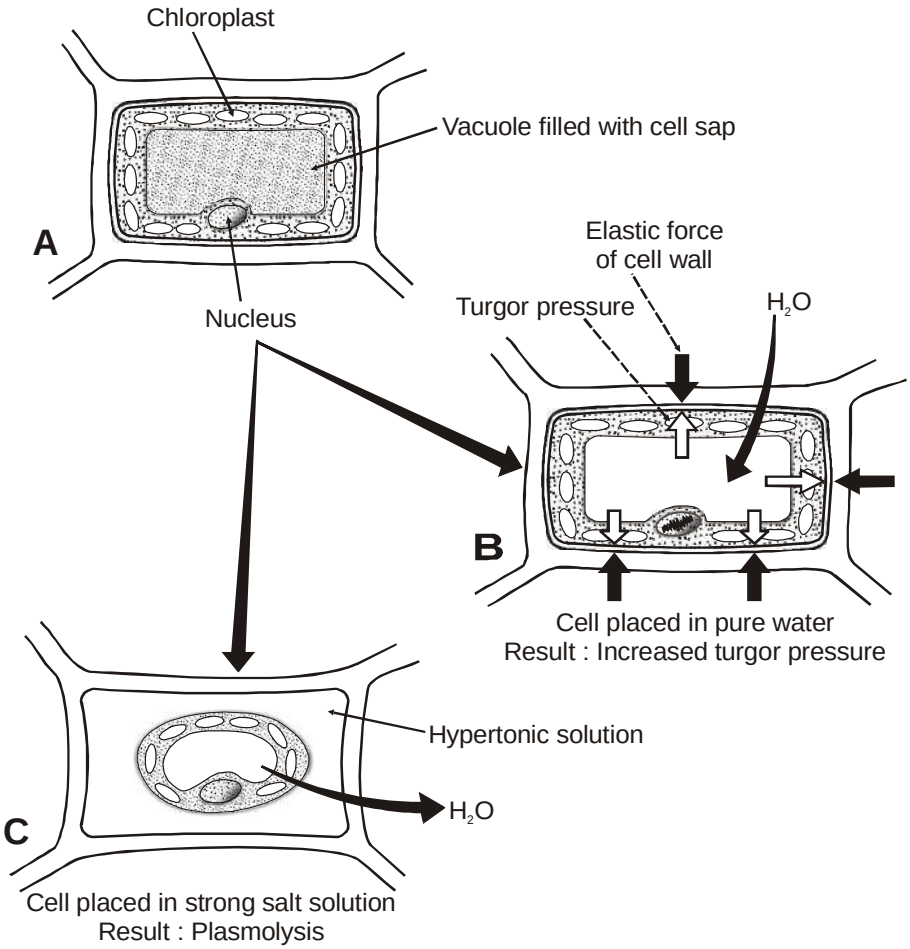
PLASMOLYSIS

"If a plant cell placed in a hypertonic solution, water molecules diffused out from the cell. As a result of exosmosis, the protoplasm of the cell detached from the cell and starts shrinking. This is called **plasmolysis**."

- The various sequences of plasmolysis are as follows -

(i) In a turgid cell, the cell sap pushed away the protoplasm, so that it is in close contact with cell wall.

(ii) When it placed in a hypertonic solution, the volume of the cell reduces due to shrinking of cell because some amount of water of cell sap diffuses out by exosmosis. Turgor pressure decreases by which cell wall is not pushed by the protoplasm, so that shrinking cell membrane reduces in total volume of the cell. This situation is called the first stage of plasmolysis or limiting plasmolysis.



Plasmolysis :

A - A cell in normal stage, B - A cell placed in pure water and resulting in increased turgor pressure and C - A cell placed in strong salt solution leading to plasmolysis

(iii) If the diffusion of water to the outside is continue by the exosmosis then central vacuole contracts and with this protoplasm also shrinks but cell wall is not contracting. So that protoplasm is seems to detach from the corners of cell wall. This condition is known as second phase of the plasmolysis or incipient plasmolysis.

(iv) The shrinking of protoplasm is continuous due to continuous exosmosis, it detaches from the cell wall and assumed a spherical shape. This phase is known as **evident plasmolysis / full plasmolysis.**

- Hypertonic solution is present in between the cell wall and protoplasm.

Significance of plasmolysis

[i] A living cell is distinguished from the non living [dead] cell through the plasmolysis. Because plasmolysis does not occur in dead cell.

[ii] The osmotic pressure of any cell can be measured by **incipient plasmolysis.**

[iii] If the plasmolysis remains for long duration in a cell then it dies. To destroy the weeds, salts puts in their roots.

[iv] Fishes and meat are prevented from spoilage by salting, which inhibits the growth of bacteria and fungus.

[v] Higher concentration of sugar in jams and jellies stops the growth of bacteria and fungus.

[vi] High amount of chemical fertilizers near the root causes death or browning of the plant due to plasmolysis.

[vii] The fresh water growing plants are either wilted or die when they are kept in marine water.

IMBIBITION

Adsorption of undissolved liquid by any solid material is called **imbibition or adsorption** of water by hydrophilic colloids is known as **imbibition**.

- This is a physical process by which a dry solid colloid material swells up by adsorption of water.
- The cell wall is made up of colloidal substance as cellulose, pectin, hemicellulose etc. All they are hydrophilic in nature. Therefore they imbibe water.
- Proteins, Agar - agar, starch etc, these are all imbibant materials.

  Agar - agar can adsorbs 99 times more water than that of its weight. Some of the proteins adsorb 15 times more water.

  Imbibition power = Agar – Agar > Pectin > Protein > Starch > Cellulose

  Affinity must be between imbibant and liquid material and movement of water occurs in order of water potential gradient.
- The heat released during the imbibition is called **heat of wetting.**
- A huge pressure is developed in material due to imbibition. This pressure is called **Imbibition pressure (IP).**
- IP is also called as **matric potential** with respect to water potential. $\Psi_W = \Psi_m$
- The imbibition is less in compact arranged material like wood, and more in lighter or soft material like gelatin.
- Imbibition decreases with increasing pressure on imbibant material.

Significance of Imbibition :

- **Absorption of water** during due the seed germination is only initiate through the imbibition.
- **Breaking of seed coat** during the seed germination is due to imbibition process. Proteins, fats and

starch is present in the kernel. This kernel swells up more as compared to the seed coat which breaks the seed coat.

- Initial process of water absorption in roots by root hairs is imbibitions.
- Resurrection in many plants like Selaginella, Lichen take place due to the process of imbibition.
- The water enter into the aerial roots and dry fruits is due to imbibition.
- Newly formed wood swells up in rainy season.
- Dry wood is filled in the natural grooves of rocks and watered them. The rocks are broken due to their swelling.

Movement of water molecules :

Higher D.P. ⟶ Lower D.P.
Lower O.P. ⟶ Higher O.P.
Lower DPD ⟶ Higher DPD
Higher (less −ve) Ψ_W ⟶ Lower (more −ve) Ψ_W
Higher T.P. ⟶ Lower T.P.
Hypotonic ⟶ Hypertonic
Lower conc. of solution ⟶ Higher conc. of solution.

ABSORPTION OF WATER BY PLANTS

SIGNIFICANCE OF WATER IN PLANTS

- 75-80% part of cells is water. In aquatic plant cells, upto 95% water may be present.
- Water is a **universal solvent.**
  (a) Gases, solids, minerals and organic compounds are found dissolved in it. Their transfer in plants occurs through aquatic medium.
  (b) Water is essential for **metabolic reactions** occuring in plants.
- Water is used in many reactions (hydrolysis, photosynthesis etc.)
- The cells remain turgid due to water, so that shape of cells/organs is maintained. Many types of movements, opening and closing of stomata, metabolic reactions, growth etc. are affected by turgidity.
- Water protects the plants from harmful effects due to high and low temperatures.
- Water is essential for **seed germination**.

FORM OF WATER

- Water is mainly obtained through rain. Some of the water goes into the reservoirs. This is called **run off water.** Rest of the water enter into the land. Water present in soil is of following types-

(a) Gravitational water :-

Form of water, which reaches at the soil water table due to the gravitational force after the rainfall. This form is not available to the plants but available by mechanical methods or by tubewell irrigation. Some plants can absorbe this water - **Calotropis, Prosopis, Capparis, etc.**

(b) Hygroscopic water :-

Thin film of water is tightly held by the soil particles is called hygroscopic water. This water is also **not available** to the plants.

ψ_W of hygroscopic water is highly negative or very low.

(c) Chemically combined water :-

The amount of water present in the chemical compounds, which are present in the particles of soil. This is **not available** to the plants ..... 24 H_2O, ... 7 H_2O

(d) Capillary water :-

Water exists between soil particles in small capillary pores is called **Capillary water**. It is **the most common available form to the plants. Plants only obsorb this form of water.**

(e) Atmospheric humidity :-

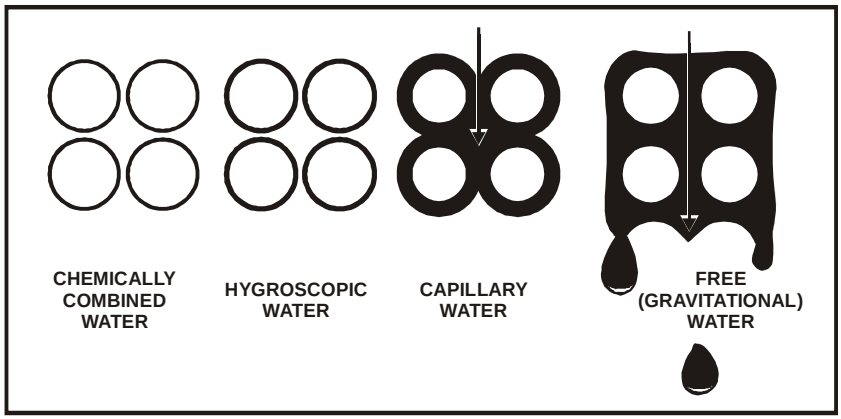
This is water vapour present in air, which can be absorbed by hanging roots of the epiphytes due to presence of velamen tissue and hygroscopic hairs.

Holard : It is the **total amount of water presents in the soil.**

Holard = Chresard + Echard

Chresard : This is the **water available** to the plants.

Echard : This **water is not available** to the plants.



WATER ABSORBING SYSTEM

- In thalophytes (fungi and algae) water absorption takes place through the whole surface of all cells.
- In Bryophyta it occurs by **Rhizoids**.
- In Pteridophyta & spermatophyta it occurs **by roots**.
- Root System consists of following parts -

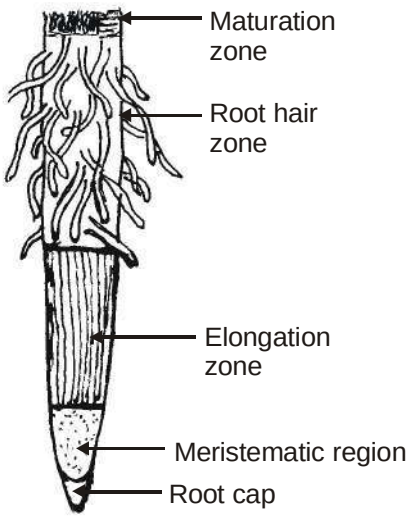
(a) **Root cap region** or **calyptra**- Present at the apex of the root as a protective tissue ; it is **impermeable** to water & solute absorption.

- It percept the **stimuli of gravity.**

(b) **Meristematic region**-Region of active cell division situated above root cap.

- **Mineral absorption** mainly occurs from this region.

(c) **Region of cell elongation -** Next to meristematic region, here growth in length of the root takes place.



Water absorbing system

(d) **Maturation region** - The cells at this region are highly differentiated to carry out different function. It includes root hair region.

- Root hairs are the **water absorbing** organs of plants.

PATH OF MOVEMENT OF WATER

- Water present in soil must reach the xylem of roots. Root hair is in contact with soil water. Their cell wall is thin & water easily diffuses in.
- From root hairs water reaches epidermis & from their to cortex made of parenchymatous cells.
- From innermost layer of cortex water enters in endodermis consisting of thin walled **passage cells** found against each protoxylem.
- In last, water reaches to xylem passing through **thin** walled **pericycle**.

In Short : -Soil water → Root hair → Epiblema → Cortex → endodermis (passage cells) → Pericycle → Xylem

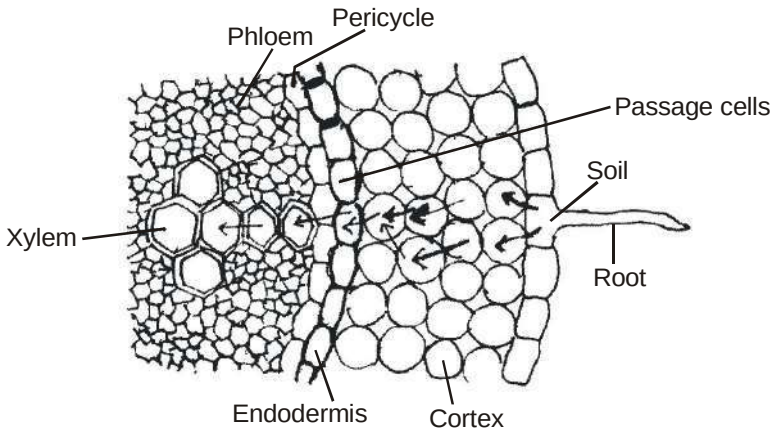


Fig.: Water Absorption Pathway

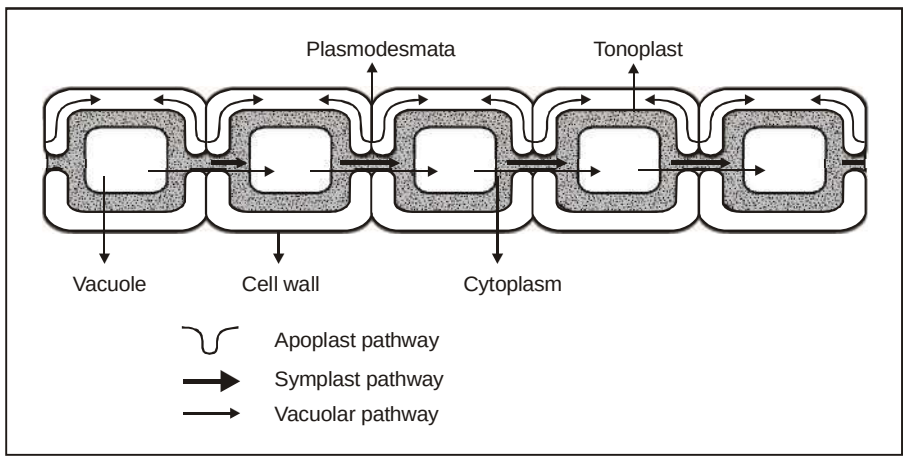
Pathway of Apoplast and Symplast :

(A) Symplast -

A substainable **living path** is known as symplast. This is the living passage. The movement of water from cell to cell through plasmodesmata is called **symplastic path** in plant. This movement of water through cell membrane is also called as **transmembrane pathway.**

(B) Apoplast -

This is the **non living path** in plants. Watered cell wall, intercellular space and xylem cavity associate together to form apoplast.



- Term **"apoplast"** & **"symplast"** given by **Munch**
- The path of water from root hair to cortex, may be apoplastic or symplastic. In **endodermis** suberised **casparian strips** blocks the apoplast, thus water must passes through passage cell via symplast.

MECHANISM OF WATER ABSORPTION

- Term active & passive absorption was proposed by **Renner.**
- Water is absorbed by two different ways-

(1) Active water absorption **(2) Passive water absorption**

1. ACTIVE ABSORPTION OF WATER

According to this method water is absorbed due to the osmotic acitivity of roots or by expenditure of ATPs.

I. Osmotic active water absorption ➡ This is given by **Atkins** & **Priestley.** According to this method water is absorbed due to the osmotic activity of roots in order to O.P. & D.P.D. **No direct ATP are consumed** in this method. It is effective during night in herbaceous plant and developes root pressure.

(A) Root Pressure :

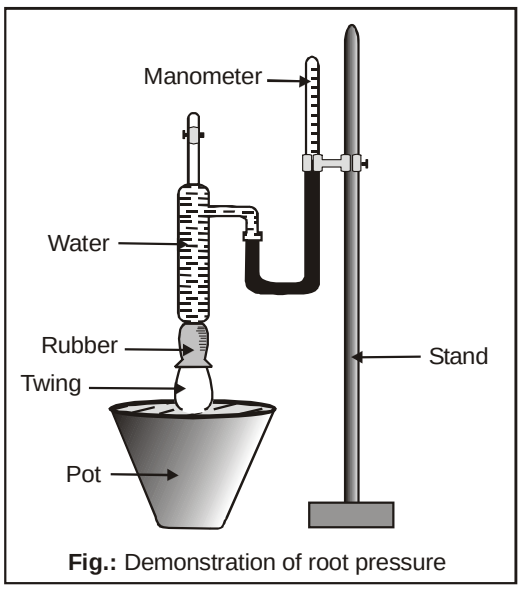


Fig.: Demonstration of root pressure

- Root pressure is the **positive hydrostatic pressure** which develops due to turgidity of cortical cells of root which excert pressure on the xylem sap of roots due to accumulation of water absorbed by roots, during night.
- Term **root pressure** was coined by **Stephan Hales**.
- Root pressure is developed when **rate of osmotic active water absorption is more than the rate of transpiration** and due to which water is pushed up in tracheary elements of roots.
- When a plant is cut near the base, the oozing of the liquid from the cut end is called **bleeding or exudation**. It is indicative of root pressure.
- The **maximum value** of root pressure can be upto **2 atm.**
- Its maximum value is found in plants growing in well aerated, well watered soil under and moist environment.
- **Root pressure** is **absent** in most of the **conifers, woody plants** and **in rapidly transpiring plants** (negative pressure is effective).
- Guttation is also the **result of root pressure**.
- Root pressure is high under favourable conditions (rains and spring). At this time **transpiration** rate is comparatively **low**. **In summers**, when there is greatest need for water, **root pressure is lacking**.
- Thus root pressure is not important in most plants. It may be effective in herbaceous plants which transpire slowly, during night.

(B) Guttation :

Loss of water from the margin of leaves of the herbaceous plant in the form of water droplets is called as **guttation**.

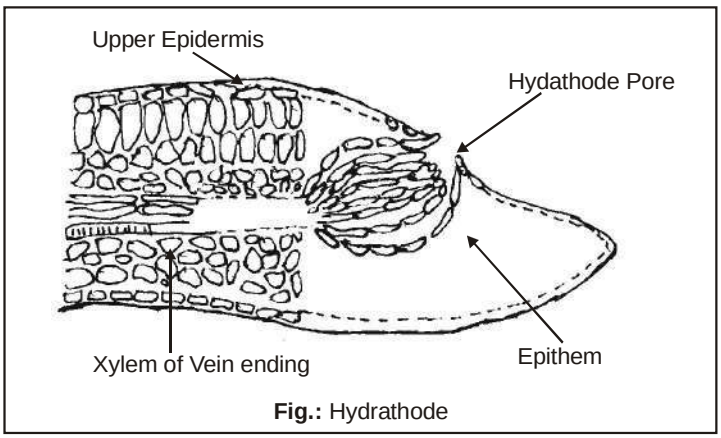

Fig.: Hydrathode

- The term **"Guttation"** was coined by **Burgerstein.**
- Exuded liquid of guttation along with water contains some **organic and inorganic (dissolved)** substances. It means it is not pure water.
- Normally, guttation process is found in herbaceous plants like **Grasses, Tomatos, Balsum, Nausterium, Colocasia, Saxifraga** and in some of the plants of **Cucurbitaceae** family.
- Guttation occurs from the margins of the leaves through the special pore (always open) like structure are called **hydathodes** or **water stomata.**
- Generally guttation occurs during mid night or early morning.
- Parenchymatous and loose tissue are lie beneath the hydathode, which are known as **epithem** or **transfer tissues.**
- The process of guttation take place due to **root pressure,** develop in cortex cells of root.

(C) Bleeding :

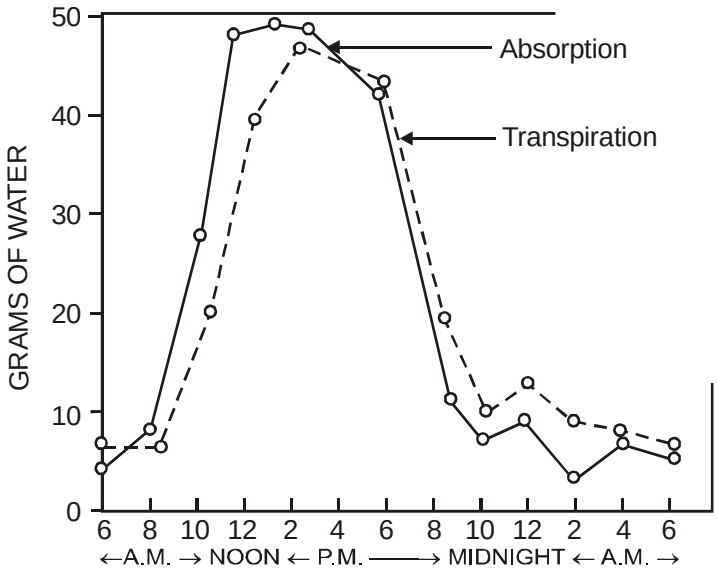
Fast flowing of liquid from the injured or cut parts of the plants is called bleeding or exudation.

- This process takes place due to high **root pressure.**
- Sugar is obtained from the sugar mapple by this process.
- The highest bleeding is found in **Caryota urens** (Toddy palm) (about 50 liter per day)
- Bleeding is important in economic biology, because **Opium, latex of rubber** is obtained by this method.

II. Non osmotic active water absorption ➡ Proposed by **Thieman, Bennet-Clark.** According to this method absorption of water occur **against the osmotic concentration** by direct investment / **expenditure of metabolic energy** in the form of ATPs. Generally this process present in **Halophytes.** Only 4% of total absorbed water is taken by this process.

2. PASSIVE ABSORPTION OF WATER

Given by **Kramer**. According to this method forces for the absorption of water originates in **aerial parts** by rapid transpiration & roots remain as passive organ. According to **Kramer** water absorption in plants is followed by transpiration. **About 96% of water is absorbed by passive method.** Due to rapid transpiration, D.P.D. of leaf cells ↑ result in suction force, which suck the water from roots.



Wilting :

- Drooping of soft parts of the plants due to loss of turgidity in their cells is called wilting. Wilting is caused due to high rate of transpiration during mid-day or deficiency of water in soil and also in prolonged drought condition.
- Wilting may be temporary or permanent.
- **Incipient wilting :** This is starting of wilting without any external symptom is called incipient wilting.

FACTORS AFFECTING WATER ABSORPTION

[1] Available soil water :-

- **Plant absorbs capillary water,** which is present in soil. Absorption of water depends on the amount of capillary water present in the soil. Absorption increases by increasing amount of capillary water.
- If, water is present in higher amount in the soil then such type of soil is called **"Water logged soil".** This soil is **Physiologically dry** and lack oxygen. Because of this an aerobic respiration takes place in roots, and alcohol is formed. Roots can be degenerate due to this alcohol. (**Dry soil** is physically dry.)

[2] Soil temperature :-

- Soil temperature affects the following mechanisms-
  - [i] Low temperature decreases the permeability of cell membrane.
  - [ii] It is essential for the activity of enzymes for the formation of root hairs.
  - [iii] At low temperature viscosity of capillary water is increased.
- Generally, normal absorption of water take place at temperature of soil between 20 - 35ºC.
- Increasing or decreasing soil temperature of soil between 20 - 35ºC.

  Cold soil is as **physiologically dry.**

[3] Soil Air :-

- Absorption of water proceeds more rapidly in well aerated soil. Deficiency of oxygen in soil causes improper respiration in roots.
- **Poorly aerated soil is physiologically dry.**

[4] Soil Concentration :

- The rate of the absorption is inversely proportional to the concentration of minerals present in soil.

$$\text{Water Absorption} \propto \frac{1}{\text{concentration of soil minerals}}$$

- Water absorption take place in appropriate soil solution. If the concentration of soil minerals is high, it decreases the rate of absorption. Therefore **saline soil** is **physiologically dry.** Halophytes can grow only in this soil.

[5] Transpiration :-

- According to **Kramer** the rate of water absorption is directly proportional to the rate of transpiration. The rate of absorption increases due to increase in the transpiration. Because passive water absorption increases due to transpiration.

ASCENT OF SAP

INTRODUCTION

- Upward conduction of water from roots to leaves through stem against force of gravity is called **ascent of sap.**
- The **inorganic substances** dissolved in xylem water are called **sap**.

PROBLEMS RELATED TO ASCENT OF SAP

(1) Path of Ascent of sap **(2) Mechanism of Ascent of Sap**

1. PATH OF ASCENT OF SAP

- The path of ascent of sap is **xylem** though exact mechanism is not clear.
- Important evidences -

(i) Ringing or Girdling Experiment **(ii) Staining Experiment**

(i) Ringing or Girdling Experiment :

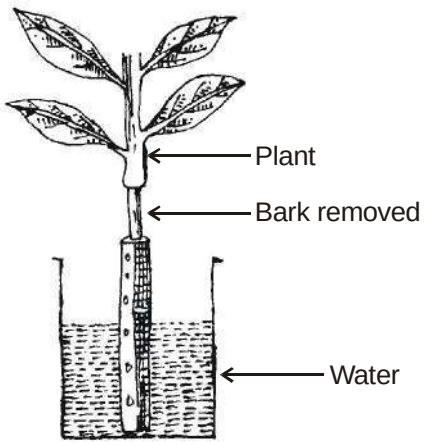


Fig.: Girdling Experiment : To show xylem as path of ascent of sap

- **Malpighi** (1671), **Stephen Hales** (1731) and **Hartig** (1837) proved by ringing experiment that ascent of sap not occurs through phloem or food conduction occurs by phloem.
- When ring or girdle upto 2-3cm of Bark (Secondry Phloem) is removed, the branches remain healthy.
- Ringing experiment cannot be performed in monocots due to presence of scattered vascular bundles in stem.
- Conclusion - Phloem is food conducting tissue or phloem is not water conducting tissue.

(ii) Staining Experiment–

- When a cut shoot of Balsam plant is dipped in solution of Eosine, **only xylem tissue is found stained**.
- **Blockage experiment -** By **Dixon,** xylem is blocked by wax.
- From above observations following conclusions can be drawn-

  Main path for ascent of sap is through **xylem cavities.**

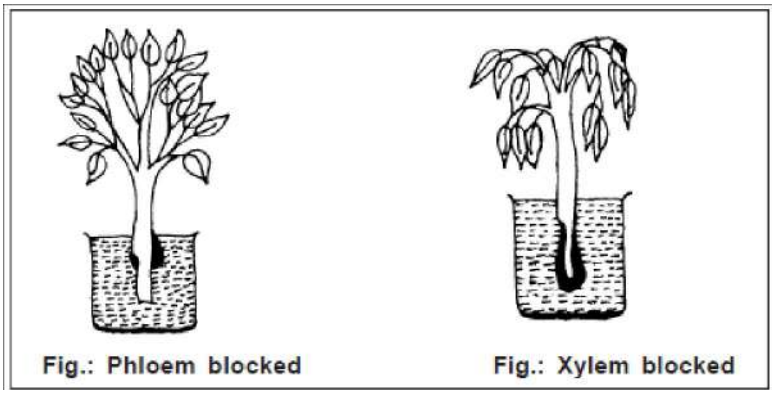

Fig.: Phloem blocked Fig.: Xylem blocked

2. MECHANISM OF ASCENT OF SAP

Two types of theories have been proposed for the mechanism of ascent of sap.

(i) Vital Force Theory **(ii) Physical Force Theory**

(i) Vital Force Theory :

According to this theory ascent of sap is due to vital activities of cells or living cells are responsible for ascent of sap. Main Supporters of this theory are -

- **Westermaier** (1884) was of the opinion that xylem parenchyma is responsible for ascent of sap. Tracheids and vessels only function as water reservoir.
- **Godlewski** (1884) gave **clambering force theory** or **relay pump theory** :

(i) According to this theory cells of xylem parenchyma and medullary rays shows rhythmic changes in osmotic pressure which causes upward movement of water.

(ii) When O.P. value of parenchyma rises, they absorb water from adjoining xylem vessel. Water rises up in parenchyma due to atmospheric pressure.

- **J.C. Bose - Pulsation theory :**

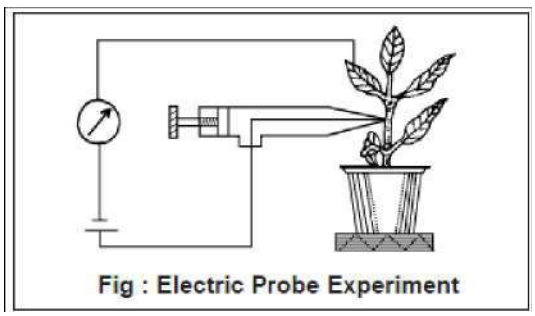

Fig : Electric Probe Experiment

(i) According to which innermost layer of cortex (=just outside the endodermis) is responsible for ascent of sap.

(ii) He concluded that these cells pulsate like heart and push water into the xylem cavity leading to ascent of sap.

(iii) He verified this with the help of electric-probe experiment. When electric probe reached in innermost layer of cortex, vibrations in galvanometer were observed.

(iv) Bose performed his experiment in Desmodium gyrans (a member of Papilionatae).

- **Strasburger** (1891) proved experimentally that living cells are not essential for ascent of sap. Ascent of sap can occur even after making the live cells dead by poisoning them (using Picric acid, $HgCl_2$ etc.)
- **Root Pressure Theory (By Priestley) :**

  Root pressure is respobsible for ascent of sap.

  Objections -

  – Root pressure is absent in woody plants, as secondry growth occurs in woody plant roots.

  – When root pressure is high, during night, then ascent of sap is low.

(ii) Physical Force Theories :

Supporters of this theory are of opinion that forces responsible for upward conduction of water are physical in nature and even dead cells can conduct water.

- **Capillary force theory : -** Proposed by **Boehm**. Xylem vessels acts as capillaries and water rises up due to capillary action.
- **Jamin's Theory : -** Also known as **chain theory**.

  – According to Jamin, there are alternate regular layers of water and air in vessels.

  – Ascent of sap occurs due to expansion of air.
- **Imbibition force theory :**

  – Proposed by **Unger** (1868) and supported by **Sachs** (1878).

  – According to this theory imbibition by thick walls of xylem vessels is responsible for ascent of sap.

  – **Sachs** considered hydrophilic colloidal substances present in cell wall of vessels to be responsible for this process.
- **Transpiration pull-cohesion force theory :**

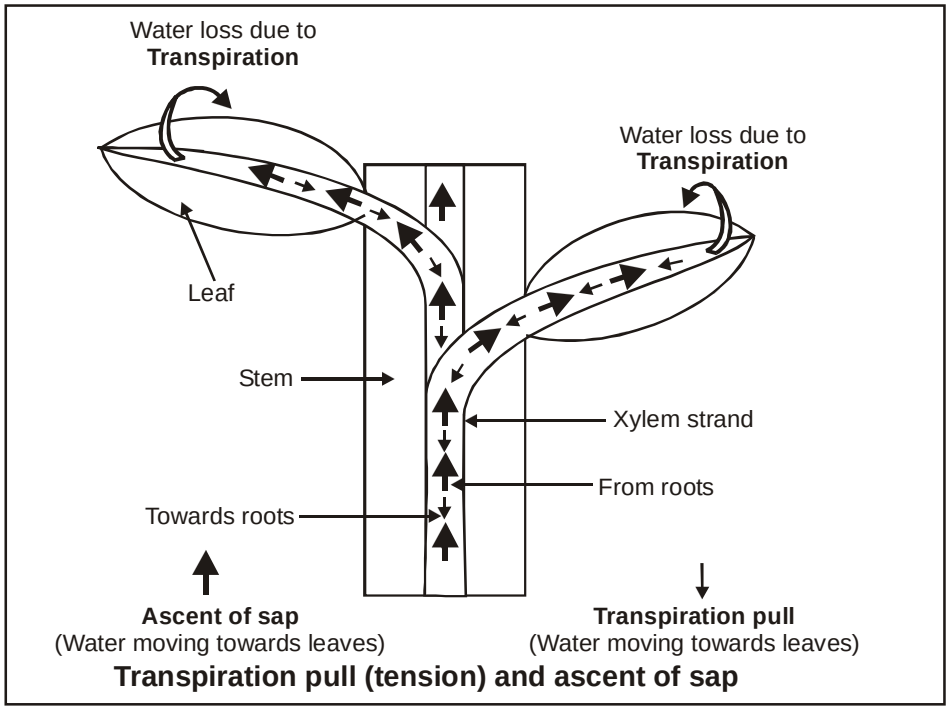
  – This theory was proposed by **Dixon** and **Jolly** (1894).

  – Most accepted or universally accepted theory of ascent of sap. According to it three components are involved in ascent of sap.

(a) Cohesion : Mutual attraction between the water molecule is called **cohesion force,** which helps in forming water coloum in xylem elements.

(b) Adhesion : Attraction between xylem walls and water molecules is called **adhesion force,** which helps in maintainance of water coloumn of xylem.

(c) Transpiration Pull : A tension or negative pressure develops in xylem due to rapid transpiration in leaves (because of high DPD), this creates a transpiration pull, which is responsible for the pulling up of water column in xylem. So ascent of sap is constitutive effect of cohesion, adhesion and transpiration pull.



Transpiration pull (tension) and ascent of sap

FACTORS AFFECTING ASCENT OF SAP

- Amount of water in Soil
- Temperature
- Atmospheric humidity
- Atmospheric pressure
- Movement of wind
- Number of stomata in leaves
- Besides them, all other factors which affects root pressure and transpiration process, also affects ascent of sap directly or indirectly.

FOOD TRANSILOCATION IN PLANTS

- Food/organic material conduction in plants mainly occurs by phloem. (Proved by Girdling experiment).
- Food conduction occurs in between **source** and **sink**. Source is net exporter while sink is net importer.
- Generally green photosynthetic plant parts acts as **source** like leaves while non photosynthetic parts like root, shoot, fruits acts as **sink**.
- Food conduction may be in any required direction or **bidirectional** unlike the water conduction which is a unidirectional process.
- Translocation of food mainly occurs in the form of **sucrose** or it is non-reducing sugar and chemically inert in it's pathway of conduction.
- **Pressure flow/mass flow hypothesis of food/sucrose translocation - Given by E. Munch (1930).** This is the most accepted theory of food conduction in plants.

According to it food translocation occur in between source and sink in order of turgor pressure gradient i.e., high T.P. to low T.P.

- **Phloem loading/sucrose loading at source** → It is an active process occurs with expenditure of ATP and helped by carrier molecules. At source due to phloem loading concentration of sieve cells increase, results in increase in osmotic pressure and water will moves from nearby xylem into sieve cells results in **increase in turgor pressure** (T.P.) and increase in water potential (Ψ_W). It establish a higher T.P at source end in sieve tubes. Sucrose moves from source in sieve tube towards sink from high T.P./ High ψ_W to towards the low T.P./low $\Psi_{W.}$
- **Phloem unloading/sucrose unloading at sink** → It is also active process occurs with expenditure of ATP and helped by carrier molecules. At sink sucrose is unloaded results in decrease in osmotic pressure (O.P.), it results in exit of water into near by xylem leads to decrease in Turgor pressure (T.P.) and water potential (Ψ_W) of phloem. In sink cells the unloaded sucrose is either changed into starch (as starch not change O.P.) or consumed, to maintain low O.P. and continuous unloading .
- The translocation of food between source and sink end is **passive process** as occurs in order of T.P. or Ψ_W gradient.
- So, the process of sucrose loading at source and unloading at sink continues. This turgor pressure difference will maintained and water will continue to move in at soure and out at sink.
- This mechanism was experimentally demonstrated by **Bimodel** exp. of **Munch.**
- According to evidences of modern research phloem conduction is an active process (only phloem loading and unloading) and it required metabolic energy of phloem cells.

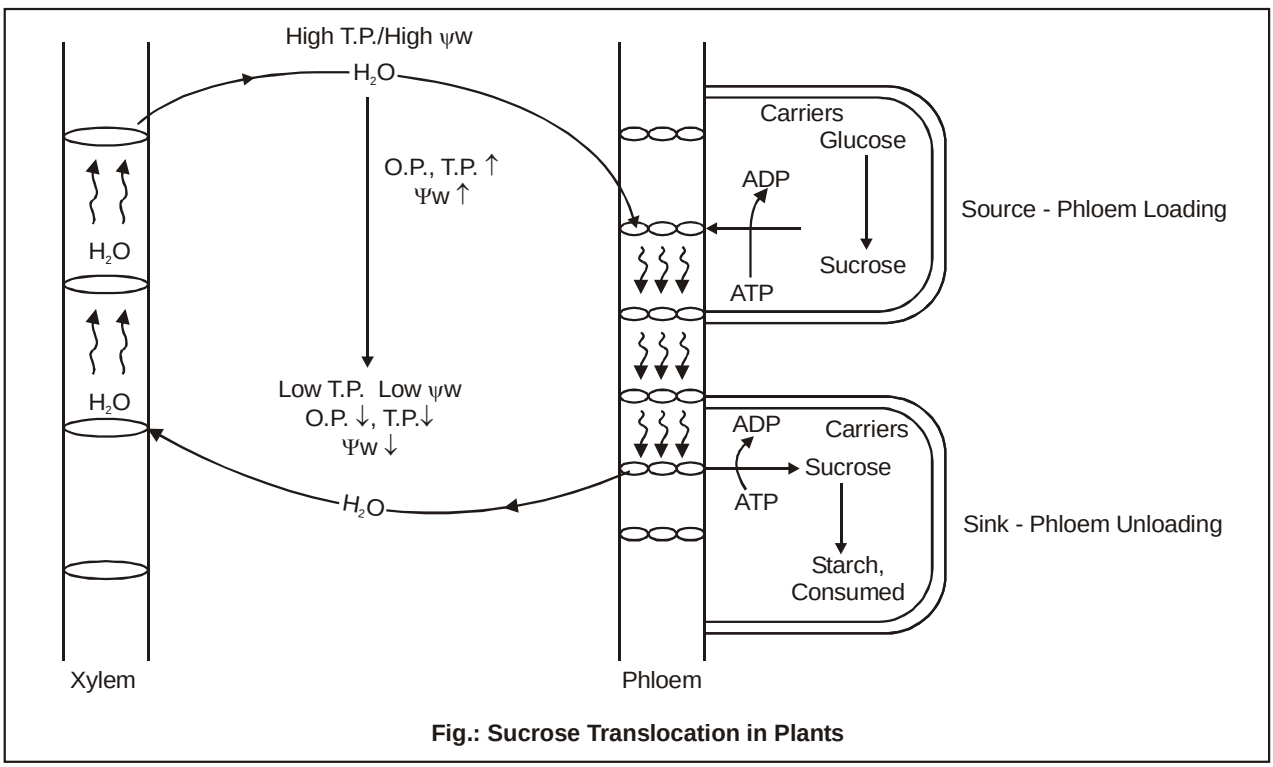


Fig.: Sucrose Translocation in Plants

TRANSPIRATION

INTRODUCTION

- Though large quantities of water is absorbed by the roots from soil, but only 2-5% of it is utilized by plant and rest 95-98% is lost in form of **transpiration**.
- Definition :- The loss of water from the aerial parts of plant in the form of vapours is **called transpiration**.
- The instrument used for measuring transpiration is **potometer**.
- **"Transpiration is an essential evil" - by Crutis.**

  "Transpiration is an unavoidable evil" - by Steward.
- The minimum transpiration is found in succulent xerophytes and no transpiration in submerged hydrophytes.
- **Maximum transpiration is found in mesophytes.**

Significance of transpiration :

[1] In regulation of temperature :

- **Cooling effect** on the surface of leaves is produced by the process of transpiration, due to which temperature remains constant in plants.
- The plant are protected from the burning of heat due to transpiration. Evaporation of water produces cooling effect.

[2] In mineral absorption :

- Mass flow of water is found during the passive absorption of water. Hence it is assumed that minerals enter the roots through the water.

[3] In ascent of sap

[4] In water absorption

[5] Distribution of absorbed salts

[6] Gaseous exchange

[7] Control of hydrological cycle

TYPES OF TRANSPIRATION

(A) Lenticular transpiration :

- Loss of water through **lenticles** (pores found in epidermis of mature stems, some roots & some fruits)
- It results in **0.1%** of water loss out of total transpiration.

(B) Cuticular transpiration :

- **10%** of total transpiration occurs from **surface**, outer wall of epidermis of aerial parts.
- The outer wall has cuticle which affects diffusion of water. It is inversely proportional to thickness of cuticle & amount of water.
- Cuticle minimize stomatal transpiration.

(C) Stomatal transpiration :

- Loss of water through **stomata** (small opening on the epidermis of leaves).

- **90%** of total transpiration occurs through **stomata**.
- The water lost from leaves is called **foliar transpiration.**

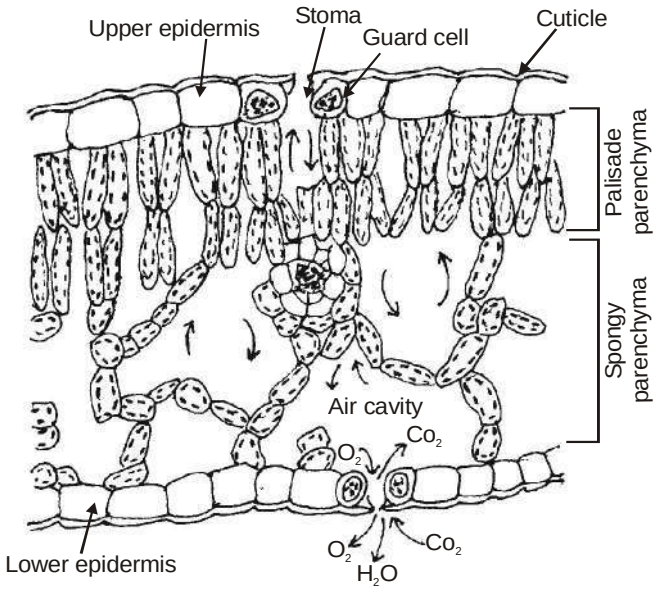

Fig.: T.S. of a leaf showing the stomatal transpiration.

STOMATA

- The name '**stomata**' was given by **Malpighie.**
- Stomata was discovered by **Pfeffer**.
- Stomata cover 1-2% of leaf area.
- Algae, fungi and submerged plants do **not possess stomata**.

Structure of stomata :

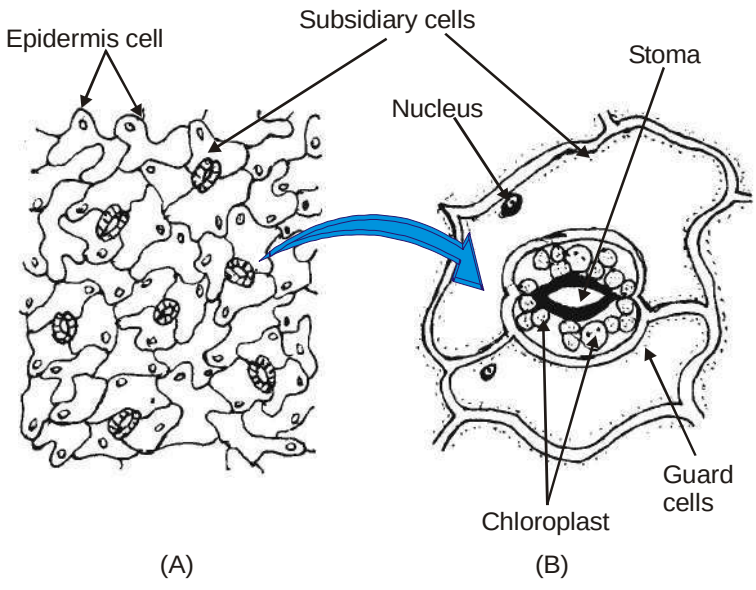

Fig.: (A) Lower epidermis of a leaf to show stomata
(B) Structure of one stomata

- Stomata are small **elliptical pores** found on the epidermis of plant leaves.
- The size of the pore varies from plant to plant. e.g. - In maize the size of pore is **4µ wide to 26µ long**.
- This pore is surrounded by **kidney shaped** or bean shaped epidermal cells called **guard cells**.
- Guard cells are living & have nucleus, chloroplast, vacuole and cytoplasm.
- Chloroplast is functionally active only in dicots. In monocots it is either rudimentry or absent or functionally inactive.
- Inner wall is thick & less elastic and outer wall is thin & more elastic in guard cells.
- Guard cells are surrounded by specialized epidermal cells called **subsidiary** or **accessory cells**.
- The pore opens or closes by the movement of guard cells.
- In the inner tangential walls of guard cells micro filaments of cellulose are present in circular form called as **radial micellation**.
- The air cavities to which the stomata opens are called as **substomatal cavity.**

Distribution of stomata :

- In monocots, stomata are **uniformly distributed** and are present on the upper and lower surface of the leaf.
- In dicots, stomata are **unevenly distributed** and are present more on the lower surface.
- In dicots guard cells are **kidney shaped**, reniform or bean like.
- In monocots, guard cells are **elliptical** or **dumbell shaped** which are called as **Graminaceous stomata.**
- In xerophytes stomata are situated in a **groove** and are thus called as **sunken stomata.**

Types of Stomata :

- **On the basis of distribution : 5 types**

Apple or Mulberry or Hypostomatous	**Potato type or Amphistomatous**	**Oat type or Amphistomatous**	**Water lily type or Epistomatous**	**Potomogeton or Astomatous**
Stomate present only on lower surface of leaf. **e.g.,** Apple, Oxalis, Mulberry	Stomata present on both surface of leaf but more on lower surface **e.g.,** Potato, Pea, Tomato, Cauliflower & other dicots.	The no. of stomata are equal on both sides. **e.g.,** Oat & other monocots like grasses, cereals, Maize	Stomata on upper suface only. **e.g.,** Water lily, Lotus, Victoria	Stomata absent or vestigeal. **e.g.,** Potamogeton, Hydrilla, Vallisneria

- **On the basis of subsidiary cells :- 4 types**

Anomocytic	**Anisocytic**	**Paracytic**	**Diacytic**
Subsidiary cells are similar in structure & 5 or 6 in no. **e.g.,** Ranunculaceae family	Subsidiary cells are in 3 in no. & one is bigger than other two. **e.g.,** Crucifereae family	Subsidiary cells two in no. & are situated parallely with gaurd cells. **e.g.,** Rubiaceae family	Subsidiary cells are two in no. & are longitudinal with guard cells. **e.g.,** Caryophyllaeceae family

- **On the basis of daily stomatal movement :- 4 types (Loftfield, 1912)**

Alfa – Alfa Type	Potato Type	Barley Type	Equisetum Type
Stomata open in day. **e.g.,** Sunflower, Pea, Apple, Grapes, Mustard, Raddish	Stomata open in day & night but get closed in the evening for few hours. **e.g.,** Potato, Banana, Onion, Cabbage, Cucurbita, Pumpkin	Stomata open for some time in day & then remain closed. **e.g.,** In Cereals, like – Wheat, Maize, Barley	Stomata always remains open. **e.g.,** Amphibious plants.

- **On the basis of Light :- 3 types**

Photoactive	Scotoactive	Hydroactive
Stomata opens in presence of light. **e.g.,** In all normal plants	Stomata opens only at night. **e.g.,** Opuntia	Stomata opens only in presence of moisture. **e.g.,** Some epiphytes plants

- **On the basis of development (Pant , 1965) : 3 types**

Mesogynous Type	Perigynous Type	Mesoperigynous Type
In this type of stomata guard cells as well as subsidiary or Accessory cells both are developed from one mother cell. **e.g.,** Rubiaceace & Brassicaceae	In this type guard cells are formed from mother cell while subsidiary cells from nearby mother cells. **e.g.,** Cucurbitaceae family	In this type guard cells & one subsidiary cell is formed from mother cell while other subsidiary cells develop independently. **e.g.,** Ranunculaceae, Caryophyllaceae family

Stomata in Gymnosperms :

(i) **Syndetochielic –** When subsidiary cells & guard cells originate from single cell.

(ii) **Haplochielic –** Both cells arises from separate cells.

MECHANISM OF TRANSPIRATION

This involves 3 steps :

1. **Osmotic diffusion of water in the leaf :**
   - Inside the leaf mesophyll cells are in contact with xylem & also with inter cellular spaces above the stomata.
   - Mesophyll cells draw water from the xylem which makes the cells turgid. Their diffusion pressure deficit and osmotic pressure decreases and in turn they release water in the form of vapours in intercellular spaces close to stomata by diffusion.
   - After releasing water the O.P. & D.P.D. of mesophyll cells increases & hence they draw water from xylem again.
2. **Opening & closing of stomata :**
   - When guard cells becomes **turgid** stomatal pore **opens**, while when they becomes **flaccid** stomatal pore **closes**.

- Stomata generally open during the day and closed during the night except in CAM plants. The important theories of stomatal movements are as follows-

(i) Photosynthesis in guard cell hypothesis :

This theory was proposed by **Schwendener and Von mohl.** According to this theory guard cell chloroplast perform photosynthesis during the day time. This produce sugars in guard cell which increases the O.P. of GC, compared to adjacent epidermal cells (subsidiary cells). Water enters in guard cells form subsidiary cells by endosmosis, due to this guard cells become turgid and stomata will open.

Objections -

(i) In CAM plants stomata open during dark/night.

(ii) Chloroplast of monocot guard cells are non-functional (inactive) photosynthetically.

(ii) Starch → Sugar interconversion theory :

- This theory was proposed by **Sayre** (1926). First of all Lloyd stated that amount of sugar in GC is increases during the day time and starch in night.
- Detail study of this change was done by **Sayre** & given **starch hydrolysis theory.** According to **Sayre,** starch converts into sugar during day time when pH of guard cell is high. Sugar changes into starch during night at low pH in guard cells (Supported by **Scarth**). **Sayre** clarified that CO_2 reacts with water during night. Due to accumulation of H_2CO_3, pH in guard cell is decreases.
- **Hanes -** Stated that this change takes place by phosphorylase enzyme.
- **Yin & Tung** reported the presence of phosphorylase enzyme in guard cells.

$$\text{Starch + ip} \underset{\text{Night pH- 4.5-5}}{\overset{\text{Day ph 7.5}}{\rightleftharpoons}} \text{Glucose-1, P} \Rightarrow \text{conc. of GC increased} \rightarrow \text{Entry of } H_2O \text{ in GC}$$

GC - Turgid → Stomata open.

- **Stewards modification -** According to Steward (1964) appreciable change in O.P. of GC is possible after the conversion of glucose - 1 P into Glucose & ip (inorganic phosphate)

(i) Glucose-1, P $\xrightarrow{\text{Mutase}}$ Glucose-6P

(ii) Glucose-6, P $\xrightarrow{\text{Phosphatase}}$ Glucose + iP

⇩

Conc. of GC increased

↓

osmotic entry of **H_2O → GC-Turgid → open.**

(iii) Glucose + ATP $\xrightarrow{\text{Hexokinase}}$ Glucose-1, P ➡ Starch ➡ Stomata closed

Objections -

(i) Starch is absent in GC of some monocots like onion.

(ii) Formation of organic acid is observed during stomatal opening.

(iii) Active K^+ ➡ H^+ exchange theory or active proton pump mechanism-

- Given by **Levitt (1973-74)**. This is modern and most accepted theory for stomatal opening and closing.

- First of all **Fujino** observed that influx of K^+ions in guard cells during stomatal opening. (Supported by Fisher and Hsiao). Detail study of this phenomenon was done by **Levitt**, who proposed this theory. According to him stomata opens by following mechanism.

(i) Cabohydrates $\xrightarrow{\text{Enzymes}}$ PEP + CO_2 $\xrightarrow[\text{Carboxylase}]{\text{PEP}}$ OAA

(ii) O.A.A. $\longrightarrow$ Malic Acid $\begin{cases} \rightarrow H^+ \rightarrow K^+ \\ \rightarrow ATP \\ \rightarrow Malate^- \end{cases}$

(iii) Malate + K^+ $\longrightarrow$ K-malate $\longrightarrow$ Conc. of GC increased $\downarrow$

Entry of H_2O in GC $\rightarrow$ **GC turgid** $\rightarrow$ **Stomata open**

- **Closing of stomata :-** Plant hormone ABA-acts on guard cells, which interfere the exchange of $K^+ \rightarrow H^+$ ions in gurad cells, results in reverse of reaction. of opening of stomata, hence stomata closed. pH of guard cells is decreases during night, which favours stomatal closing.

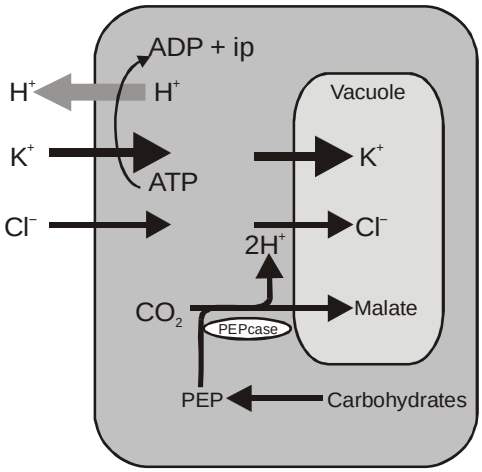

Fig.: Role of potassium, chloride and malate ions in stomatal opening. The ions accumulate in the vacuole of guard cells, lowering the water potential and thereby increasing water uptake and subsequently opening the stomata (PEPCase = Phosphoenol pyruvate carboxylase)

- High concentration of K^+ ions in guard cells is electrically balanced by uptake of Cl^- and malate ions in guard cells.

(iv) Ca-ABA second messenger model - Given by **Desilva** & **Cowan** (1985) this is modern explanation of stomatal closing only.

- **Ramdas & Raghvendra** suggested that ATPs for stomatal movement comes from cyclic ETC.
- **Bowlings :** Malate switch hypothesis.

  Raschke : K^+ ions in guard cells comes from subsidiary cells.
- Stomata opens during the night in succulent plants and closed during the day. This nature of stomata in opuntia is called **Scotoactive stomata.**
- In CAM plants organic acid is formed during night which broken down during day and CO_2 is liberated which is used in photosynthesis.

FACTORS AFFECTING RATE OF TRANSPIRATION

Factors affecting stomatal opening and closing :

[1] Light :

In most of the plants stomata open during the day except succulent xerophytic plants and close during the dark. Opening of stomata completes in the presence of blue and red light. **Blue light is most effective** and causing stomatal opening.

[2] Temperature :

Loft field show temperature quotient of opening of stomata is **$[Q_{10}] = 2$**

[3] CO_2 concentration :

- Stomata opens at low concentration of CO_2 while closed at high concentration of CO_2.

[4] Growth Hormones :

- **Cytokinin hormone induce opening of stomata.** It increase the influx of K^+ ions and stimulate the stomata for opening.
- While **ABA** stimulate the stomata for closing. This hormone **oppose the induction effect of cytokinin.**
- ABA effects the permeability of the guard cells. It prevent the out flux of H^+ ions and increase the out flux of K^+ ions. Because of this pH of the guard cells decreased.

  Cl^- ions also plays important role in stomatal movement. Above mentioned effects also found in high amount of CO_2
- ABA is formed due to high water stress in chloroplast of leaves.

[5] Atmospheric humidity :

- Stomata opens for long duration and more widen in the presence of humid atmosphere, while stomata remains closed in dry atmosphere or partial opening at higher atm. humidity transpiration will be stop but stomata remains completly open.

Factors affecting the rate of transpiration :

Factors affecting the rate of transpiration are divided into two types :

[A] External Factors (Environmental factor)

[B] Internal Factors

1. EXTERNAL FACTORS (Environmental factor)

(i) Atmospheric humidity : $T_r \propto \frac{1}{\text{Relative humidity}}$

- This is the most important factor. The rate of transpiration is higher in low atmospheric humidity while at higher atmospheric humidity, the atmosphere is moistened, resulting decreasing of rate of transpiration.
- Therefore, the rate of transpiration is high during the summer and low in rainy season.

(ii) Temperature : $T_r \propto \text{Temperature}$

- The value of Q_{10} for transpiration is 2. It means by increasing 10ºC temperature, the rate of transpiration is approximately double. (By Loftfield)

- Water vapour holding capacity of air increased at high temperature, resulting the rate of transpiration increased.
- On contrary vapour holding capacity of air decreased at low temperature so that the rate of transpiration is decreased.

(iii) Light :

- Light stimulates, transpiration by heating effect on leaf.
- **Action spectrum** of transpiration is **blue** and **red.**
- Rate of transpiration is **faster in blue light** than that of red light. Because stomata are completely opened as their full capacity in the blue light.

(iv) Wind velocity : $T_r \propto$ Wind velocity

- Transpiration is less in constant air but if wind velocity is high the rate of transpiration is also high, because wind removes humid air (saturated air) around the stomata.
- Transpiration increases in the beginning at high wind velocity [30-50 km./hour] But latter on it cause closure of stomata due to mechanical effect and transpiration decrease.

(v) Atmospheric pressure :

- The speed of the air increase at low atmospheric pressure, due to this rate of the diffusion increase which increase the rate of transpiration.
- The rate of transpiration is found maximum in the high intensity of light at high range of hills.

Transpiration ratio (TR) : Moles of H_2O transpired / moles of CO_2 assimilated.

- Ratio of the loss of water to the photosynthetic CO_2 fixation is called TR.
- TR is low for C_4 plants (200–350) while high of C_3 plants (500–1000). It means C_4 conserve water with efficient photosynthesis.
- CAM plants possess minimum TR (50–100).

(vi) Anti transpirants :

- Chemical substances which reduce the rate of transpiration are known as **antitranspirants.** Anti transpirants are as follows-
- **Phenyl Mercuric Acetate (PMA), Aspirin, (Salicylic acid), Abscisic acid (ABA), Oxi-ethylene, Silicon oil, CO_2 and low viscous wax.**
- PMA closed the stomata for more than two weeks partially.
- Antitranspirants are used in dry farming.

2. INTERNAL FACTORS :

- These factors are concerned with structure of plants. These are following types :

(i) Transpiration area :

Pruning increase the rate of transpiration per leaf but overall reduce the transpiration.

(ii) Anatomical characteristics of leaf and leaf orientation :

Several structures of leaf effect the transpiration as follows :-

Stomatal characteristics :

Transpiration is effected by the structure of stomata, position of stomata, distance between the stomata, number of stomata per unit area and activity of the stomata.

By Salisbury - Stomatal Index (SI) = $\frac{S}{E+S}$

SI = Stomatal index S = Number of stomata/unit area

E = Number of epidermal cells in same unit area.

(iii) Water status of leaves

(iv) Root - Shoot Ratio :

- The rate of transpiration decreases with decrease in root-shoot ratio.
- The rate of transpiration increases with increase in root-shoot ratio.

The following characteristics are found in leaf to reduce the transpiration.

(i) Leaves modify in spines.

(ii) Leaves transformed into needle e.g. **Pinus**

(iii) Folding and unfolding of leaves by bulliform cells. eg., **Amophilla, Pea etc.**

(iv) Small size of the leaves.

(v) Presence of thick waxy layer on leaves. eg., **Banyan tree.**

SPECIAL POINTS

- Transpiration in old stems and fruits occurs through **lenticels**.
- The loss of water through transpiration in increasing unit dry weight of the plant is called **transpiration ratio**.
- The quantity of water transpired by unit area of leaf surface in unit time is called **transpiration flux**.
- The diurnal periodicity was diagrammatically represented by **Von mohl**.
- Fresh weight of a plant would be maximum in the morning and minimum in the afternoon.
- The main reason of osmotic pressure for stomata is potassium chloride or potassium malate**.**
- Porometer is used to find out the area of stomata on the leaf.
- Transpiration measuring instrument is called **Potometer**. The rate of absorptioon of water is measured through this instrument. In potometer rate of water absorption is proportional to the rate of transpiration.
- **Cobalt-chloride test :** This method is used for the comparision of transpiration at both the surface of the leaves. It is first of all shown by **Stahl.**
- Stomata covers 1-2% of total leaf area. Size of stomata is 10-40μ (Length) × 3 – 12μ (width)
- The photophosphorylation process in the guard cells is a energy metabolic process, not CO_2-metaboic process.
- The rate of transpiration of C_4 plants is less as compared to C_3 plants. In CAM plants minimum transpiration occurs.
- **Distribution of stomata on leaf surface :**

Plant Type	Stomata No./mm²	
Dicots	**Upper epidermis**	**Lower Epidermis**
Sunflower	120	175
Alfa-Alfa	169	188
Geranium	29	179
Monocots		
Wheat	50	40
Barley	70	85
Onion	175	175

- **Auxins** which increases metabolic activities of the cells stimulate absorption of water.
- **Wilting Coefficient :** The amount of water expressed as percentage of dry weight of soil, which is left in soil at the time of permanent wilting is called **wilting co-efficient.**
- Value of **Tensile strength** of xylem sap is upto 300 atm.
- The maximum value of transpiration pull has been found to be 20 atm. 1 atm force can raise water upto 10 m height. Thus ascent of sap can occur upto 200 meters height by transpiration pull.
- Besides the translocation of water upwards, water is also translocated radially and downwards. Radial translocation is more common.
- Cytokinin enhances opening of stomata while ABA induce closing of stomata.
- In moist environment, stomata open more widely and for longer time & opposite is the case in dry environment.
- The OP of guard cells when stomata open is 30-40 atm.
- During wilting rate of photosynthesis also decreases.
- The no. of stomata per unit area of leaf is called **stomatal frequency**. It depends on position of leaf, external enviromment etc. In a leaf, it increases from base to tip and from midrib to lateral sides.

EXERCISE - 1

DIFFUSION,OSMOSIS & RELATEDTERMS

Q.1 The physical process involved in the release of molecular oxygen from leaves is : -

(1) Diffusion (2) Transpiration

(3) Osmosis (4) Capillarity

Q.2 Who is called father of plant physiology ?

(1) K.V. Thimann (2) Stephan Hales

(3) M. Calvin (4) E. Rabinowitch

Q.3 Who is called father of Indain plant physiology?

(1) J.C. Bose (2) Calvin

(3) R. Mishra (4) K.K. Nanda

Q.4 One molar solution of which substance will have maximum O.P : -

(1) NaCl (2) Glucose

(3) Fructose (4) Starch

Q.5 Pieces of beet root do not lose their colour in cold water, but so in boiling water because :-

(1) The cell wall is killed in boiling water

(2) Hot water can enter cells readily

(3) The plasma membrane gets killed in boiling water and becomes permeable

(4) The pigment is not soluble in cold water

Q.6 The movement of molecules from their higher concentration to lower concentration is called-

(1) Osmosis (2) Diffusion

(3) DPD (4) DPG

Q.7 Osomosis is the diffusion of a solution of a weaker concentration when both are seperated by semi-permeable membrane. What is error in the statement ?

(1) The movement of solvent molecule is not specified

(2) There is no mention of DPD

(3) Behavior of semipermeable membrane is not specified

(4) The exact concentration of solutions are not indicated

Q.8 What statement can be cited for 10% sodium chloride solution and 10% sugar solution present ?

(1) Both have equal OP

(2) The concentration of sodium chloride solution will be less than concentration of sugar solution

(3) The OP of sugar solution will be higher than OP of sodium chloride solution

(4) DPD of sodium chloride solution will be higher than DPD of sugar solution

Q.9 If a plant cell is immersed in water, the water continues to enter the cell until the : -

(1) Concentration of the salts is the same inside the cells as outside

(2) Cell bursts

(3) Concentration of water is the same inside the cell as out side

(4) Diffusion pressure deficit is the same inside the cell as out side

Q.10 If a cell swells, after being placed in solution, the solution is : -

(1) Neutral (2) Hypotonic

(3) Hypertonic (4) Isotonic

Q.11 Osmosis means : -

(1) Solute from low concentration to higher

(2) Solute from higher concentration to low

(3) Solvent from low concentration of solution to higher conc. of solution

(4) Solvent from higher concentration solution to low concentration solution

Q.12 If cell is reduced in size (shirnks) of placing in a solution of sugar, the solution is : -

(1) Hypertonic (2) Hypotonic

(3) Isotonic (4) None of the above

Q.13 The process of osomosis involves : -

(1) Movement of solute through a semipermeable membrane

(2) Movement of solvent through a semipermeable membrane

(3) Movement of solution through semipermeable membrane

(4) None of the above

Q.14 A cell increases in volume if the external medium is

(1) Hypotonic (2) Slightly hypertonic

(3) Isotonic

(4) Much more concentrated than the protoplasm of the cell

Q.15 Osmosis involves diffusion of : -

(1) Suspended particles from higher to lower concentration

(2) Suspended particles from lower to higher concentration

(3) Water from more to less conentration solution

(4) Water from less to more concentrated solution

Q.16 A cell placed in a strong salt solution will shrink because : -

(1) They cytoplasm will be decomposed

(2) Mineral salts will break the cell wall

(3) Salt will enter the cell

(4) Water will move out the cell by exosomosis

Q.17 Grapes placed in salt solution shrink due to :

(1) Imbibition (2) Endosmosis

(3) Exosmosis (4) Osmosis

Q.18 Process of selective transmission of a liquid through semi permeable membrane is called :-

(1) Diffusion (2) Osmosis

(3) Plasmolysis (4) Transmission

Q.19 Water enters into the root hair from the soil in its normal condition because the osmotic pressure of the soil solution :-

(1) Remains lesser than that of root hair sap

(2) Remains equal to that of root hair sap

(3) Remains higher than that of root hair sap

(4) And that of root hair sap remains zero

Q.20 Potato slices are immersed in a series of solution of diffferent osmotic concentrations. No change in volume or weight is observed with slices in a 0.3 M solutions. The osmotic concentration of vacuolar sap, therefore : -

(1) 0.3 M

(2) Greater than 0.3M

(3) Less than 0.3 M

(4) Not related at all to the out side solution

Q.21 Which helps in maintaining form and structure of cells & soft parts of plants ?

(1) Osmotic pressure (2) Turgor pressure

(3) Atmospheric (4) DPD

Q.22 Who propounded the concept of osmosis ?

(1) Abbe Nollet (2) Mayer

(3) Dixon and jolly (4) Renner

Q.23 In terms of permeability, the cell wall and plasmalemma are : -

(1) Permeable and differentially permeable respectively

(2) Both semipermeable

(3) Semipermeable and permeable

(4) Both differentially permeable

Q.24 Plasma membrane controls : -

(1) Passage of water only

(2) Passage of water and solutes in and out of the cell

(3) Passage of water and solutes into the cell

(4) Movement of cell contents out the cell

Q.25 Which process occurs against a concentration gradient of solute ?

(1) Diffusion (2) Osmosis

(3) Transpiration (4) Translocation

DPD (SP)

Q.26 When a cell is fully turgid which of the following will be zero ?

(1) Turgor pressure (2) Wall pressure

(3) Suction pressure (4) Osmotic pressure

Q.27 Water from the soil enters in to the root hairs on account of : -

(1) Turgor pressure

(2) Suction pressure DPD

(3) Barometric pressure

(4) Osmotic pressure

Q.28 In a fully turgid cell the values of DPD, OP and TP should be : -

(1) DPD = 10 atm., OP = 15 atm., TP = 5atm

(2) DPD = 5 atm., OP = 12 atm., TP = 7atm

(3) DPD = 10 atm., OP = 15 atm., TP = 5atm

(4) DPD = 0 atm., OP = 15 atm., TP = 15atm

Q.29 When the cell is placed in water, it takes water this is due to ?

(1) Osmotic pressure

(2) Suction pressure

(3) Diffusion

(4) Water potential and TP

Q.30 What is the direction of the movement of water if two cells have the same OP but differ in TP ?

(1) No net flow

(2) From lower T.P to higher TP

(3) From higher TP to lower TP

(4) Data insufficient

Q.31 The hydrostatic pressure developed in the cell is called : -

(1) Turgor pressure (2) Wall pressure

(3) Osmotic pressure (4) Suction pressure

Q.32 In fully turgid cell : -

(1) DPD = WP (2) DPD = OP

(3) DPD = OP - TP (4) DPD = 0

Q.33 In flaccid cell : -

(1) DPD = WP (2) DPD = OP

(3) DPD = 0 (4) DPD = OP - TP

Q.34 Turgor pressure of a plasmolysed cell is : -

(1) Positive (2) Zero

(3) Negative (4) None of these

Q.35 When water enters into a cell what happens to its OP, TP and DPD ?

(1) OP & TP increase & its DPD increase

(2) OP & DPD increase & TP decrease

(3) TP & DPD decrease & OP increase

(4) OP & DPD decrease & TP increase

Q.36 What is the value of DPD of a cell ?

(1) DPD = OP × TP (2) DPD = OP + TP

(3) DPD = OP – TP (4) DPD = OP ÷ TP

Q.37 Under natural conditions the osmotic pressure is : -

(1) More than turgor pressure

(2) Less than turgor pressure

(3) Equal to turgor pressure

(4) Zero

Q.38 What maintains the shape of a cell ?

(1) Osmotic pressure (2) Turgor pressure

(3) Suction-pressure (4) Wall-pressure

Q.39 Osmotic potential is numerically equal to :-

(1) Turgor pressure (2) Wall pressure

(3) Osmotic pressure (4) D.P.D

Q.40 You are given three cells, a root hair, a cell of the inner cortical layer and a cell of the mesophyll arrange them in ascending order of DPD : -

(1) Root hair < Cortical cell < Mesophyll

(2) Cortical cell < Mesophyll < Root hair

(3) Mesophyll < Root hair < Cortical cell

(4) Root hair < Mesophyll < Cortical cell

Q.41 Osmotic pressure is highest in : -

(1) Atriplex confertifolia

(2) Salsola foetida

(3) Rhizophora

(4) Chenopodium

PLASMOLYSIS & PERMEABILITY

Q.42 Plasmolysis can be used for : -

(1) Good growth of plants

(2) Good growth of weeds

(3) Killing the weeds (4) None of the above

Q.43 Along with plasmolysis which decreases in the cell -

(1) Osmotic pressure (2) Diffusion pressure

(3) Imbibition pressure

(4) Turgor pressure

Q.44 If a plasmolysed cell is placed in distilled water then it returns to its original state & become turgid, this is called as : -

(1) Plasmolysis (2) Exosmosis

(3) Endomosis (4) Deplasmolysis

Q.45 If there is high amount of fertilizer present in soil & it is deficient in water then what will be the effect

(1) Over growth (2) Under growth

(3) No effect (4) Wilting of plants

Q.46 Plant cells do not burst in distilled water because : -

(1) Cell wall is permeable

(2) Cell wall is living

(3) Cell wall is elastic, rigid and get stretched

(4) Cell wall is dead and impermeable

Q.47 When a plant cell is placed in a hypertonic solution it becomes plasmolysed what shall be present between cell wall and plasmalemma at this stage ?

(1) Water and air

(2) Cell sap

(3) Hypertonic solution

(4) Solutes

Q.48 Bacteria can not survive in a highly salted pickle. Because

(1) Salt inhibits reproduction of bacteria

(2) Enough light is unavailable for photosynthesis

(3) They become plasmolysed and death occurs

(4) Nutrients in the pickle medium can not support life

WATER POTENTIAL

Q.49 Value of water potential for pure water is : -

(1) 1 (2) 2

(3) 3 (4) Zero

Q.50 Water potential is affected by : -

(1) Osmotic potential (2) Matric potential

(3) Pressure potential (4) All of the above

Q.51 When the solute has been added to the solution; it water potential will ?

(1) Increases (2) Decreases

(3) Remains unchanged

(4) First increases then decreases

Q.52 Water potential of a cell when its placed in hypertonic solution : -

(1) Decreases (2) Increases

(3) First increases then decreases

(4) No change

Q.53 Osmotic potential (ΨS) of a solution is always-

(1) Positive (2) Negative

(3) Zero (4) Variable

Q.54 Water potential (Ψ) of a solution is always :-

(1) + Ve (2) – Ve

(3) Zero (4) Variable

Q.55 When the water potential of a cell become zero, it is said to be in ?

(1) Fully turgid state

(2) Flaccid state

(3) Incipiently plasmolysed state

(4) Completely plasmolysed state

Q.56 A root hair cell under ordinary coditions have a water potential in the range of : -

(1) – 1 to – 4 atm. (2) – 1 to + 4 atm.

(3) 1 to 2 atm. (4) – 1 to 2 atm.

Q.57 Why hygroscopic water is not available to plants ?

(1) Because its Ψ_ω is greatly increased

(2) Because its DPD is greatly decreased

(3) Because its Ψ_ω becomes strongly negative

(4) Because its Ψ_ω is increased and DPD is decreased

Q.58 The concept of water potential was propounded by : -

(1) Robert mayer (2) Abbe Nollet

(3) Slatyer & Taylor (4) Levitt

Q.59 The solute potential can be determined in a simple manner by : -

(1) Water potential

(2) DPD

(3) Osmotic pressure

(4) Suction pressure

Q.60 The accurate equation for presenting water potential is : -

(1) $\Psi\omega = \Psi_s + \Psi_p + \Psi_m$

(2) $\Psi_s = \Psi\omega + \Psi_p + \Psi_m$

(3) $\Psi\omega = \Psi_s - \Psi_p - \Psi_m$

(4) $\Psi\omega = -\Psi_s - \Psi_p - \Psi_m$

IMBIBITION

Q.61 Seeds swell when placed in water due to : -
(1) Osmosis (2) Imbibition
(3) Hydrolysis (4) All of these

Q.62 During rainy season wooden doors generally swell up due to : -
(1) Osmosis (2) Imbibition
(3) Bad wormanship (4) Wood quality

Q.63 Imbibition process involves : -
(1) Both diffusion and capillary action
(2) Only diffusion
(3) Only capillary action
(4) None of the above

Q.64 The most powerful imbibant is : -
(1) Agar - agar (2) Proteins
(3) Cellulose (4) Lignin

Q.65 Swelling of wooden planks and door-penals during the rainly season is due to : -
(1) Imbibition (2) Endosmosis
(3) Deplasmolysis (4) Diffusion

Q.66 First step of influx of water into a plant (or) a root hair cell (or)a seed is : -
(1) Osmosis (2) Imbibition
(3) Absorption (4) Suction

Q.67 Which of the following is imbibiant ?
(1) Proteins (2) Pectin
(3) Starch (4) All of the above

Q.68 Which of the following seeds develope a greater imbibition pressure ?
(1) Wheat seed (2) Gram seed
(3) Rice seed (4) Mustard oil seed

Q.69 Swelling in wooden block placed in water is due to
(1) Endosmosis (2) Capillarity
(3) Absorption (4) Imbibition

Q.70 The right sequence for imbibition is : -
(1) Agar agar > cellulose > protein
(2) Protein > cellulose > agar agar
(3) Agar agar > protein > cellulose
(4) Agar agar < protein < cellulose

Q.71 Which of the following statement is not correct ?
(1) Plants absorb excess quantity of water
(2) Plants take small quantity of mineral salts through soil water
(3) Water and inorganic salts may also simultaneously by root hair
(4) Plant absorb only one thing at a time water or inorganic salts

Q.72 Which of the following is a rapid type of absorption ?
(1) Passive absorption
(2) Active absorption
(3) Salt absorption (4) Root absorption

Q.73 The form of water absorbed by plant's root system, from the soil is : -
(1) Hygroscopic water
(2) Gravitational water
(3) Capillary water (4) All of these

Q.74 The pathway of water from soil upto the secondary xylem : -
(1) Soil $\rightarrow$ root hair $\rightarrow$ cortex $\rightarrow$ endodermis $\rightarrow$ pericycle $\rightarrow$ protoxylem $\rightarrow$ Meta xylem
(2) Metaxylem $\rightarrow$ protoxylem $\rightarrow$ pericyle $\rightarrow$ cortex $\rightarrow$ endodermis $\rightarrow$ soil $\rightarrow$ root hair
(3) Cortex $\rightarrow$ root hair endodermis $\rightarrow$ pericycle $\rightarrow$ protoxylem $\rightarrow$ metaxylem
(4) Pericycle $\rightarrow$ soil $\rightarrow$ root hair $\rightarrow$ cortex $\rightarrow$ endodermis $\rightarrow$ protoxylem $\rightarrow$ metaxylem

Q.75 Humus in soil is necessary for plant growth because it : -
(1) Increase aeration and water absorption capacity of soil
(2) Makes soil compact
(3) Makes soil sterile
(4) Decreases rate of percolation

Q.76 Water will be absorbed by root hairs when : -
(1) Concentration of salts in the soil is high
(2) Concentration of solutes in the cell sap is high
(3) The plant is rapidly respiring
(4) They are separated from the soil by a semipermeable membrane

Q.77 Water in plants is transported by ascent of sap takes place through : -

(1) Cambium (2) Phloem

(3) Xylem (4) Epidermis

Q.78 In poorly aerated soil, the rate of water absorption will : -

(1) Increase x

(2) Decrease

(3) Remains the same

(4) None of these

Q.79 Which of the following water comes under echards ?

(1) Available to the plant

(2) Whole of the soil water

(3) Amount of water not available to the plant

(4) None of the above

Q.80 Which plant hormone help in active absorption of water ?

(1) Auxin (2) GA

(3) Cytokinin (4) ABA

Q.81 What is true for the water available in the soil?

(1) Holard = Chresard + Echard

(2) Holard = Chresard – Echard

(3) Chresard = Holard + Echard

(4) Echard = Holard + Chresard

ASCENT OF SAP

Q.82 Water rises in the stem due to : -

(1) Cohesion and transpiration pull

(2) Turgor pressure

(3) Osmotic pressure

(4) None

Q.83 Sap ascends in woody stem because of : -

(1) Transpiration pull

(2) Capillarity

(3) Molecular adhesion

(4) Photosynthesis

Q.84 Pulsation theory to explain ascent of sap in Desmodium was proposed by : -

(1) Dixon and Jolly (2) Curtis

(3) J.C. Bose (4) None of these

Q.85 Dixon and Jolly are associated with : -

(1) Light reaction photosynthesis

(2) An aerobic respiration

(3) Cohesion and transpiration pull theory of ascent of sap

(4) Apical dominance

Q.86 The continuity of water column in xylem is maintained due to : -

(1) Presence of air bubbles

(2) Cohesive property of water

(3) Evaporation power of water

(4) None of the above

Q.87 Relay pump theory of ascent of sap was proposed by : -

(1) Boase (2) Godlewsky

(3) Westermaier (4) Von sachs

Q.88 The first vital theory to explain ascent of sap was proposed

(1) J.C. Bose (2) Godlewski

(3) Westermaier (4) Dixon and Jolly

Q.89 Capillary force theory to explain ascent of sap was proposed by :-

(1) Boehm (2) Sachs

(3) Jamin (4) Priestley

Q.90 Ringing experiment to explain ascent of sap path was firstly done by : -

(1) Hartig, Malpighi

(2) Dixon & Jolly

(3) Godlewski & J.C. Bose

(4) Stephen hales and Boehm

Q.91 Passage of ascent of sap is shown by :-

(1) Osmometer (2) Porometer

(3) Manometer

(4) Blockage experiment

Q.92 Transpiration - cohesion - tension theory operates in : -

(1) Active absorption

(2) Passive absorption

(3) Active & passive absorption

(4) None of the above

Q.93 Attractive forces of cell for water molecules is termed as : -

(1) Adhesion (2) Cohesion

(3) Osmosis (4) Plasmolysis

Q.94 The imbibition theory for the ascent of sap was suggested by : -

(1) Sir J.C. Bose (2) Strassburger

(3) Sachs (4) Dixon and Jolly

Q.95 If all the tissue of a plant to certain points are removed except the xylem which is left intact-

(1) The leaves will wilt

(2) The stem will die first

(3) The root will die first

(4) The whole plant will die at the same time

Q.96 Which of the following is incorrect match?

(1) Pulsation theory - J.C. Bose

(2) Relay pump theory - Godlewsky

(3) Imbibition theory - Von Sachs

(4) Capillary theory - Priestley

Q.97 Which tissue are removed when a plant is girdled ?

(1) Xylem & pith

(2) Xylem & Phloem

(3) Phloem to epidermis

(4) Phoem to pith

TRANSPIRATION

Q.98 Opening of stomata is due to : -

(1) Turgidity of guard cells

(2) Size of guard cells

(3) Number of gurad cells

(4) Amout of CO_2 in the atmosphere

Q.99 Transpiration in plants will be lowest when :-

(1) There is high humidity in the atmosphere

(2) High wind velocity

(3) There is excess of water in the soil

(4) Environmental conditions are very dry

Q.100 The metal ion involved in the stomatal regulation is

(1) Iron (2) Magnesium

(3) Zinc (4) Potassium

Q.101 The following percentage of water absorbed by herbaceous plants is lost in transpiration :-

(1) 80% (2) 60%

(3) 40% (4) 99%

Q.102 Transpiration from plants would be most rapid when

(1) There is lot of humidity in atmosphere

(2) The air is more humid

(3) There is excess rain fall

(4) Environmetal conditions are dry

Q.103 Processes occur in leaves, which may lower their temperature is : -

(1) Respiration (2) Photosytnhesis

(3) Hydrolysis (4) Transpiration

Q.104 When Oak leaf stomata opens, process is :-

(1) Water molecules enter adjacent guard cells

(2) Atmosphere outside stomata become less humid

(3) Auxins are accumulated in guard cells

(4) Salt molecules are excreted by adjacent gurad cells

Q.105 Wilting of a plant result from excessive : -

(1) Respiration (2) Photosynthesis

(3) Absorption (4) Transpiration

Q.106 The rate of transpiration is high when : -

(1) The atmosphere is saturated with water vapour

(2) Light is very dim

(3) The temperature is low

(4) The atmosphere is dry and the temperature is high

Q.107 Excessive loss of water causes wilting of leaves, it can be prevented by : -

(1) Keeping the plant in bright light

(2) Spraying the plant with alcohol

(3) Applying vaseline on the leaf surface

(4) Adding high amounts of fetilizers to the soil

Q.108 Leaves which appear wilted in the day time recover at night because : -

(1) Light is esstential for photo synthesis

(2) The stomata close down, temperature decrease, transpiration is reduced and the plant is able to absorb more water from the soil

(3) Respiration and translocation of organic substance both increases

(4) The plant is ***sleeping*** because of dark conditions

Q.109 Conversion of starch to organic acid is essential for

(1) Stomatal closure (2) Stomatal opening

(3) Stomatal initiation (4) Stomatal growth

Q.110 Increase in CO_2 concentration around leaf results in : -

(1) Rapid opening of stomata

(2) Partial closure of stomata

(3) Complete closure of stomata

(4) No effect on stomatal opening

Q.111 Which of the following wall of guard cells is thick ?

(1) Outer (2) Inner

(3) Sidewall (4) All the three

Q.112 Potometer and Clinostat are used to study :-

(1) Photosynthesis and respiration

(2) Transpiration and growth

(3) Phototropism and Geotropism

(4) Transpiration and Geotropism

Q.113 The rate of transpiration will be high when there is ?

(1) Rainy season (2) Winter season

(3) Summer season (4) None of these

Q.114 Which type of transpiration is more common -

(1) Cuticular (2) Stomatal

(3) Lenticular (4) Bark transpiration

Q.115 Maximum transpiration is taking place through the

(1) Stomata (2) Lenticel

(3) Hydathode (4) Cuticle

Q.116 The inter conversion of sugar & starch is dependent on pH changes in the guard cells; was demonstrated by : -

(1) Levitt (2) Lloyd

(3) Sayre (4) Steward

Q.117 The spray of PMA causes :-

(1) Decrease in transpiration

(2) Increase in transpiration

(3) Increase in absorption

(4) Increase in guttation

Q.118 When the stomata are opening; we observe following changes in the gurad cells ?

(1) OP increase, TP decreases

(2) OP & TP increases

(3) OP decreases, TP increases

(4) OP & TP decreases

Q.119 The pH in the guard cells was observed when stomata were open it ranges : -

(1) 9 - 10 (2) 4 - 5

(3) 7.5 (4) 2 - 4

Q.120 What will be the effects on stomata, if relative humidity is 100% in atmosphere ?

(1) Completely open (2) Partially open

(3) No effects (4) Closed

Q.121 Which of the following is produced during water stress condition ?

(1) Cytokinin (2) ABA

(3) Phytochrome (4) ATPase

Q.122 Which chemical is used to detect transpiration comparatively ?

(1) Calcium carbonate

(2) Cobalt carbonate

(3) Cobalt chloride

(4) Mercuric acetate

Q.123 Active K^+ ion exchange mechanism of opening and closing of stomata was given by :-

(1) Khorana (2) Scrath

(3) Levitt (4) Kohli

Q.124 Cuticular transpiration is observed mainly in :-

(1) Xeropytes (2) Herbaceous plants

(3) Trees (4) Shrubs

Q.125 What is action spectrum of transpiration ?

(1) Green and U.V (2) Blue and Yellow

(3) Blue and far red (4) Blue and red

Q.126 In which of the following plants, the metabolism will be hindered if upper surface of leaves are coated with wax ?

(1) Hydrilla (2) Nelumbium

(3) Vallisneria (4) Utricularia

Q.127 Which of the following substance serve as an anti-transpirant in plant ?

(1) Phenyl mercuric acetate

(2) Asprin

(3) Silicon oil (4) All of these

Q.128 Which of the factor acts as anti-transpirant?

(1) SO_2 (2) CO

(3) CO_2 (4) All pollutant gasses

Q.129 Transpiration is a non-enzymatic process its Q_{10} value is : -

(1) 1 (2) 2

(3) 3.5 (4) Zero

Q.130 The most important factor affecting transpiration is

(1) Light (2) Temperature

(3) Wind

(4) Atmospheric humidity

Q.131 Presence of thick cuticle, hairs, scales & fewer sunken stomata are found in the leaves of xerophyte it is to : -

(1) Stop transpiration

(2) Facilitate transpiration

(3) Store water

(4) Check excessive transpiration

Q.132 Which factor regulates the loss of water through transpiration : -

(1) Nitrogen

(2) Humidity

(3) Level of O_2 in air

(4) Xylem

Q.133 With increase in temperature the rate of transpiration becomes : -

(1) Low

(2) High

(3) Low in herbs and high in tress

(4) Immediately stopped

Q.134 Which of the following plant do not transpire ?

(1) Alage

(2) Fungi

(3) Submerged hydrophytes

(4) All the above

Q.135 Wilting of plant results from an excessive :-

(1) Absorption

(2) Photosynthesis & poor osmosis

(3) Respiration

(4) Transpiration

Q.136 Transpiration is completely absent in : -

(1) Xerophytes

(2) Mesophytes

(3) Submerged hydrophtes

(4) Succulents at night

Q.137 Who states "Transpiration to be an unavoidable evil' ?

(1) Blackman (2) Steward

(3) Priestley (4) Curtis

Q.138 Which pigment regulates opening and closing of stomata ?

(1) Chlorophylls (2) Carotenoids

(3) Phytochrome (4) Flavines

Q.139 Which photoreceptor controls the opening & closing of stomata ?

(1) Chlorophyll-a (2) Chlorophyll-b

(3) Phytochrome (4) Carotene

Q.140 For plants transpiration is : -

(1) Not very important

(2) Important to same

(3) A neccessary evil

(4) An important burden

Q.141 Significance of transpiration lies in : -

(1) Circulation of water

(2) Absorption and distribution of water

(3) Regulating the temperature of the plant body

(4) All of the above

Q.142 In apple type of stomata : -

(1) Stomata are present only on the upper surface of leaf

(2) Stomata are present only on the lower surface of leaf

(3) Stomata are present on both surfaces of leaf

(4) Stomata are vestigeal

Q.143 Which of the following plant product act as an internal anti-transpirant ?

(1) Phenyl mercuric acetate

(2) CO_2 and malic acid

(3) Abscisic acid

(4) Ferulic acid

Q.144 In the mechanism of the opening to stomata, the important factor is : -

(1) Turgidity of the guard cells

(2) Chlorophyll content of the guard cells

(3) Hormone content of the subsidary cells

(4) Protein content of the epidermal cells

Q.145 Stomata open at day because in day the guard cells have :-

(1) To help gas exchange

(2) A low pH

(3) A high level of sugar, organic acid ATP & K^+ ion

(4) Unequally thickened walls

Q.146 Basis of stomatal opening is : -

(1) Exosmosis

(2) Endosmosis

(3) Decrease in cell sap concentration

(4) Plasmolysis of guard cells

Q.147 Guard cells are found in : -

(1) Stomata

(2) Hydathodes

(3) Both

(4) None of the above

Q.148 Shape of guard cells in gramineae family :-

(1) Kidney shaped (2) Oval

(3) Round (4) Dumbel shaped

Q.149 Scotoactive stomata are occurs in : -

(1) Sacculent xerophytes

(2) Hydrophytes

(3) Mesophytes

(4) None of the above

Q.150 With decrease in atmospheric pressure the rate of transpiration will : -

(1) Remain unaffected

(2) Increased

(3) Decrease slowly

(4) Decrease rapidly

GUTTATION, BLEEDING, ROOT PRESSURE, WILTING

Q.151 Root presence is maximum, when : -

(1) Transpiration is high and absorption is very low

(2) Transpiration is very low and absorption is high

(3) Absorpton is very high and transpiration is also very high

(4) Absorption is low and transpiration is alwo very low

Q.152 Wilting in plant occurs when : -

(1) Xylem is blocked

(2) Epidermis is pealed off

(3) Pith is removed

(4) Phloem is blocked

Q.153 Pressure exerted on the fluid contents of the cortical cells of root by turgidity. Which forces the water in to xylem vessels and upward in the stem for a certain height is : -

(1) Imbibition (2) Root pressure

(3) Capillarity (4) Turgor pressure

Q.154 The process of the escape of liquid from the tip of uninjured leaf is called : -

(1) Evaporation (2) Transpiration

(3) Guttation (4) Evapo-transpiration

Q.155 Guttation take place during night when : -

(1) Root pressure is positive

(2) Root pressure is negative

(3) Always take place

(4) It does not takes place at all

Q.156 The hydathodes are related with : -

(1) Transpiration (2) Guttation

(3) Bleeding (4) All

Q.157 Who discovered the root pressure :-

(1) Stephen hales (2) Priestley

(3) Dixon (4) Renner

Q.158 Root pressure can be measured by the instrument

(1) Potometer (2) Auxenometer

(3) Manometer (4) Barometer

Q.159 In summer afternoon, rate of transpiration is greater than the rate of absorption then what happens to plants : -

(1) Temporary wilting

(2) No effect

(3) Leaves becomes yellow

(4) Plant will die

Q.160 Which conditions favours "Guttation" ?

(1) High water absorption

(2) High transpiration

(3) Low transpiration

(4) (1) and (3) both

Q.161 When stem of a herbaceous plant is cut, water or sap oozes out, this is due to ?

(1) Guttation (2) Transpiration pull

(3) Root pressure (4) Imbibition

EXERCISE - 2

DIFFUSION, OSMOSIS & RELATED TERMS

Q.1 When a plant cell is placed in a hypotonic solution, which of the following will not apply?
(1) Wall pressure is decreased
(2) The cell become turgid
(3) Suction pressure of the cell sap will decrease
(4) Water potential of the cell sap will increase

Q.2 When beet root slices are washed and then placed in cold water, anthocyanin does not come out, because plasma membrane is ?
(1) Differentially permeable to anthocyanin
(2) Dead structure
(3) Impermeable to anthocyanin
(4) Permeable to anthocyanin

Q.3 Osmotic pressure is highest in : -
(1) Xerophytes (2) Lithophytes
(3) Halophytes (4) Mesophytes

Q.4 If osmotic potential of a cell is – 10 bars and its pressure potential is 5 bars, its water potential would be :-
(1) – 5 bars (2) 5 bars
(3) – 10 bars (4) 10 bars

Q.5 Osmosis means : -
(1) Movement of molecules from higher concentration to lower concentration
(2) Uptake of water by roots
(3) Passage of solvent from a weaker solution to stronger solution across a semipermeable membrane
(4) Passage of solvent from a weaker to a stronger solution separated by a membrane

Q.6 The osmotic pressure of distilled water will be-
(1) Zero
(2) Maximum
(3) Higher than any solution
(4) Variable

Q.7 Tonoplast is : -
(1) Permeable membrane
(2) Semi permeable membrane
(3) Impermeable membrane
(4) Selectively permeable membrane

Q.8 If in a cell suction pressure value is 30 atm. While osmotic pressure 42 atm. then calculate the turgidity developed in form of TP in the cell-
(1) 12 atm. (2) 72 atm.
(3) – 12 atm. (4) 1.4 atm.

Q.9 If the molar concentration of the given sugar solution is 0.3 M, find out the osmotic pressure of this solution : -
(1) 6.72 atm (2) 67.2 atm
(3) 2.24 atm (4) 5.60 atm

Q.10 Osmosis is the phenomenon expressed by :-
(1) Solutes present in the solution
(2) Solution
(3) Semi-permeable membrane
(4) O_2

Q.11 The osmotic pressure of the cell is measured by : -
(1) Plasmolysis method
(2) Osmometer
(3) Molar concentration of the cell sap
(4) Deplasmolysis

Q.12 When grapes are placed in water, then which process occurs ?
(1) Plasmolysis (2) Exomosis
(3) Endosomosis (4) None of the above

Q.13 Maximum osmotic pressure is found in : -
(1) Root hair
(2) Cortex cell of the root
(3) Passage cell of the root
(4) Mesophyll cell

Q.14 The osmotic pressure is due to : -
(1) Solute
(2) Semi permeable membrane
(3) Hypertonic solution
(4) Water

DPD (SP)

Q.15 The direction of the movement of water : -
(1) From low OP to high OP
(2) From low DPD to high DPD
(3) From high DP to low DP
(4) All of the above

Q.16 The term "DPD" was coined by : -

(1) Renner (2) Kamer

(3) B.S. mayer (4) Stephen hales

Q.17 The entry of water from the soil up to xylem elements of root is due to : -

(1) Gradient of suction pressure

(2) Turgor pressure

(3) Degree of imbibition

(4) Concentration of ions in water

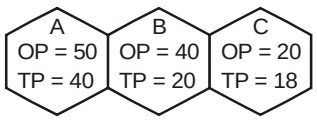
Q.18 The three cells A, B & C are joined in a linear manner. Demostrate the movement of water & direction in these ?

(1) A → B → C

(2) A ← B ← C

(3) A → B ← C

(4) A ← B → C



Q.19 When the solute has been added in the solution, then following observation can be made ?

(1) The DPD of the solution decreases

(2) The Ψ_w of the solution increases

(3) DPD of the solution decreases while its Ψ_w increases

(4) DPD of the solution increases while its Ψ_w decreases

Q.20 If the given solution is of 25% concentration; then what cannot be presented for this :-

(1) OP (2) DPD

(3) Solute potential (4) TP

Q.21 In a flaccid cell which condition does not occur-

(1) TP = 0 (2) SP = 0

(3) WP = 0 (4) SP = OP

Q.22 Osmotic pressure of a cell is zero when :-

(1) T.P. is maximum

(2) DPD is maximum

(3) T.P. is zero

(4) Not possible

Q.23 The accurate relationship between SP, OP, TP can be expressed as -

(1) SP = OP + TP (2) OP = SP – TP

(3) TP = SP – OP (4) SP = OP – TP

Q.24 In which condition the Turgor pressure of the cell becomes equal to the osmotic pressure : -

(1) In flaccid cell

(2) In plasmolysed cell

(3) In fully turgid cell

(4) It never happens

Q.25 Select the correct statement -

(1) Pure water has minimum Ψ_w

(2) Pure water has maximum Ψ_w

(3) Pure water has maximum D.P.D

(4) Pure water has variable Ψ_w & D.P.D.

Q.26 The best condition by which fully turgid cell can be identified is : -

(1) TP is minimum (2) SP is maximum

(3) OP less than SP (4) TP = OP

WATER POTENTIAL

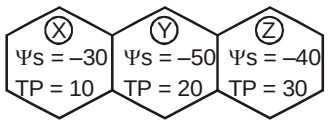
Q.27 The direction of the water flow in given cells X,Y & Z can be presented as : -

(1) X → Y ← Z

(2) X → Y → Z

(3) X ← Y ← Z

(4) X ← Y → Z



Q.28 The water potential & osmotic potential of pure water is : -

(1) 100 & zero (2) Zero & zero

(3) 100 & 200 (4) Zero & 100

Q.29 The relationship between DPD & Ψw can be expressed as : -

(1) DPD = Ψ_w (2) Ψ_w – DPD = 0

(3) $\frac{DPD}{\psi_w} = 0$ (4) Ψ_w = – DPD

Q.30 Solute potential can be presented as : -

(1) Ψs = – OP (2) Ψw = OP

(3) OP – Ψs = 0 (4) $\frac{\psi s}{OP} = 0$

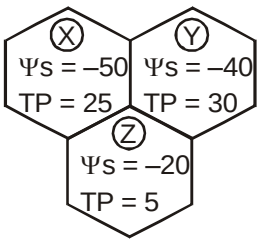
Q.31 In plant water relations, Ψ indicates -

(1) DPD (2) Solute potential

(3) Water potential (4) Suction pressure

Q.32 If the solute is added in the given solution than what osbervation can be made -
(1) Its DPD decreases
(2) It's water potential decreases
(3) DPD & water potential remains unchanged
(4) Its water pontential increases

Q.33 If three cells X, Y and Z are joined to each other & their solute potential & Turgor pressure values are given in the figure; then demonstrate the direction of flow of water in this system : -



(1)

(2)

(3)

(4)

Q.34 In 0.1M solution of a non-electolyte, Ψw value will be : -
(1) zero bar (2) +2.3 bar
(3) – 2.3 bar (4) –22.4 bar

Q.35 If a cell is placed in a hypertonic solution then Ψ_w of the cell will be : -
(1) Increased (2) Decreased
(3) Unchanged
(4) First increases then decreases

Q.36 The Ψ_w of pure water is : -
(1) Minimum (2) Less than DPD
(3) Maximum (4) Variable

Q.37 If the OP of any osmotic system is 35 atm and its turgor pressure 9 units. Find out water pontential present in the osmotic system : -
(1) – 44 unit (2) – 26 unit
(3) 26 unit (4) – 3.88 unit

IMBIBITION

Q.38 Passive absorption of water takes place by : -
(1) Osmosis
(2) The presence of energy
(3) Root pressure
(4) Transpiration pull

Q.39 Root hairs occurs in : -
(1) Meristematic zone
(2) Cell elongation zone
(3) Cell maturation zone
(4) Old root

Q.40 All the following involves osmosis except :-
(1) Movement of water from soil to root
(2) Movement of water from root hair to endodermis and pericycle
(3) Movement of water between xylem elements
(4) Movement of water from xylem to mesophyll cells of the leaves

Q.41 Suitable temperature for active absorption of water by root is : -
(1) 40-45ºC
(2) 10-15ºC
(3) 20-35ºC
(4) Can take at any temperature

Q.42 "Osmotic theory" for an active absorption of water was given by : -
(1) Thiman (2) O. Hertwig
(3) Atkin & Priestley (4) J.C. Bose

Q.43 Root cap plays no role in the absorption of water in a plant because : -
(1) Its cells are loosly arranged
(2) It has no root hairs
(3) It has no connection with xylem tissue
(4) it's cells are dead

Q.44 Energy dependent absorption of water against osmotic phenomenon is : -
(1) Active absorption
(2) Passive absorption
(3) Imbibition
(4) Bulk absorption

Q.45 In a young root the most active absorption of water takes place through : -
(1) Root cap region
(2) Root hair region
(3) Zone of elongation
(4) Mature region with a corkly layer

Q.46 Water is actively absorbed by root when : -

(1) Soil solution is hypotonic

(2) Soil solution is hypertonic

(3) Transpiration rates are high

(4) Shoot pressure is high

Q.47 Maximum absorption of water by a root occur in the region of : -

(1) Cell division

(2) Cell elongation

(3) Cell maturation

(4) Cell division and root cap togther

Q.48 Absorption of water is increased when : -

(1) Transpiration is increased

(2) Photosynthesis is increased

(3) Respiration is increased

(4) Root pressure is increased

Q.49 Passive absorption of water from the soil by the root is mainly effected by : -

(1) Typical tissue organisation

(2) Respiratory activity of root

(3) Tension on cell sap due to transpiration

(4) None of the above

Q.50 Active absorption of water from the soil by the root is mainly effected by : -

(1) Typical tissue organisation

(2) Resipiratory activity of root

(3) Tension on cell sap due to transpiration

(4) None of the above

Q.51 The water held tightly by the soil particles around them is known as : -

(1) Field capacity

(2) Run away water

(3) Hygroscopic water

(4) Capillary water

Q.52 Percentage of water left in the soil when a plant begins to wilt is known as : -

(1) Wilting coefficient

(2) pH value of soil

(3) Field capacity

(4) Water holding capacity

Q.53 Which of the following factors inhibit the absorption of water by roots ?

(1) Low soil temperature

(2) High concentration of soil solution

(3) Low soil aeration

(4) All of the above

Q.54 Which of the plants can absorb water in the form of vapour from its atmosphere ?

(1) All xerophytes

(2) Low transpiring cacti

(3) Succulents plants

(4) Epiphytes & Lichen

Q.55 "Non-osmotic" theory for an active absorption of water was given by : -

(1) Thimann & Bennet clark

(2) Atkin & Priestley

(3) J.C. Bose (4) O. Hertig

Q.56 When the temerature of soil becomes 1ºC then?

(1) Absorption of water increases

(2) Absorption of water decreases

(3) Absorption of water remains unaffected

(4) Both (2) and (3) are correct

Q.57 When the concentration of the soil solutes is low, the absorption of water is ?

(1) Retarted (2) Increase

(3) Remains normal (4) Stopped

Q.58 Which type of plant are physiologically dry ?

(1) Hydrophytes (2) Epiphytes

(3) Lithophytes (4) Halophytes

Q.59 Which method is responsible for most of the absorption in higher plants?

(1) Active absorption

(2) Passive absorption

(3) Osmotic absorption

(4) Non osmotic absorption

Q.60 The absorption of water due to expenditure of energy is called : -

(1) Non osmotic active absorption

(2) Osmotic active absorption

(3) Passive absorption

(4) All

Q.61 Halophytes can grow on physiologically dry soil due to -

(1) Dry soil

(2) Excessive humidity outside

(3) Excessive salts in plants

(4) Excessive salts in water

ASCENT OF SAP

Q.62 Removal of a ring of bark from the trunk of a tree eventually kills it because : -

(1) Water can not go up

(2) Fungi & insects attack exposed parts

(3) Food does not travel down & root becomes starved

(4) Air blocks the xylem

Q.63 Which would do maximum harm to a tree ?

(1) The loss of half of its leaves

(2) The loss of all its leaves

(3) The loss of half of its branches

(4) The loss of its bark

Q.64 Ringing experiment can not be done on a sugar cane plant because : -

(1) Its xylem is scanty

(2) Its phloem is with out phloem parenchyma

(3) Its vascular bundles are sacttered

(4) Its phloem is present inside the xylem

Q.65 In plants the translocation of organic solutes take place through : -

(1) Epidermis (2) Xylem

(3) Phloem (4) Pith

Q.66 Most accepted theory for Ascent of sap given by : -

(1) Godlewski & Sacks

(2) J.C. Bose

(3) Stephan Hales (4) Dixon and Jolly

Q.67 Ringing experiment is to show : -

(1) Path of ascent of sap

(2) Comparision of transpiration

(3) Passive absorption

(4) Stomatal opening & closing

Q.68 The conduction of water from root hair to root xylem is :-

(1) Symplastic (2) Apoplastic

(3) Osmotically

(4) Symplastic + Apoplastic

Q.69 Dixons blockage experiment is concerned with

(1) Transpiration (2) Passive absorption

(3) Path of ascent of sap

(4) Vital theory for ascent of sap

Q.70 The pulsation theory is related with : -

(1) Guttation (2) Bleeding

(3) Vital theory for ascent of sap

(4) Physical theory for ascent of sap

Q.71 Root pressure theory was proposed by : -

(1) Priestley (2) Stephen Hales

(3) Levitt (4) Sachs

Q.72 By which process absorbed water reaches upto the leaves ?

(1) Transpiration (2) Guttation

(3) Root pressure (4) Ascent of sap

Q.73 Ringing experiment was performed in : -

(1) Balsom plant (2) Mirabilis plant

(3) Indian telegraph plant

(4) Avena plant

TRANSPIRATION

Q.74 Which of the following statement is not true ?

(1) Transpiration is increased when root shoot ratio is increased

(2) Transpiration is increased when latex & mucilage is increased in tissue

(3) Transpiration is decreased when stomata are sunken

(4) Transpiration is decreased when leaves becomes leathery of hairy

Q.75 Which one of the following will reduce the rate of transpiration ?

(1) Increase in wind velocity

(2) Rise in temperature

(3) Increase in water uptake by plants

(4) Decrease in light intensity

Q.76 The most important fuction of transpiration in plants is to cause : -
(1) Loss of surplus water
(2) Cooling of the plant
(3) Rapid ascent of sap
(4) Rapid rise of minerals

Q.77 Which of the following plants economises transpiration loss of water ?
(1) C_3-plants (2) C_4-plants
(3) Both equally (4) C_2-plants

Q.78 The change in turgor pressure which causes the opening and closing of Stomata is caused by-
(1) Reversible starch-sugar conversions
(2) Reversible absorption and loss of K-ions
(3) Loss of chloride ions
(4) None of these

Q.79 The "proton transport concept" for the opening of photoactive stomata was given by :-
(1) Yin tung (2) Levitt
(3) Sachs (4) Sayre

Q.80 According to Scarth the opening & closing of stomata is governed by :-
(1) pH (2) Phosphorylation
(3) $NaDPH_2$ (4) Enzymes

Q.81 Before opening of stomata accumulation of the following ion is seen in : -
(1) PO_4 (2) K^+
(3) Mg^{++} (4) Na^+

Q.82 In sacculent plants the stomata opens at night and closes by day. Which of following would be best hypothesis to explain the mechanism of stomata opening at night only?
(1) CO_2 used up, increased pH results in accumulation of sugars
(2) CO_2 accumulates, reduces pH stimulates enzymes resulting in accumulation of carbohydrate
(3) Increase in CO_2 concentration, conversion of organic acids in to starch resulting in the increased uptake of potassium ions and water
(4) High CO_2 concentration causes accuumulation of organic acids in guard cells resulting in to the increased concentration of cell sap

Q.83 Guard cells differ from other epidermal cells in having :-
(1) Large vacuoles
(2) Secondary walls
(3) Chloroplast with PEP-carboxylase enzyme
(4) Absence of mitochondria

Q.84 The trunk of a tree shrinks in day due to : -
(1) Rapid translocation of food
(2) Transpiration induced tension
(3) Rapid growth in day hours
(4) Light induced elongation of plant

Q.85 Transpiration occures from : -
(1) Leaves (2) Stems
(3) All parts (4) All aerial parts

Q.86 Leaves of submerged hydrophytes are : -
(1) Epistomatic (2) Hypostomatic
(3) Astomatic (4) Above 1 & 2

Q.87 The diffusion of water vapours through areial parts of the plants is called : -
(1) Osmosis (2) DPD
(3) Transpiration (4) All

Q.88 If the absorption is more, but transpiration is less; then process affected will be : -
(1) Root pressure (2) Guttation
(3) Bleeding (4) All

Q.89 Active $K^+ \rightleftharpoons H^+$ exchange theory explained -
(1) Ascent of sap (2) Phloem conduction
(3) Ion absorption
(4) Stomatal movement

Q.90 Transpiration is a necessary evil, given by -
(1) Levitt (2) Curtis
(3) Steward (4) Sachs

Q.91 Potassium ions concentration is more in guard cells when stomata are open but less when stomata are closed. This was reported by :-
(1) Hsio, Fisher (2) Fujino
(3) Levitt (4) Lloyd

Q.92 The loss of water in the form of water drops is taking place through the : -
(1) Hydathodes (2) Lentical
(3) Stomata (4) All

Q.93 The potometer is based on the principle that : -

(1) Transpiration is based on stomatal opening

(2) Stomata open during day time

(3) Absorption = Transpiration

(4) Transpiration tension present in leaves

Q.94 Guttation is dependent on : -

(1) Root pressure

(2) Active absorption

(3) Flaccidity of root cortical cells

(4) High rate of transpiration

Q.95 Due to increasing temperature, transpiration:-

(1) Increases

(2) Decreases

(3) First increases then decreases

(4) Unaffected

Q.96 If temperature remains constant then with increasing alttitude, the transpiration will : -

(1) Increases

(2) Decreases

(3) First decreases then increases

(4) Unaffected

Q.97 The conversion of starch to organic acid is essential for stomatal : -

(1) Closure (2) Growth

(3) Initiation (4) Opening

Q.98 Transpiration increases when atmospheric temperature rises, due to : -

(1) Wider opening of stomata

(2) Stomatal opening becomes narrow

(3) Water holding capacity of the air increases

(4) More photosynthesis in guard cells

Q.99 The names of Yin & Tung are assoicated with findings of : -

(1) Phosphorylase enzyme

(2) Sugar-starch conversion

(3) Localization of phosphorylase enzyme in guard cells

(4) Exchange of K^+ & H^+

Q.100 Due to more wind velocity, the transpiration rate will be : -

(1) Less

(2) More

(3) Unaffected

(4) First increases then decreases

Q.101 Foliar transpiration : -

(1) Includes stomatal and cuticular transpiration

(2) Does not occur

(3) Includes all type of transpiration

(4) Shows stomatal transpiration

Q.102 Radial micellation of cellulose occurs at :-

(1) Outer wall of guard cells

(2) Inner wall of guard cells

(3) Inner wall subsidiary cells

(4) None of the above

GUTTATION, BLEEDING, ROOT PRESSURE, WILTING

Q.103 Maximum bleeding occurs in : -

(1) Agave (2) Vitis

(3) Betula (4) Caryota urens

Q.104 Guttation usually occurs in a well watered herbaceous plant and well drained soil only in-

(1) Morining hours (2) Evening hours

(3) Noon hours (4) Day hours

Q.105 Hydathodes open during -

(1) Hight hours (2) Day hours

(3) Noon hours (4) Always open

Q.106 The "Guttation" word was given by : -

(1) Bergerstein (2) Sayre

(3) Scarth (4) Stephen hales

Q.107 Which of the following is not a rhythmic phenomenon ?

(1) Stomatal opening & closing

(2) Guttation

(3) Nyctinasty

(4) Photonastic movments

Q.108 Water of guttation is : -

(1) Pure water

(2) Water with dissolved salts

(3) Solution of organic food

(4) Condensed water vapour

Q.109 Cells present on hydathodes is -

(1) Complementary cells

(2) Epithem cells

(3) Guard cells

(4) Kranz cells

Q.110 The process involved in the formation of Toddy is : -

(1) Guttation (2) Transpiration

(3) Bleeding (4) All

Q.111 The whitish powder around hydathode is due to : -

(1) Guttation

(2) Salt depositon from air

(3) Salt formation over surface

(4) Bleeding

EXERCISE - 3 PREVIOUS YEAR'S QUESTIONS

Q.1 When stomata open, the pH of guard cells : -
[Uttaranchal PMT 2004]
(1) Increases (2) Decreases
(3) Remains same (4) Both 'A' and 'B'

Q.2 Water lost in guttation is : -
[Uttaranchal PMT 2004]
(1) Pure water (2) Impure water
(3) In vapour form (4) Either 'A' and 'B'

Q.3 What will happen if plant cells are placed in hypertonic solution :
[Uttaranchal PMT 2004]
(1) Turgid (2) Plasmolysed
(3) Deplasmolysed (4) Lysed

Q.4 Loss of water from tips of leaves is called :
[Uttaranchal PMT 2005]
(1) Bleeding (2) Guttation
(3) Respiration (4) Transpiration

Q.5 Root pressure is measured by :
[Uttaranchal PMT 2005]
(1) Manometer (2) Potometer
(3) Auxanometer (4) Osmometer

Q.6 Which of the following apparatus is commonly used to measure the rate of transpiration is :
[Uttaranchal PMT 2006]
(1) Porometer (2) Altimeter
(3) Potometer (4) Luxmeter

Q.7 Leaves of Nelumbo plant are :
[West Bengal JEE 2007]
(1) Epistomatic (2) Hypostomatic
(3) Amphistomatic (4) None of these

Q.8 0.1 M solution has water potential of :
[C.G. PMT 2004]
(1) –2.3 bars (2) 0 bar
(3) 22.4 bars (4) +2.3 bars

Q.9 A small mesophytic twig with green leaves is dipped into water in a big beaker under sunlight. It demonstrates : **[C.G. PMT 2004]**
(1) Photosyntesis (2) Respiration
(3) Transpiration (4) None of the above

Q.10 Which one is not related to transpiration :
[C.G. PMT 2004]
(1) Regulation of plant body temperature
(2) Absorption and distribution of mineral salt
(3) Circulation of water
(4) Bleeding

Q.11 Sotmata can open at night also in
[C.G. PMT 2005]
(1) Xerophyte (2) Gametophyte
(3) Hydrophyte (4) None of these

Q.12 Who had said that "transpiration is necessary evil" : **[C.G. PMT 2005]**
(1) Curtis (2) Steward
(3) Andersen (4) J.C. Bose

Q.13 Stomata opens during day because the guard cells have : **[C.G. PMT 2006]**
(1) Outer walls thin (2) Kidney shape
(3) Chlorophyll (4) Large nuclei

Q.14 Stomata open and close due to :
[Jharkhand 2006]
(1) Turgor pressure change
(2) Hormone change
(3) Temperature change
(4) All of the above

Q.15 In plasmolysed cell, the space between cell wall and Protoplasm is occupied by :
[Jharkhand 2006]
(1) Hypotonic solution
(2) Hypertonic solution
(3) Isotonic solution
(4) Distil water

Q.16 In CAM plants stomata are :
[Jharkhand 2005]
(1) Closed at night and open during the day
(2) Closed at the day and open at night
(3) Never closes (4) Never opens

Q.17 The real force resposible for the movement of water from cell to cell is : **[Jharkhand 2005]**
(1) OP (2) TP
(3) DPD (4) WP

Q.18 Which of the following have sunken stomata : **[Jharkhand 2003]**

(1) Nerium (2) Mangifera

(3) Hydrilla (4) Zera mays

Q.19 When a plasmolysed cell is placed in a hypotonic solution then water will move inside the cell. Which force causes this : **[Jharkhand 2003]**

(1) DPD (2) OP

(3) WP (4) None of these

Q.20 Rate of transpiration is measured by : **[Jharkhand 2003]**

(1) Manometer (2) Auxanometer

(3) Potometer (4) Barometer

Q.21 If a cell shrinks when placed in a solution, this solution is : **[Jharkhand 2003]**

(1) Hypotonic (2) Hypertonic

(3) Isotonic (4) Pure solvent

Q.22 If a cell A with DPD 4 bars is connected to cell B, C, D whose osomotic pressure and turgor pressure are respectively 4 and 4, 10 and 5, 7 and 3 bar, the flow of water will be : **[Jharkhand 2002]**

(1) B to A, C and D (2) A to D, B and C

(3) C to A, B and D (4) A to B, C and D

Q.23 Guard cell controls : **[Bihar 2004]**

(1) Intensity of light entering

(2) Photosynthesis

(3) Closing and opening of stomata

(4) Change in green colour

Q.24 Active transport : **[Bihar 2003]**

(1) Releases energy (2) Requires energy

(3) Produces ATP

(4) Produces a toxic substance

Q.25 Valamen tissues are associated with **[Bihar 2002]**

(1) Hautorial function (2) Assimilation

(3) Aborption of moisture

(4) Nutrition

Q.26 Cohesion-tension theory regarding ascent of sap was given by : **[Bihar 2001]**

(1) Dixon and Jolly (2) J.C. Bose

(3) Cristian Wolf (4) Godlewski

Q.27 Velamen tissue is found in : **[Bihar 2004]**

(1) Mesophytes (2) Epiphytes

(3) Hydrophytes (4) Xerophytes

Q.28 In a fully turgid plant cell which one is zero : **[Bihar 2001]**

(1) Trugor pressure (2) Wall pressure

(3) Suction pressure (4) None of these

Q.29 Who proposed the 'Chohesion Theory of ascent of sap: **[Bihar 2006]**

(1) Strasburger (2) Godlewski

(3) Western (4) Dixon and Jolly

Q.30 The most accepted theroy for ascent of sap is: **[UP CPMT 2001]**

(1) Relay pump theory

(2) Pulsation theory

(3) Root pressure theory

(4) Transpiration pull cohesion theory

Q.31 Transport of water and salt is mediated by : **[MP PMT 2006]**

(1) Xylem (2) Sieve tubes

(3) Sclerenchyma (4) Phloem

Q.32 Removal of ring of tissue outside the vascular cambium from the tree trunk kills it because : **[UP CPMT 2002]**

(1) Water cannot move up

(2) Food does not travel down and root become starved

(3) Shoot become starved

(4) Annual ring are not produced

Q.33 Wilting of plant is present in : **[UP CPMT 2002]**

(1) Moss (2) Fern

(3) Algae (4) Angiosperm

Q.34 Root hair absorb water from the soil on account of :

(1) Turgor pressure (2) Osmotic pressure

(3) Suction pressure (4) Root pressure

Q.35 Increased humidy in atmosphere decreases rate of : **[UP CPMT 2003]**

(1) Transpiration (2) Photosynthesis

(3) Glycolysis (4) Growth

Q.36 In osmosis there is movement of : **[UP CPMT 2003]**

(1) Solute only

(2) Solvent only

(3) Both (1) and (2)

(4) Neither solute nor solvent

Q.37 Guttation takes place through : **[UP CPMT 2005]**

(1) Lenticels (2) Phenumatophores

(3) Stomata (4) Hydathodes

Q.38 Which of the following statements is correct ? **[UP CPMT 2003]**

(1) Cell membrane is involved only in exosmosis

(2) Cell membrane is involved only in endosmosis

(3) Cell membrane is involved both in exosmosis and endosomosis

(4) None of the above

Q.39 The root hairs absorb which of the following type of water : **[UP CPMT 2006]**

(1) Capillary water

(2) Hygroscopic water

(3) Gravitational water

(4) All of the water

Q.40 If flowers are cut and dipped in dilute NaCl solution, then : **[UP CPMT 2007]**

(1) Transpiration is low

(2) Endo-osmosis occurs

(3) No bacterial growth takes place

(4) Absorption of solute inside flower cell takes place

Q.41 Plant cell plasmolysed in a solution which is : **[MP PMT 2006]**

(1) Hypotonic (2) Hypertonic

(3) Isotonic

(4) Concentration no means

Q.42 Nitrogenase enzyme is found in Nostoc in the cell of : **[MP PMT 2001]**

(1) Vegetative (2) Heterocyst

(3) Both vegetative and heterocyst

(4) None of these

Q.43 Turgidity in guard cells is controlled by :

(1) Chloride

(2) Malic acid

(3) Potassium

(4) Potassium, chloride and malic acid

Q.44 Stomata are not found in : **[MP PMT 2001]**

(1) Algae (2) Mosses

(3) Ferns (4) Liverworts

Q.45 In which of the following the rate of transpiration is high : **[MP PMT 2001]**

(1) CAM plant (2) C_3 plants

(3) C_2 and C_4 plants (4) C_4 plants

Q.46 Cell sap is found in which cell organelle : **[MP PMT 2001]**

(1) Nucleous (2) Chloroplast

(3) Vacuole (4) Golgi Apparatus

Q.47 Which one of the following fixes nitrogen **[MP PMT 2002]**

(1) TMV (2) Yeast

(3) Nostoc (4) Denitrifying bacteria

Q.48 Active transport of ions by the cell requires : **[MP PMT 2002]**

(1) High temperature (2) ATP

(3) Alkaline pH (4) Salts

Q.49 To initiate cell plasmolysis, the salt concentration must be : **[MP PMT 2002]**

(1) Isotonic (2) Hypotonic

(3) Hypertonic (4) Atonic

Q.50 The basis of stomatal opening is : **[MP PMT 2004]**

(1) Endosmosis

(2) Plasmolysis of guard cells

(3) Decrease in cell sap concentration

(4) Exosmosis

Q.51 Plants absorb carbon dioxide from : **[MP PMT 2005]**

(1) Millets

(2) Cereals

(3) Carbohydrates present in the soil

(4) Aotmosphere

Q.52 Transpiration will increase with the increase of: **[MP PMT 2005]**

(1) Humidity (2) Temperature

(3) Carbon dioxide (4) Sulphur dioxide

Q.53 If is possible to drop a small particle through the stomata of leaf, what will you conclude : **[MP PMT 2005]**

(1) It will fall on the earth surface

(2) It will stop on lower epidermis

(3) It will stop on mesophyll cells

(4) It will stop on vascular tissue

Q.54 During transpiration turgidity in guard cells is controlled by : **[MP PMT 2006]**

(1) Potassium (2) Bromine

(3) Sodium (4) Oxalic acid

Q.55 What will happen if plant cells are placed in hypertonic solution : **[Uttaranchal PMT 2004]**

(1) Turgid (2) Plasmolysed

(3) Deplasmolysed (4) Lyse

Q.56 To initiate cell plasmolysis, the salt concentration must be : - **[MPPMT-2002]**

(1) Isotonic (2) Hypotonic

(3) Hypertonic (4) Atonic

Q.57 When a plasmolysed cell is placed in a hypotnonic solution then water will move inside the cell this will happen due to which force **[RPMT-2002]**

(1) DPD (2) OP

(3) W.P (4) None of them

Q.58 Apparatus used for measuring the transpiration: **[RPMT-2002]**

(1) Evapometer (2) Potometer

(3) Osmometer (4) Tensiometer

Q.59 Which of the following theory gives the latest explanation for closure of stomata ? **[BHU 2002]**

(1) ABA theory (2) Munch theory

(3) Starch-glucose theory

(4) Active K^+ transport theory

Q.60 The Sugarcane plant has : - **[AIIMS-2004]**

(1) Dumb-bell shaped guard cells

(2) Pentamerous flowers

(3) Reticulate venation

(4) Capsular fruits

These questions consist of two statements each, printed as "ASSERTION" and "REASON". While answering these Questions you are required to choose any one of the following responses.

(1) If both Assertion and Reason are True and the Reason is a correct explanation of the Assertion.

(2) If both Assertion and Reason are True but Reason is not correct explanation of the Assertion

(3) If Assertion is True but the Reason is False.

(4) If both Assertion and Reason are false.

Q.1 **A :** Rate of water absorption decreases by decrease in temp. of soil.
R : Permeability of cell membrane decreases at low temperature.

Q.2 **A :** Most available form of water in plants is capillary water.
R : Ψ_ω of capillary water is highly negative.

Q.3 **A :** Ascent of sap takes place by vessels & trachieds.
R : These are non living elements of phloem.

Q.4 **A :** Endosmosis causes flaccidity in Guard cells.
R : Stomata opens due to flaccidity in Guard cells.

Q.5 **A :** Plant ash contains many inorganic substances or mineral elements.
R : All the elements presents in plant ash are essential.

Q.6 **A :** Chlorine, Calcium & Manganese are important for light reaction.
R : Photolysis of water is helped by these elements.

Q.7 **A :** Osmotic pressure of solution is always higher than pure solvent.
R : O.P. is property of solvent molecules.

Q.8 **A :** In transpiration water, vapour diffuses from leaves in atomosphere.
R : Diffusion takes place from higher conc. to lower conc.

Q.9 **A :** Ascent of sap continues, after the living cells of xylem are killed by poison.
R : Path of ascent of sap is symplastic.

Q.10 **A :** In a plasmolysed cell the space between cell wall and plasma membrane is occupied by hypertonic solution.
R : Cell wall is permeable.

Q.11 **A :** Root pressure is maximum during noontime.
R : Temperature & light intensity is higher during noontime.

Q.12 **A :** T.P. of Guard cells determines the mechanism of opening and closing of stomata.
R : Inner wall of Guard cell is thin.

Q.13 **A :** Plant leaves become wilted after girdling or ringing.
R : Ascent of sap is taking place by phloem.

Q.14 **A :** DPD in plasmolysed cell is higher than O.P.
R : T.P. is negative in plasmolysed cell.

Q.15 **A :** The movement of ions from epidermis to xylem elements is an active process.
R : It requires the metabolic energy.

Q.16 **A :** Ringing Experiment is impossible in sugarcane plants.
R : Vascular bundles in sugarcane are scattered.

Q.17 **A :** Ascent of sap is function of Xylem parenchyma.
R : Xylem parenchyma is non living element.

Q.18 **A :** Active absorption of water takes place in Halophytes.
R : Halophytes can absorbe water non-osmotically.

Q.19 **A :** O.P. of pure water is higher.
R : O.P. is property of solvent.

Q.20 **A :** Root cells have lower Ψ_ω than leaf cells.
R : Root cells have greater solute concentration as compared to leaf cells.

Q.21 **A :** Rate of transpiration is higher in dry & hot atmosphere.
R : Diffusion of water vapour is rapid in dry atmosphere.

Q.22 **A :** Guttation occurs during night & morning.
R : Hydathodes remain open during all time.

Q.23 **A :** Minerals mainly absorbed by Meristematic zone of roots.
R : Metabolic energy is produced by photosynthesis in meristematic part of roots.

Q.24 **A :** The movement of ions from soil to endodermis & Xylem elements is an active process.
R : It requires metabolic energy.

Q.25 **A :** Wooden doors and windows are hard to open or close in moist season.
R : They imbibe water in humid rainy season and increase in volume.

Q.26 **A :** Guttataion is loss of water in liquid form from the hydathodes.
R : Hydathodes open during day time.

Q.27 **A :** Halophytes can grow on salty soil.
R : Osmotic pressure in halophyte is higher as comapred to normal plants.

Q.28 **A :** Transpiration is higher in humid climate.
R : Rate of water absorption is higher in heliophytes.

Q.29 **A :** Water is mainly absorbed by passive process in plants.
R : Passive absorption occurs by expenditure of metabolic energy.

Q.30 **A :** Cold soil is physiologically dry.
R : Viscosity of water is higher in cold soil.

Q.31 **A :** Ascent of sap occurs by xylem tissue.
R : Xylem is presents only in dicot plants.

Q.32 **A :** Root hair cells absorb water from soil.
R : O.P. of soil is lower than root cells.

Q.33 **A :** Ascent of sap is stopped by killing the xylem parenchyma.
R : Ascent of sap occurs by parenchyma.

Q.34 **A :** Passive absorption of H_2O increases by increase in transpiration.
R : Passive absorption of water requires ATP.

Q.35 **A :** O.P. of leaf cells is lower than root cells.
R : Root cells has more solute.

Q.36 **A :** Ascent of sap occurs by living part of xylem.
R : Ascent of sap requires metabolic energy.

Q.37 **A :** Maximum transpiration takes place through the stomata.
R : Stomatal transpiration occurs through the leaves.

Q.38 **A :** Rate of transpiration decreases with increase in conc. of CO_2.
R : CO_2 reacts with ABA in subsidiary cells.

Q.39 **A :** **Potamogeton** possesses non-functional stomata.
R : **Potamogeton** is submerged hydrophyte.

Q.40 **A :** Transplanted plant can not grow easily.
R : Uptake of CO_2 is not possible at new places.

Q.41 **A :** Rate of water absorption decreases at low temp.
R : Viscocity of water is increased at low temp.

Q.42 **A :** Ascent of sap occurs by xylem vesseles ad tracheids.
R : These are living elements of xylem.

Q.43 **A :** Orchids or epiphytes can absorb atm. humidity.
R : Orchids are photosynthetic plants.

Q.44 **A :** Rate of transpiration decreases with increase in atm. humidity.
R : At high atm. humidity sotmata close.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

MINERAL NUTRITION

INTRODUCTION

- Soil the main source of mineral nutrients. These mineral nutrients are mainely absorbed by the **meristemetic region of roots**.
- Mineral nutrients are present with soil particles in colloidal form and in water as soil solution. Conduction of mineral nutrients is done through the xylem.
- Absorption of meneral in plant is an active process.

ESSENTIAL ELEMENTS

About 50-60 elements are present in plant body but **16** elements are considered as essential elements According to **Arnon,-criteria** of essentiality of minerals are :

- The element must be neccessary for normal growth and reproduction of all plants.
- The requirement of element must be specific for plant life. That is indispensible element to plant.
- The Element must be directly involved in metabolism of plant.

C, H, O, N, K, S, Ca, Fe, Mg, P, Cu, Mn, B, Cl, Zn, Mo, Ni

CLASSIFICATION OF ESSENTIAL ELEMENTS

Arnon divides these necessary elements in two group on the basis of requirement of plant

- **Major element/Macro nutrients:** Concentration must be 1-10 mg L^{-1} more than 10 m mole $kg^{-1}$of dry matter. (mmole-Milimolar)

  C, H, O, N, P, Mg, S, K, Ca
- **Minor element/Micro nutrients:** (Concentration present 1.0-0.1 mg L^{-1} less than 10 m mole kg^{-1} per gram of dry matter)

  Cu, Zn, N, Mo, Mn, B, Cl, Fe

General functions of essential elements-

1. **Protoplasmic elements** - C, H, O, N, P, S
2. **Elements of Redox Reaction** - Fe, Cu, Mn, Cl
3. **Balancing / Antagonastic** - K, Ca
4. **Membrane Permeability** - K, Ca
5. **Co-factor of enzymes** - All micronutrients except B
6. **Osmotic pressure of cell.**

Benificial nutrients: Mineral elements other than essential elements, which satisfy specific additional nutrient requirement of some specific plants.

Ex. Na - Halophytes (eg. Atriplex - helps in C_4 pathway)

Si - Grasses (Provides mechanical strength)

Se - Astragalus

Co - Leguminous plants (root nodule formation)

- **Toxic elements/Toxicity:-** Any mineral ion concentration in plant tissue, that reduces the dry weight of tissue by about 10 percent is considerd as toxic elements and this effect is called toxicity.

- Most of the micronutrients become toxic as their required amount for plants is very low. This excess concentration inhibits activity of other essential elements.

  e.g., Toxicity of Mn (Manganese) may induce deficiency of iron, magnesium and calcium cause appearance of brown spots surrounded by chlorotic veins. Mn competes with iron (Fe) and magnesium (Mg) for uptake and for binding to enzymes. Mn also inhibits, calcium translocation into the shoot apex and causes disease **'Crickle leaf '**.

  So the dominant symptoms of Mn toxicity may actually be the symptoms of Fe, Mg and Ca deficiency.

  Deficiency symptoms and mobility of minerals :
- The deficiency symptoms of highly mobile elements in plants like **N, P, K, Cl** and **Mg** first appear in older plant parts. These minerals are present as structural constituent of biomolecules of mature plant parts and when plant parts become older, these biomolecules broken down making these elements available for younger plant parts.
- The deficiency symptoms of immobile elements like Ca, S, B, Fe first appear in young plant parts, as they are not transported from older plant parts.

MINERAL SALT ABSORPTION/MECHANISM OF MINERAL ABSORPTION

1. PASSIVE ABSORPTION OF MINERALS : (Without expenditure of ATP)

(i) By simple diffusion : According to this method mineral ions may diffuse in root cells from the soil solution. Facilitated diffusion of minerals also occurs with help of carrier proteins.

(ii) By mass flow : Proposed by Hylmo (Supported by Kramer) According to this method mineral ions absorption occurs with flow of water under the influence of transpiration.

(iii) By ion exchange : By Jenny and Over street. This is exchange of mineral ions with the ions of same charge.

(a) By contact exchange : When the mineral ion exchange occurs with the H^+ and OH^- ions.

(b) Carbonic acid exchange : When the mineral ion exchange takes place with the ions of carbonic acid.

(iv) By Donnan equilibrium : This theory explains the passive accumulation of ions against the concentration gradient or electrochemical potential (ECP) without ATP. At the inner side of cell membrane, which separates from outside (external medium), there are some anions, which are fixed or non diffusible and membrane is impermeable to these anions, while cations are diffusible.

- In such condition, for maintenance of equilibrium additonal cations are needed to balance negative charges of anions (at inner side of membrane). Thus some cations moves, inside the cell from soil solution.
- So according to this theory Donnan equilibrium is attained, if the anions and cations in the internal solution become equal to the anions and cations in external solutions.

Objections for passive mineral absorption / evidences in favour of active mineral absorption :

(1) Absorption of K^+ions in **Nitella** algae is observed against the concentration gradient.

(2) Rate of respiration of a plant is increases, when plant transferred to mineral solution. (Salt respiration)

(3) Factors like deficiency of oxygen, CO, CN, which inhibits rate of respiration, these factors also inhibit the absorption of mineral ions in plants.

Thus ion absorption in plants is considered mainly as an active process.

2. Active ion absorption : (By expenditure of ATPs)

(i) Cytochrome pump theory : By **Lundegardh and Burstrom (1933)** according to this theory, **only anions** are absorbed by active mechanism through cytochrome pumping and absorption of cation is passive process.

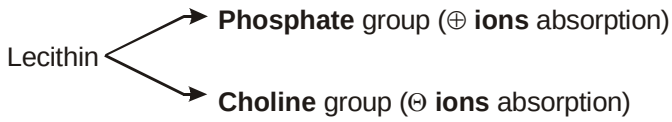
According to cytochrome pump theory **salt respiration** is called as **anion respiration.**

(ii) Carrier concept : By **Vanden Honert.** According to this theory some specific carrier molecules made up of **proteins** are present in cell membrane of root cell, which absorb both the ions and form **ion-carrier complex.** This complex is broken inside the cell membrane with the use of energy.

(iii) Protein - Lecithin theory : By **Bennet Clark**

According to this theory a **phospholipid lecithin** in root cell membrane works as carrier for both type of ions.

Lecithin has two type of groups:



- **Goldacre** - A contractile protein is associated, with absorption of minerals.
  Mineral absorbed by the roots of plants are carried by xylem by two pathways, apoplastic and symplastic pathway.
- **P.R. Stout** and **Hoagland** (1939) proved that mineral salts are translocated through xylem along with transpiration pull (exp. with help of radioisotopes).

SPECIFIC ROLES OF DIFFERENT ELEMENTS

Mineral Element	Principle Functions	Deficiency symptoms
1. Nitrogen NO_3^- /Nitrate form	(a) All living matter (b) Amino acids, proteins (c) Purines, pyrimidines (d) Early defoliation (e) NAD, NADP, FMN, FAD (f) Chlorophyll, cytochromes	Chlorosis first in older leaves, permature leaf fall reduced yield. Development of anthocyanin pigment (Mottled chlorosis)
2. Phosphorus $H_2PO_4^-$ & HPO_4^- orthophosphate anion form	(a) Nucleic acids (b) Nucleoproteins (c) Phospholipids (d) AMP, ADP, ATP (e) NAD, NADP (f) Indispensible role in energy metabolism	Chlorosis with necrosis, permature abscission of leaf, poor vasculature.
3. Potassium K^+ in free form	(a) Permieability (b) Osmotic regulation and hydration (c) Commonest free ion in cell (d) Stomatal movements (e) Translocation of sugars (f) Enzymes concerned with photosynthesis, nitrate reduction, protein bio-synthesis, respirations, etc.	Mottled chlorosis, premature death, loss of apical dominance lodging in cereal. Bushy habit. Cotton rust.

4. Calcium Ca^{++} form	(a) Cell wall Structure (b) Membrane structure (c) Influence nitrate reductase (d) In ion transport (e) In cell elongation and spindle formation (f) Activators of amylases, adenyl kinase, ATPase, etc.	Stunted growth, **degeneration of meristems**, chlorosis, curling first in young leaves. Black heart of *Celery*.
5. Magnesium Mg^{++} form	(a) Component of chlorophyll (b) Activators of a number of photosynthetic and respiratory enzymes (c) Combiness the subunits of ribosomes (d) Synthesis and hydrolysis of ATP	Marginal curling, interveinal chlorosis with anthocyanin accumulation first appearing in older leaves. 'Sand drown' of Tobacco.
6. Sulphur SO_4^{2-} form (Sulphate)	(a) Part of CoA, Ferredoxin, Vit. H, Thiamine, Lipoic acid. (b) Amino acids e.g. Cysterine, Cystine, methionine	Chlorosis first in young leaves, reduced nodulation in legume. **Tea yellow**, extensive root system.
7. Iron Fe^{++}/Fe^{+++} Form	(a) Structural component of porphyrin molecules, cytoch -romes, catalase, peroxidase leghaemoglobin	**Interveinal chlorosis** first in young leaves. Green Netting of Citrus.
8. Molybdenum MoO_4^{2-} form	(a) Component of nitrate reductase (b) Important in N_2 fixation	Mottled chlorosis, **whiptail of cauliflower**, loosening of inflorescence of cauliflower. Scald of beans.
9. Boron H_3BO_3 / BO_3^{-3} (Borate) form	(a) Translocation of sugars (b) For seed, pollen and spore germination (c) Enzymes of phosphorylation (d) RNA metabolism (e) Phenol metabolism and cell differentiation (f) Regulates pentose phosphate pathway (g) Flowering and fruiting	**Brown heart of turnip**, **internal cork** of apple, **heart rot** of sugarbeet, decreased nodulation in legumes. Hollow stem of caulifilower, stem crack of *Celery*.

10. Copper Cu^{++} form	(a) Oxidase enzyme : tyrosinases plastocyanin, cytochrome oxidase.	Dieback, exanthema, reclamation disease, blackening of potato, tubers, chlorosis
11. Manganese Mn^{++} form	(a) In chlorophyll synthesis (b) In photolysis of H_2O in photosynthesis (c) Maintenance of chloroplast membrane structure (d) Enzyme systems; RNA polymerase, NAD-malic enzyme in C_4 plants	Interveinal chlorosis, grey speck of oat, marsh spot disease of pea.
12. Zinc Zn^{++} form	(a) Tryptophan synthesis (precursor of auxin) (b) Dehydrogenase enzymes, pyriding nucleotide, alcohol, glucose-6-p and triose phosphate (c) Carbonic anhydrase (d) Promotes synthesis of cytochromes (e) Stabilizes ribosomal fractions	Little leaf, leaf rosettes leaf malformations. White bud, whip tip of maize, sickle leaf of cocao, khaira disease of rice.
13. Chlorine	(a) In the transfer of electron from water to PS II (Photolysis) (b) Maintain cation – anion balance	Bronze colour in leaves, chlorosis, necrosis, swollen root flower abscission.
14. Nickel	(a) Urease and hydrogenase activity	It helps in germination and early seedling growth of Jack Bean seeds. It causes necrotic spots.

N_2 METABOLISM

Role of Nitrogen in Plants:- Constituent of proteins, nucleic acids ATP, GTP, Vitamins, chlorophyll, alkaloids, cytochromes, hormones. Nitrogen is necessary to plants for heridity, reproduction, growth metabolism and development.

Sources of Nitrogen to plants :

(1) Atmospheric nitrogen:

$N \equiv N$ (Molecular, inert or elemental form) used by Rhizobium (Legumes), BGA, Lichens.

- These converts atm. N_2 into metabolically usefull ammonia (NH_3). This process is called as **biological nitrogen fixation**.

(2) NO_3^-,NO_2^-,NH_4^+ in soil:

These are major source of nitrogen to plants.

- **Nitrate ions (NO_3^-)** are cheif form of nitrogen used by majority of plants.

Plants grow in acidic soil & found in forest use ammonium ions (NH_4^+) as major N_2 source.
Nitrate ions are cheif source of N_2 for plants but they can not be used directly in metabolic pathway in plant cells, as it is highly oxidised form. so NO_3^- (Nitrate) first converted into NO_4^+ (ammonium ions) called **nitrate reduction**. So NH_4^+ ions enters in plant metabolism.

(3) Organic nitrogen in soil: as amino acids, protein body.
Due to death & decay of organisms. This is not a major source of N_2.

(4) Insect bodies: for some plants (insectivorous plants)

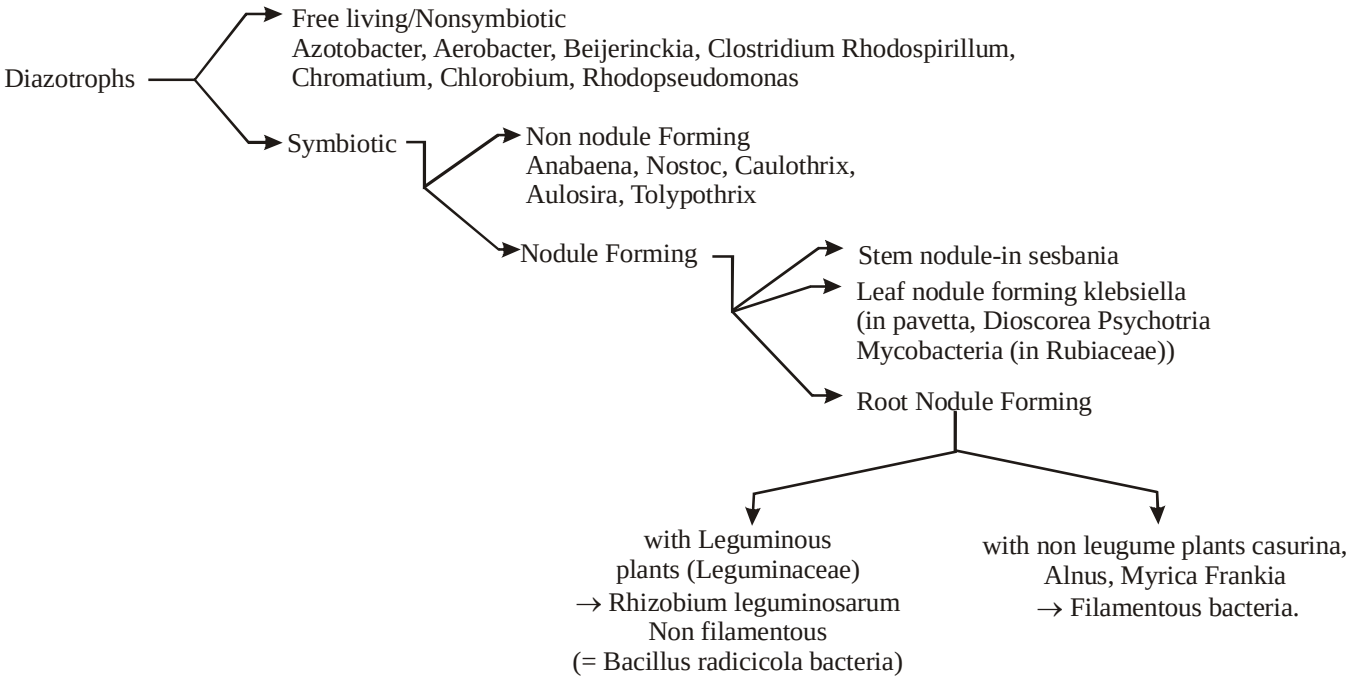
(5) Urea as chemical/artificial fertilizers

Nitrogen (N_2) Cycle:

(1) Biological Nitrogen Fixation/Diazotrophy ($N_2 \rightarrow NH_3$):- Conversion of molecular or elemental nitrogen ($N \equiv N$) into inorganic nitrogenous compounds (NH_3) through agency of living organisms is called as **biological nitrogen fixation** or **Diazotrophy.**

Nitrogen Fixing organisms (Diazotrophs):

- Free living diazotrophs carry out diazotropy only in free living condition while symbiotic diazotrophs only in symbiotic condition.



(2) Ammonification: Conversion of dead organic nitrogenous compounds into ammonia. **Bacillus mycoides**, **B. ramosus.**

(3) Nitrification: Oxidation of ammonia, produced by ammonification into nitrates by nitrifying bacteria is called as **nitrification**.

(i) $2NH_3 + 2O_2 \xrightarrow{\text{Nitrosomonas}} 2NO_2^- + 2H_2O + 2H^+$
Ammonia — Nitrite ion

(ii) $2NO_2^- + O_2 \xrightarrow{\text{Nitrobacter}} 2NO_3^-$
Nitrate ions

Some fungi like Aspergillus, Penicillium can also carry out this process.

(4) Denitrification: Nitrates or nitrites converts back into molecular or atm. nitrogen by denitrifying bacteria is denitrification. Ex. **Pseudomonas** denitrificance.

(5) Nitrate reduction:

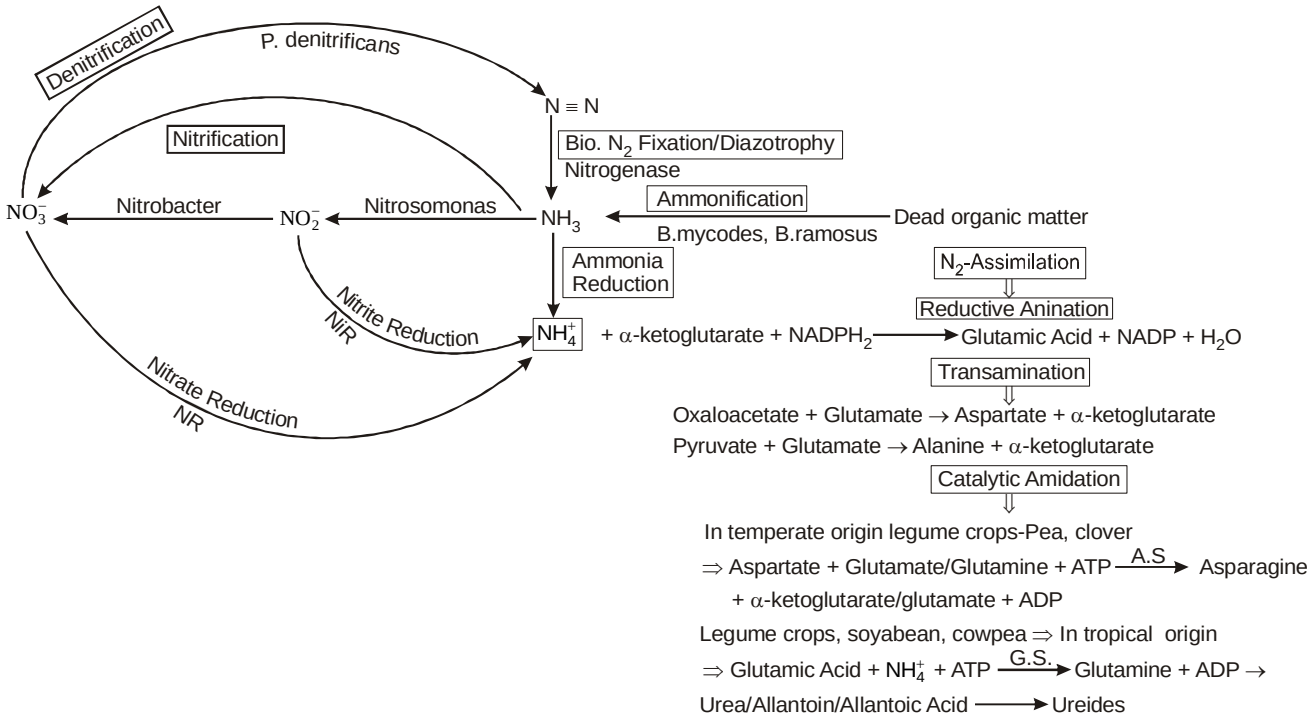
- Plants take nitrogen from soil, chiefly in nitrate forms which is highly oxidised form.
so NO_3 converts in ammonia by following method

(a) $NO_3^- + NADH_2 + H^+ \xrightarrow{\text{Nitrate reductase}} NO_2 + NAD + H_2O$

(b) $NO_2^- \xrightarrow{2e^-, 2H^+} NOH \xrightarrow{2e^-, 2H^+} NH_2OH \xrightarrow{2e^-, 2H^+} NH_4^+$

or $NO_2^- + 6H_2O + 4H^+ \xrightarrow{\text{Nitrate reductase}} 2NH_4^+ + 3O_2 + 4H_2O$

- Nitrate reductase is Molybdo flavoprotein isolated by Evans and Nason 1953 from Neurospora and Glycine max.



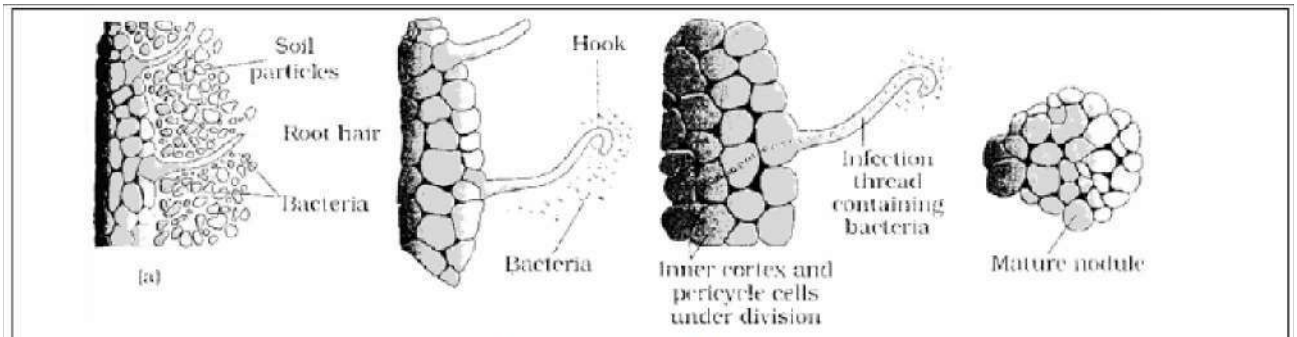
Symbiotic N_2 fixatiion (Diazotrophy) : It is done by symbiotic bacteria & free living bacteria. In leguminous plants (Fabaceae) by symbiotic bacterium **Rhizobium**, which form nodules in their roots.

- N_2 convert into NH_3 ion, which is used in plant metabolism.
- Root nodules act as site for N_2 fixation. It contains all necessary biochemical components like enzyme Nitrogenase, Leghaemoglobin, required in N_2 fixation.

NODULE FORMATION

It is due to interactions between bacteria and host root. It occurs in following steps:

- **Multiplication & colonization of Rhizobia** at Rhizosphere and attachment to epidermal root hair cells. Initial attraction of Rhizobia to host root is chemotactic (Rhicadhesin protein of bacterial cell identify host root) as root exude amino acids, sugars, organic acids and flavonoids.
- **Characterstic curling of root hairs and invasion of the bacteria** to form an **infection thread,** by the invagination of plasma membrane of root hair cells and it reaches up to the cortex of roots. Curling of root hairs is stimulated by specific complex polysaccharides found on the surface of rhizobia, recognised by Lectins (small proteins of host plant roots).
- **Nodule initiation & development in root cortex.** Mitogenic agents secreted (Kinetin) by bacteria & auxin produced by plant cell promotes cell division & extension leading to nodule formation. Nodule establishes direct vascular connection with host for exchange of nutrients. Root nudule cells have chromosome in double to other somatic cells. Thus nodule cells are polyploid specially **Tetraploid**.



Development of root nodules in soyabean : (a) *Rhizobium* bacteria contact a susceptible root hair, divide near it, (b) Upon successful infectionof the root hair cause it to curl, (c) Infected thread carries the bacteria to the inner cortex. The bacteria get modified into rod-shaped bacteroids and cause inner cortical and pericycle cells to divide. Division and growth of cortical and pericycle cells lead to nodule formation, (d) A mature nodule is complete with vascular tissues continuous with those of the root

Release of bacteria from infection thread and they differentiable as specilized nitrogen fixing cell.

- Bacteria continue to multiply during it's path in root thair cells & bacteria distribute in most of cells.
- The membrane of infection thread bud off to form small vesicles with containing one or more bacteria. Then bacteria stop dividing & enlarge & differentiate in **nitrogen fixing cells called bacteroid** & it's membrane called **peribacteroid membrane.**

MECHANISM OF BIOLOGICAL N_2 FIXATION

By Burris. The atm. N_2 is reduce by the addition of hydrogen atoms.

- The three bonds between two nitrogen atoms N ≡ N or dinitrogen are broken & ammonia (NH_3) is formed by reduction of N ≡ N.

$$N \equiv N + 8H^+ + 8e^- + 16ATP \xrightarrow[\text{Nitrogenase}]{} 2NH_3 + H_2 + 16ADP$$

(1) **Nitrogenase :**

⇒ Exclusively present in prokaryotes

⇒ Inducible enzyme

⇒ Larger sub unit/SU-I **Mo-Fe-protein**
smaller Subunit / SU-II-**Fe-S-protein/ ferredoxin**

⇒ Both Subunits bind together at the time of N_2 fixation.

⇒ Oxygen sensitive enzyme

(2) **O_2 Regulation:**

⇒ Most of diazotrophs are obligate anaerobes

⇒ Some diazotrophs are facultative like Rhizobium, perform anaerobic respiration at the time of diazotrophy

⇒ In root nodule of leguminous plants - O_2 Scavenger Leghaemoglobin (Lhb) (similar to haemoglobin of animals) is present, bind with O_2 to become oxyleghaemoglobin (OLHb) and regulates minimum O
2
concentration.

⇒ Leghaemoglobin is synthesized by combined activity of host (gives protein part globin) and bacteria (gives haem' part).

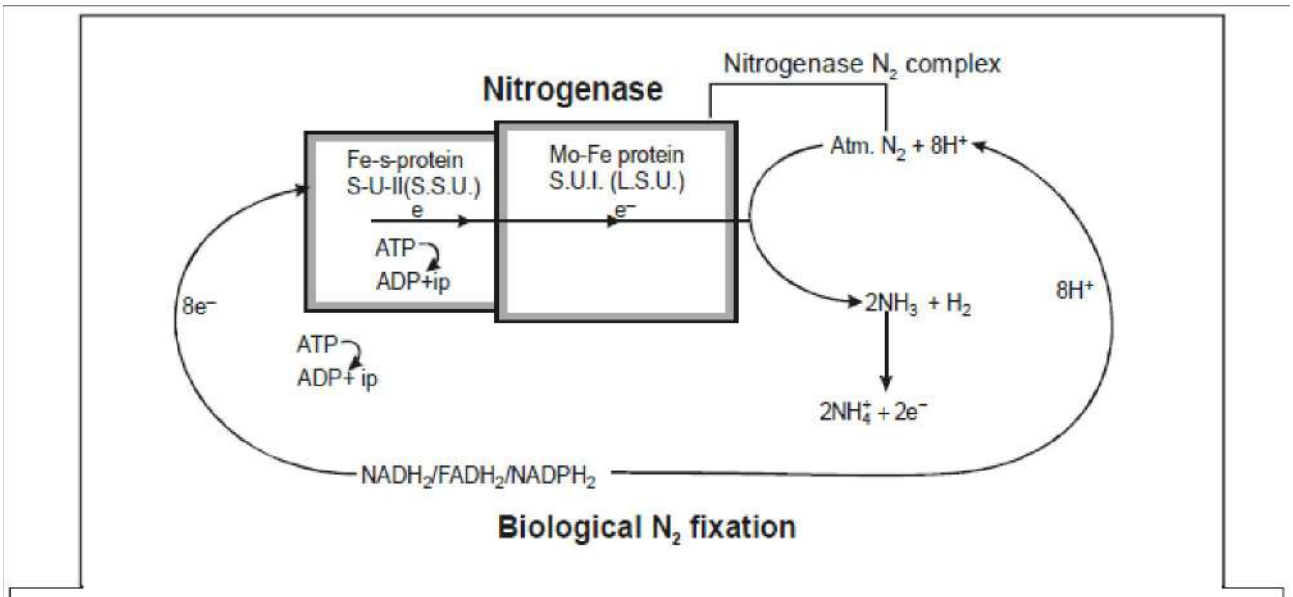
⇒ In the Heterocyst- Non photosynthetic and thick walled.

(3) **Source of H^+ and e^-**

⇒ Reducing agents $NADH_2/FADH_2/NADPH_2$ obtained from Photosynthesis and respiration

(4) **Source of ATP** ⇒ From Photosynthesis and respiration

(5) **Genes**
- Host-NOD(Nodulin protein forming gene)
- Bacteria-nod (Nodule forming gene)
- **Fix nif** (nitrogenase inducing factor)
- **Fix** (Nitrogen fixation gene)



Mechanism of nitrogen fixation

(a) The 2nd unit (ferredoxin) of nitrogenase, receive electrons from e^- donar ($FADH_2/NADH_2/NADPH_2$) and become reduced.

(b) This reduced 2nd unit is now activate by ATP and form a complex called **ferredoxin ATP complex.**

(c) On other side unit 1st (Fe-Mo protein) of nitrogenase, reacts with molecular nitrogen to form **nitrogenase-nitrogen complex.**

(d) Ferredoxin ATP complex then transfer electron to nitrogenase-nitrogen complex, so that the later gets reduced. This reaction utilize of ATP.

(e) The reduced nitrogenase-nitrogen complex now receives proton (H^+) resulting in formation of ammonia (NH_3).

Mechanism of nitrogen fixation

(a) The 2nd unit (ferredoxin) of nitrogenase, receive electrons from e^- donar ($FADH_2/NADH_2/NADPH_2$) and become reduced.

(b) This reduced 2nd unit is now activate by ATP and form a complex called **ferredoxin ATP complex.**

(c) On other side unit 1st (Fe-Mo protein) of nitrogenase, reacts with molecular nitrogen to form **nitrogenase-nitrogen complex.**

(d) Ferredoxin ATP complex then transfer electron to nitrogenase-nitrogen complex, so that the later gets reduced. This reaction utilize of ATP.

(e) The reduced nitrogenase-nitrogen complex now receives proton (H^+) resulting in formation of ammonia (NH_3).

SYNTHESIS OF AMINO ACIDS & NITROGEN ASSIMILATION

Nitrogen assimilation:- Inorganic NH_3 (Produced by nitrate reduction or biological fixation or obtained from soil as NH_4^+) reacts with a TCA cycle intermediate-α-ketoglutaric acid to form an amino acid **glutamic acid**.This process known as **Reductive amination or Amino acid Biosynthesis.**

$$\alpha\text{-Ketoglutaric acid} + NH_4^+ + NADPH_2 \underset{\text{dehydrogenase}}{\overset{\text{Glutamate}}{\rightleftharpoons}} \text{Glutamic acid} + H_2O + NADP$$

Transamination:- Transfer of Amino group from glutamic acid to other keto acid is known as **transamination**. This is a process of formation of other amino acids in plats. **(transaminase enzyme)**

Ex. Glutamic acid + Pyruvic acid $\rightleftharpoons$ **Alanine** + α-ketoglutarate

Glutamic acid + OAA $\rightleftharpoons$ **Aspartic acid** + α-ketoglutaric acid.

- **Glutamic acid is first formed amino acid in plants** & can synthesize different amino acids by transamination.

Catalytic Amidation :

Transportation of fixed N_2/Assimilated N_2 in plants occurs mainly in the form of amides especially in leguminous plants as amides are more stable than amino acids and possess high Nitrogen to Carbon ratio (2N to 4C - in Asparagine, 2N to 5C in glutamine (as glutamate posses 1N to 5C)

Formation of amides from amino acids catalysed by enzymes called as catalytic amidation.

In legumes of temperate origine like pea and clover-Asparagine is translocated in non nodulated plant parts.

In legumes of tropical origin like soyabean and cowpea-ureides are translocated in non nodulated plant parts.

Glutamine synthesis:

$$\text{Glutamic acid/Glutamate} + NH_4^+ + ATP \xrightarrow{\text{Glutamine (G.S.) Synthase}} \text{Glutamine} + ADP + iP$$

Asparagine syntnesis:

$$\text{Glutamine/Glutamate} + \text{Aspartate} + ATP \xrightarrow{\text{Asparagine (A.S.) Synthase}} \text{Asparagine} + ADP + iP +$$

Glutamate / α-Ketoglutaric acid

SPECIAL POINTS

- C, H, O, N and P are main constituents of protoplasm (organic materials). So they are called **protoplasmic elements.** C, N & O from atmosphere and H_2O from soil for H & O.
- **C, H and O** are the main components of nucleic acid, proteins, enzymes, carbohydrates, fats. (frame work elements)
- Mostly soil is deficient of **NPK** and these elements are known as **critical elements,** NPK-fetilizer is good for crop yield.
- Silica (SiO_2) is present in cell wall of diatoms grasses and paddy straw.
- **Al** present in pteridophytes i.e. - Lycopodium.
- Mo, required in minimum quantity.

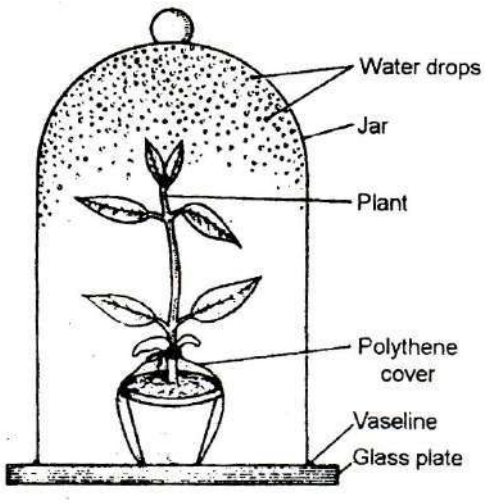
- **Hydroponics/solution culture/**soil less growth/tank farming and **ash analysis** is a technique which determines the role of nutrients in plants. (By Geriack)
- Gold (Au) present in Equisetum, mustard plants.
- Na^+ found in **halophytes** for their growth (marine plants).
- **Trace - elements are micro-nutrients,** while **tracer-elements** are **radio-isotopes**.
- Mg present in chlorophyll, as non-ionic form.
- Mg remains after chlorophyll burning.
- One abundant and stable form of Fe in leaves is stored in chloroplasts as an iron protein complex called **phytoferritin** (Seckback 1983).
- C, H, O are provided by H_2O, O_2 and CO_2, but 13 elements essential to all plants are absorbed as ions from the soil solution, is called a **solution mining.** (N_2 from soil & atm.)
- **Putrifaction/proteolysis:-** Bacillus, Pseudomonas, Clostridium.
- Proteins $\xrightarrow{\text{Proteases}}$ peptides $\xrightarrow{\text{Peptidase}}$ amino acids (conversion of proteins in to amino acids) smell of dead bodies.
- **Deamination:-** Removal of amino group as NH_3 from an amino acid.
- Root pressure is measured by **manometer**.

IMPORTANT EXPERIMENT

EXPERIMENT - 1

Bell jar experiments for demonstration of transpiration :

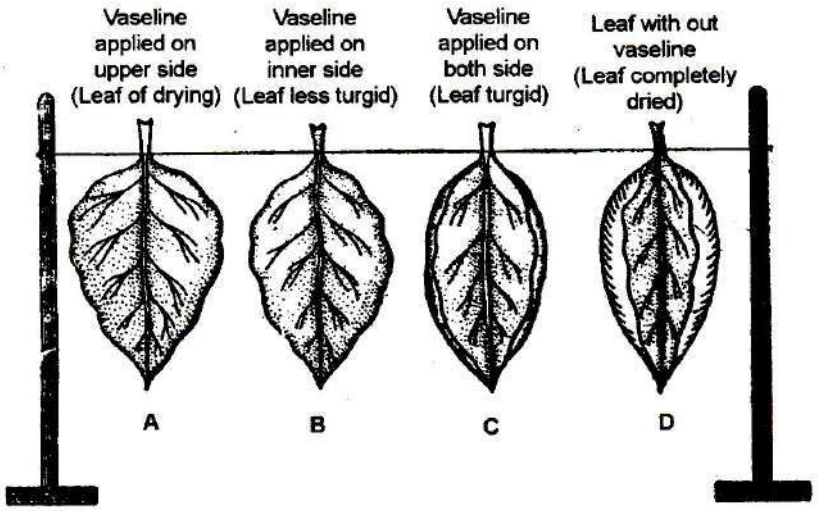
Take a small well watered potted plant. Cover the external surface of the pot and its soil thoroughly with polythene bag. Place the potted plant on a glass slab in a cool place invert a dry bell-jar over it. Seal the edges of bell-jar with vaseline. After some time drops of water will appear on the inner side of the bell-jar. The water drops have been formed by the condensation of water vapours given out by shoot of the plant in transpiration.



EXPERIMENT - 2

Compare the loss of water from the two sides of a leaf (By four leaf experiment) :

Remove four leaves of Pipal. They should be almost equal size. Seal the cut end of petioles with vaseline. Tie a thread to the petiole of each in the fashion of a loop. Apply vaseline to the upper surface of A, lower surface of B and both the surfaces of C. Keep the leaf D as such to function as control. Weight the leaves one by one. For weighing each leaf is picked up though the thread attached to its petiole. After initial weighing keeping the leaves hanging from stands by means of their threads for a few hours. Examine them closely. Leaves A & D wilt while B and C remain turgid. Weight them again. It will be seen that max loss of weigh occurs in D followed by A. Loss of weight is negligible in B.It is nill in case of C. In D leaf both surfaces loss water, while in A only the lower surface is exposed to transpire. The negligible loss of water in B shows that upper surface transpires little.



EXPERIMENT - 3

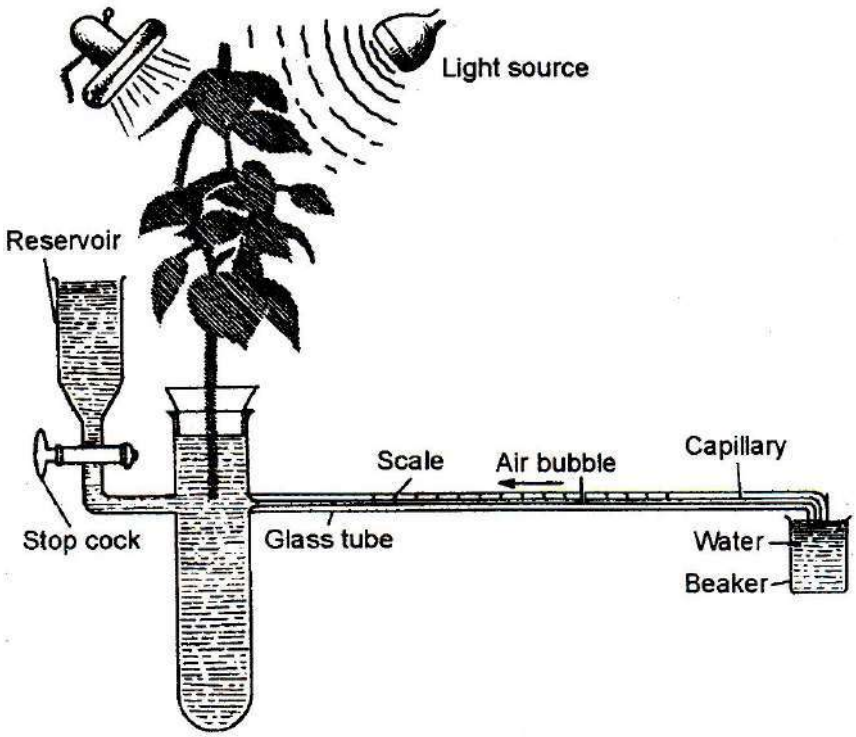
Measurement of Transpiration (By Ganong's potometer) :

Fill Ganong's Patometer completely with water. Close the hole of the capillary tube with your finger. Insert a fresh leafy shoot, cut under water, into the mouth of the wide tube by means of cork. Make the connections air tight by applying melted wax or vaseline to the joint. Place the apparatus in dry place or sunlight. Remove your finger from the free end. An air bubble will enter the graduated capillary tube

dip the free end in a beaker containing water. The air bubble will seen moving forwards.
Note the time taken for the air bubble to travel from one end to other end in tube. As soon as the air bubble reaches the other end open the stop cock of the reservior till it is pushed back to the beginning of the horizontal tube. Repeat the experiment. Note the amount of water absorption in different conditions.

$V = \pi r^2 \ell$

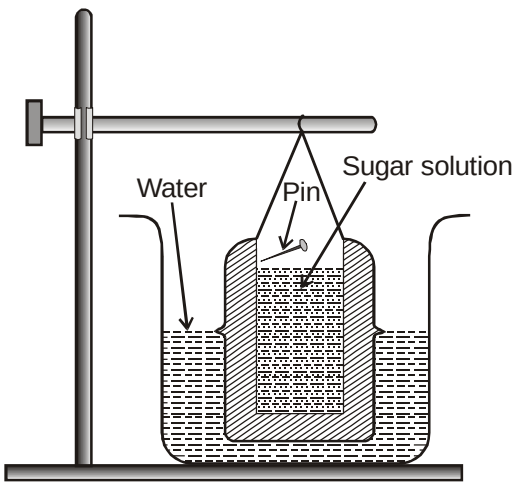
V = volume of water which absorbed/transpired water
π = 3.14
ℓ = distance of movement by air bubble



EXPERIMENT - 4

Demonstration of osmosis by Potato Osmoscope

Take a large sized potato tuber. Cut on side flat. Bore a cavity from the other side in such a way that only a thin base is left intact on the flat side. Also remove the skin near the edges of the flat end because the skin of the tuber is impermeable to water. Now place the cavity of the potato tuber by 10-20% sugar solution. Mark the level of sugar solution in the cavity with the help of pin. After some time the level of sugar solution rises in the cavity.



The rise in the level of sugar solution in the cavity of the potato tuber indicate that it has absorbed water from the petri dish. The two are separated from each other by a large number of cells.

The entry of water into sugar solution proves that (i) Sugar solution is an osmotically active solution. (ii) the cytoplasm of all the cells of the tuber that lie between the sugar solution and the water of petri dish act as a single semi-permeable membrane (iii) Water enters the sugar solution when it is separated from it by a semi-permeable membrane, the phenomenon being known as osmosis.

EXERCISE - 1

MINERAL ABSORPTION & NUTRITION

Q.1 Which of the group of elements is not essential for a normal plant ?
(1) K, Ca, Mg (2) Fe, Zn, Mn, B
(3) Pb, I, Na (4) Mg, Fe, Mo

Q.2 Hydroponics is a technique in which plants are grown in ?
(1) Green house
(2) Water saturated sand
(3) Balanced nutrient solution
(4) Purified distilled water

Q.3 For cholrophyll formation a plant needs :-
(1) Fe, Ca & light (2) Fe, Mg & Light
(3) Ca, K & light (4) Mn & Cu

Q.4 Brown heart rot of beets is due to deficiency of-
(1) B (2) P
(3) Mg (4) Mo

Q.5 Die back disease in citrus is due to deficiency of : -
(1) Mo (2) B
(3) Cu (4) Zn

Q.6 The disease related with deficiency of molybdenum is : -
(1) Whiptail disease of cauliflower
(2) Little leaf disease
(3) Reclamation disease of cereals
(4) Brown heart disease

Q.7 Protoplasmic elements are : -
(1) C, H, O, P, N, S (2) C, H, O, Fe, N
(3) N, S, Fe, P, K (4) Fe, Mg, Ca, N, P

Q.8 Which element is not considered as macronutrient ?
(1) Mg (2) Ca
(3) Mn (4) P

Q.9 The element which can not be placed along with micronutrients : -
(1) Mn (2) Mo
(3) Cu (4) Ca

Q.10 The amino acid having S in its composition is -
(1) Cystine (2) Cysteine
(3) Methionine (4) All

Q.11 Which elements are considered as balancing elements ?
(1) Ca & K (2) C & H
(3) N & S (4) Mg and Fe

Q.12 The group of mineral nutrients known as frame work elements : -
(1) N, S, P (2) C, H, O
(3) Mg, Fe, Zn (4) Zn, Mn, Cu

Q.13 Which element essential for stability of chromosome structure ?
(1) Zn (2) Ca
(3) Mo (4) Fe

Q.14 "Reclamation" and "Little leaf" disease, caused by deficiency of -
(1) Zn and Mo (2) Cu and Zn
(3) Cu and B (4) Mn and Cu

Q.15 Which element is required in comparatively least quantity for the growth of plant ?
(1) Zn (2) N
(3) P (4) Ca

Q.16 Which of the following essential element is not properly placed in the given category ?
(1) Cu (2) Zn
(3) Mg (4) Mn

Q.17 Criteria for essentiality in mineral nutrition were shown firstly by : -
(1) Arnon (2) Liebig
(3) Steward (4) Levitt

Q.18 Which mineral nutrients are called critical element for crops ?
(1) N, P, K (2) C, H, O
(3) N, S, Mg (4) K, Ca, Fe

Q.19 The mineral nutrient mainly concerning with apical meristematic activity is : -
(1) K (2) Ca
(3) N (4) S

Q.20 Little leaf disease is caused by -
(1) Zn - deficiency (2) Cu - deficiency
(3) Mo - deficiency (4) Mn - deficiency

Q.21 Which of the following does NPK denote ?
(1) Nitrogen, Potassium, Kinetin
(2) Nitrogen, Protein, Kinetin
(3) Nitrogen, Protein, Potassium
(4) Nitrogen,Phosphours, Potassium

Q.22 Plants absorb mineral salts from the soil solution through : -
(1) A semipermeable membrane into the cytoplasm
(2) Perforations at the apex of root hair cells
(3) The cell wall which is semipermeable
(4) None of these

Q.23 Mineral salts which are absorbed by the roots from the soil are in the form of : -
(1) Very dilute solution
(2) Dilute solution
(3) Concentrated solution
(4) Very concentrated solution

Q.24 By which method ions are absorbed by the plants ?
(1) Diffusion (2) DPD gradient
(3) Carrers proteins (4) Water pontential

Q.25 Hydrophytes absorb salt and water by : -
(1) Root and root hairs
(2) Leaves and root
(3) Roots and stem
(4) General epidermis

Q.26 Active and passive absorption terms were coined by : -
(1) Kramer (2) Deutrochet
(3) Priestley (4) Renner

Q.27 Which is free ion present in a cell ?
(1) P (2) K
(3) Fe (4) B

Q.28 Who give the Cytochrome pump theory ?
(1) Sachs (2) Lundegradh
(3) Bose & Renner (4) Bennet - Clark

Q.29 Who proposed the protein lecithin theory ?
(1) Sachs (2) Lundegradh
(3) Bose & Renner (4) Bennet & Clark

Q.30 Carrier protein helped in : -
(1) Active absorption of ions
(2) Passive ions absorption
(3) Water absorption
(4) Vaporization

Q.31 Active uptake of minerals depends upon :-
(1) Active water absorption
(2) Transpiration
(3) Photorespiration
(4) Dephosphorylation

Q.32 When chlorophyll is burnt, which one obtained ?
(1) Fe (2) Mg
(3) Ca (4) Mn

Q.33 Which element related with Khaira disease, of Paddy & auxin synthesis : -
(1) Fe (2) Zn
(3) B (4) Cu

Q.34 Generally plants absorbed N_2 in the form of :-
(1) NO_2^- (2) NO_3^-
(3) $N \equiv N$ (4) HNO_2

Q.35 Cobalt present in : -
(1) Vit. – A (2) Vit. – B_2
(3) Vit. – B_{12} (4) PC

Q.36 Which is essential for N_2 metabolism ?
(1) B (2) Mo
(3) Cu (4) Mg

EXERCISE - 2

Q.1 Which element is left when chlorophyll is burnt-

(1) Iron (2) Manganese

(3) Magnesium (4) Molybdenum

Q.2 Essential macroelements are-

(1) Absorbed from soil

(2) Manufactured during photosynthesis

(3) Produced by enzymes

(4) Produced by growth hormones

Q.3 What is the substrate for loading of food in the plants-

(1) IAA (2) Abscisic acid

(3) GA (4) K^+ ion

Q.4 Which of the following is not a macro-nutrient-

(1) Mn (2) Ca

(3) Mg (4) Phosphorus

Q.5 The possible resource of phosphorus ions and nitrogen ions in soil generally get depleted because they are usually found as-

(1) Positively charged ions

(2) Negatively charged ions

(3) A disproportionate mixture of negatively charged ions

(4) Particles carrying no charge

Q.6 Chlorosis, etiolation and albinism are caused by-

(1) Iron, light and certain genes

(2) Zinc, iron and magnesium

(3) Magnesium, iron, zinc, light and certain genes

(4) Magnesium, zinc and light

Q.7 Which of the following is a macro-nutrient-

(1) Ca and Mg (2) Mo

(3) Mn (4) Zn

Q.8 Phytotron is a device by which-

(1) Electrons are bombarded

(2) Protons are liberated

(3) Plants are grown in controlled environment

(4) Mutations are produced in plants

Q.9 All mineral salts are absorbed in cells as-

(1) Ions (2) Atoms

(3) Molecules (4) All the above

Q.10 Which one of the following elements plays an important role in biological nitrogen fixation-

(1) Molybdenum (2) Manganese

(3) Copper (4) Zinc

Q.11 Chlorosis of plants is caused by the deficiency of-

(1) Iron (2) Boron

(3) Copper (4) Calcium

Q.12 Which one of the following scientists used the nutrient culture solution in hydroponic cultures-

(1) Sachs (2) Webster

(3) Wallace (4) Knop

Q.13 Technique of growing plants without soil in nutrient solutions is called-

(1) Parthenogenesis (2) Hydroponics

(3) Aquaculture (4) Tissue culture

Q.14 Interveinal chlorosis of leaves is caused by the deficiency of-

(1) Nitrogen (2) Calcium

(3) Potassium (4) Magnesium

Q.15 In nature, organic compounds invariably contain-

(1) Carbon (2) Phosphorus

(3) Sulphur (4) Magnesium

Q.16 Which of the following is not macro-nutrient-

(1) C (2) P

(3) S (4) Zn

Q.17 Which of the following element is not essential for plants-

(1) Iron (2) Zinc

(3) Potassium (4) Iodine

Q.18 Which of the following is micro-element in plant-

(1) Manganese (2) Nitrogen

(3) Magnesium (4) Calcium

Q.19 Which of the following is not caused by deficiency of mineral nutrition-

(1) Necrosis (2) Chlorosis

(3) Etiolation (4) Shortening internode

Q.20 Which one is not related with plant ash ?

(1) Trace elements (2) Essential elements

(3) Nitrogen (4) Mineral elements

Q.21 Fall of immature leaf is due to the deficiency of-

(1) Sulphur (2) Phosphorus

(3) Sodium (4) Zinc

Q.22 Translocation of sugar in flowering plants occurs in the form of-

(1) Maltose (2) Glucose

(3) Sucrose (4) Starch

Q.23 Hydroponics is a-

(1) Soilless culture (2) Water less Culture

(3) Airless culture (4) None of these

Q.24 The core metal of chlorophyll is-

(1) Fe (2) Mg

(3) Ni (4) Cu

Q.25 Mass flow hypothesis was first described by-

(1) Swanson (2) Buchnan

(3) Kursanov (4) Munch

Q.26 Which of the following helps in the absorption of water and mineral salts-

(1) Mycorrhiza (2) Anbaena

(3) Nostoc (4) None of these

Q.27 Bidirectional translocation of minerals takes place in-

(1) Xylem (2) Phloem

(3) Parenchyma (4) Cambium

Q.28 Cultivation by sand culture is also called-

(1) Soilless cultivation (2) Green house effect

(3) Photorespiration (4) None of these

Q.29 Inorganic nutrients are present in the soil in the form of-

(1) Molecules (2) Atoms

(3) Electrically charged ions

(4) Parasite

Q.30 Which of the following contains copper-

(1) Quinone (2) Plastoquinone

(3) Plastocyanin (4) None of these

Q.31 Which of the following is not an essential macroelement for the growth of plants-

(1) N (2) Zn

(3) Ca (4) K

Q.32 Which of the following is the importance of molybdenum in plants metabolism-

(1) Carbon assimilation

(2) Nitrate reduction

(3) Plant breeding

(4) Chromosome contraction

Q.33 Phosphorus is a structural element in-

(1) Fat (2) Starch

(3) Nucleotide (4) Carbohydrate

Q.34 The enzyme responsible for the reduction of molecular nitrogen to the level of ammonia in the leguminous root nodule is-

(1) Nitrogenase (2) Nitrate reductase

(3) Nitrite reductase (4) Nitro-ammoniase

Q.35 Which of the following element is used up in phosphorylation-

(1) Calcium and sulphur

(2) Chlorine and maganese

(3) Iron and phosphorous

(4) Magnesium and phosphate

Q.36 The plants accept Zn as-

(1) Zn (2) Zn^{2+}

(3) ZnO (4) $ZnSO_4$

Q.37 Nodules with nitrogen fixing bacteria are present in-

(1) Cotton (2) Gram

(3) Wheat (4) Mustard

Q.38 Micro-nutrients are-

(1) Less important in nutrition than macronutrients

(2) As important nutrition as macro-nutrients

(3) May be omitted from culture media without any detrimental effect on the plant

(4) Called micro because they play only minor role in nutrition

Q.39 Nitrogen is an important constituent of-
(1) Proteins (2) Lipids
(3) Carbohydrates (4) Polyphosphates

Q.40 Legume plants are important because they-
(1) Help in NO_2 fixation
(2) Not help in NO_2 fixation
(3) Increased soil fertility
(4) All of these

Q.41 Tracer elements are-
(1) Micro elements (2) Macro-elements
(3) Radio isotopes (4) Vitamins

Q.42 Which one is Cu^{++} containing pigment-
(1) Ferredoxin (2) Plastocyanin
(3) Plastoquinone (4) Cytochrome

Q.43 Which of the following deficiency may cause leaf tip bending-
(1) Sulphur (2) Nitrogen
(3) Phosphorus (4) Calcium

Q.44 Gray space disease in oats takes place by the deficiency of-
(1) Zinc (2) Copper
(3) Potassium (4) Manganese

Q.45 The number of essential elements required for normal growth of plant is-
(1) 10 (2) 16
(3) 20 (4) 25

Q.46 Important contribution of molybdenum is-
(1) Flower growth
(2) Nitrogen fixation
(3) Chromosome condensation
(4) Carbon fixation

Q.47 Which of the following is not a micro or trace element-
(1) Boron (2) Molybdenum
(3) Manganese (4) Calcium

Q.48 Nodules with nitrogen fixing bacteria are present in roots of-
(1) Cotton (2) Gram
(3) Wheat (4) Maize

Q.49 Insectivorous plants can grow well in a soil deficient in-
(1) Calcium (2) Magnesium
(3) Nitrogen (4) Iron

Q.50 Carrier proteins are involved in-
(1) Passive transport of ions
(2) Active transport of ions
(3) Water transport
(4) Water evaporation

Q.51 Knot like bodies known as 'nodules' found in the roots of groundnut plant are produced by-
(1) Azospirillum (2) Azotobacter
(3) Pseudomonas (4) Rhizobium

Q.52 Which of the following is used as green manure-
(1) Azolla (2) Azadiracta indica
(3) Crotolarea juncea (4) Hevea brassiliansis

Q.53 Symbiotic microorganism is-
(1) Clostridium (2) Azotobacter
(3) Rhizobium (4) Chromatium

Q.54 The plants that grow on saline soils with high concentration of NaCl, $MgSO_4$ and $MgCl_2$ are called-
(1) Succulents (2) Mesophytes
(3) Xerophytes (4) Halophytes

Q.55 The major portion of the dry weight of plants comprises of-
(1) Carbon, hydrogen and oxygen
(2) Nitrogen, Phosphorus and potassium
(3) Calcium, magnesium and sulphur
(4) Carbon, nitrogen and hydrogen

Q.56 Boron in green plants assists in-
(1) Sugar transport
(2) Activation of enzymes
(3) Acting as enzyme cofactor
(4) Photosynthesis

Q.57 Active uptake of minerals by roots mainly depends on-
(1) Light
(2) Temperature
(3) Availability of CO_2
(4) Availability of oxygen

Q.58 The most abundant element present in the plants is -
(1) Carbon (2) Nitrogen
(3) Manganese (4) Iron

Q.59 A metal ion involved in stomatal regulation is-
(1) Iron (2) Potassium
(3) Zinc (4) Magnesium

Q.60 The plant ash is an indication of-

(1) Organic matter of plant

(2) Waste product

(3) Mineral salt absorbed by plants

(4) None of these

Q.61 The deficiencies of micronutrients, not only affects growth of plants but also vital functions such as photosynthetic and mitochondrial electron flow. Among the list given below, which group of three elements shall affect most both photosynthesis and mitochondrial electron transport-

(1) Co, Ni, Mo (2) Ca, K, Na

(3) Mn, Co, Ca (4) Cu, Mn, Fe

Q.62 Farmers in particular region were concerned that premature yellowing of leaves of a pulse crop might cause decrease in the yield. Which treatment could be most beneficial to obtain maximum seed yield?

(1) Application of iron and magnesium to promote synthesis of chlorophyll

(2) Frequent irrigation of the crop

(3) Treatment of the plants with cytocinins along with a small dose nitrogenous fertilizer

(4) Removal of all yellow leaves and spraying the remaining green leaves with 2,4,5-trichlorophenoxy acetic acid

Q.63 Sulphur is an important nutrient for optimum growth and productivity in-

(1) Oilseed crops (2) Pulse crops

(3) Cereals (4) Fibre crops

Q.64 A plant requires magnesium for-

(1) Protein synthesis

(2) Chlorophyll synthesis

(3) Cell wall development

(4) Holding cells together

Q.65 Which one of the following element is not an essential micronutrient for plant growth?

(1) Zn (2) Cu

(3) Ca (4) Mn

Q.66 Which is not macro nutrient element-

(1) Mn (2) Mg

(3) K (4) Ca

EXERCISE - 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Which of the following elements are essential of the photolysis of water : -

[Uttaranchal PMT 2004]

(1) Ca and Cl (2) Mn and Cl

(3) Zn and I (4) Cu and Fe

Q.2 Which of the following is releated with transfer of food material : **[Uttaranchal PMT 2005]**

(1) Xylem (2) Collenchyma

(3) Phloem (4) Parenchyma

Q.3 Which of the following element is most mobile in plant metabolism :

[Uttaranchal PMT 2006]

(1) Calcium (2) Phosphorus

(3) Carbon (4) Magnesium

Q.4 The process of converting ammonia to nitrate by bacteria is known as :

[Uttaranchal PMT 2006]

(1) Ammonification (2) Nitrification

(3) Nitrogen fixation (4) Denitrification

Q.5 Root nodules which are present in plants are meant for fertilizers and are found in/on :

[Uttaranchal PMT 2006]

(1) Certain leguminous plants

(2) Casurina

(3) Alanus

(4) All of the above

Q.6 Agriculturists have reported about 40-50% higher yieds of rice by applying :

[Uttaranchal PMT 2006]

(1) Azolla

(2) Cyanophycean members

(3) Mycorrhizae

(4) Thorn forest

Q.7 A nutrient element essential for the formation of micro-tubules of the mitotic spindle apparatus during cell division is :

[Uttaranchal PMT 2006]

(1) Phosphorus (2) Sulphur

(3) Clacium (4) Zinc

Q.8 Non-symbiotic N_2 fixer is :

[West Bengal JEE 2007]

(1) Anabaena (2) Rhizobium

(3) Azotobactor (4) Azolla

Q.9 The N_2 fixing bacterium associated with root nodules of legumes is known as :

[C.G. PMT 2004]

(1) Azotobacter (2) Nitrobacter

(3) Lactobacillus (4) Rhizobium

Q.10 The bacteria which convert nitrate in to molecular nitrogen is called :**[CGPMT 2004]**

(1) Nitrifying bacteria

(2) Methanobacteria

(3) Diazotrophic bacteria

(4) Denitrifying bacteria

Q.11 The bacterium capable of anaerobic N_2 Fixation is known as : **[C.G. PMT 2004]**

(1) Clostridium (2) Bacillus

(3) Azotobacter (4) Rhizobium

Q.12 Which element is essential for photolysis of water **[C.G. PMT 2004]**

(1) Nitrogen (2) Manganese

(3) Carbon (4) Oxygen

Q.13 Which of the following can utilize molecular nitrogen (N_2) as nutrient for growth

[C.G. PMT 2004]

(1) Rhizobium (2) Spirogyra

(3) Mucor (4) Methancoccus

Q.14 Sinks are related to : **[C.G. PMT 2005]**

(1) Transport of organic solutes

(2) Stomata

(3) Enzymes (4) phytochrome

Q.15 Supply ends in transport of solute are :

[C.G. PMT 2005]

(1) Green leaves and storage organs

(2) Root and stem

(3) Xylem and Pholem

(4) Hormones and enzymes

Q.16 Which of the following is a biofertilizer : **[C.G. PMT 2006]**

(1) Funaria (2) Fern

(3) Anabaena (4) Fungus

Q.17 Mo is related with : **[C.G. PMT 2006]**

(1) N_2 fixation

(2) Flower induction

(3) Chromosome contraction

(4) Carbon collection

Q.18 Which one of the following elements is present in chlorophylls : **[C.G. PMT 2006]**

(1) Manganese (2) Magnesium

(3) Copper (4) Iron

Q.19 Which one of the following bacteria has potential for nitrogen fixation : **[C.G. PMT 2006]**

(1) Nitrosomonas (2) Nitrobacter

(3) Nitrosococcus (4) Rhizobium

Q.20 For nitrogen fixation, pigment useful is : **[Jharkhand 2006]**

(1) Nitrogenase (2) Haemoglobin

(3) Myoglobin (4) Leghaemoglobin

Q.21 Which of the following is symbiotic bacteria : **[Jharkhand 2005]**

(1) Rhizobium (2) Azotobactor

(3) Clotrisdium (4) Streptomyces

Q.22 The metal ion involved in stomatal regulation is **[Bihar 2002]**

(1) Fe (2) Mg

(3) Zn (4) K

Q.23 Legume plants are important for crop production because they : **[UP CPMT 2002]**

(1) Help in NO_2 Fixation

(2) Do not help in NO_2 Fixation

(3) Increase soil fertility

(4) All of these

Q.24 Which of the following is a nitrogen fixing organism **[UP CPMT 2003]**

(1) Some BGA (2) Rhizobium

(3) Both (1) and (2) (4) Aspergillus

Q.25 Which of the following of bacteria is involved in two step conversion of NH_3 into nitrate : **[UP CPMT 2004]**

(1) Azotobacter and nitrosomonas

(2) Nitrosomoans and Nitrobacter

(3) Azotobacter and Achromobacter

(4) Pseudomonas and Nitrobacter

Q.26 A metal ion involved in stomatal regulation is : **[UP CPMT 2004]**

(1) Iron (2) Potassium

(3) Zinc (4) Magnesium

Q.27 The plant ash is an indication of : **[UP CPMT 2005]**

(1) Organic matter of plant

(2) Waste product

(3) Mineral salts absorbed by plants

(4) None of these

Q.28 Plant ash has maximum content of : **[UP CPMT 2006]**

(1) Mg (2) Fe

(3) K (4) B

Q.29 Which of the following is part of cytochrome: **[UP CPMT 2006]**

(1) Mg (2) Zn

(3) Fe (4) Ca

Q.30 Food in plants is translocated in the form of : **[UP CPMT 2006]**

(1) Glucose (2) Starch

(3) Sucrose (4) Fructose

Q.31 Which of the following is not related to N_2 fixation **[UP CPMT 2006]**

(1) Rhizobium (2) Anabaena

(3) Pseudomonas (4) Azotobacter

Q.32 Which of the following is not caused by deficiency of mineral : **[MP PMT 2007]**

(1) Chlorosis

(2) Etiolation

(3) Shortening of internodes

(4) Necrosis

Q.33 The mineral present in cell walls is : **[MP PMT 2007]**

(1) Na (2) Ca

(3) K (4) Mg

Q.34 What happened when we inoculated Rhizobium in wheat field : **[MP PMT 2007]**

(1) No increase in production (nitrogen content of soil remains same)

(2) A lot of increase in production (nitrogen content of soil increase)

(3) Fertility of soil decreases

(4) Fertilite of soil increases

Q.35 Nitrifying bacteria are able to : **[MP PMT 2007]**

(1) Convert atomospheric nitrogen into soluble form

(2) Convert ammonia to nitrate

(3) Ammonia to nitrogen

(4) Nitrate to nitrogen

Q.36 Magnesium is found in : **[MP PMT 2001]**

(1) Chlorophyll (2) Carotenoid

(3) Phycobilin (4) Cytochrome

Q.37 Which of the following is a trace element : **[MP PMT 2001]**

(1) S (2) Mg

(3) Cu (4) P

Q.38 Which one of the following organisms may respire in the absence of oxygen : **[MP PMT 2002]**

(1) Azotobacter (2) Clostridium

(3) Rhizobium (4) Lactobacillus

Q.39 Which of the following is not a trace element : **[MP PMT 2003]**

(1) Zn (2) Mn

(3) Mg (4) Cu

Q.40 Symbiotic microorganism is : **[MP PMT 2003]**

(1) Clostridium (2) Azotobacter

(3) Rhizobium (4) Chromatium

Q.41 Essential mineral nutrients are the element **[MP PMT 2005]**

(1) In the absence of which plants cannot complete their life cycle

(2) Which cannot be replaced by other element in its function

(3) The element which is directly associated with metabolism of the plant

(4) All of the above

Q.42 Stomatal movement is controlled by : **[MP PMT 2005]**

(1) Na (2) Mg

(3) K (4) P

Q.43 Which of the following enzyme fixes nitrogen **[MP PMT 2005]**

(1) Nitrate reductase (2) Nitrogenase

(3) PEP caboxylase (4) Rubisco

Q.44 The bacterium capable of anaerobic nitrogen-fixation is : **[MP PMT 2006]**

(1) Azatobacter (2) Rhizobium

(3) Bacillus (4) Clostridium

Q.45 In plant metabolism phosphorus play a major role to : **[MP PMT 2006]**

(1) Evolve oxygen during photosynthesis

(2) Create aerobic condition

(3) Generate metabolic energy

(4) Evolve carbon dioixde during respiration

Q.46 Photosynthetic food material is transported in the form of : **[MP PMT 2006]**

(1) Glusose (2) Sucrose

(3) Starch (4) Fructose

Q.47 Chlorosis is caued due to deiciency of **[MP PMT 2006]**

(1) Mg (2) Ca

(3) B (4) Mn

Q.48 The major portion of the **dry weight** of plants comprises of : - **[AIPMT-2003]**

(1) Nitrogen, phosphorus and potassium

(2) Calcium, magnesium and sulphur

(3) Carbon, nitrogen and hydrogen

(4) Carbon, hydrogen and oxygen

Q.49 Which one of the following mineral elements plays an important role in biological nitrogen fixation ? **[AIPMT-2003]**

(1) Copper (2) Manganese

(3) Zinc (4) Molybdenum

Q.50 Stomata of CAM plants : - **[AIPMT-2003]**

(1) Are always open

(2) Open during the day & close at night

(3) Open during the night & close during the day

(4) Never open

Q.51 Stomata of a plant open due to : -
[AIPMT-2003]

(1) Influx of potassium ions

(2) Efflux of potassium ions

(3) Influx of hydrogen ions

(4) Influx of calcium ions

Q.52 Plants deficient of element zinc, show its effect on the biosynthesis of plant growth hormone
[AIPMT-2003]

(1) Auxin (2) Cytokinin

(3) Ethylene (4) Abscisic acid

Q.53 In which one of the following is nitrogen not a constituent ? **[AIPMT-2003]**

(1) Idioblast

(2) Bacteriochlorophyll

(3) Invertase

(4) Pepsin

Q.54 Gray spots of Oat are caused by deficiency of-
[AIPMT-2003]

(1) Cu (2) Zn

(3) Mn (4) Fe

Q.55 The most abundant element present in the plants is - **[AIPMT-2004]**

(1) Iron (2) Carbon

(3) Nitrogen (4) Maganese

Q.56 The ability of the Venus Flytrap to capture insects is due to - **[AIPMT-2005]**

(1) Chemical stimulation by the prey

(2) A passive process requiring no special ability on the part of the plant

(3) Specialized "muscle-like" cells

(4) Rapid turgor pressure changes

Q.57 The deficiencies of micronutrients, not only affects growth of plants but also vital functions such as photosynthetic and mitochondrial electron flow. Among the list given below, which group of three elements shall affect most,both photosynthetic and mitrochondrial electron transport : **[AIPMT-2005]**

(1) Cu, Mn, Fe (2) Co, Ni, Mo

(3) Mn, Co, Ca (4) Ca, K, Na

Q.58 Potometer works on the principle of :
[AIPMT-2005]

(1) Amount of water absorbed equals the amount transpired

(2) Osmotic pressure

(3) Root pressure

(4) Potential difference between the tip of the tube and that of the plant

Q.59 Farmers in a particular region were concerned that pre-mature yellowing of leaves of a pulse crop might cause decrease in the yield. Which treatment could be most beneficial to obtain maximum seed yield **[AIPMT-2006]**

(1) Removal of all yellow leaves and spraying the remaining green leaves with 2,4,5-trichlorophenoxy acetic acid

(2) Application of iron and magnesium to promote synthesis of chlorophyll

(3) Frequent irrigation of the crop

(4) Treatment of the plants with cytokinins alongwith a small dose of nitrogenous fertilizer

Q.60 Sulphur is an important nutrient for optimum growth and productivity in **[AIPMT-2006]**

(1) Fibre crops (2) Oil seed crops

(3) Pulse crops (4) Cereals

Q.61 A plant requires magnesium for :
[AIPMT-2007]

(1) Cell wall development

(2) Holding cells together

(3) Protein synthesis

(4) Chlorophyll synthesis

Q.62 Which of the following is a flowering plant with nodules containing filamentous nitrogen-fixing microoganism ? **[AIPMT-2007]**

(1) Cicer arietinum

(2) Casuarina equisetifolia

(3) Crotalaria juncea (4) Cycas revoluta

Q.63 About 98 percent of the mass of every living organism is composed of just six elements including carbon, hydrogen, nitrogen oxygen and : **[AIPMT-2007]**

(1) Calcium and phosphorus

(2) Phosphorus and sulphur

(3) Sulphur and magnesium

(4) Magnesium and sodium

Q.64 Which one of the following elements is not an essential micronutrient for plant growth ? **[AIPMT-2007]**

(1) Ca (2) Mn

(3) Zn (4) Cu

Q.65 Carbohydrates are commonly found as starch in plant storage organs. Which of the following five properties of starch (a–e) make it useful as a storage material ? **[AIPMT-2008]**

(I) Easily translocated

(II) Chemically non-reactive

(III) Easily digested by animals

(IV) Osmotically inactive

(V) Synthesized during photosynthesis

The useful properties are-

(1) (I), (III) and (V) (2) (I) and (V)

(3) (II) and (III) (4) (II) and (IV)

Q.66 Nitrogen flxation is root nodules of Anlus is brought about by : - **[AIPMT-2008]**

(1) Frankia (2) Azorhizobium

(3) Bradyrhizobium (4) Clostridium

Q.67 Guard cells help in : - **[AIPMT-2009]**

(1) Fighting against infection

(2) Protection against grazing

(3) Transpiration (4) Guttation

Q.68 Manganese is required in : - **[AIPMT-2009]**

(1) Chlorophyll synthesis

(2) Nucleic acid synthesis

(3) Plant cell wall formation

(4) Photolysis of water during photosynthesis

Q.69 An element playing important role in nitrogen fixation is- **[AIPMT-2010 (Pre)]**

(1) Manganese (2) Zinc

(3) Molybdenum (4) Copper

Q.70 Which one of the following is not a micronutrient? **[AIPMT-2010 (Pre)]**

(1) Zinc (2) Boron

(3) Molybdenum (4) Magnesium

Q.71 The chief water conducting elements of xylem in gymnosperms are- **[AIPMT-2010 (Pre)]**

(1) Transfusion tissue (2) Tracheids

(3) Vessels (4) Fibres

Q.72 Which one of the following structures between two adjacent cells is an effective transport pathway? **[AIPMT-2010 (Pre)]**

(1) Endoplasmic reticulum

(2) Plasmalemma

(3) Plasmodesmata

(4) Plastoquinones

Q.73 One of the free-living, anaerobic nitrogen-fixer is- **[AIPMT-2010 (Pre)]**

(1) *Rhizobium*

(2) *Azotobacter*

(3) *Beijernickia*

(4) *Rhodospirillum*

Q.74 The common nitrogen-fixer in paddy field is- **[AIPMT-2010 (Pre)]**

(1) *Oscillatoria*

(2) *Frankia*

(3) *Rhizobium*

(4) *Azospirillum*

Q.75 Transport of food material in higher plants takes place thrugh : **[AIPMT-2010 (Mains)]**

(1) Transfusion tissue

(2) Tracheids

(3) Sieve elements

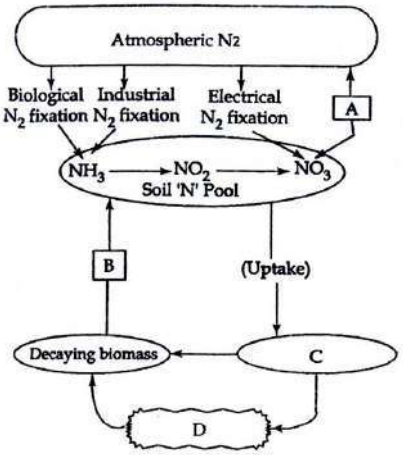
(4) Companion cells

Q.76 Given below is the diagram of a stomatal apparatus. In which of the following all the four parts labelled as A, B, C and D are correctly identified? **[AIPMT-2010 (Mains)]**

	A	B	C	D
(1)	Guard cell	Stomatal aperture	Subsidiary cell	Epidermal cell
(2)	Epidermal cell	Guard cell	Stomatal aperture	Subsidiary cell
(3)	Epidermal cell	Subsidiary cell	Stomatal aperture	Guard cell
(4)	Subsidiary cell	Epidermal cell	Guard cell	Stomatal aperture

Q.77 Study the cycle shown below and select the option which gives correct words for all the four blanks A, B, C and D.

[AIPMT-2010 (Mains)]



Option :

	A	B	C	D
(1)	Dentrification	Ammonification	Plants	Animals
(2)	Nitrification	Dentrification	Animals	plants
(3)	Dentrification	Nitrification	Plants	Animals
(4)	Nitrification	Ammonification	Animals	plants

Q.78 Leguminous plants are able to fix atmospheric nitrogen through the process of symbiotic nitrogen fixation. Which one of the following statements is not correct during this process of nitrogen fixation? **[AIPMT-2010 (Mains)]**

(1) Nodules act as sites for nitrogen fixation

(2) The enzyme nitrogenase catalyses the conversion atmospheric N_2 to NH_3

(3) Nitrogenase is insensitive to oxygen

(4) Leghaemoglobin scavenges oxygen ans is pinkish in colour.

Q.79 Which one of the following is correctly matched? **[AIPMT Pre 2012]**

(1) Apoplast - Plasmodesmata

(2) Potassium - Readily immobilisation

(3) Bakane of rice seedlings - F. Skoog

(4) Passive transport of nutrients - ATP

Q.80 Which one of the following is wrong statement ? **[AIPMT Pre 2012]**

(1) Root nodule forming nitrogen fixers live as aerobes under free-living conditions.

(2) Phosphorus is a constituent of cell membranes, certain nucleic acids and all proteins.

(3) *Nitrosomnas* and *Nitrobacter* are chemoautotrophs

(4) *Anabaena* and *Nosloc* are capable of fixing nitrogen in free-living state also.

Q.81 A nitrogen-fixing microbe associated with *Azolla* in rice fields is : **[AIPMT Pre 2012]**

(1) *Anabaena* (2) *Frankia*

(3) *Tolypothrix* (4) *Spirulina*

Q.82 Best defined function of Manganese in green plants is : **[AIPMT Pre 2012]**

(1) Calvin cycle (2) Nitrogen fixation

(3) Water absorption (4) Photolysis of water

Q.83 For its activity, carboxypeptidase requires : **[AIPMT Mains 2012]**

(1) Zinc (2) Iron

(3) Niacin (4) Copper

Q.84 For its action, nitrogenase requires : **[AIPMT Mains 2012]**

(1) High input of energy

(2) Light (3) Mn^{2+}

(4) Super oxygen radicals

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

PHOTOSYNTHESIS

HISTORY

- **Aristotle and Theophrastus (320 BC) :** (Humus theory) Believed that plants take their nourishment both inorganic and organic from the soil .
- **Van Helmont (1648)** : (Water theory) He worked on ***Salix plant*** & concluded that plants grow & gain weight by absorbing water from soil. He planted a twig of known weight in 200 lbs of soil & watered the plant by measured amount of rain water. After few years he weighted the plant & found that weight has increased to a large amount. But the weight of the soil was slightly reduced. He suggested that the increase in plant substances of the willow tree must have come from water alone.
- **John Woodward (1699) :** (Soil water theory) According to him plants grow or gain weight by soil & water both.
- **Stephen Hales (1727) :** He wrote a book **'vegetable staticks'** & said that green plants make food with the help of leaf.
- **Joseph Priestley (1772) :** He reported about purification of air as plants release oxygen. He performed the experiment using mice, mint plant & candle Firstly, he placed mice in a closed bell jar & observed that after sometime the mice dies or the burning candle extinguishes in the jar. Secondly, he placed a plant twig in a closed bell jar & observed that after sometime plant twig dies. But when he placed both plant & mice together, they survived because their is a balance between CO_2 & O_2. He called the air produced by candle as **'Phlogiston'** & said that plant convert it into **dephlogiston** or purify it.
- **J. Ingenhousz (1779) :** (Light theory). He told about the utility of light & said that plants purify air only in the presence of light.
- **Jean Senebier (1782) :** He concluded that green plants take CO_2 & release O_2 in presence of light.
- **Lavoisier (1783)** : He supported the work of J.Senebier. He identified **CO_2 as the impure air**.
- **N. Theodore de Saussure (1818) -** found the **utility of water**. Besides this he gave other facts also (i) CO_2 & not organic acid is absorbed. (ii) By CO_2 absorption, O_2 is released and (iii) found that red **wavelength** of light is the most effective in the light spectrum.
- **Pelletier and Caventou (1818) :** He discovered green colour & called it as **chlorophyll**. It can be separated by boiling in alcohol.
- **Liebig** (1840) found that (i) All organic substances get carbon from CO_2. (ii) He proposed the **law of effectiveness of minimal factor** in 1845.
- **Robert Mayer** (1845) found that green plants utilise **solar energy** to convert it into **chemical energy.**
- **Sachs** (1860) gave the concept of **Cardinal Points**.
- **Julius Von Sachs** (1862) mentioned the **first visible product** of photosynthesis to be **starch** and in photosynthesis, **chloroplast** as site of absorption of CO_2 and release of O_2.
- **G.G. Stocks** (1864) isolated chlorophyll-a and chlorophyll-b in pure form. He also indicated about the existence of Chl.-c.
- **Bossingault** (1864) found assimilatory coefficient O_2 / CO_2 as 1.
- **Engelmann** (1888) drew **action spectrum** of chlorophyll.
- **Pfeffer** (1897) found O_2 released from plants to be slightly more than CO_2.

- **F.F. Blackman** (1905) mentioned the occurrence of **light** and **dark**, two types of reactions. He expanded Liebig's **law of minimal factors** to **law of limiting factors**.
- **Willstater and Stahll** gave the detailed chemical structure and function of chlorophyll in "**Investigation on chlorophyll**".
- **Warburg** (1920) used single celled alga, **Chlorella** for photosynthesis.
- **Van Neil** (1931) studied bacterial phtosynthesis and drew many conclusions (1) They use H_2S (2) O_2 is not released in bacterial photosynthesis but S is released (3) In green plant, O_2 is liberated from H_2O.
- **Emerson & Arnold** (1932) reported **light reaction** occuring in two steps.
- **Hill** isolated **chloroplasts** from a plant ***Stellaria media*** and found liberation of O_2 in the absence of CO_2 and in the presence of a hydrogen acceptor and light. This is called **Hill's reaction**. This proved that O_2 is not liberated from CO_2.
- **Ruben, Kamen, Hassid** (1941) using radio active O^{18} proved that **source of oxygen is water**.
- **Emerson & Lewis** mentioned **red drop**.
- **Arnon et al,** In 1954 **photophosphorylation** was discovered.
- **Emerson** (1957) proposed **Emerson's enhancement effect**.
- **Calvin** (1955) found CO_2 fixation as a cyclic process. It is called by the names of **C_3 cycle**, **(Calvin cycle)**. He was awarded the Noble prize for his work in 1961.
- **Kortschak** et al (1965) found the **first product of CO_2 fixation** in tropical plants, a **4-C compound**. It is called **C_4 path**.
- **Hatch & Slack** (1967) discovered **C_4 cycle**.
- **Dowton & Treguan** established relationship between C_4 cycle and Kranz anatomy. Kranz in Kranz anatomy means a **ring**. Cells are found in **two well defined rings** in leaves with **Kranz anatomy.**
- **Huber, Michel and Dissenhofer** (1985) crystallized photosynthetic centre of **Rhodobacter bacterium** and its chemical structure. They were awarded the Nobel prize for this in 1988.

INTRODUCTION

- The most significant physio biochemical process on which the existence of life on earth is dependent is the process of **photosynthesis**
- Every living organism directly or indirectly derives its energy in form of 'food' by this process.
- "Photosynthesis is a photo-biochemical process **(anabolic & endergonic)** in which compounds (carbohydrates) are synthesised from the inorganic **raw material (H_2O & CO_2)** in presence of light and pigments. O_2 is evolved as a by product".
- **Light energy is conserved into chemical energy by photosynthesis.**

$$6CO_2 + 12H_2O \xrightarrow[\text{Light}]{\text{Pigment}} C_6H_{12}O_6 + 6O_2 \uparrow + 6H_2O$$

Oxidation/light reaction

Reduction/dark reaction

- 90% of total photosynthesis is carried out by **aquatic plants** (85% algae) & 10% by land plants.
- First true & oxygenic photosynthesis started in **cyanobacteria**. (BGA)
- In the **Cuscuta & fungi** photosynthesis is absent. **Euglena** is photosynthetic organism & link between animal & plants.
- Roots of **Tinospora & Trapa** are assimilatory or photosynthetic.

✸ **Significance of photosynthesis-**

- Photosynthesis is vital process for life on planet earth as it is the only process, that links the physical and biological world by conservation of solar energy into organic matter, which make bulk of the dry matter of any organism.
- Presence of O_2 in the atmosphere is also an outcome of photosynthesis. This oxygen is helpful to living organisms in two ways.

(1) Oxidative break down of organic food matter (respiration).

(2) Making ozone (O_3), in outer layer of atmosphere, which helps in stopping the highly destructive U.V. rays.

PHOTOSYNTHETIC REQUIREMENTS

✸ **Carbondioxide/CO_2 :**

- It comes from atmosphere (0.03%/300-350 PPM conc.)
- Gaseous exchange in plants mainly occurs through stomata. Also by general body surface and lenticels.
- It's assimilation occur into glucose during dark reaction by utilization of assimilatory power. i.e., ATP & $NADPH_2$ (Reducing Power)
- Reduction of CO_2 occurs during dark reaction by $NADPH_2$ (Reducing power)
- CO_2 acceptor in plants are and .
- Addition of CO_2 is called carboxylation. It is catalysed by enzymes **Rubisco** & **PEPcase**.
- Present level of atmospheric CO_2 is limiting factor for C_3 & CAM plants, not for C_4 plants.

✸ **Water :**

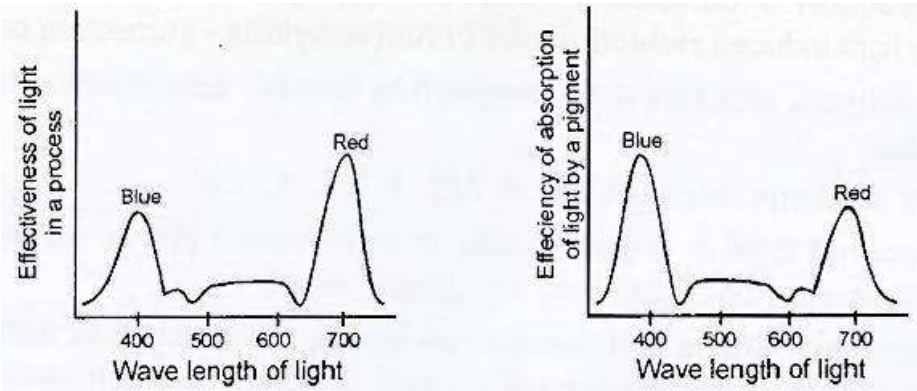
- Comes from soil.
- Absorbed by roots/root hairs and transported by water counducting tissue xylem.
- Only 1% of total water absorbed is utilized in photosynthesis.
- Oxidation of H_2O take place during ligtht reaction of photosynthesis as it provide H^+ & e^-.
- (Source of H^+ & e^-). H^+ & e^- donated by H_2O are transfered by NADP ($NADP+ H^+ + e^- \rightarrow NADPH_2$) to CO_2. So $NADPH_2$ do the reduction of CO_2 and called as **reducing power.**
- Light plays important role in oxidation of water so it is called as **photolysis of water** (R.Hill)
- O_2 released from water was first stated by C.B.Van neil and experimentally proved by Ruben, Kamen, Hassid (use of O^{18})
- Bacterial photosynthesis is non oxygenic as H_2O is not utilized as source of H^+ & e^-. First oxygenic photosynthesis by cyanobacteria as utilized H_2O as doner of H^+ & e^-.

✸ **Sunlight :**

- All kind of light wavelengths are present in sunlight **(Polychromatic & Continuous)** and available for photosynthesis but it depends on the type of pigment content of photosynthetic organism. Most of photosynthetic organism used **visible light** in their photosynthesis **(PAR-400-700nm)**.

UV	Visible	IR
Used by red algae	(400-700nm) PAR used by most of photosynthetic organisms	Used by photosynthetic bacteria

- Only 1% of total absorbed light is utilized in photosynthesis.
- Helps in oxidation of H_2O/Photolysis of water during light reaction. So directly involved in light reaction and indirectly in dark reaction.
- The only source of energy for all living organisms. It is avilable for all organisms specially chemohetrotrophs as conserved into chemical energy by photosynthesis.
- **Action spectrum -** Graph plotted between effectiveness of light in particular process against the wavelength of light. Action spectrum of photosynthesis is **Red** & **Blue.** Given by Englemann **(Experiment on Cladophora)**.
- **Absorption spectrum -** Graph plotted between the effeiciency of absorption of light during a process by pigment against the wavelength of light.
- Absorption spectrum of chlorophyll 'a' is **Blue** & **Red.**



- Rate of photosynthesis is higher in Red wavelength of light, but **highest in white light** (Full spectrum), than monochromatic light.

✸ **Chloroplast :**

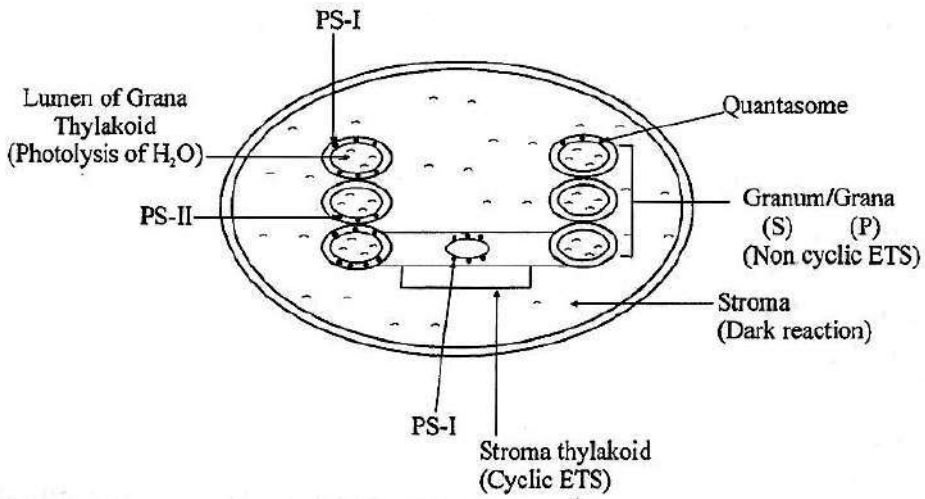


Fig.: Chloroplast

- **Chloroplast** is the main site of photosynthesis
- Inside chloroplast, **thylakoids** plays the leading role in photosynthesis
- Cyanobacteria & other photosynthetic bacteria lack chloroplast. They have pigments located on thylakoids like structure called **chlorosome**/**carboxysome**/**lamelisome**/**chromatophores** which exist freely in the cytoplasm.

✸ **Photosynthetic pigments :**

- Eukaryote & Prokaryote both possess different types of photosynthetic pigments.
- These pigments are organic substances which absorb light of specific wavelength in the visible region of spectrum.
- Being fat soluble these pigments are located in **lipid part of thylakoid**.
- Mainly there are 3 types of photosynthetic pigments-chlorophyll,carotenoid & phycobilin.

✸ **Chlorophyll -** Green colour pigments

- **Arnoff & Allen** distinguished 9 types - chlorophyll a, b, c, e, bacteriochlorophyll a, b; bacteriovirdin or chlorobium chlorophyll.
- **Biosynthesis of chlorophyll :**

(a) In plants **glycine + succinyl Co-A** start synthesis of chlorophyll. They are **first precursor** for chlorophyll synthesis.

(b) After a series of reaction a compound **Protochlorophyllide** is formed. It is pale in colour Protochlorophyllide by light induced **reduction** gives **chlorophyllide** - immediate precursor of chlorophyll.

(c) To chlorophyllide, phytol gets attached & **chlorophyll** is formed. Esterification of chlorophyllide leads to chlorophyll formation.

(d) Chlorophyll synthesis in plants require light, N, Mg, S, Fe, K, Ca.

(e) For formation of chlorophyll **light is required only in angiosperm** plants, others can form chlorophyll even in absence of light **eg :** Gymnosperm, Bryophyta, Algae.

(f) **Exception in Angiosperm - Citrus** & **Nelumbo can forms chlorophyll in dark**. If Angiosperm plant is kept in dark starting from germination it will be pale in colour & undifferentiated. Such plants are termed as **etiolated** & the process as **etiolation**.

(g) **Chlorosis -** It is due to **deficiency** of minerals or even by **viral attack**.

- **Structure :** The detailed structure was elucidated by **Willstatter & Stahll (1913, 1918)**.
- All chlorophylls are basically similar in structure, all have 2 parts - **Porphyrin head** & **phytol tail**.
- **Porphyrin head** is squarish, having 4 pyrrole rings attached with each other by methane bridges. Each ring has 4 C & 1 N.
- All 4 rings are linked to Mg in the centre

Note : Chl-C does not has phytol chain

Chlorobium chlorophyll is a derivative of bacterio chlorophyll.

Chl - a = $C_{55}H_{72}O_5N_4$ Mg

Chl - b = $C_{55}H_{70}O_6N_4Mg$

Chl - c = $C_{25}H_{32}O_5N_4Mg$

Chl - d = $C_{54}H_{70}N_4Mg$

✸ **Carotenoids :**

- Yellow, brown, red, orange colour pigments.
- Light is not required for their synthesis.
- They protect Chlorophyll from destruction due to photo-oxidation & hence called **protective pigments**.
- They acts as **accessory pigments** as they trap light energy.
- They also occur in chromoplast of flower & fruits & made them attractive for animals & thus help in pollination.
- Etiolated plants have colour of carotenoids. Deciduous or temperate forest called as **colourful forests**.
- **Carotenoids are of 2 types :**

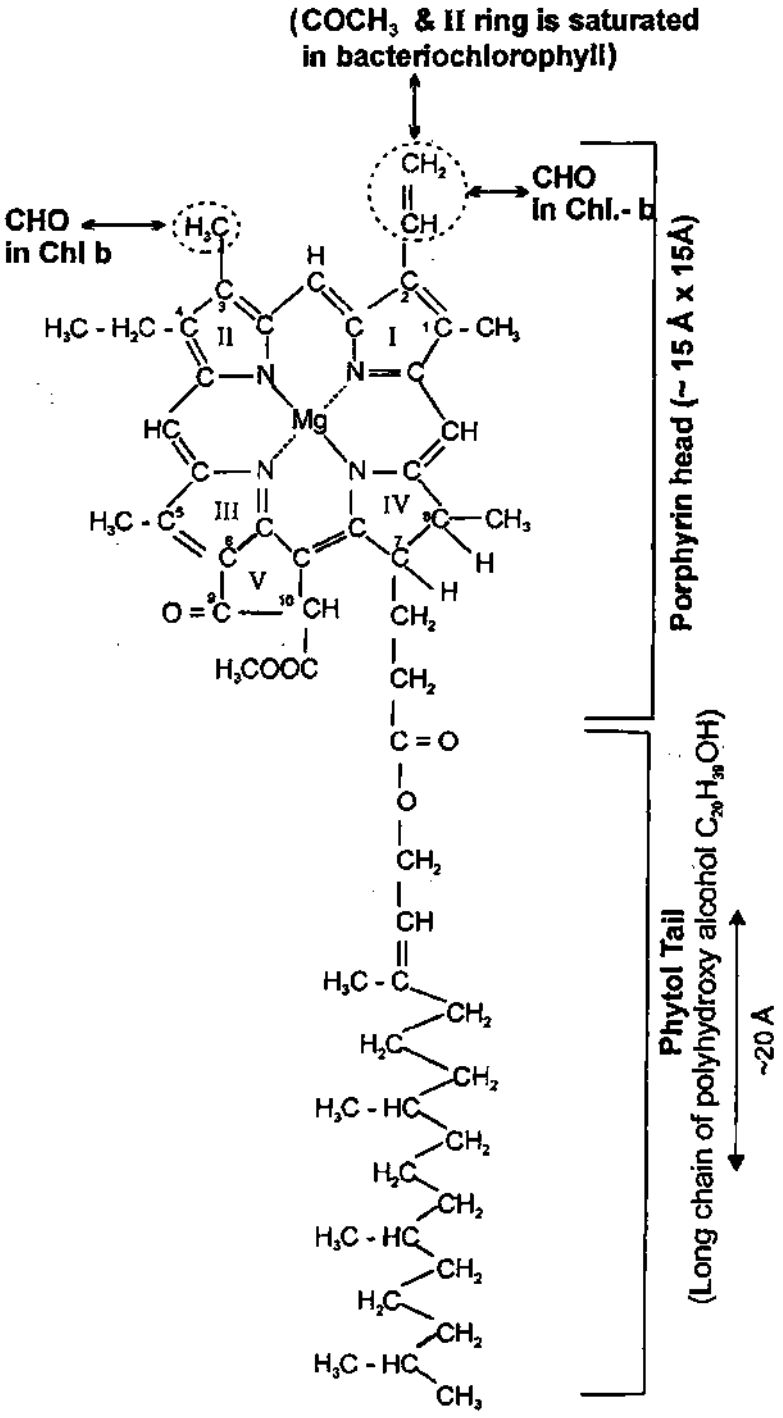
(A) ***Carotenes***

- They are hydrocarbons having formula $\mathbf{C_{40}H_{56}}$.
- Basic carotene is **lycopene** which is found in tomato, chilly, rose & purple bacteria.

- These are isomers of lycopene which are **orange yellow** in colour.
- There are **3 main isomers of carotenes** α, β, γ. **β-carotene** is the most common and generally present in **chloroplast**.
- In animals , **β-carotene** is converted into **vitamin A** and plants form **abscisic acid (ABA)**.

(B) ***Xanthophylls*** **(*Carotenols*)**

- **Yellow**, **brown** in colour
- They are **oxygen derivative of carotenes** (oxygen 1 - 8 %)
- In animals in corpus leutum **lutins** are present.
- Other eg are zeaxanthin, violaxanthin, cryptoxanthin, flavoxanthin, fucoxanthin (brown colour).



STRUCTURE OF CHLOROPHYLL–a

✵ **Phycobilins :**

- Found in red, blue green algae & cryptomonads
- They are of 3 types :

  Phycocyanin (blue), **Phycoerythrin** (red) & **Allophycocyanin** (green)
- Cryptomonads lack allophycocyanin, red & blue green algae has all the three types.
- Phycobilin are conjugated to proteins therefore called **phycobiliproteins** or biliproteins
- These pigments are closely associated with thylakoids in form of granules or microbodies, hence called as **phycobilisomes**.
- Phycobilisome of higher plants is **phytochrome** (no relation with photosynthesis). But used in stomatal movement, photomorphogenesis, photoperiodism.
- Structure : Here **4 pyrrole rings** are linked to each other in linear array.

Arrangement of photosynthetic pigments, Photosynthetic unit or pigment system or light harvesting particles :

- Photosynthetic pigments do not remain in scattered form in thylakoid instead they arrange themselves in **groups or clusters.**

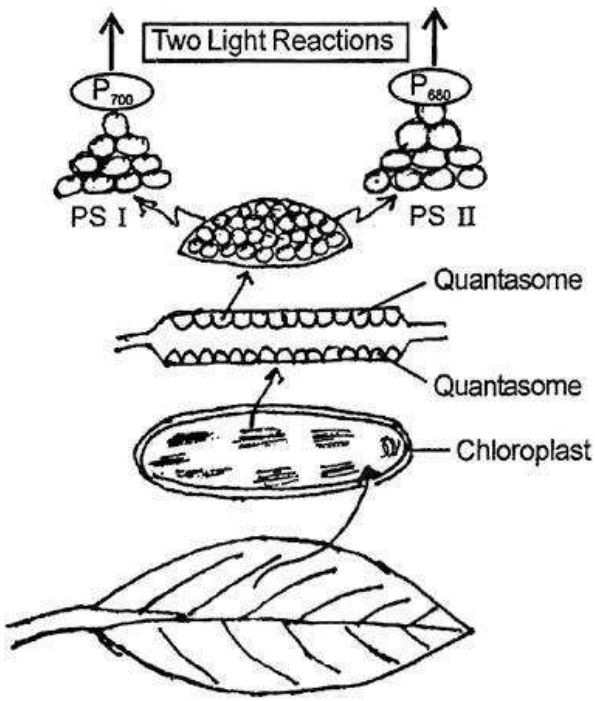


Fig : Arrangement of photosynthetic pigments

- The no. of pigment molecules required to produce a desired photochemical reaction, together constitute a **single photosynthetic unit or quantasome**.
- One unit consist of approx. **230 chlorophyll molecule** along with accessary pigments or harvesting pigments.
- In each group or unit there is a special molecule which on absorption of specific wavelength produces a desired photochemical event. This molecule is called as **"Reaction centre"** molecule.
- All the other molecules serves as secondary centres which transmits their energy to the reaction centre.These are called as **harvesting pigments** or **antenna pigments** which help in trapping energy.
- **Park & Biggins** (1964) noticed the distinct morphological structures on thylakoid membranes & named them as **quantasome**.

- Carotenoids help in **photolysis of water**. During light reaction carotenoids convert elemental oxygen to molecular oxygen. This occurs in 2 steps :

  (a) Carotenoids receive elemental oxygen (2 O) & convert it into colourless compound **epoxide**.

  (b) Epoxide with help of enzyme **deepoxidase** liberates oxygen in **molecular** form + carotenoids (colourful again)

$$2[O] + \text{Carotenoid} \longrightarrow \text{Epoxide} \quad O_2 + \text{Carotenoids}$$

TWO PIGMENT SYSTEMS / LIGHT HARVESTING COMPLEX

(Photosystem-I or PS/LHC-I & Photosystem II or PS/LHC-II)

- In green plants, PS-I contains a single molecule of reaction centre - P_{700} or Chl-a_{700} , Chl-b, 200-400, 50 carotenoids, 2 Fe containing proteins i.e. Fe-S proteins. It works on more than 680 or 700 nm of light.
- PS-II contains, a single molecule of reaction centre - P_{680} or Chl-a_{680}, lesser no. of Chl-b, i.e. 200 molecules, 50 carotenoids, quinone, Mn^{2+} , Cl^{-} & water oxidising enzyme. It works on less than 680 nm to 680 nm.
- PS-I is located on both **stroma thylakoids** and **grana thylakoids** while PS-II is located only on **grana thylakoids**.
- Light energy absorbed by pigments in the two systems is trapped by P_{700} & P_{680} forms of Chl-a which further take part in photochemical reaction.
- PS-I is involved in both **cyclic and non-cyclic photophosphorylation** while PS-II is involved in **only non-cyclic photophosphorylation**.

IMPORTANT SCIENTIFIC CONTRIBUTION

- According to **Van Niel,** oxygen comes from water in photosynthesis.

$$6CO_2 + 12H_2S \longrightarrow C_6H_{12}O_6 + 12S + 6H_2O$$

- **Ruben, Hassid** and **Kamen (1941) :-** Used $\mathbf{O^{18}}$ to show experimentally that O_2 in photosynthesis comes from water.

$$6CO_2^{16} + 12H_2O^{18} \xrightarrow[\text{Chlorophyll}]{\text{Light}} C_6H_{12}O_6^{16} + 6O_2 + 6O_2^{18}$$

- **Existence of two steps in Photosynthesis :**

- **Blackman** discovered dark reaction (By study of $\mathbf{Q_{10}}$ value or temperature coefficient). Experiment on Chlorella.

  Calvin and **Benson** gave cyclic pathway for this, thus dark reaction is called as **Calvin cycle** or **C_3-cycle.**

- Q_{10} (Temperature coefficient) for **light reaction is one,** while Q_{10} for **dark reaction is between 2-3.** (By Vont Hoff).
- Q_{10} means the doubling of rate of reaction, which involves chemicals, on 10ºC rise in temperature in it's optimum range.
- Experimental evidences for Blackman findings were given by **Wardburg (1920)**. He carried out **intermittent light experiment of Chlorella.** (by using flash light)

- The rate of photosynthesis has been found greater in **intermittent light**.(i.e., light given after intervals of dark periods) than in continuous light.
- This is due to the fact that light reactions are faster than the dark reaction.
  In continuous light product of light reactions (**ATP** and **$NADPH_2$**) are not consumed at the same rate as in subsequent dark reaction. Thus dark reaction is rate limiting step of photosynthesis.
- Photosynthesis - (i) Light reaction / Hill reaction (ii) Dark reaction / Blackman reaction
- **Hill Reaction -** Experiment on isolated chloroplast (**Stelaria** plant) study of light reaction, which is called as **Hill Reaction**.
  O_2 gas liberated from **photolysis of H_2O,** only in the presence of suitable e^- acceptor. **(DCPIP** (Dichlorophenol Indophenol-a dye), **ferricyanide, $NADP^+$— Hill reagents**)

$$\frac{1}{2}O_2 \longleftarrow \overset{\text{Light}}{\boxed{H_2O}} \swarrow\!\!\searrow \begin{matrix} 2H^+ \\ 2e^- \end{matrix} + NADP^+ \longrightarrow NADPH_2$$

- **Emerson & Arnold -** Worked on **Chlorella** and gave the concept of **two photosystem** or two pigment systems.
  When they gave monochromatic light, longer than 680 nm wavelength, then quantum yield is suddenly dropped down, this event is called as **red drop**.
- When Emerson gave light, shorter and greater than 680 nm (combined light) then photosynthetic, activity increases, this is called as **Emerson effect** or **enhancement effect**.
  (i) 680 nm↑ ⇒ PS-I (Cyclic process) **red drop appears**.
  (ii) 680 nm↓ + 680↑ nm (Mixed light) ⇒ Both cyclic and non cyclic ETS operates. **(Emerson effect)**

✵ **Quantum requirement-**

The number of light Quanta or photons required for the evolution of 1 mol. of O_2 in photosynthesis = 8

✵ **Quantum Yield-**

The number of oxygen molecule evolved by one quantum of light in photosynthesis is called as **Quantum yield.** Emerson calculated that the quantum requirement is 8. Hence the quantum yield is 1/8 = 0.125 or 12.5%.

- **Arnon's experiment (Chlorella) -**

Discovered cyclic and non-cyclic ETS or photophosphorylation (ADP + iP $\xrightarrow[\text{Chl.}]{\text{light}}$ ATP.)

MECHANISM OF PHOTOSYNTHESIS

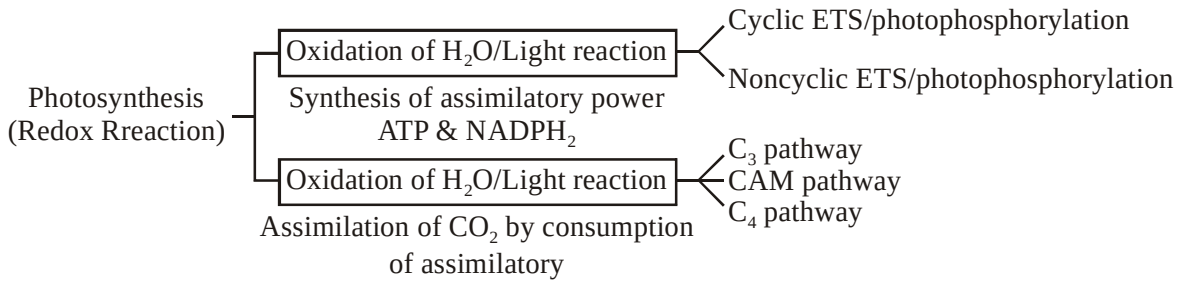
- Photosynthesis is basically an **oxidation - reduction reaction** occurring between water & CO_2.
- Removal of H^+ and e^- from water is oxidation of water & joining of H^+ and e^- with CO_2 is reduction of CO_2. **Photochemical reduction of CO_2** is called photosynthesis.
- Photosynthesis is divided in 2 main steps - **Light reaction & Dark reaction.**

$$6CO_2 + 12H_2O \longrightarrow C_6H_{12}O_6 + 6O_2 + 6H_2O$$

Oxidation/light reactoin

Reduction/dark reactoin

UNDERSTANDING PHOTOSYNTHESIS :



Light reaction / Hill reaction / Photochemical reaction / Generation of assimilatory powers ($NADPH_2$ + ATPs) / Photophase.

- During the light reaction, the primary function of the two pigment systems/photosystems is interact with each other to trap light energy and convert it into the chemical energy (ATP). These reactions are cyclic and non cyclic types.
- Antenna or accessory pigments receive radient energy and transfer it among themselves. This transfer of energy is known as **resonance transfer.** Then antenna molecules excited and transfer their energy to the chlorophyll 'a' molecules of **reaction centre**.

  It is known as **inductive resonance**. Finally chl. 'a' molcules converts the **light energy into electrical energy** by bringing about **electric charge separations**.

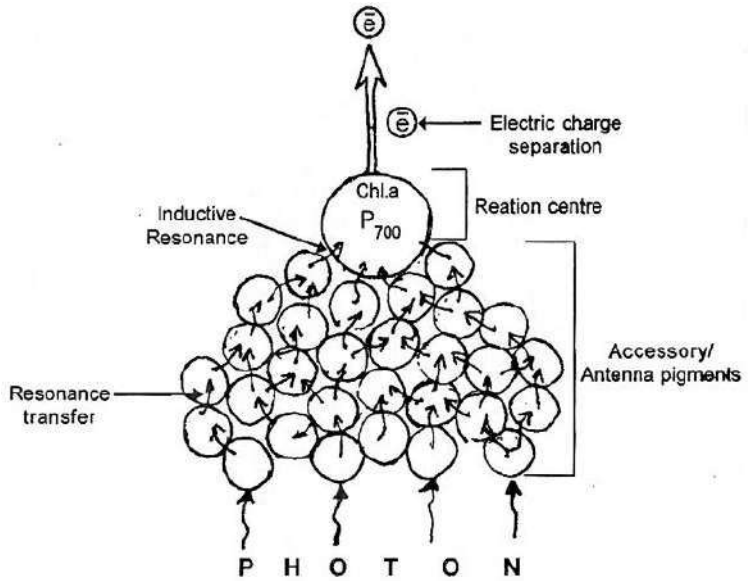


Fig : Pigment System / Light Harvesting Complex (LHC)

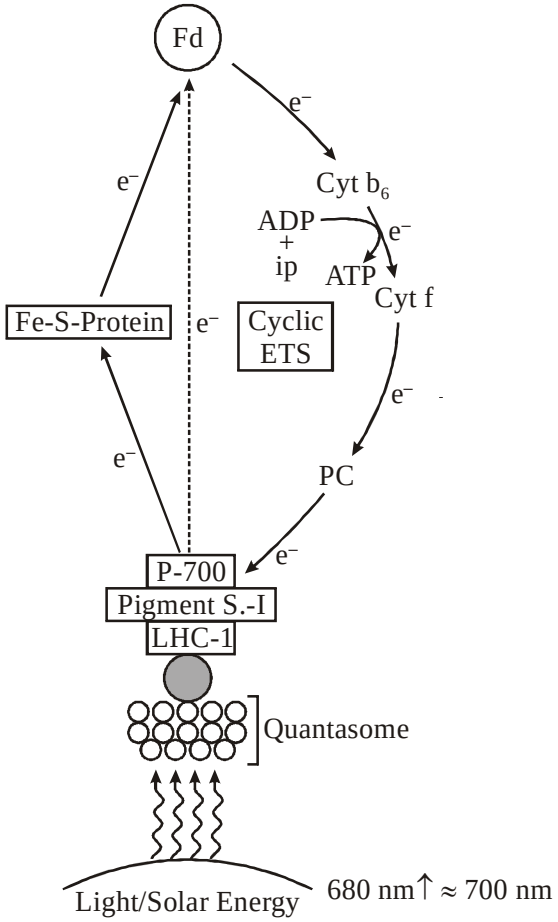
✸ Cyclic photophosphorylation/ETS :

- In this pathway only **PS-I is involved.** It occurs naturally only on stroma thylakoid but experimentally can occurs on both stroma and grana thlakoids.
- Reaction centre of PS-I activated by wavelength of light more than 680 nm or equal to 700 nm.
- In this pathway the electron released from the photosystem is received back after moving through electron carriers.
- In cyclic pathway only ATP is formed, by photophosphorylation.
- In this type of ETS first of all the reaction centre of PS-I i.e. P_{700} gets excited releasing an electron which is accepted by first electron carrier **ferrodoxin (Fd)**.

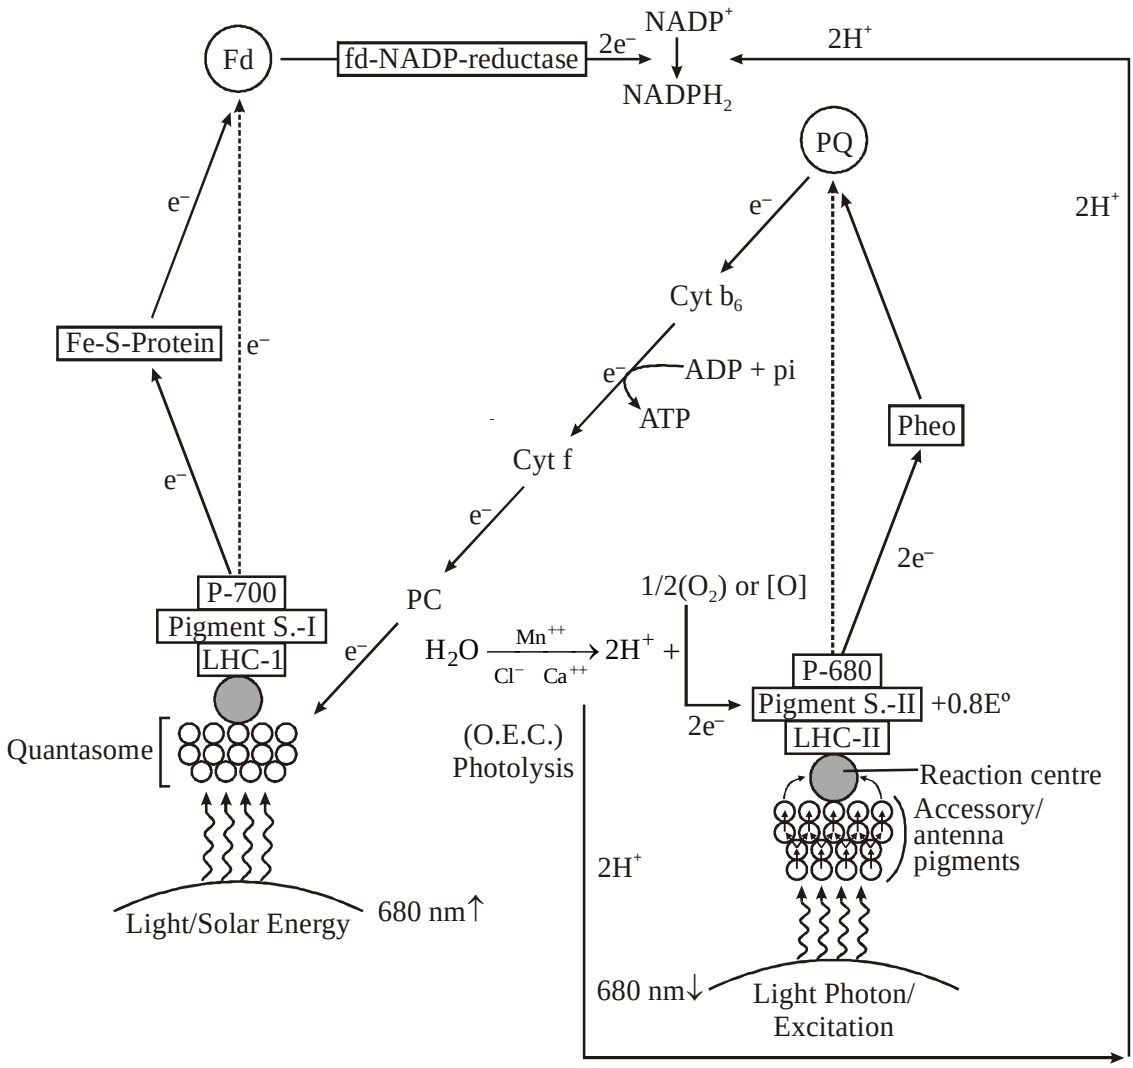
- From reduced Fd the electron is transferred to **cytochrome complex**, (Cyt-b_6 - Cyt-f) & then through **plastocyanin (PC)** is received back by oxidized P_{700} thereby causing its reduction.
- Only 2 ATP are synthesized between Fd - Cyt b_6 and Cyt b_6 - Cyt-f
- No photolysis of H_2O, O_2 evolution and $NADPH_2$ production.
- Primary e^- acceptor of PS-I is a **Fe-S -protein**.
- **Plastocyanin** is **copper** containing, blue colour carrier of cyclic ETS.



Cyclic Photophosphorylation

✸ **Non-cyclic photophosphorylation / ETS : Z-scheme (Hill & Bendall)**

- In this pathway the electron released from the photosystems is not received back after moving through electron carriers
- **PS-I & PS-II** both are involved in this pathway. It occurs only on grana thylakoids.
- In this ETS ATP, O_2 & $NADPH_2$ are formed.
- In this pathway first of all, the reaction centre of PS-II i.e. P_{680} liberates electron after absorption of quanta of light energy & becomes oxidised.
- This oxidised P_{680} chlorophyll gets reduced by receiving electron obtained from photolysis of water.
- The order of sequence of electron carriers through which electron passes is as follows.
- The high energy electron liberated from Ch-a_{680} is first of all accepted by the primary acceptor **Pheophytin (Chlorophyll without Mg)** & through it, e^- is transferred to electron transport system containing **PQ** (plastoquinone), **Cytochrome complex** (Cyto-b_6 Cyto-f) & **Plastocyanin (PC)** .
- Simultaneously, P_{700} the reaction centre of PS-I absorbs light energy (Photons) and gets **excited** thus liberates an e^-.



Non-cyclic Photophosphorelation / Z-scheme

- P_{700} which after liberating an e^- gets oxidised is reduced by an e^- transferred by **plastocyanin**.
- The e^- liberated by P_{700} is accepted by a **Fe - S - Protein** & from here e^- is transferred to Fd & then to $NADP^+$.
- $NADP^+$ is reduced to $NADPH_2$ after receiving e^- from Fd and H^+ obtained by spliting of water; in presence of an enzyme **ferredoxin – NADP reductase**.

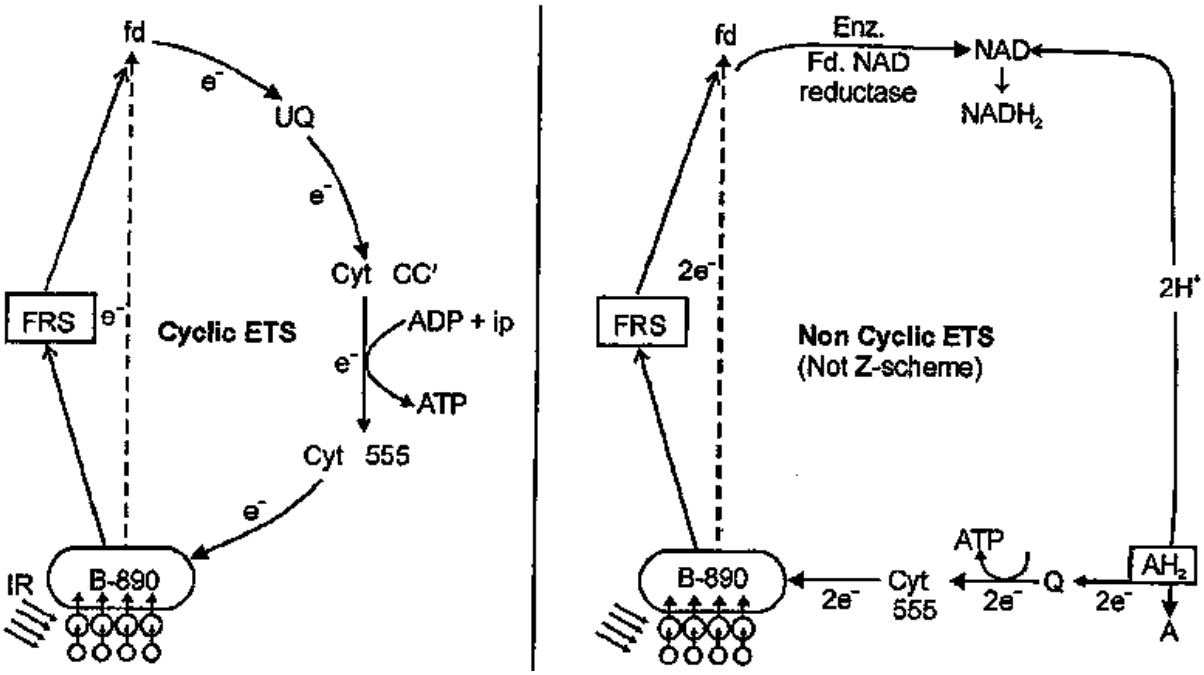
$$Fd_{(red)} + NADP^+ + H^+ \rightarrow NADPH_2 + Fd_{(Oxi)}$$

- 1 ATP is formed in between Cyt-b_6 and Cyt-f.
- In this pathway first e^- donor is water.
- During non cyclic ETS 1 ATP, 1 $NADPH_2$ is formed inolving photolysis of one H_2O molecule with release of O_2 or [O].
- 4 quanta of light are utilized in ejection of $2e^-$ at two times (PS-I and PS-II) during non cyclic ETS, Photolyse one H_2O molecule and release O_2 or [O]. So 8 quanta utilized in evolution of 1 molecule of O_2.

BACTERIAL PHOTOSYNTHESIS / LIGHT REACTION

- Certain bacteria are capable for photosynthesis Eg.: **Chlorobium** (Green Sulphur), **Chromatium** (Purpule Sulphur), **Rhodospirillium, Rhodopseudomonas** (Purple non sulphur).
- Cyclic photophosphorylation is an important method in bacterial photosynthesis.
- Absorption of **Infrared** spectrum takes place during bacterial photosynthesis thus **no red drop**.

- Bacteria has only one pigment system, PS-I (PS-II is absent).
- Pigment system of bacteria denoted by PS-I - **B-890**
- Evolution of **O_2 is not related to** bacterial photosynthesis, because water is not H^+ & e^- donor (H_2S)
- Only one ATP is produced in each turn of cyclic photophosphorylation, in bacteria.
- Bacterial light reaction occurs at chromatophores/carboxysome/lamillisome while dark reaction occurs at cytoplasm.
- Synthesis of ATP and $NADPH_2$ (Reducing Power) Occurs at cytoplasm.
- **Olson** 1970 gave a non cyclic scheme in bacterial photosynthesis.
- $6CO_2 + 12H_2S \xrightarrow[\text{Pigment in chromotophores}]{\text{IR light}} C_6H_{12}O_6 + 6H_2O + 12S.$



DARK REACTION / BLACKMAN'S REACTION / BIOSYNTHESIS PHASE

- It occurs in **'Stroma'** part of chloroplast. This reaction is **not directly controlled by light**
- This reaction is sensitive towards **temperature** & regulated by **enzymes**.
- This reaction is also called as **biosynthetic phase** or **CO_2 fixation phase** as the ATP & $NADPH_2$ formed in the light reaction are utilized for the formation of carbohydrates.
- Dark reaction in photosynthetic plants shows diversity as C_3 path, C_4 path and CAM path. This diversity is based on four important components of dark reaction.

	CO_2 acceptor	Carboxylase enzyme	1st carboxylation reaction product	Assimilatory power utilized in 1 Glucose mol. synthesis
C_3 Plants	RUBP (5C)	Rubisco	PGA(3C)	18 ATP & 12 $NADPH_2$
C_4 Plants	PEP (3C) (Primary acceptor) & RUBP (5C)	PEP case (work during day time) & Rubisco	OAA (4C)	30 ATP & 12 $NADPH_2$
CAM Plants	PEP (3C) (Primary acceptor) & RUBP (5C)	PEP case (work during night time) & Rubisco	OAA (4C)	30 ATP & 12 $NADPH_2$

- The final CO_2 assimilation into glucose in all photosynthetic plants take place by C_3 cycle, as it is the ultimate pathway of glucose synthesis operated in C_3, C_4 and CAM Plants.
- In Dark reaction, the assimilation and reduction of CO_2 takes place in the following steps :-

"C_3 cycle or Calvin Benson cycle or Photosynthetic Carbon Reduction cycle (PCR) or Reductive Pentose Phosphate Pathway (RPPP) or pentose phosphate reduction (PPR) cycle."

- The sequence & reactions of this cycle was given by **Calvin & Benson** (1948). In 1961 **Calvin got Nobel prize** for his work. They used green algae ***Chlorella*** and ***Scenedesmus*** for their experiments.
- They used radioactive $^{14}CO_2$ to find the sequence & intermediates of the reaction
- The plants in which this cycle is found are called **C_3 plants**.
- This cycle is completed in 3 phases–

(A) Carboxylation phase :

- The absorption or fixation of CO_2 takes place in this phase
- CO_2 is fixed by the primary acceptor **"Ribulose 1,5-di phosphate or RUBP"** which is a 5 carbon (5C) sugar.
- For the formation of 1 molecule of hexose sugar 6 mol. CO_2 combines with 6 RUBP to form 6C unstable compound which further break down to form 12 mol. 3C compound **phosphoglyceric acid** (PGA). This reaction is catalyzed by enzyme **RUBP carboxylase** or **RUBISCO** or **carboxydismutase**.
- RUBISCO is the **most abundant protein** found on earth. It is 16% of the protein present in chloroplast.

$$6CO_2 + 6RUBP \rightarrow 12\ PGA\ (3C)$$

(B) Glycolytic reversal :

- PGA formed is reduced to **phosphoglyceraldehyde** (PGAL)
- This phase is **reversal of glycolysis**.
- PGAL formation occurs in 2 steps firstly, PGA is phosphorylated by ATP to form 1,3-diphosphoglyceric acid in presence of kinase. Secondly, 1, 3- di PGA is reduced to phosphoglyceraldehyde (PGAL) with the help of $NADPH_2$. Now PGAL is converted to **Dihydroxy acetone phosphate** (DHAP) in presence of enzyme **triose phosphate isomerase**.
- Now DHAP & PGAL condenses to form fructose 1,6-diphosphate (F-1,6-dip) by **aldolase**, from this 1-phosphate is removed to form fructose-6-phosphate (F-6-P) by **Phosphatase**.
- F-6-P is the intermediate compound to form glucose, starch, sucrose.

$$\text{F-6-P} \xrightarrow{\text{Mutase}} \text{F-1-P} \xrightarrow{\text{isomerase}} \text{Glucose-1-P} \xrightarrow[\text{iP}]{} \text{Glucose}$$

$$\text{F-6-P} + \text{G-1-P} \longrightarrow \text{Sucrose}$$

(C) Regeneration of RUDP or RUBP :

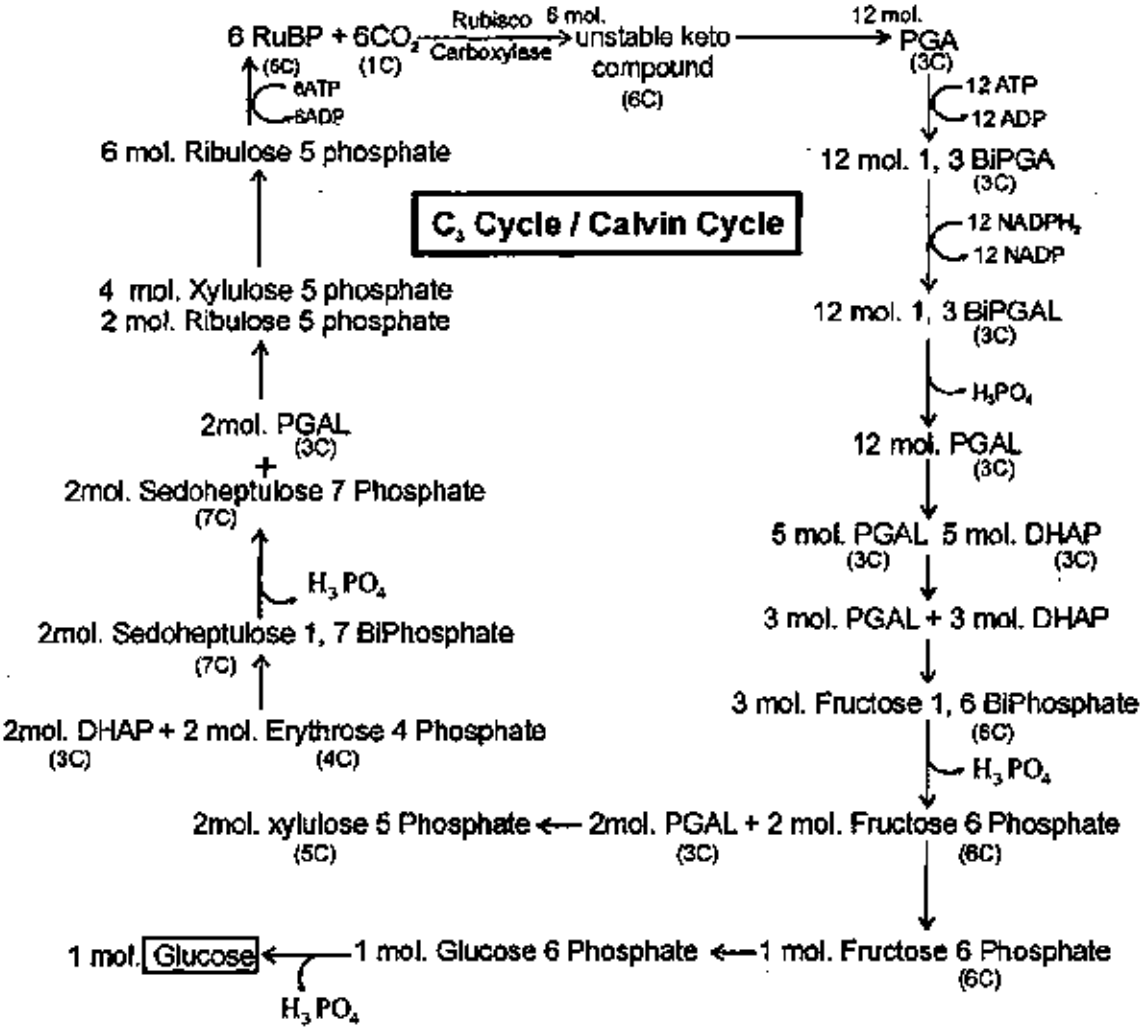
It occurs in the following sequence :

- $2\ \text{Fructose-6-P} + 2\text{PGAL} \xrightarrow{\text{Transketolase}} 2\ \text{Erythrose-4-P} + 2\ \text{Xylulose-5-P}$
- $2\ \text{Erythrose-4-P} + \text{DHAP} \xrightarrow{\text{Aldolase}} 2\ \text{Sedoheptulose-1,7-di-P} \xrightarrow[-2\text{P}]{\text{Phosphate}} 2\ \text{Sedoheptulose-7-P}$
- $2\text{Sedoheptulose-7-P} + 2\text{PGAL} \xrightarrow{\text{Transketolase}} 2\text{Ribose-5-P} + 2\ \text{Xylulose-5-P}$
- $2\ \text{Ribose-5-P} \xrightarrow{\text{isomerase}} 2\ \text{Ribulose-5-P}$
- $4\ \text{Xylulose-5-P} \xrightarrow{\text{epimerase}} 4\ \text{Ribulose-5-P} \xrightarrow[6\text{ATP}]{} 6\text{RuBP}$ (6ADP)

✸ **Net Dark reaction :**

$$6CO_2 + 18ATP + 12\ NADPH_2 \longrightarrow C_6H_{12}O_6 + 6H_2O + 18ADP + 12NADP^+$$

- Examples of C_3 plants– Pumpkin, Sunflower, Mango & mostly dicot plants, also in monocots.
- At **high O_2 concentration** RUBISCO function as **oxygenase enzyme** rather than carboxylase enzyme.



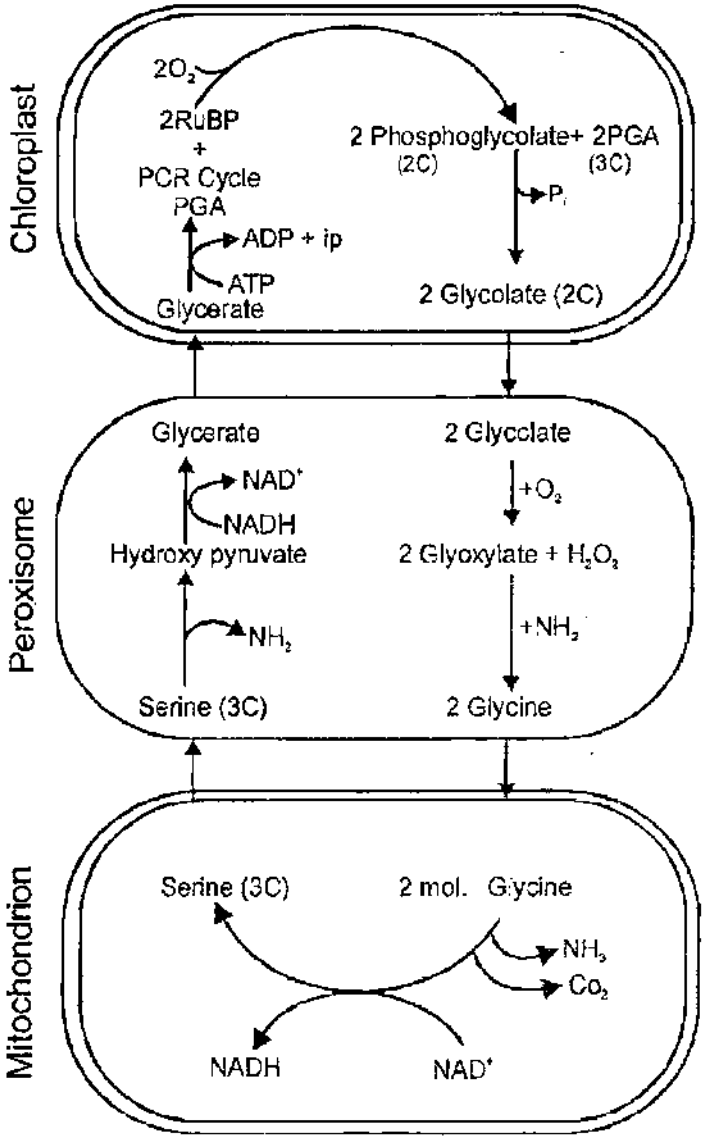
Photosynthetic carbon oxidation cycle / C_2 Cycle / Photorespiration / Glycolate - Metabolism

- Term was given by **'Krotkov'.**
- First of all **Krotkov** et. al indicated that more CO_2 evolves during day time in C_3 plants.
- **Decker** & **Tio** discovered photorespiration and clarified that **C_2-Cycle** or **glycolate pathway** operates during day time in C_3-plants & **Rubisco acts as oxygenase** at **higher concentration of O_2** and **low CO_2 concentration in the** C_3-green cells.
- The light dependent uptake of O_2 & release of CO_2 in C_3 photosynthetic cell is called **photo-respiration.**
- Photorespiration is not linked with ATP generation (in place ATP are consumed) as ordinary **dark respiration.** It is harmful or wasteful process linked with C_3 cycle.
- It occurs in **chloroplast, peroxisome** & **mitochondria (three cell organelle reaction).**

$$\underset{(5C)}{6RuBP} + \underset{(1C)}{6CO_2} \xrightarrow{\text{Rubisco}} \underset{(3C)}{12\ PGA} \longrightarrow \begin{cases} \text{Glucose} \\ 6RuBP \end{cases}$$

$$\underset{(5C)}{8RuBP} + 8O_2 \xrightarrow[\text{Low } CO_2\text{. High } O_2 \text{ con. High temp.}]{\text{RuBP – Oxygenase}} \underset{(3C)}{12\ PGA} \longrightarrow \underset{(2C)}{\begin{cases} \text{Glucose} \\ 6RuBP \end{cases}}$$

- During photorespiration, 75 percent of the carbon lost by the oxygenation RUBP is recovered. Because two molecules of glycine (2C + 2C = 4C) form one molecule of serin (3C). During this one carbon releases in form of CO_2 in mitochondria thus 25 percent carbon is lost.
- The **actual loss of carbon in form of CO_2** is **10%.**
- This serine molecule changes into PGA via different reactions of C_2 cycle.



Photorespiration / Photosynthetic carbon oxidation cycle.

- H_2O_2 (Peroxisome) and NH_3 (Mitochondria) produced in photorespiration.
- Glycine (Peroxisome) and serine (Mitochondria) are also formed in photorespiration.
- Scientists are trying to change C_3 species into C_4 species.
- It is assumed that in C_3 plants, if photorespiration does not occur, then increases O_2 conc. which oxidise (Photooxidation or Solarization) the different protoplasmic parts of photosynthetic cell at high light intensity.

C_4 CYCLE OR HATCH - SLACK CYCLE

- **Kortschak & Hartt** (1965) using radioactive $^{14}CO_2$ identified that in sugarcane the first stable product was not 3-C compound but was 4-C compound i.e. **oxaloacetic acid** (OAA).
- In 1967 **Hatch & Slack** (Australia) discovered the sequence of CO_2 fixation and reduction in C_4 plants.

- This cycle is found in many tropical & subtropical monocots eg : Maize, Sorghum etc.
- In dicots also many such plants are known eg : Amaranthus, Chenopodium, Atriplex, Euphorbia etc. In some families of dicots Compositae, Portulacaceae, Nyctaginaceae.
- There are 13 families (of these, Graminae, Cyperaceae are releated to monocots) which have C_4 plants. 11 genera are such that they have C_3 as well C_4 both types of species eg : *Atriplex patula* (C_3). *Atriplex rosea* (C_4).
- In C_4 plants photorespiration does not takes place.
- C_4 plants are generally **xerophytes**. C_4 plants leaves are anatomically different from C_3 plants.
- In the leaves of C_4 plants vascular bundles are surrounded by bundle sheath of larger parenchymatous or chlorenchymatous cells, which are further surrounded by mesophyll cells.
- The chloroplast in cells of bundle sheath are larger more in number & lack grana. Thylakoids are found scattered in these chloroplasts.
- Bundle sheath cells are **thick walled**, **multilayered** and **without intercellular spaces**.
- The chloroplast in mesophyll cells are smaller less in number & contain grana.
- The cells of mesophyll and bundle sheath are connected through **plasmodesmata**.

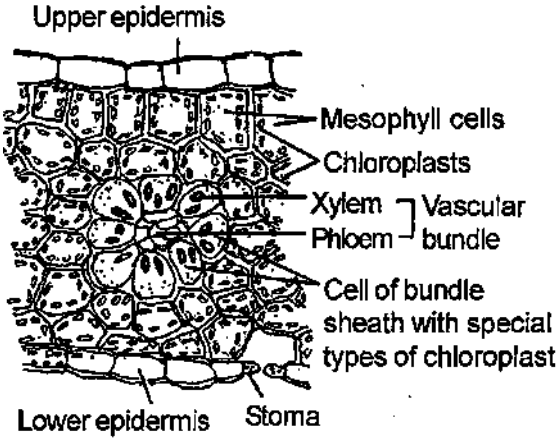


Fig : Krantz Anatomy

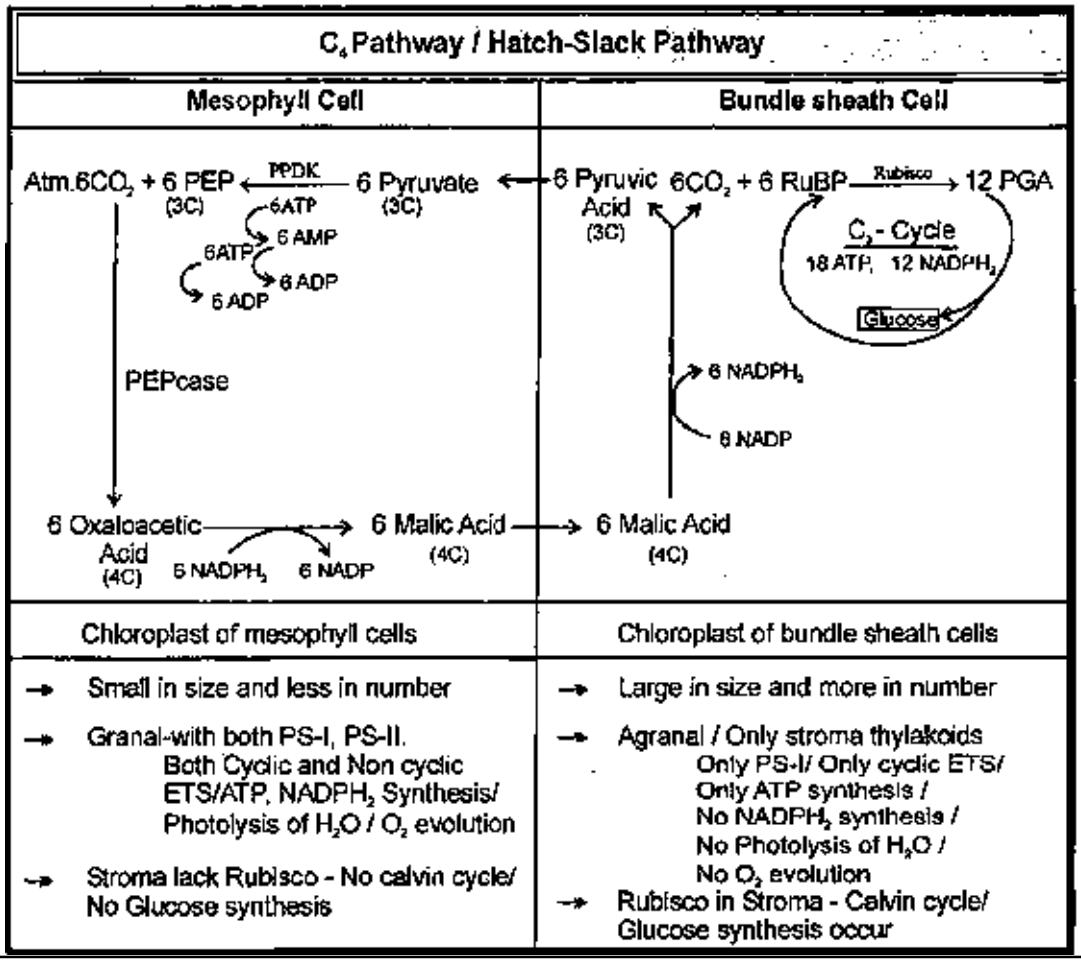
- The anatomy of leaf of C_4 plants is also called as **'kranz anatomy'** as the cells of bundle sheath are present in concentric layers around the vascular bundles which look like a **crown**, **ring** or **halo**.



✸ **Diversity in C_4 plants :**

Chollet and Ogren (1975) - Recognised three categories of C_4 plants.

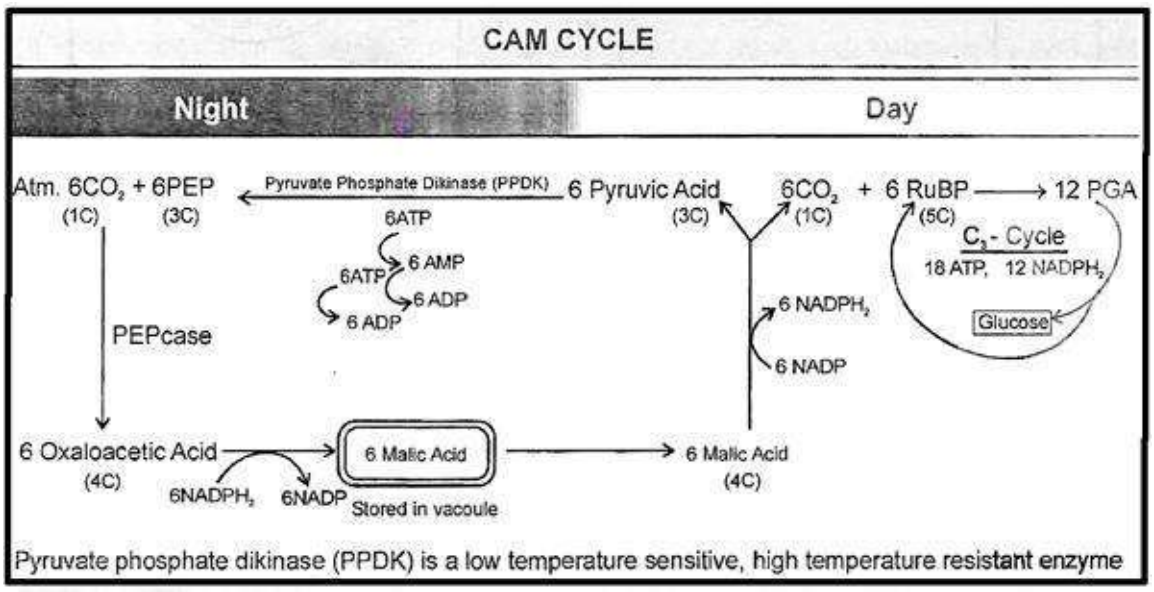
- **Maize and Sugarcane type :** In this category malate transported to bundle sheath cells and its decarboxylation given CO_2 for C_3 cycle.
- **Panicum and Chloris type :** In this category malate transported into bundle sheath cells, but this changes into **oxaloacetate,** which gives CO_2 for C_3 cycle.
- **Atriplex type :** In this category the **aspartate transported** into bundle sheath cells. where it changes into **malate**, which provides CO_2 for C_3 cycle.

✸ **Speacial features of C_4 plants / Significance of C_4 pathway :**

- To escape the conditions of water scarcity C_4 plants perform C_3 cycle in bundle sheath cells just beneath xylem which provides water for C_3 cycle.
- PEP carboxylase enzyme is abundantly present in C_4 plants. This enzyme is capable of using internal CO_2 i.e. CO_2 evolved in respiration. Thus C_4 plants has two sources of CO_2 one is from atmosphere & other from respiration.
- C_4 plants are **most efficient or most productive** plant at present CO_2 concentration.
- Present level of atmospheric **CO_2 is generally not limiting factor** for C_4 plants.
- C_4 plants posses **low CO_2 compensation points**. (8-10 ppm)
- C_4 plant would **not show CO_2 fertilization effect**, if CO_2 concentration is increases. Because high avilability of CO_2 by PEPcase and it's effective transfer in bundle sheath cells and no photorespiration due to Kranz anatomy..

Crassulacean Acid Metabolism (CAM) :

- This biochemical process is found in **succulent xerophytes**.



- **Oleary** and **Rouhani** discovered CAM-process in ***Sedum tefilium*** **leaf** members of **Crassulaceae** family. Succulent xerophytic plants. e.g., - **Kalanchoe, Bryophyllum, Sedum, Kleinia, Opuntia, Agave, Aloe, Euphorbia species, Pineapple, Welwistchia** (Gymnosperm) etc. Some members of cataceae, orchidacae, vitaceae.
- Primary acceptor of CO_2 is **PEP** (Phosphoenol pyruvate) and oxaloacetic acid is the first product of carboxylation reaction.

- In CAM plants stomata are of **scotoactive type,** so initial CO_2 fixation is found in night but light reactions operates at day time. Final CO_2 fixation (C_3 cycle) occurs in day time. PEPcase induces carboxylation reaction in night.
- **PEP carboxylase & Rubisco** present in mesophyll cells. **(No Kranz-anatomy)**
- In CAM plants 30 ATP and 12 $NADPH_2$ are required as assimilatory power for 1 glucose synthesis.
- CAM plants exhibits ecophysiological adaptation with **xeric habitat**.
- During whole night these plants absorb CO_2 from air & convert it in malic acid& store it in cell sap.
- During day time malic acid by process of **oxidative decarboxylation** liberate CO_2 and this CO_2 is converted to carbohydrates by C_3 cycle.
- C_4 & C_3 cycle occurs at different time.
- **Kranz anatomy** is **absent in CAM plants**.
- High O_2 concentration can **inhibits photosynthesis**
- Photorespiration is less.
- Transpiration is very less.
- Even at high temperature CO_2 is fixed.
- **First compound formed** is **OAA**. **Stable product** is **malic acid.**
- Leaves of CAM plants have thick cuticle.

FACTORS AFFECTING PHOTOSYNTHESIS

✸ **Concept of Cardinal Points :**

- **Sachs** in 1860 proposed the concept of **"Cardinal points"** for any factor affecting the physiological reaction.
- There are 3 main values or cardinal points for any factor -**Minimum** - below it no physiological reaction occurs, **Optimum** - at this point the reaction occurs at the maximum rate, **Maximum** - beyond this point the activity stops.

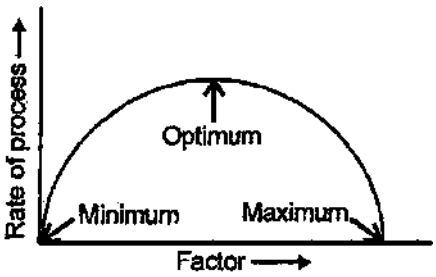


Fig : Three Cardinal points

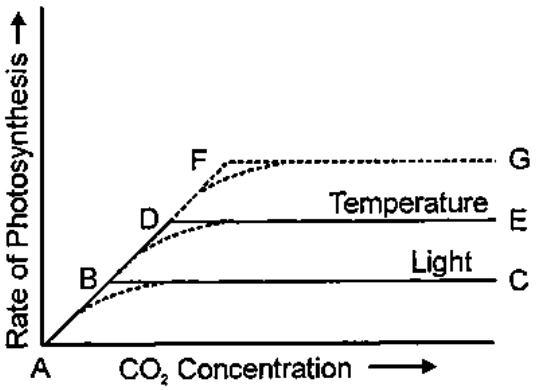
✸ **Law of minimum : By J. Liebig**

- Given by Liebig "When a vital process is affected by several environmental factors, the rate of process will increase on increase in value of factor present in minimum amount.

✸ **Blackman's law of limiting factor :**

- When a physiological reaction is at it's maximum rate and being affected by a numbers of factors, then the rate is dependent on that factor which is minimum in amount, this factor is called as **limiting factor**.
- By increasing the value of limiting factor, rate of the reaction directly increases.
- Blackmann's law is a modified **Liebig's law of minimum**.
- Concentration of **CO_2 is always a limiting factor** (it is 300 ppm or 0.03%).



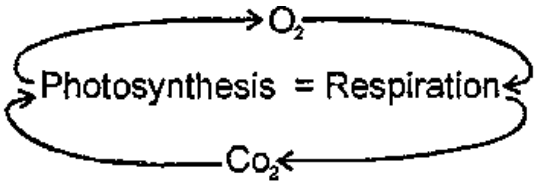
- During cloudy days light becomes limiting factor.
- For aquatic plants CO_2 is not a limiting factor, they use dissolved CO_2 in water. Bicarbonates in water is the main source of CO_2 for them.

1. EXTERNAL FACTORS :

(A) Light : Light affects photosynthesis in three ways -

(a) Compensation Point :

- The point at which rate of photosynthesis is equals to rate of respiration.
- Any environmental factor which can start or stop the photosynthesis can be responsible for compensation point.
- It attain at minimum and maximum value of factor.



- No gaseous exchange at compensation point.
- Net primary productivity (NPP) become zero.
- Growth stopped.
- Three type of compensation point-

– **Light Compensation Point :** High for heliophytes low for sciophytes.

Sciophytes posses large surface area of leaves and large number of phtosynthetic units or quantasomes per unit area of leaves ***vice versa*** in heliophytes.

– **Temperature Compensation Point :** High for C_4 and CAM Plant : 12 - 15ºC or 55ºC and Low for C_3 plants : 2 - 3ºC or 48ºC

C_4 and CAM plants are xerophytes and adapted to hot and dry climate while C_3 plants are adapted to cold climate.

– **CO_2 Compensation Point :** Not naturally attained. High for C_3 plants (40-60 PPM) while low for C_4 plants. (0 - 10 PPM)

(b) Light intensity :

- Photosynthesis increases upto a limit by increasing light intensity, then becomes constant, beyond that it decreases. Decreasing light intensity decreases photosynthesis.
- At certain intensity, air exchange from the photosynthetic zone of the plant stops. This intensity is called **light compensation point**. In evening and morning this point is reached.
- The compensation point in sciophytes or Heliophobus is established at 10-100 ft candle but in heliophytes or Heliophilous, it is 100-200 ft. candle.
- Solarisation effect is due to **photo-inhibition** or **photo-oxidation**. Due to light effect, transpiration increases and the cells of leaves becomes less hydrated, so stomata closes. Inhibition of photosynthesis in this way is called **photo-inhibition**. Decrease in photosynthesis due to destruction of chlorophyll by oxidation in strong light in the presence of O_2 is called **photo-oxidation**.

(c) Light quality :

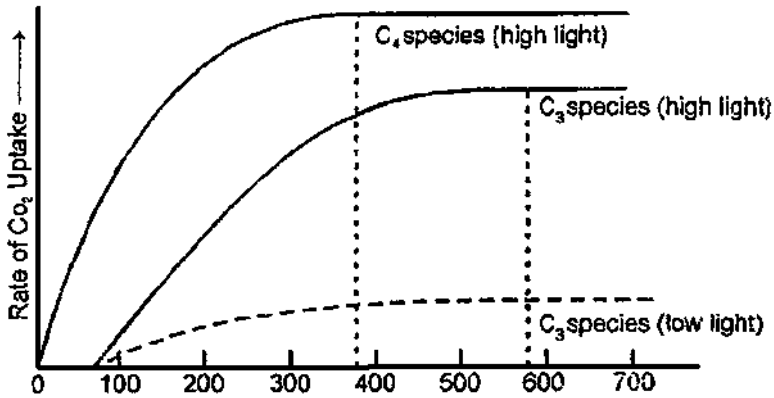
- Most plants photosynthesize in visible light ; Generally **maximum photosynthesis** occurs in **red** and **minimum** in **green light**.

(B) Temperature :

- Generally photosynthesis does not occur at 0ºC due to inactivation of enzymes. It is maximum at 25-30ºC (In C4 plants at 35-40ºC). At 50-55ºC, generally **photosynthesis stops** because of **denaturation of enzymes.**
- Upto optimum point, $\mathbf{Q_{-10}}$ **value is 2 or 3.**
- In most plants, photosynthesis has been found to start between 0ºC to 5ºC. But in lichens, it has been found to occur at -20ºC and in some conifers even at -35ºC.
- Certain succulents can photosynthesize at 55º and a few algae even at 75ºC.
- C_3 plants exhibit photosynthetic capacity at low temperature while C_4 plants do so at higher temperature.

(C) Carbon dioxide :

- Generally in the environment, 0.03% CO_2 is found.
- On lowering of CO_2 concentration, at one point $\mathbf{CO_2}$ **compensation point** is established. The CO_2 concentration at which rate of CO_2 fixation and CO_2 liberation is same is called CO_2 compensation point.
- In C_3 plants CO_2 compensation point is higher (50-100 ppm) than C_4 plants(0-10 ppm) as they do not have photorespiration.
- Higher concentration of CO_2 has **toxic effect on plants** and photosynthesis is lowered.



(D) Oxygen :

- In C_3 plants, increasing the O_2 lowers the photosynthesis. This effect is called **Warburg's effect**. Which is due to photorespiration.
- With increase in O_2, photo-respiration increases and Photo-oxidation may occur.
- The **inhibitory effect** of O_2 is **lacking in C_4 plants**.(Photorespiration)

(E) Water :

- As medium for enzyme activity during dark reaction.
- As reactent during light reaction.

(F) Minerals :

- **Mg** is the mineral which is **structural component** of **chlorophyll.**
- Fe, N, S, K are essential for synthesis of chlorophyll.
- **Mn** is essential for **photolysis of water**.
- P is required for the formation of ATP.

(G) Pollutants :

- Smoke and dust particles reduce the intensity of light. Ozone, Nitrogen oxides, Hydrogen fluorides affect cell organelles and enzymes and thus reduce photosynthesis.

(H) Inhibitors :

- **DCMU** (**Diuron/**Dichlorophenyl Dimethyl Urea), **CMU** (Monuron), **PAN, Atrazine, Simazine, Bromocil, Isosil -** Inhibit the photosynthesis by blocking PS-II. They stop e^- flow between P-680 & PQ.
- In cyclic ETS diquat, paraquat (Viologen dyes) inhibit e^- flow between P-680 & PQ.
- In these chemicals are used as herbicides, which mostly block ETS.

2. INTERNAL FACTORS :

(A) Chlorophyll :

- Chlorophyll is essential for absorption of light. Part of leaf without chlorophyll (in variegated leaves) does not have starch.
- **Willstater** and **Stahll** described the relationship between chlorophyll and assimilation number according to **photosynthetic number** or **assimilatory number**. The amount of CO_2 absorbed in grams by 1 gm chlorophyll in 1 hr is called **photosynthetic number**. They found this number varied in different species.
- Generally, **chlorophyll is not the limiting factor. Carotenoids prevent photo-oxidation**.

(B) Age :

- Rate of photosynthesis increase from young leaves to maturity. After that it lowers down.

(C) Anatomy of leaf :

- Diffusion of CO_2 availability and distribution of light to leaf, transport of photosynthetic products etc. are affected by anatomy of leaf. Thus, photosynthesis is also affected.

(D) Hydration of protoplasm :

- Photosynthesis is lowered when hydration of protoplasm becomes less.

(E) Accumulation of photosynthetic end products :

- Accumulation of photosynthetic products in green cells lowers photosynthesis.

HETEROTROPHIC PLANTS NUTRITION

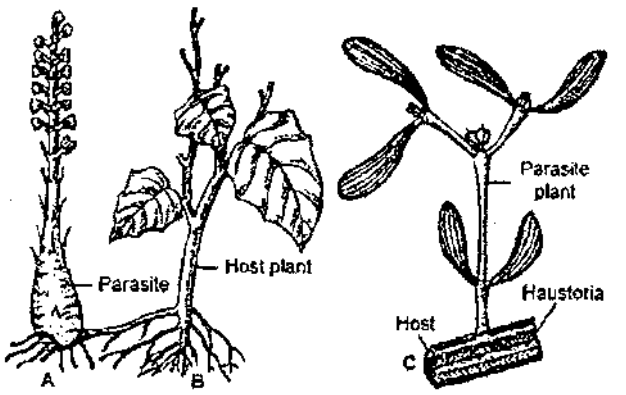
1. HETEROTROPHS - Heterotrophic plants are of following types -

(A) Parasites :

- **Total stem parasites :** ***Cascuta*** or dodar (totally depend)
- **Partial stem parasites :** ***Loranthus***, ***Viscum*** (depend on host for H_2O & minerals)
- **Total root parasites :** Members of Rafflesiaceae, Balanophoraceae and Orobancheae (totally depend on host).
- **Partial root parasites :** ***Santalum album*** **&** ***Striga*****.**

(B) Insectivorous plants :

These are green plants but of insectivorous habits which develop, due to deficiency of nitrogen, because they grow on N_2-deficient place (Swampy places).

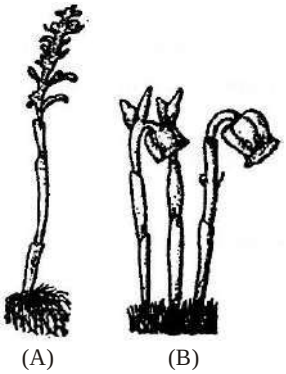


Parasitic plants-*Orobanche*
(A) A flowering plant growing on the root of *bringal*
(B) *Viscum*-Plant attached to the host stem
(C) Part of host stem is cut open to show the haustorium

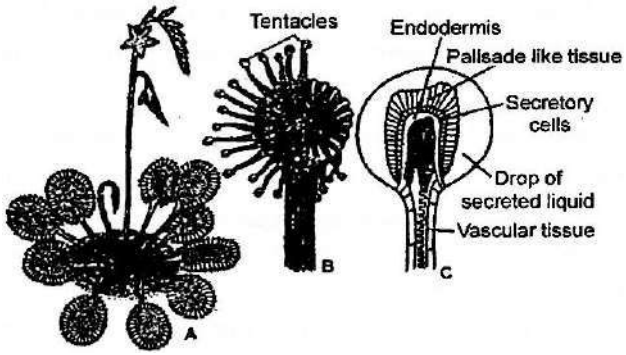
- ***Nepenthes*** or pitcher plant - Found on north eastern parts of India (Endangerd).
- ***Utricularia*** or bladderwort - Hydrophyte and pullution indicator.
- ***Drosera*** or Sundew
- ***Pinguicula*** or butterwort.
- ***Dionaea*** or venus fly trap.
- ***Saracenia*** or pitcher plant with symbiotic bacteria.
- ***Aldrovanda*** (Water flea trap)
- ***Genlisea*** (Lobster pot trap)

(C) Saprophytes :

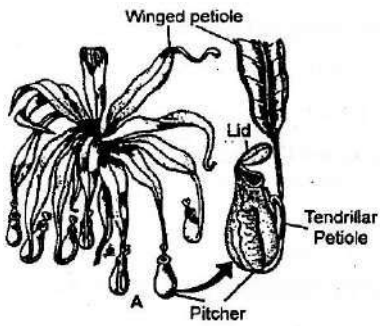
- Non green plants, which depend on dead organic matter - ***Monotrapa*** (Indian Pipe) ***Noettia*** (Birds eye nest) (***Dischidia*** is a pitcher plant but not insectivorous).



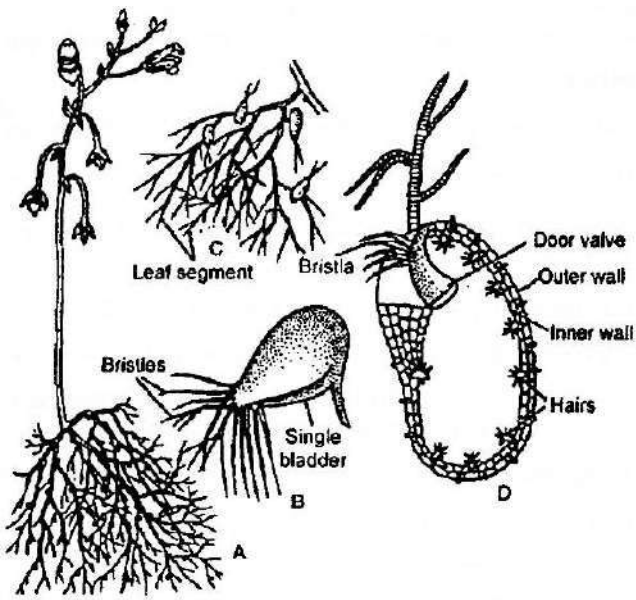
Saprophytic Plants
(A) Neottia (Birds nest plant)
(B) Monotrapa (Indian pipe)



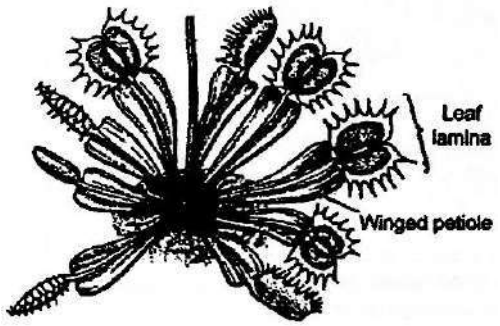
Insectivorous Plants - Drosera
(A) Complete plant (B) One leaf (C) One glandular tentacle



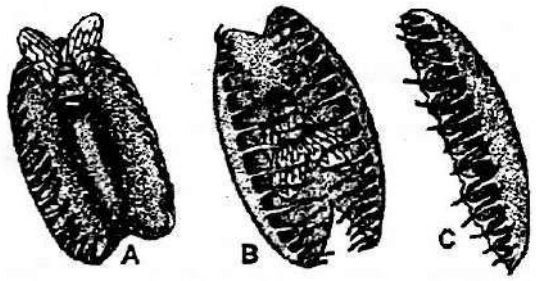
Insectivorous plant - Nepenthes
(Pitcher plant)
(A) A pitcher plant with pithcer



Insectivorous plant - Utricularia - (Bladderwort)
(A) Complete plant (B) One bladder
(C) Part of leaf with bladers (D) Internal structure of bladder



Insectivorous plant - Dionaea (Venus fly trap)



Insectivorous plant - Dionaea : Different stages in the capture of the insect

SPECIAL POINTS

- Photosynthesis is an **endergonic, anabolic, oxidation-reduction process.**
- A particle of light containing energy is called a **photon** or **quantum**.
- **Quantasomes** were discovered by **Park and Biggins** (1964). They are also called **photosynthetic units**.
- Rate of Photosynthesis is higher than that of respiration during day time and the ratio of O_2 produced to that of consumed is 10 : 1.
- **Moll's half leaf experiment** is used to show that CO_2 is less **essential for photosynthesis**.
- **Wilmott's bubbler** is used for the measurement of the rate of photosynthesis.
- During photosynthesis, 264 gms of CO_2 and 216 gms. of water are utilized to produce 108 gms of water, 192 gms of O_2 and 180 gms of glucose.
- Photosynthesis involves oxidation of water and reduction of CO_2.
- Ferric compounds (Ferricyanide & ferric oxalate), quinone and 2,6-dichloroindophenol used as hydrogen acceptors in Hill's experiments are called **Hill's Reagents**.
- **DCMU**(Dichlorophenyl dimethyl urea), a **herbicide**, is a **strong inhibitor** of non cyclic photophosphorylation and O_2 evolution in photosynthesis.
- **Manganese** and **chloride ions** are required for evolution of O_2 in photosynthesis.
- In 1971, Rubisco was crystallised from tobacco leaves in **Wildman's laboratory**.
- Rubisco is **most abundant protein** of the world.
- Due to the affinity to O_2, **Carotenoids** assist in photolysis of water by taking up O_2.
- **Chl-a** is called the **key molecule** due to its ability to **initiate** light reaction.
- In photosynthesis, the quanta of light required to release one molecule of O_2 is called **quantum requirement**. It is 8 quanta.
- Chlorophyll pigment soluble in organic solvents like acetone, ether etc. (anthocyanin is non photosynthetic water soluble pigment, which present in vacuole).
- Photolysis of water occurs at +0.8 E^o
- In cyanobacteria (BGA), photosynthesis occurs on **chlorosomes** or **lamellisome** or **carboxysome.**
- PS-I is strong reductant as PS-I has good ability to reduce $NADP^+$, while PS-II is a strong oxidant, because it has extrem power of oxidation & photolysis of water molecule.
- **Efficiency of photosynthesis-**

– One quantum of red light = 47.6 Kcal (One red photon or quantum = 47.6 Kcal)
– One glucose = 686 Kcal. (1 CH_2O = 114.3 Kcal)
– 8 Quantum × 47.6 Kcal = 381 Kcal energy require for fixation of one CO_2.

Thus, $\frac{114.3}{381} \times 100 = 30\%$

DIFFERENCES

Photorespiration	Dark Respiration
(i) Occurs in chloroplast, peroxisome and mitochondria.	(i) Occurs in cytoplasm, mitochondria.
(ii) Wasteful process.	(ii) Useful process.
(iii) NH_3 & CO_2, H_2O_2 are produced	(iii) CO_2, H_2O &ATP genetrated.
(iv) In green cells of C_3-plants.	(iv) In all living cells.
(v) Occurs during day time only.	(v) All time.

Cyclic photophosphorylation	Non-cyclic photophosphorylation
(i) Only PS-I involved in cyclic process.	(i) Both PS-II & PS-I works in non cyclic process.
(ii) The e^- expelled from chl-700 is cycled back.	(ii) The e^- expelled from reaction centre is not cycled · back. Its loss is compensated by e-form H_2O.
(iii) Photolysis of water and evolution of 02 does not take place.	(iii) Photolysis of water and evolution of 02 takes place.
(iv) Phosphorylation at two places.	(iv) Phosphorylation at one site.
(v) NADP+ is not reduced.	(v) $NADP^+$ is reduced to NADPH.
(vi) Activated by 680 NMt light.	(vi) Activated by 680 NM ↓

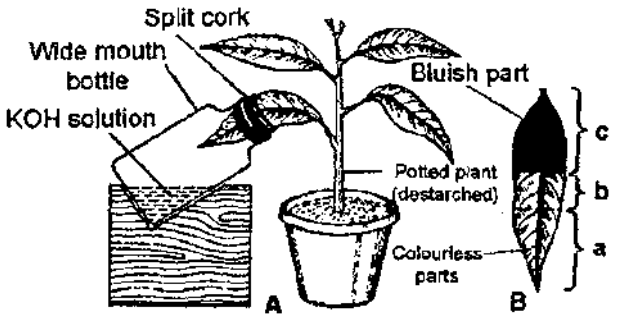
C_3-pathway	C_4-pathway	CAM-pathway
(1) 1st stable compound is 3-C PGA	(1) 1st stable compound is 4C O.A.A.	(1) First formed compound is O.A.A.
(2) 18 ATP & 12 $ADPH_2$ used for 1 glucose formation	(2) 30 ATP & 12 $NADPH_2$ used for 1 glucose formation	(2) 30 ATP and 12 $NADPH_2$ used for production of 1 glucose
(3) Kranz anatomy absent	(3) Krenz anatomy present	(3) Kranz anatomy absent
(4) Presence of photorespiration	(4) Absence of photorespiration	(4) Photorespiration may present
(5) One type of carboxylase enzyme, Rubisco only	(5) Two type of carboxylase enzyme Rubisco & PEPcase.	(5) Two type of carboxylase enzyme Rubisco & PEPcase
(6) CO_2 acceptor - RUBP	(6) Primary CO_2 acceptor PEP & RUBP is secondary acceptor	(6) Primary CO_2 acceptor is PEP & RUBP is secondary acceptor
(7) Transpiration ratio (TR) 500-1000	(7) TR - 200 - 300	(7) TR - 50 - 100

IMPORTANT EXPERIMENTS

EXPERIMENT - 1

CO_2 Necessary for photosynthesis molls half leaf experiment :

Destarch a potted plant by keeping it in dark for 2-3 days till its leaves do not show positive starch test. Insert one half of a leaf in wide mouthed bottle containing a few c.c. of KOH solution by means of a split cork. Make the connection air tight the leaf hald present inside the bottel is unable to get carbon dioxide as the same gets carbon dioxide as the same gets absorbed by potassium hydroxide solution.



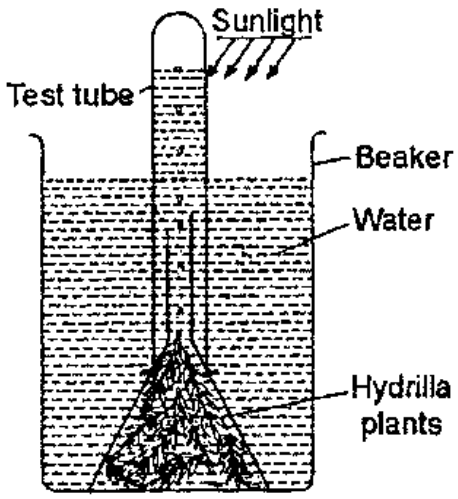
Place the apparatus in sun light for few hours. Remove the leaf under study & test for starch. It will be seen that the inner half of the leaf which was devoid of CO_2 supply does not turn blue, while the outer half shows positive starch test. This experiment shows positive starch test. This experiment shows that photosynthesis does not occurs in the absence of CO_2.

EXPERIMENT - 2

Experiment that prove O_2 gas is evolved during photosynthesis.

Place an aquatic plant like Hydrilla at the bottom of a large waterfilled beaker with the cut end of the stem pointing towards the upperside. Cover the plant by inverting over it a short stemmed funnel. Pour water into beaker till it has covered the stem of the funnel completely. Dissolve a bit of sodium bicarbonate in it.

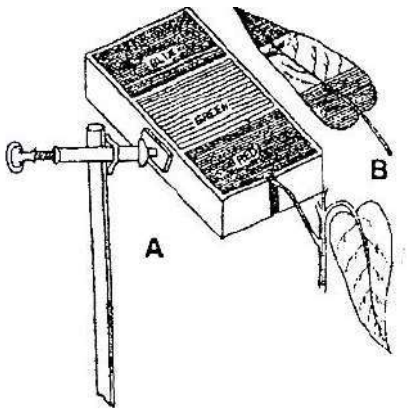
Invert a test tube full of water over the funnel and place the apparatus in bright sunlight. Soon gas bubbles will be seen coming out of the plants and get collected in test tune. When sufficient gas has been collected, remove the test tube and introduce a glowing splinter which will burn brightly showing that the gas evolved is oxygen.



EXPERIMENT - 3

Light is necessary for photosynthesis (By Ganong's light screen)

Fit Ganong's light screen to one of the leaves of a destarched plant. Place the plant in sunlight. The leaf receive the light only through the stencil. After a few hour pick up the leaf under examination and test for starch with iodine solution the area manufactures starch get blue and thus perform photosynthesis which has received light.

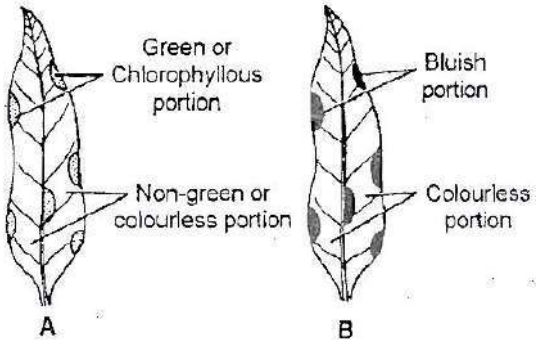


EXPERIMENT - 4

Chlorophyll is essential for photosynthesis (By experiement of varigated leaf)

Pick up a variegated leaf from coleus, pathos plant.

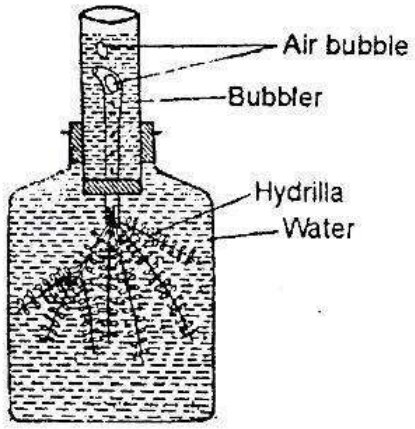
Which has received light for a few hours. Take a piece of rice paper and place it over the surface of variegated leaf. Mark out the green and non green areas by means of a pencil. 'Kill the leaf in boiling water and remove its chlorophyll by immersing it in warm spirit. Wash and test for starch. Only those parts of the leaf will give positive test which were originally green or with chlorophyll.



EXPERIMENT - 5

Measurement of photosynthesis by the rate of evolution of oxygen (By Wilmott Bubbler)

Take as fresh shoot of Hydrilla plant remove its apical 10 cm long portion by giving an oblique cut while keeping it submerged in water. Place it in a test tube 3/4th full of water with the cut end upwards as such or gently tied to a glass rod for support. And some sodium bicarbonate in the water of test tube. Give a fresh oblique cut to the shoot end & place the test tube in sunlight. Bubbles of oxygen gas are seen coming out of the cut end of hydrilla plant count the no. of bubbles per minute. Rate of reaction increases by adding in H_2O.



EXERCISE - 1

Q.1 Bio-Chemical phase in photosynthesis was first discovered by
(1) Calvin (2) Blackman
(3) Arnon (4) Hill

Q.2 In chlorophyll molecule "Mg' is situated in
(1) Centre of porphyrin ring
(2) Corner of porphyrin
(3) In phytol tail (4) In isocyclic ring

Q.3 The accepted size of chlorophyll molecule is
(1) Head ; 15 × 10 Aº & Tail; 25Aº
(2) Head : 20 × 20 Aº & Tail : 25Aº
(3) Head : 10 × 10 Aº & Tail : 15Aº
(4) Head : 15 × 15 Aº & Tail : 20 Aº

Q.4 The photosynthetic pigment "chlorophylls" are soluble in
(1) Water (2) Inorganic solvent
(3) Organic solvent
(4) Water & organic solvent

Q.5 Which of the following chlorophyll is lack of phytoltail ?
(1) Chl'a' (2) Chl.'b'
(3) Chl.'c' (4) Chl.'e'

Q.6 Photosythetic pigment phycobilin are not associated with : -
(1) PS II (2) Cyanobacteria
(3) PS I (4) All the above

Q.7 Percentage of chlorophyll in a normal chloroplast
(1) 5 - 10% (2) 40 - 50%
(3) 65 - 75% (4) 90 - 95%

Q.8 The correct formula for carotene is
(1) $C_{40}H_{56}$ (2) $C_{40}H_{50}$
(3) $C_{40}H_{56}O_2$ (4) $C_{41}H_{56}O_3$

Q.9 Normally phycobillins occurs in
(1) Red alage (2) Blue green algae
(3) Rhodophyceae (4) All of the above

Q.10 Which of the following protein is most abundant on the earth ?
(1) Catalase (2) Rubisco
(3) Amylase (4) None of these

Q.11 Porphyrin is occurs in
(1) Chlorophyll (2) Hameoglobin
(3) Cytochrome (4) All the above

Q.12 Universal photosynthetic chlorophyll is
(1) Chl-'a' (2) Chl 'b'
(3) Chl - 'c' (4) Chl- 'e'

Q.13 Which of the following is the site of photolysis of water ?
(1) Stroma of chloroplast
(2) Cristae of chloroplast
(3) Ribosome of chloroplast
(4) Lumen of thylakoid sacs

Q.14 Which one of the following is precursor of protochlorophyll ?
(1) Acethyl COA (2) Succinyl COA
(3) Oxlaoacetic acid (4) α-ketoglutarate

LIGHT REACTIONS OR PHOTOPHOSPHORYLATION

Q.15 The first step in photosynthesis is
(1) Joining of three carbon atoms to from glucose
(2) Formation of ATP
(3) Ionization of water
(4) Excitement of an electron of chlorophyll by a photon of light

Q.16 The ultimate gain of light reaction is : -
(1) ATP & $NADPH_2$ (2) $NADPH_2$
(3) only ATP (4) Only O_2

Q.17 Photophosphorylation is the process in which
(1) CO_2 and O_2 unite
(2) Phosphoglyceric acid is produced
(3) Aspartic acid is formed
(4) Light energy is converted in to chemical energy by production ATP

Q.18 Alage and other submerged plants bount in water during day time and sink at night, becuase
(1) They come upto enjoy some time
(2) They lose weight at night
(3) They become bouyant due to accumulation of O_2 as a result of photosynthesis
(4) They become light due to food material accumulation

Q.19 Which one of the following concerns with photophosphorylation :

(1) ADP + AMP $\xrightarrow{\text{Lightenergy}}$ ATP

(2) ADP + Inorganic PO_4 $\xrightarrow{\text{Lightenergy}}$ ATP

(3) ADP + Inorganic PO_4 $\longrightarrow$ ATP

(4) AMP + Inorganic PO_4 $\longrightarrow$ ATP

Q.20 Which occurs during the light reaction of photosynthesis

(1) Chlorophyll is produced

(2) Water splits to form $2H^+$ & O_2

(3) CO_2 is given off as a waste

(4) Sugar is formed from CO_2 and water

Q.21 The function of ATP in photosynthesis is the transfer of energy from the

(1) Dark reaction to the light reaction

(2) Light reaction to the dark reaction

(3) Chloroplasts to mitochondria

(4) Mitochondira to chloroplasts

Q.22 In photosynthesis, hydrogen is transferred from the light reaction to dark reactions by :-

(1) DPN (2) DNA

(3) ATP (4) NADP

Q.23 Which of the following element is a component of ferredoxin : -

(1) Copper (2) Manganese

(3) Zinc (4) Iron

Q.24 During photochemical reaction of photosythesis-

(1) liberation of O_2 takes place

(2) Formation of ATP and $NADPH_2$ take place

(3) Liberation of O_2, formation of ATP, and $NADPH_2$ takes place

(4) Assimilation of CO_2 takes place

Q.25 Splitting of water in photosynthesis is called:

(1) Dark reaction (2) Photolysis

(3) Electron transfer (4) Phototropism

Q.26 The chief product of hill reaction are : -

(1) ATP and $NADPH_2$ in chloroplast

(2) ATP and $NADPH_2$ in mitochondria

(3) Only oxygen

(4) A reduced substance $NADPH_2$, ATP and O_2 in chloroplast

Q.27 ADP + iP = ATP in grana is called : -

(1) Phosphorylation

(2) Oxidative phosphorylation

(3) Photophosphorylation

(4) Photolysis

Q.28 Which of the following is excited molecule during photosynthesis : -

(1) Chlorophyll (2) Oxygen

(3) Carbondioxide (4) Water

Q.29 $NADPH_2$ is also called : -

(1) Real power

(2) Oxidising agent

(3) Power house of energy

(4) Reducing power

Q.30 During ionisation of H_2O, H^+ is captured by

(1) Chlorophyll (2) NADP

(3) O_2 (4) Cytochrome

Q.31 At the time of ionization of H_2O, which initially captures the electron

(1) Chlorophyll (2) NADP

(3) OH^- (4) Cytochrome

Q.32 In cylic photophosphorylation which one of the following is formed

(1) NADP & ATP (2) ATP

(3) $NADH_2$ and O_2

(4) $NADPH_2$, ATP and O_2

Q.33 Fixation of 1 CO_2 requires : -

(1) $6NADPH_2$ & 3ATP

(2) $2NADP.H_2$ & 3ATP

(3) $4NADP.H_2$ & 3ATP

(4) $5NADP.H_2$ & 3ATP

Q.34 Photooxidation of water in photosynthesis is in association of

(1) Cythochrome b_6

(2) Pigment system-I

(3) Pigment system-II

(4) Plastocyanin

Q.35 During ATP synthesis electron pass through

(1) Water (2) Cytochromes

(3) O_2 (4) CO_2

Q.36 Which pigment system utlimately donates e^- for the reduction of NADP.

(1) PS II (2) PS I

(3) CO_2 (4) Plastoquinone

Q.37 Respiration and photosynthesis both require

(1) Green cells (2) Sunlights

(3) Cytochromes (4) Organic fuel

Q.38 Photosynthesis is an oxidaton reduction process, the materials that is oxdised is :

(1) CO_2 (2) NADP

(3) H_2O (4) PGA

Q.39 Element which helps in electron transport in the process of photosynthesis is

(1) Zinc (2) Molybdenum

(3) Boron (4) Mangnese

Q.40 Photo-oxidation of chlorophyll is called

(1) Intensification (2) Chlorosis

(3) Solarization (4) Defoliation

Q.41 The by product of photosynthesis is

(1) CO_2 (2) Oxygen

(3) Energy (4) Sugar

Q.42 The electron ejected by P_{680} in light reaction is initially accepted by

(1) Plastoquinone (2) ATP

(3) Ferredoxin (4) P-700

Q.43 Decreased rate of photosynthesis at high concentration of O_2 is referred to as

(1) Pasteur effect (2) Emerson effect

(3) Warburg effect

(4) Richmond lang effeect

Q.44 Which element are presents in OEC (Oxygen evolving complex)

(1) Mn^{++} (2) Cl^-

(3) Ca^{++} (4) All

Q.45 Which one is Cu^{++} containing protein complex : -

(1) Ferridoxin (2) Plastocyanin

(3) Plastoquitnone (4) Cytochrome

Q.46 Pigment system-I is concerned with

(1) Photolysis

(2) Cyclic photophosphorylation

(3) Non-cylic photophosphorylation

(4) Oxidative phosphorylation

Q.47 The important role of PS-II in photosynthesis is

(1) To cause photolysis of water

(2) To release energy

(3) To trap & assimilate CO_2

(4) To reduce NAD to $NAD.H_2$

Q.48 The first electron carrier molecule from P_{700} to $NADP^+$ is believed to be

(1) Cytochrome

(2) Cu protein/Plastcyanin

(3) FeS protein/Ferredoxin

(4) Fe-Mg protein

Q.49 In plants, hill reaction occurs

(1) All the time

(2) Only in day time

(3) Only when the plants are grown in cold climate of hills

(4) When the plant carries out up hill task of salt absorption and food translocation

Q.50 Pigment system-II occur

(1) Grana (2) Stroma

(3) Matrix (4) Oxysomes

Q.51 The excess energy of e^- (in ETS) is used in the systhesis of :-

(1) ATP from ADP & –ip

(2) $NADPH_2$ from NADP

(3) Organic compounds

(4) ADP from ATP

Q.52 During photosynthesis

(1) Water is reduced & CO_2 is oxidized

(2) CO_2 is reduced & water is oxidized

(3) Both CO_2 & water get reduced

(4) Both CO_2 & water get oxidized

Q.53 Photolysis is related to

(1) Clavin cycle (2) H.S.K. cycle

(3) Cylic photophosphorylation

(4) Non cyclic flow of electrons

Q.54 Connecting link between light phase and dark phase of photosynthesis

(1) Only ATP (2) Only $NADH_2$

(3) Only $NADPH_2$ (4) Both (1) and (3)

Q.55 When the two pigment systems absorb light in what direction does the energy flow between them

(1) PS-I → PS-II (2) PS-II → PS-I

(3) PS-II-PS-I (4) None of the above

Q.56 Which photosynthetic pigment converts nascent oxygen to molecular oxygen : -

(1) Chlorophyll-a (2) Carotenoids

(3) Phycobilins (4) Chlorophyll-b

Q.57 Hill reaction occurs in : -

(1) High altitude plants

(2) Total darkness

(3) Presence of ferricyanide

(4) Absence of water

Q.58 Which cofactor is necessary for photolysis of water

(1) Mg (2) Mn

(3) Fe (4) Cu

Q.59 Who proposed Z-scheme of light reaction

(1) Arnon (2) Calvin and Bensen

(3) Emmerson and Arnon

(4) Blackman

Q.60 Detail study of pigment systems made by

(1) Robert Hill (2) H.P. Nanda

(3) Govindji (4) Emmerson

Q.61 Which of the following absorb light energy for photosynthesis : -

(1) Chlorophyll (2) Water molecule

(3) O_2 (4) RUBP

DARK REACTIONS (C_3-PLANTS, C_4-PLANTS CAM-PLANTS)

Q.62 In photosynthesis CO_2 combines with

(1) RUDP/RUBP (2) ATP

(3) ADP (4) PGA

Q.63 During the dark reactions of photosynthesis :-

(1) Water splits

(2) CO_2 is reduced to organic compounds

(3) Chlorophyll is activated

(4) C_6-sugar is broken into three carbon sugars

Q.64 The first stable product of photosynthesis in C-3 plants is : -

(1) 3-phosphoglyceric acid

(2) Dihydroxyacetone phosphate

(3) Fructose-1, 6-diphosphate

(4) Ribulose-1, 5-dil phosphate

Q.65 The enzyme that fixes atmospheric CO_2 in C_4 plants is : -

(1) PEP carboxylase (2) Hexokinase

(3) RUBP oxygenase (4) Hydrogenase

Q.66 During photosynthesis when PGA is changed into phosphoglyceraldehyde which of the following reaction occur : -

(1) Oxidation (2) Reduction

(3) Electrolysis (4) Hydrolysis

Q.67 Which one of the following is a C_4 plant :-

(1) Papaya (2) Potato

(3) Maize (4) Pea

Q.68 Carbon refixation in C_4 plants occurs in chloroplasts of :-

(1) Palisade tissue (2) Sprongy Mesophyll

(3) Bundle sheath cells

(4) Gaurd cells

Q.69 Tropical plants like sugarcane show high efficiency of CO_2 fixation because of : -

(1) Calvin cycle (2) Hatch-Slack cycle

(3) Cyclic photophosphorylation

(4) TCA Cycle

Q.70 "Kranz" type of Anatomy is found in : -

(1) C_4 plant (2) C_3 plant

(3) Succulents (4) None of the above

Q.71 Carbon dioxide acceptor in C_4 plants is : -

(1) Phosphoenol pyruvic acid (PEP)

(2) Ribulose-1, 5-dil phosphate

(3) NADP

(4) Ribulose-5- phosphate

Q.72 What is the first stable intermediate product of photosynthesis : -

(1) Glucose (2) Formaldehyde

(3) Phosphoglyceric acid

(4) PGAL

Q.73 All the reactions from the reduction of CO_2 to the formation of sugar are included in :-
(1) Light reaction (2) Photolysis
(3) Dark reaction (4) Hill reaction

Q.74 Ribulosediphosphate carboxylase enzyme, catalyse the carboxylation reaction between
(1) CO_2 and ribulose-1, 5-diphosphate
(2) Oxalloacetic acid and acetyl Co-A
(3) PGA and dihydroxyacetone phosphate
(4) Ribulosediphosphate and phosphate glycerldehyde

Q.75 Which of the following is C-4 plants
(1) Maize (2) Atriplex
(3) Sugarcane (4) All of the above

Q.76 "Kranz Anatomy" is found in
(1) Flower (2) Seed
(3) Leaves (4) Stem

Q.77 C-4 plants are adapted to
(1) Hot and dry climate
(2) Temperate climate
(3) Cold and dry climate
(4) Hot and Humid climate

Q.78 C-4 plants are found among
(1) Only gramineae
(2) Only monocot
(3) Only dicot
(4) Monocots as well as dicots

Q.79 In case of C-4 pathway, in the first step is
(1) CO_2 combines with RUDP
(2) CO_2 combines with PGA
(3) CO_2 combines with PEP
(4) CO_2 combines with RMP

Q.80 The enzyme which catalyzes the photosynthetic C_4 cycle is
(1) RUDP carboxylase
(2) PEP carboxylase
(3) Carbonic anhydrase
(4) None of these

Q.81 The family in which many plants are C_4 type
(1) Malvaceae (2) Solanaceae
(3) Crucifereae (4) Graminae

Q.82 In dark reaction, first reaction is the
(1) Carboxylation (2) Decarboxylation
(3) Dehydrogenation (4) Deamination

Q.83 Number of ATP molecules required for regeneration phase of RUBP during synthesis of 1 glucose molecule.
(1) 6 (2) 12
(3) 18 (4) 30

Q.84 Which of the following is likely to be the first substance that a green plant makes in photosynthesis : -
(1) A simple sugar (2) Starch
(3) Fats (4) Proteins

Q.85 Isotopes employed to study the process of photosynthesis reaction.
(1) S^{35} and P^{32} (2) C^{14} and O^{18}
(3) N^{14} and Co^{60} (4) N^{14} and O^{18}

Q.86 Chloroplast is present in bundle sheath cells of
(1) C_3-plants (2) C_4 plants
(3) CAM plants
(4) Photorespiring plants

Q.87 CO_2 is accepted by RUBP in C_4 plants in
(1) Mesophyll cells
(2) Bundle sheath cells
(3) Stomatal gaurd cells
(4) Epidermal cells

Q.88 How many type of photosynthetic cells occur in C_4 plant is
(1) One type (2) Two type
(3) Four type (4) Eight type

Q.89 Bundle sheath chloroplast of C_4 plant are :-
(1) Large & agranal (2) Large & granal
(3) Small & agranal (4) Small & granal

Q.90 Most efficient photosynthesis & presence of bundle sheath chloroplast are characteristics of
(1) C_3 - plants (2) C_2 plants
(3) C_4 plants (4) CAM plants

Q.91 In C_4 pathway the fixation of CO_2 by PEPCase occurs in
(1) Palisade tissue (2) Mesophyll
(3) Bundle sheath (4) Gaurd cell

Q.92 Sythesis of fructose in C_4 pathway occurs in the chloroplast of
(1) Spongy mesophyll
(2) Bundle sheath cells
(3) Gaurd cells
(4) Palisade tissue

Q.93 C_2 and C_3 cycles predominantly operates in
(1) Cytoplasm and mitochondria
(2) Mitochondria and peroxysome
(3) Peroxisome and stroma
(4) Stroma and grana of chloroplast

Q.94 In addition to the 12 molecules of $NADP.H_2$ the energy required for the synthesis of one mole of hexose by C_3 and C_4 pathway is
(1) 18 molecules of ATP
(2) 30 molecules of ATP
(3) 18 & 30 molecules of ATP respectively
(4) 30 & 18 molecules of ATP respectively

Q.95 How many molecules of water are needed by a green plant to produce one molecule of hexose/reduce 6 molecules of CO_2
(1) 6 (2) 12
(3) 24 (4) 1

Q.96 How much energy in terms of ATP equivalents is consumed in the photosynthetic production of a mole of hexose
(1) 36 ATP e (2) 38 ATP e
(3) 40 ATP e (4) 54 ATP e

Q.97 How many molecules of water would be consumed to support one calvin cycles
(1) One (2) Two
(3) Four (4) Six

Q.98 How many calvin cycles would generate one molecules of glucose/hexose
(1) One cycles (2) Three cycles
(3) Six cycles (4) Twelve cycles

Q.99 CAM - plants are mainly
(1) Succulent xerophyte
(2) Hydrophtytes
(3) Epihytes
(4) None of the above

Q.100 Hatch and Slack pathway occurs in
(1) Amaranthus (2) Atriplex-rosea
(3) Saccharum (4) All of the above

Q.101 The first stable product of calvin cycle and HSK-cycle are
(1) 4-C and 3-C compounds
(2) 4-C and 6-C compounds
(3) 3-C and 4-C compounds
(4) 5-C and 4-C compounds

Q.102 Which one is the first seven carbon compound in the C_3 cycle
(1) SHP (2) DHAP
(3) SHDP (4) FDP

Q.103 Which compound is four carbon compound in the C_3 cycle
(1) Erythrose-P (2) DHAP
(3) PGAL (4) OAA

Q.104 Term-Apoplast & symplast first used by : -
(1) Clark (2) Munch
(3) Dixon (4) Lundegardh

Q.105 In Photosyntheisis energy from light reaction to dark reaction is transferred in the form of : -
(1) ADP (2) ATP
(3) RUDP (4) Chlorophyll

Q.106 The rate of photosynthesis does not depend upon
(1) Light duration (2) Light intensity
(3) Light quality (colour)
(4) Temperature

Q.107 Optimum temperature of photosynthesis is :-
(1) 10 – 15ºC (2) 20 - 25ºC
(3) 20 - 35ºC (4) 35 - 50ºC

Q.108 Which one of the following have high CO_2 compensation point :-
(1) C_2 plants (2) C_3 plants
(3) C_4 plants (4) Alpine herbs

Q.109 Solarisation is a process in which : -
(1) Sugar are formed with the help of solar energy
(2) Chlorophyll is formed
(3) Destruction of chlorophyll and ultimate death of protoplasmic components
(4) Mobilization of light energy

Q.110 Accumlation of food in assimilatory cells results in

(1) Increase in the rate of photosynthesis

(2) Decrease in the rate of photosynthesis

(3) No effect

(4) May increase or decrease

Q.111 The principle of limiting factor was given by:-

(1) Hill (2) F.F. Blackman

(3) Will statter ans stoll

(4) Calvin

Q.112 Etiolated plants are formed due to lack of

(1) Light (2) Hg

(3) Fe (4) Mg

Q.113 During day light hours, the rate of photosynthesis is higher than that of respiration and the ratio of oxygen produced to that of consumed is

(1) 10 : 1 (2) 5 : 1

(3) 1 : 1 (4) 50 : 1

Q.114 Substrate for photorespiration is

(1) Serine (2) Glycolate

(3) Indole acetic acid (4) Malic acid

Q.115 Generally atmo. CO_2 is not limiting for hydrophytes

(1) Mesophytes plants fix H_2S in their photosynthesis

(2) These plants obtain CO_2 from water in the form of HCO^-_3

(3) Glucose is not required for their respiration

(4) All the above

Q.116 What is called "warburg's effect" on photosynthesis

(1) Low rate of process due to O_2 supply

(2) Low rate of the prcoess due to CO_2 supply

(3) Both (1) & (2)

(4) None of the above

Q.117 Photorespiration is favoured by

(1) Low light intensity

(2) Low O_2 and high

(3) Low temperature

(4) High O_2 and Low CO_2

Q.118 Bacterial photosynthesis involves

(1) PS - I only

(2) PS-II only

(3) Both PS-I & PS-II

(4) None of the above

Q.119 Photorespiration occurs in

(1) Mitochondria (2) Chloroplast

(3) Peroxisome (4) Cytoplasm

Q.120 What is C_2 - Cycle

(1) Glycolate cycle (2) Clavin cycle

(3) Kreb's cycle (4) TCA - cycle

Q.121 Drocera is photosyntheic plant but still captures insects why ?

(1) Grown in N_2 rich soil

(2) Grown in N_2 deficient soil

(3) It is connnecting plant between plants and animals

(4) Insects helps in its pollination

Q.122 Plants which exhibit photorespiration are :

(1) C_4 plants (2) C_3 plants

(3) CAM plants (4) Alpine plants

Q.123 Glycolate accumulates in chloroplast at

(1) Low temp. (2) Low CO_2

(3) Bright illumination (4) High CO_2

Q.124 Which of the following plants are Low CO_2 compensation plants

(1) C_3 - plants (2) C_4-plants

(3) C_2 - plants (4) Alpine plants

Q.125 In photorespiring plants the atmospheric CO_2 is fixed via-

(1) HSK-cycle (2) Kreb's cycle

(3) Calvin cycle (4) Glycolate cycle

Q.126 Compensation point means

(1) When the rate of photosynthesis is equal to rate of respiration

(2) When there is neither photosynthesis nor respiration

(3) When the entire food manufactured in photosynthesis remains unutilized

(4) When availabilty of water equalise with necessity of water

Q.127 At the compensation point there will not be
(1) Any photosynthesis
(2) Any gaesous exchange between the plant and its environment
(3) Any respirationin in plants
(4) Loss in weight of the plant in dark

Q.128 What does not occur in photorespiration
(1) Utilization of O_2 (2) Production of CO_2
(3) Synthesis of ATP (4) All the above

Q.129 DCMU is an inhibitor of
(1) PS-I (2) PS-II
(3) Calvin cycle (4) Kreb's cycle

Q.130 Which of the following plants can carry out photosynthesis even at –20ºC/below freezing point :
(1) Palms (2) Marine algae
(3) Diatoms (4) Lichens

Q.131 Photorespiration occur during
(1) Respiration (2) Photosynthesis
(3) Transpiration (4) Translocation

Q.132 Photorespiration is discovered by
(1) Decker & Tio (2) Van sachs
(3) Rouhani (4) O-leri

Q.133 Photorespiration is favoured by
(1) High light intensity
(2) High temperature
(3) High O_2 concentration
(4) All of the above

Q.134 Photorespiration does not occurs in
(1) C-4 plants (2) C-3 plants
(3) C-2 plants (4) None of these

Q.135 What is the value of temperature coefficient (Q_{10}) for dark reaction
(1) 1 (2) 2 or 3
(3) Both (4) None of the above

Q.136 Main factor which limits the rate of photosynthesis on a clear day is
(1) Chlorophyll (2) Light
(3) CO_2 (4) Water

Q.137 Photosynthetic bacteria differ from green plants in
(1) Nature of their pigments
(2) Type of electron donors
(3) Photosynthetic process being non oxygenic
(4) All of the above

Q.138 What is meant by photolysis of water ?
(1) Breakdown of water by light
(2) Breakdown of water by chloroplast
(3) Breakdown of water by illuminated chloro plast
(4) Break down of illuminated water in the presence of H acceptors

Q.139 Who gave the detailed structure of chlorophyll?
(1) Arnoff and Allen
(2) Willstatter and Stahl
(3) Hill and Scarisbrik
(4) Woodward

Q.140 Granum is formed from –
(1) Thylakoids (2) Pigments
(3) Thylakoids with pigments
(4) Stroma and thylakoids

Q.141 Which is called the universal molecule ?
(1) Chlorophyll–a (2) Chlorophyll–b
(3) β–Carotene (4) None of the above

Q.142 Which of these is a molecule of bacteriochlorophyll –a ?
(1) $C_{55}H_{72}O_5N_4Mg$ (2) $C_{55}H_{70}O_6N_4Mg$
(3) $C_{55}H_{74}O_6N_4Mg$ (4) $C_{55}H_{72}O_6N_4Mg$

Q.143 Who protects chlorophyll against photo–oxidation ?
(1) Carotenes (2) Xanthophylls
(3) (1) and (2) above mentioned
(4) Biliproteins

Q.144 Generally phycobilins are found in –
(1) Algae
(2) Red & Blue–green algae
(3) Higher plants (4) Bacteria

Q.145 Which molecules are found in pigment system I (PS–I) ?
(1) Only ChL–a
(2) Chl–a and Phycobilin
(3) Chl–a but also Chl–b and carotenoids
(4) Chl–b and rest accessory pigments

Q.146 Of which pigment system, P–700 is the trap centre ?
(1) PS–I (2) PS–II
(3) Both of above (4) None of the above

Q.147 Which of these is found in PS–I ?
(1) FRS, Cyt.f. Cyt.b–6
(2) Mn, Cyt.b. 559, Cyt.f
(3) Plastoquinone, Plastocyanin
(4) All of the above

Q.148 It is found in stroma lamellae –
(1) PS–I (2) PS–II
(3) PS–I & PS–II both
(4) None of the above

Q.149 Which ion is required for photolysis of water?
(1) Mg^{++} (2) Fe^{++}
(3) Mn^{++} (4) Ca^{++}

Q.150 From which source charged molecule of P–680 gets the electron ?
(1) From P–700 (2) From water
(3) From $NADPH_2$ (4) None of the above

Q.151 Glucose is formed –
(1) On Grana (2) In Stroma
(3) Both of above (4) None of the above

Q.152 Which accepts CO_2 during CO_2 fixation in C_3 cycle ?
(1) RUDP (2) Pep
(3) Both of above (4) RUMP

Q.153 What is the first stable product in C_3 Cycle?
(1) PGA (2) OAA
(3) PGAL (4) DiHAP

Q.154 C_4 cycle is found in –
(1) Monocots (2) Dicots
(3) Both of above (4) Gymnosperms

Q.155 In how many families of plants, C_4 cycle is known ?
(1) 7 families (2) 13 families
(3) 17 families (4) 27 families

Q.156 It is not found in C_4 plants –
(1) Photosynthesis (2) Photorespiration
(3) Phototropism (4) C-4 cycle

Q.157 Which of these can photosynthesize effectively at high temperature and low CO_2 conc ?
(1) C_3 plant (2) C_4 plant
(3) Both of above (4) None of these

Q.158 Who gave the three cardinal points theory for physiological reactions ?
(1) Sachs (2) Leibig
(3) Blackman (4) Warburg

Q.159 The cardinal points affecting physiological reactions are –
(1) One (2) Two
(3) Three (4) Four

Q.160 What is the value called after which if it increases than the reaction stops ?
(1) Minimum value (2) Maximum value
(3) Optimum value (4) None of the above

Q.161 At a certain brightness of light, gaseous exchange from photosynthetic region stops. This brightness is called –
(1) CO_2 compensation point
(2) Light saturation point
(3) Light compensation point
(4) CO_2 saturation point

Q.162 Carbon dioxide is necessary of photosynthesis. The chemical used to remove this gas most effectively from entering a control apparatus is-
(1) Distilled water
(2) Sodium carbonate
(3) Calcium oxide
(4) Potassium hydroxide solution

Q.163 Assimilatory powers produced during photosynthesis are –
(1) RuDP and RuMP(2) H_2O and O_2
(3) ATP and $NADPH_2$
(4) $C_6H_{12}O_6$ and PGAL

Q.164 Hill reaction was demonstrated in the –
(1) Absence of CO_2
(2) Presence of carbon dioxide
(3) Presence of a suitable electron acceptor
(4) None of these

Q.165 Match the names of scientists given under column I with their important contributions given under column II ; choose the answer which gives correct combination of the alphabets :

Column I (Scientists)	**Column II (Contributions)**
A. Peter Mitchell	p. Steps of dark reaction of photosynthesis
B. J.W. Gibbs	Photosynthetic phosphorylation
C. Danial Aron	r. Concept of free energy
D. Melvin Calvin	s. Chemiosmotic hypothesis
	t. Mass flow hypothesis

(1) A = s, B = r, C = q, D = p
(2) A = r, B = s, C = p, D = q
(3) A = s, B = t, C = r, D = q
(4) A = s, B = r, C = p, D = q

Q.166 The name Melvin Calvin is associated with–

(1) Synthesis of ATP during photosynthesis

(2) Release of water during photosynthesis

(3) Carbon fixation during photosynthesis

(4) Capature light energy during photosynthesis

Q.167 Considering all plants the process of photosynthesis can occur –

(1) In roots

(2) In shoots

(3) Any cell of the plant

(4) Chlorophyll rich cells of the plant

Q.168 In the initial fixation of CO_2 in C_3 plants

(1) CO_2 reacts with PGA

(2) CO_2 react with PEPA

(3) CO_2 reacts with RuBP

(4) CO_2 rects with RuMP

Q.169 That in photosynthesis there are two pigment systems and two phtosystems was discovered by –

(1) Hill (2) Emerson

(3) Blackman (4) Arnon

Q.170 Emerson found red drop in wavelength –

(1) 660 nm (2) 670 nm

(3) 680 nm (4) 680-700 nm

Q.171 Of the total amount of water absorbed by the plant, its actual percentage used during photosynthesis is –

(1) 50% (2) 90%

(3) hardly 1% (4) 25%

Q.172 Which plant was used by Robert Hill in Hill's reaction ?

(1) Chlorella (2) Tradescantia

(3) Spinach (4) Stellaria

EXERCISE - 2

Q.1 Oxygen which is liberated during photosynthesis comes from-
(1) Carbon di oxide (2) Water
(3) Chlorophyll
(4) Phosphoglyceric acid

Q.2 Nine-tenth of the world photosynthesis is carried out by-
(1) Shrubs (2) Herbs
(3) Trees (4) Algae

Q.3 The process of taking in CO_2 by plants and releasing O_2 is termed as-
(1) Transpiration (2) Respiration
(3) Photosynthesis (4) Endosmosis

Q.4 In plants during the process of photosynthesis-
(1) CO_2 is taken in (2) O_2 is taken in
(3) CO_2 is taken out
(4) O_2 is taken in and CO_2 is given out

Q.5 Our present day view regarding photosynthesis is that-
(1) Converts light energy into chemical energy
(2) Creates useful energy
(3) Fixes CO_2 into carbohydrates
(4) Reverse the action of respiration

Q.6 In which of the following process, the light energy is converted into chemical energy-
(1) Digestive action (2) Respiration
(3) Photosynthesis (4) Fermentation

Q.7 The dark reaction in photosynthesis is called so because-
(1) It can only occur in dark
(2) It does not require light
(3) None of these
(4) Both (1) and (2)

Q.8 During photosynthesis the oxygen in glucose comes from-
(1) Water (2) Carbon di oxide
(3) O_2 in air
(4) Both from water and CO_2

Q.9 The law of limiting factor for photosynthesis was given by-
(1) R. Hill (2) Krebs
(3) Calvin (4) Blackman

Q.10 The percentage of light energy utilized by higher plants, in the process of photosynthesis is -
(1) 100% (2) 10%
(3) 50% (4) 1-2%

Q.11 Photosynthesis is most active in-
(1) Sun light (2) Yellow light
(3) Red light (4) Green lights

Q.12 Beside water and light which is more essential as a raw material for food formation-
(1) CO_2 (2) O_2
(3) NADP (4) Mineral salts

Q.13 The concentration of CO_2 in the atmosphere is approximately-
(1) 0.003% (2) 0.03%
(3) 0.30% (4) 3.00%

Q.14 If the CO_2 content of the atmosphere is as high as 300 parts per million-
(1) All plants would be killed
(2) The plants would not grow properly
(3) Plants would grow for some time and then die
(4) The plants would thrive wells

Q.15 R.Hill used a dye for his famous Hill-reaction-
(1) Dichlorophenol indophenol DCPIP
(2) Sulphur green
(3) Methylene blue
(4) Eosine

Q.16 The isotope of carbon used extensively for studies in photosynthesis-
(1) C^{13} (2) C^{14}
(3) C^{15} (4) C^{16}

Q.17 Which is the evidence to show that oxygen released in photosynthesis comes from water-
(1) Isotopic oxygen (O^{18}) supplied as H_2O appears in the O_2 released in photosynthesis
(2) Activated chloroplast in water released O_2 if supplied potassium ferrocyanide or some other reducing agent in the absence of CO_2
(3) Photosynthesis bacteria use H_2S and CO_2 to make carbohydrates, H_2O and sulphur
(4) All of the above

Q.18 The path of CO_2 in the dark reaction of photosynthesis was successfully traced by the use of the following-

(1) $O_2{}^{18}$ (2) $C^{14}O_2$

(3) P^{32} (4) X-rays

Q.19 Discovery of Emerson effect has already shown the existence of-

(1) Two distinct photosystems

(2) Light and dark reactions of photosynthesis

(3) Photophosphorylation

(4) Photorespiration

Q.20 The colour of light not utilized during photosynthesis is-

(1) Violet (2) Green

(3) Red (4) Blue

Q.21 During the process of photosynthesis the raw materials used are-

(1) Glucose (2) Chlorophyll

(3) Starch (4) CO_2 and H_2O

Q.22 Products of photosynthesis are :-

(1) Carbon dioxide and food material

(2) Cabohydrates and oxygen

(3) Carbon dioxide and oxygen

(4) Formaldehyde and nitrogen

Q.23 Usually the process of photosynthesis is :

(1) Slower than respiration

(2) Faster than respiration

(3) Equal to respiration

(4) Any of the above is possible

Q.24 Name the scientist, who first pointed out that plants purify foul air by bell jar experiment.

(1) Willstatter (2) Robert Hooke

(3) Priestley (4) Iean Senebier

Q.25 Of the total amount of water absored by the plant, its actual percentage used during photosynthesis is : -

(1) 50% (2) 90%

(3) 1% (4) 25%

Q.26 It is only the green part of the plant, which takes part in

(1) Respiration (2) Transpiration

(3) Photosynthesis (4) Osmosis

Q.27 Moll's experiment explains that

(1) Carbon dioxide is essential for photosynthesis

(2) Chlorophyll and water are necessary for photosynthesis

(3) Light and water are essential for photosynthesis

(4) All the above are correct

Q.28 The chemical composition of pigments chlorophylls and carotenoids for the first time was given by :-

(1) Willstatter and Stoll

(2) Mayer and Anderson

(3) Robert Mayer

(4) Senebier

Q.29 Which of the following is not a significance of photosynthesis ?

(1) Glucose synthesis for most of consumer

(2) Increase in green house effect

(3) Provides O_2 for syntheesis of ozone umbrella

(4) Provides O_2 for cell respiration

Q.30 Oxygen during photosynthesis comes from water was proved by O^{18} experiment : -

(1) Ruben and Kamen

(2) Hill

(3) Warburg

(4) Blackman

Q.31 Name of the scientist who pointed out the importance of different wavelengths of light using a green algae and aerobic bacteria :-

(1) Priestley (2) Ingen-Housz

(3) K.V. Thimann (4) Engleman

Q.32 Conversion of light energy into chemical energy within the plant body was first stated by?

(1) Mayer and Anderson

(2) Calvin

(3) Robert Mayer

(4) Willstatter and Stoll

Q.33 Photosynthesis includes

(1) Light phase

(2) Dark phase

(3) Light and dark phase

(4) None of the above

Q.34 The rate of photosynthesis decreases if the wavelength of visible light exceeds 680 nm. This was shown by which scientist & what is its R ?

(1) Black man - Law of limiting factors

(2) Calvin & Benson - Photooxidation

(3) Emerson & Arnold - Red drop

(4) Ruben & Kamen - Photolysis

Q.35 Which of the following category of photosynthetic plants posses minimum transpiration ratio (TR).

(1) C_3-Plants (2) C_4-Plants

(3) CAM-Plants (4) All the above

Q.36 The most effective wavelength of visible light in photosynthesis in the region of which of the following ?

(1) Green (2) Yellow

(3) Red (4) Violet

Q.37 Photosynthesis is mainly responsible for the existence of

(1) Animals of this earth

(2) Plants on this earth

(3) Both plants and animals

(4) None of the above

Q.38 Which step of non cyclis photophosphorylation is blocked by DCMU ?

(1) Flow of e^- between PS I to Fd

(2) Flow of e^- between cyto b_6 to cyto. f

(3) Flow of e– between PC to PS I

(4) Flow of e– between PS II to PQ

Q.39 The radiant energy is tored in the form of chemical energy in -

(1) NADP (2) Stored food

(3) RNA (4) DNA

Q.40 How many quanta are required to reduce one molecule of CO_2 and produce one molecule of O_2 in green plant photosynthesis ?

(1) 1 (2) 8

(3) 16 (4) 32

Q.41 Photosynthesis is

(1) Oxidative, exergonic, catabolic

(2) Redox-reaction, endergonic, anabolic

(3) Reductive, exergonic, anabolic

(4) Reductive, endergonic, catabolic

Q.42 The significance of light & chlorophyll in photosynthesis was discovered by

(1) Priestley (2) Ingenhousz

(3) Englemann (4) Blackkan

Q.43 What is photosynthetic quotient ?

(1) O_2/CO_2 (2) CO_2/O_2

(3) O_2/Strach (4) Water/starch

Q.44 What is the common value of PQ (Photosynthetic quotient) of a leaf ?

(1) > 1 (2) < 1

(3) One (4) Zero

Q.45 Which of the following carries out non-oxygenic photosynthesis ?

(1) Caynobacteria (2) Crab grass

(3) Bacteria (4) Wheat plant

Q.46 What is the unique process which has supported life on this planet ?

(1) N_2 fixation (2) Photosynthesis

(3) Protein synthesis (4) Respiration

Q.47 Wavelength of light responsible for Emerson's enhancement effect : -

(1) only 680 nm↑

(2) only 680 nm↓

(3) infra red wavelength

(4) Both 680 nm↑ and 680 nm↓

Q.48 The "red - drop" phenomenon is due to the disruption of the photo chemical activity of

(1) PS - I

(2) PS-I & PS-II both

(3) PS - II

(4) Carotenoids

Q.49 True for photosynthesis : -

(1) Oxidation of CO_2 and reduction of H_2O

(2) Process which connects the biotic and abiotic world

(3) Exergonic process

(4) Oxidation of Glucose

Q.50 Which of the following order is correct about the rate of photosynthesis ?

(1) Blue > yellow > orange > red

(2) Blue > red > yellow > orange

(3) Red > blue > yellow > orange

(4) Yellow > orange > blue > red

Q.51 Who discoverd chlorophyll ?
(1) Schimper (2) Errera
(3) Coventou (4) Sachs

Q.52 Who discovered carotenoid ?
(1) Schimper (2) Willstatter
(3) Wakenroder (4) Warburg

Q.53 The process of photosynthesis takes place in
(1) Roots only
(2) Shoot only
(3) All the cells of plant
(4) Chlorophyll containing cells only

Q.54 Leaves appear green because
(1) They absorb green light
(2) They reflect green light
(3) They absorb & reflect green light
(4) They absorb & reflect white light

Q.55 First of all which organism creates oxidsing atmosphere on earth ?
(1) Cyanobacteria (2) Photosynthesis
(3) Ferns (4) Dicots

Q.56 During photosynthesis, oxygen is evolved from :-
(1) H_2S (2) H_2O
(3) CO_2 (4) HCO_3

Q.57 The process of photo-phosphorylation take place in -
(1) Chloroplast (2) Ribosomes
(3) Mitochondria (4) Cell-wall

Q.58 PS I occurs in
(1) Appressed part of granal thylakoids
(2) Appressed and non appressed part of grana thylakoids
(3) Stroma
(4) Stroma thylakoids and non-appressed part of grana thylakoids

Q.59 Photophosphorylation means synthesis of
(1) ATP from ADP (2) NADP
(3) ADP from ATP (4) PGA

Q.60 Which one of the following pigment does not occur in the chloroplast ?
(1) Carotene (2) Xanthophyll
(3) Chlorophyll 'b' (4) Anthocyanin

Q.61 Start of manufacture of chlorophyll in a plant seedling is stimulated by
(1) Gibberellins (2) Indole acetic acid
(3) Kinin (4) light

Q.62 Chlorophyll contains
(1) Fe (2) Mg
(3) K (4) Mn

Q.63 Which pigment is water soluble ?
(1) Chlorophyll (2) Carotene
(3) Anthocyanin (4) Xanthophyll

Q.64 Chloroplasts fix :
(1) Carbon dioxide (2) Oxygen
(3) Nitrogen (4) Hydrogen

Q.65 ATP formation during photosynthesis is termed-
(1) Phosphorylation
(2) Photophosphorylation
(3) Oxidative phosphorylation
(4) Photolysis

Q.66 The main site for dark reaction of photosynthesis is
(1) Stroma (2) Grana
(3) Intergrana (4) Mitochondria

Q.67 What will be left if chlorophyll is burnt ?
(1) Magnesium (2) Manganese
(3) Iron (4) Sulphur

Q.68 Chlorophyll is present : -
(1) In the grana of chloroplasts
(2) On the surface of chloroplasts
(3) Dispersed through out the chloroplasts
(4) In the stroma of chloroplasts

Q.69 Bacteriochlorophyll differs from chlorophyll 'a' in having : -
(1) One pyrrole nucleus with one hydrogen
(2) One pyrrole nucleus with two hydrogen
(3) One pyrrole nucleus with three hydrogen
(4) One pyrrole nucleus with four hydrogen

Q.70 Solar energy is converted into ATP in
(1) Mitochondria (2) Chloroplast
(3) Ribosome (4) Peroxisome

Q.71 In blue-green alage photosynthesis takes place in -
(1) Cloroplasts (2) Lamellisome
(3) Heterocysts (4) Carotene

Q.72 Conditions necessary for photosynthesis are :-
(1) Light and suitable temperature
(2) Chlorophyll and water
(3) Carbon dioxide
(4) All of the above

Q.73 Photosynthesis is maximum during : -
(1) Continuous weak light
(2) Continuous strong light
(3) Intermittent light
(4) None of the above

Q.74 Process of photophosphorylation was first given by
(1) Hill (2) Willstatter & Stoll
(3) Arnon (4) Park & Biggins

Q.75 Which colour of light gives maximum adsorption peak by chlorophyll"a" ?
(1) Blue light (2) Green light
(3) Violet light (4) Red light

Q.76 Which scientists are related with light reaction & what its site ?
(1) Arnon & Hill, Grana
(2) Ruben & Kamen, Stroma
(3) Willstatter, Stoll, inner membrane of chloroplast
(4) Calvin & Benson, outer membrane of chloroplast

Q.77 Presence of carotenes in chloroplast help in
(1) ATP synthesis
(2) Transferring radiant energy into chemical energy
(3) Protecting chlorophyll molecules from photooxidation
(4) Absorption of longer wavelength of light

Q.78 Ribulose bisphosphate carboxylase oxygenase (Rubisco) is located in
(1) Golgibodies (2) Peroxisome
(3) Chloroplast (4) Mitochondria

Q.79 Which of the following photosynthetic bacteria have both PS-I & PS-II ?
(1) Purple sulphur bacteria
(2) Cyanobacteria
(3) Purple non sulphur
(4) Gree sulphur bacteria

Q.80 The site of oxygen evolution and photosynthetic phosphorylation in chloroplast is : -
(1) Grana
(2) Matrix
(3) Surface of chloroplast
(4) Inner wall of chloroplast

Q.81 The formula of chlorophyll 'a' is
(1) $C_{35}H_{72}O_5N_4Mg$ (2) $C_{55}H_{70}O_3N_4Mg$
(3) $C_{55}H_{72}O_5N_4Mg$ (4) $C_{51}H_{70}O_6N_4Mg$

Q.82 The number of pigment molecules in quantasome is :
(1) 250 - 400 (2) 300 - 900
(3) 500 - 600 (4) 50 - 100

Q.83 The main difference between chlorophyll 'a' and 'b' is :
(1) Chlorophyll 'a' is a linear chain compound and 'b' is branched chain
(2) Chlorophyll 'a' has no Mg^+ ion in centre of molecule
(3) In chlorophyll 'a' three is $-CH_3$ group whereas in 'b' it is –CHO group
(4) All of the above

Q.84 For chorophyll formation in plants elements needed are
(1) Sodium and copper
(2) Calcium and potassium
(3) Iron and magnesium
(4) Iron and calcium

Q.85 Which one is the precursor of chlorophyll ?
(1) Tryptophan
(2) Protochlorophyll
(3) Bacterio chlorophyll
(4) Bacterioviridin

Q.86 The role of chlorophyll in photosynthesis is
(1) Absorption of CO_2
(2) Absorption of light
(3) Absorption of light and photochemical decomposition of water
(4) Absorption of water

Q.87 Chloroplast contains maximum quantity of
(1) Pyruvic carboxylase
(2) Hexokinase
(3) RUDP carboxylase
(4) None of these

Q.88 Chlorophyll 'a' is found in
(1) All O_2 releasing photosynthetic forms
(2) Only higher plants
(3) Higher plants that photosynthesize
(4) All photosynthetic eukaryotes

Q.89 In angiosperms, synthesis of chlorophyll occurs in presence of : -
(1) Phytochrome (2) Light
(3) Cytochrome (4) None of the above

Q.90 In pigment system-I active chlorophyll occurs in presence of : -
(1) P-600 (2) P-680
(3) P-700 (4) P-720

Q.91 Chlorophyll 'e' is generally present in
(1) Thallophytes (2) Rhodophytes
(3) Mycophytes (4) Xanthophytes

Q.92 In pigment system-II the trapping centre of light energy is -
(1) P-700 (2) P-680
(3) Carotene (4) Xanthopyll

Q.93 Basic structure of all chlorophyll comprises of
(1) Cytochrome sytem
(2) Flavoprotiens
(3) Porphyrin system
(4) Plastocyanin

Q.94 The chemical fomula of bacteriochlorophyll is
(1) $C_{55}H_{70}O_4N_4Mg$ (2) $C_{55}H_{72}O_5N_4Mg$
(3) $C_{55}H_{70}O_5N_4Mg$ (4) $C_{55}H_{74}O_6N_4Mg$

Q.95 What is the by product of bacterial photosynthesis ?
(1) O_2 (2) H_2S
(3) S (4) H_2S

Q.96 Photosynthetic bacteria do not contain
(1) PS - I (2) PS - II
(3) PS- I or PS-II (4) Quantasome

Q.97 In photosynthetic bacteria the photosynthesis takes place in
(1) Chloroplast (2) Chromoplast
(3) Chromatophores (4) Mesosomes

Q.98 What is the role of light in plants ?
(1) Necessary for photosynthesis
(2) Controls growth & Movement
(3) Controls distribution of hormones & flowering
(4) All of the above

Q.99 Photosynthetic units are referred as
(1) Quantasome (2) Oxysome
(3) Phycobilisome (4) F_1-particles

Q.100 Rubisco constitutes
(1) 4% of the chloroplast protein
(2) 11% of the chloroplast protien
(3) 16% of the chloroplast protien
(4) 25% of the chloroplast protein

EXERCISE - 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Photochemical reactions in the chloroplasts are directly involved in - **[Uttaranchal 2004]**

(1) Fixation of carbondioxide

(2) Synthesis of glucose and starch

(3) Formation of phosphoglyceric acid

(4) Photolysis of water and phosphorylation of ADP to ATP

Q.2 Which of the following elements are essential for the photolysis of water - **[Uttaranchal 2004]**

(1) Ca and Cl (2) Mn and Cl

(3) Zn and I (4) Cu and Fe

Q.3 Which of the following is involved in transfer of electrons in photosynthesis - **[Uttaranchal 2005]**

(1) Phytochrome (2) Cytochrome

(3) Photohormone (4) Desmosome

Q.4 Substrate for photorespiration is - **[Uttaranchal 2005]**

(1) Glycolate (2) Glucose

(3) Lipid (4) Sucrose

Q.5 In aquaria, green plants are grown for : **[Uttaranchal 2005]**

(1) Co_2 production (2) Strarch production

(3) O_2 Production (4) Increase beauty

Q.6 A structure known as peroxisomes is associated with - **[Uttaranchal 2006]**

(1) Photosynthesis (2) Respiration

(3) Photorespiration (4) Photophosphorylation

Q.7 In the mesophyll cells of CAM plants, CO_2 fixation during day occur through - **[Uttaranchal 2006]**

(1) RuBP-oxygenase (2) PEP-carboxylase

(3) RuBP-carboxylase

(4) Both RuBP carboxylase and PEP carboxylase

Q.8 The first electron acceptor in photosystem-I of cyclic photophosphorylation is - **[Uttaranchal 2006]**

(1) Cytochrome (2) Plastocyanin

(3) Ferredoxin (4) Plastoquinone

Q.9 Kranz anatomy is found in leaves of : **[West Bengal 2007]**

(1) C_3 plants (2) C_4 plants

(3) Both C_3 and C_4 plants

(4) None of these

Q.10 In bacterial photosynthesis - **[West Bengal 2007]**

(1) PS I is present (2) PS II is present

(3) Both PS I and PS II present

(4) None of these are present

Q.11 Which chlorophyll molecule does not have a phytol tail - **[West Bengal 2007]**

(1) chl a (2) chl b

(3) chl c (4) chl d

Q.12 Calvin, used algae in his experiment, for tracing out the path of carbon, the algae used were- **[West Bengal 2007]**

(1) Chlorella and Chlamydomonas

(2) Chlorella and Scenedesmus

(3) Chlorococcum and Chorella

(4) Chlorococuum and Scenedemus

Q.13 Which element is essential for photolysis of water: **[C.G. PMT 2004]**

(1) Nitrogen (2) Chlorine

(3) Carbon (4) Oxygen

Q.14 In C_4 plants, initial CO_2 fixation takes place in the chloroplasts of : **[C.G. PMT 2004]**

(1) Guard cells (2) Mesophyll cells

(3) Spongy tissue (4) Bundle sheath

Q.15 Which one of the following elements is required for photosynthetic oxygen evolution? **[C.G. PMT 2007]**

(1) Copper (2) Iron

(3) Manganese (4) Zinc

Q.16 Agranal chloroplasts occurs in -
[C.G. PMT 2005]
(1) Succulent (2) C_3 plants
(3) C_4 plants (4) Hydrophytes

Q.17 The wavelength of light most absorbed by chlorophyll-'a' during photosynthesis is :
[C.G. PMT 2005]
(1) 400 nm (2) 550 nm
(3) 660 nm (4) 700 nm

Q.18 Which are related with photorespiration :
[C.G. PMT 2005]
(1) Spherosome (2) Lysosomes
(3) Glyoxysomes (4) Peroxisomes

Q.19 Which of the following is a C_4 plant :
[C.G. PMT 2006]
(1) Sugarcane (2) Mango
(3) Apple (4) Tomato

Q.20 The first stable compound formed in photosynthesis of C_3 plants is :
[C.G. PMT 2006]
(1) Phosphoglyceric acid
(2) Starch
(3) Pyruvic acid
(4) Ribulose diphosphate

Q.21 Ferridoxine is component of :
[C.G. PMT 2006]
(1) PS-I (2) PS-II
(3) Hill reaction (4) P_{680}

Q.22 Correct percentage of CO_2 in atmosphere is:
[C.G. PMT 2006]
(1) 003% (2) 03%
(3) 1% (4) 11 %

Q.23 Isotopes used in photosynthesis were :
[C.G. PMT 2006]
(1) C^{11} and P^{32} (2) C^{15} and P^{32}
(3) C^{16} and P^{15} (4) C^{14} and O^{18}

Q.24 P_{680} is related with : **[C.G. PMT 2006]**
(1) PS-I (2) PS-II
(3) Hill reaction (4) None

Q.25 NADP reduces to $NADPH_2$ in :
[C.G. PMT 2006]
(1) PS-I (2) PS-II
(3) Calvin cycle (4) Non cyclic ETS

Q.26 Hills reaction completes in :
[C.G. PMT 2006]
(1) Light (2) Dark
(3) Both (4) None

Q.27 Who described C4 pathway for first time ?
[Jharkhand- 2006]
(1) Hatch and Slack (2) Robert Hill
(3) Hens Kerbs (4) Melvin Kelvin

Q.28 In photosynthesis, for synthesis of one mole of glucose number of ATP and $NADPH_2$ required is : **[Jharkhand- 2006]**
(1) 12 and 18 (2) 18 and 12
(3) 6 and 12 (4) 18 and 18

Q.29 The first acceptor of CO_2 in C_4 plant is -
[Jharkhand- 2005]
(1) Pyruvic acid
(2) Phosphoenol pyruvic and
(3) Acetic acid (4) Oxaloacetic acid

Q.30 Insectivorous plants usually survive in -
[Jharkhand- 2005]
(1) water rich soil
(2) N_2 deficient soil
(3) N_2 rich soil
(4) Sugar deficient medium

Q.31 In the process of photosynthesis water molecule breaks in : **[Jharkhand- 2005]**
(1) Red drop (2) Photolysis
(3) Phosphorylation
(4) Carbon assimilation

Q.32 Who proved that oxygen evolved in photosynthesis comes from water :
[Jharkhand- 2004]
(1) Calvin (2) Mayer
(3) Blackman
(4) Ruben,Hassid and Kamen

Q.33 The process in which water is split during photosynthesis is : **[Jharkhand- 2004]**

(1) Plasmolysis (2) Photolysis

(3) hydrolysis (4) haemolysis

Q.34 Which the following is used during discovery of calvin cycle ? **[Jharkhand- 2004]**

(1) Spirogyra (2) Volvox

(3) Chlamydomonas (4) Chlorella

Q.35 Which of the following is maximum in chloroplast ? **[Bihar- 2005]**

(1) RuBP caroxylase (2) Hexokinase

(3) Phosphatase (4) Nuclease

Q.36 O_2 released in the process of photosynthesis, comes from : **[Bihar- 2004]**

(1) CO_2 (2) water

(3) sugar (4) pyruvic acid

Q.37 The first carbon-dioxide acceptor in C_4 plants is : **[Bihar- 2003]**

(1) Phosphoenol pyruvate

(2) Oxalo acetic acid

(3) Phosphoglyceric acid

(4) Ribulose 1, 5-diphosphate

Q.38 The C_4 plants are different from the C_3 plants with reference to the : **[Bihar- 2003]**

(1) type of pigments involved in photosynthesis

(2) the number of NADPH that are consumed

(3) end product

(4) the substance that accepts CO_2 in carbon assimilation and first stable product

Q.39 Calvin cycle occurs in : **[Bihar- 2003]**

(1) Cytoplasm (2) Chloroplasts

(3) Mitochondria (4) Glyoxysomes

Q.40 Oxygen which is liberated during photosynthesis comes from : **[Bihar- 2002]**

(1) CO_2 (2) H_2O

(3) Phosphoglyceric (4) Chlorophyll

Q.41 Which one is produced during cyclic photo phosphorylation ? **[Bihar- 2001]**

(1) ATP and $NADPH_2$

(2) ATP only

(3) ATP and O_2 (4) $NADPH_2$

Q.42 A student sets up an experiment on photosynthesis as follows : **[Bihar- 2006]**

He takes soda water in a glass tumbler and add a chlorophyll into the contents and keeps the tumbler exposed to sunlight hoping that he has provided necessary ingredients for photosynthesis to proceed (viz. CO_2 H_2O, chlorophyll and light). What do you think what happen after, say a few hours of exposers of light ?

(1) Photosynthesis will take place and glucose will be produced

(2) Photosynthesis will take place and starch will be produced which turn the mixture turbid

(3) Photosynthesis will not take place because CO_2 dissolved in soda water escapes into the atmosphere

(4) Photosynthesis will not take place because intact chloroplasts are needed for the process

Q.43 The first reaction in photorespiration is : **[UP CPMT- 2001]**

(1) carboxylation (2) decarboxylation

(3) oxygenation (4) phosphorylation

Q.44 The law of limitting factor, in photosynthesis, was given by : **[UP CPMT- 2001]**

(1) R. Hill (2) Calvin

(3) Blackman (4) Amon

Q.45 Carbon dioxide acceptor in C_3 plants is - **[UP CPMT- 2001]**

(1) PEP (2) RuDP

(3) PGA (4) NADP

Q.46 Insectivorous plants grow in soils which are deficient in : **[UP CPMT- 2001]**

(1) Nitrogen (2) Calcium

(3) Magnesium (4) Carbohydrate

Q.47 Quantasomes are found in : **[UP CPMT- 2002]**

(1) Mitochondria (2) Chloroplast

(3) Lysosome

(4) Endoplasmic reticulum

Q.48 During photosynthesis : **[UP CPMT- 2002]**

(1) O_2 evolved come from CO_2

(2) ATP is formed

(3) ATP is not formed

(4) Water is required as medium but it does not take part in photosynthesis

Q.49 Cu is present in - **[UP CPMT- 2003]**

(1) Plasmalemma (2) Plastoquinone

(3) Plastocyanin (4) Ferredoxin

Q.50 In which of the following oxygen does not evolve during photosynthesis ? **[UP CPMT- 2003]**

(1) Photosynthetic red algae

(2) Photosynthetic green algae

(3) Photosynthetic blue-green algae

(4) Photosynthetic bacteria

Q.51 In the process of photosynthesis : **[UP CPMT- 2003]**

(1) O_2 is taken and CO_2 is evolved

(2) O_2 is taken and CO_2 is not evolved

(3) CO_2 is taken and O_2 is evolved

(4) CO_2 is taken and NO_2 is evolved

Q.52 Cuscuta is a : **[UP CPMT- 2003]**

(1) Parasitic plant (2) Symbiotic plant

(3) Predator (4) Decomposer

Q.53 In photosynthesis there is - **[UP CPMT- 2003]**

(1) Reduction of H_2O

(2) Oxidation of H_2O

(3) Oxidation of CO_2

(4) Oxidation of NO_2

Q.54 In case of C_4 plants the acceptor of CO_2 is: **[UP CPMT- 2004]**

(1) Phosphoglyceraldehyde

(2) Ribulose monophosphate

(3) Phosphoenol pyruvate

(4) Ribulose diphosphate

Q.55 The first step in light reaction of photosynthesis- **[UP CPMT- 2004]**

(1) Formation of ATP

(2) Ionization of water

(3) Attachment of CO_2 to a pentose sugar

(4) Excitement of electron of chlorophyll by a photon of light

Q.56 Sugarcane show high efficiency of CO_2 fixation because of : **[UP CPMT- 2004]**

(1) Calvin cycle

(2) Hatch and slake cycle

(3) TCA cycle (4) Greater sunlight

Q.57 Source of CO_2 for photosynthesis during day in CAM plants is - **[UP CPMT- 2005]**

(1) 3-PGA (2) Malic acid

(3) Oxalo-acetic acid (4) Pyruvate

Q.58 Chlorophyll has.....in its centre - **[UP CPMT- 2005]**

(1) Iron (2) Magnesium

(3) Copper (4) Sulphur

Q.59 Calvin cycle of C_4 plants operates in : **[UP CPMT- 2005]**

(1) Grana of mesophyll chloroplasts

(2) Stroma of chloroplasts in mesophyll cells

(3) Bundle sheath cells chloroplasts

(4) The statements is wrong

Q.60 Photorespiration takes place in - **[UP CPMT- 2005]**

(1) Chloroplast, mitochondria

(2) Mitochondria, peroxisome

(3) Bundle sheath chloroplasts

(4) Chloroplast, peroxisome, mitochondria

Q.61 Which one is false about kranz anatomy ? **[UP CPMT- 2005]**

(1) Bundle sheath cells have large chloroplast and less developed grana

(2) Mesophyll cells have large chloroplast and more developed grana

(3) It is found in Atriplex, sugarcane, maize

(4) Plant having it have better photosynthesizing power than C_3 plants

Q.62 Who discovered that CO_2 is taken in and O_2 is released by green plants ? **[UP CPMT- 2006]**

(1) Meyer (2) Ijugen Housz

(3) Senebier (4) Priestly

Q.63 Primitive photosynthetic plants utilize solar energy by : **[UP CPMT- 2006]**

(1) Cyclic photophosphorylation

(2) Z-scheme

(3) Both (1) and (2)

(4) Calvin cycle

Q.64 Which one of the following is a wasteful process ? **[UP CPMT- 2006]**

(1) Photorespiration (2) Respiration

(3) Photosynthesis (4) ETS

Q.65 DCMU- **[UP CPMT- 2007]**

(1) Inhibits PS-1

(2) Inhibits PS-II

(3) Destroy chloroplast

(4) Inhibits oxidative phosphorylation

Q.66 NH_3 releases from **[MP PMT- 2007]**

(1) Photorespiration (2) Dark respiration

(3) CAM (4) All of these

Q.67 Photosystem I and Photosystem II are found in : **[MP PMT- 2001]**

(1) Stroma of chloroplast

(2) Grana of chloroplast

(3) Matrix of mitochondria

(4) Inner membrane of mitochondria

Q.68 A cell organelle essential for photorespiration is : **[MP PMT- 2001]**

(1) Ribosome (2) Dictyosome

(3) Peroxisome (4) Glysoxisome

Q.69 In which of the following the rate of transpiration is high ? **[MP PMT- 2001]**

(1) CAM Plant (2) C_3 plants

(3) C_3 and C_4 (4) C_4 plants

Q.70 Of which cell organelle is grana is part **[MP PMT- 2002]**

(1) Mitochondria (2) Chloroplast

(3) Aleurone grain (4) Starch grain

Q.71 The substrate of photorespiration is : **[MP PMT- 2002]**

(1) Glycolate (2) Glucose

(3) Pyruvic acid (4) Acetyl COA

Q.72 The maximum light absorbed by the chlorophyll 'a' is at the wavelength of : **[MP PMT- 2002]**

(1) 460 nm (2) 500 nm

(3) 600 nm (4) 660 nm

Q.73 During photosynthesis, Oxygen is evolved from: **[MP PMT- 2002]**

(1) H_2S (2) H_2O

(3) CO_2 (4) HCO_3

Q.74 Which of the following acts as electron carrier in both photosynthesis and respiration ? **[MP PMT- 2003]**

(1) Ferredoxin (2) Phytochrome

(3) Cytochrome (4) Cryptochrome

Q.75 Photosynthetic unit is : **[MP PMT- 2003]**

(1) Glyoxysome (2) Spherosome

(3) Microsome (4) Quantasome

Q.76 Warburg effect is related with : **[MP PMT- 2003]**

(1) conc. of O_2 (2) conc. of N_2

(3) conc. of H_2 (4) conc. of Cl

Q.77 Stroma is the ground substance of ..... **[MP PMT- 2004]**

(1) Endoplasmic reticulum

(2) Mitochondria

(3) Nucleous

(4) Chloroplast

Q.78 From which of the following peroxisomes in plants are associated : **[MP PMT- 2004]**

(1) Photorespiration (2) Photosynthesis

(3) Photoperiodism (4) Phototropism

Q.79 In C_3 plants the first stable product of photosynthesis is : **[MP PMT- 2004,05,06]**

(1) Malic acid

(2) Oxaloacetic acid

(3) Phosphoglyceric acid (PGA)

(4) Phosphoglyceraldehyde (PGAL)

Q.80 The process of taking CO_2 by plants and releasing O_2 is known as: **[MP PMT- 2004]**

(1) Photosynthesis (2) Endosmosis

(3) Transpiration (4) Respiration

Q.81 Which of the colour of light is mostly absorbed by chlorophyll 'a'? **[MP PMT- 2005]**

(1) Green (2) Red

(3) Blue (4) Infra red

Q.82 In photosynthesis, ATP is synthesized during: **[MP PMT- 2005]**

(1) Cyclic photophosphorylation

(2) Non-cyclic photophosphorylation

(3) Both (1) and (2)

(4) In the photolysis of water

Q.83 which of the following element is essential for photolysis of water ? **[MP PMT- 2005]**

(1) Fe (2) Mg

(3) Mn (4) Cu

Q.84 Peroxisomes are concerned with : **[MP PMT- 2005]**

(1) Respiration (2) Photorespiration

(3) Photosynthesis (4) Flowering

Q.85 Reduction process of CO_2 and ATP formation in plants has relationship. In this reaction ATP is : **[MP PMT- 2005]**

(1) Formed (2) Utilised

(3) Not utilised (4) None of these

Q.86 ATP synthesis during photosynthesis is termed as : **[MP PMT- 2006]**

(1) Phosphorylation

(2) Oxidative phosphorylation

(3) Photophosphorylation

(4) Photorespiration

Q.87 Which of the following is used during discovery of calvin : **[RMPT-2002]**

(1) Spirogyra (2) Volvox

(3) Chlamydomoans (4) Chlorella

Q.88 Primay receptor of CO_2 in photosynthesis is : - **[RMPT-2002]**

(1) Phosphoric acid

(2) Ribulose phosphate

(3) Glucose

(4) Ribulcose-1,5-biphosphate

Q.89 In sugarcane plant $^{14}CO_2$ is fixed in malic acid, in which the enzyme that fixes CO_2 is **[AIPMT-2002]**

(1) Ribulose biphosphate carboxylase

(2) Phosphoenol pyruvic acid carboxylase (PEP-case)

(3) Ribulose phosphate kinase

(4) Fructose phosphatase

Q.90 Photorespiration in C_3 plants starts from : - **[AIMS-2003]**

(1) Phosphoglycerate

(2) Glycerate

(3) Glycine

(4) Phosphoglycolate

Q.91 The subtrate of photorespiration is : - **[MP PMT-2002]**

(1) Glycolate (2) Glucose

(3) Pyruvic acid (4) Acetyl CO-A

Q.92 Tracer elements are :- **[MP PMT -2002]**

(1) Micro-elements (2) Macro-elements

(3) Radio-isotopes (4) Vitamins

Q.93 Choose the correct match - **[AIPMT -2002]**

Bladderwort, sundew, venus flytrap : -

(1) Nepenthese, Dionea, Drosera

(2) Nepenthese, Utricularia, Vanda

(3) Utricularia, Drosera, Doionea

(4) Dionea, Trapa, Vanda

Q.94 Which of the following is wrong in relation to photorespiration : - **[AIPMT-2003]**

(1) It occurs is chloroplasts

(2) It occurs in daytime only

(3) It is a characteristic of C_4 plants

(4) It is a characteristic of C_3 plants

Q.95 Photosynthetically active radiation (PAR) represents the following range of wavelength : **[AIPMT-2004]**

(1) 400-700 nm (2) 500 - 600 nm

(3) 450 - 950 nm (4) 340 - 450 nm

Q.96 In C_3 plants, the first stable product of photosynthesis during the dark reaction is :- **[AIPMT-2004]**

(1) Phosphoglycereldehyde

(2) Malic acid

(3) Oxaloacetic acid

(4) 3-Phosphoglyceric acid

Q.97 Plants adapted to low light intensity have : - **[AIPMT-2004]**

(1) Leaves modified to spines

(2) Large photosynthetic unit size than the sun plants

(3) Higher rate of CO_2 fixation than the sun plants

(4) More extended root system

Q.98 In chloroplast, chlorophyll is present in the : **[AIPMT-2004]**

(1) Stroma (2) Outer membrane

(3) Inner membrane (4) Thylakoids

Q.99 Which one of the following categories of organisms do not evolve oxygen during photosynthesis : - **[AIMS-2004]**

(1) Red algae

(2) Photosynthetic bacteria

(3) C_4–plants with Kranz anatomy

(4) Blue green alage

Q.100 Which pair is wrong : - **[AIPMT-2001]**

(1) C_3 plant-maize

(2) Calvin cycle-PGA

(3) Hatch-Slack cycle-OAA

(4) C_4-plant-Kranz Anatomy

Q.101 Photosynthesis in C_4 plants is relatively less limited by atmospheric CO_2 levels because : **[AIPMT-2005]**

(1) Four carbon acids are the primary inital CO_2 fixation produts

(2) The primary fixation CO_2 is mediated via PEP carboxylase

(3) Effective pumping of CO_2 into bundlesheath cells

(4) Rubisco in C_4 plants has higher affinity for CO_2

Q.102 Chlorophyll in chloroplasts is located in : **[AIPMT-2005]**

(1) grana (2) pyrenoid

(3) stroma

(4) both grana and stroma

Q.103 As compared to a C_3-plant how many additional molecules of ATP are needed for net production of one molecule of hexose sugar by C_4-plants : **[AIPMT-2005]**

(1) two (2) six

(3) zero (4) twelve

Q.104 Carbohydrates, the most abundant biomolecules on earth, are produced by : **[AIPMT-2005]**

(1) all bacteria, fungi, and algae

(2) fungi, algae and green plant cells

(3) some bacteria, algae and green plants cells

(4) viruses, fungi and bacteria

Q.105 The deficiencies of micronutrients, not only affects growth of plants but also vital functions such as photosynthetic and mitochondrial electron flow. Among the list given belows, which group of three elements shell affect most, both photosynthetic and mitochondrial electron transport : **[AIPMT-2005]**

(1) Cu, Mn, Fe (2) Co, Ni, Mo

(3) Mn, Co, Ca (4) Ca, K, Na

Q.106 Chemiosmotic theroy of ATP synthesis in the chloroplasts and mitochondria is based on : **[AIPMT-2005]**

(1) Proton gradient

(2) Accumulation of K ions

(3) Accumulation of Na ions

(4) Membrane potential

Q.107 Photosynthetic Active Radiation (PAR) has the following range of wavelengths : **[AIPMT-2005]**

(1) 400-700 nm (2) 450-920 nm

(3) 340-450 nm (4) 500-600 nm

Q.108 In light reaction of photosynthesis oxygen is come from - **[RPMT-2005]**

(1) Water (2) CO_2

(3) Soil (4) Atmosphere

Q.109 Product of light reaction of photosynthesis is **[RPMT-2005]**

(1) Carbohydrate
(2) ATP
(3) NADP and O_2
(4) $NADPH_2$, ATP & O_2

Q.110 In photosytem-I, the first electron acceptor is **[AIPMT-2005]**

(1) Plastocyanin
(2) An iron-sulphur protein
(3) Ferredoxin
(4) Cytochrome

Q.111 The translocation of organic solutes in sieve tube members is supported by **[AIPMT-2006]**

(1) Mass flow involving a carrier and ATP
(2) Cytoplasmic streaming
(3) Root pressure and transpiration pull
(4) P-protein

Q.112 During photorespiration, the oxygen consuming reactions(s) occur in **[AIPMT-2006]**

(1) Grana of chloroplasts and peroxisomes
(2) Stroma of chloroplasts
(3) Stroma of chloroplasts and mitochondria
(4) Stroma of chloroplasts and peroxisomes

Q.113 The first acceptor of electrons from an excited chlorophyll molecule of photosystem II is :- **[AIPMT-2007]**

(1) Quinone (2) Cytochrome
(3) Iron-sulphur protein
(4) Ferredoxin

Q.114 In the leaves of C_4 plants, malic acid formation during CO_2 fixation occurs in the cells of :- **[AIPMT-2008]**

(1) Epidermis (2) Mesophyll
(3) Budndle Sheath (4) Phloem

Q.115 In leaves of C_4 plants malic acid synthesis during CO_2 fixation occurs in : - **[AIPMT-2008]**

(1) Bundle sheath (2) Guard cells
(3) Empidermal cells (4) Mesophyll cells

Q.116 The C_4 plants are photosynthetcially more efficient then C_3 plants because : - **[AIPMT-2008]**

(1) The CO_2 efflux is not prevented
(2) They have more chloroplasts
(3) The CO_2 compensation point is more
(4) CO_2 generated during photorespiration is trapped and recylced through PEP carboxylase

Q.117 Electrons from excited chlorophyll molecule of photosystem II are accepted first by : - **[AIPMT-2008]**

(1) Quinone (2) Ferredoxin
(3) Cytochrome - b (4) Cytochrome - f

Q.118 Stroma in the chloroplasts of higher plant contains **[AIPMT-2009]**

(1) Chlorophyll
(2) Light-independent reaction enzymes
(3) Light-independent reaction enzymes
(4) Ribosomes

Q.119 Oxygenic photosynthesis occurs in : - **[AIPMT-2009]**

(1) Chlorobium (2) Chromatium
(3) Oscillatoria (4) Rhodospirillum

Q.120 Cyclic photophosphorylation results in the formation of : - **[AIPMT-2009]**

(1) ATP
(2) NADPH
(3) ATP and NADPH
(4) ATP, NADPH and O_2

Q.121 PGA as the first CO_2 fixation product was discovered in photosynthesis of- **[AIPMT-2010]**

(1) Angiosperm (2) Alga
(3) Bryophyte (4) Gymnosperm

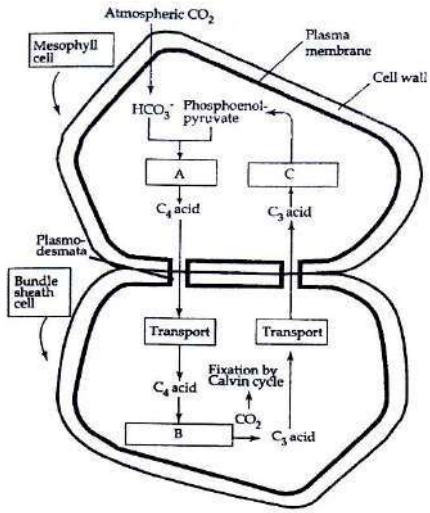
Q.122 C_4 plants are more efficient in photosynthesis than C_3 plants due to- **[AIPMT-2010]**

(1) Presence of thin cuticle
(2) Lower rate of photorespiration
(3) Higher leaf area
(4) Presence of larger number of chloroplasts in the leaf cells

Q.123 Kranz anatomy is one of the characteristics of the leaves of- **[AIPMT-2010]**

(1) What (2) Sugarcane
(3) Mustard (4) Potato

Q.124 Study the pathway given below :



In which of the following options correct words for all the three blanks A, B and C are indicated? **[AIPMT-2010]**

	A	B	C
(1)	Fixation	Transamination	Regeneration
(2)	Fixation	Decarboxylation	Regeneration
(3)	Carboxylation	Decarboxylation	Reduction
(4)	Decarboxylation	Reduction	Regeneration

Q.125 Read the following four statements, A, B, C and D and select the right option having both correct statements- **[AIPMT-2010]**

(A) Z scheme of light reaction takes place in presence of PS-I only

(B) Only PS-I is functional in cyclic photophosphorylation

(C) Cyclic photophosphorylation results into synthesis of ATP and $NADPH_2$

(D) Stroma lamellae lack PS-II as well as NADP

(1) A and B (2) B and C

(3) C and D (4) B and D

Q.126 A process that makes important difference between C_3 and C_4 plants is : **[AIPMT Pre 2012]**

(1) Glycolysis (2) Photosynthesis

(3) Photorespiration (4) Transpiration

Q.127 Which one of the following organisms is correctly matched with its three characteristics? **[AIPMT Mains 2012]**

(1) Pea : C_3 pathway, Endospermic seed, Vexillry aestivation

(2) Tomato : Twisted aestivation, Axile placentation, Berry

(3) Onion : Bulb, Imbricate aestivation, Axile placentation

(4) Maize : C_3 pathway, Closed vascular bundles, Scutellum

These questions consist of two statements each, printed as "Assertion" and "Reason". While answering these Questions you are required to choose any one of the following responses.

(1) If both A and R are True and the R is a correct explanation of the A.

(2) If both A and R are True but R is not correct explanation of the A

(3) If A is True but the R is False.

(4) If both A and R are false.

Q.1 **A :** Dark reaction of photosynthesis occurs only in absence of light.

R : Dark reaction occur in grana.

Q.2 **A :** Photorespiration is a wasteful phenomenon in C_3-plants.

R : Decrease in photosynthetic productivity due to photorespiration.

Q.3 **A :** For evolution of O_2 in photosynthesis, PS-II is required.

R : O_2 is released in photosynthesis, of **Chromatium.**

Q.4 **A :** Insectivorous habit of plants is to cope with oxygen deficiency.

R : Insectivorous plants are non-green plants.

Q.5 **A :** O_2 is not released in photosynthesis of bacteria.

R : Photolysis of water is absent in bacterial photosynthesis.

Q.6 **A :** All plants are not photosynthetic.

R : Leaves are large in all types of plants.

Q.7 **A :** Lysosomes help in the process of photorespiration.

R : Lysosomes have enzymes for photorespiration.

Q.8 **A :** The first product of CO_2 fixation in C_4 plants is OAA.

R : Oxaloacetic acid is formed in agranal chloroplast.

Q.9 **A :** Dark-reaction occurs at night in the stroma of chloroplast.

R : All the enzymes responsible for CO_2 fixation remain inactive in presence of light.

Q.10 **A :** Oxygen liberates during photosynthesis in cyanobacteria.

R : Cyanobacteria use H_2S as source of electron or hydrogen.

Q.11 **A :** **Rafflesia** is a pitcher plant.

R : **Refflesia** grows in nitrogen deficient soil.

Q.12 **A :** Daily preodicity of stomatal movement is not character of CAM plants.

R : In CAM plants stomata are closedat night and day.

Q.13 **A :** ***Amaranthus*** and sugarcane are called as Hatch and Slack plants.

R : One glucose forms by fixation of $6CO_2$ in these plants.

Q.14 **A :** Site of light and Dark reactions are different in C_4-plants.

R : Two type of photosynthetic cells found in C_4-plants.

Q.15 **A :** Mangnese is important for Hill reaction.

R : Photolysis of water occurs in the presence of manganese.

Q.16 **A :** By insectivorous habit, the insectivorous plants fulfil their nitrogen deficiency.

R : Nitrogen requirement of insectivorous plants are fulfilled through the proteins of insects.

Q.17 **A :** Bacterial photosynthesis occurs in presence of oxygen.

R : Bacteria has only PS-II

Q.18 **A :** Photosynthetically C_4 plants are better than C_3 plants.

R : Photorespiration absent in C_4 plants.

Q.19 **A :** Red drop occur above 680 nm light.

R : PS-II becomes inactive above 680 nm of light.

Q.20 **A :** C_4-plants are more efficient than C_3-plants.

R : C_4-plants are photorespiratory plants.

Q.21 **A :** Photosynthetic production decreases above 680 nm light.

R : PS-II inactivates above 680 nm wavelength of light.

Q.22 **A :** Oxygen does not release in bacterial photosynthesis.

R : e^- donar is CO_2 in bacterial photosynthesis.

Q.23 **A :** Production of dark reaction is increased at high concentration of oxygen.

R : Rubisco converts in PEPCase at high conc. of oxygen.

Q.24 **A :** Photorespiration is absent in Hatch and Slack plants.

R : These plants lack enzyme of C_3-cycle.

Q.25 **A :** Photosynthetic bacteria do not release oxygen gas in photosynthesis.

R : Photosynthetic bacteria do not absorb light energy.

Q.26 **A :** CAM plants initialy, fixes CO_2 during night.

R : They overcome loss of water by this process as stomata closed during day time.

Q.27 **A :** Dark reaction of photosynthesis is biosynthetic phase.

R : Dark reaction is affected by temperature.

Q.28 **A :** Leaf of ***Nepenthes*** is modified in to pitcher to capture insects.

R : ***Nepenthes*** lacks chlorophyll & not green in colour.

Q.29 **A :** Liberation of O_2 in bacteria was discovered by Van Niel.

R : Bacteria use green light for photophosphorylation.

Q.30 **A :** Rate of photosynthesis is higher in combination of $680\uparrow$ & $680\downarrow$ nm than $680\uparrow$ nm alone.

R : Both cyclic & non cyclic Photophosphorylation takes place by mix light.

Q.31 **A :** C_3-plants photosynthetically more efficient than C_4-plants.

R : CO_2 inhibits photosynthesis in C_3 plants.

Q.32 **A :** Sulphur bacteria do not release O_2 in photosynthesis.

R : These bacteria do not use water in photosynthesis.

Q.33 **A :** Photosynthetically ***Zea mays*** is more efficient than Pea plant.

R : Pea is non photorespiratory plant.

Q.34 **A :** Initial fixation of CO_2 in CAM-plants takes place in night.

R : PS-II is absent in CAM-plants.

Q.35 **A :** Evolution of O_2 is not linked with bacterial photosynthesis.

R : Bacteria absorb the I-R spectrum.

Q.36 **A :** ***Utricularia*** captures insects for nitrogen source.

R : This plant grows in nitrogen deficient habitats.

Q.37 **A :** One mole of oxygen gas liberates in bacterial non cyclic ETS.

R : Bacteria is first photosynthetic Eukaryotes.

Q.38 **A :** Action spectrum of photosynthesis is Red & Blue colours of light.

R : Plants absorb maximum Red and Blue colour.

Q.39 **A :** D.C.M.U. is a photosynthetic inhibitor.

R : D.C.M.U. inhibits photolysis of water.

Q.40 **A :** Dark reaction does not occur in absence of light.

R : Synthesis of assimilatory powers occurs during light reaction.

Q.41 **A :** C_4-plants are most efficient photosynthetic plants of todays.

R : Photorespiration does not occurs in C_4-plants.

Q.42 **A :** CAM plants may show photorespiration.

R : Dark reaction occurs during day time in CAM plants.

Q.43 **A :** Photophosphorylation is the only process of generation of ATP in plants.

R : Light energy converted into stable chemical energy during photophosphorylation.

Q.44 **A :** Growth will stop in plants at compensation point.

R : Net primary productivity is zero at compensation point.

Q.45 **A :** Photorespiration is also known as glyoxilate cycle.

R : Substrate for photorespiration is glyoxylic acid.

Q.46 **A :** The only product of light reaction, required in dark reaction are $NADPH_2$ and ATP.

R : Dark reaction occurs in night only.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

CELL RESPIRATION

HISTORY

- Respiration term was given by **Deutrochet**.
- **Malpighie** (1679) showed the importance of air at the time of **germination of seeds** of plants.
- **Pasteur** (1870) discovered **anaerobic** respiration with the help of **fermentation**.

INTRODUCTION

- Respiration is a **catabolic process** in which complex organic molecules are oxidized to simpler one with gradual and step wise release of energy.
- Such respiration is also called **cellular respiration** or **dark respiration** or **internal respiration**.
- It is a **catabolic**, **exothermic** and **oxidative** process.
- It is also **anabolic**
- Respiration is represented by following general equation :

$$C_6H_{12}O_6 + 6O_2 + 6H_2O \rightarrow 6CO_2 + 12H_2O + \text{Energy}$$

- Respiration is oxidation of organic food, which release the energy, which is utilized in systhesis of ATP.
- Various respiratory intermediates are used up in biosynthesis so **amphibolic** process.
- All living cells participate in the respiration process.

Significance of Respiration :

- **Energy** is necessary for all biological processes.
- The energy released during respiration is used for the various metabolic processes.
- Various chemical substances are formed in this process which are important for cellular components.
- CO_2 released in this process maintains a balance in the atmosphere.
- Complex insoluble food materials are converted into simple soluble molecules by this process.
- It converts the stored (static potential energy) into more useful (kinetic) form.

TYPE OF RESPIRATION

On the basis of kind of Respiratory Substrate:

- **Floating respiration :**

  It is normal respiration, where general respiratory substrate and stored food is oxidized, e.g., Starch, fat, protein

- **Protoplasmic respiration :**

  It is respiration of starved cells when protoplasmic constituents are oxidized.

On the basis of availability of Oxygen :

- Aerobic respiration
- Anaerobic respiration

Aerobic respiration - The **complete oxidation** of food with the use of oxygen and when entire carbon released as CO_2, is called as aerobic respiration.

$$C_6H_{12}O_6 + 6O_2 + 6H_2O \xrightarrow[\text{cyto.\&mito}]{\text{Enzyme}} 6CO_2 + 12H_2O + 686 \text{ Kcal E (38 / 36 ATP)}$$

Anaerobic respiration - This is incomplete oxidation.

- When food is oxidized into alcohol or organic acids without use of oxygen.

  During it most of energy is lost in form of heat. It occurs in cytoplasm and only 2ATP are produced.

$$C_6H_{12}O_6 \xrightarrow[\text{cytoplasm}]{\text{Enzyme}} 2C_2H_5OH + 2CO_2 + 21KCal\ (2ATP)$$

- Anaerobic respiration was first reported by Kostytchev.
- Anaerobic respiration may takes place in bacteria, some lower parasitic animals (Ascaris, Taenia) plants, R.BCs. & muscles of human body. When oxygen is not available, then food is incompletely oxidised in to some organic compounds like ethanol, acetic acid, lactic acid.
- In muscle cells & some bacteria, the energy is produced by breaking of glucose into lactic acid inside the cells.
- The amount of energy released in anaerobic respiration is much less than aerobic respiration.
- Fermentation is performed by some fungi & some bacteria (only by microbes) and is an extracellular process. 2 ATP are produced.

$$C_6H_{12}O_6 \xrightarrow[\text{Bact.}]{\text{Yeast}} 2C_2H_5OH + 2CO_2 + \text{Heat}\ (2\ ATP)$$

- Both anaerobic respiration and fermentation are incomplete oxidations.
- Inhibitory effect on respiration (anaerobic respiration) of oxygen is called **Pasteur effect**.

  (Anaerobic $\rightarrow$ Aerobic)

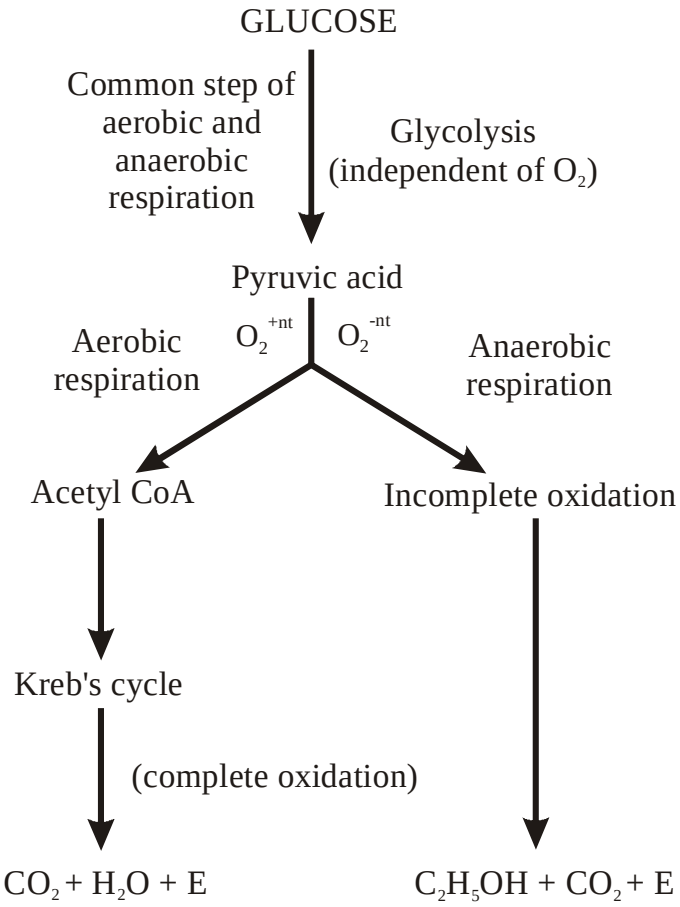

Fig : Aerobic and Anaerobic Respiration

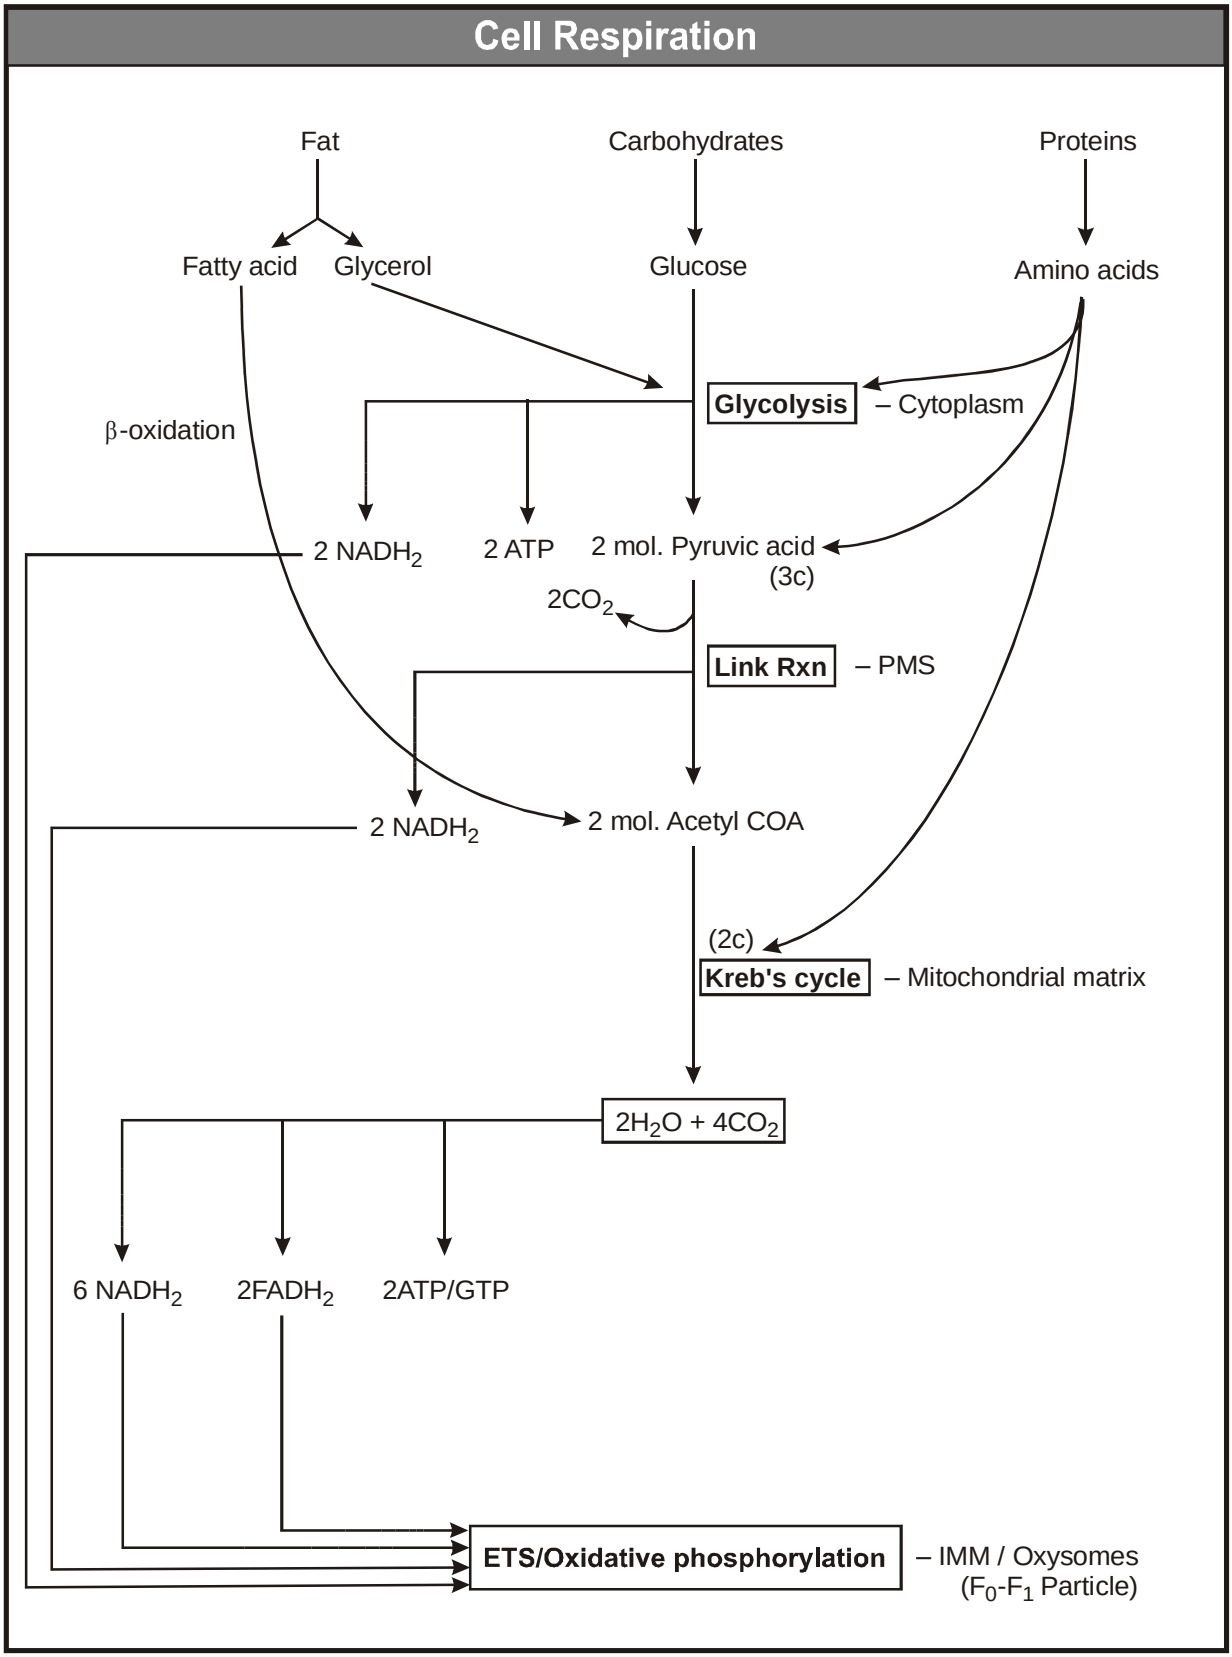
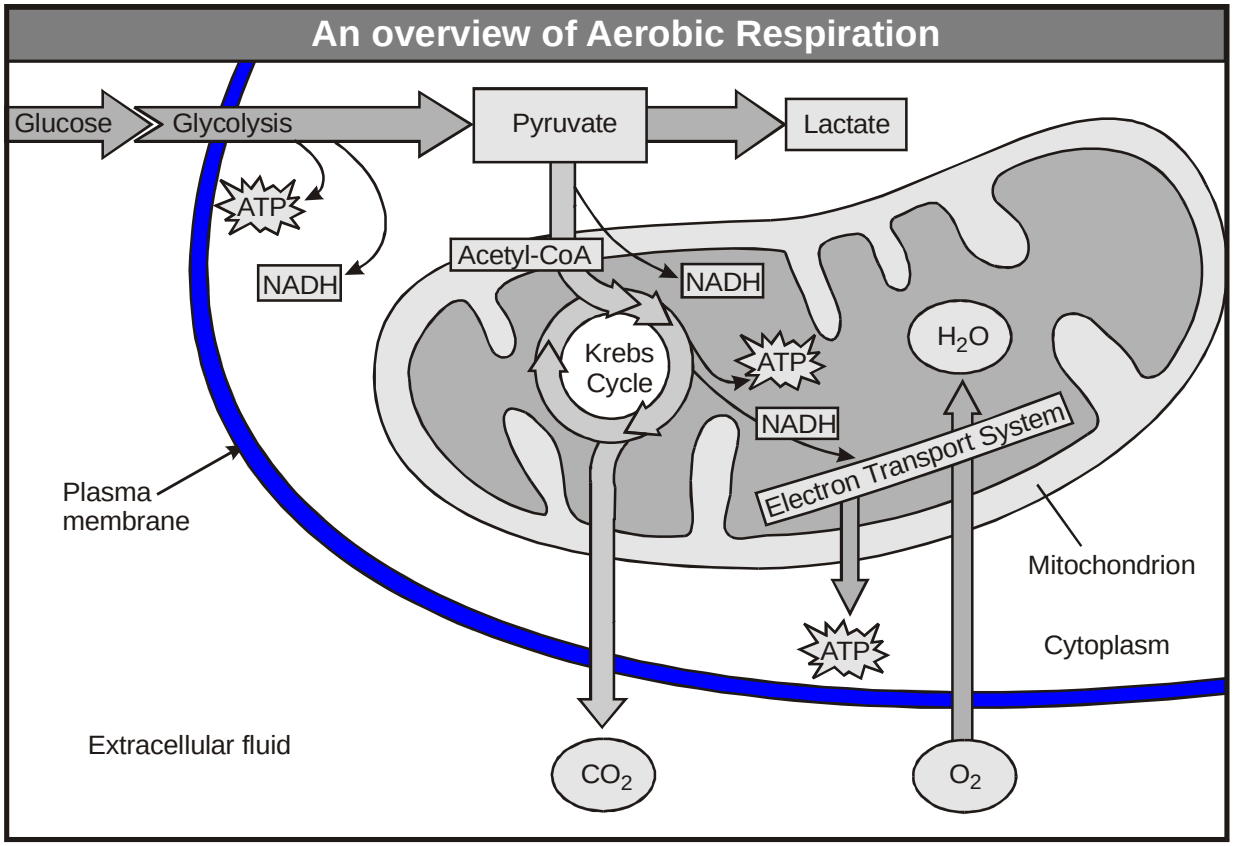
MECHANISM OF RESPIRATION



- Initial steps of aerobic and anaerobic respiration are same i.e. Glucose is converted to pyruvic acid. Further fate of **pyruvic acid is dependent upon presence or absence of O_2**.
- There are **2 major** pathways of respiration.

  (i) Common Pathway (ii) Pentose Phosphate Pathway (PPP)



(i) Common Pathway :

It has 3 main parts.

(a) Glycolysis

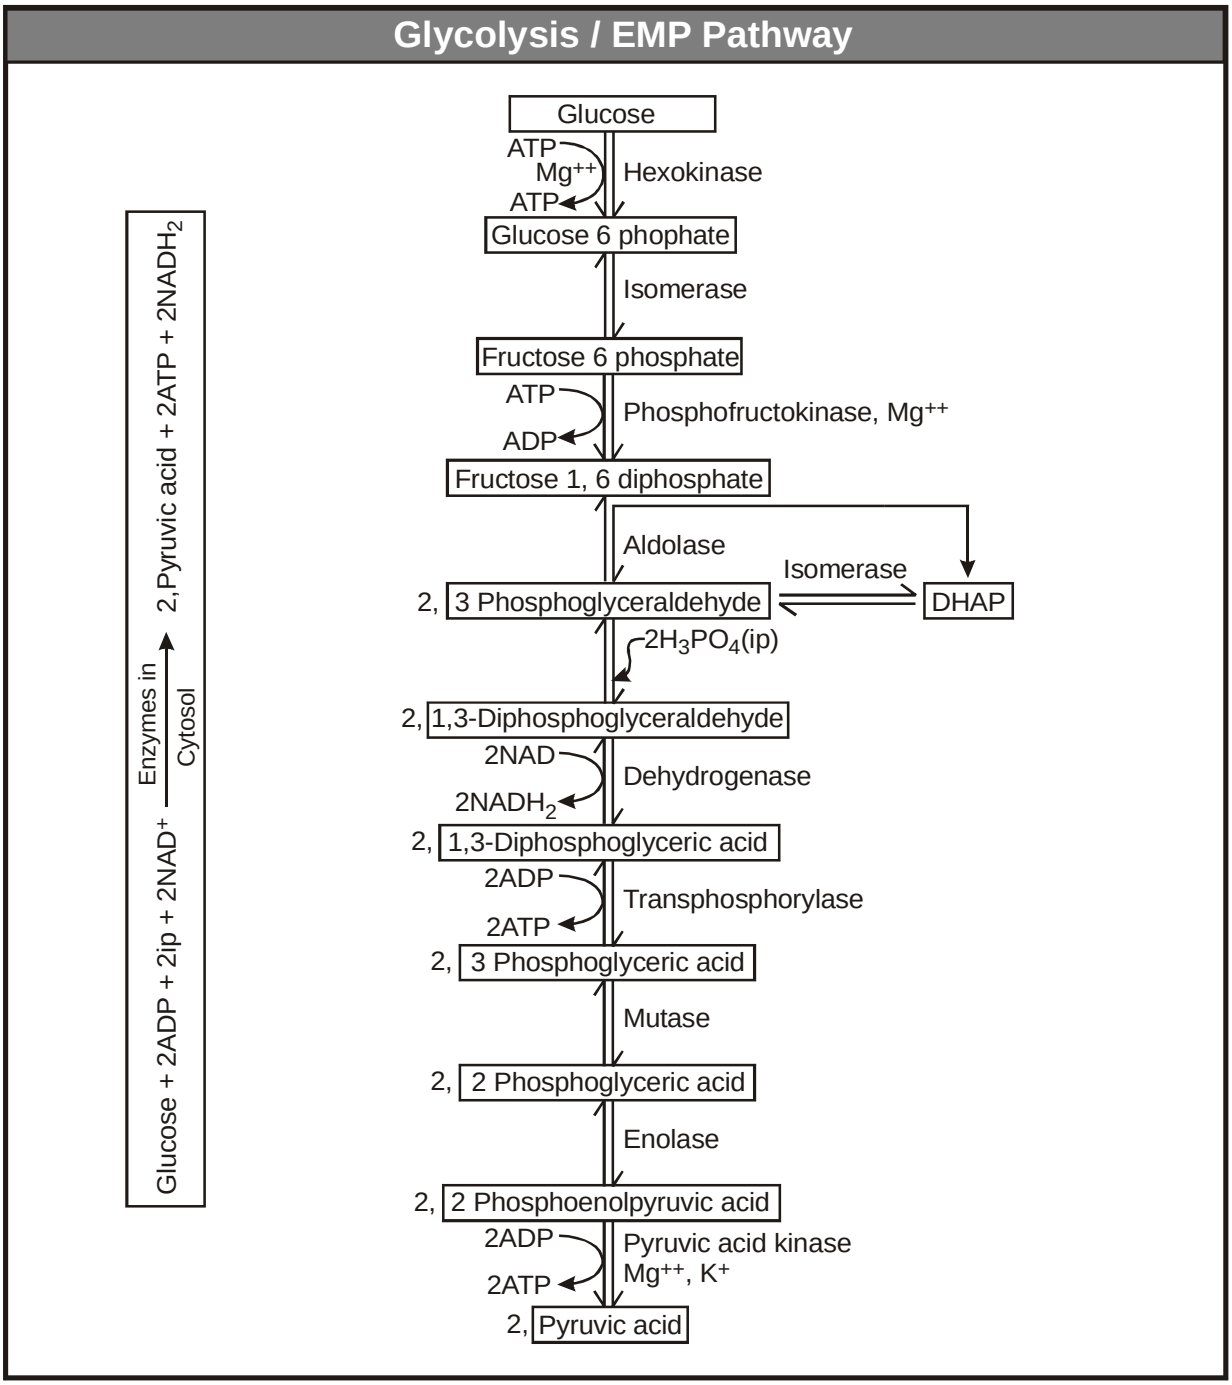
(b) Krebs Cycle

(c) Terminal Oxidation

(a) Glycolysis :

- Glycolysis was discovered by **Embden**, **Meyerhoff** and **Parnas** and hence it is called as **EMP pathway**.
- Glycolysis is **independent of O_2**, hence it is common in both **aerobic** and **anaerobic** conditions.
- Glycolysis is completed in **cytoplasm**.
- **Glucose** is substrate of glycolysis. Most of enzymes requires Mg as cofactor.
- The glycolysis is common phase for aerobic & anaerobic respirations both.
- Glycolysis involves a series of ten biochemical reactions in cytoplasm.
- In glycolysis, neither consumption of oxygen nor liberation of CO_2 take place.
- In glycolysis, 1 glucose, produces 2 mol. of pyruvic acids (3C)
- $2NADH_2$ & 2ATP are generated in glycolysis, which are equal to 8 ATP.
- **Substrate level phosphorylation** forms 2 ATP - [When the substrate releases energy for phosphorylation of ADP OR formation of ATP, without ETS then called as **substrate level phosphorylation**]
- Glycolysis is also known as **oxidative anabolism** or **catabolic resynthesis**, because it links with anabolism of fats and amino acids. Its intermediate PGAL is used for the synthesis of glycerol later forms fats or lipid. PGA is used for synthesis of Serine, Glycine, cystine. Alanine synthesized from pyruvate.

- Biochemical reactions of Glycolysis are



- **Phosphofructokinase** and **Hexokinase are allosteric enzymes**. The steps catalysed by these enzymes are considerd as control point reactions of glycolysis.
- Ist & 3rd and last reaction of glycolysis are considered as irreversible reactions of glycolysis.
- Further oxidation of puruvic acid and $NADH_2$ after glycolysis in mitochondria requires oxygen. So the fate of pyruvic acid is decided by presence or absence of Oxygen.

KREBS CYCLE / TRICARBOXYLIC ACID (TCA) CYCLE / CITRIC ACID CYCLE

- Krebs cycle was discovered by **Sir Hans Krebs** in 1937 in **pigeon muscles**.
- It is also called **citric acid cycle**, citric acid being the **first** product of krebs cycle.

- Krebs cycle **occurs in matrix of mitochondria** as its enzymes are present in the matrix.
- Kreb's cycle is **amphibolic or anaplerotic in nature** because it is **central metabolic pathway** playing an important role in both **catabolism** and **anabolism**.
- **Acetyl CoA** is substrate entrant of krebs cycle.
- During oxidation of 1 molecule of glucose, there occurs **two rounds in a kreb's cycle**.
- **4 $NADH_2$, 1 $FADH_2$** and **1 ATP** molecules are obtained from **one pyruvic acid** molecule.
- Two pyruvic acid are formed from one glucose. Therefore, two molecules of pyruvic acid yields 8$NADH_2$, 2 $FADH_2$ and 2 ATP molecules.
- Before Krebs cycle operates, pyruvic acid is converted into Acetyl CoA.
- **Formation of Acetyl CoA / Link reaction / Gateway Reaction :**

  It occurs in perimitochondrial space.

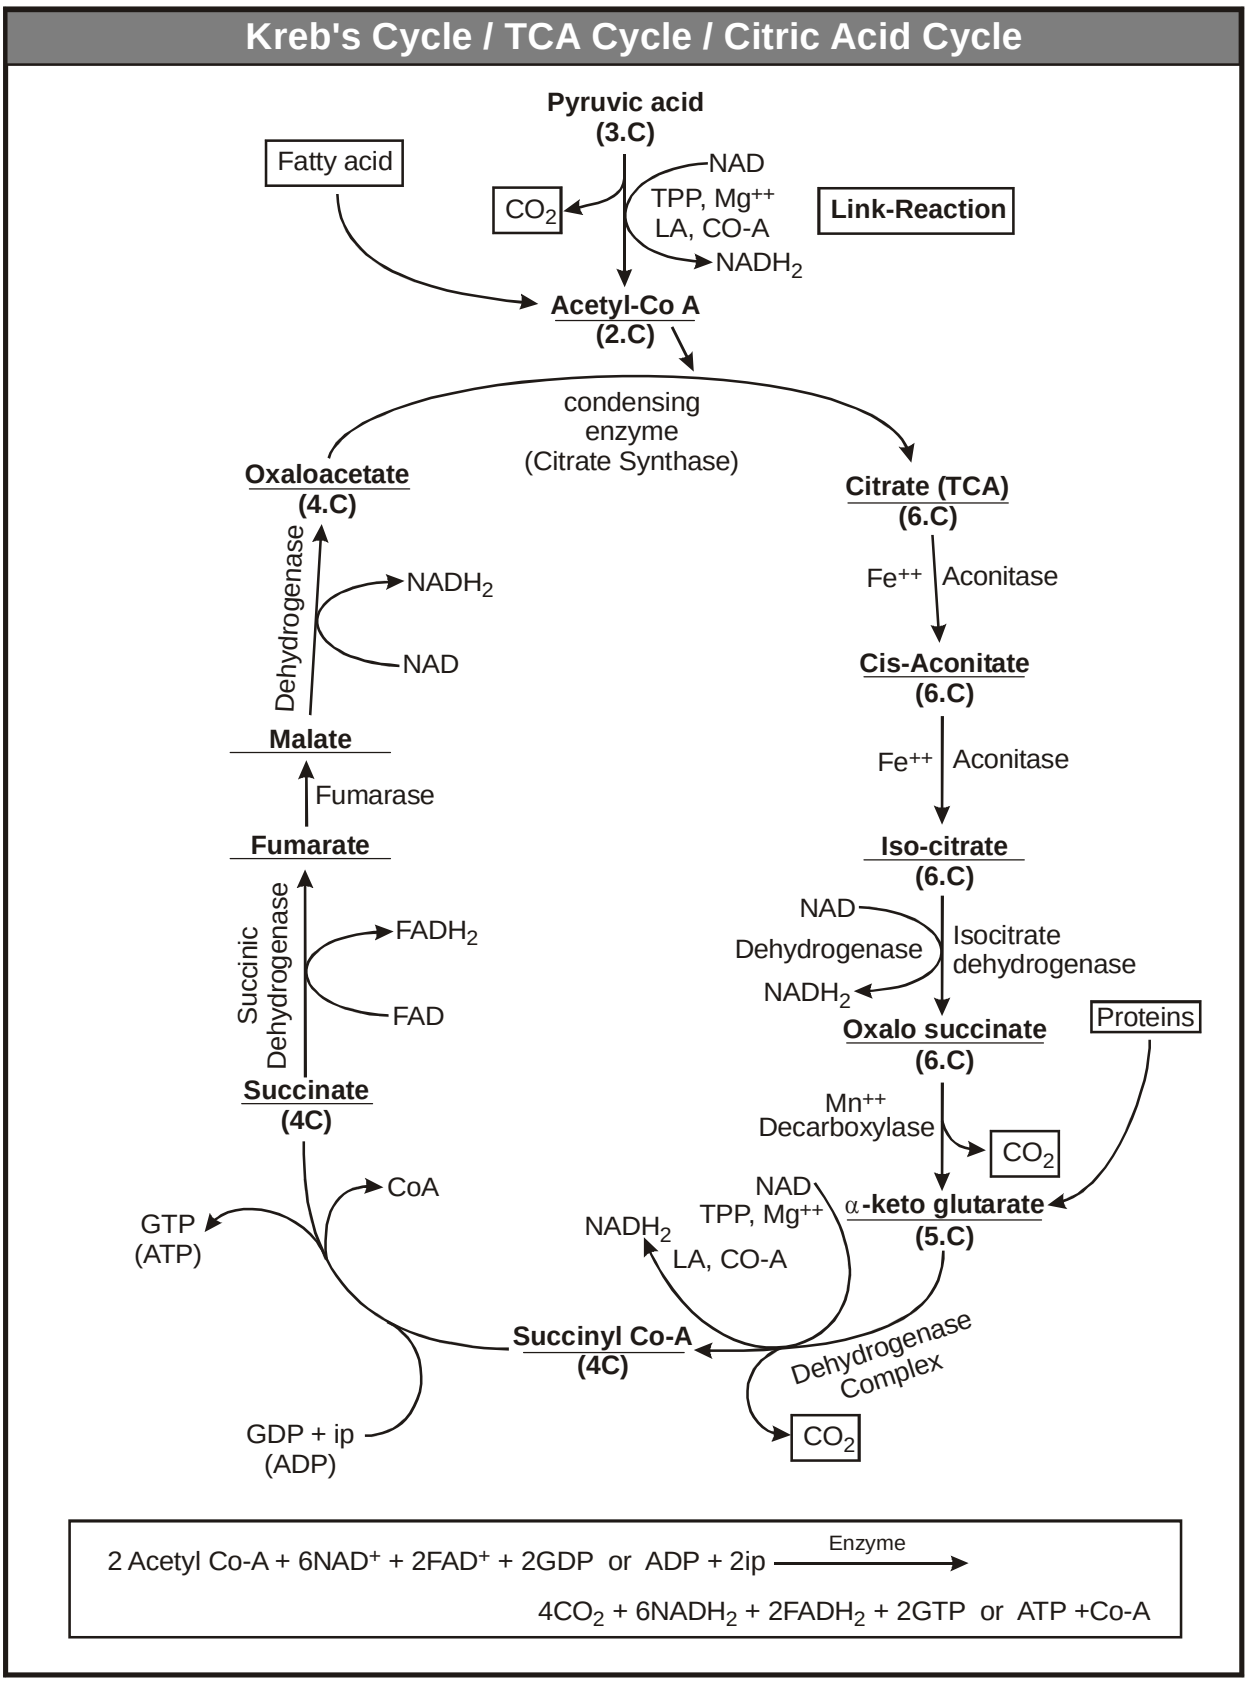
  Pyruvic acid is **oxidatively decarboxylated** to form Acetyl CoA. This requires a **multienzyme complex**, **Pyruvate dehydrogenase complex**.

  Pyruvate dehydrogenase complex consists of **4 Coenzymes and one cofactors** i.e. **TPP** (Thiamine pyrophosphate), **lipoic acid, coenzyme A, NAD, Mg^{+2}**

  Acetyl CoA is **connecting link** between glycolysis and Kreb's cycle.

- Kreb cycle begins by formation of citric acid & O.A.A. is the aceptor molecule of Acetyl CoA in Kreb's cycle. All 6C intermediates have 3, carboxylic groups. So called as **tricarboxylic Acid cycle**.
- A number of Krebs cycle intermediates are used in synthetic (anabolic) pathways, thus TCA cycle is also called **amphibolic pathway** or **anaplerotic pathway**.
- **Succinyl CO-A** is important for synthesis of porphyrin ring compounds like **Chlorophylls, Phytochromes, Cytochromes, Haemoglobin** etc.
- **α-ketoglutaric acid** (5c) involves in Amino Acid **Glutamate** formation (Nitrogen-metabolism)
- Oxidation occurs at 4 steps in Kreb cycle.
- 3 $NADH_2$, 1$FADH_2$ & 1 GTP (ATP) produced by each turn of TCA cycle. (= 12 ATP)
- All the enzymes of TCA cycle, except mitochondrial marker enzyme **Succinic dehydrogenase** (on **inner mitochondrial membrane**) present in **matrix**.

- Biochemical reactions in Krebs Cycle :



TERMINAL OXIDATION

- It is combination of oxygen with electrons and protons released from reduced co-enzymes which produces water (metabolic water).

- Terminal oxidation consists of two processes :

  (i) Electron Transport System (ETS) **(ii) Oxidative Phosphorylation**

(i) Electron Transport System (ETS) :

- $NADH_2$ & $FADH_2$ obtained from **glycolysis** and **Kreb's cycle** enter in electron transport chain and form water molecule by oxidation with the help of **molecular oxygen**.
- In this process, energy is released which is used for the synthesis of ATP.
- Transfer of electrons from $NADH_2$ or $FADH_2$ occurs through a chain of electron acceptors and donors arranged in a specific sequence.
- Electron transport chain is located in **inner mitochondrial membrane** in **Eukaryotes** and in inner side of **plasma membrane or in mesosome membrane in prokaryotes.**
- ETS (Respiratory chain) consists of four components
  - FP (flavoprotein) or FMN
  - Fe-S Protein
  - Co-Q
  - Cytochromes.
- Cytochromes are cyt.-b, cyt.-C_1 & cyt. C, cyt.-a & cyt a_3 (cyt a & a_3 – **Cu** containing)
- Now compounds of ETS are categories as follows :

Name of complexes	Components of ETS	Inhibitors
Complex-I	FMN-$NADH_2$ dehydrogenase	Rotenone & amytal
Complex-II	CoQ/UQ-$FADH_2$ dehydrogenase / Succinate dehydrogenase	
Complex-III	Cytochrome b-Cyt c_1	antimycin
Complex-IV	Cyt, a – Cyt. a_3	cyanide, CO
Complex-V	ATP synthase / ATPase	

- Two electron acceptors **coenzyme Q** or **ubiquinone** and **cytochrome** C can be easily separated from respiratory chain, therefore they are called **mobile carriers**. CoQ functions for e^- transport between complex I and III and cyt.C transports e^- between complex III and IV.
- Hydrogen is transferred from $NADH_2$ to FMN and NAD is obtained back from $NADH_2$. FMN forms $FMNH_2$.
- Two **protons** and **electrons** are released from $FMNH_2$. Two protons are transported out through membrane and two electrons are taken up by Fe-S protein.
- Terminal oxidation of reduced coenzyme $FADH_2$ also occurs at mitochondrial ETS. FADH2 gives its e^- & H^+ to CoQ and become FAD.
- During the ETS, **$NADH_2$** gives it's $2e^- / 2H^+$ to FMN in respiratory chain, thus **3 ATP** are generated, while **$FADH_2$** give it's $2e^- / 2H^+$ to CoQ hence only **2 ATP** are formed during the process of oxidative phosphorylation.
- Cyanide inhibits the activity of cytochrome oxidase as it inhibits the oxidation of cyto-a_3. The respiration of most of living organisms is **cyanide sensitive respiration**.

- In mitochondria, of some plants **alternative oxidase** system is present, in which ETS continues even in presence of cyanides. This type of respiration is known as **cyanide resistance respiration** or Alternate electron pathway. Ex. **Spinacea, Pisum**. Alternate oxidase is inhibited by mCLAM and SHAM.

ELECTRON SHUTTLES

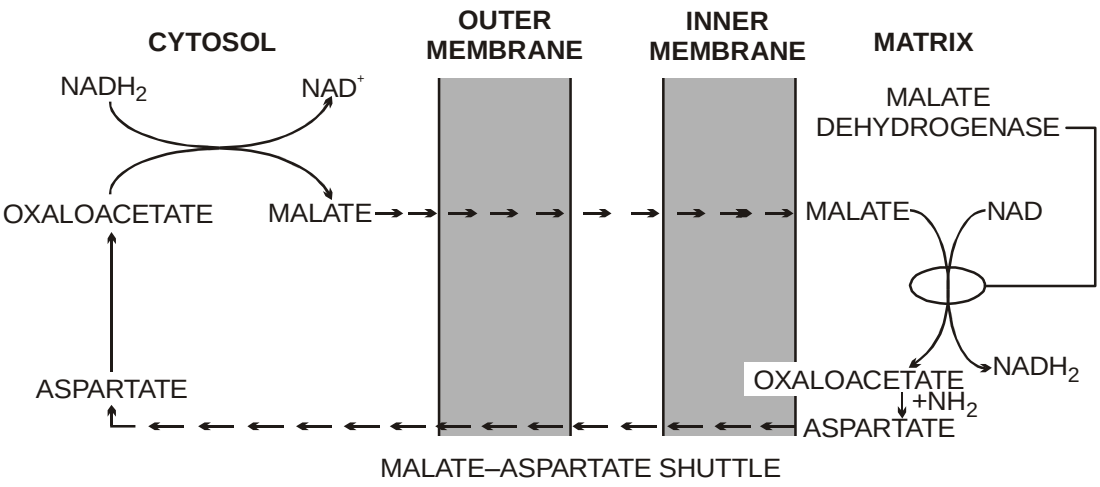
- 2 molecule of $NADH_2$ produced during glycolysis in cytoplasm have to go inside the mitochondria for production of ATP through ETS.
- The mitochondrial membrane is impermeable to $NADH_2$.
- Hence a **special carrier system** known as electron shuttle is present in inner mitochondrial membrane which transports electrons from $NADH_2$ to the electron carriers inside the mitochondria.
- Shuttle system is only present in eukaryotes, as prokaryotes does not have membrane bounded cell organelle.
- Electron shuttles are of two types in eukaryotes :

  (i) Malate–Aspartate Shuttle

  (ii) Glycerol–Phosphate Shuttle

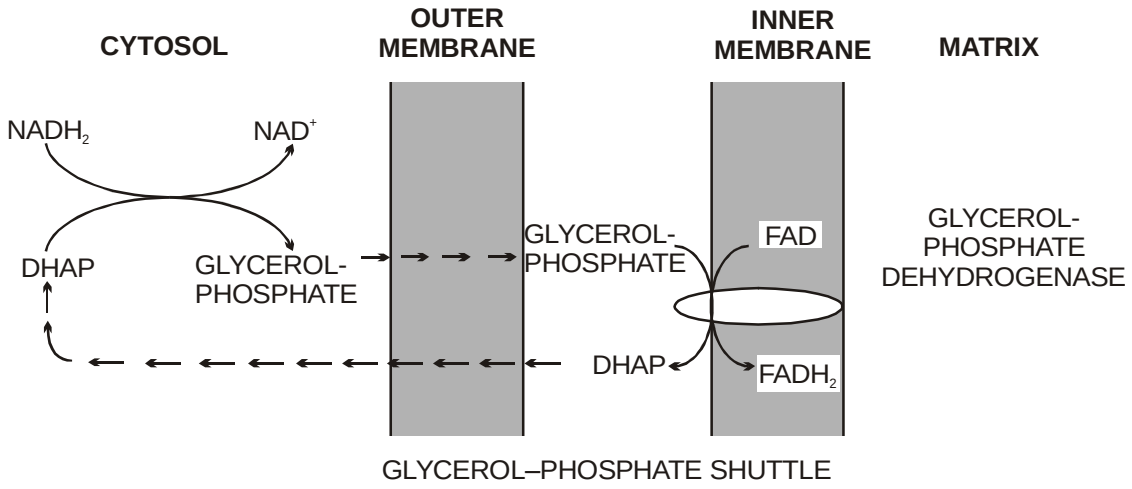
(i) Malate-Aspartate Shuttle :

- The electrons and hydrogen of $NADH_2$ are transferred to malate which enter into the **matrix of mitochondria**.
- Malate and NAD react to form $NADH_2$ and **Oxaloacetic acid**.
- Oxaloacetic acid cannot cross mitochondrial membrane. Hence it is ammonified to form **aspartic acid** which passes from matrix to the cytoplasm.
- If this shuttle is effective, then **38 ATPs are formed from one glucose molecule. (2 Glycolytic $NADH_2$ = 6ATP)**.
- It is **more efficient** and present in **heart**, **liver** and **kidney** cells.



Malate-aspartate shuttle scheme

(ii) Glycerol Phosphate Shuttle :



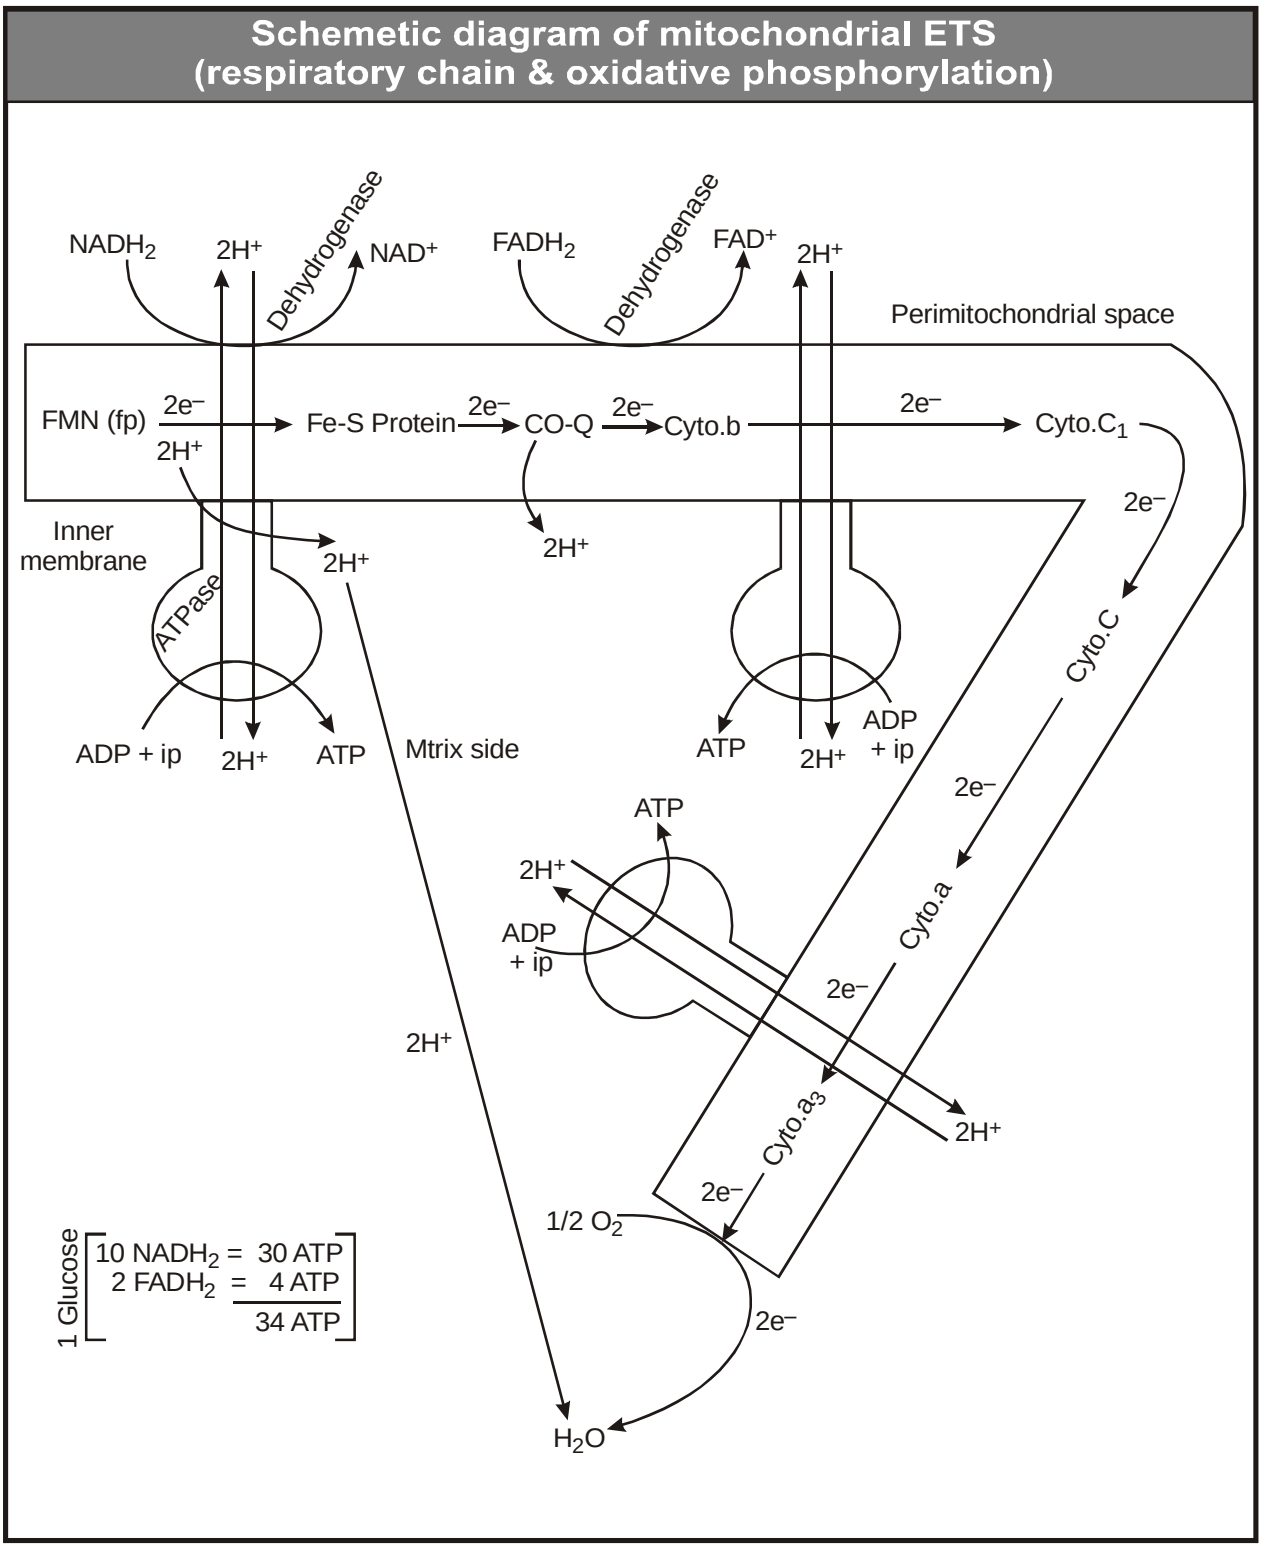
Glycerol–Phosphate Shuttle Scheme

- It is **less efficient** and present in **skeletal** muscles and **brain cells** or most **eukaryotic** cells.
- In this $NADH_2$ transfers electrons to FAD of mitochondria.
- **Dihydroxyacetone phosphate** (DHAP) and $NADH_2$ react to form Glycerol-Phosphate in cytoplasm.
- Glycerol-Phosphate goes to outer surface of inner membrane of mitochondria, where it reacts with FAD to form $FADH_2$ and DHAP.
- $FADH_2$ enters the electron system to form 2 ATP. DHAP gets transferred to **cytosol**.
- In the presence of this **shuttle**, **36 ATP are produced from one glucose molecule**. **(2 Glycolytic $NADH_2$ = 4 ATP)**
  Note : When which shuttle will be functional, depends on the tissue and the species.

OXIDATIVE PHOSPHORYLATION AND CHEMIOSMOTIC THEORY

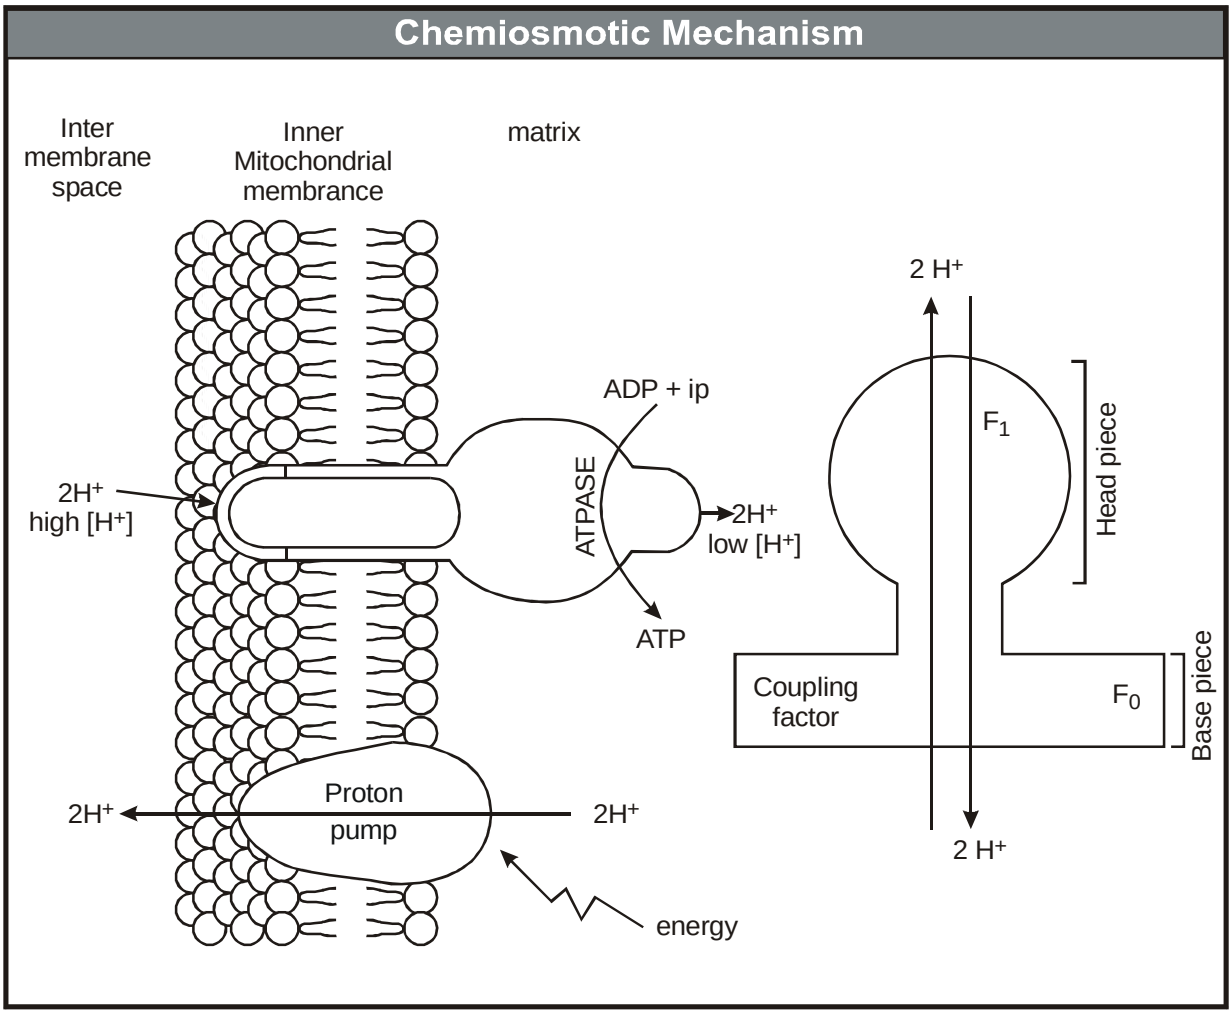
- **By P.Mitchell**
- The synthesis of energy rich ATP molecules with the help of energy librated by **oxidation** of reduced coenzyme produced during respiration is called **Oxidative Phosphorylation**.
- The protons which are expelled out from inner mitochondrial membrane during electron transport, produce proton gradient (ΔpH) and membrane potential in the external environment.
- This creates **proton motive force**. This is utilized in the formation of ATP.
- ATP synthesis is explained by **chemiosmotic theory.**
- **Oxidative phosphorylation** occurs on **F_1–F_0 particles** (oxysomes or elementary particles) which are located on inner mitochondrial membrane.
- **ATPase activity** is found in **F_1 (head)** which is protruded towards matrix of the mitochondria. **F_0 (base)** which is embedded in inner membrane has **proton channels**.
- ATPase becomes active only when **proton gradient** develops.
- Passage of $2e^-$ from $NADH_2$ pushes out three pairs of protons to outer chamber of mitochondria causing **proton gradient** and **membrane potential**. These collectively create **proton motive force (pmf)**.
- pmf cause protons to move back only passing through F_0, as inner membrane is impermeable for H^+.
- Energy is released during transfer of protons to the matrix passing through F_1 which is used for ATP formation. Formation of ATP from ADP is induced by the enzyme **ATP synthase (ATPase) present in F_1**.
- Transfer of **one pair of proton** back into inner chamber through F_1 head form **one ATP**. Thus, 3ATPs are formed by 3 pairs of H^+ released during electron transport of **1 molecule of $NADH_2$**.

- Two pairs of H^+ are liberated in respiratory chain by $FADH_2$, thus **2ATPs** are formed.



Chemiosmosis during oxidative phosphorylation :

- ATP synthesis during oxidative phosphorylation & Photophosphorylation is explained by Chemi-osmotic theory of P.Mitchell 1978. According to this theory energy liberated during ETS, is used in creation of proton gradient (pH gradient) & membrane potential which constitutes proton motive force (pmf) due to this formation of ATP takes place in F_1 particle of oxysome.



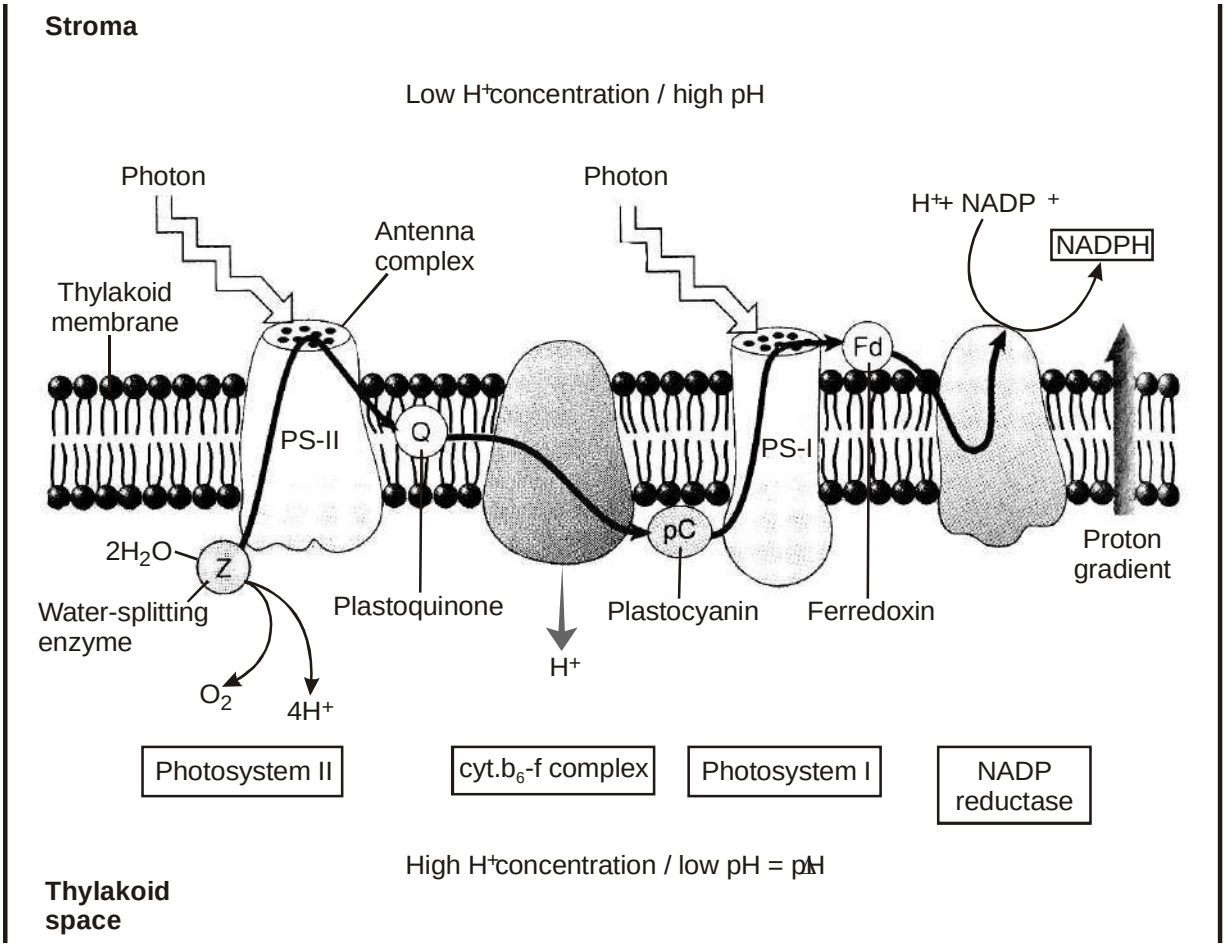
- Coupling factor : ATP formation requires H+ transport. These H+ only passes through the proton tunnel or **coupling** factor or **F_0 particle** in mitochondrial membrane, and bacterial membrane
- The process of electron transport and oxidative phosphorylation in mitochondria is tightly coupled. Some chemicals like 2,4 Dinitrophenol (2, 4 DNP) and oligomycin acts as **uncouplers** for this process.

Chemiosmosis during photophosphorylation :

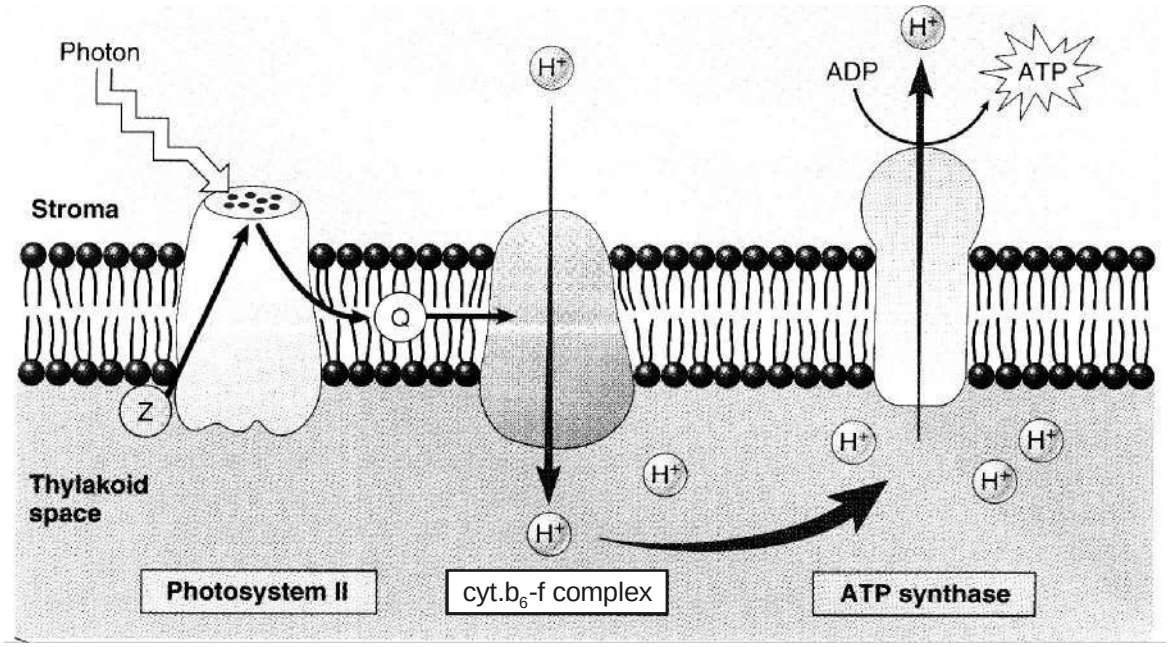
- The synthesis of ATP is coupled with electron transport system and creation of proton gradient across the membrane during photophosphorylation and oxidative phosphorylation. Both are same but the difference is that during oxidative phosphorylation high H^+ ion concentration at intermembrane space/perimitochondrial space and low H^+ concentration in mitochondrial matrix. While during photophosphorylation High H+ conc. inside the thylakoid lumen (due to photolysis of water at thylakoid lumen) and low H+ ion conc. in stroma.
- Thylakoid membrane is impermeable for protons so plastoquinone (which acts as both e^- and H^+ carrier) and Cf_0 particle (similar to F_0 particle of oxysome in mitochondria) helps in proton transport across the thylakoid membrane.
- Due to free energy of electrons, protons or H^+ ions transported from stroma side towards lumen of thylakoid by PQ or CF_0($PQ + 2H^+ \rightarrow PQH_2$ then $PQH_2 \rightarrow PQ + 2H+$)
  So within the chloroplast protons in the stroma decreases in number, while in the lumen there is accumulation of protons. This event creates a proton gradient (ΔpH) across the thylakoid membrane, which results in development of membrane protential. Both **proton gradient** and **membrane potential** constitute **proton motive force (Pmf)** or **electro-chemical gradient.**

- Due to high proton motive force (Pmf) inside the lumen results in collapse's of proton gradient and this potential is used in phosphorylation of ADP, results in synthesis of ATP (ADD + ip → ATP) catalysed by enzyme ATP synthase.

  The returned protons are accepted by NADP leads to formation of $NADPH_2$ in stroma side.



The photosynthesis electron transport system



Chemoiosmosis in a chloroplast

BIOENERGETICS OF RESPIRATION - (1 MOL. OF GLUCOSE)

- EMP-Pathway -

  ATP formed at substrate level phosphorylation ⇒ 4 ATP

  ATP produced via ETS ($2NADH_2$) ⇒ 6 ATP

  ATP consumed in glycolysis ⇒ 2 ATP

  10 ATP – 2 ATP = $\boxed{8\ ATP}$

  Gross – Expenditure = Net or Total gain

  Direct Gain = 2 ATP

- Link reaction or Gateway reaction -

  $2NADH_2$ = $\boxed{6\ ATP}$ (via ETS)

- Kreb's Cycle -

  ATP produced at substrate level phosphorylation ⇒ 2GTP / 2ATP

  ATP produced via ETS $\begin{cases} 6NADH_2 \rightarrow 18ATP \\ 2FADH_2 \rightarrow 4ATP \end{cases}$

  $22\ ATP + 2ATP$

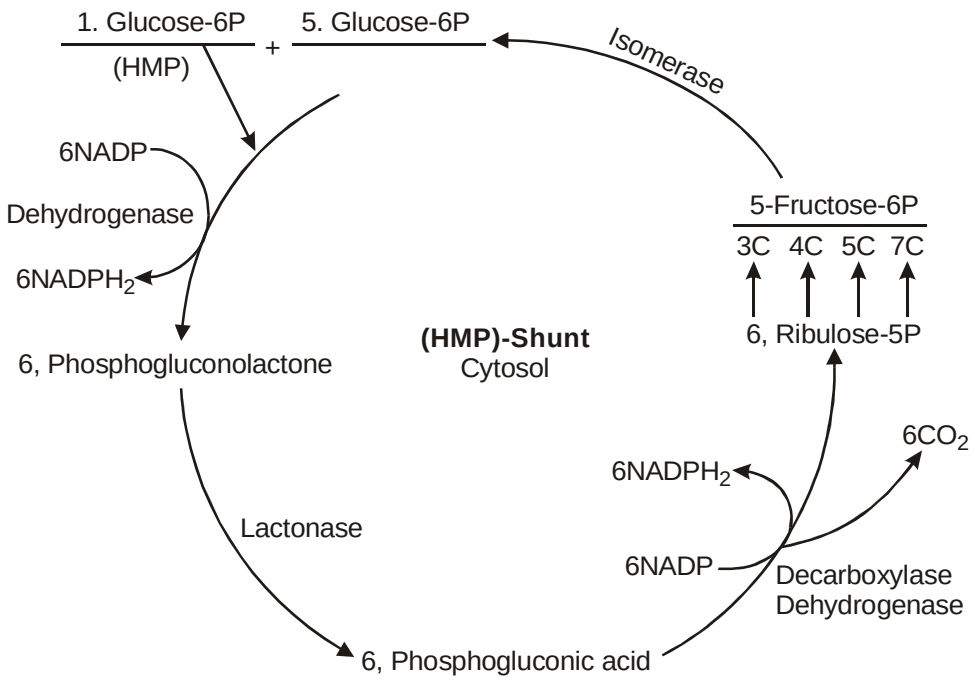
  $24\ ATP$

  Total ⟶ $38\ ATP$

  (8ATP in EMP + 6ATP link reaction + 24 ATP Krebs cycle)

- 1 Sucrose = 76 ATP
- 1 Fructose 1,6-Biphosphate = 40 ATP
- 1 Pyruvic acid = 15 ATP
- 1 Acetyl Co-A or 1 TCA cycle = 12 ATP

PENTOSE PHOSPHATE PATHWAY



HMP–Shunt

- It is an **alternative pathway** for glucose break down which was discovered by **Warburg et al** in 1935 and **Dickens et al** in 1938 in animal cells.
- It was described in detail by **Raecker** in 1954.
- It is completed in **cytoplasm.**
- This pathway is also known as **hexose monophosphate shunt (HMP shunt)**, **Pentose phosphate shunt, Phosphogluconate shunt, Warburg Dickens pathway, Oxidative pentose pathway Direct oxidation pathway and cytosolic oxidative decarboxylation**.
- This pathway starts with **6 molecules of Glucose-6-PO_4.12 $NADPH_2$ are obtained** and **6 CO_2** are released and **5** molecules of **Glucose-6-PO_4** are recovered.

Pentose Phosphate pathway can be summarized as :

- 6 Glucose-6-P + 12 NADP $\longrightarrow$ 6 CO_2 + 12 $NADPH_2$ + 5 Glucose-6-P

or

- Glucose-6-P + 12 NADP $\longrightarrow$ 6CO_2 + 12 $NADPH_2$

Significance of PPP / HMP shunt :

- This pathway **produces reducing power $NADPH_2$** for the various biosynthetic pathways, other than photosynthesis like **fats synthesis, starch synthesis, hormone synthesis and chlorophyll synthesis.**
- An intermediate **erythrose-P (4C)** of this pathway is precursor of **shikimic acid**, which goes **synthesis of aromatic compounds and amino acids.**
- This cycle provides pentose sugars **Ribose-p** for synthesis of nucleotides, nucleosides, ATP and GTP.
- A five carbon intermediate **Ribulose-5-phosphate** may used as CO_2 acceptor in green cells.
- Intermediates like **PGAL** and **fructose-6-phosphate** of this pathway may link with glycolytic reactions.

OTHER METHODS OF RESPIRATION

Respiration of Fats :

- It occurs **during germination of fatty seeds** and in plants when carbohydrates reserve declines.
- Fats are hydrolysed in presence of **enzymes lipase** to yield **fatty acid and glycerol**.

Oxidation of Glycerol :

- Glycerol reacts with ATP in presence of **glycerol kinase** to form **glycerol-3-PO_4**, which is then oxidised in presence of glycerol phosphate dehydrogenase and NAD to form **dihydroxy acetone phosphate** (DHAP). DHAP enters into glycolysis.

  Glycerol + ATP $\xrightarrow{\text{Kinase}}$ Glycerol-3-PO_4

  Glycerol-3-PO_4 + NAD $\xrightarrow{\text{Dehydrogenase}}$ DHAP/PGAL + $NADH_2$

Oxidation of Fatty Acids (β–oxidation) :

- It takes place **in mitochondria and glyoxysomes**.
- It involves sequential **removal of 2C in the form of acetyl COA** molecules from the carboxyl end of the fatty acid.
- Each turn of β–oxidation generates one $FADH_2$, one $NADH_2$ and one acetyl COA molecule. So each turn of β–oxidation generates 5 ATP molecules.

- Complete oxidation of one mole of acetyl COA in TCA results in production of 12 ATP molecules, CO_2 and H_2O.

  Palmitic acid (16 C)
  (1 mole)

  7 turns of β–oxidation ↓ 5 ATP per turn

  = 35 ATP – 2 ATP (consumed in first turn) = 33 ATP

  8 mole of Acetyl COA

  TCA cycle ↓ 12 ATP per cycle = 96 ATP

  16 mole CO_2 + 16 mole H_2O Total = 129 ATP
- **Acetyl COA** which is the end product of β–oxidation of fatty acids may enter into **Kreb's cycle** or into **glyoxylate cycle** in **germinating fatty seeds** to form **sucrose**.

  Note : Glyoxylate cycle is an example of **gluconeogenesis**.

Respiration of Proteins :

- Proteins are hydrolysed to form amino acids.
- Amino acids are deaminated to form organic acids, which are oxidized in glycolysis and Kreb's cycle.

FERMENTATION

- It is **anaerobic breakdown** of carbohydrates and organic compounds into **CO_2**, **alcohols** and **organic acids** with the help of microorganisms and their enzymes.

Mechanism of Fermentation :

- It occurs in two steps :

  Glycolysis

  Breakdown of Pyruvic acid

Glycolysis :

- Pyruvic acid is formed in glycolysis.

$$C_6H_{12}O_6 \xrightarrow[\text{Complex}]{\text{Enzyme}} \text{Pyruvic acid} + 2ATP + 2NADH_2$$

Breakdown of Pyruvic acid :

- Pyruvic acid in anearobic respiration is broken down in **different** products.

Types of Fermentation :

- Based on different products formed by pyruvic acid, fermentation can be of following types

Alcoholic Fermentation :

- Most common type. It occurs in **some fungi** (yeast) and **higher plants** during anaerobic conditions.
- It is completed in 2 step :

$$2CH_3CO.COOH \xrightarrow{\text{Decarboxylase}} 2CH_3CHO + 2CO_2$$

Pyruvic acid — Acetaldehyde

$$2\ CH_3CHO + 2\ NADH_2 \xrightarrow{\text{Alcohol dehydrogenase}} 2C_2H_5OH + 2NAD$$

Acetaldehyde — Ethyl Alcohol

Lactic Acid Fermentation :

- Lactic acid is formed by the activity of bacteria **Lactobacillus lactis** in presence of enzyme **lactic dehydrogenase** which requires **FMN** and **Zn^{+2}**.

$$2CH_3CO.COOH + 2\ NADH_2 \xrightarrow[Zn^{+2}]{\text{Lactic dehydrogenase}} 2CH_3.CHOH.COOH$$

Pyruvic acid — Lactic acid

Acetic Acid Fermentation :

- It is a **fermentation process** which requires atmospheric oxygen.
- Ethyl alcohol is oxidized into **acetic acid** by the activity of **acetic acid bacteria** (Acetobacter aceti).

$$C_6H_{12}O_6 \xrightarrow{\text{yeast}} 2C_2H_5OH + 2CO_2$$

$$2\ C_2H_5OH + O_2 \xrightarrow{\text{Acetobacter aceti}} CH_3COOH + H_2O$$

Acetic acid

Butyric Acid Fermentation :

- **Pyruvic** acid is converted to **butyric** acid by the activity of **anaerobic bacteria**. e.g. Bacillus butyricus, Clostridium butyricum.
- CO_2 is liberated during such fermentation.

Pyruvic acid $\xrightarrow{\downarrow CO_2}$ Acetoacetic acid $\longrightarrow$ Butyric acid.

RESPIRATORY QUOTIENT

- The ratio of volume of CO_2 released to the volume of O_2 absorbed in respiration is called **respiratory quotient** (RQ) or **respiratory ratio**.

$$\boxed{RQ = \frac{\text{Vol. of } CO_2 \text{ released}}{\text{Vol. of } O_2 \text{ absorbed}}}$$

- Value of RQ measured by **Ganong's respirometer**.
- Value of RQ varies from one **substrate** to another.
- RQ gives the idea of nature of substrate being respired in a particular tissue.

R.Q. value equal to unity (RQ = 1) :

- When carbohydrates are the respiratory substrate, as in green leaves, flowers, fruits, germinating seeds of cereals etc.

$$C_6H_{12}O_6 + 6O_2 \longrightarrow 6CO_2 + 6H_2O$$

RQ = 6 / 6 = 1

RQ value less than unity (RQ < 1) :

Fats as respiratory substrate :

- When fats are respiratory substrate RQ is **less than one** because **fats are poorer in oxygen** and hence require more oxygen for their oxidation. e.g. : **germinating seeds of peanuts**, **mustard**, **sunflower**, **castor** etc.

$$2\ C_{51}H_{98}O_6 + 145O_2 \longrightarrow 102\ CO_2 + 98H_2O$$

Tripalmitin

RQ = 102/145 = 0.7

Proteins as respiratory substrate –

- RQ value for proteins is also **less than one**. Value of RQ is between 0.8 and 0.9. Eg : germinating seeds of gram, pea, bean etc.

RQ equal to zero (RQ = 0) or less than 1 :

- **In some succulent or CAM plants** (Eg. – Opuntia, Bryophyllum) carbohydrates are incompletely oxidised to organic acids in dark.

  $2\ C_6H_{12}O_6 + 3\ O_2 \longrightarrow 3\ C_4H_6O_5 + 3\ H_2O + 2\ CO_2$

  Malic acid

  $2/3 = RQ = < 1$

  CO_2 is not evolved.

  $RQ = 0/3 = 0$

RQ value more than unity (RQ > 1) :

When respiratory substrates are **organic acids**

- Succulent plants form organic acids during the night which are completly oxidized during the day.
- **Organic acids are rich in oxygen** and therefore require less O_2 during respiration but release more CO_2.

  $C_4H_6O_5 + 3\ O_2 \longrightarrow 4\ CO_2 + 3\ H_2O$

  Malic acid

  $RQ = 4/3 = 1.33$

- **Hightest R.Q., oxalic acid = 4**

RQ value equal to infinity (RQ = ∞) :

- During **anaerobic respiration**, CO_2 is evolved, without intake of oxygen and so value of RQ is **infinite**.

  $C_6H_{12}O_6 \longrightarrow 2\ C_2H_5OH + 2\ CO_2$

  $RQ = 2 / 0 = \infty$

FACTORS AFFECTING RESPIRATION

Temperature :

- A rise in temperature from 0°C to 40°C **increases** the **rate of respiration**.
- Optimum temperature for respiration lies between 20° - 40°C.
- In most of the plants rate of respiration is affected according to **Von't Hoff's Law**. **Q_{10} value** or **temperature coefficient value** (increase in rate of a particular process with every 10°C increase in temp.) for respiration is 2–3.
- At low temp. (below 0°C), activity of enzyme is less and hence low respiration. It is for this reason that **vegetables and fruits are stored at low temp**. (cold storage or refrigerators).
- At high temp. (45°C or above), denaturation of enzymes occurs and hence **respiratory rate** is decreased.

Oxygen :

- The presence or absence of O_2 determines the kind of respiration and respiratory products.
- **Oxygen is essential** for aerobic respiration, as it is one of the reactants in the process. It is the **final acceptor of electrons and protons** in electron transport system of the mitochondria.
- The inhibition of anaerobic respiration by O_2 concentration is called as **Pasteur's effect**.
- The minimum amount of oxygen, at which aerobic respiration takes place & anaerobic respiration become extinct is called as **extinction point**.

- Oxygen conc^{n} at which both aerobic & anaerobic respiration take place simultaneously is called as **transition point**.

Carbondioxide :

- Increase in CO_2 concentration reduces respiration. Consequently inhibits the **germination of many seeds** and rate of growth falls down.

Water :

- Proper hydration of respiring cells is must because decrease in water content, **decreases respiratory rate** as water is **necessary for the activity of enzymes**.
- **Dry seeds** having 8–12% of water, have negligible respiratory rate but as the seeds **imbibe** water the respiration increases.
- **The rate of respiration of seeds increases with increase of water** because water causes hydrolysis and so enzyme activity increases. Oxygen also enters the seed through water.

Light :

- Light has no direct effect.
- Under suitable light, **rate of photosynthesis** is optimun which supplies respiratory substrate at a moderate rate and hence **indirectly affects respiration**.

Injury :

- Injury or **wounds causes increase in respiration** because healing of wound needs more meristmatic activity of cells which needs more energy provided by increased rate of respiration.
- After some time the rate of respiration returns to normal.

Mineral Salts :

- If the plants are transferred from water to adequate salt solution, then **rate of respiration** increases. This process is known as **salt respiration**.

Hormones :

- IAA, GA & cytokinin increase the respiration rate.
- The rapid increase in rate of respiration during ripening of fruits and senscence of leaves and plant organs is called as "**Climacteric respiration**". The rate is decrease after sometime.
  It is due to production of **ethylene** hormone.

Inhibitors :

- CN, azides, DNP (Dinitrophenol) CO, rotenone, antimycin, amytal, etc inhibit the respiration.
- **Heavy metals** like lead and zinc **inhibit respiration** by inactivating respiratory enzymes.

SPECIAL POINTS

- In the prokaryotic cells, oxidation of a glucose molecule always provides 38 ATP molecules because $NADH_2$ enter to the mitochondria which are absent.
- A lot of energy is released during seed germination and flowering which cause increase in their temperature.
- **Bioluminescence** is the production of light by some living organisms like bacteria and fungi. This mechanism requires water, inorganic ions, O_2, ATP, **luciferin** and **enzyme luciferase**.
- Inhibition of fermentation due to presence of O_2 is called **Pasteur effect**.
- Glycolysis provides energy to **RBCs** and **most muscles**.
- **Glyoxylate cycle** occurs in **seed rich in fats** and convert stored fats into carbohydrates. Enzymes for this cycle are present in **glyoxysomes**.

- **Comparison between Respiration & Combustion :**

  Burning of fuel is also oxidation in which energy is released from organic substances but it is different from respiration.

S.No.	Respiration	Combustion
1	It is a biological process occuring in all living cells.	It is not performed in living cells.
2	It is a sequential chain of numerous small reactions controlled by specific enzymes.	It is a simple chemical reaction. Enzymes are not needed.
3	Energy is liberated in numerous step.	Energy is released in one step continuously.
4	Fraction of released energy is stored as ATP and rest is released as heat.	Whole energy is released as heat and light.
5	Respiration occurs at body temperature. Body temperature does not increase by this process.	As most energy is released in form of heat and light thus, there is an enormous increase in temperature of the environment.

- **Significance of ATP**

  ATP transfers the energy conveniently. Therefore, ATP is called the '**universal currency of energy transaction**' in the cell.

  Besides ATP, **GTP** (Guanosine triphosphate), **CTP** (Cytosine triphosphate), **TTP** (Thymidine triphosphate) and **UTP** (Uridine triphosphate) are also high energy compounds which are used in certain biosynthetic processes.

- **Entner Duodoroff Pathway :**

  This pathway was discovered by **Entner & Duodoroff**.

  This pathway was first discovered in **bacteria Pseudomonas**.

  It is also known as **glycolysis of bacteria**.

- ATP discovered by Lohman, while importance of ATP in metabolism by Lipman.
- 1 gram of fat equals to 9.8 K.Cal.
  Proteins = 4.8 K.Cal.
  Carbohydrate = 4.4 K.Cal (Old 3.8 K.Cal)
  (Fat is energy rich respiratory substrate)
- Almost all enzymatic reactions are reversible type.
- Cytochromes are Iron-porphyrin protein discoverd by MacMunn (Termed by Keilin)
- When respiratory substrate is **fats** or **proteins**, then **level of Hg rises in Ganong's respirometer**, because more O_2 absorbed than CO_2 released, If respiratory substrate is **organic acids** than **Hg level will fall**.
- In bacteria site of ETS is **mesosome.**
- Respiration efficiency :

  1 glucose = 686 K cal.

  $$38 \text{ ATP} \times 7.6 \text{ K cal} = \frac{288\,\text{kcal}}{686} \times 100 = 42\%$$

  Thus efficiency of aerobic respiration is 42%.

- For the complete oxidation of one glucose if, option 38 or 36 ATP are not given, then the answer goes to 32 or 30 ATP.
- Biochemical difference between Aerobic, Anaerobic respiration and fermentation.

Aerobic Respiration → The electron ejected by oxidation of organic ompound is terminally accepted by external component to organic compound or inorganic compound which is **oxygen**.

Anaerobic Respiration → The electron ejected by oxidation of organic compound is terminally accepted by external component to organic ompound or inorganic compound other than oxygen **NO_2^-, NO_3^-, SO_4^{-2}, N_2** etc.

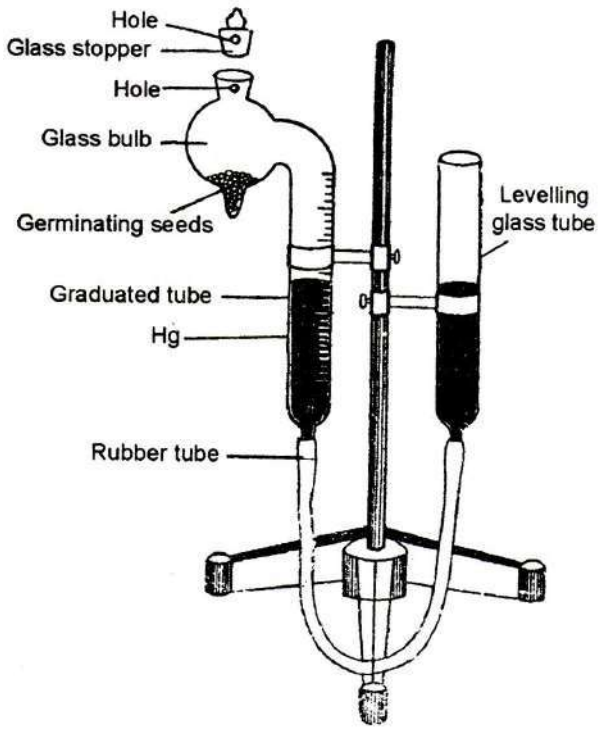
Fermentation → The electron ejected by oxidation of organic compound is terminally accepted by internal component to organic compound or organic compound **C_2H_5OH**, **Lactic Acid**, etc

- During fermentation and anaerobic respiration only 2 ATP and $2NADH_2$ are produced during glycolysis. The $2NADH_2$ produced terminally **reduce the organic compound in fermentation** and **inorganic compound, in anaerobic respiration** and energy lost in form of heat **as mitochondrial ETS not occurs.**

EXPERIMENT

Measurement of R.Q. by means of Ganongs respirometer.

Ganong's respirometer has a large stoppered bulb, a graduated side tube and a large stoppered bulb, a graduated side tube and a levelling tube. Both the stopper and neck of the bulb have a hole which can be used to equalise the atmospheric pressure inside the apparatus.



Place the respiring material in the bulb of Ganong's respirometer. Pour saturated common salt solution (CO_2 is sparingly soluble in it) in the levelling tube. Adjust the level of solution in the levelling tube and note the reading. After an hour note the reading. Calculate the rise (e.g., when organic acids are substrate) of salt solution level in the graduated tube through the levelling tube. KOH shall absorb CO_2. Take a new reading. Let it be $V_2CC.V_2CC$ is the volume of CO_2 librated during respiration. The O_2 used is V_2 plus V_1. R.Q. will therefore be

$$\text{R.Q.} = \frac{V_2}{V_2 + (-\text{ve or } +\text{ve } V_1)}$$

If v_1 is zero, positive or negative, R.Q. will be accordingly unity, less than unity or more than one respectively.

EXERCISE - 1

Q.1 How many molecules of ATP are produced per molecule of $FADH_2$ oxidised -
(1) One (2) Two
(3) Three (4) four

Q.2 Which of the following cytochrome donated electron to oxygen -
(1) cyto.-a_1 (2) cyto.-a_3
(3) cyto.-b (4) cyto.-c

Q.3 The amount of energy given by one ATP molecule is -
(1) 67 K cal (2) 6.7 K cal
(3) 7.6 K cal (4) 75 K cal

Q.4 How many ATP molecules produced from the complete oxidation of a molecule of active acetate or acetyl Co-A -
(1) 38 ATP (2) 15 ATP
(3) 12 ATP (4) 4 ATP

Q.5 How many ATP equivalents are produced by the oxidation of succinate into fumarate -
(1) 1 ATP (2) 2 ATP
(3) 3 ATP (4) 4 ATP

Q.6 The product of aerobic respiration of glucose is -
(1) $CO_2 + H_2O + ATP$
(2) CO_2 + Pyruvic acid
(3) CO_2 + ethyl alcohol
(4) CO_2 + Pyruvic acid + citric acid

Q.7 Product formed by the activity of malic dehydrogenase is -
(1) Fumaric acid (2) Malic acid
(3) Oxaloacetic acid (4) Succinc acid

Q.8 Which of the following is 5-carbon compound of Kreb's cycle -
(1) Citric acid
(2) Furmaric acid
(3) Oxalosuccinic acid
(4) α-Ketoglutaric acid

Q.9 Energy for ATP synthesis is obtained from -
(1) Oxygen ion gradient
(2) Heavy water grdient
(3) Uranium ion gradient
(4) Hydrogen ion gradient

Q.10 Mitochondria is the site of -
(1) CO production (2) Cell division
(3) The release of energy during respiration
(4) None of the above

Q.11 Substrate level ATP molecules during complete oxidation of molecule of glucose-
(1) 8 ATP (2) 6 ATP
(3) 4 ATP (4) 2 ATP

Q.12 How many ATP generates in aerobic respiration via glycerol phosphate shuttle in eukaryotes ?
(1) 38 ATP (2) 36 ATP
(3) 40 ATP (4) 80 ATP

Q.13 How many ATP generates in aerobic respiration of eukaryotic cell ?
(1) 28 ATP (2) 36 ATP
(3) 20 ATP (4) 40 ATP

Q.14 Respiration differs from burning in which of the following ?
(1) Energy released in respiration
(2) Oxidation of substance occurs
(3) Enzymes are involved
(4) All the above

Q.15 Energy produced per gram is highest in -
(1) Starch (2) Sucrose
(3) Protein (4) Lipid

Q.16 Site of Kreb's-cycle in respiration & ATP synthesis is -
(1) Mitochondrial stroma
(2) Matrix & oxysome
(3) Cytoplasm (4) None of the above

Q.17 Minimum respiration rate found in -
(1) Leaves (2) Stem
(3) Parenchyma (4) Seeds

Q.18 Cyanide resistant respiration is found in -
(1) Homo sapiens (2) Brassica
(3) Spinacea (4) Bacteria

Q.19 Ganong's respirometer used for -
(1) Respiration measuring
(2) R.Q. measuring
(3) Transpiration measuring
(4) All of the above

Q.20 Direct gain of ATP from one mole of glucose during glycolysis or EMP pathaway -
(1) 2 ATP (2) 6 ATP
(3) 36 ATP (4) 38 ATP

Q.21 In glycolysis of aerobic respiration the ATP synthesized are -
(1) 2 ATP (2) 6 ATP
(3) 8 ATP (4) 30 ATP

Q.22 $FADH_2$ Produced in Kreb's-cycle from -
(1) Isocitrate (2) α-ketoglutarate
(3) succinate (4) malate

Q.23 Which 5-carbon organic acid of TCA-cycle is key compound in N_2 -metabolism ?
(1) Cirtric acid (2) Fumaric acid
(3) Oxalosuccinic acid
(4) α-ketoglutaric acid

Q.24 mole of glucose when oxidised through EMP & TCA-cycle would yield -
(1) 30 ATP gross
(2) 40 ATP net
(3) 36 or 38 ATP net
(4) 38 ATP only

Q.25 When 00% carbon is oxidised to CO_2 the efficiency of such a respiration is ?
(1) 40% (2) 60%
(3) 80% (4) 00%

Q.26 What is true for Kreb's cycle ?
(1) GTP/ATP is formed
(2) 2 Decarboxylation
(3) Acetyl Co-A acceptor is O.A.A .
(4) All the above

Q.27 β-oxidation takes place in -
(1) Cell Membrane
(2) Mitochondrial Membrane
(3) Oxysomes Head
(4) Perimitochondrial space

Q.28 Warburg-Dickens pathaway is -
(1) PPP (2) TCA-cycle
(3) EMP pathway (4) None

Q.29 Which enzyme break downs the fructose, 6-Disphosphate ?
(1) Hexokinase (2) Phosphatase
(3) Aldolase (4) None

Q.30 How much energy equal to ATP will be produced by HMP shunt ?
(1) 40 ATP (2) 38 ATP
(3) 35 ATP (4) 8 ATP

Q.31 Link between glycolysis & TCA cycle is -
(1) Pyruvic acid (2) Acetyl Co-A
(3) Citric acid (4) None

Q.32 Aceptor of acetyl Co-A in Kreb's-cycle is -
(1) Malic acid (2) Fumaric acid
(3) α-ketoglutric acid
(4) Oxalo acetic acid

Q.33 Enzyme alternate oxidase is inhibited by :
(1) NADP
(2) SHAM (Salicy hydroxamic acid)
(3) m-CLAM (m-chloro-benzhydroxamic acid)
(4) 2 & 3

Q.34 When 2-pyruvic acids froms two lactic acid by anaerobic respiration then ?
(1) One ATP is lost (2) 3 ATP is lost
(3) 6 ATP is lost (4) None

Q.35 During oxidative phosphorylation follwoing provides energy for the ATP formation -
(1) Co-A
(2) NADPH
(3) Efflux of proton to PMS
(4) Pyruvic acid

Q.36 Energy required for start of biochemical reaction is -
(1) Potential energy (2) Entropy
(3) Activation enegy (4) Kinetic energy

Q.37 R.Q. of maturing fatty seeds will be -
(1) 1 (2) More than one
(3) 0 (4) 0.7

Q.38 Anaerobic degradation of proteins by microbes is known as -
(1) Putreification (2) Degradation
(3) Decomposition (4) None

Q.39 How is the energy present in food released during biological oxidation ?
(1) In one step, quickly
(2) In two steps, slowly
(3) In different steps, slowly
(4) In different steps, quickly

Q.40 During biological oxidation in which form energy is temporarily stored –
(1) In the form of Glucose
(2) In the form of Pyruvic acid
(3) In the form of ATP
(4) All the above

Q.41 Which of these is a high energy molecule ?
(1) GTP (2) CTP
(3) TTP (4) All the above

Q.42 ATP is formed in –
(1) Respiration
(2) Photosynthesis
(3) Photophosphorylation
(4) All the above

Q.43 ATP is called the –
(1) Cellular furnace
(2) Energy centre of the cell
(3) Biological energy currency
(4) Energy depositing molecule

Q.44 What is wrong about respiration ?
(1) It does not occur in cell
(2) Oxidation occurs without the use of enzymes
(3) Energy is released in one step quickly
(4) All the above

Q.45 Which statement about respiration is correct ?
(1) All energy is released in the form of heat
(2) Some energy is stored and rest is released as heat
(3) Body temperature increases greatly
(4) All the above

Q.46 What is the product of aerobic respiration ?
(1) CO_2 (2) H_2O
(3) Energy (4) All the above

Q.47 It is equally found in aerobic as well as anaerobic respiration ?
(1) Glycolysis (2) Kreb's Cycle
(3) Both of above (4) ETS

Q.48 What happens in fermentation ?
(1) Incomplete breakdown of Glucose
(2) Complete breakdown of Glucose
(3) Any of the above
(4) None of the above

Q.49 What are the reasons for less frequent fermentation ?
(1) Due to less energy production, the energy supply is less
(2) Due to more use of respiratory substrate, it is not available for growth and other process
(3) The excess of final and intermediate products of fermentation produce toxicity
(4) All the above

Q.50 What is the other name of glycolysis
(1) HMP pathway (2) EMP pathway
(3) PPP (4) All the above

Q.51 What is formed at the end of first step of phosphorylation of glycolysis ?
(1) Glucose 6-PO_4 (2) Fructose 6-PO_4
(3) Fructose-6 diPO_4 (4) Any of the above

Q.52 Phosphorylation of glucose occurs by –
(1) H_3PO_4 (2) ATP
(3) Any of the above (4) None of the above

Q.53 What is formed by the breakdown of Fructose -6 diphosphate in glycolysis ?
(1) PGAL (2) DHAP
(3) Both of above (4) PGA

Q.54 When is $NADH_2$ formed in glycolysis ?
(1) During the formation of DiHAP from PGAL
(2) During the formation of -3 DiPGAL from PGAL
(3) During the formation of -3 DiPGA from -3 DiPGAL
(4) During the formation of PeP from PGA

Q.55 When is ATP formed in glycolysis ?
(1) During the formation of 3-PGA from -3 DiPGA
(2) During the formation of Pyruvic acid from PEP
(3) Both of above
(4) None of the above

Q.56 How many molecules of pyruvic acid are formed in glycolysis ?
(1) One (2) Two
(3) Three (4) Four

Q.57 The products of glycolysis are –
(1) Pyruvic acid (2) 2 $NADPH_2$
(3) 2 ATP (4) All the above

Q.58 What is the total gain in terms of ATP in glycolysis ?
(1) Six (2) Four
(3) Eight (4) Ten

Q.59 How many ATPs are stored in anaerobic respiration ?
(1) Two (2) Four
(3) Six (4) Eight

Q.60 What is formed during exercising in skeletal muscles ?
(1) Pyruvic acid (2) Lactic acid
(3) Ethyl alcohol (4) Acetone

Q.61 Why the animals feel fatigue during exercise?
(1) Due to accumulation of malic acid
(2) Due to accumulation of lactic acid
(3) Due to accumulation of pyruvic acid
(4) Due to all the above

Q.62 What is there in Pyruvic dehydrogenase complex ?
(1) Pyruvic decarboxylase with TPP Mg^{++}
(2) COA
(3) Lipoic acid (4) All the above

Q.63 What is the other name for Kreb's Cycle ?
(1) TCA Cycle (2) DCA Cycle
(3) Both of above (4) None of the above

Q.64 Which is the 6 carbon compound in Kreb's cycle ?
(1) Citric/Isocitric acid
(2) Aconitic acid
(3) Oxalosuccinic acid
(4) All the above

Q.65 What is formed besides succinic acid during its formation in Kreb's Cycle ?
(1) ADP (2) GTP
(3) $NADH_2$ (4) $FADH_2$

Q.66 Which is the 4-carbon compound found in Kreb's cycle ?
(1) Succinic acid (2) Fumaric acid
(3) Malic acid (4) All the above

Q.67 What else is formed during formation of Fumaric acid from succinic acid ?
(1) $FADH_2$ (2) $NADH_2$
(3) $NADPH_2$ (4) None of these

Q.68 How many $FADH_2$ are formed from one pyruvic acid molecule ?
(1) One (2) Two
(3) Three (4) Four

Q.69 How many $NADH_2$ are formed from one glucose molecule ?
(1) Four (2) Five
(3) Eight (4) Ten

Q.70 How many $FADH_2$ are formed in one Kreb's cycle ?
(1) One (2) Two
(3) Three (4) Four

Q.71 How many $FADH_2$ are formed from one glucose molecule ?
(1) One (2) Two
(3) Three (4) Four

Q.72 Where the reaction of Kreb's cycle occur ?
(1) Cytoplasm
(2) Mitochondrial matrix
(3) Mitochondrial cristae
(4) F_1 particles of mitochondia

Q.73 How many ATP are obtained from $NADH_2$?
(1) One (2) Two
(3) Three (4) Four

Q.74 How many ATP are obtained from $FADH_2$?
(1) One (2) Two
(3) Three (4) Four

Q.75 $NADH_2$ to ATP synthesis occurs through –
(1) ETS (2) PPP
(3) EMP (4) HMP

Q.76 Which complex is formed by FMN $NADH_2$, Dehydrogenase,?
(1) Complex–I (2) Complex–II
(3) Complex–III (4) All the above

Q.77 Which substances are found in complex II of ETS ?
(1) FMN $NADH_2$, dehydrogenase
(2) Co-Q $FADH_2$, Dehydrogenase
(3) Both of above (4) None of above

Q.78 Which complex is formed by Cyt.a_3 and Cyt.a of ETS ?
(1) Complex–I (2) Complex–II
(3) Complex–III (4) Complex–IV

Q.79 Where is ATPase complex found ?
(1) On cristae of mitochondria
(2) In matrix of mitochondria
(3) In oxysomes present on cristae of mitochondria
(4) On F_0 particles of mitochondria

Q.80 Which electron acceptors can easily be separated from respiratory chain ?
(1) Co-Q (2) Cyt-c
(3) Both of above (4) Fe-S Protein

Q.81 Which are called mobile carriers of respiratory chain ?
(1) Co-Q (2) Cyt-c
(3) Both of above (4) None of the above

Q.82 Which acts as mobile carrier between complex-III and complex-IV ?
(1) Fe-S (2) Co-Q
(3) Cyt-C (4) None of these

Q.83 Hydrogen is transferred from $FADH_2$ to –
(1) NAD (2) FMN
(3) Co-Q (4) NADP

Q.84 Hydrogen is transferred from $NADH_2$ to –
(1) FAD (2) FMN
(3) Co-Q (4) Fe-S

Q.85 Who discovered chemiosmosis ?
(1) Mitchell (2) Warburg & Dickens
(3) Raecker (4) Krebs

Q.86 From which place H^+ protons enter matrix from outside of inner membrane of mitochondria ?
(1) Any part of the membrane
(2) Through elementary particles/oxysomes of membrane
(3) From terminal end of cristae
(4) None of the above

Q.87 Which part of elementary particle is completely embedded in the membrane ?
(1) F_0 (2) F_1
(3) Both of above (4) None of these

Q.88 By transfer of how many protons, one ATP is formed ?
(1) $1H^+$ (2) $2H^+$
(3) $3H^+$ (4) $4H^+$

Q.89 How many pairs of protons are released in respiratory chain by one $NADH_2$?
(1) One pair (2) Two pairs
(3) Three pairs (4) Four pairs

Q.90 What is the method of formation of ATP in mitochondria?
(1) Osmosis
(2) Chemiosmosis
(3) Chemiphosphorylation
(4) Osmophosphorylation

Q.91 Phosphorylation at substrate level is found in-
(1) Glycolysis (2) Kreb's cycle
(3) Both (1) and (2) (4) None of the above

Q.92 Which is called phosphorylative coupling ?
(1) Formation of ATP
(2) Formation of ATP by energy present in $NADH_2$, $FADH_2$ through respiratory chain
(3) Formation of ATP at substrate level
(4) All the above

Q.93 Who resists terminal oxidation of respiratory chain ?
(1) CO (2) KCN
(3) Both (1) and (2) (4) None of these

Q.94 Where is PPP (Pentose Phosphate pathway) performed in cell ?
(1) In mitochondrial matrix
(2) In cytoplasm
(3) In mitochondrial membrane
(4) None of the above

Q.95 PPP is related to –
(1) Glycolysis (2) Kreb's cycle
(3) Respiration (4) Photosynthesis

Q.96 PPP is an alternative of –
(1) Anaerobic respiration
(2) Fermentation
(3) Aerobic respiration
(4) All the above

Q.97 What is the significance of PPP ?
(1) It provides reductive power
(2) It provides ribose sugars for nucleic acid synthesis
(3) Provides Erythrose 4-P for synthesis of lignin, anthocyanin, auxin etc
(4) All the above

Q.98 Why $NADH_2$ produced in glycolysis cannot enter mitochondria generally ?
(1) Mitochondrial membrane is impermeable to $NADH_2$
(2) $NADH_2$ is used in cytoplasm only
(3) Both of above
(4) None of the above

Q.99 If malate aspartate shuttle is effective then how many ATPs are formed from Glucose ?
(1) 36 ATP (2) 38 ATP
(3) 30 ATP (4) 34 ATP

Q.100 Where H_2 of $NADH_2$ obtained by glycolysis through Glycerol Phosphate shuttle is transferred ?

(1) In matrix of mitochondria

(2) On inner surface of inner membrane of mitochondria

(3) On inner surface of outer membrane of mitochondria

(4) On outer surface of inner membrane of mitochondria

Q.101 In presence of Glycerol Phosphate shuttle, a glucose molecule yields –

(1) 38 ATP (2) 36 ATP

(3) 34 ATP (4) 30 ATP

Q.102 In prokaryotes, a glucose molecule always yields –

(1) 38 ATP (2) 36 ATP

(3) 2 ATP (4) 8 ATP

Q.103 In eukaryotes, a glucose molecule forms –

(1) Always 36 ATP (2) Always 38 ATP

(3) Always 38 ATP or 36 ATP

(4) None of the above

Q.104 Which is the substrate generally used first of all in respiration ?

(1) Protein (2) Fat

(3) Carbohydrate (4) Organic acid

Q.105 The ratio of CO_2 released and O_2 utilised in a definite time by a definite weight of respiratory substrate is called –

(1) Respiration (2) Respiratory quotient

(3) Respiratory ratio (4) Respiratory effect

Q.106 Why RQ value of carbohydrates is one ?

(1) Carbohydrates breakdown completely in respiration

(2) Carbohydrates have almost equal C and O

(3) Both of above

(4) None of the above

Q.107 Why the RQ value for fats and proteins is less than one ?

(1) Due to less O as compared to C in fats and proteins

(2) Due to incomplete breakdown of fats and proteins

(3) Due to complete breakdown of fats and proteins

(4) Due to more O in fats and proteins

Q.108 The fruits in which rate of respiration increases during ripening is called –

(1) Respiratory fruit (2) Climacteric fruit

(3) Climax fruit (4) Ethylinated fruit

EXERCISE - 2

Q.1 What is the importance of respiration in organisms ?
(1) It provides oxygen to plant
(2) It liberates energy
(3) It liberates CO_2
(4) All of the above

Q.2 Energy obtained by a cell from catabolic reaction is stored immediatlety in the form of-
(1) Pyruvic acid (2) Glucose
(3) ATP (4) DNA

Q.3 Which component of ETS is mobile, e^- carrier?
(1) UQ (CO-Q) (2) Cyto a
(3) Cyto - b (4) Cyto - f

Q.4 Which of the following is the source of respiration ?
(1) Stored food (2) RNA
(3) DNA (4) ATP

Q.5 R.Q. is less than one at the time of respiration of-
(1) Starch (2) Sugarcane
(3) Glucose (4) Ground nut

Q.6 Number of ATP produced from one pyruvic acid during conversion to actyl Co-A-
(1) 6 (2) 3
(3) 12 (4) 15

Q.7 In succulent plants R.Q. is less than one because of
(1) Complete oxidation
(2) Complete reduction
(3) Incomplete reduction
(4) Incomplete oxidation

Q.8 The link between Glycolysis and Krebs cycle is
(1) Citric acid (2) Malic acid
(3) Fumaric acid (4) Acetyl co-enzyme-A

Q.9 Aerobic respiration of glucose produces energy-
(1) 637 K.cal (2) 640 K.cal
(3) 686 K.cal (4) 693 K.cal

Q.10 Succinyl Co-A is related to -
(1) Krebs cycle (2) Calvin cycle
ycle (4) HMP-cycle

Q.11 According to chemiosmotic theory of P.Mitchell (1978), ATPs are synthesised on membrance due to the -
(1) Proton gradient (2) Electron gradient
(3) Osmosis (4) From H_2SO_4

Q.12 A reducton of NADP to $NADPH_2$ is associted with-
(1) EMP-pathway (2) HMP-shunt
(3) Calvin cycle (4) Glycolysis

Q.13 Cut surface of fruit and vgetable often become dark because -
(1) Dirty knife makes it dark
(2) Oxidation of tannic acid in the presence of trace of iron from the knife makes it dark
(3) Dust of the air makes it dark
(4) None of the above

Q.14 An example of competitive inhibition of an enzyme is the inhibition of :
(1) Succinic dehydrogenase by malonic acid
(2) Cytochrome oxidase by cyanide
(3) Hexokinas by glucose-6 phosphate
(4) Carbonic anhydrase by carbon-dioxide

Q.15 In hexose monophosphate shunt the number of CO_2 molecules evolved is-
(1) Same as in glyclysis
(2) Less than glycolysis
(3) More than glycolsis
(4) Much less than glycolysis

Q.16 Conversion of pyuvic acid into ethyl alcohol is mediated by -
(1) Phosphatase (2) Dehydrogenase
(3) Decarboxylase & dehydrogenase
(4) Catalase

Q.17 The commonest living, which can respire in the absence of O_2 is -
(1) Fish (2) Yeast
(3) Potato (4) Chorella

Q.18 The formation of Acetyl Co-A from pyuvic acid is the result of its -
(1) Reduction (2) Dehydration
(3) Phosphorylation
(4) Oxidative decarboxylation

Q.19 Which of the following is link between carbohydrate and fat metabolism ?

(1) CO_2 (2) Acetyl Co-A

(3) Pyruvic acid (4) Citric acid

Q.20 Pyruvate dehydrogenase complex is used in converting-

(1) Pyuvate to glucose

(2) Glucose to pyruvate

(3) Pyruvic acid to lactic acid

(4) Pyruvate to acetyl Co-A

Q.21 The first compound of TCA cycle is -

(1) Oxalo succinic acid

(2) Oxalo acetic acid

(3) Citric acid

(4) Cis aconitic acid

Q.22 End product of glycolysis is-

(1) Citirc acid

(2) Glyceraldeyde

(3) Phosphoglyceraldehyde

(4) Pyruvic acid

Q.23 First reaction in pentose phosphate pathway is-

(1) Oxidation of glucose-6-phosphate

(2) 6-Phosphogluconic acid

(3) Ribose-5-phosphate

(4) Fructose-5-phosphate

Q.24 Oxidation of one molecule of glucose in aerobic respiration result in the formation of-

(1) 36 ATP molecules (2) 38 ATP moleules

(3) 3 ATP molecules (4) 15 ATP molecules

Q.25 In the electron transport chain during terminal oxidation, the cytochrome, which donated electrons to O_2 is ?

(1) Cytochrome-b (2) Cyto-C

(3) Cyto-a_3 (4) Cyto-f

Q.26 Number of oxygen atoms required for aerobic oxidation of one pyruvate-

(1) 5 (2) 8

(3) 10 (4) 12

Q.27 Alternate name of Krebs cycle is -

(1) Glyoxylate cycle (2) Glycolate cycle

(3) Citric acid cycle (4) EMP Pathway

Q.28 Respiration in plants

(1) Occurs only during day

(2) Results in the formation of vitamins

(3) Is characteristic of all living cells

(4) Often requires CO_2

Q.29 In plants energy is produced during the process of -

(1) Photosynthesis (2) Transpiration

(3) Respiration (4) Water abosrption

Q.30 A very important feature of respiration is that

(1) It liberates energy

(2) It provides O_2

(3) Utilize CO_2

(4) Synthesize complex compounds

Q.31 Complete oxidation of 1 gm mol of glucose gives rise to -

(1) 6860000 cals (2) 686000 cals

(3) 68600 cals (4) 6860 cals

Q.32 The cell orgnelle in, which aerobic respiration occurs -

(1) Ribosome (2) Mitochondria

(3) Lysosmes (4) Chloroplast

Q.33 For the purpose of respiration in plants

(1) Light is necessary

(2) CO_2 is necessary

(3) O_2 is necessary

(4) Chlorophyll is necessary

Q.34 The end products of respiration in plants are

(1) CO_2, H_2O and energy

(2) Starch and O_2

(3) Sugar and oxygen

(4) H_2O and energy

Q.35 The incomplete breakdown of sugars in anaerobic respiration result in the formation of-

(1) Fructose and water

(2) Glucose and carbon dioxide

(3) Alcohol and CO_2

(4) Water and CO_2

Q.36 Carbon dioxide is liberated during -

(1) Phtosynthesis (2) Transpiration

(3) Acent of sap (4) Respiration

Q.37 Common immediate source of energy in cellular acticity is -

(1) glucose (2) aldohexose

(3) ATP (4) NAD

Q.38 Energy obtined by a cell from catabolic reaction is stored immediataly in the form of

(1) Glucose (2) Pyruvic acid

(3) ADP (4) ATP

Q.39 A.T.P. is

(1) A hormone (2) A protiein

(3) An enzyume which brings about oxidation

(4) A molecule which contain high energy bond

Q.40 In anaerobic respiration seeds respirs -

(1) In presence of O_2

(2) In presence of CO_2

(3) In absence of O_2

(4) In absence of CO_2

Q.41 The following is required both by the process of respiration and phtosynthesis -

(1) Carbohydrates (2) Sunlight

(3) Chlorophyll (4) Cytochromes

Q.42 The net gain of ATP molecules in glycolysis is-

(1) Zero (2) Two

(3) Four (4) Eight

Q.43 Cytochromes are concerned with -

(1) Protein synthesis (2) Cellular digestion

(3) Cell division (4) Cell-respiration

Q.44 How is respiration affected on the basis of protoplasm activity ?

(1) Rate of respiration in seed is found low

(2) In dormant organs, rate of respiration is low

(3) Rate of respiration is high in meristematic cells

(4) All the above

Q.45 Number of every cytochrome molecule require for transfer of $2e^-$ in ETS :

(1) 2 (2) 4

(3) 1 (4) 10

Q.46 Kreb's cycle takes place in -

(1) Vesicles of E.R

(2) Mitochiondrial matrix

(3) Dictyosomes (4) Lysosomes

Q.47 The respiration in germinating seeds produces energy, which can be defflected in the form of-

(1) water (2) O_2

(3) Heat (4) CO_2

Q.48 In respiration pyruvic acid is -

(1) Formed only when oxygen is available

(2) One of product of krebs cycle

(3) Broken down into Acetyl Co-A and CO_2

(4) a result of protein break down

Q.49 Most of the energy of the carbohydrates is released by oxidation when -

(1) Pyruvic acid is converted into CO_2 and H_2O

(2) Pyuvic acid is converted into acetyl Co-A

(3) Sugar is converted into pyruvic acid

(4) Glucose is converted into alcohol and CO_2

Q.50 Glycolysis takes place in -

(1) Cytoplasm (2) Chloroplast

(3) Ribosome (4) Mitochondria

Q.51 The universal hydrogen acceptor is -

(1) NAD (2) ATP

(3) Co-A (4) FMN

Q.52 The end product of fermentation when sugar are used as raw materials are -

(1) Alcohol and CO_2 (2) Alcohol, Pyruvate

(3) CO_2 (4) Alcohol

Q.53 Iron-porphyrin protein complex occurs in -

(1) phytochrome (2) cytochrome

(3) chlorophyll (4) both (1) and (3)

Q.54 Fermentation is conducted by

(1) All bacteria (2) All fungi

(3) Some fungi and some bacteria

(4) All microorganism

Q.55 In the process of respiration in plants 180 gm of Glucose plus192 gm of oxygen produce -

(1) 132 gm of CO_2 , 54 gm of H_2O & 483 Cal.E

(2) 264 gm of CO_2 , 108 gm of H_2O & 686 Cal.E

(3) 200 gm of C_2H_5OH, 72 gm of H_2O & 21 K. Cal E.

(4) None

Q.56 Respiratory enzymes are localised in -
(1) Ribosomes (2) Chloroplast
(3) Mitochondria (4) None of the above

Q.57 Respiration is an -
(1) Exothermic process
(2) Endothermic process
(3) Anabolic process
(4) None of these

Q.58 In Opuntia during night the R.Q. will be -
(1) 1 (2) less than 1
(3) More than 1 (4) 0

Q.59 Number of ATP molecules formed during aerobic respiration in break down of one glucose molecule via malate aspartate shuttle-
(1) 38 (2) 18
(3) 28 (4) 4

Q.60 During respiration pyruvic acid is formed by-
(1) Glycolysis (2) Kreb's cycle
(3) TCA cycle (4) None of the above

Q.61 Enzyme involved in alcoholic fermentation -
(1) Pyruvate decarboxylse
(2) Lactate dehydrogenase
(3) Hexoisomerase
(4) Both decarboxylase and dehydrogenase

Q.62 Kreb's cycle is -
(1) Aerobic respiration
(2) Photosynthesis
(3) Transpiration
(4) Anaerobic respiration

Q.63 The organism in which kreb's cycle does not occur in mitochondria is -
(1) Yeast (2) E.coil
(3) Ulothrix (4) Molds

Q.64 Citric acid is produced in
(1) Bacterial episome
(2) Kreb's cycle
(3) Calvin cycle
(4) Calvin + HSK cycle

Q.65 How many times CO_2 released in aerobic respiration -
(1) One or two (2) Three
(3) Six (4) Twelve

Q.66 Raw material for respiration is -
(1) Glucose & O_2
(2) Glucose & CO_2
(3) Glucose & Carbon
(4) Glucose & sucrose

Q.67 Slow respiring plant or plants tissues are -
(1) Promeristem
(2) Cambium
(3) Leaf primordia & young plant
(4) Adult plants & matured tissues

Q.68 The tissue of highest respiratory activity is -
(1) Meristem (2) Ground tissue
(3) Phloem (4) Mechanical tissue

Q.69 Respiratory quotient is expressed as -
(1) O_2/CO_2 (2) CO_2/O_2
(3) O_2/H_2O (4) CO_2-O_2

Q.70 What causes R.Q. to vary
(1) Respiratory Substrate
(2) Light & O_2
(3) Respiratory Product
(4) Temperature

Q.71 The first preferred respiratory substrate is -
(1) Glucose (2) Fats
(3) Protein (4) Polypeptide

Q.72 Respiration results into -
(1) Gain in weight (2) Loss in weight
(3) No change in weight
(4) Loss of ATP

Q.73 Respiration occurs in -
(1) All living cells both in lights & dark
(2) Non green cells only in light
(3) Non green cells in light and dark
(4) All living cells in light only

Q.74 The value of R.Q. at compensation point is -
(1) One (2) More than one
(3) Less than one (4) Inifinite

Q.75 The value of R.Q. at compensation point is -
(1) Unity (2) Two
(3) >1 (4) Zero

Q.76 The value of R.Q. of starved cell is -
(1) Zero (2) Less than one
(3) 1 (4) infinite

Q.77 R.Q. of an activley phtosynthesizing tissue is-
(1) Unity (2) < 1
(3) > 1 (4) Zero

Q.78 R.Q. of germinating ground nut & castor seed is-
(1) 1 (2) < 1
(3) >1 (4) 0

Q.79 The value of RQ of a ripening fatty seed is-
(1) < 1 (2) > 1
(3) zero (4) Unity

Q.80 When the evolution of CO_2 is more than the intake of O_2 the respired substrate should be-
(1) Fatty acid (2) orgainc acid
(3) Glucose (4) Polysaccharides

Q.81 The value of R.Q. of a succulent plant at night is-
(1) unity (2) >1
(3) Zero (4) Infinite

Q.82 Protoplasmic proteins are used as a respiratory substrate only when -
(1) Carbohydrates are absent
(2) Fats are absent
(3) Both 1 & 2 are absent
(4) Fats & carbohydrates are abundant

Q.83 The term ''Protoplasmic respiratory'' is used when the respiratory substrate is -
(1) Carbohydrates (2) Portein
(3) Organic acid (4) Lipid

Q.84 The term ''Floating respiration'' is used when the respiratory substrate is -
(1) Carbohydrates (2) Fats
(3) Both 1 and 2 (4) Protein

Q.85 Respiration may take place -
(1) In the presence of O_2
(2) In the absence of O_2
(3) In the presence or absence of O_2
(4) In the presence of CO_2

Q.86 Apparatus used to measure respiratory quotient-
(1) Potometer (2) Auxanometer
(3) Respirometer (4) Warburg's apparatus

Q.87 Glycolysis involves the conversion of -
(1) Protein into glucose
(2) Glucose into fructose
(3) Starch into glucose
(4) Glucose into pyruvic acid

Q.88 The end product of glycolysis is -
(1) Glycolate & ethanol
(2) Glyoxylic acid & CO_2
(3) Glucose or hexose units
(4) Pyruvate

Q.89 The common phase between aerobic & anaerobic respiration is -
(1) TCA cycle (2) Kreb's cycle
(3) Glycolysis (4) Photo respiration

Q.90 Which of the follwing scientist discovered the conventional path of glycolysis -
(1) Embeden, Myerhof and Parnas
(2) Emerson, Hoffman and Peterson
(3) Embeden, Morrison and Pitcher
(4) Warburg, Dickens and Horecker

Q.91 What is active glucose -
(1) FAD glucose (2) NAD glucose
(3) Glucose-6-P (4) Glycerophosphate

Q.92 The enzyme which converts glucose to glucose 6-phosphate-
(1) Phosphorylase
(2) Gluco-phosphorylase
(3) Hexokinase
(4) Phospho glucomutase

Q.93 Glycolysis give rise to -
(1) 8ATP, $2NADH_2$, 2 Pyruvate
(2) 2ATP, 2CoA, $2NADH_2$
(3) 2ATP, $2NADH_2$, 2 Pyruate
(4) 2ATP, 2 acetate, $2NADPH_2$

Q.94 The inhibitory effect of the presence of O_2 on anaerobic respiration is termed -
(1) Warburg effect (2) Pasteur effect
(3) Emerson's effect (4) Oxygen effect

Q.95 During glycolysis the mineral needed as an enzyme activator is -
(1) Mn^{++} (2) Fe^{++}
(3) Ca^{++} (4) Mg^{++}

Q.96 Green plants kept in light produce ATP from the glucose. This process is -
(1) Photophosphroylation
(2) Hill reaction
(3) Oxidative phosphorylation
(4) β-oxidation

Q.97 Anaerobic respiration was reported for the first time by -

(1) Pasteur (2) Kostytchev

(3) Klein (4) Pfeffer

Q.98 Which of the follwing ETS complex is inhibited by cyanide -

(1) Complex II (2) Complex V

(3) Complex IV (4) Comlex III

Q.99 Final e^- acceptor of mitochondria is -

(1) Pyruvate (2) NADP

(3) O_2 (4) OAA

Q.100 The number of ATP molecules produced from one Kreb's cycle are -

(1) 15 (2) 30

(3) 38 (4) 40

ANSWER KEY

EXERCISE - 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Respiratory Quotient (R.Q) is defined as - **[Uttaranchal 2004]**

(1) vol. of O_2 / vol. of CO_2

(2) vol. of CO_2 / vol. of O_2

(3) vol. of O_2 / vol. of N_2

(4) vol. of N_2 / vol. of CO_2

Q.2 Pyuvic acid is formed during - **[Uttaranchal 2005]**

(1) Krebs cycle (2) Glycolysis

(3) Ornithine cycle (4) Calvin cycle

Q.3 The correct sequence of electron acceptor in ATP synthesis - **[Uttaranchal 2005]**

(1) cyt a,a_3 b, c (2) cyt b, c, a, a_3

(3) cyt b, c_3, a, a_3 (4) cyt c, b, a, a_3

Q.4 Which one of the following contains copper besides iron -

(1) Cytochrome-f

(2) Cytochrome oxidase

(3) Platoquinone

(4) Cytochrome-c_1

Q.5 Where does formaton of acetyl Co-A from pyruvic acid take place -**[Uttaranchal 2006]**

(1) Mitochondria (2) Cholroplast

(3) Cytoplasm (4) Golgi body

Q.6 The number of ATP molecules prduced by electron transport system from kreb's cycle intermediates in a single turn is - **[Uttaranchal 2004]**

(1) 11 (2) 14

(3) 12 (4) 16

Q.7 In anaerobic respiration the number of ATP molecules produced are - **[West Bengal 2006]**

(1) 1 (2) 2

(3) 3 (4) 8

Q.8 In which of the following steps of Krebs cycle CO_2 is evolved - **[West Bengal 2007]**

(1) Isocitric acid $\rightarrow$ oxalosuccinic acid

(2) Oxalosuccinic acid $\rightarrow$ α-ketoglutaric acid

(3) succinic acid $\rightarrow$ fumaric acid

(4) malic acid $\rightarrow$ oxaloacetic acid

Q.9 Which of the following enzyme is not used in Krebs' cycle - **[West Bengal 2007]**

(1) Aconitase (2) Decarboxylase

(3) Aldolase (4) Furmarase

Q.10 End produced of fermentation is - **[West Bengal 2007]**

(1) O_2 (2) N_2O

(3) H_2O (4) C_2H_5OH

Q.11 Gluconeogenesis is - **[West Bengal 2007]**

(1) Formation of glucose from other than carbohydrate

(2) Formation of glycogen

(3) Breakdown of glucose

(4) Formation of ammonia from glucose

Q.12 β-oxidation takes place in - **[West Bengal 2007]**

(1) Matrix of mitochondria

(2) Cell cytoplasm

(3) Inter mitochondrial chamber

(4) Ribosomes

Q.13 In TCA cycle the conversion of succinyl co-A to succinic acid requires - **[West Bengal 2007]**

(1) Acetyl Co-A + GTP + ip

(2) Acetyl Co-A + GDP + iP

(3) Co-A + GTP + iP

(4) GDP + iP

Q.14 Yeast is used in the formation of - **[C.G. PMT 2007]**

(1) Ammonia (2) Alcohol

(3) Curd (4) Petrol

Q.15 Fermentation is represented by equation - **[C.G. PMT 2007]**

(1) $C_6C_{12}O_6+6O_2 \rightarrow 6CO_2+6H_2O$ +673 Kcal

(2) $C_6C_{12}O_6 \rightarrow 2C_2H_5OH + 2CO_2$

(3) $6CO_2+12H_2O \rightarrow C_6H_{12}O_6 + 6H_2O + 6O_2$

(4) $6CO_2 + 6H_2O \xrightarrow[\text{chlorophyll}]{\text{light}} C_6H_{12}O_6 + 6O_2$

Q.16 Which of the following is formed during respiration ? **[C.G. PMT 2004]**

(1) O_2 (Oxygen)

(2) CO_2 (Carbon dioxide)

(3) NO_2 (NItrogen dioxide)

(4) SO_2 (Shulphur dioxide)

Q.17 The pyruvic acid formed in glycolysis is oxidised to CO_2 and H_2O in a cycle called : **[C.G. PMT 2007]**

(1) Calvin cycle (2) Hill reaction

(3) Krebs cycle (4) Nitrogen cycle

Q.18 The end product of glycolysis is : **[C.G. PMT 2005]**

(1) Glucose (2) Fructose

(3) Pyruvic acid (4) Ethyl alcohol

Q.19 R.Q. is more than one in case of : **[C.G. PMT 2005]**

(1) Fat (2) Fructose

(3) Glucose (4) Organic acid

Q.20 Total yield in one Kerb cycle : **[C.G. PMT 2006]**

(1) 3 $FADH_2$, 2 $NADH_2$, 1 ATP

(2) 2 $FADH_2$, 2 $NADH_2$, 2 ATP

(3) 2 $NADH_2$, 1 $FADH_2$, 2ATP

(4) 3 $NADH_2$, 1 $FADH_2$, 1 ATP

Q.21 How many ATP will be produced during the production of 1 molecule of Accetyl Co-A from 1 molecule of pyryvic acid ? **[C.G. PMT 2006]**

(1) 3 ATP (2) 5 ATP

(3) 8 ATP (4) 38 ATP

Q.22 Sequence of cytochromes is : **[Jharkhand- 2006]**

(1) cyt. a, b,c, a_3 (2) cyt. b, c, a, a_3

(3) cyt. b, a,,a_3, c (4) cyt. b, c, a_3, a

Q.23 Cytochrome is a : **[Jharkhand- 2006]**

(1) Mg pyrole ring (2) Fe prophyrin ring

(3) Nucleotide (4) Alloy of nichrome

Q.24 Krebs cycle takes place in : **[Jharkhand- 2006]**

(1) mitochondrial matrix

(2) Cytoplasm

(3) Lysosome (4) Nucleus

Q.25 Cellular respiration occurs in - **[Jharkhand- 2005]**

(1) Chloroplast (2) Golgibodies

(3) Mitochondria (4) Nucleus

Q.26 Maximum amount of energy/ATP is liberated on oxidation of : **[Jharkhand- 2004]**

(1) Fats (2) Proteins

(3) Starch (4) Vitamins

Q.27 More CO_2 is evolved than the volume of oxygen consumed when the respiratory substrate is : **[Jharkhand- 2004]**

(1) Fat (2) Sucrose

(3) Glucose (4) Organic acid

Q.28 Krebs cycle begins with the reaction : **[Jharkhand- 2004]**

(1) Citric acid + Acetyl CO-A

(2) Oxalacetic acid + Pyruvic acid

(3) Oxalacetic acid + Citric acid

(4) Oxaloacetate + Acetyl CO-A

Q.29 Hydrolysis of fat yields : **[Jharkhand- 2004]**

(1) Facts

(2) Fatty acids and glycerol

(3) Mannose and glycerol

(4) Maltose and fatty acid

Q.30 Respiratory quotient of which diet is less than unity ? **[Jharkhand- 2004]**

(1) Carbohydrate (2) Fats

(3) Organic acid (4) Sugar

Q.31 Richest energy compound is : **[Bihar- 2005]**

(1) Creatinine phosphate

(2) Protein

(3) carbohydrate (4) Fat

Q.32 The stage upto which glycolysis and fermentation is common : **[Bihar- 2005]**

(1) dihydroxy acetone

(2) 3-phosphoglyceraldehyde

(3) pyruvate

(4) glucose-6-phosphate

Q.33 Respiratory quotient of carbohydrate is - **[Bihar- 2005]**

(1) unity (2) greater than unity

(3) less than units (4) equal to five

Q.34 During conversion of pyruvic acid into acetyl Co-A, pyruvic acid is **[Bihar- 2003]**

(1) oxidised (2) reduced

(3) isomerised (4) condensed

Q.35 In Kreb's cycle : **[Bihar- 2003]**

(1) ADP is converted into CO_2

(2) Pyruvic acid is converted into CO_2 and H_2O

(3) Glucose is converted into CO_2

(4) Pyruvic acid is converted into ATP

Q.36 Incomplete breakdown of sugar in anaerobic respiration forms- **[Bihar- 2003]**

(1) glucose and CO_2 (2) alcohol and CO_2

(3) water and CO_2 (4) fructose and water

Q.37 Significance of Kreb's cycle : **[Bihar- 2002]**

(1) Synthesis of ATP

(2) Synthesis of amino acid

(3) Synthesis of chlorphyll

(4) All

Q.38 In plants, respiration takes place : **[Bihar-2002]**

(1) During day only (2) During night only

(3) All the 24 hours (4) At dusk

Q.39 Glycolysis takes place in : **[Bihar- 2001]**

(1) Cytoplasm (2) Nucleus

(3) Plastid (4) Miltochondria

Q.40 In respiration, largest amount of energy is produced in - **[Bihar- 2006]**

(1) anaerobic respiration

(2) Krebs cycle

(3) glycolysis

(4) none of the above

Q.41 Which of the following is not an intermediate in Krebs cycle ? **[Bihar- 2006]**

(1) Acetic acid

(2) Succinyl coenzyme-A

(3) Malic acid

(4) Citric acid

Q.42 The pyruvic acid is formed during : **[UP CPMT- 2001]**

(1) Krebs cycle (2) glycolysis

(3) ornithine cycle (4) photophosphorylation

Q.43 The number of ATP molecules gained during aerobic respiration of 1 mole of glucose is : **[UP CPMT- 2001]**

(1) 12 (2) 18

(3) 30 (4) 38

Q.44 Alcoholic fermentation takes place in the presence of : **[UP CPMT- 2001]**

(1) maltase (2) zymase

(3) amylase (4) invertase

Q.45 The site of EMP pathway in cell is : **[UP CPMT- 2001]**

(1) peroxisome

(2) cytoplasm

(3) matrix of mitochondria

(4) inner membrane of mitochondria

Q.46 Step of respiration are controlled by : **[UP CPMT- 2002]**

(1) Substrates (2) Enzymes

(3) Hormone (4) Bile juice

Q.47 Enzymes of electron transport system is present in : **[UP CPMT- 2003]**

(1) Inner mitochondrial membrane

(2) Matrix

(3) Intermembranous space

(4) Endoplasmic reticulum

Q.48 Which of the following connects glycolysis to Kreb's cycle ? **[MP PMT 2001,UP CPMT- 2003]**

(1) Acetyl CO-A

(2) Ribozyme

(3) Cytochrome oxidase

(4) N-acetyl glucosamine

Q.49 Pyruvic acid is the end product of **[UP CPMT- 2003]**

(1) Kreb's cycle

(2) Electron transport system

(3) Phtosynthesis

(4) Glycolysis

Q.50 Which of the following accepts terminal electron during aerobic respiration ? **[UP CPMT- 2003]**

(1) Molecular O_2 (2) Molecular H_2

(3) Molecular CO_2 (4) $NADOH_2$

Q.51 Glycolysis occurs in : **[UP CPMT- 2004]**
(1) Cytoplasm (2) Nucleus
(3) Mitochondria (4) Both 'a' and 'c'

Q.52 Which one of the following is the first step of glycolysis ? **[UP CPMT- 2004]**
(1) Breakdown of glucose
(2) Phosphorylation of glucose
(3) Conversion of gloucose into fructose
(4) Dehydrogenation of glucose

Q.53 How many ATP molecules released when 1 molecules of glucose is oxidised in our liver cells ? **[UP CPMT- 2005]**
(1) 36 (2) 38
(3) 2 (4) 8

Q.54 Sequence of food materials consumed during starvation is : **[UP CPMT- 2005]**
(1) Carbohydrate $\rightarrow$ fats $\rightarrow$ protein
(2) Carbohydrate $\rightarrow$ proteins $\rightarrow$ fats
(3) Proteins $\rightarrow$ facts $\rightarrow$ carbohydrate
(4) Fats $\rightarrow$ proteins $\rightarrow$ carbohydrate

Q.55 How many ATPs are produced during glycolysis of one molecule of glucose ? **[UP CPMT- 2006]**
(1) 4 (2) 2
(3) 36 (4) 38

Q.56 Final electron acceptor in ETS is : **[UP CPMT- 2006]**
(1) NAD (2) FAD
(3) Oxygen (4) Hydrogen

Q.57 Respiratory cycle where $NADH_2$ are produced is - **[UP CPMT- 2006]**
(1) Calvin cycle (2) Kreb's cycle
(3) EMP pathway (4) HMP shunt

Q.58 Most of the enzymes which participate in Kreb's cycle are found in :**[MP PMT- 2001]**
(1) Matrix of mitochondria
(2) Inner membrane of mitochondria
(3) Outer membrane of mitochondria
(4) Stroma of chloroplast

Q.59 The connecting link between glycolysis and Krebs cycle is : **[MP PMT- 2001]**
(1) Acetyl CO A (2) CO Q
(3) Conenzyme (4) COA

Q.60 The process of oxidative phosphorylation takes place in : **[MP PMT- 2002]**
(1) Mitochondria (2) Chloroplasts
(3) Ribosomes (4) Cytoplasm

Q.61 Glycolysis is the conversion of : **[MP PMT- 2002]**
(1) Glucose to glycogen
(2) Glycogen to glucose
(3) Glucose to pyruvic acid
(4) Glucose to citric acid

Q.62 Anaerobic respiration takes place in : **[MP PMT- 2002]**
(1) Ribosome (2) Nucleus
(3) Cytoplasm (4) Vacuole

Q.63 Which of the following is the product of glucose fermentation by yeast? **[MP PMT- 2003]**
(1) $C_6H_{12}O_6$ (2) C_2H_5OH
(3) $(C_6H_{10}O_5)_n$ (4) CH_2OH

Q.64 Fermentation is an : **[MP PMT- 2003]**
(1) Anaerobic respiration
(2) Incomplete oxidation
(3) Excertory process
(4) None of the above

Q.65 Organelles which are regarded as ''Power house of the cell and in which the oxidative reactions of the respiratory process takes place are known as : **[MP PMT- 2004]**
(1) Chloroplast (2) Ribosomes
(3) Mitochondria
(4) Endoplasmic reticulum

Q.66 In which of the following, respiration in absence of oxygen also takes place : **[MP PMT- 2004]**
(1) Man (2) Potato
(3) Yeast (4) Spirogya

Q.67 CO_2 is liberated during : **[MP PMT- 2004]**
(1) Ascent of sap (2) Respiration
(3) Photosynthesis (4) Transpiration

Q.68 ATP stands for which of the following - **[MP PMT- 2004]**
(1) Adenine tetraphosphate
(2) Adenine triphosphate
(3) Adenosine diphosphate
(4) Adenosine triphosphate

Q.69 Glycolysis occurs in : **[MP PMT- 2005]**
(1) Vecuoles (2) Nucleolus
(3) Mitochondria (4) Cytoplasm

Q.70 The number of ATP produced during the production of 1 molecule of acetyl CoA from 1 molecule of Pyruvic acid is : **[MP PMT- 2006]**
(1) 3 ATP (2) 8 ATP
(3) 36 ATP (4) 38 ATP

Q.71 The energy produced by one ATP molecule is : **[MP PMT- 2006]**
(1) 7.6 kcal (2) 12 kcal
(3) 20 kcal (4) 100 kcal

Q.72 Which of the following show anaerobic respiration : **[MP PMT- 2006]**
(1) Earthwarm (2) Rabbit
(3) Echinoderms (4) Tapeworms

Q.73 It is belived that the organisms first inhabited earth's sufarce were : **[MP PMT- 2006]**
(1) Autotrophs (2) Mixotrophs
(3) Chemoautotrophs (4) Heterotrophs

Q.74 Pyruvic acid before combining with oxaloacetic acid of Krebs cycle, becomes :
(1) Citric acid (2) Acetoacetic acid
(3) Cis-aconitic acid (4) Acetyl CoA

Q.75 Anaerbic respiration takes place in - **[MP PMT 2002]**
(1) Ribosome (2) Nucleus
(3) Cytoplasm (4) Vacuole

Q.76 What is the energy coin of a cell ? **[MP PMT 2002]**
(1) DNA (2) RNA
(3) ATP (4) Minerals

Q.77 The process of oxidative phosphorylation takes place in - **[MP PMT 2002]**
(1) Mitochondria (2) Chloroplasts
(3) Ribosomes (4) Cytoplasm

Q.78 R.Q. of which diet is less than unit ? **[RPMT 2002]**
(1) Carbohydrate (2) Fats
(3) Organic acid (4) Sugar

Q.79 Pyruvic acid is the end product of which process ? **[RPMT 2002]**
(1) Kreb's cycle (2) Calvin cycle
(3) Pentose phosphate pathway
(4) Glycolysis

Q.80 molecule glucose + 6 molecule of O_2 and 38 ADP combined to form 6 H_2O, 6 CO_2 and- **[RPMT 2002]**
(1) 38 molecules of ATP
(2) 28 ATP
(3) 38 ADP (4) 28 ADP

Q.81 Number of ATP obtained at the end of Kreb's cycle - **[RPMT 2002]**
(1) 2 ATP (2) 4 ATP
(3) 8 ATP (4) 38 ATP

Q.82 During the formation of bread, it becomes porous due to release of CO_2 by the action of- **[CPMT 2002]**
(1) Yeast (2) Bacterial
(3) Virus (4) Protozoans

Q.83 How many ATP molecules produced by aerobic oxidation of one molecule of glucose ? **[CPMT 2002]**
(1) 2 (2) 4
(3) 38 (4) 34

Q.84 In which one of the following do the two names refer to one and the same thing - **CPMT 2003]**
(1) Kreb's cycle and calvin cycle
(2) Tricarboxylic acid cycle and citric acid cycle
(3) Citric and cycle and Calvin cycle
(4) Tricarboxylic acid cycle and urea cycle

Q.85 In alcohol fermentation - **[CPMT 2003]**
(1) Triose phosphate is the electron donor, while acetaldehyde is the electron accceptor
(2) Triose phosphate is the electron donor, while pyruvic acid is the electron acceptor
(3) There is no electron donor
(4) Oxygen is the electron acceptor

Q.86 In glycolysis, during oxidation electrons are removed by - **[CPMT 2004]**
(1) Molecular oxygen (2) ATP
(3) Glyceraldehyde (4) NAD^+

Q.87 Aerobic respiration is how many times useful than anaerobic respiration - **[RPMT 2004]**
(1) 2 (2) 8
(3) 9 (4) 38

Q.88 For retting of jute, the fermenting microbe used is - **[AIPMT 2005]**

(1) Helicobactor pylori

(2) Methophilic bacteria

(3) Streptococcus lactin

(4) Butyric acid bacteria

Q.89 During which stage in the complete oxidation of glucose are the greatest number of ATp molecules formed form ADP? **[AIPMT 2005]**

(1) Conversion of pyruric acid to acetyl Co A

(2) Electron transport chain

(3) Glycolysis (4) Krebs cycle

Q.90 The deficiencies of micronutrients, not only affects growth of plants, but also vital functions such as photosynthetic and mitochondrial electron flow. Among the list given below, which group of three elements shall affact most, both photosynthetic and mitochodrial electron transport - **[AIPMT 2005]**

(1) Cu, Mn Fe (2) Co, Ni, Mo

(3) Mn Co, Ca (4) Ca, K, Na

Q.91 Chemiosmotic theory of ATP synthesis in the chloroplast and mitochondria is based on - **[AIPMT 2005]**

(1) Proton gradient

(2) Accumulation of K ions

(3) Accumulation of Na ions

(4) Membrane potential

Q.92 Respiration is which type of process- **[RPMT 2005]**

(1) Catabolic (2) Metabolic

(3) Anabolic (4) None

Q.93 R.Q. is represented by- **[RPMT 2005]**

(1) O_2/CO_2 (2) CO_2/O_2

(3) $V_2/V_2–V$ (4) O_2 taken in

Q.94 Which is the site of Kreb's cycle -

(1) Chloroplast **[RPMT 2005]**

(2) Golgibody

(3) Mitochondria

(4) Endophasmic reticulum

Q.95 Curing of tea leaves is broght about by the actiivty of - **[AIPMT 2006]**

(1) viruses (2) fungi

(3) bacteria (4) mycorrhiza

Q.96 Which of the following statements regarding mitochondrial membrane is NOT correct ? **[AIPMT 2006]**

(1) The inner membrance is highly convoluted forming a series of infolding

(2) The outer membrane resembles a sieve

(3) The outer membrance is permeable to all kinds of molecules

(4) The enzymes of the electron transfer chain are embedded in the outer membrane.

Q.97 How many ATP molecules could maximally be generated from one molecule of glucose, if the complete oxidation of one mole of glucose to CO_2 and H_2O yields 686 kcal and the useful chemical energy available in the high energy phosphate bond of one mole of ATP is 2 Kcal? **[AIPMT 2006]**

(1) 57 (2)

(3) 2 (4) 30

Q.98 The overall goal of glycolysis, Krebs cycle and the electron transport system is the formation of - **[AIPMT 2007]**

(1) Nucleic acids

(2) ATP in small stepwise units

(3) ATP in one large oxidation reaction

(4) Sugars

Q.99 All enzymes of TCA cycle are located in th mitochondrial martix except one which is located in inner mitochondrial membrane in eukaryotes and in cytosol in prokaryotes. This enzyme is - **[AIPMT 2007]**

(1) Succinate dehydrogenase

(2) Lactate dehydrogenase

(3) Isocitrate dehydrogenase

(4) Malate dehydrogenase

Q.100 Which one of the following mamalian cells are not capable of metabolising glucose to carbondioxide aerobically ? **[AIPMT 2007]**

(1) Red blood cells

(2) White blood cells

(3) Unstriated muscle cells

(4) Liver cells

Q.101 A competitive inhibitor of succinc dehydrogenase is - **[AIPMT 2008]**

(1) $\propto$-ketoglutarate (2) Malate

(3) Malonate (4) Oxaloacetate

Q.102 The chemiosmotic coupling hypothesis of oxidative phosphorylation proposes that adenosine triphosphate (ATP) is formed because - **[AIPMT 2008]**

(1) A proton gradient forms across the inner membrane

(2) There is a change in the permeabity of the inner mitochondrial membrane towrds adenosine diphosphate (ADP)

(3) High energy bonds are formed in mitochondrial proteins

(4) ADP is pumped out of the matrix into the intermembrane space

Q.103 The energy-relesing process in which the substrate is oxidised without an external electron acceptor is called - **[AIPMT 2008]**

(1) Aerobic respiration

(2) Glycolysis

(3) Fermentation

(4) Photorespiration

Q.104 In germinating seeds fatty acids are degraded exclusively in the - **[AIPMT 2008]**

(1) Peroxisomes (2) Mitochondria

(3) Proplastids (4) Glyoxysomes

Q.105 The energy-releasing metabolic process in which substrate is oxidised without an external electron acceptor is called- **[AIPMT-2010 (Pre)]**

(1) Aerobic respiration

(2) Photorespiration

(3) Glycolysis (4) Fermentation

Q.99	1	Q.100	1	Q.101	3	Q.102	1	Q.103	3	Q.104	4	Q.105	4

These questions consist of two statements each, printed as Assertion and Reason. While answering these Questions are required to choose any one of the following four responses.

(1) If both Assertion & Reason are True & the Reason is a correct explanation of the Assertion.

(2) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.

(3) If Assertion is True but the Reason is False.

(4) If both Assertion & Reason are false.

Q.1 **Assertion :-** In the process of alcoholic fermentation, the hexose molecule is converted in starch.

Reason:- Alcoholic fermentation is aerobic.

Q.2 **Assertion :-** Respiration occurs both in prokaryotic & eukaryotic cells.

Reason:- In eukaryotic cells respiration is only aerobic.

Q.3 **Assertion :-** Pentose phosphate pathway is also known as cytosolic decarboxylation.

Reason:- All the carbon dioxide is released in cytosol during this pathway.

Q.4 **Assertion :-** Aerobic (oxygenated) atmosphere on earth is maintained due to the action of photosynthetic organisms

Reason:- Cyanobacteria are non oxygenic form of plants

Q.5 **Assertion :-** Value of R.Q. is more than one during the germination of fatty seeds.

Reason:- More CO_2 liberated than absorbed O_2 in fat-oxidation.

Q.6 **Assertion :-** Enzymes of Krebs cycle are endo enzymes.

Reason:- All the enzymes of Kreb's cycle function inside the cell

Q.7 **Assertion :-** Kerbs cycle is called as amphibolic pathway of respiration

Reason:- Krebs cycle takes place in cytosol

Q.8 **Assertion :-** Pyruvic acid can not enter in mitochondria

Reason:- Pyruvic acid is 4-Carbon compund.

Q.9 **Assertion :-** Fermentation is an incomplete oxidation of substrate outside the cell.

Reason:- In Alocholic fermentation the hexose converts in to glucose & fructose

Q.10 **Assertion :-** Glyoxilate cycle is an example of gluconeogenesis.

Reason:- Glyoxilate cycle operates in stroma of chloroplast.

Q.11 **Assertion :-** Only 2 molecules of ATP generates in anaerobic respiration

Reason:- Anaerobic respiration is incomplete oxidation of respiratory substrate

Q.12 **Assertion :-** 4-carbon intermediate of Kreb's-cycle is **Erythrose**-P

Reason:- Kreb's-cycle occurs in night

Q.13 **Assertion :-** Lactic acid is produced anaerobically in human muscles

Reason:- The reaction is catalysed by lactobacillus

Q.14 **Assertion :-** Anaerobic respiration gives only 2 ATP.

Reason:- Only one FADH2 reacts at ETS in anaerbic respiration

Q.15 **Assertion :-** Glycolysis is also known as oxidative anabolism.

Reason:- Glucose splits during this and some intermediates involve in anabolism

Q.16 **Assertion :-** Anaerobic respiration occurs only in fungi.

Reason:- Fungi are green plants.

Q.17 **Assertion :-** HMP-shunt is alternate of Glucose oxidation.

Reason:- This take place in cytoplasm.

Q.18 **Assertion :-** Kreb-cycle is called as TCA-cycle.

Reason:- First formed compound of Krebs cycle is tri carboxylic acid.

Q.19 **Assertion :-** Respiration is a vital process.

Reason:- Respiration is characteristic of only living cells.

Q.20 **Assertion :-** Glycolysis is common step in aerobic & anaerobic respiration.

Reason:- Glycolysis splits the pyruvate in to H_2O & CO_2

Q.21 **Assertion :-** HMP shunt is also known as Reductive pentose phosphate pathway.

Reason:- Reduction of pentose sugar ribulose occurs during HMP shunt.

Q.22 **Assertion :-** Succinyl CoA is the precursor of most pf porphyrin ring containing compounds

Reason:- Chlorophyll is synthesised from succinyl Co-A.

Q.23 **Assertion :-** Reduction of NAD in glycolysis is energy conserving step.

Reason:- Energy neither be created nor be destroyed.

Q.24 **Assertion :-** Glycolysis is common between aerobic & anaerobic respiration.

Reason:- Glycolysis can takes place in presence and absence of O_2.

Q.25 **Assertion :-** Lactobacillus Perfoms fermentation

Reason:- Lactobacillus is an anaerobic bacteria

Q.26 **Assertion :-** Oxidative decarboxylation occurs in mitochondria.

Reason:- Link reaction and Kreb's cycle occurs in mitochondria.

Q.27 **Assertion :-** Formation of Acetyl CoA in mitochondria is known as link reaction.

Reason:- Acetyl CoA is a compound which links the glycolysis & TCA-cycle

Q.28 **Assertion :-** HMP shunt is known as oxidative decarbroxylation.

Reason:- HMP shunt involves removal of H+/ e and CO_2.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A Question I am unable to solve in first attempt	COLUMN : B Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

PLANT GROWTH & GROWTH HORMONES

INTRODUCTION

- Growth is defined as **permanent and irreversible change** in the size or volume of cell organ or whole organism, usually accompanied by an **increase** in **fresh** or **dry weight**.
- Growth is a **biological reaction**, occuring in protoplasm of all living cells.
- Growth is a basic feature of all living organisms.

FEATURES OF PLANT GROWTH

- Seed germination is the first step of plant growth. Almost all the plants face a period of suspended growth.
- If the suspension of growth is due to **exogenously cotrolled factors** (environmental factors) then it is called **quiescence.**
- When the suspension of growth is due to the **endogenously controlled factors** (hormonal, genetics) then it is termed as **dormancy.**
- Growth is **diffused in animals,** but in **plants growth is localised & irregular** (nail in plant stem, occupies same height till several years of growth).
- Growth in plant is both **limited/determinate** and **unlimited/Indeterminate.**

  Limited/Determinate growth - In annuals & biennials. Growth activities are restricted for a determined period of time.

  Unlimited/Indeterminate growth - In perennials. Growth activities occurs through out the life.
- **Differentiation :** Cell derived from active meristem tissue, become mature to perform specific function.
- **Development :** Sum of morphogenesis and differentiation activities in livings is called as development.
- **Dedifferentiation :** In plants the living differentiated cell which lost the capacity of cell division, regain the capacity of cell division under certain conditions called Dedifferentiation.

  e.g.: Formation of meristems intrafascicular cambium and cork from differentiated parenchyma cells.
- **Redifferentiation :** The regain of differentiation by losing the capacity of cell division for performing specific function by a dedifferentiated cells.

MEASUREMENT OF PLANT GROWTH

✸ **Main base for growth measurement :**

- Increase in number of cells.
- Increase in weight.
- Increase in volume and area of fruits and leaves.
- Increase in length of roots and shoot - This is the general basis for growth measurement.

✸ **Instruments used for measurement of growth :**

- **Auxanometers –** Arc auxanometer and Pfeffer's auxanometer.
- **Horizontal microscope**
- **Bose's Crescograph** - It is **most sensitive** apparatus. It magnify growth as 10,000 times.
- **Space maker disc** - It is maximally used instrument to determine the area of leaves.
- **Efficiency index (E.I.) :-**

  Growth can be measured by an increase **in size** or **area of an organ** of the plant (leaf, flowers, fruits etc.) in a unit time is called as **efficiency index (E.I.)** may be same or different in species to species and organ to organ.

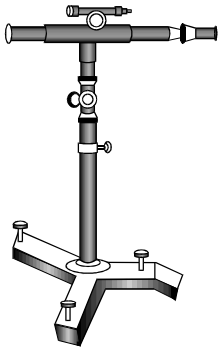

Fig.: Horizontal Microscope

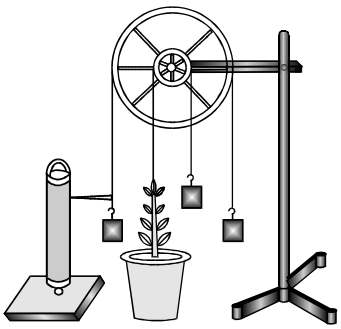

Fig.: Pfeffer's Auxanometer

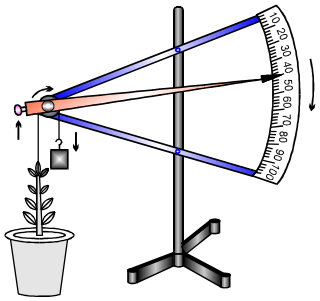

Fig.: Arc Auxanometer

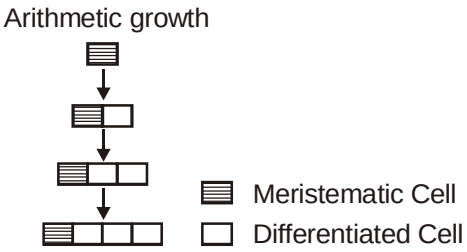
✸ **Growth rate :**

Increased growth per unit time. Plant growth is of two types :

A. Arithmetic growth : From dividing cell two new cells are formed (by mitotic division) out of them one daughter cell continues to divide while other differentiate and mature (stop dividing).



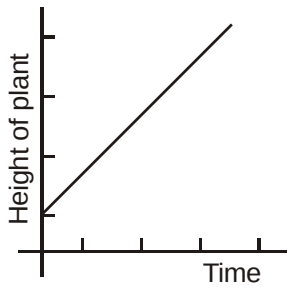
e.g. **Root** & **Shoot elongation** at constant rate.

- It is methematically expressed as
- It's curve is **linear**

$L_t = L_0 + rt$ where L_t - length at time 't'

L_0 - length at time 'zero'

r - growth rate / elongation per unit time.



B. Geometric / Exponential growth : From dividing cell (by mitotic division) both doughter cells retains the ability to divide and continue to do so.

e.g. All cells, **tissue**, **organs**, **developing seed**, **germinating seed**, **seasonal activities** etc.

It is mathematically represented as

It's curve is **sigmoid**

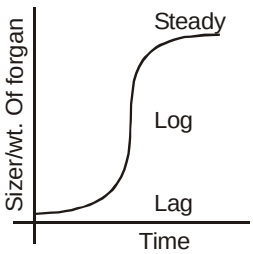
$W_1 = W_0 e^{rt}$

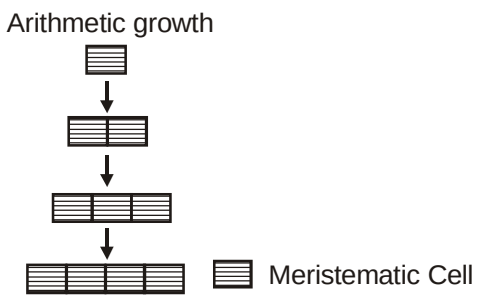
Where W_1 - final size (Weight, height, number etc.)

W_0 - initial size at the beginning of period.

r - growth rate

e - base of natural logrithms.





C. Absolute and relative growth rates : Absolute growth rate : Measurement and the comparision of total growth per unit time in plant or plant parts.

or

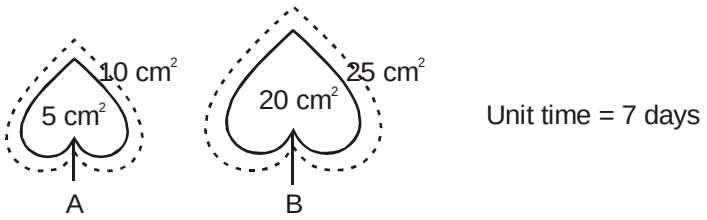
Total growth occurs in unit time in plant or plant parts.

Relative growth rate : The growth of the given system per unit time expressed in a common basis i.e., per unit initial parameter in plant parts.

or

Total growth occurs in unit time in comparision to initial growth in plant or plant parts. Relative growth rate is generally high in young developing plant parts.

Ex.



- Both passes same absolute growth rate i.e., 5 cm^2 in 7 days.
- But high relative growth rate in leaf 'A' about 100%, while in leaf 'B' it is about 25%.

COURSE OF GROWTH

✸ **Growth Activities and Phases of Growth :**

- **Cell division or cell formation :** Number of cells is increased by cell division.
- **Cell enlargement or cell elongation :** Size of cells increases due to **vacuolization** & T.P. (turgor pressure).
- **Cell maturation or differentiation phase :** (Also called as **morphogenetic, organogenic** or differentiation phase) Development or qualitative change is important feature of this phase.
- Growth in size or weight of a specific part in a definite time is known as rate of growth.
- Rate of growth is not uniform. In all parts of a plant, rate of growth in initial stages is more, then it increases more, becomes slow and finally stops.
- If rate of growth of a plant is plotted against time, a **'S'** shaped curve is obtained. This is known as **sigmoid curve**.
- So, growth curve is the graphic representation of the total growth against time.
- Sigmoid curve or total time period can be divided into **three phases** :–

(I) Lag Phase (II) Log Phase (III) Stationary or Steady Phase

(I) Lag Phase :

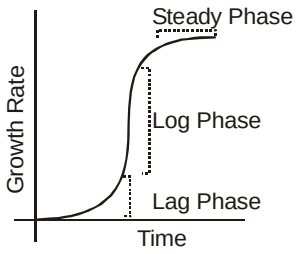
- It is initial phase of slow growth.
- It is a phase of formation of cells.

(II) Log Phase :

- It is middle phase of rapid growth
- Growth increases rapidly to a maximum during elongation phase.
- It represents **grand period of growth.**

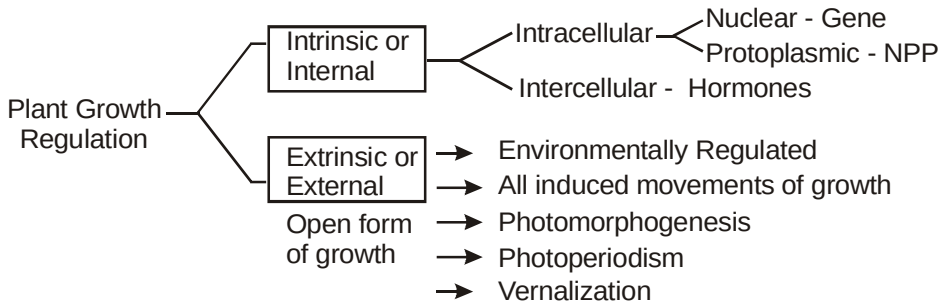
(III) Stationary or Steady Phase :

- Finally rate of growth becomes almost zero.



FACTORS AFFECTING GROWTH / REGULATION OF PLANT GROWTH

Growth is affected by **external** and **internal** factors -



✸ Photoperiodism

- The relative length of day and night is called **photoperiod.**
- The response of plants to the photoperiod, expressed in the form of flowering is called as **Photoperiodism.** "Effect or requirement of relative length of day **(photoperiod)** & night **(dark phase)** on flowering of plants is called as **Photoperiodism.**"
- The phenomenon of photoperiodism was first dicsovered by **Garner & Allard.** They experiment on **Maryland mammoth** (a mutant variety of **tobacco**), They study the **Biloxy soyabean**.

- **Garner** & **Allard** classified the plants in following groups :

(1) SDP (Short Day Plants) : "These plants give flowers on exposure to photoperiod **equal** or **shorter than their critical day length."**

- They need a continuous (uniterrupted) dark period for flowering. Thus SDP also called as **LNP (Long Night Plants).**
- Example of SDP :- **Tobacco, Soyabean, Viola, Xanthium (Cocklebur), Chrysanthemum, Cannabis, Coleus, Chenopodium, Mustard, Dahlia, Sugarcane, Strawberry, Cosmos, Rice etc.**
- In SDP the **dark period is critical** and **must be continuous.** If this dark period is breaks by a brief exposure to red light, then SDP will not flowers.
- Maximum inhibition of flowering with red light occur at about the middle of critical dark period.
- Prolongation of the continuous dark period, initiates early & good flowering in SDP.

(2) LDP (Long Day Plants) : "These plants flowers only when they exposed to critical photoperiod or photoperiod longer than their critical day length".

The **light period is critical for LDP.**

Ex.: **Henbane** (Hyoscyamus) **Spinach, Sugarbeet, Radish, Carrot, Wheat, Larkspur, Barley, Avena, Potato.**

- A brief exposure of red light in the dark period stimulates flowering in LDP.

(3) DNP (Day Neutral Plants) or Intermediate Plants : These plants do not need specific critical day length for the flowering. Ex. **Zea, Cotton, Tomato, Sunflower, Cucumber.**

- **L-SDP :** These are SDP but must be exposed to long day during early stage of their growth. Ex. Bryophyllum.
- **S-LDP :** These are LDP but must be exposed to short photoperiod during early stage of growth.

Ex. **Wheat & Rye.**

- **Cajlachjan :** Reported that stimulation of critical photoperiod is percepted by **leaves**.
- **Chailakhyan :** Discovered **"Florigen"**. It has been not isolated, thus called as **Hypothetical hormone.**

✸ **Phytochrome**

- **Borthwick & Hendricks :-** Discovered a light sensitive pigment responsible for flowering .
- **Butler :-** Given term **"phytochrome"** for this pigment and isolated it.
- Pigment phytochrome is a chromophore billiprotein, which have open tetrapyrrolic structure similar to phycobilin.
- Phytochrome mainly located on cell membrane of all type of plants.
- Phytochrome :- exists in two different forms

  Pr (Phytochrome red) - Red light absorbing from (**630-670 nm**, Peak-**667 nm**), **Blue colour, stable** form, **Physiologically inactive,** induce **flowering in SDP,** inhibits flowering in LDP.
- **Pfr (Phytochrome far red) -** This is **far-red light absorbing** form **(720 - 740 nm, Peak-735 nm), Yellow colour, unstable** form, **Physiologically active** form, induce **flowering in LDP,** inhibits flowering in SDP.
- Both forms of phytochrome are photobiochemically show **photochromicity** and **interconvertibility.**
- The **Pfr** (Yellowish) form, gradually changed into **Pr** (Bluish) form in dark.
- During the day both Pr and Pfr form are accumulated in the plants.
- Control of morphogenesis by light and phytochrome is called **Photomorphogenesis.**
- Now phytochrome is considered as universal distribution in plant kingdom..

Photomorphogenesis in plants appear to be under control of three phtoreceptors.

(i) Phytochrome - Which absorbs red and far red region of light.

(ii) Cryptochrome - Which absorbs blue and UV-A (380 nm) light.

(iii) UV-B-Receptors - Which absorb UV-B (290 nm) light.

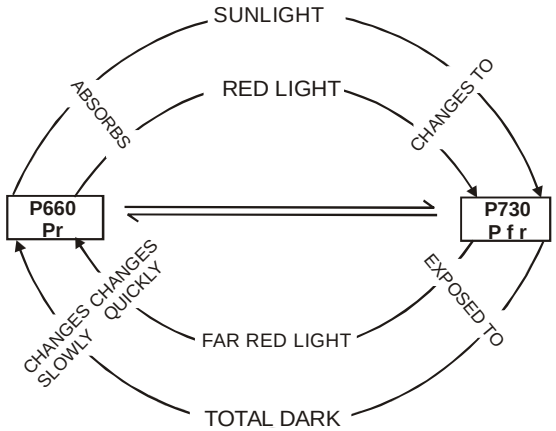


Fig : The Phytochrome concept

- In SDP, during critical dark period P_{fr} form gradually changes into P_r form which results in flowering.
- If critical dark period is interuptted by red light for short duration then P_r form is again converted to P_{fr} form, thus inhibiting flowering.

- The **inhibitory** effect can be **reversed** by subsequent far red light exposure.
- In SDP, whether flowering will be promoted or inhibited will **depend** on the exposure given in the last when the two types of radiations (Red and far red) are given **successively** –

  SDP + R $\rightarrow$ Inhibits flowering

  SDP + R + FR $\rightarrow$ Promotes flowering

  SDP + R + FR + R $\rightarrow$ Inhibits flowering
- In LDP, **prolongation** of light period or interruption of dark period by red light result in **accumulation** of P_{fr} form which stimulates flowering.
- P_{fr} form is biologically active form which is responsible to initiate a number of physiological process such as -

  (a) Seed germination (b) Photoperiodism

  (c) Stomatal opening & closing (d) Photomorphogenesis

✸ **Vernalization**

- Effect of low temperature on the initiation and development of flower, was first realised by **Klippart 1857** (Experiment on winter & $\rightleftharpoons$ Spring wheat)
- Detail study and term - **"Vernalisation"** by **Lysenko** (Credit of discovery).
- **Chourad** defined as **'acceleration of ability to produce flower by chilling treatment is called vernalisation'.**
- Mainly **embryo tip, shoot apex and leaves percept** induction of low temperature on plants.
- Concept of hormone **'vernalin'** in vernalisation was given by **Melcher et. al.** This is a **hypothetical plant hormone,** because not has been isolated till today.
- Vernalisation of **seeds or plant progagule** in laboratory can be induced at 1ºC to 10ºC in presence of O_2 and H_2O. Proper photoperiodic induction also required after vernalization.
- If vernalized plant prapagules are kept in high temperature, just after the low temperature treatment then effect of vernalization is reverse, this effect is called as **devernalization.**

✸ **Significance :-**

(i) Better and early flowering

(ii) Vernalization increases the resistance to fungal diseases.

(iii) Protects natural precocious reproductive development.

GROWTH REGULATORS

Growth is mainly regulated by small amount of chemical substances present at growth points in plants. These are known as **Growth regulators** or **Growth hormones**.

✸ **Growth regulators or Plant Growth hormones :**

- Term 'hormone' was first of all used by **Starling** (1902).
- **Sachs** (1948) first suggested the presence of **growth regulating substances** in the plants.
- **Thimann** (1948) gave the term **Phytohormone**.
- **Thimann** defined Phytohormones as organic substances produced naturally in minute quantities in one part of plant body and transported to another parts where they are active and produce effect on growth.
- Growth regulators = Phytohormones + Synthetic Substances

  so, all phytohormones are growth regulators but **all growth regulators are not phytohormones**.

✵ **Special features of plant growth Hormones / Chemicals :**

- Plants hormones works in concentration based manner.
- Synthetic hormones or chemical are not transported by plants, so provided at the target sites.
- Synthetic hormones or chemical only induce the somatic changes not the genetic changes. So, treatment should be provided every year.
- Supra optimum concentration of any synthetic hormone/chemical leads to death of plant.
- **Fruit Thinning :** All the measures which are used to obtain the commercially valuable fruits are collectively known as Fruit thinning. Like increase in number and size of flower and fruit etc.
- **Bolting effects :** Elimination of Rosette growth (extreme dwarfism) by the application of gibberellins.
- **Lodging :** Falling of crops or plants due to less mechanical strength. Auxin prevents **lodging.**
- **Gibberellin** treatement elongates the internodes of dwarf plants (Genetic, mutational, environmental dwarf plants) not works in normal plants.
- **Auxin** and **Cytokinin** both hormones naturally and synthetically works together.
- **Richmond lang effect :** Delay in senescence due to effect of **cytokinin.**
- **Climacteric Respiration :** Ethylene is highly effective in fruit ripening. It enhance the respiration rate during ripening of the fruits. This rise in rate of respiration is called **Respiratory Climacteric**. Rapid rise in rate of respiration which later decrease during starting of ripening of fruits and senescence is due to ethylene production.
- Growth regulators are of two types -

  (1) Growth **promoters** (2) Growth **Inhibitors**

1. GROWTH PROMOTERS :

- Those hormones which increases the rate of growth are called **growth promoters**.
- Growth promoters are of following 3 types -

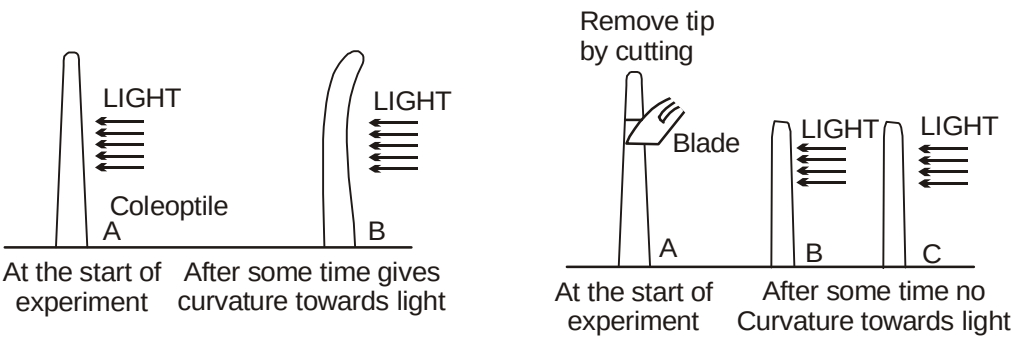
  (A) Auxin (B) Gibberellin (C) Cytokinin

A. AUXIN

(a) History :

✵ **Charles Darwin & Francis Darwin (1887) :**

- They first of all reported the presence of first growth hormone in the **coleoptile** tip of canary grass **(*Phalaris canarensis*).**
- They described the effect of **light** and **gravity** in the book **"Power of movement in plants"**.
- **Darwin** reported that coleoptile tip of canary grass bend towards light. Thus it shows phototropism.
- Thus, Darwin concluded that certain kind of substance is generated at the tip which is then transmitted to the base where growth takes place.



Discovery of Auxins (Darwin's Experiment)

✸ **Boysen-Jonsen (1913) :**

- After performing an experiment on **Avena sativa** coleoptile they found that if its tip was **cut** then its phototrophic sensitivity is **destroyed**.
- But they found that when an excised coleoptile tip was **replaced without** or **with gelatin**, **bending** resulted as in normal coleoptile.
- He further found that insertion of **mica plate prevents** curvature following **unilateral** illumination of the tip.

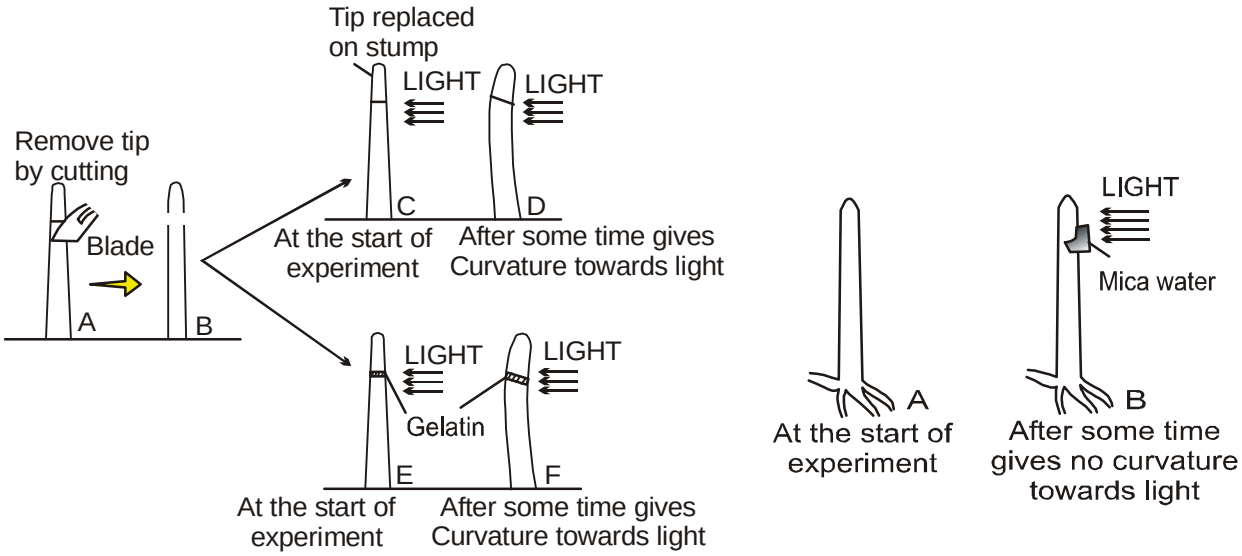


Fig : Experiments of Boysen-Jensen

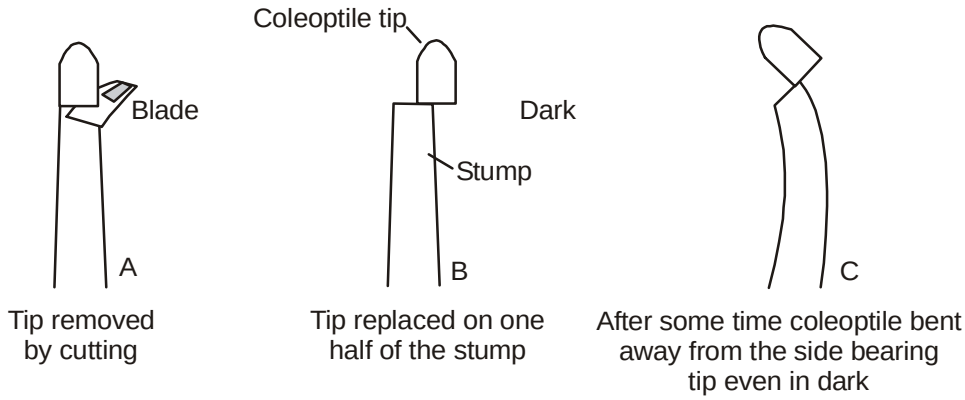
✸ **Paal (1919) :**

- He found that when the excised tip is replaced on one side of **Avena** coleoptile stump then accelerated growth beneath the tip, which results in curvature, in dark.
- He gives the idea of unequal distribution of the chemical responsible for phototropism.



✸ **F.W. Went (1920) :**

- He first isolated a substance from the coleoptile tip of **Avena sativa** (Oat) and named it **auxin**.
- He placed the cut end of coleoptile tip of Oat on agar block.
- Then he placed one of the agar block on stump in ecentric position and kept it in dark for 2 hrs. He observed that **curvature** resulted in **oppsite** direction to agar block.
- Went discovered **auxin** in tip of coleoptile.
- He also stated that auxin concentration towards **non-illuminated** side is 57% and towards **illuminated** side is 27% because -

About 16% auxin is **destroyed by light**.

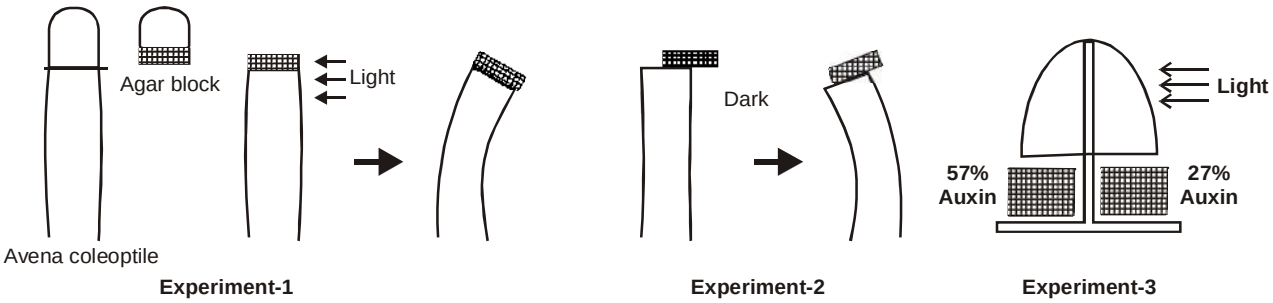


Fig.: F.W. Went's Experiment

Conclusion :-

(1) Growth is directly proportional to concentration of Auxin in agar block in limit

(2) Transport of auxin is Polar and Basipetal.

(3) High concentration of auxin towards dark side (57%) and less auxin concentration towards light side (27%). Rest of auxin is Photoxidised (16%).

- **Kogl, Haagen Smidt and Erxleben (1931) :**

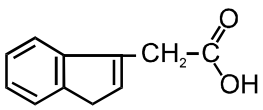
They discoveresd 3 types of auxin like substances from different sources -

(a) **Auxin-a :** It was isolated from **human urine** and was named as **Auxenotriolic acid ($C_{18}H_{32}O_5$)**.

(b) **Auxin-b :** It was isolated from **corn endosperm** (corn germ oil) and named as **Auxenolonic acid ($C_{18}H_{30}O_4$)**.

(c) **Heteroauxin ($C_{10}H_9O_2N$) :** It was also isolated from **human urine** which is now known as **Indole-3-Acetic acid (IAA)**.

- **Thimann (1935) :** isolated IAA from cultures of **Rhizopus** species.
- **Introduction of Auxin :**
- **Precursor** = Tryptophan {'**Zn**' is essential for biosynthesis}
- **Biosynthesis** = Shoot and Root apex
- **Transportation** = Polar and Basipetal, By parenchyma cells.
- **Structure of IAA is -**



IAA

Forms
- Natural Auxins = **IAA**(Indole Acetic Acid), **IBA**(Indole Butyric Acid), **PAA** (Phenoxy Acetic Acid)
- Synthetic Auxins = α, β-**NAA** (Nepthelene Acetic Acid), **IPA** (Indole Propionic Acid), **PAA**, **2**, **4-D**, **2**, **4-5-T**
- Free Auxins = Diffusible Auxin
- Bound Auxins = Binded with esters at the site of synthesis
- Antiauxin = TIBA, Morphactin, MH
  - {Inhibits polar transport of Auxin}
  - Decrease apical dominance. Increase Lateral branches
  - Decrease phototropism
  - Shortening of internodes
  - Decrease laminar area of leaves

- **Oxdation = Photooxidation, IAA oxidase**
- **Bioassay = Avena Curvature test, Root growth inhibition test.**

✸ **Physiological effects and applications of Auxin :**

(i) **Cell elongation, Morphogenesis, Apical dominance** →
- Pruning increase lateral branching
- Shortening of internodes → Use of NAA, MH in Apple, Pear
- Potato Dormancy → Use of NAA, MH

(ii) **Root formation and root growth inhibition** →
- Increase adventitious branching of roots
- Prevents lodging - IBA - Rooting hormone

(iii) Prevents abscission →
- Fruit thinning in mango.
- Collection of cotton bolls - TIBA

(iv) **Flowering and Parthenocarpy** →
- Flowering - **Femaleness** in **Bromeliaceae,** (Pineapple, Litchi) and **Cucurbitaceae.**
- Parthenocarpy in **solanaceae** and **cucurbitaceae.**

(v) **Phototropism**

(vi) Selective weed killer = Dicots weeds/broad leaf weed killer = 2, 4-D and 2, 4-5-T,
= **Dioxin/Agent orange/Jungle defoliant**

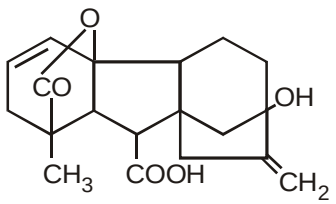
B. GIBBERELLIN (GA)

✸ **History :**

- Japanese farmers noted that some plants in rice fields were taller, thinner and paler than the normal plants and named this disease as **'bakanae disease or foolish seedling disease'**.
- **Kurosawa** and **Swada** (1926) reported that this disease was due to a fungus **Gibberella fujikuroi** (Ascomycetes) whose incomplete state is **Fusarium moniliformae** (Deuteromycetes).
- **Yabuta**, **Sumuki** and **Hyashi** (1938) isolated gibberellin from this fungus and named it as **Gibberellic acid**. It was **GA_3**.
- Untill now more than 100 GA have been discovered.

✸ **Introduction of Gibberellin :**

- **Precursor** = Acetyl-CoA {By Mevalonic acid Pathway} / Kaurene.
- **Biosynthesis** = Germinating seed, Bud, Shoot, Root, Leaves.
- **Transports** = Non Polar, By xylem and phloem.
- **Chemical structure** of Gibberellic acid is –



GA

- **Form** = GA_3 - First discovered and most common GA [Commercially]
  GA_1 and **GA_{20}** = **GA_1** first discovered GA of higher plants. Most common **GA's** of higher plants.
- **Anti GA** - Phosphon - D, Cycocel, Chlormquet, Ancymidol [A-Rest], Alar-85 (B-Nine), AMO - 1618. All are used in Bonsi.
- **Oxidation**
- **Bioassy = (i) α-amylase activity test in Barley endosperm.**
  (ii) Dwarf pea and Maize test.

✸ **Physiological effects and application of GA :**

- **Stem and internode elongation**
  - Elongation of genetic dwarf plant.
    Ex.: Pisum, Vicia, Maize, Sugarbeet.
  - **Bolting effect :** Elimination of rosette growth in cabbage.
  - Increase malting in sugarcane.
- **Seed germination**
  - Breaking seed dormancy
  - Germination of photoblastic seeds, Ex. Lettuce, Tobacco

  Increase activity of stored food hydrolysing enzymes like Amylase, Lipase, Protease.
- **Flowering and Parthenocarpy**
  - Flowering
    - Maleness in Bromeliaceae and Cucurbitaceae
    - In LDP during short day condition.
    - In vernalisation requiring plants (winter annuals, biennials) without vernalisation.
  - Parthenocarpy - In solanaceae and Cucurbitaceae.
- **Fruits and flower enlarger-** Thompson grapes / Table grapes, geranium flower.
  Pomalin (Apple enlarger) = mixture of GA (GA_4 and GA_7) + Cytokinin

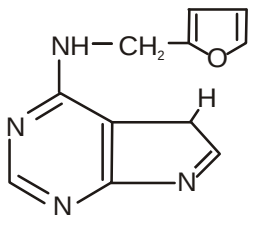
C. CYTOKININ

✸ **History :**

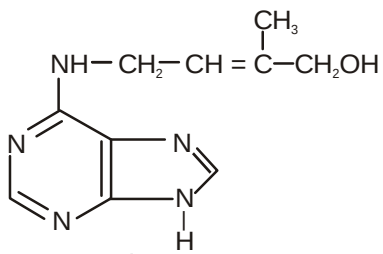
- **Miller** (1956) first isolated them from **herring fish sperm DNA** and named them as **kinetin**.
- **Letham** (1953) isolated and characterised a cytokinin called **zeatin** from **immature maize kernels**.**(corn grain oil)**
- Cytokinin name given by **F. Skoog.**
- Phytokinin term by **Osborne**.

✸ **Introduction of Cytokinin :**

- **Precursor** - Acetyl CoA [By Mevalonic acid pathway] Adenin derivatives.
- **Biosynthesis** - Root and shoot apex.
- **Transport** - Polar and Basipetal, By xylem.
- **Structure** -



Kinetin



Zeatin

- **Form** -

  Kinetin - First discovered Ck. (Only in animals).

  Zeatin - First discovered CK and most common CK of plants. Coconut milk factor - Zeatin.

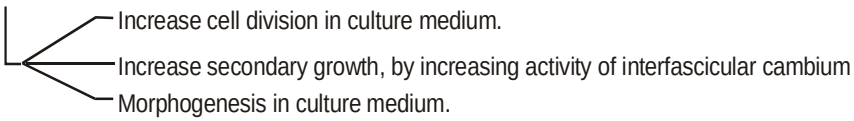
  Synthetic CK - BAP (Benzyl Amino Purine), Diphenyl Urea, thidiazuron.
- **Oxidation** - Cytokinin oxidase.
- **Bioassay** -

  (i) Chlorophyll preservation test.

  (ii) Tobacco pith cell division test.

  (iii) Radish and soyabean cotyledon cell division test.

- **Physiological effects and applications of Cytokinins :**
- **Cell division, Morphogenesis, Vascular differentiation :**



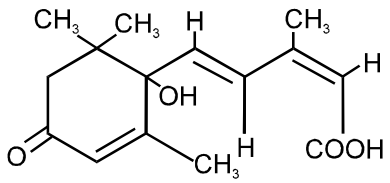
$\frac{\text{High CK}}{\text{Low Auxin}}$ = Shoot, $\frac{\text{Low CK}}{\text{High Auxin}}$ = Root, $\frac{\text{CK}}{\text{Auxin}}$ = 1 callus.

- **Promotes growth of lateral branches.**
- **Nutrients Mobilisation and delay in Senescence. Richmond Lang effect.**
  Increase Proplastid formation, Increase phloem/food conduction, increase lignin biosynthesis. Seed germination in parasitic plants without host plants. (Striga)
- **Stomatal opening.**

2. **GROWTH INHIBITORS** -
   - Growth Inhibitors are of following 2 types
     (A) ABA and (B) Ethylene

A. Abscisic Acid /ABA

- **History**
- First indication of growth inhibitors was given by **Osborne.**
- **First growth inhibitor** was identified by Bennet-Clark and Kefford (1953) from dormant potato tuber and called it **β-inhibitor**.
- **Addicott and Okhuma (1963)** obtained from mature **Cotton fruits** and named as **Abscisin II. ($C_{15}H_{20}O_4$)**
- **Waring and Robinson -** Isolated a growth inhibitor from old Betula leaves and called it **Dormin**.
- Later established that β-inhibitor, Abscisin-II and Dormin are same and called as Abscisic acid.
- **Introduction of ABA**
- **Precursor** - Acetyl Co-A {By Mevalonic acid pathway}. **Oxidation of β-carotene**.
- **Biosynthesis -** In any plants part where required.
- **Transpotation -** Not transported
- **Structure**



Chemical Structure of ABA

- **Oxidation.**
- **Bioassay.**
- **Physiological effects and applications of ABA**

- **Induced bud and seed dormacy**
  - Tuberisation of potato.
  - Inhibits activity of amylase, lipase, protease.
  - Prevents vivipary
  - Growth inhibition in duck weeds (Lemna).

- **Regulates abscission and senescence** — Inhibits cells divisionand cell elongation.; Increase activity of polysaccharide hydrolysing enzymes, pectinase, cellulase.
- **Stomatal Closing**
- **Increase geotropism in root of xerophytes.**
- **Flowering delay in LDP.**

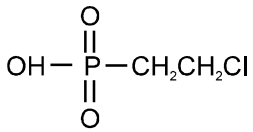
B. ETHYLENE

✸ **History**

- **H.H. Cousin** (1910) first suggested that ripened oranges are responsible for ripening of unripened bananas.
- **R.Gane** identified volatile substance as ethylene.
- Ethylene is a **gaseous** pollutant **hydrocarbon,** But **Burg** reported it as a **fruit reipening hormone.**
- **Pratt Goeschl -** Recognized ethylene as a natural plant growth regulator.

✸ **Introduction of Ethylene**

- **Precursor - Methionine.** Auxin induced ethylene production.
- **Bisynthesis -** Ripening of fruits, Senescent plant parts. Roots, Shoots,
- **Transport - Diffusion**
- **Structure : $CH_2 = CH_2$**
- **From =** Ethephon/CEPA (2-Chloroethyl phosphoric acid). - Artificial fruit ripener.
  Ascorbic acid and iodoacetate also induces its synthesis. O_2 is essential.



Ethephon

- **Oxidation** - Autocatalytic.

✸ **Physiological effects and applications of Ethylene**

- **Fruit Ripening =** Natural - Climacteric respiration.
  Artificial - Ethephon / CEPA used.
- **Regulates senescence and abscission.**
- **Flowering - Femaleness -** In *Bromeliaceae* (Pineapple, Litchi) and Cucurbitaceae.
- **Root-shoot growth -** Root (Like Auxin) : Increase formation of roots, Root hair, inhibits root growth. Shoot (Antiauxin : inhibits transports of auxin) : Decrease apical dominance, decrease stem elongation, Increase radial swelling of stem.
- **In hydrophytes -** Increase gaseous diffusion.
- **Abnormal effects :** — Increase radial swelling or horizontal growth of stems.; Epinasty of leaves.; Tightening of hooks of epicotyl and hypocotyl.

ABSCISSION

- Detachment of senescent or mature plant organs like leaves, fruits, flowers due to change in hormonal activity.
- There is a separation layer **(abscission layer)** is formed within the region of attachement of these parts. Cell wall layers and middle lamella are dissolved by the activity of **cellulase** and **pectinase** (Polysaccharide hydrolysing enzymes) during **abscission.**
- Hormone **ABA and Ethylene are main controller** of abscission process.

PLANT SENESCENCE

- Period from reproductive maturity to degredative changes during the death of an organ or plant is known as **Senescence.**
- During senescence a gradual destruction occurs in protoplasm, cell, tissue, organ or plant and functioning of the plant and plant parts.
- During the senescence, higher rate of catabolism starts, under the control of growth hormones like **ABA, ethylene.** Senescence occurs as a result of ageing and leads to death of plant parts or whole plant. (Senescence and ageing - studied in **phyto-gerontology**)
- Senescence may be of following types :

(a) **Whole plant senescence :** Ex. Tomato, Wheat, Mustard, Rice, Beans.

(b) **Organ senescence :** When plant part above ground dies (shoot) each year and root & rhizome system alive. Ex. Alfa-alfa, Sugarcane, Banana, Ginger.

(c) **Sequential or progressive leaf senescence :** Evergreen perennials show progressive or sequential senescence of older leaves, lateral organs, branches, flowers, fruits and shoot. Ex. Eucalyptus, Mango.

(d) **Simultaneous or Synchronous leaf senescence :** In perennial deciduous plants all the leaves undergo senescence and abcission at a time.

Ex. : *Dalbergia siso, Azadirachta indica, Ficus religeosa*

PLANT MOVEMENT

1. Movement of locomotion : When the whole plant, part or organs of plant move from one place to another place.

A. Autonomous :- (By internal stimulus)

(i) Amoeboid : Ex.: Gametes of Spirogyra

(ii) Ciliary movement : Ex.: Chlamydomonas, Euglena, Zoospores

(iii) Cyclosis :

(a) Rotation : Whole protoplasm moves around the one central vacuole, in one direction.

Ex.: **Hydrilla, Vallisneria cells.**

(b) Circulation : Protoplasm moves, around the different vacuoles in different directions..

Ex.: Stamenal hairs of **Tradescantia.**

B. Induced/paratonic/tactic movement : (due to **external stimulus**)

(i) Phototactic : Due to stimulus of light. Ex.: Algae - by Eye spot/Stigma

(ii) Chemotactic : Due to stimulus of chemicals. Ex.: Male gametes of lower plants (antherozoids). By **Chemical gradient sensing mechanism.**

(iii) Thermotactic : Due to stimulus of temperature. Ex.: **Chlamydomonas, Euglena.**

2. Movement of curvature : Movement of plant organs only.

A. Autonomous : Movement of variation - Dance movement by Desmodium. (Indian telegraph) due to turgor pressure change.

Epinasty & hyponasty, the growth movements in floral bud and leaves.

B. Induced/Paratonic movement : (By external stimulus, but directional)

(i) Tropic movement : Definite direction towards stimulus.

(a) Phototropism
- + ve ex : stem
- – ve ex : Root

- Definite direction in relation to light.

(b) Geotropism
- + ve ex : Root (Root cap percept stimulus)
- – ve ex : Stem & Mangrove plant roots.

- Definite direction in relation to gravity, (Root cap percept stimulus).

(c) Chemotropism : Ex.: Pollen tube & fungal hyphae

- Definite direction in relation to chemicals.

(d) Thigmotropism (haptotropism) : Ex : **Tendrils, haustoria of Cuscuta.**

- Definite direction in responce to contact or support.

(e) Hydrotropism : Ex.: Roots of seedlings

(ii) Nastic movement (External stimulus but diffused type or nondirectional) :

(a) Nyctinasty :- Ex.: Flowers, leaves, stomata, daily movement (Sleep movements)

- Due to rhythmicity of day and night.

(b) Thigmonasty or haptonasty :- Ex.: Tentacles of insectivorous plants.

(c) Chemonasty :- Ex.: Tentacles of insectivorous plants.

(d) Seismonasty :- Ex.: **Mimosa** (Touch me not plant) turgor change in pulvinus at leaf base **K^+ions** also involved in this movement.

SPECIAL POINTS

- The hormone which is produced in leaves due to effect of light and induces flowering is called **florigen**. Florigen has not been isolated yet. **Anthecin** is another hormone responsible for flowering.
- The chemical which perceives the photoperiodic stimulus in leaves is **phytochrome**.

- Many plant parts specially leaves exhibits nastic movement and involves differential growth, this type of movement is known as movement of growth. This movement is caused due to unequal growth in plant organs. Ex.: Epinasty, Hyponasty, Nutation.
- **Epinasty & Hyponasty :** Ex : Leaves, Flowers (petal) opening and closing respectively.

  Epinasty - More growth on upper surface of plant parts.

  Hyponasty - More growth on lower surface of plant parts.

  Both epinasty and hyponasty are example of autonomic growth movements.
- **Nutation :** Zig-zag growth of plant organ mainly shoot, is called as nutation.
- **Circumnutation :** Spiral growth of plants in tendrils.
- **Portulaca** is known as **compas plant.**
- **Rhizomes** diageotropic (**90º** to gravitation axis)
- **Plageotropism :** Shown by stem and root branches growing at an angle of **0-90ºC** from axis of gravity.
- **Clinostat :** Used for nullifying geotropism.
- **Hygroscopic Movement** (Mechanical movement)
  - **Xerochasy :** Due to loss of water
    Ex. : Dehiscence of legume fruits
  - **Hydrochasy :** By excess of water
    Ex. : Ruellia fruit dehiscence
- **Traumatropism :** Injury induced plant movement.
- **Climacteric fruits :** (Banana, Apple, Avocados) : Fruits, in which rate of respiration increses **(Climacteric respiration)** during their ripening **(ethylene).** Citrus is non climacteric fruit.
- The flower stalk of poppy is +vely geotropic but after the opening of flower, this stalk changes as negative geotropic.
- Formation of nodule is a combined activity of **cytokinin** (By bacteria) and **auxin** (By leguminous plant).
- **Blue light** has more effects on most of physiological and growth processess in plants except photosynthesis and photoperiodism.
- ***Arabidopsis thaliana*** (Brassicaceae) is the most widely used plant tool for the studies of devlopmental genetics and growth physiology of plants.
- **Betacyanin or Betalains :** Pigment mainly found in valcoule of **beet roots** and flower of **Bougainvellia** are differ from anthocyanin due to the presence of nitrogen (N). These pigments do **show reversibility of colour change due to p^H change.**
- **Anthocyanin** is water soluble **vacuolar** pigment, which does not involve in photosynthesis.

  Anthocyanin exhibits different colour like purple, pink, blue, scarlet etc.
- The colour of anthocyanin is sensitive to p^H change e.g. colour of anthocyanin changes from **Red (acidic p^H)** to **Violet (neutral p^H)** to **blue (in alkaline p^H).**
- **Turgorin-a** newly discovered hormone found in pulvinous leaf base regulates turgor pressure changing movements.

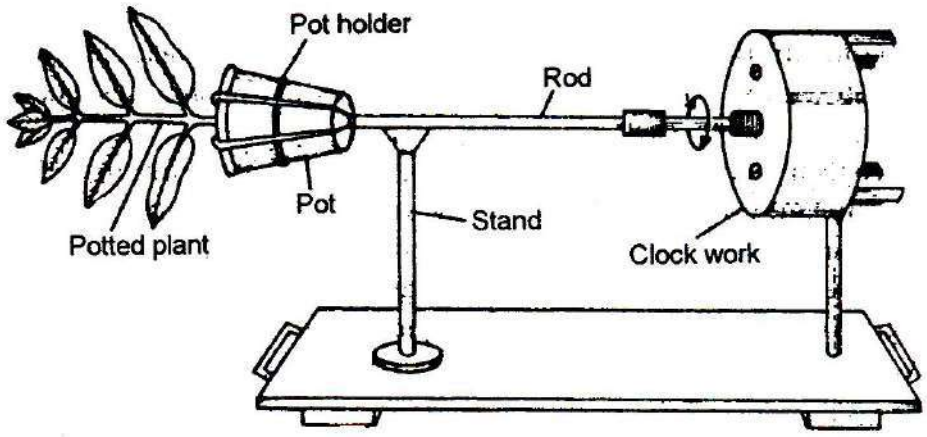
EXPERIMENT

Demonstration of Geotropism by Clinostat

Geotropic curvature results is due to unilateral gravity stimulus can be demonstrated by using a Clinostat. Clinostat consist of a disc attached to the tip of an horizontal rod, which can be rotated with the help of a clockwork.

Fix a small young potted plant on a clinostat in horizontal position and rotated, neither the root will bend down nor the stem will curve upward (Nullify the geotropism). It is because in such case the effect of gravity will be uniform all.

Round the stem and root. If however, the plant lies in horizontal position & not rotated, the roots will receive gravity stimulus only their lower sides or the effect of gravity will be unilateral. Unilateral stimulus of gravity causes unequal distribution of auxin in root tip. (more auxin on upper side than on lower side). This in turn results in more growth on the upperside and less growth on lowerside and ultimately a + ve geotropism is observed. However in case of stem the more conc. of Auxin on lower side promotes more growth on that side so stem is negative geotropic.



EXERCISE - 1

Q.1 Which breaks dormancy of potato tuber ?
(1) Gibberellin (2) IAA
(3) ABA (4) Zeatin

Q.2 In tissue culture, differentiation of shoot is controlled by-
(1) Light Intensity
(2) Temperature shock
(3) Low Auxin+High CK $\left(\text{High } \frac{\text{Cyto}}{\text{Auxin}} \text{Ratio}\right)$
(4) None

Q.3 Pineapple can made to uniform flowering by the application:-
(1) Zeatin (2) Ethylene
(3) Short day (4) Low temperature

Q.4 A natural growth regulator is-
(1) Ethylene (2) NAA
(3) 2, 4-D (4) Benzyladenine

Q.5 Among the following which helps in early ripening of fruits ?
(1) Methane (2) Ethylene
(3) CO_2 (4) CO

Q.6 Abscisic acid induces-
(1) Shoot elongation
(2) Cell elongation and cell wall formation
(3) Cell division
(4) leaf fall and dormancy

Q.7 In autumn leaf fall occurs, because-
(1) Formation of abscission layer at the base
(2) Leaf becomes heavy
(3) Leaf does not remain green
(4) Of low temperature

Q.8 The hormone produced during adverse environmental condition is-
(1) Abscisic acid
(2) N^6-Isopentanyl adenine (CK)
(3) Dichlorophenoxy acetic acid (2, 4-D)
(4) Gibberellic acid (GA)

Q.9 The which of the following is growth inhibitor-
(1) IAA (2) ABA
(3) NAA (4) GA_3

Q.10 During adverse environmental condition plants develop a stress hormone, which is ?
(1) Abscisic acid (2) Ethylene
(3) Benzyl amino purine
(4) Dichlorophenoxy acetic acid

Q.11 Abscisic acid treatment results in-
(1) Leaf expansion (2) Stem elongation
(3) Stomatal closure (4) Root elongation

Q.12 Natural cell division inducing factor occurs in-
(1) Coconut milk
(2) Immature maize seeds
(3) Both (4) Heated t - RNA

Q.13 Recognition of ethylene as a natural plant hormone was done by-
(1) Pratt Goeschl (2) Richmond Lang
(3) Sorokin (4) Haberlandt

Q.14 Seeds of Tomato do not germinate in its pulp due to-
(1) Presence of excess salts
(2) Presence of ferulic acid
(3) Absence of oxygen
(4) Presence of ABA

Q.15 Fruits ripening hormone is-
(1) Kinetin (2) Gibberellin
(3) Ethylene (4) IAA

Q.16 Morphactins are-
(1) Auxins
(2) Natural growth regulators
(3) Synthetic growth inhibitor
(4) Metabolic inhibitors

Q.17 What is a stress hormone ?
(1) Benzyl aminopurine
(2) Dichlorophenoxy acetic acid
(3) Ethylene (4) Abscisic acid

Q.18 A fungus which secretes abscisic acid is-
(1) Aspergillus (2) Gibberella
(3) Cercospora (4) Alternaria

Q.19 Seed dormancy is due to the-
(1) Ethylene (2) Abscisic acid
(3) IAA (4) Starch

Q.20 Hormone responsible for senescence-
(1) ABA (2) Auxin
(3) GA (4) Cytokinin

Q.21 Hormone responsible for vernalization-
(1) Florigen (2) Caulocaline
(3) Abscisin (4) Vernalin

Q.22 Effect of day length on plant development is called
(1) Phototropism (2) Photoperiodism
(3) Chemotropism (4) Photosynthesis

Q.23 The phenomenon of photoperiodism in plants was discovered by-
(1) Garner and Allard
(2) Steward and Salisbury
(3) Thiman and Skoog
(4) Hendricks and Borthwick

Q.24 Selaginella sperms swims towards the archaegoina, this movement is-
(1) Chemotropic (2) Chemotactic
(3) Chemonastic (4) Archaenastic

Q.25 Active form of phytochrome for seed Germination is-
(1) P_{fr}–form (2) Pr–form
(3) Both (4) None

Q.26 Long day plant's produces flowers when they exposed to-
(1) Any duration of light
(2) Light period longer than a critical day length
(3) Light period longer than 12 hrs.
(4) None of these

Q.27 Which of the following is a hypothetical hormone ?
(1) Gibberellin (2) Auxin
(3) Cytokinin (4) Florigen

Q.28 Which plant is LDP ?
(1) Tobacco (2) Glycine max.
(3) Mirabilis (4) Spinach

Q.29 In red-far red treatment response of plant depends upon-
(1) First treatment
(2) Last treatment
(3) Middle treatment
(4) Sum total of all the treatment

Q.30 Phytochrome is found in-
(1) Algae (2) Fungi
(3) Gymnosperms (4) Angiosperms

Q.31 Wheat, potato & henbane are-
(1) SDP (2) DNP
(3) LNP (4) LDP

Q.32 In short day plants (SDP) flowering is induced by
(1) Long night
(2) Photoperiod less than 12 hours
(3) Photoperiod shorter than critical value and uninterrupted long night.
(4) Short photoperiod and interrupted long night

Q.33 Which one shows red far red inter-conversions?
(1) Carotenoids (2) Cytochromes
(3) Chlorophyll (4) Phytochrome

Q.34 Physiologically active form of phytochrome is-
(1) P_{730} (2) P_{660}
(3) P_{700} (4) P_{680}

Q.35 Pneumatophore are-
(1) Positively geotropic
(2) Negative phototropic
(3) Negatively geotropic
(4) Hydrotropic

Q.36 Which one prevents photooxidation and pigment destruction-
(1) Carotene (2) Phytohormone
(3) Phycocynin (4) Phycoerythrin

Q.37 If a tree flowers thrice in a year in October, January and July in northern India, the plant is-
(1) Photo and thermo sensitive
(2) Photo and thermo insensitive
(3) Photosensitive but thermo insensitive
(4) Thermo sensitive but photo insensitive

Q.38 A long day plant is -
(1) Xanthium (2) Chrysanthemum
(3) Radish (4) Tomato

Q.39 Which is not a plant hormone-
(1) Phytochrome (2) Florigen
(3) GA (4) IAA

Q.40 A pigment concerned with both floral induction and seed germination is-
(1) Florigen (2) Chlorophyll
(3) Plastocyanin (4) Phytochrome

Q.41 Which pigment absorbs the red and far-red light ?
(1) Cytochrome (2) Phytochrome
(3) Carotenoids (4) Chlorophyll

Q.42 Mimosa pudica shows-
(1) Chemotropism (2) Nyctinasty
(3) Seismonasty (4) All the above

Q.43 The style in ***Arachis*** before fertilization is-
(1) Positive phototropic
(2) Negative phototropic
(3) Positive geotropic
(4) None of the above

Q.44 Rhizomes and runner stems are-
(1) Diageotropic (2) Apogeotropic
(3) Plagiotropic (4) Aerotropic

Q.45 Physiologically active form of phytochrome is-
(1) P_{730} (2) P_{660}
(3) P_{700} (4) P_{680}

Q.46 Low temperature is harmful for plants, because it has-
(1) Dessication effect
(2) Chilling effect
(3) Freezing effect
(4) All of these

Q.47 Greater growth on the lower surface of a bifacial leaf is-
(1) Nyctinasty (2) Photonasty
(3) Hyponasty (4) Epinasty

Q.48 Opening of flower is example of-
(1) Curvature movement
(2) Epinasty
(3) Hyponasty (4) Autonomus

Q.49 Mimose (touch me not plant) shows-
(1) Thigmotropism movement
(2) Chemotactic movement
(3) Thigmonasty (4) Seismonasty

Q.50 Movement of tendrils is-
(1) Hydrotropism (2) Chemotropism
(3) Thigmotropism (4) Geotropism

Q.51 Movement of pollen tube is-
(1) Chemotropism (2) Hydrotropism
(3) Phototropism (4) None

Q.52 Movement of male gametes in lower plants (Fern, Bryophytes) is-
(1) Thermotactic (2) Chemotropism
(3) Chemotactic (4) Phototactic

Q.53 Phototactic movements found in-
(1) Plants (2) Some Algae
(3) Bryophytes (4) Male gametes

Q.54 Negatively geotropic roots present in-
(1) Bryophytes (2) Mangrooves
(3) Pteridophytes (4) Xerophytes

Q.55 Movement can see in fungal hyphae-
(1) Chemotactic (2) Chemotropic
(3) Thigmotropism (4) None

Q.56 Cucurbitaceae is good example of-
(1) Haptotropism (2) Thigmotropism
(3) Both (4) None

Q.57 Diurnal change in flower & leafs is known as-
(1) Nyctinasty or sleep movement
(2) Haptonasty
(3) Photonasty
(4) None

Q.58 Movement of Indian telegraph plant (Desmodium) is–
(1) Movement of variation (Turgor movement)
(2) Geotropism
(3) Phototropism
(4) Movement of cyclosis

Q.59 Hydrotropism have seen in-
(1) Flowers (2) Seedlings
(3) Stem (4) None

Q.60 ***Crocus*** and ***Tulip*** flower shows response to-
(1) Water (2) Light
(3) Temperature (4) Touch

Q.61 ***Mimosa pudica*** (Sensitive plant) leafs movement due to-
(1) Nerve impulsion
(2) Delicate leafs
(3) Loss of tissue
(4) Turgor change in leaf base

Q.62 Plant hormone associated with Climacteric respiration is-
(1) Auxin (2) Cytokinin
(3) Ethylene (4) Gibberellin

Q.63 Movement of Spirogyra gametes is-
(1) Ciliary (2) Cyclosis
(3) Amoeboid (4) None

Q.64 Movement in peristome teeth is-
(1) Hydrochasy (2) Xerochasy
(3) Chemotactic (4) Chemotropism

Q.65 Haustorial movement in Cuscuta-
(1) Hapto/thigmotropism
(2) Aerotropism
(3) Hydrotropism
(4) Thermotropism

Q.66 Drosera tentacles shows-
(1) Chemonasty (2) Thigmonasty
(3) Chemotropism (4) Both (1) & (2)

Q.67 Scototropic movements induced by-
(1) Light (2) Night
(3) Touch (4) Heat

Q.68 Motor or bulliform cells In grasses shows-
(1) Growth movement
(2) Tropism
(3) Nastic movement
(4) Turgor movement

Q.69 The coiling of tendril around some base in response to touch is called:
(1) Hydrotaxis (2) Chemotaxis
(3) Thigmotaxis (4) Geotaxis

Q.70 What is the speciality of Crescograph ?
(1) Growth can be measured at the rate of per hour
(2) Growth can be measured at the rate of per minute
(3) Growth can be measured at the rate of per second
(4) Growth can be measured at the rate of per day

Q.71 Short days plants should be actually called–
(1) Long night plants
(2) Day neutral plants
(3) Photo neutral plants
(4) Light unaffected plants

Q.72 The effect of red light in short day plants can be nullified by –
(1) Orange light (2) Far red light
(3) Blue light (4) All the above

Q.73 Which is the critical period in short day plants ?
(1) Duration of light
(2) Duration of darkness
(3) Duration of both
(4) None of the above

Q.74 Which pigment induces formation of florigen in short day plants ?
(1) P_r (2) P_{fr}
(3) Both of above (4) None of the above

Q.75 Which pigment induces synthesis of florigen in long day plants ?
(1) P_r (2) P_{fr}
(3) Both of above (4) None of the above

Q.76 Which plant harmone is effective for inducing flowering in LDP under short day conditions?
(1) Auxin (2) Gibberellin
(3) Cytokinin (4) None of the above

Q.77 Which is active form out of P_r and P_{fr} ?
(1) P_r
(2) P_{fr}
(3) Both equally active
(4) None of the above

Q.78 Phytochrome is related to –
(1) Seed germination in salad
(2) Inhibition of albinism and development of chloroplast
(3) Expansion of leaves in dicots
(4) All the above

Q.79 Who discovered vernalization ?
(1) Lysenko (2) Went
(3) Boysen & Jenson (4) Darwin

Q.80 Went found that curvature of coleoptile is –
(1) Directly proportional to concentration of auxin
(2) Inversely proportional to concentration of auxin
(3) Not affected by concentration of auxin
(4) None of the above

Q.81 In which plant Went discovered auxin ?
(1) Phalaris canarienses
(2) Avena sativa
(3) Mirabilis jalapa
(4) Oryza sativa

Q.82 How the polar transport of auxins occurs ?
(1) From tip towards base
(2) From base towards tip
(3) From centre towards lateral side
(4) From lateral side towards centre

Q.83 Dormancy in potato can be induced by –
(1) IBA (2) NAA
(3) Maleic hydrazide (4) All the above

Q.84 Parthenocarpy can be induced by –
(1) IAA (2) NAA
(3) IBA (4) All the above

Q.85 Testing of biologically active substances on living beings is called –
(1) Biological testing (2) Utility testing
(3) Bio-assay (4) Active assay

Q.86 The auxins which can't diffuse are called –
(1) Unbound/free (2) Bound
(3) Dependent (4) None of these

Q.87 What was used by the name "Agent Orange" by America to defoliate forests of Vietnam ?
(1) 2-4 D (2) 2-4-5T
(3) Both (1) and (2) (4) None of these

Q.88 It is essential for synthesis of auxin –
(1) Mn (2) Zn
(3) Ca (4) Mg

Q.89 What is the reason of bakane disease of rice ?
(1) Bacteria (2) Mycoplasma
(3) Fungus (4) Virus

Q.90 Gibberellins are found in –
(1) Algae, fungi and bacteria
(2) Bryophytes, pteridophytes and gymnosperms
(3) Angiosperms (4) All the above

Q.91 Gibberellin is synthesized in –
(1) Rhizome & root tip
(2) Young developed leaves
(3) Young expanded leaf
(4) All the above

Q.92 Gibberellin is formed from –
(1) Acetyl CoA (2) Methionine
(3) Isoprene (4) None of these

Q.93 Which of these effect is due to gibberellins ?
(1) Internode elongation
(2) Bolting
(3) Breaking of dormancy
(4) All the above

Q.94 In which plants, flowering can be induced by gibberellins even in the absence of appropriate photo period required for them ?
(1) In LDP (2) In SDP
(3) In LDP & SDP (4) None of these

Q.95 Due to the effect of which substance flowering can be induced even in the absence of vernalisation ?
(1) Gibberellin (2) Auxin
(3) Cytokinin (4) Ethylene

Q.96 Which enzyme is synthesized de-novo in aleurone layers of germinating seeds due to the effect of gibberellins ?
(1) α-Amylase (2) Protease
(3) Lipase (4) None of the above

Q.97 What is the chemical name of Kinetin ?
(1) 6-(4 hydroxy 3-methyl trans 2-butene aminopurinol)
(2) 6-furfuryl aminopurine
(3) Dimethyl allyl adenine
(4) None of the above

Q.98 Which one acts as cytokinins ?
(1) Diphenyl urea
(2) Indoleacetic acid
(3) Phosphon-D
(4) None of the above

Q.99 Due to which hormone effect, seeds of Striga asiatica can be germinated without coming in contact with their host ?
(1) Auxin (2) Gibberellin
(3) Cytokinin (4) Ethylene

Q.100 Delay of senescence is called –
(1) Richmond effect
(2) Lang effect
(3) Richmond–Lang effect
(4) None of the above

Q.101 What happens during delay of senescence ?
(1) Chlorophyll breakdown stops in the treated area
(2) Transfer of proteins, amino acids and auxins towards the treated area
(3) More protein synthesis in the treated area
(4) All the above

Q.102 Who gave the name cytokinin ?
(1) Miller (2) Letham
(3) Skoog (4) None of the above

Q.103 Which is called the fruit ripening hormone ?
(1) Auxin (2) Gibberellin
(3) Ethylene (4) All the above

Q.104 Ethylene synthesis occur in –
(1) Fruit (2) Stem
(3) Leaf (4) All the above

Q.105 What is the precursor of ethylene ?
(1) Tryptophan (2) Ethene
(3) Methionine (4) None of the above

Q.106 Which are the climactric fruits ?

(1) Fruits forming auxins in more quantity during fruit ripening

(2) Fruits forming ethylene in more quantity during fruit ripening

(3) Fruits forming gibberellin in more quantity during fruit ripening

(4) Fruits forming cytokinin in more quantity during fruit ripening

Q.107 Ethylene synthesis is induced by –

(1) Auxin (2) Gibberellin

(3) Cytokinins (4) ABA

Q.108 Which of the following effects is related to ethylene ?

(1) Origin of root from graft

(2) Origin of lateral root

(3) Origin of root hair

(4) All the above

Q.109 The increase in rate of respiration during ripening of fruits is called –

(1) Fruit ripening respiration

(2) Climactric respiration

(3) Maturation respiration

(4) Climax respiration

Q.110 Chemically abscisic acid is –

(1) Terpenoid

(2) Fatty acid

(3) Precursor of typical fat

(4) Steroid

Q.111 Synthesis of abscisic acid occurs in –

(1) Leaves (2) Stem

(3) Seeds and fruits (4) All the above

Q.112 Abscission in leaves occurs due to –

(1) Abscissic acid

(2) Ethylene

(3) Combined effect of both

(4) None of the above

Q.113 Which effect is due to abscisic acid ?

(1) Induction of dormancy in buds and seeds

(2) Inhibition of growth

(3) Senescence

(4) All the above

Q.114 Which type of movement is exhibited by male gametes of Bryophytes and Pteridophytes when moving towards archegonial neck ?

(1) Photonastic (2) Chemonastic

(3) Chemotropic (4) Chemotactic

Q.115 What is it called when the plant remains fixed and the organ/part changes its position ?

(1) Fixed movement

(2) Curvature movement

(3) Tactic movement

(4) Nastic movement

Q.116 What is the special feature of growth movements ?

(1) They are irreversible

(2) They are reversible

(3) They are found only in flat organs

(4) None of the above

Q.117 In which organ circumnutation found ?

(1) In stem (2) In tendril

(3) In leaves (4) In flowers

Q.118 What is the reason of phototropism ?

(1) More distribution of auxin

(2) Less distribution of auxin

(3) Uneven distribution of auxin

(4) Rapid synthesis of auxin

Q.119 How is distribution of auxin affected by light?

(1) Less toward dark, more towards light

(2) Less toward light, more towards dark

(3) More toward light, zero towards dark

(4) None of the above

Q.120 Which type of geotropic effect is exhibited by secondary roots ?

(1) Orthogeotropism (2) Plageotropism

(3) Dia geotropism (4) All the above

Q.121 Which type of geotropism is shown by ginger (rhizome) –

(1) Diageotropism (2) Ortho-geotropism

(3) Plageotropism (4) All the above

Q.122 Which of the following structures have negative geotropism ?

(1) Coralloid roots of Cycas

(2) Pneumatophores

(3) Most stems

(4) All the above

Q.123 The coiling of tendril around the support is a type of –
(1) Thigmonastic movement
(2) Thigmotropism
(3) Geotropism (4) Phototropism

Q.124 The reason for automatic movement of variation is –
(1) Osmosis (2) Turgor
(3) Imbibition (4) All the above

Q.125 Automatic movement of variation can be seen in–
(1) Mimosa pudica (2) Desmodium gyrans
(3) Both of above (4) Acacia arabica

Q.126 Turning of sunflower head towards sun is –
(1) Photonastic movement
(2) Phototatic movement
(3) Phototropic movement
(4) None of the above

Q.127 What is it called, when there is no effect of the direction of the stimulus on movements ?
(1) Tactic movement (2) Tropic movement
(3) Nastic movement (4) None of the above

Q.128 Which type of movement is found in leaves of members of Leguminosae ?
(1) Thermonastic (2) Photonastic
(3) Nyctynastic (4) All the above

Q.129 Which movements occur to capture insects in insectivorous plants ?
(1) Thigmotropic (2) Chemotropic
(3) Chemonastic (4) Seismonastic

Q.130 Chemonasty is found in –
(1) Drosera (2) Dionea
(3) Nepenthes (4) All the above

Q.131 Which is called the compass plant ?
(1) Lactuca sativa (2) Lactuca scariola
(3) Sunflower (4) All the above

Q.132 Sleep movements (nyctinasty) of legume plants is–
(1) Turgor movement
(2) Growth movement
(3) Hygroscopic movement
(4) Movement of locomotion

ANSWER KEY

EXERCISE - 2

Q.1 Avena coleoptile test to find out the quantity of growth promoting hormones was discovered by –
(1) F,W, Went (2) L.J. Oudus
(3) K.V. Thimann (4) F. Skoog

Q.2 Primary precursor of I.A.A. is–
(1) Phenyl alanine (2) Tyrosine
(3) Tryptophan (4) Leucine

Q.3 The biological activity of I.A.A. is tested by–
(1) α - amylase test
(2) Avena curvature test
(3) Soybean callus test
(4) Xanthium leaf disc test

Q.4 Indole, 3 acetic acid, called as auxin was first isolated from–
(1) Human urine (2) Corn germ oil
(3) Fusarium (4) Rhizopus

Q.5 Which of the following effects of auxins is of wide application?
(1) Induction of fruit development
(2) Induction of root initiation
(3) Prevention of abscission
(4) All of the above

Q.6 Stem elongation is affected by–
(1) Gibberellin and florigen
(2) Auxin and gibberellin
(3) Florigen and kinin
(4) Kinin and auxin

Q.7 Apical dominance means–
(1) Suppression of growth of apical bud by axillary buds
(2) Suppression of growth of axillary buds by the presence of apical bud
(3) Stimulation of growth of axillary buds by removal of apical bud
(4) Inhibition of growth of axillary buds by removal of apical bud

Q.8 Auxin inhibits the growth of–
(1) Apical bud
(2) Lateral axillary buds
(3) Roots on stem cutting
(4) Parthenocarpic development of fruits

Q.9 Induction of rooting in stem cutting by auxin treatment would be beneficial in which of the following–
(1) Marchantia (2) Wheat
(3) Cuscuta (4) Bougainvillea

Q.10 Which of the following is not natural occuring plant hormone?
(1) 2, 4-D (2) GA_2
(3) Gibberellin (4) I.A.A

Q.11 Seedless fruits can be obtained by treating the unpollinated ovaries with–
(1) Colchicine (2) Sucrose solution
(3) Hormones (4) Pure lanolin

Q.12 Leaf fall occurs when the content of–
(1) Auxin increase
(2) Auxin decreases
(3) Abscisic acid decreases
(4) Gibberellic acid decreases

Q.13 Substance which originate at the tip of stem to control growth–
(1) Vitamins (2) Enzymes
(3) Food materials (4) Auxins

Q.14 Which of the growth substance acts as a stimulant during nodule formation in leguminous plant–
(1) Ethylene (2) ABA
(3) IAA (4) Morphactin

Q.15 Auxanometer is meant for measuring–
(1) Respiratory activity
(2) Photosynthetic activity
(3) Growth activity
(4) Osmotic pressure

Q.16 Apical dominance in higher plants is due to–
(1) Phytohormones (2) Enzymes
(3) Carbohydrates (4) Photoperiodism

Q.17 Parthenocarpy is the production of–
(1) Fruits with pollination
(2) Fruits with out fertilization
(3) Seeds with fertilization
(4) Only seeds and no fruits

Q.18 Auxin is mainly produced by–
(1) Apical root meristem
(2) Root cambium
(3) Apical shoot meristem
(4) Phloem in shoot tip

Q.19 Indole acetic acid generally inhibits the growth of –
(1) Roots (2) Leaves
(3) Shoots (4) Plants in general

Q.20 Fruit drop is caused by–
(1) From the shoot tip in the downward direction
(2) From the root tip in the upward direction
(3) Through vascular systems in plants
(4) By a special transport system in the root

Q.21 Fruit drop is caused by–
(1) Less auxin in fruit than in stem
(2) More auxin in fruit than in stem
(3) Equal distribution of auxin in stem and fruit
(4) Absence of auxin in stem and fruit

Q.22 In plants growth is–
(1) Restricted to certain regions or structure
(2) Irreversible
(3) Change in size
(4) All the above

Q.23 Which one of the following is motivation force for growth–
(1) Turgor pressure
(2) Root pressure
(3) Atmospheric pressure
(4) Osmotic pressure

Q.24 Growth is primarily affected by two climatic factors which are?
(1) Light and temperature
(2) Temperature and relative humidity
(3) Light and wind
(4) Rainfall and temperature

Q.25 Which of the following instrument can be used to record plant growth by seconds?
(1) Arc auxanomemter
(2) Arc indicator
(3) Space marker disc
(4) Crescorgraph

Q.26 In a growing plant, the first phase during the process of growth is–
(1) Cell division
(2) Cell enlargement
(3) Cell differentiation
(4) Cell maturation

Q.27 The classical experiments on growth were performed by–
(1) Lamarck & Boysen Jensen
(2) Boysen Jensen & Darwin
(3) Darwin and Lamarch
(4) Darwin and Paal

Q.28 The natural plant hormones were first isolated from–
(1) Cotton fruits, spinach leaves and rice plant
(2) Avena coleoptiles, spinash leaves and fungus Gibberella
(3) Human urine and corn germ oil
(4) Human urine and rice plant

Q.29 Which one of the following nutrients is concerned with the growth of the plants in view or their role in synthesis of auxin–
(1) S (2) Mn
(3) Zn (4) K

Q.30 Plants bend toward the light because–
(1) They need light for photosynthesis
(2) They need light for respiration
(3) Light attracts them
(4) Cells on the shaded side elongate more

Q.31 Auxins are abundantly produced in–
(1) Root
(2) Meristematic region of root
(3) Shoot
(4) Meristematic region of shoot

Q.32 Clinostat is used in study for–
(1) Photosynthesis (2) Respiration
(3) Geotropism (4) Osmosis

Q.33 Which of the following exerts profound effect on the reproductive growth of a flowering plant–
(1) Quality of light
(2) Quantity of light
(3) Direction of light
(4) Duration of light cycles

Q.34 What is the cause of excurrent habit in pinus–
(1) Presence of gibberellin
(2) Presence of apical dominance
(3) High concentration of cytokinin
(4) High concentration of ABA

Q.35 Which of the following hormone is concerned chiefly with root initiation?
(1) IBA (2) GA_3
(3) ABA (4) Kinetin

Q.36 If the tip of a seeding is cut off growth as well as bending ceases because it hampers–
(1) Respiration
(2) Photosynthesis
(3) Perception of light stimulus
(4) Transpiration

Q.37 What causes a green plant to bend towards light as it grows ?
(1) Because green plants need light to carry on photosynthesis
(2) Because green plants are phototropic
(3) Light stimulates plant cells on the lighted side to grow faster
(4) Auxin accumulates on the shaded side

Q.38 An apparatus used to demonstrate phototropism is–
(1) Luxmeter (2) Solarometer
(3) Clinostate
(4) Heliotrophic chamber

Q.39 phytohormone term was coined by–
(1) Gregory and Purvis
(2) F.W. Went
(3) Thieman
(4) L.J. Audus

Q.40 Growth hormone acts–
(1) Always as growth promotors
(2) Always are growth inhibitors
(3) Some as promotors and some as inhibitors
(4) Rarely as growth inducers

Q.41 The movement of auxin is largely–
(1) Acropetal (2) Basipetal
(3) Lateral (4) Centripetal

Q.42 The formula of Auxin-A is–
(1) $C_{18}\ H_{30}\ O_7$ (2) $C_{18}\ H_{22}\ O_5$
(3) $C_{12}\ H_{30}\ O_6$ (4) $C_{20}\ H_{30}\ N_5$

Q.43 Which growth hormone is responsible for apical dominance–
(1) Auxin (2) Cytokinin
(3) Gibberellin (4) Ethylene

Q.44 2, 4-D is a synthetic–
(1) Auxin (2) Gibberellin
(3) Cytokinin (4) Florigen

Q.45 Which of the following induces femaleness in plants?
(1) Auxin & ethylene
(2) Ethanol
(3) ABA (4) Gibberellin

Q.46 Which of the following prevents the fall of fruits?
(1) GA_3 (2) NAA
(3) Ethylene (4) Zeatin

Q.47 Which of the following is weed killer?
(1) 2, 4-D (2) NAA
(3) GA (4) ABA

Q.48 Which one is prevents over-ripening of banana and browning of cut fruits?
(1) Gibberellic Acid
(2) Indole-3 Acetic Acid
(3) Ascorbic Acid (4) Abscisic Acid

Q.49 Which weedicide can defoliate the complete forest?
(1) 2, 4-D (2) MH
(3) AMO - 1618 (4) ABA

Q.50 Agent orange is–
(1) Biodegradable insecticide
(2) Dioxin weedicide
(3) Biofertilizer (4) Biopesticide

Q.51 Phytotron is a device by which?
(1) Induce mutation breeding in wheat
(2) Electron bombarding system
(3) Plants are grown in controlled environment
(4) Heavy water plants

Q.52 Lateral axillary buds are not allowed to grow by–
(1) Auxin (2) Ethylene
(3) Gibberellin (4) Cytokinin

Q.53 Richmond– Lang effect is due to
(1) Cytokinin (2) Auxin
(3) ABA (4) All the above

Q.54 A hypothetical chemical believed to be involved in flowering is–
(1) Gibberellin (2) NAA
(3) Florigen (4) IAA

Q.55 DCMU is a herbicide which kills the plant by–
(1) Inhibiting photolysis of water as it is a strong inhibitor of pigment system II
(2) Inhibiting CO_2 function as it is a strong inhibitor of pigment system II
(3) Checking respiration
(4) Destroying Chloroplast

Q.56 Supra optima (more than 10 PPM) concentration of Auxins–
(1) Promotes flowering
(2) Kill the plant
(3) Prevents shortening of the internodes
(4) Promotes growth in both stem and roots apex

Q.57 Growth curve is–
(1) S-shaped (2) Sigmoid
(3) L-Shaped (4) Both 1 & 2

Q.58 Which of the following auxins are widely used as herbicides–
(1) 2, 4-D and 2, 4, 5-T
(2) 2, 4-D and cytokinin
(3) 2, 4-D and 2, 4-T
(4) 2, 4, 5-T and GA

Q.59 The compounds that inhibit the action of auxin are known as–
(1) Antiauxins (2) Auxins promotors
(3) Auxin precursors (4) Both 1 & 2

Q.60 Premature fall of fruit can be stopped by–
(1) Auxin (2) GA_3
(3) ABA (4) None of these

Q.61 Photoperiodic stimulus is picked up by–
(1) Phytochrome (2) Phytohormone
(3) Enzyme (4) Vernalin

Q.62 Parthenocarpy can be achieved by–
(1) Zeatin (2) ABA
(3) Auxins (4) Kinetin

Q.63 IAA was isolated by–
(1) Kogl and Erxleben
(2) Kogl and Haagen Smit
(3) Erxleben and Haagen Smit
(4) Kogl, Darwin and Haagen Smit

Q.64 Maximum of growth occurs in–
(1) Exponential phase
(2) Decline phase
(3) Stationary phase (4) Lag phase

Q.65 Cholodnyl-Went theory is related with–
(1) Turgor movement
(2) Chemotropism
(3) Phot-tropism
(4) Phototropism & Geotropism

Q.66 Which of the following plant hormone substitutes for long photoperiod in flowering plant–
(1) Auxin (2) Gibberellin
(3) Cytokinin (4) Ethylene

Q.67 Gibberellin stimulates flowering in–
(1) The plants growing in japanese farms
(2) The short day plants
(3) The long day plants
(4) Day neutral plants

Q.68 Internodal elongation is stimulated by–
(1) Auxin (2) Cytokinin
(3) Gibberellin (4) Phenol

Q.69 Cytokinin–
(1) Is a hormone whose main function is to induce the cell division
(2) Is the process of cell division
(3) Refers to cell division
(4) Causes dormancy

Q.70 The excised leaf does not turn yellow if it is induced to root. The is attributed to synthesis in the root of–
(1) Ethylene (2) Cytokinins
(3) Gibberellins (4) Auxins

Q.71 Hormone involved in photoperiodism is–
(1) IAA (2) Gibberellin
(3) Kinetin (4) 2, 4-D

Q.72 Gibberellin was first extracted from–
(1) Fusarium moniforme = Gibberella fujikuroi
(2) Gellidium
(3) Gracillaria
(4) Aspergillus

Q.73 Bolting hormone is–
(1) Auxin (2) Gibberellin
(3) ABA (4) Ethylene

Q.74 The plant hormone, which synthesized in root and translocated to aerial parts is–
(1) Auxin (2) Cytokinin
(3) Traumatin (4) Morphactins

Q.75 The elongation of genetically dwarf plants is brought about by application of–
(1) Cytokinins (2) Gibberellins
(3) X-Rays (4) Vitamin-C

Q.76 Gibberellin was isolated from–
(1) An alga (2) A fungus
(3) A bacterium (4) A virus

Q.77 Gibberellins could be extracted from–
(1) Rice
(2) Fungus/Fusarium moniliformis
(3) More healthy plants
(4) Diseased plants

Q.78 Gibberellins are–
(1) Growth inhibitors
(2) Growth promotor
(3) Not concerned with growth at all
(4) Of little potential in agriculture

Q.79 Gibberellins do not cause–
(1) Shortening of genetically tall plants
(2) Stimulation of seed germination
(3) Promotion of parthenocarpy
(4) Induction of α-amylase synthesis in barley

Q.80 Gibberellic acid has been successfully employed to induce flowering in–
(1) Short day plants under long day condition
(2) In long day plants under short day condition
(3) For some plants
(4) None of the above

Q.81 The growth regulator that retards ageins of plant organ is-
(1) Auxin (2) Gibberellin
(3) Cytokinin (4) Abscisic acid

Q.82 Which of the following hormones can replace vernalization ?
(1) Cytokinins (2) Auxins
(3) Ethylene (4) Gibberellin

Q.83 Which of the following breaks the dormancy of seeds ?
(1) IAA (2) GA_3
(3) Ethylene (4) All the above

Q.84 First natural cytokinin was discovered by-
(1) Miller (2) Letham
(3) Calvin (4) Govindii

Q.85 The first cytokinin was discovered by-
(1) Skoog (2) Went
(3) Addicot (4) Miller

Q.86 Richmond lang effect is-
(1) The effect of kinetins in delaying senescence
(2) The effect of auxin on root and shoot formation
(3) The effect of traumatic acid in wound formation
(4) None of these

Q.87 Which of the following is a coconut milk factor ?
(1) Auxin (2) ABA
(3) Morphactin (4) Cytokinin

Q.88 Which of the following induces morphogenesis in tissue culture ?
(1) Gibberellin (2) Cytokinin
(3) IAA (4) Ethylene

Q.89 The habit of Cabbage plant can be changed drastically by the application of -
(1) Auxin (2) Gibberellin
(3) Cytokinin (4) ABA

Q.90 In germinating seeds Amylase, Proteases, Lipases are stimulated by)-
(1) Auxin (2) Gibberellin
(3) Cytokinin (4) Ethylene

Q.91 Which of the following hormones is known to promote maleness in flowering plants ?
(1) Gibberellic acid (2) Kinetin
(3) IAA (4) 2, 4-D

Q.92 Richmond lang effect due to cytokinins pertains to
(1) Root formation
(2) Apical dominance
(3) Delay of senescence
(4) Leaf formation

Q.93 The gibberellin which is of wide distribution in higher plants are-
(1) GA_{29} (2) GA_{32}
(3) GA_1 (4) GA_{22}

Q.94 The most common cytokinin is-
(1) IAA
(2) Kinetin
(3) Isopentanyl adenine
(4) Dehydrozeatin

Q.95 Which one of the following is a gaseous plant hormone ?
(1) Auxin (2) Gibberellin
(3) Ethylene (4) Cytokinin

Q.96 Pomalin is sprayed over apple to increase fruit size, it is-
(1) Auxin
(2) Mixture of auxin and gibberellin
(3) Mixture of auxin and cytokinin
(4) Mixture of cytokinin and gibberellin

Q.97 Apical dominance can be overcome by application of-
(1) Auxin (2) Gibberellin
(3) Cytokinin (4) Florigen

Q.98 In plants natural cytokinin was discovered by-
(1) Skoog & Miller (2) Letham
(3) Benson & Calvin (4) Thimann & went

Q.99 The activity of α-amylase in the endospore of barley germinating seed is induced by-
(1) Ethylene (2) Cytokinin
(3) IAA (4) Gibberellin

Q.100 Dormancy of seed is broken by-
(1) Auxin (2) Gibberellins
(3) Ethylene (4) Cytokinin

EXERCISE - 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Plant hormones are : -
[Uttaranchal PMT 2004]
(1) Growth regulators
(2) Growth promoters
(3) Growth inhibitors
(4) None of above

Q.2 The most common auxin is : -
[Uttaranchal PMT 2004]
(1) GA (2) ABA
(3) Kinetin (4) IAA

Q.3 Gibberellin promotes cell division and elongation in : - **[Uttaranchal PMT 2004]**
(1) Leaves (2) Roots
(3) Shoots (4) All of these

Q.4 The deteriorative processes in plants, that naturally terminate their functional life, are collectively called : -
[Uttaranchal PMT 2004]
(1) Wilting (2) Abscission
(3) Plasmolysis (4) Senescence

Q.5 Which of the following is used for ripening of fruits **[Uttaranchal PMT 2004]**
(1) Auxin (2) ABA
(3) Ethylene gas (4) Cytokinin

Q.6 Induction of flowering in plants by low temperature treatment is called :
[Uttaranchal PMT 2005]
(1) Vernalization (2) Photoperiodism
(3) Cryobiology (4) Chilozology

Q.7 Plant growth is : **[Uttaranchal PMT 2004]**
(1) Limited (2) Unlimited
(3) Diffused (4) Both (1) & (2)

Q.8 Hormone produced during leaf fall is :
[Uttaranchal PMT 2005]
(1) IAA (2) ABA
(3) Florigen (4) Kinetin

Q.9 Climacteric fruit shows :
[Uttaranchal PMT 2004]
(1) High respiration rate at ripening
(2) Sudden change in taste
(3) Sudden change in colour and shape
(4) None of the above

Q.10 Phytochrome is present in : **[MP PMT 2007]**
(1) Vascular cryptogams
(2) Prokaryotes
(3) Brain cell
(4) Kidney cell

Q.11 Genetically dwarf plant can be converted into a plant of normal height with the application of:
[Uttaranchal PMT 2006]
(1) Auxin (2) Gibberellin
(3) Cytokinins (4) Auxin

Q.12 A phytohormone involved in the de novo synthesis of α-amylase in germinating seeds is:
[Uttaranchal PMT 2006]
(1) Auxin (2) Gibberellin
(3) Ethylene (4) Cytokinin

Q.13 Phytochrome is responsible for :
[West Bengal JEE 2007]
(1) Photosynthesis (2) Flowering
(3) Fruit formation (4) Respiration

Q.14 Which of the following is a gaseous hormone:
[West Bengal JEE 2007]
(1) Ethylene
(2) Cytokinin
(3) Both ethylene and auxin
(4) Gibberellin

Q.15 The pineapple which under natural conditions is diffcult to blossom has been made to produce fruits throughout the year by the application of:
[West Bengal JEE 2007]
(1) IAA, IBA
(2) NAA, 2,4-D
(3) Phenyl murcuric acid
(4) Cytokinins

Q.16 Most of the plants are seasonal due to :
[C.G. PMT 2004]
(1) Photoperiodism (2) Phototropism
(3) Photosynthesis (4) Photolysis

Q.17 Certain chemical susbtances having profound effect on plant growth are called :
[C.G. PMT 2004]
(1) Catalyic agents (2) Phytohormones
(3) Enzymes (4) Compost

Q.18 Phytochrome was discovered by : **[C.G. PMT 2005,06]**

(1) W. Went
(2) Garner and Allard
(3) F.F. Blackman
(4) Borthwick and Handricks

Q.19 The activity of α-amylase in the endosperm of barley germinating seed in induced by : **[C.G. PMT 2005]**

(1) Ethylene (2) Cytokinin
(3) IAA (4) Gibberellin

Q.20 A pigment concerned with floral induction is **[C.G. PMT 2005]**

(1) Florigen (2) Chlorophyll
(3) Plastocyanin (4) Phytochrome

Q.21 Gibberellins were first discovered in fungal genus **[C.G. PMT 2006]**

(1) Mucor (2) Rhizopus
(3) Agaricus (4) Fusarium

Q.22 The presence of auxins in a solution could be tested **[C.G. PMT 2006]**

(1) Avena sativa stem tip test
(2) Carbon tetrachloride test
(3) Iodine test (4) Defoliation test

Q.23 Auxanometer is used to measure : **[Jharkhand 2005]**

(1) Length (2) Width
(3) Depth (4) Growth

Q.24 The pigment sensitive for red and far red light is **[Jharkhand 2005]**

(1) Chlorophyll (2) Phytochrome
(3) Cytochrome (4) Carotene

Q.25 Hormone which breaks seed dormancy is : **[Jharkhand 2005]**

(1) Auxin (2) Gibberellin
(3) Ethylene (4) Cytokinin

Q.26 Which one of the following is not a synthetic auxin **[Jharkhand 2002]**

(1) 2, 4-D (2) 2-4-5-T
(3) NAA (4) IAA

Q.27 Which plant hormone causes fruit ripening : **[Bihar 2004]**

(1) IAA (2) Cytokinin
(3) Ethylene (4) GA

Q.28 Which hormone is responsible for apical growth **[Bihar 2004]**

(1) IAA (2) ABA
(3) GA (4) All of these

Q.29 Abscisic acid controls : **[Bihar 2002]**

(1) Cell elongation and cell wall formation
(2) Shoot elongation
(3) Leaf fall and dormancy
(4) Cell division

Q.30 Which hormone is used to induce ripening in banana **[Bihar 2002]**

(1) Cytokinin (2) Ethylene
(3) ABA (4) GA_3

Q.31 Which among the following is a synthesis plant hormone : **[Bihar 2001]**

(1) IAA (2) GA
(3) 2, 4-D (4) ABA

Q.32 Richmond-Lang effect is shown by : **[UP CPMT 2001]**

(1) Auxins (2) Sugars
(3) Zeatin (4) Gibberellins

Q.33 Ethylene gas is used for : **[UP CPMT 2001]**

(1) Growth of plants
(2) Delaying fruit's abscission
(3) Ripening of fruits
(4) Stopping the leaf abscission

Q.34 Auxanometer is used to detect : **[UP CPMT 2002]**

(1) Respiration (2) Transpiration
(3) Plant movement (4) Growth

Q.35 Which of the following plant hormone is extracted from fungus : **[UP CPMT 2003]**

(1) Ethylene (2) Gibberellin
(3) Cytokinin (4) 2, 4 D

Q.36 Highest concentration of auxin is found in : **[UP CPMT 2003]**

(1) Root and Shoot tips
(2) Leaves and Fruits
(3) Mid stem portion (4) None of these

Q.37 Ethylene is used for : **[UP CPMT 2001]**

(1) Decreases the senescence
(2) Increases the hights of stem
(3) Ripening of fruits
(4) Prevention of leaf fall

Q.38 The movement of pollen tube is called : **[UP CPMT 2003]**

(1) Chemotropism (2) Thermotaxis

(3) Thermonastic (4) Hydrotropism

Q.39 Phytotron is : **[UP CPMT 2003]**

(1) A controlled condition chamber for plants

(2) Leaf culture process

(3) Special culture of seeds

(4) Root culture process

Q.40 Phytochrome occurs in two forms. It's stable form is : **[UP CPMT 2004]**

(1) P_{fr} forms (2) P_r forms

(3) Both forms (4) None of these

Q.41 Which pigment is resposible for flowering in plant **[UP CPMT 2006]**

(1) Phytochrome (2) Cytochrome

(3) Anthocyanin (4) xanthophyll

Q.42 Process of vernalization can be induced by : **[UP CPMT 2007]**

(1) Cytokinin (2) Auxin

(3) Phototropin (4) GA

Q.43 Which of the following plant is LDP **[MP PMT 2007]**

(1) Xanthium (2) Soyabean

(3) Wheat (4) Tobacco

Q.44 Phototropism is due to the hormone **[MP PMT 2007]**

(1) IAA (2) GA

(3) 2-4 D (4) Cytokinin

Q.45 Photoperiodism affects : **[MP PMT 2001]**

(1) Vegetative growth

(2) Internode elongation

(3) Seed germination

(4) Reproductive growth

Q.46 Apical dominance is not affected by : **[MP PMT 2001]**

(1) Indoleacetic acid (2) Gibberellins

(3) Indoleacetaldehyde

(4) Indolebutyric acid

Q.47 The activity of α-amylase in the endosperm of barley germinating seed is induced by : **[MP PMT 2002]**

(1) Ethylene (2) Cytokinin

(3) I.A.A. (4) Gibberellin

Q.48 A pigment concerned with both floral induction and seed germination is : **[MP PMT 2007]**

(1) Florigen (2) Chlorophyll

(3) Plastocyanin (4) Phytochrome

Q.49 Which of the following may be the substitute of photoperiodism : **[MP PMT 2005]**

(1) Humidity (2) Temperature

(3) Mineral nutrients (4) Soil moisture

Q.50 Phytohormone commonly called stress hormone is **[MP PMT 2006]**

(1) Auxin (2) Abscissic acid

(3) Gibberellin (4) Cytokinins

Q.51 Fruit ripening can be hastened by treatment with **[MP PMT 2006]**

(1) IAA (2) Florigen

(3) Ethylene (4) Cytokinin

Q.52 Opening of floral bud is an example of **[UP CPMT 2002]**

(1) Induced movement

(2) Hyponastic movement

(3) Epinastic movement

(4) Cleistogamous movement

Q.53 Prunning of plants promotes branching, because the axillary buds get sensitized to- **[AIIMS - 2004]**

(1) Ethylene (2) Gibberellin

(3) Cytokinin (4) IAA

Q.54 Cell elogation in internodal regions of the green plants takes place due to- **[AIPMT - 2004]**

(1) Ethylene (2) Indole acetic acid

(3) Cytokinin (4) Gibberellins

Q.55 One set of a plant was grown at 12 hrs. day and 12 hours night period cycles and it flowered. While in the other set night phase was interrupted by flash of light and it did not flower. Under which one of the following catagories will you place this plant **[AIPMT - 2004]**

(1) Short day (2) Long day

(3) Darkness neutral (4) Day neutral

Q.56 The maximum growth rate occurs in- **[AIPMT - 2004]**

(1) Exponential phase (2) Stationary phase

(3) Senescent phase (4) Lag phase

Q.57 The ability of the Venus Flytrap to capture insects is due to- **[AIPMT - 2005]**
(1) Chemical stimulation by the prey
(2) A passive process requiring no special ability on the part of the plant
(3) specialized "muscle-like" cells
(4) rapid turgor pressure changes

Q.58 Why is vivipary an undesirable character for annual crop plants ? **[AIPMT-2005]**
(1) It reduces vigour of the plant
(2) The seeds cannot be stored under normal conditions for the next season.
(3) The seeds cannot exhibit long dormancy
(4) It adversely affects the fertility of the plant.

Q.59 Gibberellins can promote seed germination because of their influence on:**[AIPMT-2005]**
(1) Rate of cell division
(2) Production of hydrolyzing enzymes
(3) Synthesis of abscisic acid
(4) Absorption of water through hard seed coat.

Q.60 I.A.A. mainly inhibits growth of- **[RPMT-2005]**
(1) Root (2) Leaf
(3) Shoot
(4) Generally whole plant

Q.61 Movement due to external stimuli is known of- **[RPMT-2005]**
(1) Autonomic movement
(2) Paratonic movement
(3) Ameboid movement
(4) Excretory movement

Q.62 How does pruning help in making the hedge dense **[AIPMT-2006]**
(1) The apical shoot grows faster after pruning
(2) It releases wound hormones
(3) It induces the differentiation of new shoots from the rootstock
(4) It frees axillary buds from apical dominance

Q.63 Parthenocarpic tomato fruits can be produced by? **[AIPMT-2006]**
(1) raising the plants from vernalized seeds
(2) treating the plants with phenylmercuric acetate
(3) removing androecium of flowers before pollen grains are released
(4) treating the plants with low concentrations of gibberellic acid and auxins

Q.64 An enzyme that can stimulate germinationof barley seeds is- **[AIPMT-2006]**
(1) Prptease (2) Invertase
(3) α-amylase (4) Lipase

Q.65 Opening of floral buds into flowers, is a type of : **[AIPMT-2007]**
(1) Autonomic movement of growth
(2) Autonomic movement of locomotion
(3) Autonomic movement of variation
(4) Paratonic movement of growth

Q. 66 Which one of the following pairs, is not correctly matched ? **[AIPMT-2007]**
(1) IAA - Cell wall elongation
(2) Abscisic acid - Stomatal closure
(3) Gibberellic acid - Leaf fall
(4) Cytokinin - Cell division

Q.67 The wavelength of light absorbed Pr form of phytochrome is- **[AIPMT-2007]**
(1) 620 nm (2) 640 nm
(3) 680 nm (4) 720 nm

Q.68 "Foolish seeding" disease of rice led to the discovery of - **[AIPMT-2007]**
(1) IAA (2) GA
(3) ABA (4) 2, 4-D

Q.69 Senescence as an active developmental cellular process in the growth and functioning of a flowering plant, is indicated in- **[AIPMT-2008]**
(1) Annual plants (2) Floral parts
(3) Vessels and tracheid differentiation
(4) Leaf abscission

Q.70 Importance of day length in flowering of plants was first shown in- **[AIPMT-2008]**
(1) Cotton (2) Petunia
(3) Lemna (4) Tobacco

Q.71 One of the synthetic auxin is : - **[AIPMT-2009]**
(1) IBA (2) NAA
(3) IAA (4) GA

Q.72 Which one of the following acids is a derivative of carotenoids ? **[AIPMT-2009]**
(1) Abscisic acid (2) Indole butyric acid
(3) Indole-3-acetic acid
(4) Gibberellic acid

Q.73 Phototropic curvature is the result of uneven distribution of- **[AIPMT-2010 (Pre)]**

(1) Cytokinins (2) Auxin

(3) Gibberellin (4) Phytochrome

Q.74 Photoperiodism was first characterised in- **[AIPMT-2010 (Pre)]**

(1) Tomato (2) Cotton

(3) Tobacco (4) Potato

Q.75 Coiling of garden pea tendrils around any support is an example of- **[AIPMT-2010 (Pre)]**

(1) Thigmotropism (2) Thermotaxis

(3) Thigmotaxis (4) Thigmonasty

Q.76 One of the commonly used plant growth hormone in tea plantations is- **[AIPMT-2010 (Mains)]**

(1) Absicisic acid

(2) Zeatin

(3) Indole-3-acetic acid

(4) Ethylene

Q.77 Root development is promoted by : **[AIPMT-2010 (Mains)]**

(1) Auxin (2) Gibberellin

(3) Ethylene (4) Absicisic acid

Q.78 Through their effect on plant growth regulators, what do the temperature and light control in the plants ? **[AIPMT Mains 2012]**

(1) Apical dominance

(2) Flowering

(3) Closure of stomata

(4) Fruit elongation

Q.79 Which one of the following generally acts as an antagonist to gibberellins ? **[AIPMT Mains 2012]**

(1) Zeatin (2) Ethylene

(3) ABA (4) IAA

Q.80 Vernalisation stimulates flowering in : **[AIPMT Mains 2012]**

(1) Zamikand (2) Turmeric

(3) Carrot (4) Ginger

EXERCISE - 4

These questions consist of two statements each, printed as "ASSERTION" and "REASON". While answering these Questions you are required to choose any one of the following responses.

(1) If both Assertion and Reason are True and the Reason is a correct explanation of the Assertion.

(2) If both Assertion and Reason are True but Reason is not correct explanation of the Assertion

(3) If Assertion is True but the Reason is False.

(4) If both Assertion and Reason are false.

Q.1 **A :** Ethylene is a gaseous phyto hormone.
R : It promotes ripening of fruits.

Q.2 **A :** Plants usually bend towards the source of light.
R : Shoot apex shows positive phototropism due to unequal distribution ofr auxin.

Q.3 **A :** Lateral branches grow well when apical bud is removed.
R : Effect of Auxin is finished.

Q.4 **A :** Some plants flower only in summer.
R : Such plants are always LDP.

Q.5 **A :** **Xanthium** will not flower if the long dark period is interrupted by red light.
R : **Xanthium** is a long night plant.

Q.6 **A :** GA Induces the germination of seeds in plants.
R : GA activates the enzyme Amylase.

Q.7 **A :** Florigin is called as hypothetical hormone.
R : Florigin is inhibitory to flowering.

Q.8 **A :** Ethylene is a plant hormone, which can transfer from one plant to another plants.
R : Ethylene is a gaseous hormone in plants.

Q.9 **A :** ABA play an important role in plants during water stress.
R : ABA promotes stomatal closing during water stress.

Q.10 **A :** Some plants flower only in summer & some only in winters.
R : Such plants require specific air currents for flowering.

Q.11 **A :** Leaves of **Mimosa** plants droopes after touching.
R : Phytochrome is necessary for flowering in **Mimosa** plant.

Q.12 **A :** α-amylase activity test, used for bioassay of Gibberellins.
R : Gibberellins inhibit the activity of α-amylase in barley endosperm.

Q.13 **A :** Senescence is induced by the application of cytokinins in plants.
R : Cytokinin promotes the degradation of chlorophylls & nucleic acids.

Q.14 **A :** The plant hormones diffuse from site of origin.
R : Plant hormones are growth promoters and growth inhibitors.

Q.15 **A :** **Avena** colepotile curves towards light.
R : Hormone Gibberellin produced in **Avena** coleoptile for light stimulus.

Q.16 **A :** Auxin hormone resposnible for apical dominance.
R : Apical dominance is genetical phenomenon.

Q.17 **A :** Gibberellin hormone is antitranspirant.
R : Gibberellin closes the stomata.

Q.18 **A :** Gibberellin is a bolting hormone.
R : Gibberellin induces parthenocarpy in fruits.

Q.19 **A :** Flowering is inhibited in LDP by interruption of long night by red light.
R : LDP requires P_R for flowering.

Q.20 **A :** Cytokinins called as stress hormone.
R : Cytokinins induce flowering.

Q.21 **A :** Brief exposure of red light in dark phase of **Maryland** & Biloxy soyabean plants inhibits flowering.
R : These are SNP.

Q.22 **A :** Bolting effect in plants is performed by G.A.
R : G.A. induces internode elongation.

Q.23 **A :** Morphactins are growth inhibitors.
R : Morphactins are artificial or synthetic hormones.

Q.24 **A :** LDP does not flower if dark period is interrupted by red light.
R : They can synthesize Pr in red-light.

Q.25 **A :** **Xanthium** (Cocklebur) does not flower if dark phase is interrupted by exposer of red light.
R : **Xanthium** is a LNP.

Q.26 **A :** Florigen is a hypothetical hormone.
R : Florigen synthesised in leaves.

Q.27 **A :** Movement under the effect of gravity is called geotropism.
R : Tendrils of cucurbits exhibit geotropism.

Q.28 **A :** Flowering in tobacco is inhibited if dark phase is interrupted by red light.
R : Tobacco is a short day plant.

Q.29 **A :** Ethylene is unique plant hormone, which can reach from one plant to another plant by air.
R : Ethylene is gaseous hormone.

Q.30 **A :** Gibberellins induce seed germination in plants.
R : GA activates the genes for synthesis of protease & amylase.

Q.31 **A :** Rosette habit of cabbage can be eliminate by gibberellins.
R : Gibberellin induces α-amylase.

Q.32 **A :** ABA used in dry farming or desert farming.
R : ABA reduces transpiration.

Q.33 **A :** Napthalene acetic acid used for elimination of genetic dwarfism in plants.
R : This chemical increase the size of internode.

Q.34 **A :** Plant growth is localised and irregular.
R : Plant growth is reversible.

Q.35 **A :** Coconut milk factor can be used in tissue culture.
R : Coconut milk factor performs activity like cytokinin.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

AIIMS SPECIAL

Q.1 The shade of a tree is cooler than the shade of a roof due to

(1) Transpiration (2) Guttation
(3) Photosynthesis (4) Green leaves

Q.2 Translocation of organic materials is best explained by

(1) Imbibition theory (2) Active transport
(3) Mass flow hypothesis
(4) Transpiration pull

Q.3 The process of the escape of liquid from the tip of uninjured leaf is called

(1) Guttation (2) Transpiration
(3) Evaporation (4) Evapo-transpiration

Q.4 Rate of transpiration can be measured by

(1) Ganong's potometer (2) Porometer
(3) Auxanometer (4) Respirometer

Q.5 Wooden doors swell up and get stuck during the rainy season. This is due to the phenomenon of

(1) Imbibition (2) Endosmosis
(3) Capillarity (4) Deplasmolysis

Q.6 In plants, water moves from

(1) Less negative to more negative gradi.ent
(2) More negative to less negative gradient
(3) Same gradients
(4) None of these

Q.7 Stomata opens

(1) In day time - for gaseous exchange
(2) In day time - no gaseous exchange
(3) In night time only - for gaseous exchange
(4) In night time only - no gaseous exchange

Q.8 If turgor pressure becomes equal to the wall pressure, then

(1) Water leaves the cell
(2) Water enters the cell
(3) No exchange of water takes place
(4) Solute goes from the cell into water

Q.9 The function of leghaemoglobin during biological nitrogen fixation in root nodules of legumes is to

(1) Convert atmospheric N_2 to NH_3
(2) Convert ammonia to nitrite
(3) Transport oxygen for activity of nitrogenase
(4) Protect nitrogenase from oxygen

Q.10 Photosynthetic pigments in chloroplast are embedded in the membrane of

(1) Thylakoids (2) Matrix
(3) Chloroplast envelope
(4) Photoglobin

Q.11 How many quanta of light are required to evolve one oxygen molecule in photosynthesis?

(1) Three (2) Eight
(3) Four (4) Two

Q.12 Carbon dioxide is necessary for photosynthesis. The chemical used to remove this gas most effectively from entering a control apparatus is

(1) Calcium oxide
(2) Distilled water
(3) Potassium hydroxide solution
(4) Sodium carbonate

Q.13 During photosynthesis, oxygen in glucose comes from

(1) Oxygen in air (2) Water
(3) Carbon dioxide (4) Both (2) & (3)

Q.14 The molar ratio of chlorophyll and xanthophyll is

(1) 4 : 1 (2) 3 : 1
(3) 1 : 1 (4) 2 : 1

Q.15 The C_4-plants differ from C_3-plants with reference to the

(1) Substrate that accepts CO_2 in carbon assimilation
(2) Type of end product
(3) Type of pigment involved in photosynthesis
(4) Number of ATP that are consumed in preparing sugar

Q.16 Which of the following prevents the photo-oxidation and destruction of chlorophylls?

(1) Phycoerythrin (2) Phytochrome
(3) Phytohormone (4) Carotenoids

Q.17 The molecule which mainly absorb light energy and convert it to chemical energy in photosynthesis are

(1) Chlorophyll c (2) Chlorophyll a
(3) Chlorophyll b (4) Xanthophyll

Q.18 Photorespiration, usually occurs in

(1) One-cell organelles
(2) Two cell organelles
(3) Three cell organelles
(4) Four cell organelles

Q.19 Blackmann's law is related to

(1) Respiration (2) Transpiration
(3) Root pressure (4) Photosynthesis

Q.20 Classical experiment to prove essentiality of CO_2 for photosynthesis was given by

(1) Amon (2) Von Moll
(3) Calvin et. al. (4) Hill

Q.21 Photosynthetic bacteria do not contain

(1) Quantasome (2) PS-I and PS-II
(3) PS-II (4) PS-I

Q.22 The photo respiratory carbon-oxidation cycle involves the interaction of

(1) Chloroplast (2) Mitochondria
(3) Peroxisomes (4) All of these

Q.23 Photorespiration in C_3 plants starts from

(1) Phosphoglycerate (2) Phosphoglycolate
(3) Glycerate (4) Glycine

Q.24 Hill reaction occurs in

(1) High altitude plants
(2) Total darkness
(3) Absence of water
(4) Presence of ferricyanide

Q.25 Which one of the following categories,of organisms do not evolve oxygen dui-ing photosynthesis?

(1) Red algae
(2) Photosynthetic bacteria
(3) C_4 plants with Kranz anatomy
(4) Blue green algae

Q.26 Aerobic respiration produces more usable chemical energy than fermentation, because fermentation involves

(1) Formation of lactic acid
(2) Complete oxidation of food
(3) Partial oxidation of food
(4) Evolution of CO_2 and alcohol

Q.27 How many types of cytochromes are involved in the thylakoid electron transport chain?

(1) Five (2) Two
(3) Six (4) Four

Q.28 First step of utilisation of glucose in metabolism is

(1) Glycogen (2) ATP
(3) Pyruvic acid
(4) Glucose-6-phosphate

Q.29 The high energy bonds of ATP are between

(1) C - O (2) O - P
(3) C - N (4) C - C

Q.30 In respiration from 180 gm of glucose which of the following is formed?

(1) 264 gm CO_2 + 190 gm H_2O + 391 kcal
(2) 264 gm CO_2 + 108 gm H_2O + 686 kcal
(3) 390 gm CO_2 + 108 gm H_2O + 686 kcal
(4) 390 gm CO_2 + 264 gm H_2O + 391 kcal

Q.31 Glycolysis is found in cytoplasm of virtually all types of aerobic/anaerobic cells. In this process, glucose is converted into a compound which is

(1) PEP (2) Acetyl CoA
(3) Pyruvic acid (4) Citric acid

Q.32 The leaves of *Mimosa pudica* drop down, when touched due to

(1) Seismonasty (2) Photonasty

(3) Epinasty (4) Nyctinasty

Q.33 A pigment, which absorbs red and far red light, is

(1) Cytochrome (2) Phytochrome

(3) Xanthophyll (4) Carotene

Q.34 The growth hormones, responsible for 'bolting', are

(1) Coumarins (2) Auxins

(3) Gibberellins (4) Kinetins

Q.35 Decapitation of plant leads to the activation of axillary buds due to

(1) Increase in cytokinins

(2) More light availability

(3) Auxin translocation

(4) All of these

Q.36 The movement of lamina lobe of *Dionaea* is.

(1) Thigmonastic (2) Photonastic

(3) Seismonastic (4) Thermonastic

Q.37 Which of the following reduces plant growth and induces dormancy?

(1) Cytokinin (2) Auxin

(3) Xylene (4) Abscisic acid

Q.38 Apical dominance can be overcome by application

(1) Auxin (2) Cytokinin

(3) Florigen (4) Gibberellin

Q.39 Coiling of a tendril around a support is an example

(1) Photonasty (2) Thigmotropic

(3) Nyctinasty (4) Chemotropic

Q.40 Induction of flowering by low temperature in plants is

(1) Cryobiology (2) Vernalization

(3) Phototropism (4) Pruning

Q.41 Which of the following statements are correct regarding short day plants (SOPs)?

(1) They flower when night length is longer

(2) They are the same as long as long day plants

(3) They do not have a critical photoperiod

(4) All of these are correct

Q.42 Which of the following statements about phytochrome is true?

(1) P_r absorbs yellow light and becomes P_{fr}

(2) P_r absorbs red light and becomes P_{fr}

(3) P_{fr} absorbs red light and becomes P_r

(4) P_{fr} absorbs yellow light and becomes P_r

Q.43 Pruning of plants promote branching because the axillary buds get sensitized.to

(1) Ethylene (2) Gibberellin

(3) Cytokinin (4) Indole acetic acid

Q.44 Gibberellins can promote seed germination because of their influence on

(1) Rate of cell division

(2) Production of hydrolyzing enzymes

(3) Synthesis of abscisic acid

(4) Absorption of water through hard seed coat

Q.45 *Avena* curvature test is a bioassay for examining the activity of

(1) Auxins (2) Gibberellins

(3) Cytokinins (4) Ethylene

INSTRUCTIONS FOR Q.46 TO Q.70

In the following questions (46 to 70), a statement of assertion (A) is followed by a statement of reason (R)

(1) If both Assertion & Reason are true and the reason is the correct explanation of the assertion, then mark (1).

(2) If both Assertion & Reason are true but the reason is not the correct explanation of the assertion, then mark (2).

(3) If Assertion is true statement but Reason is false, then mark (3).

(4) If both Assertion and Reason are false statements, then mark (4).

Q.46 **A :** Submerged plants get CO2 in the form of carbonates and bicarbonates.

R : Stomata are not present in submerged plants.

Q.47 **A :** Light is very important external factor of transpiration.

R : Light induces stomatal opening and darkness stomatal closure. Thus the rate of transpiration increases in light and decreases in dark.

Q.48 **A :** Stomata remain open during day.

R : Stomata help in exchange of gases.

Q.49 **A :** A plant girdled upto bast will die.

R : Water transportation will cease.

Q.50 **A :** If you burn a plant, its nitrogen component is given off as ammonia and other gases.

R : Hydroponics does not allow plants to grow well if they are supplied with all the mineral nutrients they need.

Q.51 **A :** Rhizobial aggregates have been observed at distinct sites on curled root hairs.

R : The infection thread is formed by a process of invagination of the hair cell layer in the region of curling.

Q.52 **A :** Deficiency of sulphur causes chlorosis in plants.

R : Sulphur is a constituent of chlorophyll, proteins and nucleic acids.

Q.53 **A :** Nitrogen-fixing bacteria in legume root nodules survive in oxygen-depleted cells of nodules.

R : LeghE\amoglobin completely removes oxygen from the nodule cells.

Q.54 **A :** Action spectrum of photosynthesis compares well with the absorption spectrum of chlorophyll.

R : Chlorophyll is the only pigment which can absorb light energy.

Q.55 **A :** Plants possessing C_4-pathway of carbon fixation have a higher net primary productivity than the C_3-pathway possessing plants.

R : For each unit weight of fixed carbon, C_4-pathway possessing plants require less water than the C_3-pathway possessing plants.

Q.56 **A :** The 'absorption spectrum' of chlorophyll *'a'* shows close correlation with its 'action spectrum'.

R : Chlorophyll a is present in both the pigment systems I and II.

Q.57 **A :** C_4-plants photosynthesize more efficiently than C_3-plants.

R : C_4-plants have a shorter carbon dioxide fixation cycle.

Q.58 **A :** In bacteria, photosynthesis occurs by utilizing wavelengths longer than 700 nm.

R : Here the reaction centre is B-890.

Q.59 **A :** When six molecules of carbon dioxide participate in photosynthesis, 12 molecules of NADPH + H^+ and 18 ATP are used up, forming one hexose molecule.

R : The photosynthetic light reaction results in the (I) formation of ATP and $NADPH_2$.

Q.60 **A :** *Rhoeo* leaves contain anthocyanin pigments in epidermal cells.

R : Anthocyanins are accessory photosynthetic pigments.

Q.61 **A :** Cyclic pathway of photosynthesis first appeared in some eubacterial species.

R : Oxygen started accumulating in the atmosphere after the non-cyclic pathway of photosynthesis evolved.

Q.62 **A :** C_4 photosynthetic pathway is more efficient than the C_3 pathway.

R : Photorespiration is suppressed in C_4 plants.

Q.63 **A :** Under conditions of high light intensity and limited CO_2 supply, photorespiration has a useful role in protecting the plants from photo-oxidative damage.

R : If enough CO_2 is not available to utilize light energy for carboxylation to proceed, the excess energy may not cause damage to plants.

Q.64 **A :** Photosynthetically, C_4 plants are less efficient than C_3 plants.

R : The operation of C_4 pathway requires the involvement of only bundle-sheath cells.

Q.65 **A :** The aerobic respiration is bioenergetically more efficient than the anaerobic glycolysis.

R : The aerobic respiration occurs in the mitochondria, while glycolysis is purely cytosolic.

Q.66 **A :** Photomodulation of flowering is a phytochrome regulated process.

R : Active form of phytochrome (Pfr) directly induces floral induction in shoot buds.

Q.67 **A :** A correct concentration of auxin and cytokinin is required for the development of root and shoot in a callus.

R : When the ratio of kinetin to auxin is high, then only shoots develop. But when the ratio is low then only roots develop.

Q.68 **A :** Auxiliary buds, in actively growing herbaceous plants generally remain dormant.

R : This is due to apical dominance which is under the influence of auxins.

Q.69 **A :** Plants also have hormones called as phytohormones.

R : They increase the rate of reactions and thus always accelerate growth and other related changes.

Q.70 **A :** Senescence is the time when age associated defects are manifested.

R : Certain genes may be undergoing sequential switching on and off during one's life.

CIRCULATORY SYSTEM

INTRODUCTION

Each and every cell of the body requires consistent supply of O_2, food etc. for energy. Similarly toxic substances like CO_2, ammonia, urea, uric acid are needed to get removed from the body. In lower organism cell is in direct contact of surrounding medium and there is direct exchange of material in between cell and the medium so, circulatory system is not needed. In higher and multicellular organism due to its complex form a specialized system is needed to supply useful, substance to the body cell and to remove, harmful substance out of the body. This specialized, system is called **circulatory system**. Components involved in circulatory system originate from **mesoderm** of embryo. Except the inner lining of blood vessels and capillaries which are endodermal in origin.

TYPES OF CIRCULATION

Numerous types of fluid circulation are found in animals which are as follows-

1. Intracellular circulation

(i) Streaming movement of the cytoplasm which is called cyclosis is the **intracellular circulation**.

(ii) In all living cells and unicellular organism intracellular circulation is found.

(iii) Cyclosis helps in uniform distribution of material like O_2, food within the cell.

(iv) It also plays important role in amoeboid locomotion found in certain protozoans like *Amoeba* and WBC.

2. Extracellular circulation

(i) Circulation which occurs outside of the cell is called extracellular circulation.

(ii) Such type of circulation is found in **multicellular organism**.

It is of numerous types which are as follows-

Water circulation : Such type of circulation is found in **sponges** and ***Hydra***.

Parenchymal circulation : Such type of circulation is found in **flatworm**.

Pseudocoelomic fluid circulation : Such type of circulation is found in **roundworm**.

BLOOD VASCULAR SYSTEM

- Blood vascular system is present in higher invertebrates from the **Annelida** to the **Echinodermata** and all the **Chordates**.

Note :

(i) Annelida are the 1st metazoans to have a well developed circulatory system.

(ii) ***Nereis*** among Annelida and ***Amphioxus*** among the **Chordata** have well developed circulatory system but lacks heart.

The blood vascular system may be **open or closed circulatory system**.

I. Open circulatory system

(i) When the circulating fluid is present in a central cavity called Haemocoel or it flows into spaces called sinuses in the tissue, it is termed as the **open circulatory system**.

(ii) Animals in which circulatory system is open are Arthropoda (Prawn, lobsters, crabs, insects and spiders) and Mollusca (snails, oysters).

II. Closed circulatory system

(i) When the blood remains confined to the blood vessel it is called **closed circulatory system**.

(ii) In invertebrate, closed circulatory system is found in some annelida like earthworm and some mollusca like, squid.

(iii) In all vertebrate animals closed circulatory system is found.

(iv) The circulation of blood in the closed circulatory system was at first discovered and demonstrated by William Harvey who is known as father of angiology. He called heart as the "Pumping station of body".

Open circulatory system	Closed circulatory system
(1) In open circulatory system blood flows through large open spaces and channels called lacunae and sinuses among the tissues.	(1) In closed circulatory system blood flows through a closed system of chambers called heart and blood vessels.
(2) Tissues are in direct contact with the blood.	(2) Blood does not come in direct contact with tissue.
(3) Blood flow is very slow and blood has very low pressure.	(3) Blood flow is quite rapid and blood has a high pressure.
(4) Exchange of gases and nutrients takes place directly between blood and tissues.	(4) Nutrients and gases pass through the capillary wall to the tissue fluid from where they are passed on to the tissues.
(5) Less efficient as volume of blood flowing through a tissue cannot be controlled as blood flows out in open space.	(5) More efficient as volume of blood can be regulated by the contraction and relaxation of the smooth muscles of the blood vessels.
(6) Open circulatory system is found in higher invertebrates like most arthropods such as prawn, insects, etc., and in some molluscs.	(6) Closed circulatory system is found in echinoderms, some molluscs, annelids and all vertebrates.
(7) Respiratory pigment, if present, is dissolved in plasma; RBCs are not present.	(7) Respiratory pigment is present and may be dissolved in plasma but is usually held in RBCs.

(1) Blood circulatory system : It consist of : - Blood, Bloood vessels, Heart.

(2) Lymphatic system : It consist of lymiph, lymph capillaries, lymph vessels, lymph nodes, lymphoid tissues/ organs

The study of blood vascular system or circulatory system is called-**Angiology.**

PHYSIOLOGY OF BLOOD CIRCULATION

- **GENERAL FACTS**

(i) Physiology of blood circulation was at first described by **Sir William Harvey**.

(ii) Study of circulatory system is called **Angiology**. William Harvey is called **father of Angiology**.

(iii) There are two types of heart circuit in **vertebrates single heart circuit** and **double heart circuit.**

(iv) Single heart circuit is found in fishes having two chambered called **venous heart**.

The heart of fishes is called venous because heart receives and pumps only deoxygenated blood to gills for oxygenation.

(v) Double heart circuit is found in birds and mammals due to complete division of ventricle.

(vi) Double circulation means blood passess twice through the heart to supply once to the body. **Double circulation involves two circulation which are as follow :**

- **SYSTEMIC CIRCULATION**

(i) In this type of circulation, blood completes its circulation from left ventricle to right auricle through body organs.

(ii) From the left ventricle blood is pumped into the aorta and then to various part of the body (except lungs) Deoxygenated blood from these organs is returned to the right auricle through two large veins superior and inferior vena cava. From right auricle blood comes to right ventricle.

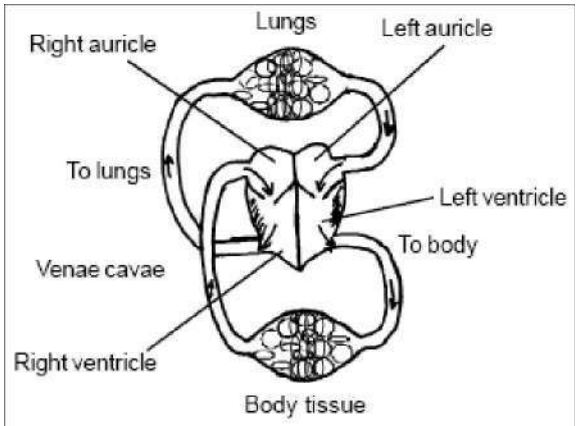

Fig. Blood flow in a bird and a mammal

PULMONARY CIRCULATION

(i) In this type of circulation blood completes its circulation from right ventricle to left auricle through lungs.

(ii) From right ventricle deoxygenated blood is pumped into pulmonary arch which carries blood to the lungs for oxygenation. From lungs oxygenated blood is carried to left auricle by four pulmonary veins. Left auricle pumps the blood to the left ventricle.

HEART OF VERTEBRATES

- **Heart (Fish)**

(i) In fish 2 chambered heart is found (1 auricle + 1 ventricle)

(ii) Ventricle pumps venous blood to gills purification.

(iii) Since only deoxygenated blood is present in the heart, such heart is called venous heart.

Note :

In lung fishes 3 chambered heart is found.

- **Heart (Amphibia)**

(i) In amphibians 3 chamberd heart is found (2 auricle + 1 ventricle)

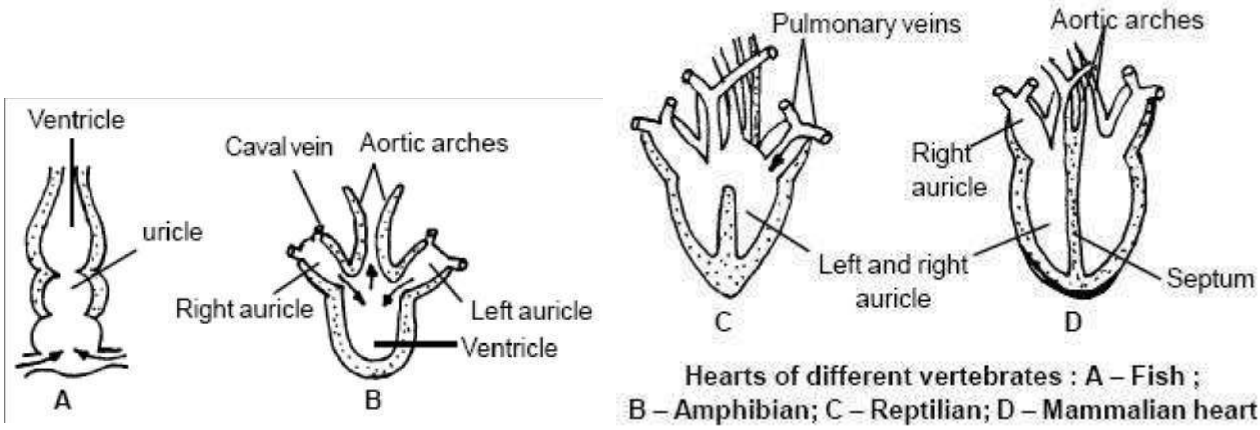
(ii) Both accessory chamber are found.

(iii) Double circulation is found.

- **Heart (Reptilian)**

(i) In reptilian 3½ chamberd heart is found.

(ii) The ventricle is partially divided.



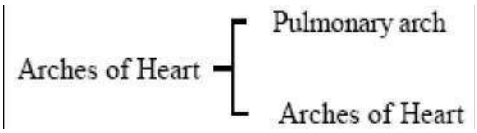
Hearts of different vertebrates : A – Fish ; B – Amphibian; C – Reptilian; D – Mammalian heart

Note :

(i) In crocodile and alligators ventricle is completely divided.

- **Sinus Venosus And Conus Arterious -** Sinus venousus and conus arterious are not found in rabbit but they are present in frog. In rabbit Sinus-venosus is formed in the embryo but later it becomes a part of the right-auricle. So the impure (deoxygenated) blood collect by the precavals (SVC) and postacavals (IVC) directly comes into the right auricle. The pure blood brought by the pulmonary veins from the lungs directly comes into the left auricle.
- Due to the separation of ventricle and the absence of Conus-arterius in rabbit, the pulmonary arches and the Carotico-systemic arches or aorta, arise respectively from the right and the left-ventricles.
- **Anatomical Landmarks :**

Coronary artery	–	Supplies blood to HEART
Vasso-Vassorium	–	Blood vessels which supply blood to wall of blood vessels
Bicuspid valve	–	Mitral vavle (Between L.A. & L.V.)
Tricuspid valve	–	(Between R.A. & R.V.)
Haversian valve	–	[On the end of opening of precavals]
Eustachian valve	–	On opening of postcavals.
Semilunar valve	–	At opening of Aorta and ventricles
Thebesian valve	–	Coronayr valve = at opening of coronary sinus
Columane carnae	–	Finger like projection from ventricle walls
Papillary muscles	–	Present at tip of columnae carnae
Chorda tendiane	–	Arise from papillary muscles and keep the valves in proper position.



Lacteals → Lymph capillaries of intestinal villi

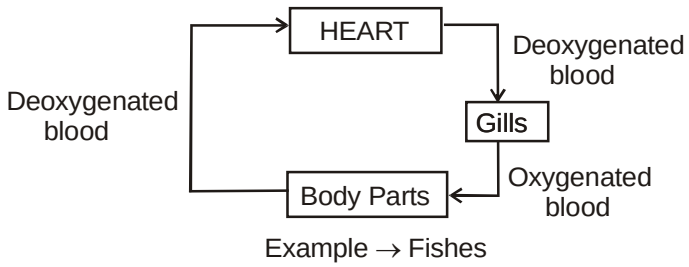
Lymphatic system present in class Amphibia is of **open type.**

Lymph heart and lymph sinuses found in frog are **absent** in the lymphatic system in **rabbit** & **man**

Payer's patches are present in mucosa of intestine and tonsils are present in mucosa of pharynx.

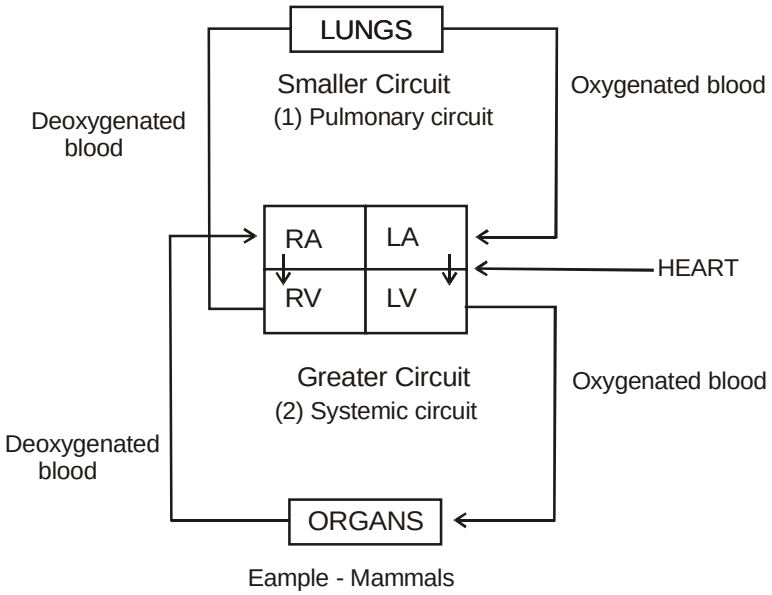
DOUBLE CIRCULATION OF HEART

- **Single Circuit :**



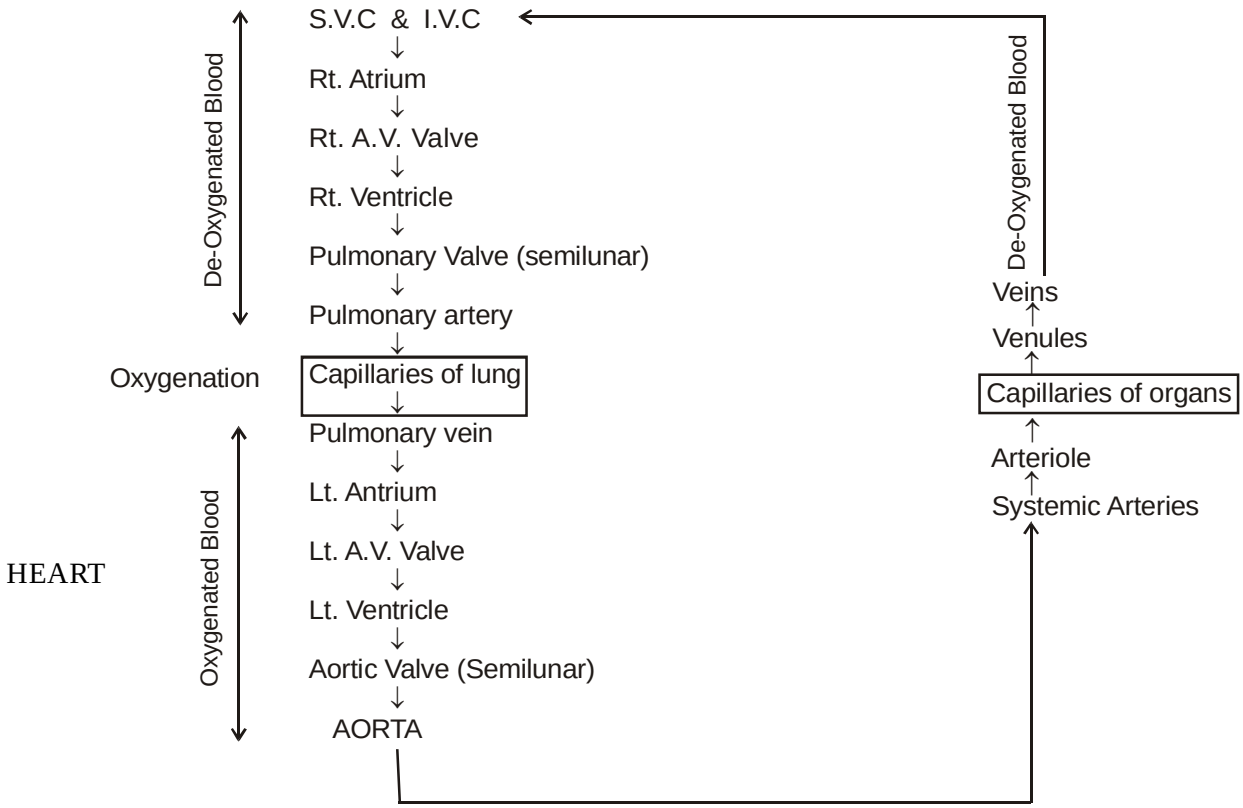
Example → Fishes

- **Double Circuit :**

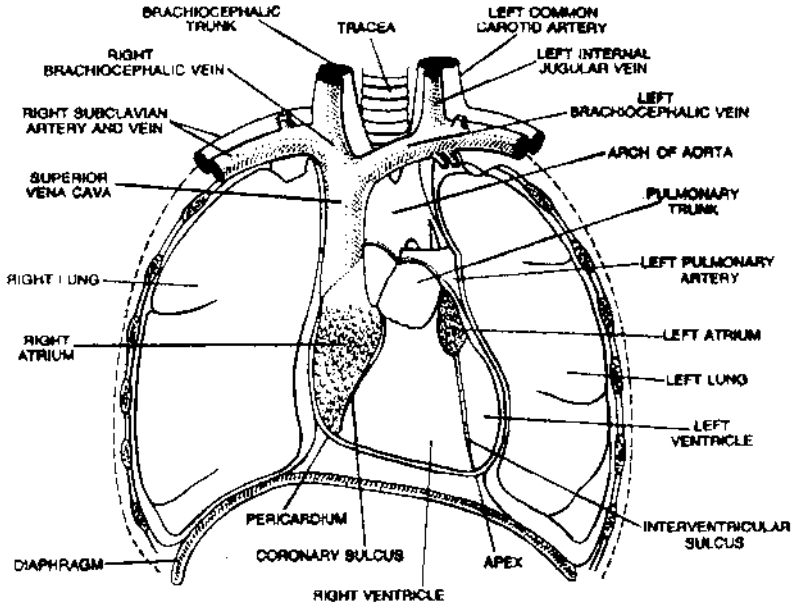


Eample - Mammals

- **Path of Blood in Double Circuit (Man)**



HEART



Location of Heart

STURCTURE OF HEART

Position, Size and Shape

(i) Human heart is thick, muscular, contractile, reddish brown, contractile automatic pumping organ.

(ii) It is present in the mediastinal space of thoracic cavity in between the lungs.

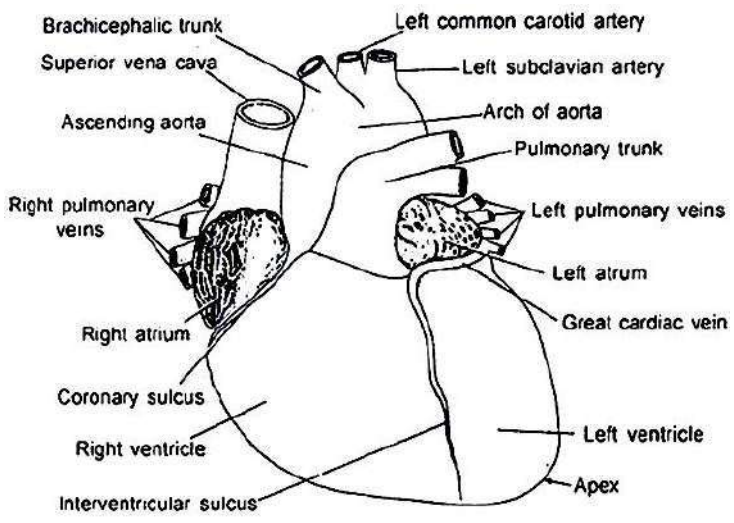
(iii) Human heart 12 cm in length and 9 cm in breath.

(iv) Its weight varies in males from 280-340 gm and in female from 230-280 gm.

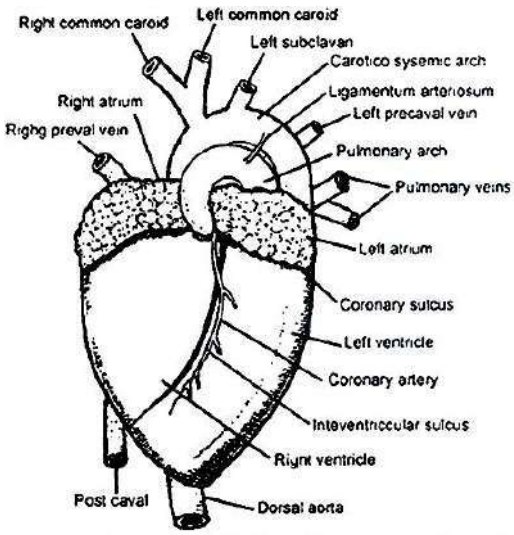
(v) Its upper part is broader called **base** whereas, its lower part is pointed called **apex**. The apex is slightly directed to left

(vi) It is covered by a two layered sac called **pericardium.** Outer layer is called **parietal pericardium** and inner layer is called **visceral pericardium** in between two layers pericardial cavity is present which is filled with **pericardial fluid**.

The pericardial fluid keeps the outer surface moist, protects the heart from mechanical injury and shock, it also allows free movement of the heart.



External features of Man's heart (ventral view)



External features of Rabbit's heart (ventral view)

The heart of rabbit or man is four chambered with 2 auricles and 2 ventricles. It is pinkish in colour and conical in shape. The broad upper part of heart is called auricular part or base and lower conical part is called ventricular part (Its tip is called apex.)

In between the auricles and ventricles, a clear groove is present, which is known as **coronary sulcus.** This groove is more towards auricles, by the effect of this the auricular surface is smaller than ventricles.

(a) Auricles - Auricular part of heart is smaller and of dark colour. Its walls are thin. It is divided into right and left auricles by fissure called **interauricular sulcus,** which is shifted slighty towards left. Therefore out of these two, right auricular surface is bigger than left auricle.

(b) Ventricles - Ventricular part is broad, muscular and of light colour. Ventricles have thicker walls than auricles.

The grooves which divide the two ventricles are termed as **Inter-ventricular groove** or **sulcus**. It is oblique or tilted towards Right. It does not reach till the tip or apex of the heart, So the right ventricle is smaller than the left ventricle.

Left ventricle is more muscular and got more thick walls as compared to right ventricle because it has to pump blood into those arteries which take blood thoughout the body while right ventricle has to pump blood only to the lungs.

- **Systemic heart -** Left part of the heart (i.e. **left auricle** and **left ventricle**) contains the blood which is to be pumped into the ***systemic circulation,*** therefore it is called systemic heart. The main purpose of such a circulation is to transport oxygen, as well as nutrients to the body tissues, and to remove carbondioxide and other harmful nitrogenous waste from them.
- **Pulmonary heart** - Right part of the heart (i.e. **right auricle** and **right ventricle**) contains the blood which is to be pumped in ***pulmonary circulation*** for oxygenation, therefore it is called pulmonary heart. The pulmonary circulation is responsible for regular oxygenation of the impure deoxygenated blood which is received by the right auricle.

- **Blood supply of heart (Coronary circulation)**

The oxygenated blood is supplied to the heart musculature for its consumption with the help of two coronary arteries, left and right. These arteries arise from the common origin at arch of aorta. the left and right coronary arteries then further subdivide into a number of branches carrying blood to different regions of heart. The impure blood from heart wals return back via coronary veins which drain into the coronary sinus. The coronary sinus opens in the right atrium.

- **Ischemic heart diseases**

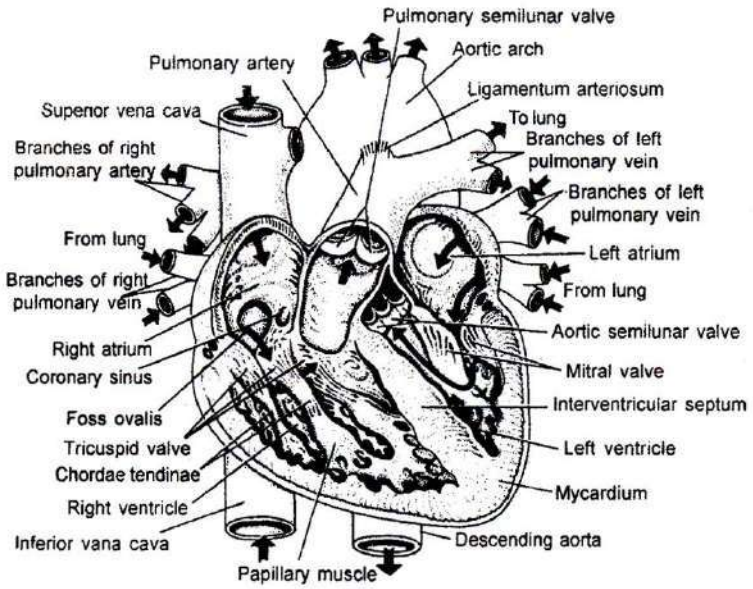
If the lumen of any of the coronary artery gets narrowed due to obstruction or cholestrol deposition, the cardiac tissues enter a condition of more demand and less supply whenever the person performs exhertion. Under such hypoxic conditions a pain might arise in heart muscles, this condition is called **Angina Pectoris.** This condition is reversible when the demand supply ratio is restabilised. (i.e. when the person stops exhertion and rests). A coronary artery by pass grafting (CABG) may be required to provide additional channel of blood suppply in such cases.

In coronary artery By pass grafting a part of internal mammary artery or a segment of patients own saphenous vein is used as the By pass channel.

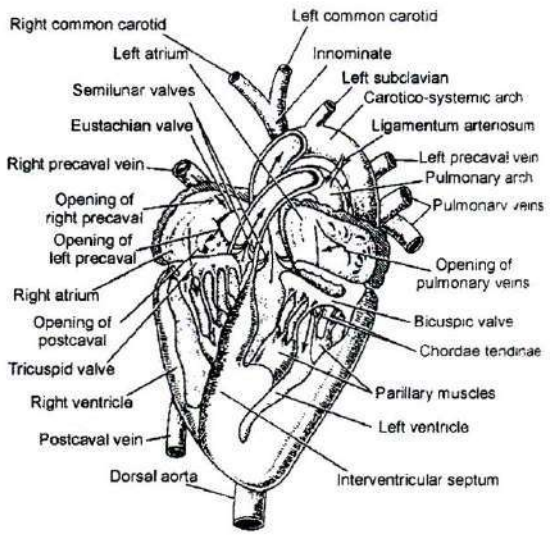
Myocardial Infarction (M.I.) - This is cellular death of cardiac tissue due to anoxia.

When the blood supply to the heart completely stops due to complete block of a coronary artery, under reduced oxygen condition the heart tries to restablish the blood supply by working even harder, thus aggravating the situation even further. Due to this reason the cardiac tissue starts dying by necrosis and myocardial infarction sets in, this is an irreversible condition. It is also called as HEART ATTACK in common language.

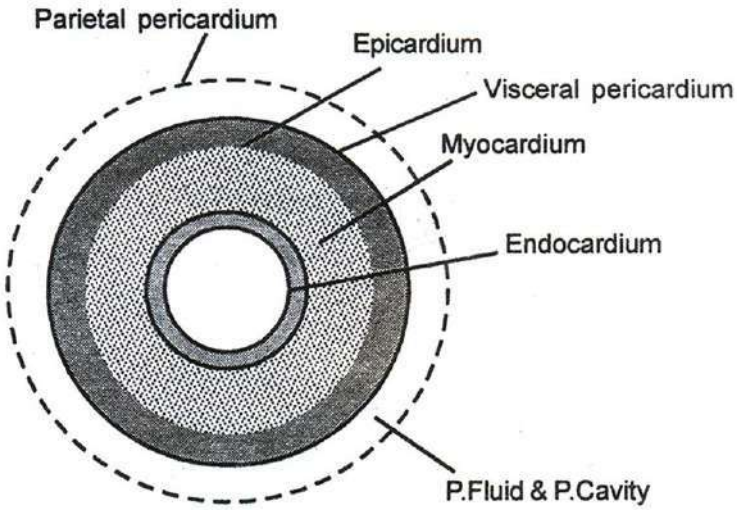
A blockage of left anterior descending artery (LAD) can be most fatal for the heart, (widows artery)



Horizontal longitudinal section of Man's heart (ventral view)



Horizontal longitudinal section of Rabbit's heart (ventral view)



Internal Structure of Heart

- The internal structrue of heart is discussed under following headings :

1. Cut section of heart :

The wall of heart is made of three layers, from outside inwards :

(i) Epicardium - outermost layer, mesodermal in origin. Made of simple squamous epithelium.

(ii) Myocardium - middle layer, thickest, mesodermal. Made of cardiac muscles which are striated but involuntary.

(iii) Endocardium - innermost layer, endodermal in origin. Made of simple squamous epithelium.

2. Partitions of heart :

- **Interauricular septum –** it is a partition between the left and right auricles. It is shifted slightly towards left, so the Right auricle is slightly broader than left. An oval depression **(Fossa Ovalis)** is present on its Posterior part. It is remainant of **foramen ovale** present in fetal stage which closes at birth. In fetal circulation the lungs are non functional and by-passed so the blood directly reaches the It. Atrium from rt Artium through foramen ovale.

- **Interventricular septum –** it is separates the two ventricles. It is shifted slightly towards right. Therefore left venrticle is larger than right ventricle.
- **Auriculoventricular septum –** it separates the two auricles from the two ventricles. It is shifted upwards towards Auricles. Therefore auricles are samaller than ventricles.

3. Chambers

- The mammalian heart has four chambers.

(i) **Right Auricle or Atrium -** Inlet : it receives on **S.V.C.,** one **I.V.C.** and one opening of **coronary sinus** in man. (it receives two S.V.C(rt. & It.) in case of rabbit).

SVC = superior vena cava = anterior vena cava =precava ; **IVC =** inferior vena cava = posterior vena cava = post cavals.

The SVC & IVC bring impure blood from the upper and lower body parts respectively. The **Coronary sinus** receives impure blood from the rt. & It. Coronary veins and drains it in the right auricle.

Outlets : this impure blood drains through the right AV foramen into the right ventricle.

(ii) **Right ventricle -**

- **Inlets :** receives impure blood through right AV foramen from right auricle.
- **Outlets :** drains the impure blood into pulmonary artery through which it reaches lungs for oxygenation.

(iii) **Left Auricle -**

- **Inlets :** receives oxygenated blood from lungs via pulmonary vein
- **Outlets :** this pure blood is drained into left ventricle through left AV foramen.

(iv) **Left Ventricle -**

- **Inlets :** receives pure blood through left AV foramen from left auricle.
- **Outlets :** drains pure blod into the Aorta from where it is supplied to systemic organs.

4. Walls

- **Auricles -**

The inner wall surface here presents a series of transverse muscular ridges called ***musculi pectinati.*** They run forwards and downwards towards AV foramen, giving appearance of the teeth of a comb (combed muscles).

- **Ventricles -**

The inner wall is rough due to presence of muscular ridges ***trabeculae carnae*** or ***columnae carnae.*** These continue as ***papillary muscles***, whose one end is attached to the ventricular wall and the other end is connected to the cusps of AV valves by ***chordae tendinae.*** These chorda tendinae are collagenous and inelastic chords one end of which is inserted in the papillary muscles and other end is connected to the flaps of AV valves. These are meant for preventing the pushing of flaps into atrium during ventricular contraction

5. Valves

- **Rt. Atrium -**

All its inlets are guarded with valves to prevent backflow of the blood. The SVC opening is said to be guarded by **Haversion valve (absent in rabbit).** The IVC which opens below this has its opening guarded by a valve called **Eustachian valve** (during embryonic life the valve guides the inferior vena caval blood to the left auricle through foramen ovale) The opening of coronary sinus in rt. Atrium is guarded by **Thebesian valve.**

- **Ventricles -**

  The inner wall is rough due to presence of muscular ridges ***trabeculae carnae*** or ***columnae carnae.*** These continue as ***papillary muscles***, whose one end is attached to the ventricular wall and the other end connected to the cusps of AV valves by ***chordae tendinae.*** These chorda tendinae are collagenous and inelastic chords one end of which is inserted in the papillary muscles and other end is connected to the flaps of AV valves. These are meant for preventing the pushing of flaps into atrium during ventricular contraction.

- **Lt. Atrium -**

  At its inlet is pulmonary vein (four veins in man and two in rabbit), these have no guarding valve.

- **AV formen -**

  The right AV foramen has a unidirectional valve called **tricuspid valve** (made of three flaps or cusps) which allows entry of Blood from Rt. Atrium to Rt ventricle and prevents its backflow. The unidirectional valve present on left AV foramen is made of two cusps only, hence called **bicuspid valve.** (also called as the **Mitral valve**).

- **Rt.Ventricle -**

  Its outlet is in the pulmonary artery. It is guarded by a **pulmonary semilunar valve**

- **Lt.Ventricle -**

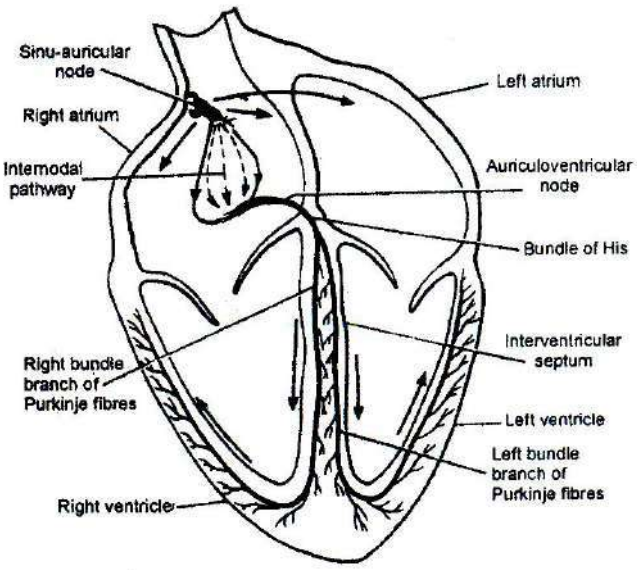
  Its outlet is in the systemic aorta. This opening is guarded by an **aortic semilunar valve**. Both these semilunar valves are made of three cusps each and are unidirectional in nature.

  From the two ventricles the pulmonary artery & systemic aorta arise out in the form of arches (called as pulmonary and systemic arches). These arches cross each other, and at the point of crossing they are attached by **ligamentum arteriosum.** Ligamentum arteriosum is the remainant of **ductus arteriosus.** ductus arteriosus is a small channel connecting the lumen of the two arches which gets closed at the time of birth.

CONDUCTION PATHWAY

The Conducting system of Heart :

It is made of myocardium that is specialised for initiation and conduction of the cardiac impulse. Its fibres are finer than other myocardial fibres, these are completely cross striated and posses special nerve like properties (= self excitatory neuromuscular pathway).



The conducting system has the follwoing parts.

S.A. Node (Pacemaker)

↓

Inter nodal pathway

↓

A.V. Node

↓

Bundle of His

↓

Purkinje fibres (Rt & Lt)

Rate of conduction is fastest in bundle of His and slowest in AV node.

(1) Sinuatrial node (SA node). It is known as the "pacemaker" of the heart. Located in the wall of Rt. Atrium it generates impulses at the rate of about 72 per minute. and initiates heart beat.

(2) Internodal pathway. it is the network of neuromuscular pathway that connects the SA node to the AV node.

(3) Atrioventricular node (AV Node). It is smaller than SA node and is situated in the atria near AV septum. It capable of generating impulse at rate of about 40/mt.

(4) Bundle of His (AV Bundle) . it is the connection between the atrial and ventricular musculature. It begins at the AV node and then divides into left and right branches as it descends down towards ventricles. The left branches of the AV bundle descends on their respective side of the interventricular septum and is distributed to the ventricles after dividing into Purkinje fibres.

(5) The Purkinje fibres. These are distributed through the endocardium of the ventricles and propogate the impulse in the entire ventricle musculature.

Why SA node is called the pacemaker of the heart ?

Although impulse is produced by the entire neuromuscular pathway, the frequency of impulse generation is maximum is case of SA node in comparison to other parts of pathway. Hence it guides the rhythm of heart beat and is called the pacemaker of the heart. The AV node on the other hand just conducts the impulse forwards.

WORKING OF HEART

Heart Beat

- Rhythmic contraction and expansion of heart is called heart beat. Actually, contraction and expansion occur separately in atrial and ventricle. however, ventricular movements are quite prominent and forceful. Therefore, heart beat is synonym with **ventricular** or **apex beat.** The rate of heart beat in an adult male is on the averge 72 per minute. It is higher in women, children and infants and lower in aged persons. it increases temporarily with activity and disease. In animals heart beat is connected with size. In mammals, smaller animals have higher heart beat is only 28/min in elephant. In frog heart beat is 64/mt. It is maximum among mammals in shrew (800/mt) and minimum in Bluewhale (25 per min).
- Heart beat is entirely controlled by nervous supply in arthopods and some annelids. It is called **neurogenic heart beat** and the heart is called **neurogenic heart.** In molluscs and vertebrate heart beat originates from a special muscular tissue. Such a heart beat is called **myogenic heart beat** and this is called **myogenic heart.** Human heart is myogenic.

Differences between Neurogenic and Myogenic Hearts

	Neurogenic Heart	Myogenic Heart
1.	Impulse of heart beat comes from outside heart.	The impulse of heart develops within the heart.
2.	Impulse is generated by nervous system.	Impulse is generated by a special muscular tissue.
3.	Nerve fibres are spread over the heart to bring about contracton and expansion.	There are special conducting muscles fibres for spreading the impulse.
4.	Heart will stop beating if removed from the body	It will continue to beat for some time, if detached heart is supplied with proper nourishment and favourable conditions.

Each heart beat has two components, **systole** and **diastole.** Systole represents contraction while diastole represents expansion or distension of heart chambers.

Heart beats are listened with the help of an instrument called stethoscope (invented by Laennec).

REGULATION OF HEART BEAT

- The rate of heart beat is regulated by two mechanism.

(A) Nervous regulation **(B)** Hormonal regulation

(A) NERVOUS REGULATION

The cardiac centre lies in the upper part of ventral wall of the medulla oblongata.

Cardiac centre is composed of-

(I) Cardioinhibitory centre (CIC) **(II)** Cardioacceleratory centre (CAC)

(I) Cardioinhibitory centre

(i) It decreases rate of heart beat.

(ii) The cardio-inhibitor is connected with SA node through vagus nerve or parasymphathetic nerve fibre.

(iii) It decreases the rate of heart beat (about 20 to 30 times/minute) as well as strength of heartbeat (by 20 to 30 percent).

(II) Cardioacceleratory centre

(i) It accelerates the rate of heart beat.

(ii) Cardio acceleratory centre is associated with SA node through sympathetic nerve fibre.

(iii) It increase rate of heart beat.

(B) HORMONAL REGULATION

(i) Heart beat is mainly regulated **by adrenaline** (epinephrine) and **non adrenaline** (nor epinephrine). Both hormones are secreted by medulla of adrenal gland.

(ii) **Nor adrenaline** and **adrenaline** both accelerate the rate of heart beat but operate in different conditions. Adrenalin increase the heart beat during emergency conditions, whereas non adrenaline increase the heart beat during normal conditions.

- **Note :**

Thyroxine hormone indirectly increase the heart beat because thyroxine increases oxidative metabolism of the body cell, so body cells require more oxygen.

Key Points

Hormonal control	Adrenaline	– ↑ Rate
	Nor adrenaline	– ↑ Rate
	Vagal stimulation releases Acetyl choline	– ↓ Rate
Autonomonic Nervous System	Sympathetic	– ↑ Rate
	Parasympathetic	– ↓ Rate

TACHYCARDIA

- It is the condition where heart rate exceeds 90 per minute for an average adult.

Common causes of tachycardia :

(i) Tachycardia. Rate of heart beat increases. Fever causes tachycardia because increased body temperature increases the rate of metabolism of the sinus node, whihc in turn directly increases its excitability and rhythm.

(ii) Stimulation by sympathetic nerves. Stimulation of the sympathetic nerves releases the hormone norepinephrine at the sympathetic nerve endings. Therefore this leads to increase in the heart rate.

(iii) Weak condition of the heart. Weakening of the myocardium usually increases the heart rate because the weakened heart does not pump blood into the arterial tree to a normal extent, and this causes sympathetic reflexes to increase heart rate.

(iv) Circulatory Shock/loss of blood. When a patient looses and passes into a state of shock or semishock, reflex stimulation of heart occurs which increases the frequency of heart beat to compensate for less delivery.

(v) Exercise. Physical exhertion cause in increased consumption of oxygen by tissues. In order to meet the increased demand the heart has to work faster.

(vi) Sinus tachycardia. Increased frequency of impulse discharges from the SA node will in run increase the heart rate.

BRADYCARDIA

- It is the condition where the heart rate falls below 60 per minute in an average adult.

Common causes of bradycardia :

(i) Temperature. Fall in body temperature leads to fall in the rate of SA node metabolism, which in turn reduces its Excitability and rhythm.

(ii) Stimulation by parasympathetic Vagus. Parasympathetic stimulation of acetylcholine secreted by vagus has an inhibitory effect on the SA node. (opposite phenomenon of sympathetic stimulation occurs here).

(iii) Stronger condition of the heart. The athelete's heart is considered stronger than that of a normal person. This allows it to pump greater stroke volume output per heart beat. When the athelete is at rest, this exessive quantity of pumped blood causes a negative feed back response resulting in bradycardia when he is at rest.

(iv) Rest. When at rest or sleeping, the oxygen demand of body is lesser this gives a negative feedback resulting in fall in heart rate.

(v) Sinus bradycardia. Peduced frequency of impulse discharge from SA node will reduce the heart rate.

The ratio of heart rate to respiratory rate in an average adult under normal circumstances is 4 : 1

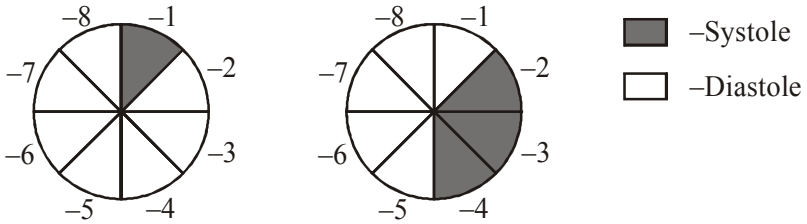
CARDIAC CYCLE

The cardiac events that occur from the begining of one heart best to begining of the next are called cardiac cycle. The action potential travels rapidly through both atria and then through the AV bundle into the all of ventricles. Because of special arrangement of the conducting system from the atria to the ventricles, there is a delay of more than 1/10th a second between passage of the cardiac impulse from the atria into the ventricles. This allows the artia to contract ahead of the ventricles, there by pumping blood into the ventricles before the strong ventricular contraction begins.

Thus the artria are the primer pumps for the ventricles, and ventricles then provide the major source of power for moving blood through the vascular system.

- **Cardiac-Cycle** - The process of heart-beat begins from the time of embryonal development. Once the heart beat starts, it continues throught out the life. In resting stage of man in 1 minute the heart beats around **72** times and during this 1 minute, 5 litres of blood is pumped to different parts of the body through heart through left ventricle.
- The serial wise or sequential changes which takes place in the heart are called cardiac-cycle.
- The contraction of the auricles is termed as Auricular systole or Atrial-systole, and their relaxation is called Atrial diastole.
- Same way the contraction and relaxation of ventricles is termed as ventricular systole and ventricular Diastole.
- The time of cardiac-cycle is the reverse ratio of heart beat per minute. If heart beat per minute is 72, then the time of cardiac-cycle is 60/72 = 0.8 seconds.

Cardiac Events

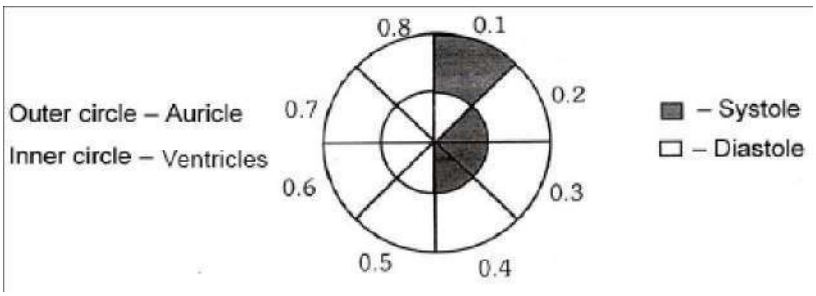


Atria **Ventricles**

Joint Diastole. 8 – .4 = 4 sec. (Period during which entire heart is in Diastole)

In a single cardiac cycle of man -			
(1) Auricular systole	=	0.1 sec	0.8 sec
(2) Auricular diastole	=	0.7 sec	
(3) Ventricular systole	=	0.3 sec	0.8 sec
(4) Ventricular diastole	=	0.5 sec	

- Following events are related to the Cardiac-cycle -



Common diagram showing events of both auricle & ventricles

(1) **''Ventricular-systole''** - It is important process because during it the blood is pumped out of the heart into the arteries. It has four main parts.

(a) **''Isometric-contraction''** - Walls of the ventricles start contracting, due to which pressure is more in the ventricles. Due to the increase of this pressure the " Cuspid valves" close producing "LUBB" sound.

(b) **''Period of Ejection''** - During this cycle when pressure increases in the ventricles, then the semi-lunar valves of the arches open and blood rapidly enters into the arches pushing the valves on one side.

- Oxygenated blood from the left-ventricle enters into the caotico-systemic arch or aorta and deoxygenated blood from the right-ventricle enter into the pulmonary-arch.

(c) **''Protodiastole'' -** Due to the ejection of blood from the ventricles now the inter-ventricular pressure decreases and the rate of blood ejection from the ventricles also decreases.

(d) **''Isometric Relaxation'' -** When due to blood-ejection, the pressure inside the ventricles decreases as compared to the pressure inside the arches. The blood stops moving out and the ventricles prepare for relaxation.

(2) **''Ventricular Diastole'' -** Ventricular start relaxing now due to which pressure inside them falls further. As a result of this, closure of semilunar valves occurs due to which 'DUP' sound is heard at the onset of ventricular diastole.

- Ventricular-diastole has two sub-stages -

(a) **''Rapid in-flow'' -** After the systole in the ventricles the systolic pressure reduces very much. This pressure becomes very less than atrial-pressure. Moreover due to relaxation in ventricles the pressure inside them falls further. So, now the cuspid-valves open up and bood flows rapidly from the auricles to the ventricles.

(b) **''Diastasis'' -** After rapid in flow, the auricles transfer the blood to the ventricles at the same rate at which they receive blood from the veins. So the inflow of blood reduces considerably. At this moment pressure inside all four chambers is equal and entire heart is in diastole. Also at this moment of this time, the AV valves are open but semilunar valves are closed.

(3) **''Auricle-Systole'' -** Due to contraction in the auricles the remaining blood comes into the ventricles so the Artrial pressure now becomes zero.

(4) **''Auricle-Diastole'' -** Auricle start relaxing now. Due to the presence of almost zero pressure in the auricles, the auricles now start receiving further blood from the veins.

Volumes of blood related with cardiac cycle.

During diastole, filling of the ventricles normally increases the volume of each ventricle to about 120 mililitres. This volume is known as ***end diastolic volume.*** Then as the ventricles empty during systole, the volume decrease by 70 mililitres, which is called the ***stroke volume.*** (i.e. the volume of blood pumped by left ventricle in the aorta in one stroke or beat). The remaining volume in each ventricle is now about 50 mililitres and is called ***end systolic volume.***

The fraction of the end diastolic volume which is ejected out is called the **ejection fraction.** (usually around 60% or 7/12). EF = SV/EDV

- **Cardiac output** it is the amount of blood pumped by the left ventricle in the aorta in a minute. Its value in a normal adult is about 5 litre/minute.

  Cardiac output = stroke volume x heart rate.
- End diastolic volume $\Rightarrow$ 120 ml.
- End systolic volume $\Rightarrow$ EDV – SV = 50 ml (approx)

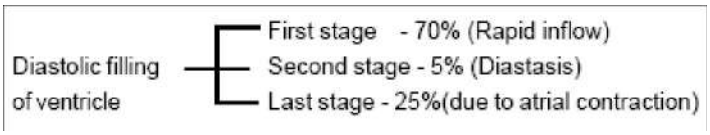
  Stroke Volume = EDV– ESV = 70 ml (approx)

Filling of Heart (Ventricles) :

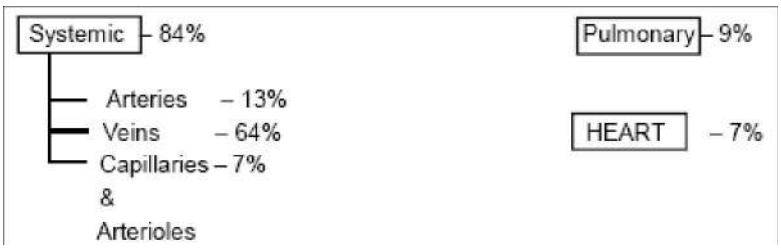
Blood normally flows from the great veins into the atria. About 75% of the blood flows directly through the atrial into the ventricles even before the atria contracts. Then atrial contraction usually causes an additional 25% filling of the ventricles.

The period of Atrial Systole – Fills 25 % of ventricles.

The period of Atrial Diastole fills 75% of ventricles.



Distribution of blood in Body



Distribution of Blood Flow in various organs at rest in Man

Brain	–	700 ml/mt	(14%)	approx
Heart	–	300 ml/mt	(7%)	
Muscles	–	1200 ml/mt	(20%)	
Skin	–	500 ml/mt	(8%)	
Kidney	–	1100– 1300 ml/mt	(20–25%)	
Abdominal organs	–	1400 ml/mt	(20–25%)	
Others	–	600 ml/mt	(10%)	
Total		5800 ml/mt	100%	

HEART-SOUND

(1) Ist Sound – This is a contraction sound which denotes the begining of ventricle-contraction. it arises due to closing of mitral vave and the tricuspid valve. It is weak and appears in the form of **''Lubb''** (L - U - B - B)

(2) IInd Sound – This is a diastolic sound which denotes the beginning of ventricular diastole. This arises due to the closing of the semi-lunar valves of the two arches and is heard in the form of **''Dup''** . It is shriller than the Ist sound and takes less time.

- These "Lubb" and "Dup" sounds of the heart can be heard with the help of an instrument called **''Stethoscope.''**
- The study of heart-sounds by marking them on a Graph is termed as **''Phona-Cardiography''**
- The measurement of the electrical-activity of the cardiac muscles at the time of heart-beat is necessary for the healthy working of the heart. The transmission of impulses in the sarcolemma of cardiac muscle fibres is in the form of electro-chemical waves.

  The graph which is marked by the machine due to the voltage difference is termed as the **"E.C.G."** **''or''**

  Electro Cardio Gram'' and this process is termed as **''Electro Cardio Graphy''**
- It was first of all recorded by ***''Waller''***
- **''Einthovan''** is known as the father of Electro Cardio Graphy.

HEART SOUND

I Heart Sound	II Heart Sound
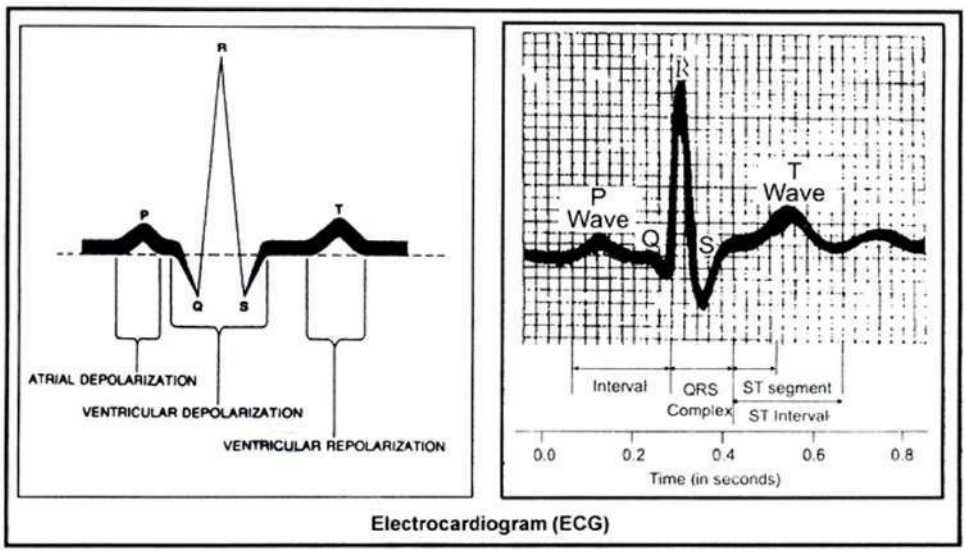
1. LUBB 	DUP 2. DULL ; Prolonged	Sharp, Shorter timed, High pitch
3. Systolic (Ventricular) onset	Diastolic Sound
4.. Caused by vibrations due to Closure of AV valves	Caused by Closer of Semilunar valves

NORMAL ELECTROCARDIOGRM (E.C.G.)

An electrocardiogram records electrical activity of the heart. The impulse travelling in the neuromuscular pathway of the heart is conduced to the wall of heart musculature where it gets amplified and part of it leaks via the pericardium to the skin surface. The leaked current is picked up with help of electrode and amplified. A time voltage graph of this current is then plotted which is called the E.C.G It is taken with help of 12 leads, placed at different positions on body



Electrocardiogram (ECG)

Components of a normal ECG

- **Waves** :

  ''P'' wave – it represents auricular depolarisation which is follwed by auricular contraction. Its first half represents Rt. Auricle and second half represents left auricle.

  "QRS complex'' – it represents ventricular depolarisation which is followed by ventricular contraction

  ''T'' wave – it represents ventricular repolarisation during which the ventricles relax

- **Intervals**

  P-Q interval – time period between start of auricle depolarisation and ventricular depolarisation (also called P-r interval, it lasts normally for 0.16 seconds)

  S-T interval – time period between ventricular depolarisation and ventricular repolarisation.

  P-P, R-R inverval : The interval between any two successive similar wave denotes time taken for one heart beat.

BLOOD PRESSURE

DEFINITION

It is the pressure exerted by flow of blood on the wall of blood vessels (arteries).

TYPES

Arterial blood pressure is of two types :

- **Systolic blood pressure**

(i) It is the pressure which the blood exert on the wall of arteries at the time of ventricular contraction (systole).

(ii) In normal adult person at resting condition it is about **120 mm of Hg** .

(iii) It is **higher limit of arterial blood pressure**.

- **Diastolic blood pressure**

(i) It is the pressure which the blood exert on the wall of arteries at the time of relaxation (diastole) of ventricle.

Blood pressure in normal person is **120/80 mmHg**.

Note :

The difference between systolic and diastolic pressure is called **pulse pressure**. Its normal value is 40 mmHg.

- **Measurement of blood pressure**

(i) Blood pressure is measured by an instrument called **Sphygmomanometer**.

(ii) It was discovered by **Karat koff in (1905)**.

(iii) At first **Hales** measured B.P. of horse.

- **Factor influencing the blood pressure**

(i) Increase in Age - B.P. increase

(ii) Thickening of arteries - B.P. increase

(iii) Due to obesity - B.P. increase

(iv) Constriction of blood vessel - B.P. increase

(v) Due to fear, tension, anxiety, B.P. increase.

- **Pulse**

(i) Pulse is the rhythmic contraction and relaxation in aorta and its main arteries.

(ii) It is wave of contraction started in the aorta and travels down to the wall of the arteries.

(iii) Pulse rate will be exactly equal to the heart beat, so the pulse rate in normal adult person is 72/minute.

(iv) Pulse rate is more rapid in children, in newly born baby in particular. It is more rapid in female in comparison to male.

Disorders related to the Circulatory System :

- **Hypertension :**

It is also called **high blood** pressure. Hypertension or high blood pressure is the occurrence of persistent

systolic arterial pressure of more than 140 mm Hg and diastolic arterial pressure of more than 90 mm Hg. Hypertension is of two types, primary and secondary.

Secondary hypertesion is due to an underlying cause like Hormonal or obstructional. **Primary hypertension** is also called **essential hypertension.** 90% fo the hypertensive patients suffer from this type of hypertension. It is caused by several factors like arteriosclerosis, atherosclerosis, varicose veins, obesity, increasing age etc.

- **Hypotension :** It is also called **low blood pressure.** Hypotension or low blood pressure is the occurrence of persistent systolic arterial pressure of less than 110 mm Hg and diastolic arterial pressure of less than 70 mm Hg. It is caused by persistent vasodilation of arterioles, ventricular pumping, valvular defects, amaemia and deficient diet.
- **Atherosclerosis :** It is irregular thickening of arterial walls and narrowing of their lumen due to deposition of yellow plaques or atheromas in their tunica intima and inner part of tunica media.
- **Arteriosclerosis :** It is a group of degenerative diseases characterised by thickening and loss of elasticity of arterial walls. Arteriosclerosis occurs more in elderly persons.
- **Varicose Veins :** On prolonged standing or due to defect in the valves of the veins of the legs. These veins may become dialated,torturous and thickened (Most commonly affected is the saphenous vein). such veins become clearly visible and prominent. Treatment is surgical removal of such veins.

BLOOD VESSELS

In closed type of blood vascular system blood vessels are of 3 types (1) Arteries (2) veins (3) Capillaries.

- Normally artery carries pure blood from heart to the different organs of the body.
- Veins carry impure blood from body organs to the heart.
- Capillaries are present in the organs, and these are the vessels through which exhange takes place.

Anatomy of arteries and veins : Normally there are three layers are found in the walls of blood vessels -

(i) **Tunical externa :** It is the outer most layer. It is formed of loose connective tissue in which many collagen fibres, elastin fibres and longitudinal muscles are found.

(ii) **Tunica media :** It is a thick laye of circular non striated muscles and a network of elastin fibres.

(iii) **Tunica interna :** This layer is made up of squamous epithelium, It is also known as Endothelium

- One more layer is present in the wall bigger arteries, that is known as elastic membrane. This is found in between the tunica media and tunica interna layers.
- These all layers are well developed in the walls of arteries as compared to the walls of veins.
- Walls of arteries are thick and more muscular and these walls are **elastic** and **non-collapsable.**
- The walls of veins are thin, less muscular **non elastic** and **collapsible.**
- In the walls of blood capillaries only endothelium layer is found. Its cells are flat and squamous, Their walls are perforated. These blood capillaries join the arteries with the veins.
- Blood capillaries were discovered by a scientist named as **Marcello Malpighi**
- A thin network of blood capillaries is present in the walls of blood vessels itself which supply blood and other necessary substances to the blood vessels. This blood supply is known as **Vasa-vasorum.**

	ARTERY		VEIN
1.	It carries blood from the heart to the organs.	1.	It carries blood from organs to the heart
2.	All the arteries carry pure blood except pulmonary artery which carries impure blood.	2.	All the veins carry impure blood except pulmonary vein which carries pure blood.
3.	Blood flows with a high pressure & speed.	3.	In the vein, blood flows with a low pressure & speed
4.	Arteries are deeply situated in the body.	4.	Veins are superficial just below the skin.
5.	The walls of arteries are thick and tough.	5.	The walls of veins are thin and soft.
6.	Their lumen is constricted.	6.	Their lumen is wide.
7.	Valves are absent in the walls of arteries.	7.	Walls of veins contain valves.
8.	These are pinkish or bright red in colour.	8.	These are deep red or bluish in colour
9.	Arteries do not collapse when empty, because	9.	Veins usually collapse when empty.
10.	Their tunica media layer is much thicker as compared to veins.	10	Their tunica media layer of wall is thinner as compared to arteries.

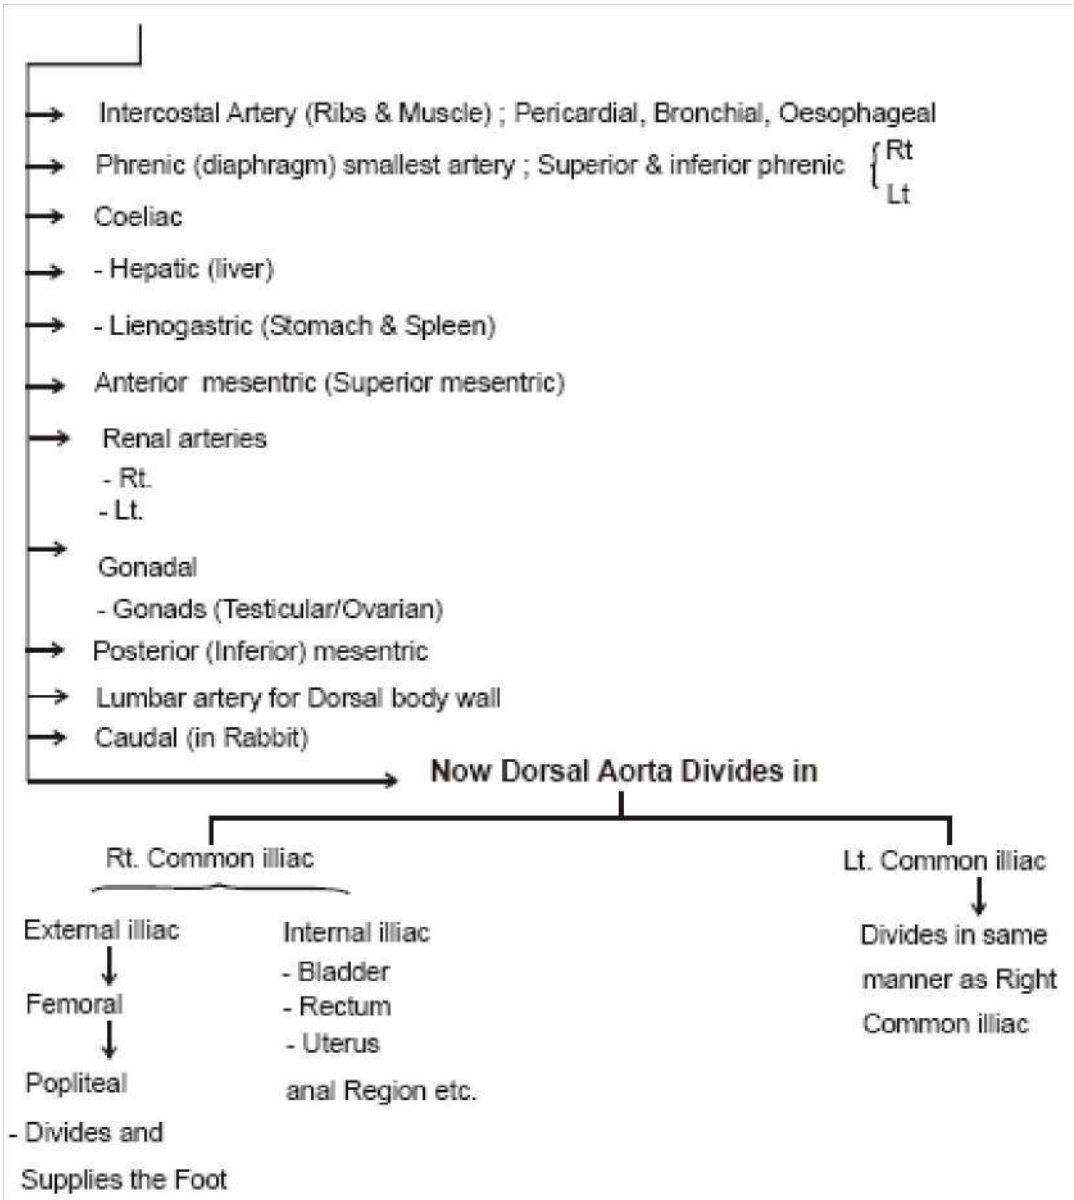
ARTERIAL SYSTEM IN MAN



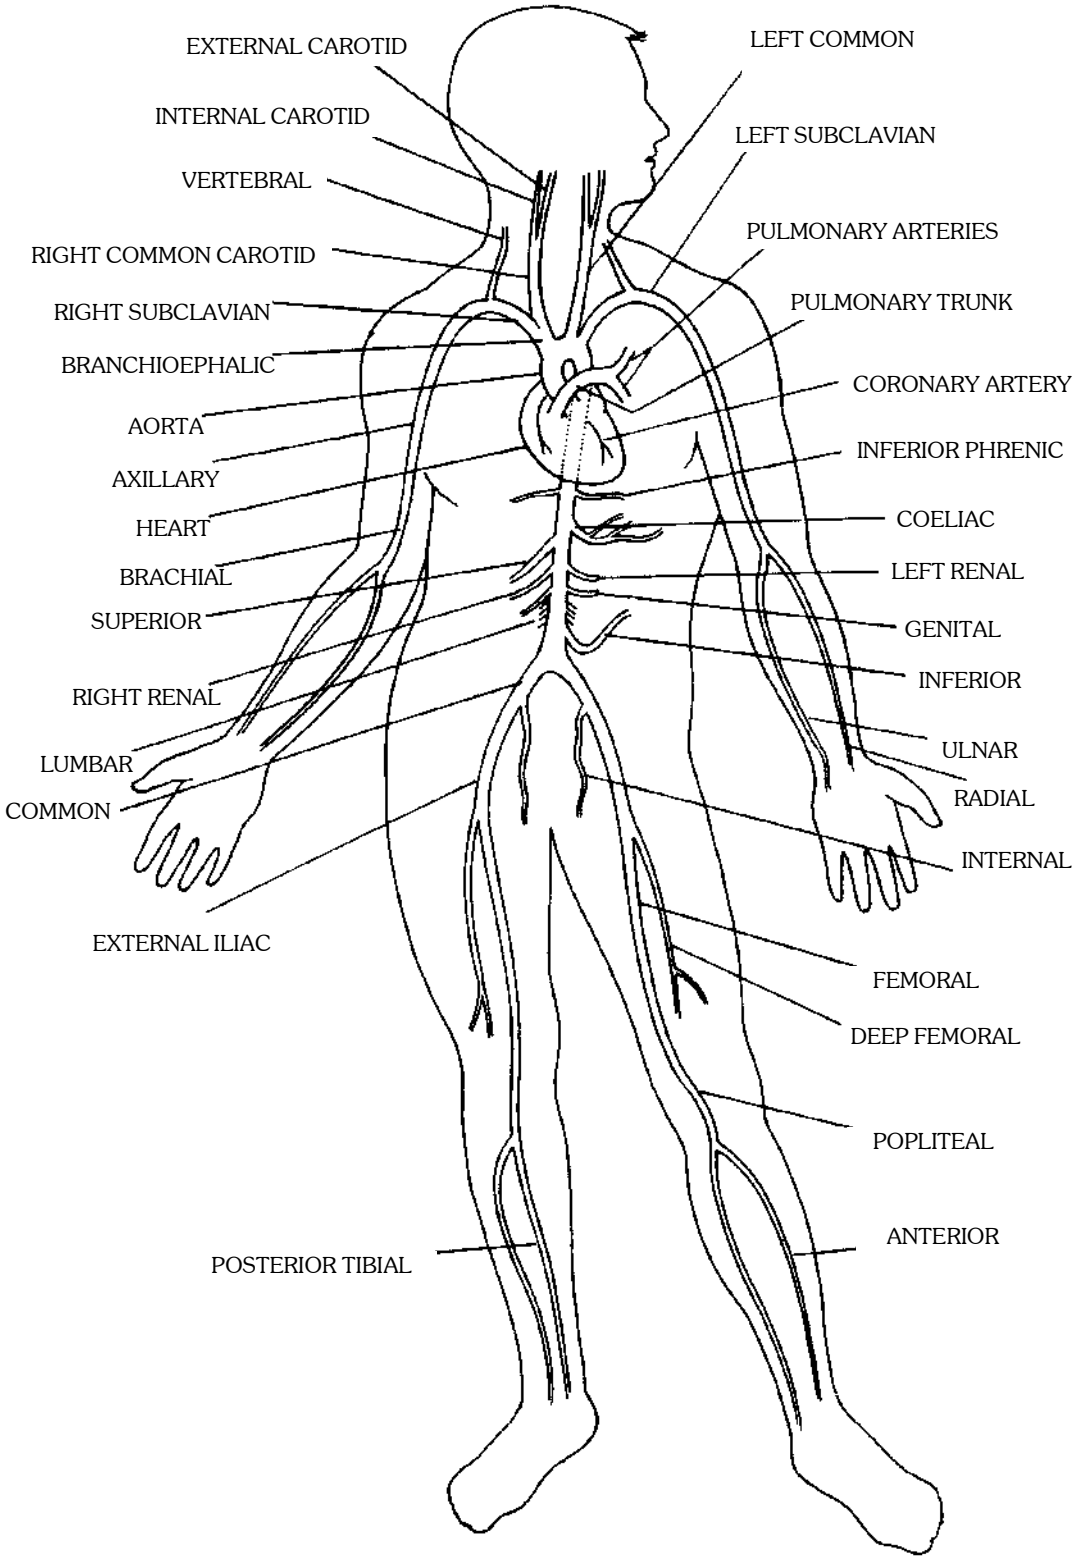


Fig. – Arterial system in human body

- **Arterial System :** It is blood vascular system which carries blood away from heart in thick walled muscular blood vessels called, arteries and systemic aora from left ventricle.

1. **Pulmonary artery or Arch.** It develops from left upper end of right ventricle. Pulmonary arch carries deoxygenated blood. Soon after coming out of heart, it divides into two pulmonary arteries, right and left. They carry deoxygenated blood to the lungs of their sides for oxygenation.

2. **Arch of Aorta [Carotico Systemic Arch].** It arises from right upper end of left venricle. Ascending aorta has a swelling at its base known a **aortic sinus.** Two **coronary arteries,** right and left, develop from it to suppply oxygenated blood to heart walls.

   Roughly 4% to 7% of the arterial blood passes into musculature of heart, though heart forms only 0.5% of the body weight. subclavians supply blood to fore limbs, chest and spinal cord. Common carotids provide oxygenated blood to brain, scalp, face, eyes, mouth, neck, etc.

   The descending aotra has two components, thoracic and abdominal. thoracic descending aorta gives off **intercostal** arteries to intercostal muscles, **bronchial** to lungs, **oesophageal** to oesophagus and **superior phrenic** to superior surface of diaphragm.

   Abdominal aorta gives out following branches.

(i) **Inferior phrenic** to the inferior surface of diaphragm.

(ii) **Coeliac artery** or **trunk** with lieno gastric branch which then divides into gastric & splenic branch, hepatic branch to liver and pancreatic to pancreas.

(iii) **Superior mesenteric** to small intestine.

(iv) Two **supra-renals** to adrenal glands

(v) Two **renals** to two kidneys.

(vi) Two **gonadals,** ovarian in case of females and testicular in case of males.

(vii) **Inferior mesenetric** to large intestine.

(viii) A few pairs of **lumbar arteries** to skin, muscles, vertebrae and other parts of lumbar region.

Adominal aorta now divides into two common **iliacs,** left and right, in the pelvic region. Each common iliac divides to form an external and an internal iliac. Internal iliac or hypogastric supplies blood to pelvic region External iliac passes into lower limb of its side.

- **Caudal artery -** In Rabbit the posterior most part of dorsal aorta enters into the tail in the form a single caudal artery after the common iliac arteries have already separated.

VENOUS SYSTEM IN MAN RABBIT

- **Heart Receives**

(1) One superior vena cava (Two in rabbit)

(2) One inferior vena cava

(3) Pulmonary veins

(4) Coronary veins through coronary sinus

[A] Superior vena Cava (Anterior) Receives

- Two (Rt. & Lt.) External jugular (Both connected by transverse jugular)
- Two internal jugular (Rt & Lt)
- Subclavian (Rt & Lt)
- Anterior intercostal (RT & Lt)
- Internal mammary (Rt & Lt)

  Azygous vein (RT. Side only)
- Hemiazygous vein (Lt. side only) opens in Azygous vein

[B] Inferior Vena cava I.V.C. (Posterior)

- Post Intercostal vein
- Hepatic portal (to liver)
- Gonadal
- Ext & Int. iliac
- Phrenic
- Renal
- ilio lumbar
- Veins from lower leg.

- **Venous System :**

It is system of blood vessels through which blood is received from different parts of the body to the heart. It consists of pulmonary veins, coronary sinus, superior vena cava, inferior vena cava and portal systems.

1. **PulmonaryVeins.** Each lung returns oxygenated blood to left atrium of heart through two pulmonary veins. total 4 veins open in the chamber of left atrium.
2. **Coronary Sinus.** It collects deoxygenated blood from different parts of the heart. Coronary sinus opens into right atrium.

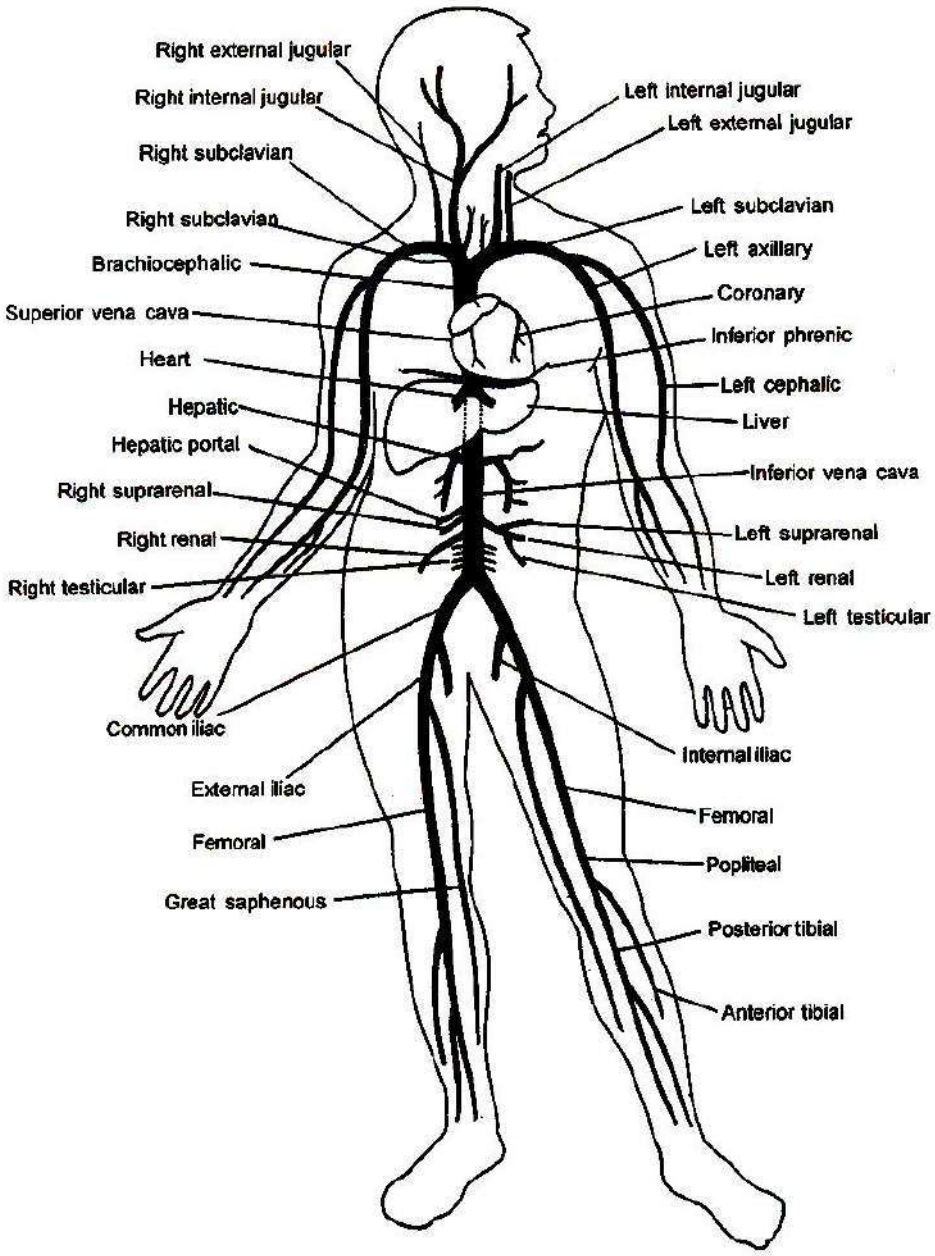

Fig. Venous System in Male Human Being

3. **Superior Vena Cava.** It drains deoxygenated blood from head, neck, upper, limbs and part of the chest. Superior vena cava is formed by two **brachiocephalic veins.** Each branchiocephalic vein is formed of a juglar vein from head and neck, a subclavian vein from upper limb and internal thoracic vein from part of chest. A small unpaired **azygos** vein from intercostal area joins superior vena cava before its opening into right atrium.
4. **Inferior vena Cava.** It is formed the pelvic region by the union of two common **iliac veins** from limbs and pelvic region, It proceeds towards upper part of the body receiving genital veins from gonads, lumbar veins from back of the lumbar region, renal veins form kidney. Suprarenal veins from adrenal glands, three hepatic veins from liver and inferior phrrenic veins from inferior face of the diaphgragm. Inferior vena cava opens into righ atrium.
5. **Azygous vein.** An axygous vein opens into precaval (SVC) just behind the anterior intercostal vein. A hemiazygous vein is present in the left sdie which opens into azygous vein through a transverse connection An accessory Hami Azygous vein also drains blood for left upper part into Azygous.
   Azygous and hemizygous veins carry blood from the muscles of posterior ribs and dorsal body wall through so many small branches.

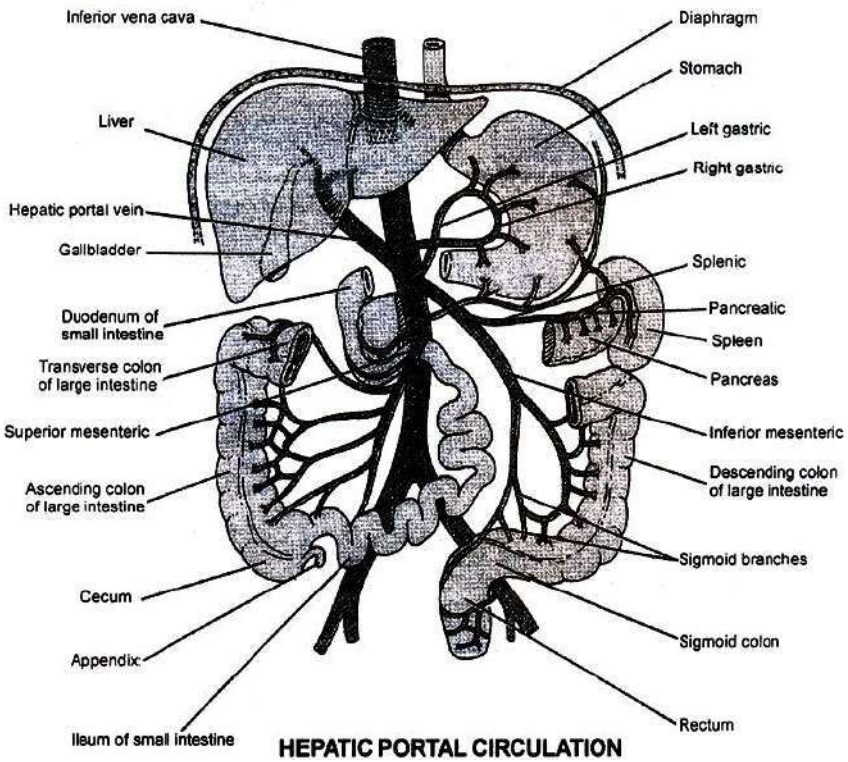
PORTAL SYSTEM

When the vein of any organ of the body does not open in the caval vein or heart but it divides into capillaries in any other organ and its blood is transported by vein of that other organs to the heart, then this type of system is termed as **portal system.**

- it is of following types -
  (i) Renal portal system
  (ii) Hepatic portal system
  (iii) Hypophysial portal system

(I) Renal portal system - Veins which collect blood from posterior parts of the body and legs combine to forms a renal portal vein. This vein goes into kidney and divides into capillaries. Kidneys separate nitrogenous wastes from this blood. This blood is now transported to the heart. It is present in frog

- In mammals, renal portal system is absent.
  In Frog both the portal systems; renal portal system and hepatic portal system are present.



HEPATIC PORTAL CIRCULATION

(II) Hepatic Portal System - It is a portal system which brings venous blood directly from digestive tract, spleen, pancreas and gall bladder to liver for extraction of nutrients and other metabolites by breaking up into single celled thick capillaries and sinusoids. Portal vein is about 8 cm long. It is formed by following veins.

(i) Splenic from spleen and Gastric from stomach which join to form lienogastric vein.

(ii) Superior mesenteric from small intestine, caecum, ascending and transverse parts of colon.

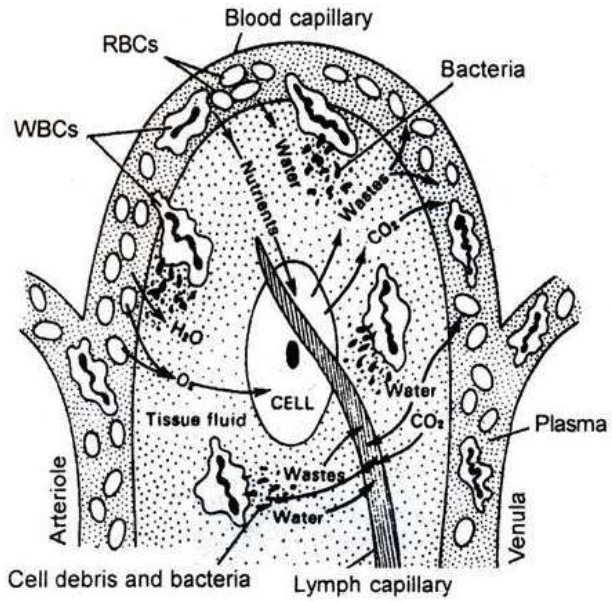
(iii) Inferior mesenteric from rectum, sigmoid and descending part of colon.

(iv) Cystic vein from gall bladder.

(v) Paraumbilical vein from abdominal wall. Hepatic portal vein branches.

The branches enter into different liver lobes. They divide and redivide. Ultimately branches of hepatic portal veins open into sinusoids for exchange of materials between portal blood and liver cells. Along with deoxygenatd blood of liver, portal blood is recollected by venules which form hepatic veins.

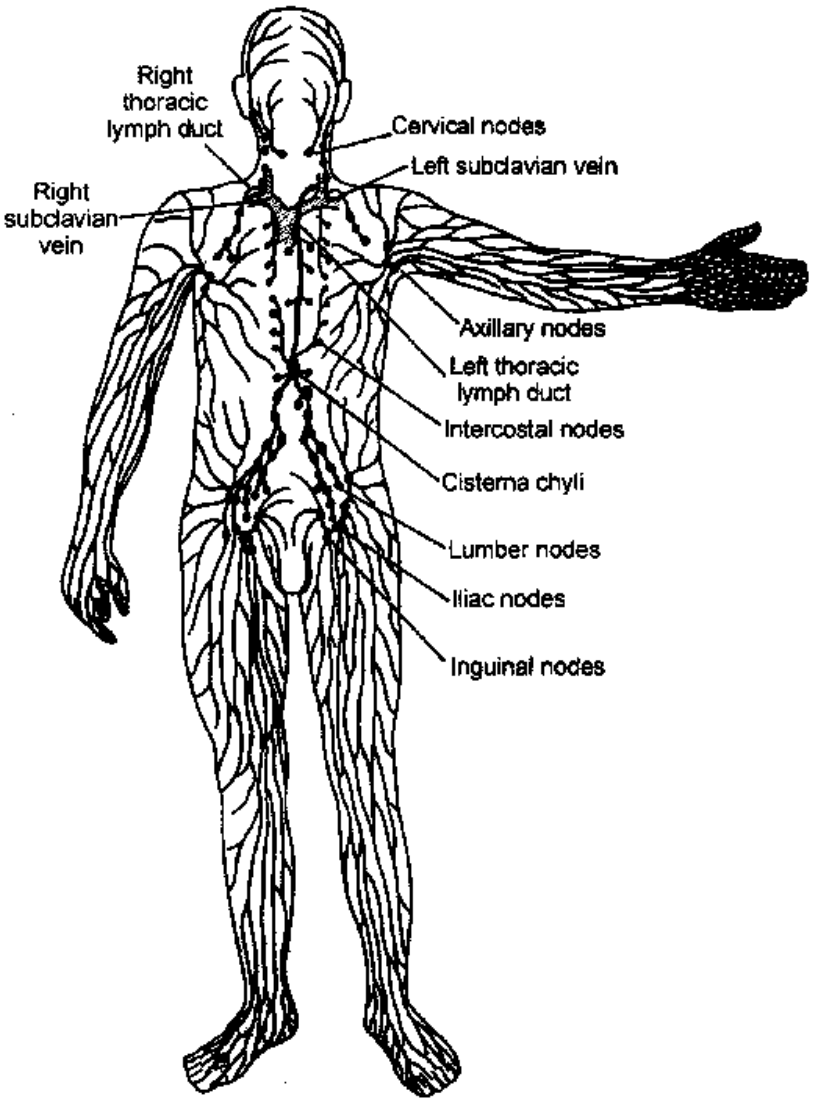
(III) Hypophysial Portal System - It is a portal system formed by a vein from hypothalamus which breaks up into capilliaries in hypophysis or pituitary gland. The vein is called **hypophysial portal vein.** It is formed by union of capillaries and venules in hypothalamus. The portal vein enters anterior lobe of pituitary gland or adenohypophysis where it breaks up into capillaries. Hypophysial portal system is a short circuit arrangement. Hypothalamus produces a number or hormones for controlling endocrine activity of adenohypophysis. They are pored into blood in hypothalamus. The same is directly drained by hypophysial portal vein into adenohypophysis.



Chemical exchange between blood, tissue fluid and tissue cells

- **Lymphatic Circulatory System -** Here a different kind of circulating fluid (lymph) transferres CO_2 and waste products from the interstitial spaces to the veins through lymph vessels. This fluid is derived from filteration of blood in the capillaries. It is devoid of RBC's. The lymph vessels originte from lymph capillaries and end either in the vein or a main big lymph vessels called thoracic duct. This fluid is propelled from the interstitial space to the veins ultimately due to pressure differences.
- **The Lymph :** From arteriolar regions of capillaries, about 90 percent fluid is returned back into their venous regions. To drain back the remaining ten percent of the filterd out fluid, vertebrates possess an additional independent system of pipelines, called **lymphatic system.** This system begins in tissue fluid

with lymphatic capillaries which are always terminally closed. These capillaries occur extensively in between the blood capillaries in various body parts except in skin epidermis, hair follicles, cornea of eyes, most cartilages, brain, spinal cord, spleen and bone marrow. The cavity of **lymph capillaries** is wider and irregular. Their wall is thinner than that of blood capillaries, but its pores are so much larger as to allow entrance of even bacteria, cell debris and proteins and other larger colloid particles. The fluid that flows into these capillaris from the interstituium is called **lymph.**



Lymphatic system of mammals shown in man (ventral view)

Arteries divide into blood capillaries inside the tissue. These capillaries combine to form a vein at the other end. These veins carry impure blood from tissue. Blood presssure is more at the side of arteriole side of blood capillaries. it is approximately 40 mm Hg. Colloidal osmotic pressure of blood is 28 mm Hg. Thus net filteration pressure of blood in this region remains only 12 mm Hg column. In this region blood is filtered is called tissue fluid. There are present plasma WBCs, O_2 and nutrients in tissue fluid.

- The systemic venous pressure is as low as 15 mm Hg, while colloid osmotic pressure here remains 28 mm Hg. Hence due to a negative pressure (– 13 mm Hg) the lymph is poured from lymphatics into the veins.
- W.B.Cs. and plasma are found in lymph but R.B.Cs. and platelets are absent from lymph.

- Lymph forms second dcirculatroy system in the body. Lymphatic system is also known as helping circulatory system.
- Clotting capacity is present in lymph but its clotting takes more time as compared to blood.

Differences between lymph and blood

Blood	Lymph
1. It forms circulatory system.	1. It forms lymphatic system.
2. R.B.Cs. present	2. R.B.Cs. absent
3. Neutrophills more	3. Lymphcytes in largest amount
4. Soluble proteins in large amount but insoluble proteins in small amount.	4. Soluble proteins in small amount but in soluble insoluble proteins in large amount.
5. O_2 & nutrients in large amount but CO_2 very less.	5. O_2 & nutrients in small amount CO_2 in large amount.
6. It is of red colour.	6. It is of colourless, just like water.

LYMPH VESSELS

- Lymph capllaries combine together to form lymph vessels in rabbit/man
- Lymph vessels are like veins in structure. Their wall is comparatively thin. One way semilunar valves are present in these vessels which open towards heart; valves are more in number than veins
- Lymph vessels combine to from two bigger vessels, these are left thoracic lymph duct and right thoracic lymph duct.

– **Right thoracic lymph duct** is some what smaller lymph vessels of head, neck, right part of thorax and right hand open into it. It (right duct) opens into right sub clavian vein.

– **Left thoracic lymph duct** (Largest lymph vessel of body) is made up of lymph vessels of head, neck left part of thorax, left anterior limb and both the hind limbs, alimentary canal, some parts of thorax and abdomen.

- This duct is connected by a structure called **cisterna chyli** just behind the diaphragm in abdominal cavity. Left thoracic duct opens in left sub-clavian vein at its anterior side.
- Lymphatic capillaries of intestinal villi are called **lacteals.**Their lymph is milky in colour due to the absorbed fat from the intestine. It is called **chyle.** This chyle drains into cisterna chyli.

– **Lymphoid organs and lymph nodes** - lymphoid organs made up of lymph tissue are present in lymphatic system, which are relatedd to lymph capillaries and lymph vessles. Lymph nodes, spleen, thymus, patches of payer, tonsil etc. are such type of organs.

(a) Lymph node - At places many lymphatics may intersect with each other forming a knob or node like structure called the lymph node. The vessels entering the lymph node carrying lymph from the interstitial space are called *afferent lymphatics*. The lymphatic leaving the lymph node and draining the lymph in veins or thoracic duct is called *efferent lymphatic*.

The lymph node thus acts as a filter apparatus which filter the lymph coming from the interstitial space and remove cellular debris etc. from it.

- Other functions of lymph nodes are as follows -

1. These form lymphocytes and pour into lymph.
2. Filter and clean the lymph.
3. Synthesize the antibodies.
4. Destroy bacteria and other harmful substance by feeding upon (phagocytize) them

- Lymph nodes are present in all parts of body, but their number is comparatively more in armpits of hand legs. groins, neck and abdomen. Their number is much more in neck region.

SPLEEN ::

Lymph glands includes spleen and thymus.

Spleen Structure

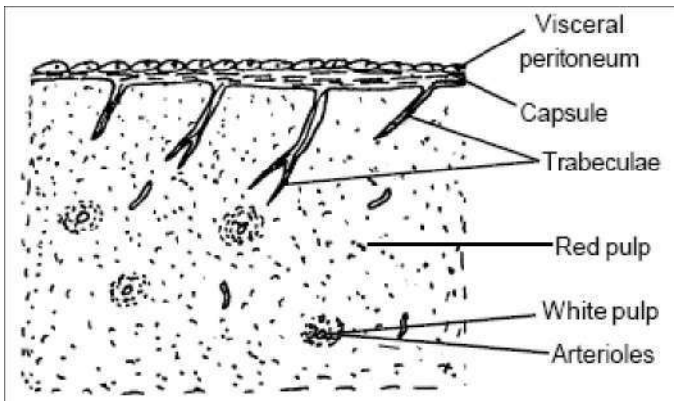


Fig. A part of T. S. of Spleen

(i) Spleen is dark red elongated structure lying behind the human stomach.
(ii) It is covered by sheath, called capsule, capsule is composed of white fibrous connective tissue.
(iii) Capsule further remain covered by **visceral peritoneum**.
(iv) The capsules are inserted deep in the body of spleen in the form of strands which is called **trabeculae**.
(v) Red and white pulp are found in spleen these are known as **splenic pulp**.
(vi) In the red pulp **cord of Biltroth** are found, which are blood spaces forming red pulp.
(vii) The spleen also contain **macrophages**.

Functions

(i) Phagocytic cells macrophages are present in the spleen which engulf foreign bodies and bacteria. More over lymphocytes of the spleen also produce antibodies.
(ii) In embryo (foetus) it produces erythrocytes and lymphocytes.
(iii) Spleen is 1st reservior blood, so it is called **blood bank**.
(iv) Spleen produces lymph.
(v) Spleen also stores iron.
(vi) Spleen is filter apparatus for blood. It filter out the old, weak and disintegrating erythrocytes from the blood stream.

Due to this speciality spleen is called as the **graveyard of RBC**.

General information related with spleen

(i) Spleen is lymphoid gland.
(ii) It is mesodermal in origin.
(iii) It is largest lymph gland.
(iv) Spleen increase in size during malaria fever due to increased number of lymphocytes and dead RBC.

Note :

Tonsil is also lymphoid tissue. Lymphoid tissue is also found in peyer's patches and vermiform **appendix**.

IMPORTANT POINTS

- Lymphatic system in class amphibia is of open type.
- Lymph sinuses are the large spaces containing lymph. These are present in frog but absent in mammals.
- Lymph heart - The heart which collects lymph.
- In frog, lymph hearts are two pairs - an anterior pair and a posterior pair which collect lymph from respective regions. There are no lymph hearts in mammals.
- The process of lymph formation is called Transudation.
- Lymph serves to return the interstitial fluid to the blood.
- Oedema (Edema) or Dropsy - A local swelling due to the accumulation of tissue fluid in tissues caused by the defective circulation of blood or lymph.
- Lymph nodes are secondary lymphatic organs because they harbour lymphocytes. Primary lymphoid organs are bone marrow and thymus.
- Lymph nodes are maximum in armpits and groin.
- Spleen is called "first reservoir" of blood while liver is called "second reservoir" of blood.
- Spleen, liver and kidneys - all are called filter apparatus of blood.
- Diseasess where there is more destruction of RBCs such as malaria, banti disease, there is enlargement of spleen called as splenomegaly.
- Thymus is concerned with the immunological reactions.
- In AIDS, there occurs generalised swelling of all lymph nodes.
- Spleen is absent in cyclostomes.
- **Cardiology -** Study of heart.
- **Pericarditis -** Inflammation of pericardium.
- **Endocarditis -** Inflammation of endocardium, generally caused due to the rheumatic fever.
- **Frank-Starling law -** Within certain physiological limits, the heart pumps all the blood that comes in it.
- Largest sized heart is found in Blue whale.
- Papillary muscles of ventricles are found only in the heart of mammals.
- Valves in heart were first reported by Fabricious.
- World's first heart transplant was performed by Dr. Christian Barnard on 55-year old Louis Wash kansky in Cape town, South Africa in the year 1967.
- India's first heart transplant was conducted by cardiac surgeon Dr. P. Venu Gopal in a 42-year old man Mr. Devi Ram on 3rd August, 1994 at AIIMS, Delhi.
- **Cardiomegaly -** Enlargement of heart.
- **Myocardial Ischaemia -** Deficient blood supply to heart muscle leading to angina pectoris.
- **Angina pectoris -** Severe but temporary heart pain of short duration which is usually felt in front of the chest and may pass into the arms.
- **Coronary thrombosis -** Formation of blood clot in coronary arteries of heart causing death of tissue and leading to heart attack or MI.
- **Coronary sclerosis -** Narrowing of coronary arteries leading to severe chest pain (Angina pectoris).
- **Rheumatic heart Disease (RHD) -** Defects in heart valve due to toxins produced by throat infection caused by streptococcus leading to rheumatic fever.
- **Coronary angiography -** X-ray of the arteries, supplying the heart, after injecting them with radio-opaque material.

EXERCISE - 1

1. Poikilothermic (cold blooded) or exothermic animals are those in which
(1) Body freezes
(2) Body temperature remains constant
(3) Body temp. changes according to sur roundings
(4) None of the above

2. An open circulatory system occurs in
(1) Man (2) Reptiles
(3) Animals (4) Insects

3. William Harvey is known for the discovery of
(1) Blood transfusion
(2) Blood clotting
(3) Blood circulation
(4) Blood purification

4. The blood vascular system of mammals is known as double vascular system because
(1) A group of veins carry oxygenated and other group conduct deoxygenated blood
(2) Oxygenated blood runs from heart to different organs by one set of veins while deoxygenated blood runs from heart to lung by another set
(3) The two different systems never meet
(4) All of the above

5. Which one of the following does not have an open circulatory system
(1) Chelone (2) Cockroach
(3) Frog's tadpole (4) (1) and (2) both

6. Mammals are said to have a "double circulatory system". This means
(1) That the blood vessels are paired
(2) That there are two types of blood vessels attached to every organ; an artery and a vein
(3) That there are two system; one from the heart to the lungs and back to the heart and other to and from rest of the body
(4) That the blood circulates twice as quickly

7. The heart of fish is different from the other group because
(1) It has lymph only
(2) It pumps only arterial blood
(3) It pumps only venous blood
(4) It pumps only lymph

8. The heart of a crocodile consists of
(1) A single auricle and two ventricles
(2) Two auricles and a single ventricle
(3) Two auricles and two ventricles
(4) A single auricle and a single ventricle

9. Open vascular system is found in
(1) Man (2) Fish
(3) Prawn (4) Snake

10. In amphibia, the heart has
(1) Two auricles and two ventricle
(2) Two auricles and one ventricle
(3) One auricle and two ventricles
(4) One auricle and one ventricle

11. Single circuit circulatory system is characteristic of
(1) Fishes (2) Amphibians
(3) Aves (4) Mammals

12. Double circuit circulation is seen in
(1) Humans and rabbit
(2) Pigeon and rat
(3) Lizard and crocodile
(4) All of the above

13. In the evolution of animals a heart to pump the blood is found for the first time in
(1) Annelids (2) Roundworms
(3) Arthropods (4) Flat worms

14. Regarding blood circulation, it may be said that in Pheretima the dorsal vessel is a
(1) Collecting vessel in first two segments and distributing vessel in other
(2) Distributing vessel in first five segments and collecting vessel in other
(3) Collecting vessel in first thirteen segments & distributing vessel in intestinal region
(4) Distributing vessel in first thirteen segments & collecting vessel in intestinal region

15. Identify the animal which has neurogenic heart
(1) Rat (2) Rabbit
(3) Hamster (4) Periplaneta

16. Which of the following has myogenic heart
(1) Frog (2) Humans
(3) Rabbit (4) All of the above

17. Which of the following chordata does not have a heart
(1) Petromyzon (2) Lung fishes
(3) Branchiostoma (4) Herdmania

18. Heart beat can be recorded and displayed as
(1) ECG (2) EEG
(3) ERG (4) EMG

19. Innervation of heart in the intact animals is primarily meant for
(1) Initiation of heart beat
(2) Regulation of heart beat
(3) Release of acetylcholine only
(4) Release of adrenalin only

20. Purkinje's fibres are special types of
(1) Muscle fibres located in heart
(2) Nerve fibres located in cerebrum
(3) Connective tissue fibres joining one bone to another bone
(4) Sensory fibres extending from retina into optic nerve

21. Identify the cardiac inhibitor
(1) Y-aminobutyric acid
(2) 5' Hydroxytryptamine
(3) Adrenaline (4) Acetylcholine

22. Identify the wrong statement
(1) The arterial and venous pressure of blood constitutes the blood pressure
(2) Defective heart valve are the cause of heart murmur
(3) When the semilunar valves close the DUP sound is produced
(4) Contraction of right ventricle pumps blood into pulmonary vein

23. Identify the correct statement
(1) The lubb-dup sound of heart beat is due to closure of mitral-tricuspsid valve followed by semilunar valve
(2) The passage of blood from post caval to diastolic right auricle is due to gravity
(3) One heart beat in man lasts for 0.2 sec.
(4) Pulmonary artery originates from left ventricle

24. Regulation of heart beat in mammals is due to
(1) The volume of blood in the circulatory system
(2) The presence of excess of oxygen in blood
(3) The presence of thyroxine in blood
(4) The presence of pacemaker in the heart

25. Purkinje's fibres of the vertebrate heart are modified
(1) Parasympathetic nerves
(2) Sympathetic nerves
(3) Motor nerves (4) Muscle cells

26. The nerve like modified muscle in the right auricle is known as
(1) Lymph node
(2) Atrio-ventricular node
(3) Pacemaker
(4) Bulbus arteriosus

27. Pace maker of the heart is
(1) S.A. node (2) A.V. node
(3) A.V. septum (4) I.A. septum

28. The first heart sound is
(1) 'Lubb' sound at the end of systole
(2) 'Dub' sound at the end of systole
(3) 'Lubb' sound at the beginning of systole
(4) 'Dub' sound at the beginning of systole

29. How many times does the heart of humans beat per minute
(1) 80 (2) 120
(3) 72 (4) 60

30. The heart of a healthy man beats normally per minute
(1) 60-70 times (2) 70-80 times
(3) 80-90 times (4) 85-95 times

31. Heart beat can be initiated by
(1) Sinu-auricular node
(2) Sinu-ventricular node
(3) Sodium ion
(4) Purkinje's fibres

32. Which one is the correct route through which pulse making impulse travels in the heart
(1) SA node $\rightarrow$ Purkinje fibres $\rightarrow$ Bundle of His $\rightarrow$ AV node $\rightarrow$ Heart muscles
(2) AV node $\rightarrow$ SA node $\rightarrow$ Purkinje fibres $\rightarrow$ Bundle of His $\rightarrow$ Heart muscles
(3) AV node $\rightarrow$ Bundle of His $\rightarrow$ SA node $\rightarrow$ Purkinje fibres $\rightarrow$ Heart muscles
(4) SA node $\rightarrow$ AV node $\rightarrow$ Bundle of His $\rightarrow$ Purkinje fibres $\rightarrow$ Heart muscles

33. The rate of heart beat per minute is highest in case of
(1) Elephant (2) Whale
(3) Man (4) Mouse

34. The viscosity of blood is important in maintaining
(1) Acid-base balance
(2) Diastolic blood pressure
(3) Systolic blood pressure
(4) Osmotic pressure

35. Regulation of heart beat in mammals is due to
(1) Presence of excess of oxygen in blood
(2) The presence of pacemaker in the heart
(3) The presence of thyroxin in blood
(4) The volume of blood in the circulatory system

36. Pace maker of the heart is situated
(1) In wall of right atrium close to eusta chian valve
(2) On intra-auricular septum
(3) On inter-venticular septum
(4) In wall of left atrium close to the open ing of pulmonary veins

37. Stimulation of the vagus nerve will make the heart beat
(1) Faster (2) 70 times/minute
(3) Slower (4) Normal

38. During systole
(1) Auricles and ventricles contract simultaneously
(2) Auricles and ventricles contract separately
(3) Only auricles contract
(4) Only ventricles contract

39. What is the maximum efficiency of heart
(1) 10 - 15 % (2) 20 - 25 %
(3) 40 - 60 % (4) 100 %

40. Blood leaving and moving to heart has higher concentration of
(1) Glucose (2) Urea
(3) Bile (4) Erythrocytes

41. If the vagus branch of frog is stimulated, the heart will show
(1) Stoppage of heart beat
(2) Decreased heart beat
(3) Increased heart beat
(4) No change

42. Artificial pace maker is transplanted in
(1) Inter ventricular septum
(2) Below the collar bone
(3) Inter auricular septum
(4) Right auricle

43. The rate of heart beat is controlled by
(1) CNS (2) SN
(3) CN
(4) Autonomic nervous system

44. Bundle of HIS is found in
(1) Muscles (2) Brain
(3) Heart (4) Liver

45. In rabbit oxygenated blood flows from
(1) Left auricle to left ventricle during auricular systole
(2) Right auricle to right ventricle during ventricular systole
(3) Right ventricle to aorta during ventricular systole
(4) Pulmonary vein to left auricle during auricular systole

46. Systole refers to the contraction of
(1) SA node (2) AV node
(3) Major arteries (4) Atria and ventricles

47. Heart beat is initiated by
(1) AV node (2) SA node
(3) Purkinje fibres (4) Papillary muscles

48. Impulse originating from sinu-atrial node are transmitted to the
(1) Atrio-ventricular node
(2) Bundle of His
(3) Pacemaker (4) Purkinje system

49. Heart beats are controlled by a nodal tissue which is composed of
(1) Purkinje fibres (2) Myonemes
(3) Collagen fibres (4) Telodendrites

50. During diastole
(1) Blood enters lungs
(2) Blood leaves the ventricle
(3) Blood leaves the heart
(4) Blood enters the heart

51. During systole of ventricle
(1) Blood enters the heart
(2) Blood leaves the heart
(3) Blood leaves the ventricle
(4) Blood enters lungs

52. Acetylcholine is secreted by
(1) Adrenal cortex (2) Adrenal medulla
(3) Parasympathetic neuron
(4) Sympathetic neuron

53. Heart beat originates from
(1) Pacemaker (2) Cardiac muscles
(3) Left atrium (4) Right ventricle

54. Heart beat of humans is controlled by
(1) Sympathetic and parasympathetic ner vous system
(2) Medullary hormones
(3) Hypothalamus (4) (1) and (2)

55. Which one of the following is a matching pair
(1) Lubb - sharp closure of AV valves at the beginning of ventricular systole
(2) Dupp - sudden opening of semilunar valves at the beginning of ventricular diastole
(3) Pulsation of the radial artery-valves in the blood vessels
(4) Initiation of the hear beat Purkinje fibres

56. First heart sound occurs at
(1) Opening of semilunar valve
(2) Closing of semilunar valve
(3) Onset of auricular systole
(4) Sudden closure of A.V. valves

57. The pace-setter in the heart is called
(1) Purkinje fibres
(2) Sino-aterial node (SAN)
(3) Papillary muscle
(4) Atrio-ventricular node (AVN)

58. Apex beat of heart is synchronous with
(1) First sound (2) Second sound
(3) Third sound (4) Fourth sound

59. The typical Lubb-Dup sounds heard in the heart beat of a healthy person are due to
(1) Closing of the tricuspid and bicuspid value
(2) Blood flow through the aorta
(3) Closing of the tricuspid and semilunar valves
(4) Closing of the semilunar valves

60. If heart of a mammal was injected with 2% solution, then
(1) Heart beat will increase
(2) Heart beat will decrease
(3) Heart beat will stop
(4) No effect

61. The auriculo-ventricular node in human heart was discovered by
(1) Hiss (2) Loewis
(3) Ringer (4) William Harvey

62. The murmuring sound in heart takes place due to
(1) The defective and leaking valve
(2) The thrombosis in coronary artery
(3) Defect in SA node
(4) The arterial pulse

63. The beating of heart of man is heared on the left side because
(1) The left ventricle is towards the left side
(2) Both the ventricles are towards the left side
(3) Entire heart is on the left side
(4) The aorta is on the left side

64. The cardiac output of human heart per min is
(1) 4320 ml (2) 5000 ml
(3) 1500 ml (4) 2000 ml

65. What is the volume of blood drained by heart in one ventricular stroke
(1) 1 ml (2) 800 ml
(3) 500 ml (4) 80 ml

66. In terms of heart function, epinephrine is antagonistic to
(1) Norepinephrine (2) Acetylcholine
(3) Dopamine (4) Prostaglandin

67. The heartbeat is regulated by
(1) Pacemaker (2) Vagus nerve
(3) Sympathetic nerve (4) All the above

68. Which of the animal has only deoxygenated blood in its heart
(1) Scoliodon (2) Rabbit
(3) Pigeon (4) Snake

69. Blood returns from lungs to heart through
(1) Right auricle (2) Right ventricle
(3) Left ventricle (4) Left auricle

70. In the heart of mammal the bicuspid valve is situated between
(1) Left auricle and left ventricle
(2) Post caval and right caval
(3) Right auricle and left auricle
(4) Right ventricle and pulmonary aorta

71. Nature of valves in the heart is
(1) Membranous (2) Muscular
(3) Tendinous (4) Ligamentous

72. Chordae tendinae are found in
(1) Ventricle of heart (2) Atria of heart
(3) Joints (4) Ventricle of brain

73. Covering of heart is called
(1) Pericardium (2) Peritoneum
(3) Perineurium (4) Periostium

74. The middle layer of heart is known as
(1) Endocardium (2) Pericardium
(3) Epicardium (4) Myocardium

75. Post caval in right auricle is guarded by
(1) Eustachian Valve (2) Bicuspid valve
(3) Tricuspid valve
(4) Atrio-ventricular valve

76. Tricuspid valve are present between
(1) Right auricle and right ventricle
(2) Sinous venosus and right auricle
(3) Left auricle and left ventricle
(4) Superior and inferior vena cava

77. Auricles of human heart contains
(1) Columnae carnae (2) Chordae tendenae
(3) Papillary muscles (4) Purkinje's fibres

78. Right auricle of mammalian heart receives blood from
(1) Sinus vinosus (2) Pulmonary veins
(3) Precavals (4) Pre and postcavals

79. During ventricular diastole
(1) The auricles relax (2) The heart contracts
(3) The heart pumps blood
(4) The ventricles relax

80. In rabbit, the four chambered heart promotes
(1) Double circulation
(2) Single circulation
(3) Systematic circulation
(4) Venous circulation

81. Trilobed valve present between right atrium and ventricle in mammalian heart is
(1) Triac (2) Triad
(3) Tricuspid or besian (4) Trigeminal

82. For reaching left side of heart, blood must pass through
(1) Liver (2) Kidneys
(3) Lungs (4) Brain

83. Which one of the statement is correct with reference to the circulation of blood in a mammal
(1) Left auricle receives oxygenated blood from the lungs
(2) Pulmonary artery returns oxygenated blood from the lungs to the left auricle
(3) Pulmonary vein carries venous blood from right auricle to lungs
(4) Venous blood is returned to the left auricle

84. Mixing up of arterial and venous blood does not take place in a heart having
(1) Two chambers (2) Four chambers
(3) Three chambers (4) None of the above

85. Tricuspid valve is present in
(1) Right auricle (2) Right ventricle
(3) Left ventricle (4) Left auricle

86. Mitral valve in mammals guards the opening between
(1) Stomach and intestine
(2) Pulmonary vein and left auricle
(3) Right auricle and right ventricle
(4) Left auricle and left ventricle

87. Tunica media of an elastic artery is made up of mainly
(1) Smooth muscle fibre
(2) Loose alveolar tissue
(3) Elastic fibres
(4) Collagen fibres

88. Which of the following statements is false

(1) Blood from the right side of the heart is carried to the lungs by the pulmonary artery

(2) The term 'pleura' refers the double layered covering of the kidney

(3) Pancreas is both an exocrine and endocrine gland

(4) Scurvy is caused by the deficiency of vitamin C

89. Histology of heart superficially shows the following structure except

(1) Endocardium (2) Cardiac muscle

(3) Fibrous pericardium

(4) Tunica intima

90. Cardiac muscle is composed of

(1) Striated, branched and voluntary muscle fibres

(2) Unstriated (smooth), spindle shaped and voluntary muscle fibres

(3) Unstriated (smooth), spindle shaped and involuntary muscle fibres

(4) Striated, branched and involuntary muscle fibres

91. How much of the total blood volume is present in heart

(1) 2.5 % (2) 17 %

(3) 9 % (4) 15 %

92. Bicuspid valve is also called as

(1) Mitral valve (2) Eustachean valve

(3) Pulmonary valve (4) Ventricular valve

93. Largest heart is found in

(1) Elephant (2) Giraffe

(3) Crocodile (4) Lion

94. Which of the following has the thickest wall

(1) Left auricle (2) Left ventricle

(3) Right auricle (4) Right ventricle

95. The blood returning to the heart from lungs via pulmonary vein has more

(1) RBC per ml of blood

(2) Haemoglobin per ml of blood

(3) Oxygen per ml of blood

(4) Nutrient per ml of blood

96. Which of the following structure is absent in rabbit's heart

(1) Left auricle (2) Left ventricle

(3) Sinus venosus (4) Pace maker

97. Heart of elephant is

(1) Neurogenic (2) Myogenic

(3) Both (1) and (2) (4) None of these

98. What is correct about sinus venosus

(1) It is situated on dorsal surface of rabbit heart

(2) It is situated ventrally in frog heart

(3) It sends blood to dorsal aorta

(4) It opens into right auricle

99. The wall of heart is made up of

(1) Epicardium (2) Myocardium

(3) Endocardium (4) All of the above

100. Pylangium is part of

(1) Truncus arteriosus (2) Left atrium

(3) Right atrium (4) Ventricles

101. The contraction of the heart of frog commences from

(1) Sinus venosus

(2) Right auricle

(3) Left auricle

(4) Interauricular septum

102. Heart is simple tubular and ventral in

(1) Urochordata (2) Cyclostomata

(3) Cephalochordata (4) Vertebrate

103. Valve of Thebesius occurs in the heart of

(1) Fish (2) Frog

(3) Rabbit (4) Chameleon

104. Heart of prawn carries

(1) Oxygenated blood

(2) Deoxygenated blood

(3) Mixed blood

(4) No blood

105. In frog's heart, there are muscular ridges which consist of fibres called

(1) Myonemes

(2) Purkinjee fibres

(3) Telodendria

(4) Columneae carnae

106. Even the ventricles of reptiles are partitioned but there is mixing of blood

(1) Due to common ejection and entrance of blood in lungs

(2) Auricles are non-separated

(3) Heart is partially four-chambered

(4) None of these

107. In the mammalian heart, ventricular filling of blood takes place due to

(1) Relaxation of right ventricle

(2) A higher blood pressure in right auricle

(3) Adequate blood in the right auricle (4) All the above actions

108. The thick muscular projections on the walls of the ventricle are called

(1) Chordae tendinae (2) Columnae carnae

(3) Conus arteriosus

(4) Truncus arteriosus

109. Atherosclerosis refers to the ailment of

(1) Lungs (2) Heart

(3) Kidney (4) Liver

110. Inter-auricular septum in the embryonic stages has a/an

(1) Fossa ovalis (2) Fenestra ovalis

(3) Fenestra rotunda

(4) Inter-auricular aperture

111. The sinu-auricular valve occurs

(1) In the sinus venosus

(2) In the edges of sinu-auricular aperture

(3) In the truncus arteriosus

(4) At the auriculo-ventricular aperture

112. The coronary sinus in the heart is situated along its

(1) Left margin (2) Right margin

(3) Diaphragmatic surface

(4) Lower boarder of the heart

113. Purkinje fibre is found in

(1) Conduction system of heart

(2) Brain

(3) Nephrons of kidneys

(4) Sensation of skin

114. Neurogenic heart is characteristic of

(1) Lower vertebrates (2) Humans

(3) Rat (4) Rabbit

115. Eustachian valve which is of no significance in the adult mammal, is a vestigial organ, a vestige of

(1) Spiral valve (2) Sinus venosus

(3) Sino-auricular valve

(4) Semilunar valve

116. Which is not true for cardiac muscles

(1) Presence of intercalated disc

(2) Striated nature

(3) Involuntary

(4) Voluntary

117. The pericardium and the pericardial fluid help in

(1) Protecting the heart from friction, shocks and keeps it moist

(2) Pumping the blood

(3) Receiving the blood from various parts of the body

(4) None of the above

118. The atrio-ventricular valves of the heart is prevented from turning inside out by tough strands of connective tissue is called as

(1) Tendinous cords (2) Tricuspid

(3) Pocket valve (4) Mitral valve

119. Wenckebach phenomenon is seen in

(1) Complete heart block

(2) Partial heart block

(3) Ventricular fibrillation

(4) Myocardial infarction

120. Since it is the sinu-auricular node which initiates the impulses the heart of mammal is called

(1) Cholinergic (2) Adrenergic

(3) Neurogenic (4) Myogenic

121. Which one of the following doctors performed the first heart transplant

(1) Hargovind Khorana

(2) Christian Bernard

(3) Watson (4) William Harvey

122. The tricuspid valve is present at the origin of

(1) Carotid arch (2) Pulmonary arch

(3) Truncus arteriosus (4) Systemic arch

123. Bicuspid and tricuspid valve are supported by

(1) Columnae carnae (2) Endocardium

(3) Chordae tendinae (4) Epicardium

124. What happens if the sympathetic nervous system is stimulated

(1) Heartbeat increases

(2) Cardiac output decreases

(3) Blood pressure is lowered

(4) Pulse becomes erratic and falls steadily

125. Sinus venosus is spread over

(1) Dorsal surface of the heart of frog

(2) Dorsal surface of the heart of rabbit

(3) Ventral surface of the heart of frog

(4) Ventral surface of the heart of rabbit

126. Right chamber of Atria have :

(1) Semilunar valve (2) Bundle of Hiss

(3) Cordiactendinae (4) S.A. Node

127. In India first successful heart transplant was performed at

(1) Escorts Hospital, New Delhi

(2) Apollo Hospital, Madras

(3) AIIMS, New Delhi

(4) Batra Hospital, New Delhi

128. First successful heart transplant was conducted by

(1) Dr. N. Trihan (2) Dr. Venugopal

(3) Dr. M.S. Mani (4) Dr. Gambhir

129. Foramen of panizzae is found in the heart of

(1) Frog (2) Pigeon

(3) Crocodile (4) Rabbit

130. What is not true about the pace maker

(1) It initiates and maintains heart beat at the rate of 72/min.

(2) It is present in the right auricle

(3) Its activity is modulated by various chemicals

(4) It is not a characteristic of myogenic heart

131. What is true about the pace maker present in human heart

(1) Initiates and regulates heart beat

(2) Increases cardiac output

(3) Is not affected by acetylcholine

(4) Does not respond to epinephrine

132. What is not true about human heart

(1) Myogenic

(2) Rhythmicity

(3) Heart beat initiated and controlled by SA node

(4) AV node modulate and dominate the activities of pace maker

133. AV node was discovered by

(1) Loewis (2) His

(3) Ringer (4) Harvey

134. Bundle of His is a network of

(1) Nerve fibres found throughout the heart

(2) Muscle fibres distributed throughout the heart walls

(3) Muscle fibres found only in the ventricle wall

(4) Nerve fibres distributed in ventricles

135. If the pace maker is absent

(1) Only auricles will contract

(2) Only ventricles will contract

(3) Cardiac muscles will contract in a coordinated manner

(4) Cardiac muscles will not contract in a coordinated manner

136. A pace maker is meant for

(1) Transplanting liver

(2) Transplanting heart

(3) Initiation of heart beats

(4) Regulation of blood flow

137. Identify the incorrectly matched pair

(1) Diastole - Phase of contraction of cardiac muscle

(2) Systole-Dilation phase of cardiac muscle

(3) Duration of cardiac cycle in humans 0.8 sec.

(4) Haemoglobin - Respiratory pigment

138. QRST is related with
(1) Ventricular contraction or depolarization
(2) Auricular contraction
(3) Auricular relaxation
(4) Cardiac cycle

139. In an ECG, QRS wave represent
(1) Activity of pace setter
(2) Auricular relaxation
(3) Ventricular contraction
(4) Ventricular relaxation

140. In an old man's ECG, T-waves shall be
(1) Flat (2) Inverted
(3) Very prominent (4) Same as in adults

141. Although much CO_2 is carried in the blood, yet blood does not becomes acidic. This is because
(1) In CO_2 transport, blood buffers play an important role
(2) CO_2 combines with water to form H_2CO_3 which is neutralised by
(3) CO_2 is continuously diffused through the tissues and is not allowed to accumulate
(4) CO_2 is absorbed by leucocytes

142. What is the end diastolic volume of blood in a normal adult heart
(1) 50 ml (2) 70 ml
(3) 90 ml (4) 110 ml

143. Which of the following cardiac effects can be observed if the potassium concentration is increased two to three times the normal value
(1) Weakness of heart (2) Abnormal rhythm
(3) Death (4) All the above

144. In all the leads of ECG, all following are positive waves except
(1) P (2) Q
(3) R (4) T

145. Which of the following is a repolarization wave
(1) P (2) T
(3) QRS (4) None of these

146. ECG records
(1) Electric current of the body
(2) Potential differences
(3) Pulse rate
(4) Quantity of blood pumped per minute

147. Sinu-atrial node is innervated by branches of
(1) V cranial nerve (2) X cranial nerve
(3) IX cranial nerve (4) VI cranial nerve

148. A man will be unconscious if the blood supply to the brain is stopped for more than
(1) 2 second (2) 5 second
(3) 10 second (4) 30 second

149. The blood pressure is high in
(1) Arteries (2) Veins
(3) Capillaries
(4) Veins of portal system

150. Fall in blood pressure due to loss of blood is soon restored because the
(1) Blood vessels dilate
(2) Blood cells decrease in number
(3) Heart beat is increased
(4) Heart beat is decreased

151. Serotonin in the blood
(1) Relaxes blood vessels
(2) Prevents clotting of blood
(3) Helps in clotting of blood
(4) Constricts blood vessels

152. Systolic pressure is higher than diastolic pressure because
(1) Arteries are contracting during systole
(2) Blood is pumped with a pressure in the arteries by the heart during systole but not during diastole.
(3) Arteries resist during systole only
(4) Volume of blood is higher in systole than that of diastole in the heart

153. In several vertebrates the rate of heart beat and increase in blood pressure is caused by a hormone
(1) Thyroxin (2) Secretin
(3) Noradrenalin (4) Adrenalin

154. In man, blood passes from the post caval into the diastolic right atrium of the heart because of
(1) Pushing of venous valves
(2) Suction pull
(3) Beating of S.A. node
(4) Pressure between post caval and atrium

155. Sphygmomanometer measure
(1) Nerve conduction rate
(2) Heart beat rate
(3) Blood pressure (4) Pulse rate

156. Renin is released by the kidney when the arterial blood pressure
(1) Gets elevated (2) Becomes low
(3) Remains constant (4) Becomes high

157. Cardiac output signifies
(1) The amount of blood entering the heart per unit time
(2) The amount of blood entering the lung per unit time
(3) The amount of blood leaving the heart per unit time
(4) The amount of blood leaving the lung per unit time

158. Normal diastolic pressure in young man is about
(1) 20 mm Hg (2) 80 mm Hg
(3) 110 mm Hg (4) 130 mm Hg

159. How much arterial pressure rises during arterial contraction (mm Hg)
(1) 2 – 4 (2) 4 – 6
(3) 6 – 8 (4) Does not rise at all

160. If glucose is to be injected in human blood, the property to be matched with glucose is
(1) Density (2) Viscosity
(3) Osmotic potential (4) Sugar group

161. For the diffusion to take place effectively in capillaries the blood stays there for how long
(1) 1 - 3 second (2) 5 - 9 second
(3) 9 - 13 second (4) > 20 second

162. Heart rate is increased by all the following except
(1) Anoxia
(2) Moderate excess
(3) Elevated body temperature
(4) Increased intracranial pressure

EXERCISE - 2

Q.1 All arteries carry oxygenated blood except
(1) Systemic (2) Hepatic
(3) Pulmonary (4) Cardiac

Q.2 Heart beat in vertebrates is –
(1) Neurogenic (2) Myogenic
(3) Both (4) None

Q.3 Rate of heart beat in frog is –
(1) 72 times per minutes
(2) 75 times per minutes
(3) 50 times per minutes
(4) 64 times per minutes

Q.4 Single heart circuit occurs in –
(1) Fishes (2) Frog
(3) Reptiles (4) Man

Q.5 Which of these has a closed type of circulatory system –
(1) Cockroach (2) Fish
(3) Mollusca (4) Scorpion

Q.6 Pain in heart muscle is–
(1) Angina
(2) Angina pericardius
(3) Angina pectoris
(4) None

Q.7 Heart of frog differs from that of rabbit by presence of –
(1) Sinus venosus (2) Four chambers
(3) Mitral valve (4) Two aortae

Q.8 Study of blood circulation system is called–
(1) Angiology (2) Cardiology
(3) Haematology (4) Osteology

Q.9 Father of Angiology is–
(1) William Harvey
(2) Batson
(3) Marsello Malpighi
(4) Landsteinar

Q.10 'Vasa Vasorum' refers to–
(1) Jugular anastomosis
(2) A netwatk of blood vessels in an organ
(3) 'Vessels of vessels' nutritive in function
(4) Carotid labyrinth regulating pressure of blood vessels

Q.11 Coronary artery supplies blood to–
(1) Mammary glands (2) Ribmuscles
(3) Skin (4) Heart

Q.12 When there is a sudden loss of blood from the body the organ which supplies blood is–
(1) Spleen (2) Heart
(3) Liver (4) Lungs

Q.13 The blood vascular system of rabbit is–
(1) Open type (2) Closed type
(3) Semi closed type (4) Semi open type

Q.14 Carotico-systemic arch aries from–
(1) Right auricle (2) Right ventricle
(3) Left auricle (4) Left ventricle

Q.15 The colour of lymph is–
(1)White (2) Pale yellow
(3) Colourless (4) Milky

Q.16 Lymph node in man are found abundantly in–
(1) Fingers (2) Neck
(3) Arms (4) Legs

Q.17 Coagulation of lymph is–
(1) Faster than blood
(2) Not possible
(3) Slower than blood
(4) A passive process

Q.18 An artery can be distinguised from a vein in having
(1) Thicker wall (2) Lesser lumen
(3) No valves (4) All of the above

Q.19 The most important center of lymph formation is–

(1) Liver (2) Spleen

(3) Bone marrow (4) Mucosa of ieum

Q.20 The renal portal system of vertebrates is significant for–

(1) Elimination of excess fats by kidneys

(2) Removing nitrogenous wastes in kidneys

(3) Sypplying food to the kidneys

(4) Draining blood from the kidney

Q.21 The spleen of rabbit serves to–

(1) Generate all blood cells in early foetal life

(2) Produce lymphocytes, monocytes and antibodies in adult stage

(3) Acts as blood bank for the peiod of emergency and control blood volume in adults

(4) All of the above

Q.22 The wall fo Rabbit's heart is thick due to presence of –

(1) Inner layer endocardin

(2) Middle layer mycardium

(3) Outer most layer paricardium

(4) Outer layer epicardium

Q.23 Removal of which organ will have least effect in an adult Rabbit–

(1) Spleen (2) Liver

(3) Pancreas (4) Pituitary

Q.24 The pulmonary aorta aries from–

(1) Left ventricle (2) Right ventricle

(3) Left auricle (4) Right auricle

Q.25 Contraction of heart is called–

(1) Peristalsis

(2) Systole

(3) Diastole

(4) Voluntary contraction

Q.26 Mitral valve is the other name of–

(1) Valve found in venacava

(2) Valve found at the base of dorsal aorta

(3) Tricuspid valve

(4) Bicuspid valve

Q.27 Thebesian valve guards–

(1) Coronary sinuns

(2) Bases of pulmonary veins

(3) Opening between right auricle & right ventricle

(4) Opening between left auricle and left ventricle

Q.28 The rate of heart beat in a Rabbit is nearly–

(1) 92 per minute (2) 100 per minute

(3) 72 per minute (4) 200 per minute

Q.29 Bundle of His originates from–

(1) Sinu-auricular node

(2) Auriculo-ventricular node

(3) Pulmonary aorta

(4) Systemic aorta

Q.30 The small oval depression found on inter auricular septum in adult Rabbit is termed–

(1) Foramen ovale

(2) Fossa ovalis

(3) Foramen of monro

(4) Foramen of magnum

Q.31 Purkinje fibres mainly help in contraction of–

(1) Right auricle (2) Left ventricle

(3) Ventricles (4) Aorta

Q.32 One of the following nerves inhibit the rate of heart beat–

(1) Vagus

(2) Sympathetic

(3) Ocullomotor

(4) None of the above

Q.33 Sinus venosus in mammals is believed to have merged with the wall of–

(1) Right auricle (2) Left auricle

(3) Right ventricle (4) Left ventricle

Q.34 Which one of the following is the main graveyard of RBC–
(1) Bone marrow (2) Spleen
(3) Liver (4) Kidney

Q.35 Brachial arteries suply blood to–
(1) Neck (2) Fore lims
(3) Chest (4) Abdomen

Q.36 A portal system is that in which–
(1) A vein begins from an organ and ends in heart
(2) An artery breaks up in an orgain & restarts by the union of its capillaries
(3) The blood from gut is brought in to kidneys before it is poured in to heart
(4) A vein breaks up in an organ in to capillaries & restarts by their union as a new vein in the same organ

Q.37 Right sub clavian artery in Rabbit arises from–
(1) Right common carotic artery
(2) Carotico sytemic aorta
(3) Dorsal aorta
(4) Innominate artery

Q.38 Adult mammals have–
(1) Only left aortic arch
(2) Only right aortic arch
(3) Both of the above
(4) Completely developed left arch but right arch is poorly developed

Q.39 The papillary muscles are helpful in–
(1) Movement of eye balls
(2) Movement of eye lids
(3) Closing & opening thevalves of heart
(4) Movement of pinnae

Q.40 After the death of Rabbit–
(1) Both veins & arteries are empty
(2) Both veins & arteries are empty
(3) Arteries are full of blood while veins are empty
(4) Veins are full of blood while arteries are empty

Q.41 Indicate correct statement for Rabit–
(1) Arteries always carry oxygenated blood while veins always carry deoxygenated blood
(2) Venous blood is retured to left aurilce
(3) Arteries are provided with valves while veins are devoid to valves
(4) Arteries always carry blood away from the heart, while veins always carry blood towards the heart

Q.42 A vein differ from an artery in having–
(1) Strong muscular walls
(2) Narrow lumen
(3) Valves to control direction of blood flow opposite to heart
(4) Valves to control direction of blood flow towards heart

Q.43 The correct sequence of layers found in the walls of arteries from inside outward is–
(1) Tunica adventitia, tunica interna & tunica media
(B) Tunica interna, tunica externa & tunica media
(3) Tunica interna, tunica media & tunica externa
(4) Tunica media , tunica externa & tunica interna

Q.44 If spleen of Rabbit is removed from body then–
(1) Animal will die
(2) Number of blood plateles will increase
(3) Number of blood plateles will decrease
(4) There will be no effect on the number of blood plateles

Q.45 Heart of Rabbit does not have–
(1) Right auricle (2) Sinus venosus
(3) Conus arterious (4) Both B & C

Q.46 The 'Lubb' and "Dupp" heart sound are due to–
(1) Opening of heart valves
(2) Action of papillary muscles
(3) Closing of heart valves
(4) Activity of pace maker

Q.47 The valves of the heart are attached to papillary muscles by–
(1) Columnae corrinae
(2) Chordae tendinae
(3) Tendinae
(4) Pectinati muscles

Q.48 In cyanosis colouration of body parts appears–
(1) Bluish (2) Yellowish
(3) Reddish (4) Brownish

Q.49 Filter apparatus for dead R.B.C is–
(1) Spleen + Kidney
(2) Liver + Kidney
(3) Spleen + Liver + Kidney
(4) Liver + Spleen

Q.50 Heart of fishes–
(1) Two chambered
(2) Venous heart
(3) Both
(4) None of the above

Q.51 Cells foming the wall blood capillaries are called–
(1) Oxyntic cells (2)Endothelium cells
(3) Parietal cells (4) Haemocytes

Q.52 Blood pressure and heart beat is regulated by–
(1) Insulin (2) Adrenalin
(3) Optic nerve (4)Growth hormone

Q.53 The pace maker in frog heart is–
(1) SA Node (2) AV Node
(3) Conus arterious (4) Heart muscles

Q.54 Heart beat is controlled by which cranial nerve–
(1) X^{th} (2) IX^{th}
(C) III^{rd} (D) V^{th}

Q.55 Blood capillaries are made of–
(1) Endothelium and thin coat of connective tissue
(B)Endothelium and thin coat of muscle fibres
(3) Endothelium and thin coat of connective tissue and muscle fibres
(4) Only endothelium

Q.56 If the vagus branch of frog is stimulate the heart will show–
(1) Stoppage of heart beat
(2) Decreased heart beat
(3) Increased heart beat
(4) No change

Q.57 The heart sound "DUP" is Produced when
(1) Mitral valve opens
(2) Mitral valve closes
(3) Semilunar valve at the base of aorta closes
(4) Tricuspid valve opens

Q.58 Red pulp and whit pulp are histological structure found in–
(1) Tooth (2) Spleen
(3) Bone (4) Liver

Q.59 Where is the pace makes situated–
(1) In left auricle near opening of pulmonary vein
(2) In right auricle near eustachan valve
(3) On inter–auricular septum
(4) On inter–ventricular septum

Q.60 Papillary muscles are found in –
(1) Haemocoel of cockroach
(2) Auricles of heart
(3) Ventricles of heart
(4) Arm

Q.61 In mammalian embryo the pulmonary aorta communicates with carotico systemic aorta by a narrow ducts arteriousus, in the adult this connection closes leaving–
(1) Fossa-ovalis
(2) Carotico pulmonary aperture
(3) Ligamentum arteriosus
(4) None of these

Q.62 Right atrium or auricle in mammalian heart receives blood From–
(1) Precavals
(2) Precavals and post cavals
(3) Pulmonary veins
(4) Sinus venosus

Q.63 Blood circulation take following course in heart of mammals –
(1) Left auticle–left ventricle–body–right auricle–right ventricle
(2) Right auricle–left
(3) Left auricle–left ventricle–lungs–right auricle–right ventricle
(4) None of them

Q.64 Pulmonary veins are those which–
(1) Carry impure blood from lungs to heart
(2) Carrying pure blood from lungs to heart
(3) Carry impure blood from heart to lung
(4) Carry pure blood from heart to lungs

Q.65 To reach the left side of heart the blood must pass through–
(1) Sinus venosus (2) Kidneys
(3) Liver (4) Lungs

Q.66 How many contraction nodes are found in heart of Rabbit–
(1) One (2) Two
(3) many (4) None

Q.67 Characteristics of cardiac muscles are that they–
(1) Contract quicly and get fatigued
(2) Contract quicly and do not get fatigued
(3) Contract slowly and get fatigued
(4) Contract slowly and do not get fatigued

Q.68 Larget amount of urea in blood is found in–
(1) Hepatic portal vein
(2) Hepatic artery
(3) Coeliac artery
(4) Renal artery

Q.69 Oxygenated blood is carried by–
(1) Pulmonary artery
(2) Pulmonary vein
(3) Renal vein
(4) Hepatic portal vein

Q.70 Lymph can be defined as–
(1) Blood minus corpuscles
(2) Blood minus plasma
(3) Blood minus WBC
(4) Blood minus RBC & Platlates

Q.71 Sphygmomanometer measures
(1) Blood pressure
(2) Pulse rate
(3) Rate of heart beat
(4) All

Q.72 Chordae tendinae are found in–
(1) Ventricles of brain
(2) Ventricles of heart
(3) Auricles of heart
(4) Connection between bone

Q.73 William Harvey is credited with discovery of–
(1) Blood clotting
(2) Blood circulation
(3) Process of digestion
(4) Mechanism of respiration

Q.74 A Pace maker of S.A. Node is found in–
(1) Lungs (2) Brain
(3) Spleen (4) Heart

Q.75 The blood during diastole–
(1) Leaves the heart (2) Enters the heart
(3) Enters lungs (4) Heart

Q.76 The blood vein have :
(1) More CO_2
(2) More O_2
(3) Both
(4) None

Q.77 Eustachian valve occurs in–
(1) Connection between middle ear and pharynx
(2) Middle ear
(3) Left ventricles of heart
(4) Right auricle of heart

Q.78 Heart of Man is–
(1) Myogenic (2) Neurogenic
(3) Cardiogenic (4) Digenic

Q.79 In heart of Rabbit bicuspid valve is situated in–
(1) Right auricle and pulmonary aorta
(2) Post caval and auricle
(3) Left auricle and left ventricle
(4) Right auricle and right ventricle

Q.80 Which has no muscular walls–
(1) Capillary (2) Arteriole
(3) Veins (4) Artery

Q.81 Pulse beat is measured in–
(1) Veins (2) Artery (Radial)
(3) Nerve (4) Capilary

Q.82 pH of blood in arteries and vein is–
(1) More in veins and less in arteries
(2) More in arteries and less in veins
(3) same (4) Not definite

Q.83 In a normal man blood pressure is–
(1) 120/80 mm of Hg
(2) 80/120 mm of Hg
(3) 80/120 mm of Hg
(4) 100/80 mm of Hg

Q.84 Post caval opening in right auricle is guarded by–
(1) Arterio-ventricular valve
(2) Tricuspid valve
(3) Bicuspid valve
(4) Eustachain valve

Q.85 When the right ventricle contracts the blood is pump in to–
(1) Superior vena cava
(2) Dorsal aorta
(3) Pulmonary aorta
(4) Pulmonary veins

Q.86 The blood leaving the lungs is richer than the blood entering the lung in–
(1) Oxygen (2) CO_2
(3) Hydrogen (4) Moisture

Q.87 Caroid artery carries the blood which is–
(1) Impure blood to kidneys
(2) Oxygenated blood to brain
(3) Oxygenated blood to heart
(4) Inpur blood from brain

Q.88 Role of spleen in mammals is–
(1) To control blood pressure
(2) To assist liver
(3) To assist kidneys
(4) To act as haemopoitic tissues in embryo

Q.89 Pace maker influences–
(1) Contraction of heart muscles
(2) Flow of blood in heat
(3) Rate of heart beat
(4) Formation of nerve impulse

Q.90 In which of the following charactor a vein differs from an artery–
(1) Having valves to control flow of blood
(2) Having narrow lumen
(3) Having muscular wall
(4) Having pigmented wall to give dark look

Q.91 Systolic pressure is higher than diastolic pressure due to–
(1) Volume of blood in the heart is greater during systole
(2) Arteries contract during systole
(3) Blood vessels offer ressistance to flowing blood during systole
(4) Blood is forced into arteries during systole

Q.92 The venous system of from differs form that of a mammals in the presence of–
(1) Ranal portal system
(2) Hapatic portal system
(3) Three superior venacava
(4) Hepatic vein

Q.93 First heart transplant was perfomed by–
(1) William harvey (2) Watson
(3) Christian Bernard (4) Khorana

Q.94 When heart beat is decreased than normal is called–
(1) Bradicardia (2) Tachycardia
(3) Hypocardia (4) Nicacardia

Q.95 First heat sound is–
(1) Lubb sound at the end of systole
(2) Lubb sound at the gegining of ventricular systole
(3) 'Dup' sound at the end of systole
(4) Dup sound at the begining of ventricular systole

Q.96 Which artery supplies blood to the diaphragm–

(1) Phrenic (2) Splenic

(3) Renal (4) Caudal

Q.97 Which one of the following organ can be called a sort of 'blood bank'

(1) Heart (2) Liver

(3) Spleen (4) Lungs

Q.98 A renal portal system is found in–

(1) Rabbit (2) Mouse

(3) Horse (4) Frog

Q.99 Purkinje fibres are found in–

(1) Brain (2) liver

(3) eyes (4) Heart

Q.100 Blood of which vessel in mammals carries least percentage of urea –

(1) Dorsal aorta

(2) Renal vein

(3) Renal artery

(4) Posterior vena cava

EXERCISE - 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Which organ receives only oxygenated blood? **[AFMC 2001]**

(1) Gill (2) Spleen

(3) Lung (4) Liver

Q.2 Largest heart is of **[KCET 2003]**

(1) Giraffe (2) Elephant

(3) Crocodile (4) Lion

Q.3 Cardia output is blood **[Karnataka 1996]**

(1) Received by heart per minute

(2) Pumped by ventricles per sec

(3) Pumped by left ventricle per minute

(4) Pumped by left ventricle per hour

Q.4 Pericardial fluid is secreted by **[HP PMT 1995]**

(1) Myocardium

(2) Perietal peritoneum

(3) Visceral peritoneoum

(4) Pericardium

Q.5 Which one generates heart beat? **[Punjab PMT 1997]**

(1) Pukinje fibres

(2) Cardiac branch of vagus nerve

(3) SA nnode (4) AV node

Q.6 Heart wall is made of **[Punjab PMT 1997]**

(1) Myocardium (2) Epicardium

(3) Endocardium (4) All the above

Q.7 In order to study blood circulation in rat, capillaries are observed in

(1) Mesentery (2) Kidney

(3) Liver (4) Lung

Q.8 Glucose is carried from digestive tract to liver by **[CBSE 1999]**

(1) Hepatic artery

(2) Hepatic portal vein

(3) Pulmonary vein

(4) None of the above

Q.9 Match the columns **[Karnataka 1999]**

	Column I		Column II
(a)	Superior Vena Cava	(p)	Carries deoxysgenated
(b)	Inferior Vena Cava	(q)	Carries oxygenated blood from lungs
(c)	Pulmonary Artery	(r)	Brings deoxygenated blood from lower parts of body to right atrium
(d)	Pumonary Vein	(s)	Brings deoxygentaed blood from upper parts of body into right atrium

(1) a–q, b–t, c–r, d–p

(2) a–t, b–p, c–q, d–r

(3) a–t, b–r, c–p, d–q

(4) a–t, b–p, c–r, d–q

Q.10 During high blood pressure, regulations of heart beat and circulation are controlled by **[AIIMS 1999]**

(1) Vasodilator and vasconstrictor centres

(2) Cardio-stimulatory and vasoconstrictor centres

(3) Cardio-inhibitory and vasocintrictor centres

(4) Cardio-inhibitory and vasodilator centers

Q.11 Pulmonary artery differs from pulmonary vein in having **[CBSE 2000]**

(1) Thick wall (2) Thin wall

(3) Valves (4) Both (2) and (3)

Q.12 Blood vessel which brings oxygenated blood to left auricle is **[AFMC 2000]**

(1) Precaval vein (2) Post caval vein

(3) Pulmonary vein (4) Pulmonary artery

Q.13 Blood pressure is measured by **[AIIMS 2000]**

(1) Sphygmonanometer

(2) Phonocardiogram

(3) Electrocardiogram

(4) Stethoscope

Q.14 Heart beat is inititated by **[CET Chd. 2000]**

(1) AV node (2) SA node

(3) Bundle of His (4) Purkinje fibres

Q.15 Match the columns **[Karnataka 2000]**

	Column I		Column II
(a)	Bicuspid valve	(p)	Brain
(b)	Nephron	(q)	Liver
(c)	Alveoli	(r)	Heart
(d)	cerebrum	(s)	Kidney
		(t)	Lungs

(1) a–s, b–r, c–p, d–t

(2) a–r, b–t, c–s, d–p

(3) a–r, b–s, c–t, d–p

(4) a–s, b–q, c–p, d–t

Q.16 All veins have deoxygenated blood except **[AIIMS 2001]**

(1) Renal vein (2) Hepatic vein

(3) Hepatic portal vein

(4) Pulmonary veins

Q.17 'Dup' sound is produced during closure of

(1) Semilunar valves (2) Bicuspid valve

(3) Tricuspid value (4) Both (2)and (3)

Q.18 The value of diastolic blood pressur is **[Karnataka 2001]**

(1) 120 mm Hg (2) 80 mm Hg

(3) 120/80 mg Hg (4) 40 mg Hg

Q.19 Normal pulse pressure is **[Manipal 2001]**

(1) 80 mm Hg (2) 120 mm Hg

(3) 40 mg Hg (4) 40 mg Hg

Q.20 Arterial blood pressure in human beings

(1) 120 and 80 mm Hg

(2) 150 and 100 mm Hg

(3) 50 and 100 mm Hg

(4) None

Q.21 Ventricular contraction in command of– **[CBSE 1999]**

(1) S.A. Node (2) A.V. Node

(3) Pukinje fibers (4) Papillary muscles

Q.22 Fully digested food reaches to liver by– **[CBSE 1999]**

(1) Hepatic portal vein

(2) Hepatic artery

(3) Hepatic vein (4) All the above

Q.23 Impulse of heart beat originates from **[CBSE 2002]**

(1) S.A. Node (2) A.V. Node

(3) Vagus Nerve (4) Cardiac Nerve

Q.24 Which of the following statement is true for Lymph **[CBSE 2002]**

(1) WBC adn serum

(2) All components of blood except RBCs, Platelets and some proteins

(3) RBCs, WBCs and Plasma

(4) RBCs, Proteins and Platelets

Q.25 Bundle of His is a network of - **[CBSE 2003]**

(1) Muscle fibres distributed throughout the heart walls

(2) Muscle fibres found only in the ventricle wall

(3) Nerve fibres distributed in ventricles

(4) Nerve fibres found throughout the heart

Q.26 Systemic heart refers to - **[CBSE 2003]**

(1) The heart that contracts under stimulation from nervous systm

(2) Left auricle and left ventricle in higher vertebrates

(3) Entire heart in lower vertebrates

(4) The two ventricle together in humans

Q.27 The cardiac pacemaker in a patient fails to function normally. The doctors find that an artifical pacemaker is to be grafted in him. It is likely that it will be drafted at the site of- **[CBSE 2004]**

(1) Purkinje system (2) Sinuatrial node

(3) Atrioventricular node

(4) Atrioventricular bundle

Q.28 If parasympathetic nerve of the Rabbit is cut then heart beat - **[RPMT 2001]**

(1) Unaffected (2) Decreases

(3) Increases (4) Stop

Q.29 In Rabbit oxygenated blood flows from - **[RPMT 2001]**

(1) Left auricle to left ventricle durin gauricular systole

(2) Righ tauricle to right ventricle during ventricular

(3) Right ventricle to aorta during ventricular systole

(4) Pulmonary vein to left auricle during auricular systole

Q.30 Which of the folllowing vessel in rabbit starts with capillaries and ends in capillaries- **[RPMT 2002]**

(1) Pulmonary artery (2) Renal vein

(3) Hepatic portal vein

(4) Renal artery

Q.31 In cardiac circulation, "Dup" sound is heard when **[RPMT 2003]**

(1) Mittral valves close

(2) Mittral valves open

(3) Semilunar valves

(4) Tricuspid valve close

Q.32 Lymph vessels pour trheir materials in **[RPMT 2003]**

(1) Vena cava which enters in right auricle

(2) Pulmonary artery

(3) Artery which enters in legs

(4) Rgiht ventricle

Q.33 Which of the following have thickest wall **[RPMT 2003]**

(1) Right auricle (2) Left auricle

(3) Right ventricle (4) Left ventricle

Q.34 Which vein in rabbit is unpaired **[RPMT 2004]**

(1) Azygous (2) Hemiazygous

(3) Caudal (4) All of the above

Q.35 Which of the following blood vessel in the circulatory system of frog has more deoxygenated **[Uttaranchal PMT 2004]**

(1) Pulmonary artery

(2) Precaval veins

(3) Pulmocutaneous artery

(4) Pulmocutaneous vein

Q.36 Tachycardia is **[Uttaranchal PMT 2004]**

(1) Fast heart rate (2) Slow heart rate

(3) Stop heart rate (4) Normal heart rate

Q.37 The cardiac impules that results into the heart beat is delayer at - **[West Bengal JEE 2007]**

(1) Intenodal tract (2) AV node

(3) Bundle of His (4) Purkinje fibres

Q.38 Among the following which one is not true about chordae tendinae - **[West Bengal JEE 2007]**

(1) They are strips of muscle fibre

(2) They are attached to the valves

(3) They regulated opening of valves

(4) They prevent backflow of blood

Q.39 The heart keeps on beating throughout the life without fatigue because - **[West Bengal JEE 2007]**

(1) In contracts slowly

(2) It has a resting or recovery period

(3) It can use lactic acid as an extra source of energy

(4) None of the above

Q.40 In the animal body blood bank is - **[Jharkhand 2004]**

(1) Heart (2) Spleen

(3) Lungs (4) Liver

Q.41 Which of the following vessel in Rabbit starts with capillaries and ends in capillaries **[Jharkhand 2003]**

(1) Pulmonary artery

(2) Renal vein

(3) Hepatic ortal vein

(4) Renal artery

Q.42 Pace-maker in heart is situated - **[Jharkhand 2004]**

(1) In the wall of left atrium

(2) In the wall of righ atrium

(3) On inter-ventricular septum

(4) On inter-auricular septum

Q.43 72 beat per minute heart beat rate of man is controlled by **[Bihar 2004]**

(1) SA-node (2) Ventricles

(3) PUrkinje fibers (4) AV-node

Q.44 Cardiac muscles contract **[Bihar 2002]**

(1) quickly and they fatigue

(2) quicklyu and unfatigued

(3) Slowly and are not fatigued

(4) slowly and they fatigue

Q.45 ECG is a measure of - **[Bihar 2002]**

(1) Rate of heart beat

(2) Difference in electric potential

(3) Volume of blood pumped

(4) Ventricular contraction

Q.46 Heart of elephant is **[UP CPMT 2002]**

(1) Neurogenic (2) Myogenic

(3) Loop of Henle

(4) Bownman's capsule

Q.47 Blood leaving liver and moving to heart will have more concentration of - **[UP CPMT 2005]**

(1) Bile (2) Urea

(3) Glycogen (4) Amino acid

Q.48 The blood circulatio which starts and ends into capillaries is **[UP CPMT 2006]**

(1) Renal circulation (2) Portal circulation

(3) Hepatic circulation

(4) Lymphatic circulation

Q.49 Maximum surface area of Circulatory gsystem is seen in - **[UP CPMT 2007]**

(1) Heart (2) Capillaries

(3) Arterioles (4) Veins

Q.50 "Bundle of His" are - **[MP CPMT 2007]**

(1) Nervous tissue supplied to ventricles

(2) Nervou tissue supplied to heart

(3) Muscular tissue supplied to ventricle

(4) Musclular tissue supplied to heart

Q.51 "Bundle of His" is group of - **[MP PMT 2004]**

(1) Nerve fibres (2) Ganglia

(3) Connective tissue (4) Muscle fibres

Q.52 Blood pressure is controlled by - **[MP PMT 2004]**

(1) Pituitary gland (2) Thymus gland

(3) adrenal gland

(4) Parathyroid gland

Q.53 Haemoglobin shows maximum affinity with - **[MP PMT 2005]**

(1) Carbon monoxide (2) Carbon dioxide

(3) Oxygen (4) Ammonia

Q.54 Pace maker of heart is - **[MP PMT 2005]**

(1) B (2) U

(3) G (4) A

Q.55 Bicuspid valve (mitral) guards the opening in mammals between **[MP PMT 2006]**

(1) Left atrium and let ventricle

(2) Pulmonary vein and left auricle

(3) Stomach and intestine

(4) Right atrium and right ventricle

Q.56 Cardiac muscle fibres are differ from skeletal muscles because these are **[MP PMT 2006]**

(1) Striated, involuntary

(2) Non-striated-volvntary

(3) Non striated involuntary

(4) Antagonistic

Q.57 Atherosclerosis refers to the ailment of **[MP PMT 2005]**

(1) Lungs (2) Heart

(3) Kidney (4) Liver

Q.58 All arteries carry oxygenated blood except **[MP PMT 2001]**

(1) Hepatic artery (2) Renal artery

(3) Pulmonary artery (4) Cardiac artery

Q.59 Diameter of capillaries for RBC to pass should be **[BHU / JIPMER 1986]**

(1) 4 μ (2) Less than 5 μ

(3) More than 5 μ (4) More than 10 μ

Q.60 Femoral artery supplies blood to **[EAMCET 1976]**

(1) Hind limb (2) Rectum

(3) Dorsal region of thigh

(4) Ventral region thigh

Q.61 Iliac artery carries blood to the **[EAMCET 1977]**

(1) Lungs (2) Ileum

(3) Hind limbs (4) Brain

Q.62 The wall of blood capillaries is made up of

(1) Mesenchymal cells **[CPMT 1999]**

(2) Connective tissues

(3) Endothelial cells (4) Fibrocytes

Q.63 Which of the following has no muscular wall **[DPMT 1985, 86]**

(1) Artery (2) Vein

(3) Arteriol (4) Capillary

Q.64 Smallest lumen blood vessel in the body is **[BHU 1985]**

(1) Capillary (2) Artery

(3) Vein (4) Venacava

Q.65 In which region the lymphatic system and blood circulatory system meet **[Bih. 2000]**

(1) Liver (2) Precaval

(3) Pulmonary artery (4) Systematic arch

Q.66 The process of blood clot formation within the circulatory system is **[CBSE PMT 1993]**

(1) Thrombosis (2) Thrombocytes

(3) Thrombin

(4) Thrombocytopenia

Q.67 Thrombin occurs in the vertebrates in **[CMC Vellore 1993]**

(1) The liver and is important for bile secretion

(2) The stomach and digests proteins

(3) The blood and is important for clotting

(4) The blood and gives it red colour

Q.68 Blood leaving lungs is rich in **[AFMC 1983, 87]**

(1) Oxygen (2) Haemoglobin

(3) Carbon dioxide

(4) More number of RBC

Q.69 The artery can be distinguished from the vein in having **[CPMT 1970]**

(1) Thicker walls (2) More blood cells

(3) More plasma (4) Larger cavity

Q.70 A vein differs from the artery in having **[Pb. PMT 2000]**

(1) Narrow lumen

(2) Strong cuticular and muscular wall

(3) Valves to control direction of flow

(4) Dark pigmented wall

Q.71 Oxygenated blood is carried by **[AFMC 1984, 95]**

(1) Pulmonary vein (2) Pulmonary artery

(3) Renal vein

(4) Hepatic portal vein

Q.72 The blood coming out of lungs is richer than that entering into lungs in **[MP PMT 1994]**

(1) Oxygen (2) Carbon dioxide

(3) (1) and (2) both (4) None of these

Q.73 Pulmonary veins **[MP PMT 1994]**

(1) Carry pure blood from heart to lungs

(2) Carry impure blood from lungs to heart

(3) Carry pure blood from lungs to heart

(4) Carry impure blood to lungs

Q.74 The posterior venacava **[CPMT 1988]**

(1) Divides into the hepatic portal veins

(2) Opens into the left auricle

(3) Commences at the kidney

(4) Begins at the hind end of abdomen

Q.75 Oxygenated blood is found in **[MP PMT 1998]**

(1) Pulmonary veins

(2) Pulmonary arteries

(3) Right atrium (4) Right ventricle

Q.76 The blood vessel which brings oxygenated blood from lungs towards the heart of frog is **[AFMC 2000]**

(1) Pre caval (2) Post caval

(3) Pulmonary vein (4) Pulmonary artery

Q.77 When the right ventricle contracts the blood goes into **[AFMC 1989; CBSE PMT 1992]**

(1) Aorta (2) Brain

(3) Pulmonary artery (4) None

Q.78 Arteries are **[CPMT 1980, 84]**

(1) Thin-walled and blood flows under diminished pressure

(2) Thick-walled and blood flows under high pressure

(3) Thin-walled and blood flows under high pressure

(4) Thick-walled and blood flows under diminished pressure

Q.79 All arteries carry oxygenated blood except **[MP PMT 2001; AFMC 2003]**

(1) Systemic (2) Hepatic

(3) Pulmonary (4) Cardiac

Q.80 The pre-caval veins collect blood from **[Pune CET 1998]**

(1) Trunk and hind limbs

(2) Fore limbs and hind limbs

(3) Head and fore limbs

(4) Head and hind limbs

Q.81 The post-caval vein collects blood from **[Pune CET 1998]**

(1) Hind limbs

(2) Hind limbs and organs of the body cavity

(3) Body cavity organs

(4) Renal organs

Q.82 Which of the following is different from others in absence of muscular coat **[CPMT 1999; JIPMER (Med.) 2001]**

(1) Veins (2) Arteries

(3) Capillaries (4) Arterioles

Q.83 Right systemic arch is absent in **[AMU 1997]**

(1) Reptiles (2) Birds

(3) Mammals

(4) None of the above

Q.84 Iliac artery carries blood to **[APMEE 1977]**

(1) Hind limb (2) Fore limb

(3) Lung (4) Brain

Q.85 The blood vessel of frog which opens in its right ventricles bringing oxygenated blood is **[AFMC 2000]**

(1) Pulmocutaneum artery

(2) Inferior vena cava

(3) Pulmocutaneum vein

(4) Superior vena cava

Q.86 Splenic artery arises from **[CBSE PMT 1990]**

(1) Anterior mesenteric artery

(2) Coeliac artery

(3) Posterior mesenteric artery

(4) Intestinal artery

Q.87 The carotid labyrinth of frog is concerned with the control of **[EAMCET 1996]**

(1) Number of RBCs

(2) Number of WBCs

(3) Blood pressure

(4) Blood glucose level

Q.88 Common thrombosis leading to myocardial infarction is of **[AIIMS 1988]**

(1) Right circumflex coronary artery

(2) Left circumflex coronary artery

(3) Left anterior descending artery

(4) Right coronary artery

Q.89 Pulmonary aorta in mammalian embryo communicates with carotico - systemic aorta by a thin vessel called ductus arteriosus which later closes and remains in adult as **[CPMT 1971]**

(1) Fossa ovalis
(2) Ligamentum arteriosus
(3) Carotico-pulmonary aperture
(4) None of these

Q.90 The internal carotid artery **[Orissa JEE 1995]**

(1) Supplies impure blood to kidney
(2) Supplies oxygenated blood to brain
(3) Brings impure blood from the brain
(4) Supplies oxygenated blood to heart

Q.91 The two branches of the iliac artery are **[Pune CET 1998]**

(1) Femoral and renal
(2) Femoral and sciatic
(3) Vesiculo - epigastric and femoral
(4) Renal and sciatic

Q.92 The pre-caval vein is formed of **[Pune CET 1998]**

(1) External jugular and innominate
(2) Innominate and subclavian
(3) External jugular, innominate and subclavian
(4) External jugular and subclavian

Q.93 The post-caval is constituted by **[Pune CET 1998]**

(1) Renal, gonadial and hepatic
(2) Renal and gonadial
(3) Gonadial and hepatic
(4) Hepatic and renal

Q.94 Which of the following carries glucose from digestive tract to liver **[CBSE PMT 1999; BHU 2001]**

(1) Hepatic artery
(2) Hepatic portal vein
(3) Pulmonary vein
(4) None of these

Q.95 Which of the following blood vessels in mammals normally carry largest amount of urea **[MP PMT 1997]**

(1) Hepatic portal vein
(2) Hepatic vein
(3) Renal artery
(4) Hepatic artery

Q.96 Which one of the following is found both in frog and in rabbit **[CPMT 1992]**

(1) Spinal accessory nerve
(2) Diaphragm
(3) Hepatic portal system
(4) Eustachian tube

Q.97 Thrombosis in which coronary artery is met most frequency in MI **[AIIMS 1988]**

(1) Right coronary artery
(2) Left anterior descending artery
(3) Left circumflex coronary artery
(4) Right circumflex coronary artery

Q.98 Systemic heart refers to **[CBSE PMT 2003]**

(1) The two ventricles together in humans
(2) The heart that contracts under stimulation from nervous system
(3) Left auricle and left ventricle in higher vertebrates
(4) Entire heart in lower vertebrates

Q.99 Which substance is more in blood flowing through hepatic vein than blood flowing through portal vein **[CPMT 1979]**

(1) Water (2) Urea
(3) Fatty acid
(4) Amino acid + oxygen

Q.100 Carotid artery carries **[NCERT 1975, 76; MP PMT 1995]**

(1) Impure blood from brain
(2) Oxygenated blood to anterior region of body or to brain
(3) Impure blood to kidney
(4) Oxygenated blood to heart

Q.101 Innominate is **[CPMT 1984]**

(1) A nerve and artery
(2) A muscle and artery
(3) Skeleton part and artery
(4) A nerve and vein

Q.102 Valves are found in veins to check the backflow of blood flowing under **[CPMT 1977]**

(1) Low pressure (2) High pressure
(3) No pressure (4) Very high pressure

Q.103 Hepatic portal system starts from **[CMC Vellore 1982]**

(1) Digestive system to liver
(2) Kidney to liver
(3) Liver to heart (4) Liver to kidney

Q.104 Digested food materials entering the blood reach the heart by **[EAMCET 1978]**

(1) Hepatic portal vein, hepatic vein and post caval
(2) Hepatic vein and post caval
(3) Hepatic portal vein and post caval
(4) Hepatic portal vein and hepatic vein

Q.105 Blood circulation that starts in capillaries and ends in capillaries is called **[NCERT 1984]**

(1) Portal circulation
(2) Hepatic circulation
(3) Cardiac circulation
(4) None

Q.106 A portal system is a system in which **[NCERT 1978]**

(1) A vein starts from an organ and ends up in heart
(2) An artery breaks up in an organ and restarts by the union of its capillaries
(3) The blood from the gut is brought into the kidney before it is poured into posterior venacava
(4) A vein breaks up in an organ into capillaries and restarts by their union as a new vein in the same organ

Q.107 Hypophysial portal system is found in **[AMU 1997]**

(1) Kidney (2) Liver
(3) Brain (4) Heart

Q.108 The principle function of the lymph node in the man is **[CPMT 1983, 84]**

(1) Destruction of old RBC
(2) Destruction of old WBC
(3) Collection and destruction of pathogens blood
(4) Production of WBC

Q.109 What will happen to an adult human being if spleen is removed **[MP PMT 2000]**

(1) RBC production will be lowered
(2) Antibody production will be lowered
(3) Filteration of dead RBC will not be there
(4) WBC production will be lowered

Q.110 Lymph is colourless because **[MP PMT 1999]**

(1) WBC are absent
(2) WBC are present
(3) Heamoglobin is absent
(4) RBC are absent

Q.111 Spleen is **[CBSE PMT 2001]**

(1) Haemopoeitic (2) Lymphoid
(3) Reproductive (4) Celluloid

Q.112 Lymphoid tissue is found in **[CPMT 2000]**

(1) Thymus (2) Tonsils
(3) Lymph nodes (4) All of these

Q.113 In our body, the blood bank is **[MP PMT 1999, 2001]**

(1) Red bone marrow (2) Spleen
(3) Liver (4) Heart

Q.114 The lymph differs from the blood in having **[CPMT 1973, 74, 84]**

(1) Blood with more RBC and less WBC
(2) Blood without plasma
(3) Plasma without proteins
(4) No RBC but more WBC

Q.115 In connection with circulatory system, valves are present **[CBSE PMT 1995]**

(1) Not only in heart and blood vessels or vertebrates and invertebrates, but in vertebrate lymphatics as well
(2) Vertebrate heart only
(3) Vertebrate heart and invertebrate hearts only
(4) Vertebrate hearts, invertebrate hearts and their blood vessels

Q.116 A yellow substance oozing out from wound has **[AFMC 1986]**

(1) Lymph + RBC + WBC
(2) Lymph + RBC + dead bacteria
(3) Lymph + WBC + dead bacteria
(4) Lymph + dead leucocytes

Q.117 Function of human spleen is to **[DPMT 1984]**

(1) Control the pulse rate
(2) Secrete hormone
(3) Stimulate heart
(4) Control blood volume

Q.118 Which organ is considered as "Graveyard of RBC" where most of them are destroyed by macrophages **[AFMC 2001]**

(1) Red bone marrow (2) Spleen
(3) Kidney (4) Intestine

Q.119 Lymph vessels are united to form **[BHU 2001]**

(1) Lymph heart (2) Cisterna chyle
(3) Thoracic duct (4) Jugular vein

Q.120 The most active phagocytic white blood cells are : **[AIPMT 2008]**

(1) Neutrophils and eosinophils
(2) Lymphocytes and macrophages
(3) Eosinophils and lymphocytes
(4) Neutrophiles and monocytes

Q.121 'Bundle of His' is a part of which one of the following organs in humans? **[AIPMT 2011]**

(1) Brain (2) Heart
(3) Kidney (4) Pancreas

Q.122 Arteries are best defined as the vessels which : **[AIPMT 2011]**

(1) Supply oxygenated blood to the different organs
(2) Break up into capillaries which reunite to from a vein
(3) Break up into capillaries which renite to from a vein
(4) Carry blood from one visceral organs to another visceral organ

Q.123 Given below is the ECG of a normal human. Which one of its components in human is correctly interpreted below **[AIPMT Mains 2008]**

(1) Complex QRS – One complete Pulse
(2) Peak T – Initiation of total cardiac contraction
(3) Peak P and Peak R together – Systolic and diastolic bool pressures
(4) Peak P – Initiation of left atrial contraction only

Q.124 Bulk of carbon dioxide (CO_2) released from body tissuse into the blood present as

(1) Bicarbonate in blood plasma and RBCs
(2) Free CO_2 in blood plasma
(3) 70 % carbamino – haemoglobin and 30 % as bicarbonate
(4) Carbamino – haemoglobin in RBCs

Q.125 Cardiac output is determind by : **[Manipal / BHU 2008]**

(1) Heat rate (2) Stroke volume
(3) Blood flow (4) Both (1) and (2)

Q.126 In frog heart, there are cardiac muscles which consist of fibres called : **[BHU 2006, CPMT 2008]**

(1) Myonemes (2) Telodendria
(3) Purkinje fibres (4) Columnae carnae

Q.127 In a standard ECG which one of the following alphabets is the correct representation of the respective activity of the human heart? **[CBSE 2009]**

(1) P–depolarisation of the atria
(2) R–repolarisation of ventricles
(3) S-start of systole
(4) T–end of diastole

Q.128 If the heart sound recording and ECG recordings are superimposed then the heart sound would occur : **[Pune CET 2002]**

(1) At the P wave
(2) Just after the P wave
(3) Just before the QRS complex
(4) Just after the QRS complex

Q.129 An oval depression called fossa ovalis is seen on : **[Kerala PMT 2009]**

(1) Interatrial septum
(2) Papillary muscles
(3) Inter ventricular septum
(4) Right auriculo – ventricular septum
(5) left auriculo – ventricular septum

Q.130 The deposition of lipids on the wall lining the lumen of large and medium sized ateries is referred to as : **[Kerala PMT 2009]**

(1) Osteoporosis (2) Osteoarthritis

(3) Atherosclerosis

(4) Deep vein thrombosis

(5) Stokes – Adams syndrome

Q.131 If due to some injury the chordae tendinae of the tricuspid valve of the human heart is partially non-functional, what will be the immediate effect? **[CBSE 2010]**

(1) The 'pacemaker' will stop working

(2) The blood will tend to flow back into the left atrium

(3) The flow of boond into the aorta will be slowed down

(4) The flow of blood into the pulmonary artery will be reduced

Q.132 Fastest distribution of some injectable material/ medicine and with no risk of any kind can be achieved by injecting it into the : **[CBSE 2010]**

(1) Muscles (2) Arteries

(3) Veins (4) Lymph vessels

Q.133 Which statement is true about the venous blood vessels of frog? **[AMU 2010]**

(1) Lingual and Submandibular unite to from internal jugular

(2) musculocutaneous and Brachial unite to form the subclavian

(3) The ventral abdominal vein drains into the posterior vena cava

(4) The pelvic veins unite to from the renal portal vein

Q.134 Which of following is not a major organ of lymphatic system? **[MPPMT 2010]**

(1) Spleen (2) Kidney

(3) Thymus (4) Lymph nodes

Ans.	2	2	3	1	4	3	1	4	1	3	4	3	2	2						

These questions consist of two statements each, printed as Assertion and Reason. While answering to choose any one of the following four responses.

(1) If both Assertion & Reason are True & the reason is correct explanation of the Assertion.

(2) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.

(3) If Assertion is True but the Reason is False.

(4) If both Assertion & Reason are false.

Q.1 **A :** A chronic vasoconstriction of arterioles may cause hypertension.
R : In vasoconstriction abnormal rise in the arterial blood pressure occurs.

Q.2 **A :** Fainting is a homeostatic mechanism.
R : Prolonged standing leads to fainting.

Q.3 **A :** The increased permeability of the lymph capillaries is easily altered.
R : Do not increased permeability of the lymph capillaries is easily altered.

Q.4 **A :** Arterioles possess smooth muscles on their walls.
R : These smooth muscles help in regulating blood volume flowing through a tissue or organ.

Q.5 **A :** Blood flows at a very slow velocity in the lacunae and sinuses of prawn.
R : This happens because of the absence of heart in the prawn.

Q.6 **A :** The open circulatory system is more efficient than the closed circulatory system.
R : The blood flows far more rapidly in open circulatory system than in the closed one.

Q.7 **A :** Larger animals have higher heart rates than smaller animals.
R : Metabolic rate of a larger animal is higher than a smaller animal.

Q.8 **A :** Heart of fish contains only deoxygenated blood.
R : Oxygenated blood do not return back to the heart in fishes.

Q.9 **A :** The cardiac impulse is said to be myogenic.
R : Rate of formation and conduction of cardiac impulse can be changed by the action of nerves

Q.10 **A :** Walls of ventricles are thicker than the auricles.
R : This helps in preventing the back flow of the blood.

Q.11 **A :** Ventricular systole precedes the atrial systole.
R : The cardiac impulse passes relatively fast across the AV node.

Q.12 **A :** Left ventricle of heart has a thinner wall than that of the right ventricle.
R : Left ventricle needs to pump blood to nearby lungs only.

Q.13 **A :** AV bundle is essential for the conduction of cardiac impulse.
R : There is no continuity between the cardiac muscle fibres of the auricles and those of the ventricles.

Q.14 **A :** Mixing of oxygenated blood occurs in reptilian and amphibian hearts.
R : This happens because of the incomplete partitioning of the auricle.

Q.15 **A :** AV node is also called as the pacemaker of the heart.
R : It is because of the fact that AV node determines the rate of heart beat.

Q.16 **A :** Pulse rate per minute can be counted to know the heart rate.
R : Each heart beats send one pulse along the arteries.

Q.17 **A :** There is no mixing of oxygenated and deoxygenated blood in the human heart.
R : Valves are present in the heart which allows the movement of blood in one direction only.

Q.18 **A :** Hypotension is observed in arteriosclerotic patients.

R : In the condition of arteriosclerosis, the arteries gain their elasticity and get stiffened.

Q.19 **A :** EEG is of immense diagnostic value in the cardiac diseases.

R : Defects in cardiac functions can be reflected in changes in the pattern of electrical potential recorded in the EEG.

Q.20 **A :** An artificial pacemaker can replace the sinoatrial node of heart.

R : This is because, an artificial pacemaker is capable of stimulating the heart electrically to maintain its beats.

Q.21 **A :** Extracellular fluids transport nutrients.

R : Extracellular fluids flow throughout the body.

Q.22 **A :** More advanced animals require a greater and speedier supply of nutrients and oxygen.

R : More advanced group of animals possesses higher metabolic rates.

Q.23 **A :** Blood is the circulatory fluid.

R : Blood has some advantage over water.

Q.24 **A :** Many advanced invertebrates have open circulatory system.

R : The open circulatory system is open to the environment.

Q.25 **A :** The vertebrates have closed circulatory system.

R : Circulation is confined in certain regions of the body.

Q.26 **A :** Heart valves resemble swing doors in action.

R : Valves are present in the heart chamber, at the opening of the heart into large arteries and veins.

Q.27 **A :** Closed circulatory system is more effective than open type.

R : The closed circulatory system considerably enhances the speed, precision and efficiency of circulation.

Q.28 **A :** The normal heart rate is 75/min and cardiac cycle is 0.8 sec.

R : Cardiac cycle is inversely proportional to the heart rate.

Q.29 **A :** Mammalian heart can prevent the mixing of deoxygenated and oxygenated blood.

R : Sinus venosus has totally fused with the right auricle.

Q.30 **A :** Sinus venosus is present as the remnant in mammalian heart.

R : Sinus venosus is not necessary in human blood circulation.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	**Good / Important questions**
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

RESPIRATORY SYSTEM

DEFINITION

Respiration is the physiological catabolic process in which gaseous exchange occurs to oxidise food. The energy generated is utilized and by products, CO_2 and H_2O are given out.

So, respiration is a physio-chemical process. The surface at which exchange of gases occurs is called respiratory surface, and the compounds oxidised in respiration are called respiratory substrate.

TYPES OF RESPIRATION

Following are the types of respiration :

(1) Direct and Indirect respiration

(2) Aerobic and Anaerobic respiration

1. DIRECT AND INDIRECT RESPIRATION

Direct respiration

(a) In this type of respiration, there is direct exchange of gases in between body cells and respiratory medium.

(b) Exchange of gases occurs on the principle of diffusion, through moist body surface.

(c) Direct respiration is found in unicellular organisms like, aerobic bacteria, amoeba, ssponges, hydra, flatworm, roundworm etc.

Indirect respiration

(a) In this type of respiration, their is no direct contact in between the body cells and respiratory medium.

(b) Indirect respiration is found in complex and higher form of organism.

(c) Higher organism have some specialized, structure for gaseous exchange which are called **respiratory organs**.

e.g. (a) Skin - Skin is respiratory organ in annelida and amphibians.

(i) Gills - Most of crustaceans, mollusca, all fishes and some amphibians the exchange of gases in gills is called branchial respiration.

(ii) Lungs - Lungs is respiratory organ in snails, some amphibians, all reptiles, birds and mammals.

(iii) Trachea - Trachea is respiratory organ in insects.

2. AEROBIC AND ANAEROBIC RESPIRATION

AEROBIC RESPIRATION

(i) Respiration which occurs in presence of oxygen is called aerobic respiration.

(ii) The oxygen completely oxidises the food to CO_2 and H_2O releasing large amount of energy. This process can be shown by following way.

$C_6H_{12}O_6 + 6O_2 \rightarrow 6CO_2 + 6H_2O + 2880$ KJ Energy

(iii) Such type of respiration (aerobic respiration) found in most animals and plants.

Phases of aerobic respiration

There are two phases of aerobic respiration.

(A) External respiration (B) Internal respiration

A. External respiration

(i) External respiration is also called **breathing** or **ventillation**.

(ii) It is gaseous exchange in between respiratory organ and outer environment.

e.g. Exchange of gases in between lungs and air.

B-Internal respiration

(i) Internal respiration is also called **tissue respiration**.

(ii) It is the exchange of oxygen of blood and carbon dioxide of body cells through tissue fluid at the cellular level

(iii) It involves cellular respiration in which glucose is oxidised inside the mitochondria of cell to produce H_2O, CO_2 and energy.

ANAEROBIC RESPIRATION

(i) Respiration which occurs in absence of oxygen is called anerobic respiration, anaerobic respiration is also called **fermentation.**

(ii) It is found in bacteria, yeast, parasitic worms

(iii) In this type of respiration food is partially oxidised. It can be shown by following way.

$$C_6H_{12}O_6 \xrightarrow{\text{In intestinal worms}} 2CH_3CHOHCOOH + \text{Energy}$$

(Lactic acid)

Note :

Anaerobic respiration even takes place in certain particular body tissues of aerobes.

e.g. In skeletal muscles fibres, In mammalian RBC.

(iv) In skeletal muscle fibres during vigrous exercise **glucose is metabolised into lactic acid**. The rapid formation and accumulation of lactic acid are responsible for muscle fatigue.

(v) In mammalian RBC anaerobic respiration is found, because no mitochondria is found in mammalian RBC.

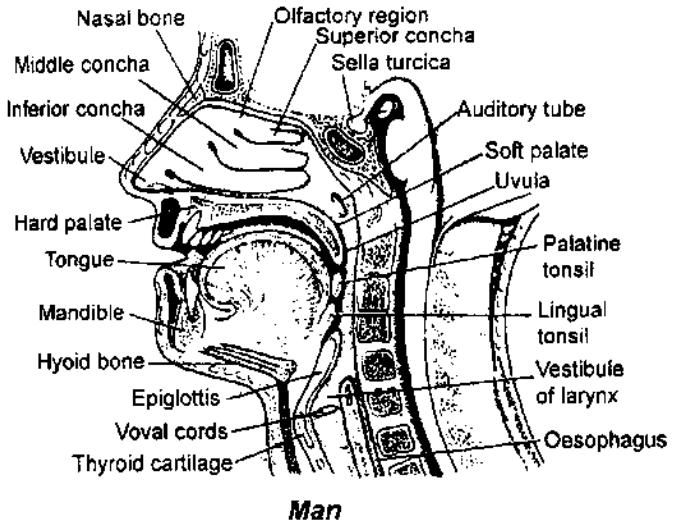
MAMMALIAN (HUMAN) RESPIRATORY SYSTEM

Mammalian respiratory system is formed of following parts-

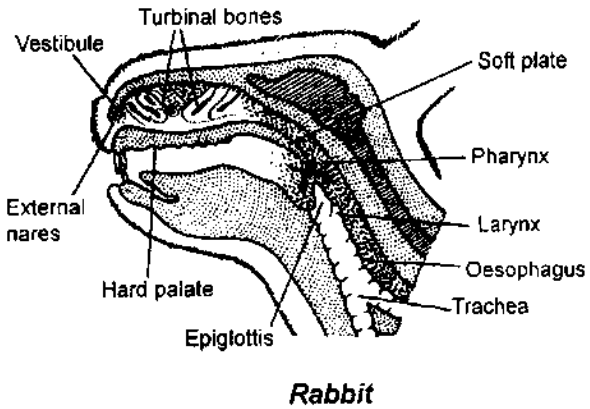
(1) Nostril (2) Nasal chamber (3) Internal nare (4) Pharynx

(5) Laryngopharynx (6) Larynx (7) Vocal cord (8) Trachea

(9) Primary bronchi (10) Lungs



Man



Rabbit

Nostril

(i) It is also called external nare.

(ii) It is oval aperture of nose present at the lower end.

Note : Presence of two nares is called dirhynous stage.

- **Nasal chamber**

  Nasal septum (made of Hyaline cartilage) divides nasal cavity into two nasal chamber by the nasal septum. Each nasal chamber can be divided into three regions. These three parts are as follows -

  (i) Vestibular part

  It is smaller and anterior part, and is lined by hairy skin which acts as filter and prevents entry of dust particles.

  (ii) Respiratory part

  It is middle part and is lined by pseudo-stratified epithelium which acts as air conditioner and brings the inspired air at the body temperature.

  (iii)Olfactory part

  It is upper part of nasal chamber and is lined by olfactory epithelium called **schneiderian membrane**. It looks yellowish brown, This region acts as an organ of smell. Three bony ridges the superior, middle and inferior nasal conchae arises from the wall of each nasal chamber. The nasal conchae increases the surface area of nasal chamber for better air conditioning

- **Internal nares**

  There are posterior opening of nasal chambers that leads into nasopharynx.

- **Pharynx**

  Pharynx comprises nasopharynx, oropharynx and laryngopharynx. The pharynx provides passage to both air and food.

- **Laryngopharynx**

  It is the lower part of pharynx and has a slit like aperature called **glottis**, which can be closed by a leaf like bilobed cartilage **epiglottis**, during swallowing of food bolus.

- **Larynx**

  (i) It is also called **voice box** or **adam's apple** or **pomas adami**.

  (ii) After puberty it get more developed in males in comparison to female, because of this very reason, males have deeper voice.

  (iii) It is supported by four cartilage which prevent its collapsing these cartilage are as follows.

  – Cricoid-1 – Thyroid-1 – Arytenoid-2 – Cartilage of santorini-2

  (i) **Thyroid cartilage**

  - It is single in number (Hyaline Cartilage).
  - It is largest size and c shaped cartilage which supports anterior and lateral sides of upper part of the larynx.

(ii) **Cricoid cartilage**

- It is single in number. (Hyaline Cartilage)
- It is some what smaller, thicker and a complete ring or collar like cartilage around the larynx behind the thyroid cartilage.
- It is broad **dorsally** and narrow ventrally.

(iii) **Arytenoid cartilage**

- These are two pyramid shaped cartilage.(Hyaline carhilage)
- It is smallest cartilage which support posterior wall of upper part of larynx.

(iv) **Cartilage of Santorini**

Each arytenoid terminates in front in a Swollen knob called the cartilage of santorini.(Elastin Cartilage)

- **Vocal cords**
  - In larynx, 2 pairs of vocal cord is found outer pair is **false vocal cord** whereas, inner pair is **true vocal cord** when air is forced through the larynx it cause vibration of true vocal cards and sound is produced.
  - The pitch of the sound is determined by the tension of vocal cards, the greater the tension the higher the pitch.
  - Vocal cards are modified mucous folds of larynx.

Note :

(i) Sound get converted into speech by Tongue. Movement of Tounge is controlled by Speech centre of the brain.

(ii) Speech centre is not well developed in dumb persons.

(iii) Voice of rabbit is called **Quacking**.

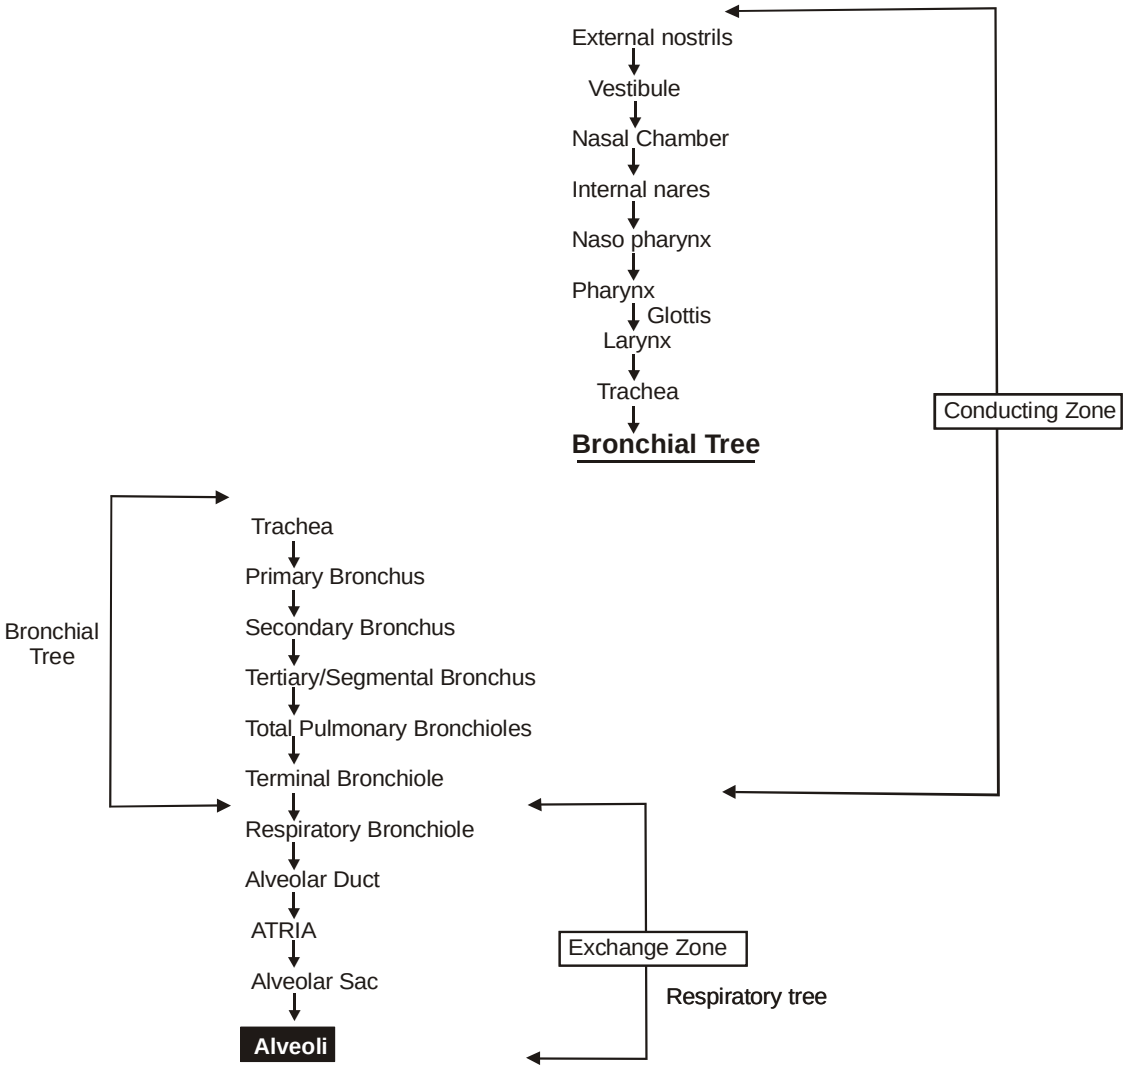
(iv) False vocal cord remain absent in **Elephant**.

(v) True vocal cord remain absent in **Hippopotamus**.

(vi) Voice apparatus of birds is called **syrinx**.

- **Trachea (Wind pipe)**
  - It is long, tubular structure which runs downward through the neck in front of oesophagus.
  - It is supported by 16-20 dorsally incomplete C-shaped cartilagenous tracheal ring, which prevents its collapsing.
  - It is lined by pseudostartified ciliated epithelium with mucous secreting goblet cells.
- **Primary bronchi**
  - These are one pair of small thin walled tubular structure formed by the division of trachea at the level of 5th thoracic vertebrae near the heart.
  - The right bronchus (2.5 cm) is wider shorter and more vertically placed then the left bronchus.
  - Like trachea primary bronchi is supported by cartilaginous rings.
  - Each primary bronchus enters the lungs of its own side.
- **Bronchial tree (B.T.) & Respiratory Tree (R.T.)**
  - When trachea enter into thoracic cavity, it divides in two branches called as primary bronchus. Branches of Primary bonchus upto terminal bronchioles makes **bronchial tree**
  - Terminal bronchioles divide to form respiratory bronchioles & branches of respiratory broncholes makes **respiratory tree**
  - In branchile tree, cartilage rings are present, while these are absent in respiratory tree.
  - Gaseous exchange occurs in respiratory tree while it is absent in bronchial tree.
  - Volume of air which is filled in B.T. is a part of **dead space volume.** which doesn't take a part in gaseous exhange. (150 ml)

There are two zones.



- **Lungs**
  - **Position**

    Lungs are present in thoracic cavity on either side of heart.
- **Pleural membranes**
  - Each lung is enclosed with double membrane pleural membrane.
  - The outer membrane is called **parietal pleura**. Whereas inner membrane is known as visceral pleura.
  - In between two pleural membranes, hollow space is found which is called pleural cavity.
  - Pleural cavity is filled with watery fluid called **pleural fluid.** Pleural fuild is secreted by pleural membrane.

    Pleural fluid perform three function which are as follows-

(a) It allows free frictionless movement of lungs.

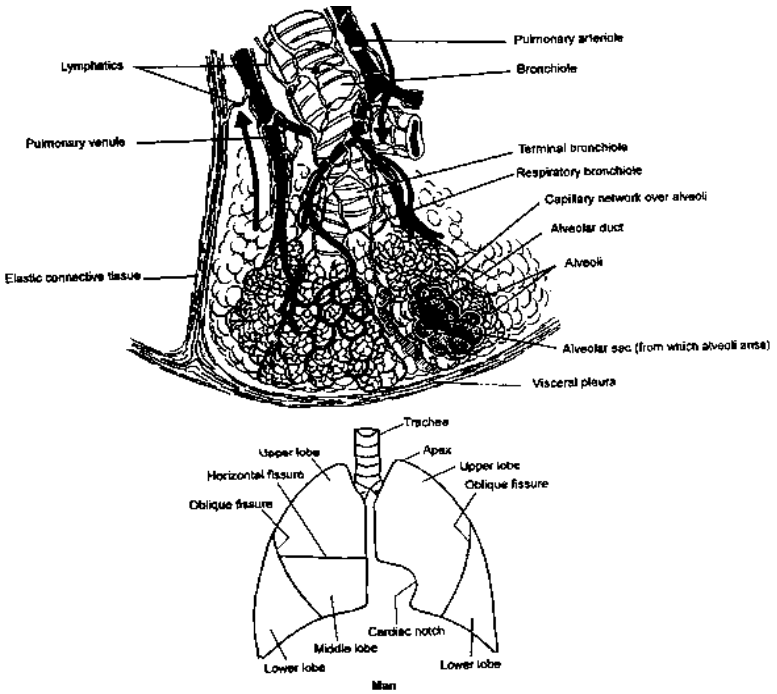
(b) It protects the lungs from mechanical shock.

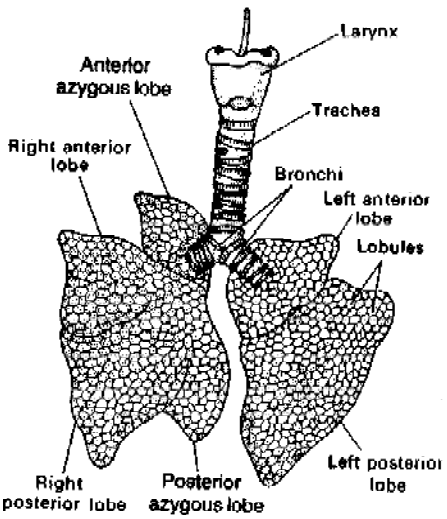
(c) It prevents pleural membrane from sticking together.

Note :

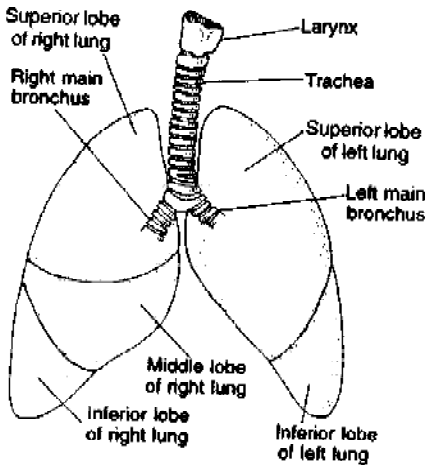
Accumulation of fluid between the pleura is called pleural effusion or pleuricy. It happens because of bacterial infection and the person feel difficulty in breathing. due to the increased intrapleural pressure

- **External structure of lungs**
  - The lungs are spongy, soft, pinkish elastic organs.
  - The most upper portion of each lungs is called the **apex** and the most lower portion is called the **base**.
  - **Right lung** is slightly larger and broader in size.
  - Each lung is a lobulated structure and is divided externally into the lobes by transverse and oblique grooves called **fissures**.





Lung of Rabbit



Lung of Man

- **Lobes of lungs**

  (A) Lobes of lungs in man

  (i) Left lung is 2 lobed, upper superior lobe, and lower inferior lobe. (575 gm)

  (ii) Right lung is 3 lobed; upper superior lobe, middle lobe and lower inferior lobe. It is demarcated by transverse and oblique fissures. (625 gm)

(B) Lobes of lungs in rabbit

(i) Right lung is 4 lobed, the right lobes are anterior and posterior azygous medianwards and right anterior and right posterior lobes outwards.

(ii) Left lung is 2 lobed upper anterior and lower posterior lobe.

- **Alveoli :**

Each lobe is further divided into several lobules by septas of connective tissue. Each lobule is further divided into several airsacs ; and in the end, each air-sac is lastly divided into 3 or 4 alveolis ; which are also termed as the units of lungs.

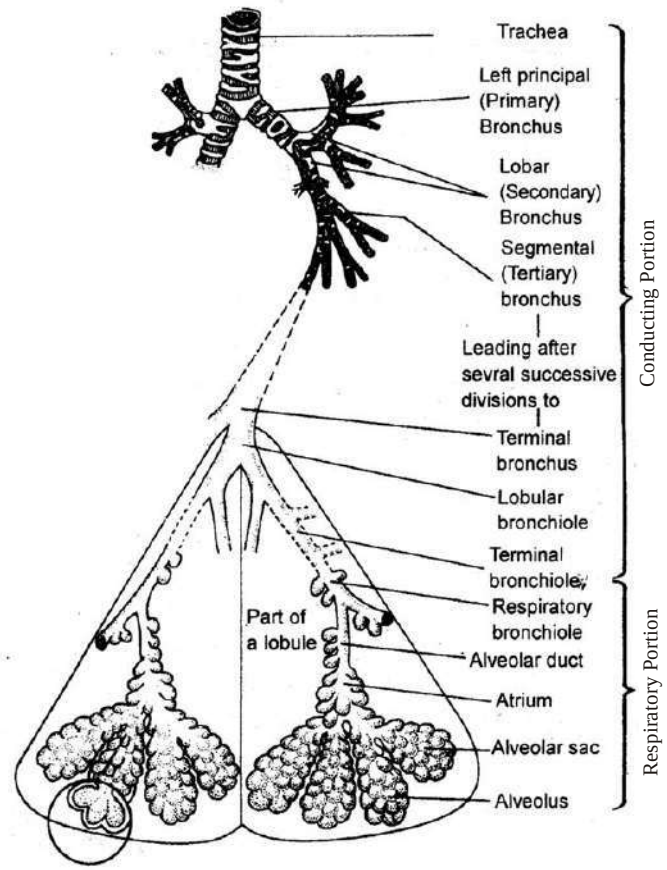
Sturctural & functional unit of lungs is called **alveoli**

Approximately 300 million alveoli are present in Both lungs. Inner (Alveolar) surface area of both lungs is approximately 100 m^2. Wall of alveoli consists of two layers, outer layer is composed of yellow fibrous C.T. Inner layer is composed of Simple Squamous Epithelium

– squamous cells are called as **pneumocytes.**

– most of these Pneumocytes help in gasesous exhanges while few pneumocytes which are larger in size (type II pneumocyte) secrete LECITHIN (Phospholipid) this acts as surfactant which prevents alveoli from remaining collapse by reducing its surface tension.

Alveolis internal surface is termed as the Respiratory surface. It is derived from the endoderm of the embryo. Rest whole lung is mesodernal. The middle part of alveoli wall is made up of connective tissue.It is richly supplied with blood capillaries, a dense network of blood capillaries is found in alveoli.



These blood capillaries come from pulmonary artery. Pulmonary artery divides into blood capillaries after reaching in lungs. These capillaries from a dense network in the walls of alveoli. All these capillaries combine to form pulmonary vein at the another end.

These veins carries pure blood to the left auricle of the heart. There are small pores present in the walls of alveoli. These pores make difusion of gases easy. These pores are called **pores of Kuhn**. It is the characterstic feature of mammalian lungs, that there is no central cavity, Mammalian lungs are **solid and spongy.**

Muscles are absent in the lungs of mammals. So the power of self-contraction and self-expansion is absent in these lungs. (Sucken lungs).

- **Internal structure of lungs**
- **Thoracic cavity**
  - Thoracic cavity is like a cage, so also called thoracic cage.
  - Thoracic cavity is combination of following structure.

(a) Vertebral column - Found on dorsal part of thoracic cavity.
(b) Sternum - Found on ventral part of thoracic cavity.
(c) Ribs - Found on lateral part of thoracic cavity.
(d) Diaphragm - Found on posterior part of the throacic cavity.

- **Diaphragm**

A muscular septum which is found only in mammals (and crocodile). Normal shappe of it is dome like which divides body cavity in two parts upper thoracic cavity & lower adbominal cavity.
In it radial muscles are present. They originate from periphery and inserted in central region of diaphragm. By the contraction in these mucles, diaphragm become flattened in shape. So, volume of thoracic cavity increases. Therefore, diaphragm helps in inspiration.

- **Intercostal muscles (ICM)**

Space between two ribs is called intercostal space in which 2 types of muscles are present
– External ICM. (EICM) – Internal ICM. (IICM)

(a) EICM

They originate from dorsal part of upper rib & insert on ventral part of lower rib. By the contraction in this muscles, rib. and sternum shifts upward and outward. So they helps in inspiration.

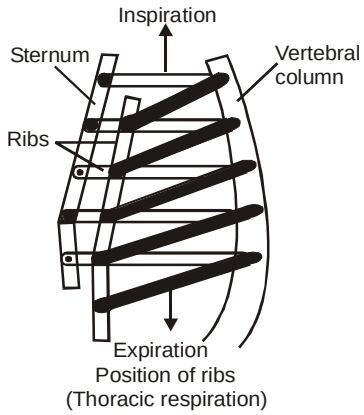
(b) IICM

They originate from dorsal part of lower rib and insert in ventral part of upper rib. By the contraction in these muscles, ribs and sternum shifts downward and inward respectively, so it helps ih forceful expiration which is a voluntary acitivity. So contraction of IICM is under the control of cerebrum.

MECHANISM OF RESPIRATION OR BREATHING

Mechanism of Breathing involves two phases

(1) Inspiration (2) Expiration



Position of ribs
(Thoracic respiration)

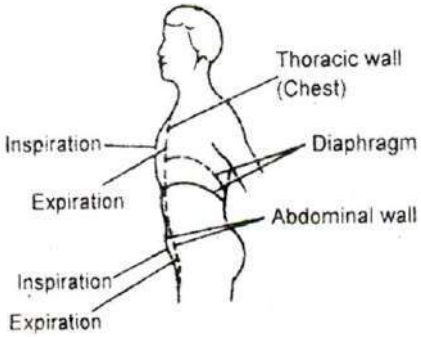
- **INSPIRATION**

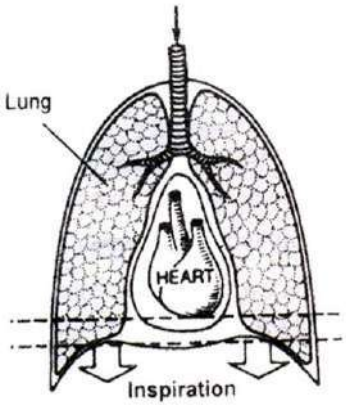
(i) It is a process by which fresh air enters the lungs, the intercostal muscles, diaphragm, and abdominal muscles play an important role.

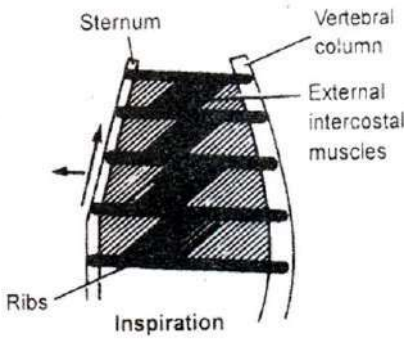
(ii) During inspiration, diaphragm becomes flat and gets lowered by the contraction of its radial muscle fibres, This increases vertical diameter of Thoracic cavity.

(iii) Due to contraction of external intercostal muscles, ribs and sterum are pulled upward and outward and it also result in increase of transverse diameter of thoracic cavity.

(iv) Due to increase in both diameters of thoracic cavity, intrapleural pressure falls causing decompression of lungs so lungs expand due to elastic recoil and air pressure within lungs decrease. The greater pressure outside the body now causes air to flow rapidly into lungs.





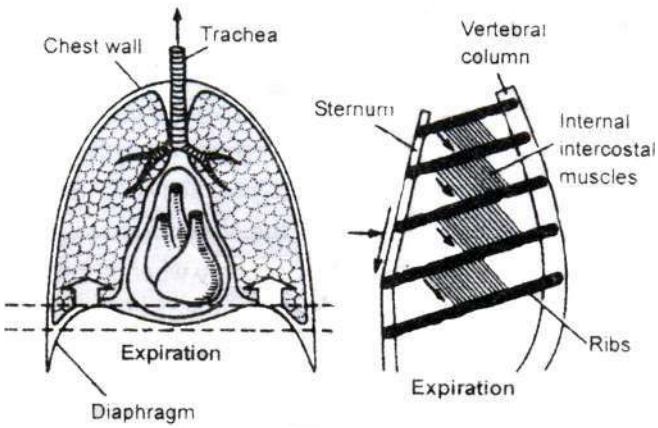


- **EXPIRATION**

(i) It is a process by which the foul air (carbon dioxide) is expelled out from the lungs.

(ii) It is passive process

(iii) During expiration muscles fibres of the diaphragm relax, so diaphragm becomes convex towards thoracic cavity, it results in decrease vertical diameter of thoracic cavity.



(iv) Due to relaxation of external intercostal muscles, ribs and sternum return back to their original position and this also results in decrease in transverse diameter of thoracic cavity.

(v) Due to decrease in both diameter of thoracic cage, intrapleural pressure increases, lungs are now compressed so pressure within lungs increase, the greater pressure within lungs force foul air from lungs to outside of body.

- **Forceful expiration**

During forceful expiration as during exercise coughing and sneezing, abdominal muscles and internal intercostal muscles come into action which rapidly reduces volume of thoracic cavity. So, abdominal musclesand internal intercostal muscles are called expiratory muscles.

REGULATION OF BREATHING

Breathing is an **involuntary process** and is **controlled by medulla oblongata**, but it can be made voluntary for a short while, during this period it is **controlled by cerebrum**, those involuntary process which can be made voluntary are called **Reflex action**.

- Breathing is regulated by two controls

  (1) Nervous control (2) Chemical control

1. NERVOUS CONTROL

The respiratory rhythm is controlled by the nervous system. The rate of respiration can be enhanced asper demand of the body during strainous physical exercises. A number of groups of neurons are located bilaterally in the medulla oblongata control the respiration, these are called **respiratory centres.** Three groups of respiratory centres have been indentified, namely : dorsal respiratory groups, ventral respiratory group and pneumotaxic centre.

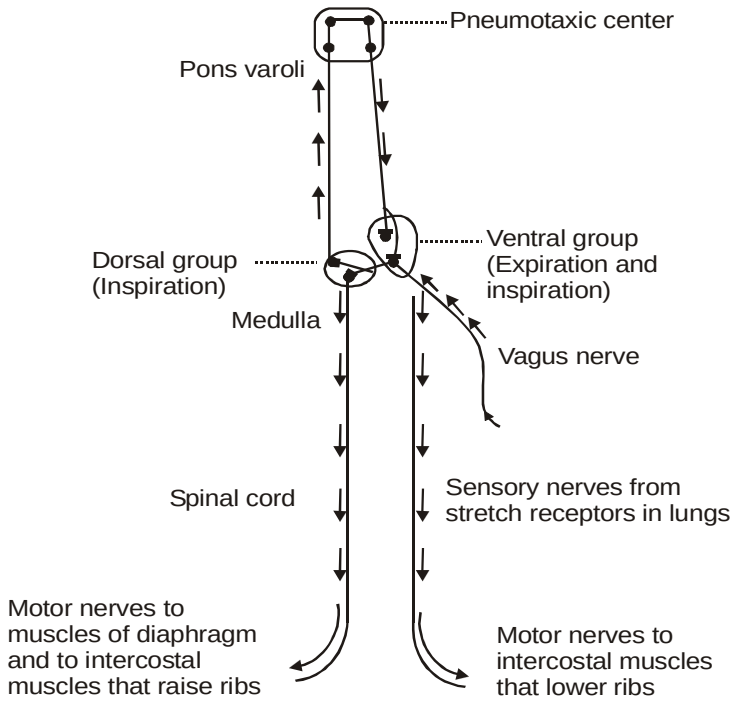


Diagram showing nervous control of breathing

The **dorsal respiratory group** is present in the dorsal portion of medulla oblongata. The signals from these neurons generate the basic respiratory rhythm. The nervous signal released from this group is transmited to the diaphragm, which is the primary inspiratory muscles & EICM. The **ventral respiratory group** of neurons are located anterolateral to the dorsal respiratory group During normal respiration, this remains inactive and even does not play any role.

In this enhanced respiratory drive, the respiratory signal of this group contributes to fulfil the demand by regulating both inspiration and expiration. Few of the neurons of this group control inspiration, while few other control expiration, thus regulating both. The **pneumotaxic centre** is located dorsally in the upper pons. It transmits signals to the inspiratory area. Primarily, it controls the switch off point of inspiration. When this signal is strong (high frequency), the inspiration lasts for a shorter duration and lungs are filled partially. During weak pneumotaxic signal, inspiration lasts for a longer duration resulting into complete filling of lungs. The strong signal (high frequency) causes increased rate of breathing, because duration inspiration as well as expiration, is shortened. The concentration of CO_2 and H^+ cause increased strength of inspiratory, as well as expiratory signal. However, oxygen has no such direct effect.

- **Heiring breuer reflex arch :**

  In the walls of terminal bronchioles and atria stretch receptors are present, Which are normally inactive but they become active when the lungs are excessively inflated due to failure of switch off of inspiration. The heiring breuer reflex arch now becomes activated and sends inhibitory signals to the inspiratory centre to switch off inspiration. This prevents the alveoli from over stretching and bursting. Thus Heiring Breuer reflex arch is a protective reflex which works only when normal mechanism of switch off of inspiration does not work timely due to any reason.

2. CHEMICAL CONTROL

- **Effect of CO_2**
  - Chemoreceptors are found in the **carotid bodies** (located in the wall of carotid arteries) and in the **aortic bodies** (located in the wall of aorta).
  - These chemoreceptors are stimulated by an increase in carbon dioxide concentration and by an increase in hydrogen ion concentration (pH) in the arterial blood.
  - Increased CO_2 concentration lowers the pH resulting in **acidosis**. These chemoreceptors sends signals to inspiratory and expiratory centres, thus rate of breathing is increased.

Note :

Activity and function of respiratory centre also get affected by body temperature and blood pressure. In case of increased blood pressure or increased body temperature the breathing rate also increases.

EXCHANGE OF GASES

(i) Ledwig at first described exchange of gases in blood.

(ii) Exchange of gases occurs in lungs and body tissue.

- **Exchange of gases in lungs**
  - Exchange of gases in lungs is also called pulmonary gas exchange.
  - In the lungs exchange of gases takes place between the air in the alveoli and the blood in the capillaries around the alveoli.
  - In this exchange of gases blood takes up oxygen from the alveolar air and release CO_2 to the alveolar air.
- **Uptake of oxygen (O_2) by pulmonary blood**

  The pO_2 (partial pressure of oxygen) of the alveolar air is 104 mm Hg and PO_2 of blood in alveolar capillaries is 40 mm Hg. Due to pO_2 differences of 64 mm Hg between air and blood. Oxygen diffuses rapidly from the alveolar air into the blood of alveolar capillaries raising PO_2 of blood to about 95 to 104 mm Hg.
- **Uptake of CO_2 by the air**

  The pCO_2 of the venous blood entering the pulmonary capillaries is 46 mm Hg while that of the alveolar air is 40 mm Hg. Therefore CO_2 diffuses from the blood of alveolar capillaries into the alveolar air till the pCO_2 of blood falls to 40 mm Hg.
- **Exchange of gases in tissue**

(i) The oxygenated blood is send from the pulmonary blood capillaries to the heart. The heart distributes this oxygenated blood to various body parts and tissues through arteries. The arteries divide to form arterioles which further divide to form capillaries.

(ii) In tissues exchange of gases occurs between the blood and the tissue cells. The exchange occurs through tissue fluid that surrounds the tissue cells.

(iii) The blood reaching the tissue capillaries has PO_2 of 95 to 104 mmHg and PCO_2 of 40 mmHg. The tissue cell have lower pO_2 and higher pCO_2. Due to pO_2 and pCO_2 difference between blood and tissue cell, oxygen separates from oxyhaemoglobin and diffuses from the blood into the tissue fluid and finally into the tissue cells. CO_2 diffuses from tissue cell into the tissue fluid and finally into the blood present in the tissue **capillaries**, as a result of this, the blood becomes deoxygenated. The deoxygenated blood returns to right side of the heart that sends it to lungs for reoxygenation.

(iv) In inspired air oxygen is 19.6% whereas in expired air oxygen is 15.7%, hence, **nearly 4% oxygen comes in from air to blood, similarly in inspired air CO_2 is 0.04%**. Whereas in expired air CO_2 is 3.6% hence nearly **3.56% CO_2 comes out from blood into air**.

Table of partial pressures and percentage concentrations (in brackets) of gases in various airs

Gas	Atmospheric air	Inspired (= humidified air)	Functional residual alveolar air	Expired air
N_2	597.0(78.62%)	563.4(74.09%)	569.0(74.9)	566.0(74.5%)
O_2	159.0(20.84%)	149.3(19.67%)	104.0(13.6%)	120.0(15.7%)
CO_2	0.3(0.04%)	0.3(0.04%)	40.0(5.3%)	27.0(3.6%)
H_2O	3.7(0.5%)	47.0(6.2%)	47.0(6.2%)	47.0(6.2%)
	760.0(100%)	760.0(100%)	760.0(100%)	760.0(100%)

Partial Pressure	Alveolar air	Pulmonary Arterial Blood	Pulmonary Venous Blood
PO_2	104 mm Hg	40 mm Hg	95 - 104 mm Hg
PCO_2	40 mm Hg	45 - 46 mm Hg	40 mm Hg

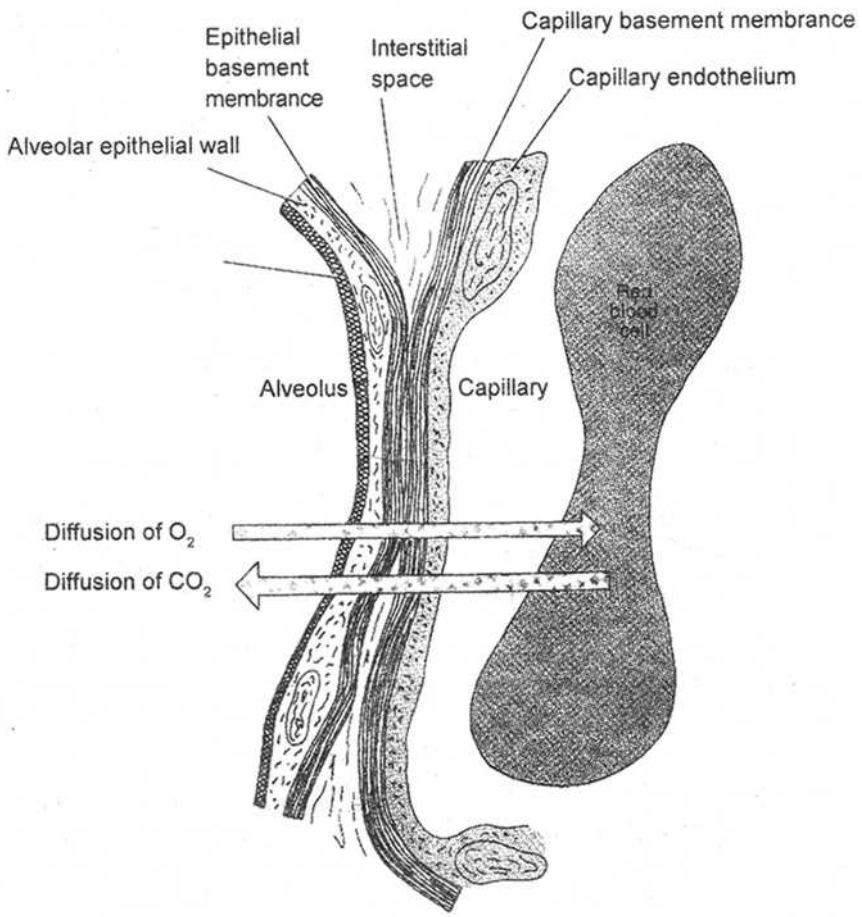
TRANSPORT OF GASES IN BLOOD

Blood carries oxygen from lungs to the heart and from the heart to various cells and tissue.

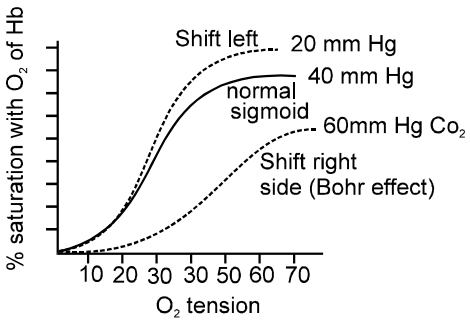
The blood also brings CO_2 from cells and tissue to the heart, from heart to lungs, for expiration.

- **TRANSPORT OF OXYGEN**

As much oxygen comes in the blood from air, approximately 3% of it dissolves in the blood plasma. Remaining 97% oxygen combines with haemoglobin to form oxygaemoglobin. One molecule of haemoglobin combines with 4 molecules of oxygen Haemoglobin is made up of 4 units. Every unit of it, reacts with one molecule of oxygen. 1 gm haemoglobin can combine with a maximum of 1.34 ml of oxygen and 100 ml blood carries about 15 gm haemoglobin so 100 ml blood transports approximately 20 ml of oxygen. Oxygen does not oxidise haemoglobin. Formation of oxyhaemoglobin is a process of oxygenation. The valency of iron is 2 in oxyhaemoglobin. Some gases (eg. Ozone SO_3, NO, NO_2 etc.) oxidise haemoglobin. This oxidised haemoglobin is alled Methamoglobin. This is a colourless compound. This type of gases are enviromental pollutant. At the time, oxyhaemoglobin reaches upto the tissues it dissociates. O_2 freed it goes into the tissue fluid from blood. In place of it, CO_2 from tissue fluid comes into blood. Gaseous exhange between blood and tissue is called internal respiration. It is also done by simple diffusion. In a conduction cycle blood gives its 25%O_2 to tissues . The rate of saturation of haemoglobin with O_2 is directly proportional to concentration of oxygen as with a rise in pO_2 the affinity between O_2 and Hb also increases.



- **Oxygen dissociation curve**
  (i) The relationship between the saturation of haemoglobin and oxygen tension is studied by examination of dissociation curve of oxyhaemoglobin.
  (ii) Oxygen dissociation curve is **sigmoid**. It is also called oxygen equilibrium curve.
  (iii) At normal condition it is sigmoid & normal.
  (iv) With increase in concentration of CO_2 in tissues curve shifts towards right side and % of O_2 in Hb decreases due to more dissociation of oxyhaemoglobin.
  (v) By decrease in conc. of CO_2 in tissues curve shifts towards left side and % of O_2 in Hb becomes more due to low dissociation of oxyhaemoglobin.
  (iv) p50 is the partial pressure of O_2 at which Hb is 50% saturated with O_2. Its normal value is 30 mmHg.



Factors affecting oxygen dissociation curve

(a) Temperature - Oxygen dissociation curve turns to right side with increase in temperature.

(b) pCO_2 - Oxygen dissociation curve turns to right side and oxygen binding capacity of haemoglobin is lowered with increase in pCO_2.

(c) pH - Oxygen dissociation curve turns to right side with decrease in pH. Moreover dissociation of oxyhaemoglobin will increase when pH of blood falls or H^+ concentration of blood rises.

(d) Fetal Haemoglobin - Pressure of Fetal Hb shifts the curve fowards left. Because fetal Hb has a higher degree of affinity with oxygen than normal haemoglobin.

- **Bohr effect**

(i) Bohr effect is the effect of CO_2 on **oxyhaemoglobin**.

(ii) Dissociation of oxyhaemoglobin is directly proportional to blood pCO_2. Because with a rise in pCO_2 the affinity between oxygen & haemoglobin decreases.

- **Haldane effect**

According to haldane effect the **oxyhaemoglobin** behave like strong acid and cause dissociation of CO_2 from its carrier compounds.

TRANSPORT OF CARBON DIOXIDE

During oxidation of food CO_2, water and energy are produced. From the cells carbon dioxide in gaseous state diffuses out of the cells into the capillaries. From capillaries it is transported by 3-ways.

1. As a dissolved gas

A very small amount of CO_2 about 5% to 7% dissolves in the plasma and is carried as a physical solutions to the lungs.

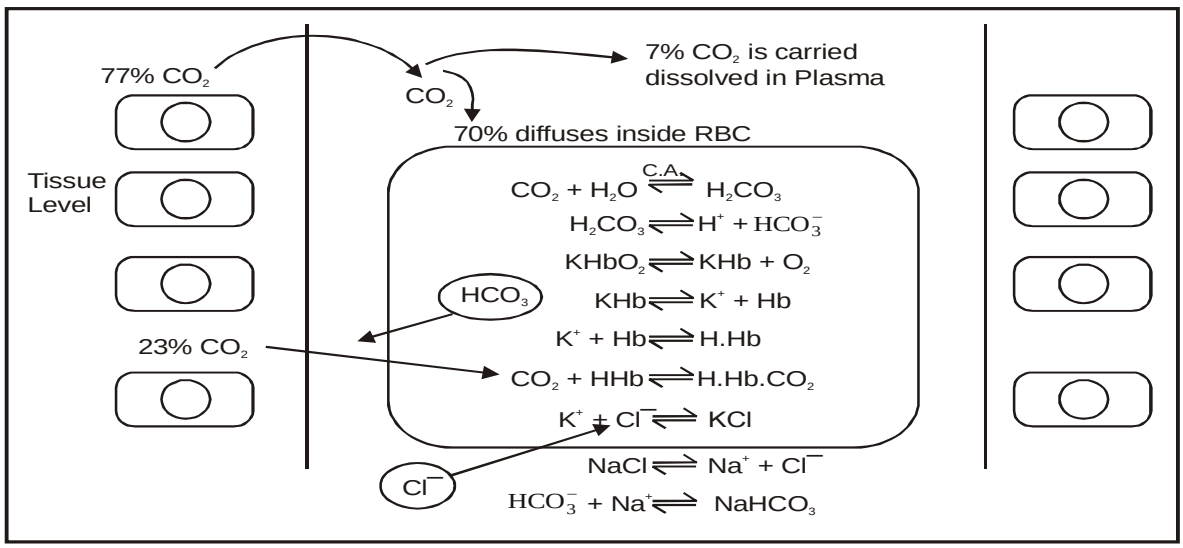
2. As bicarbonates

(i) About 70% of CO_2 enters the erythrocytes where it react with water to form **carbonic acid** in the presence of an enzyme called the **carbonic anhydrase**.

(ii) In erythrocytes most of the **carbonic** acid rapidly dissociates to form bicarbonate and hydrogen ion.

(iii) Bicarbonate ion passes out from the erythrocytes into the plasma. This causes significant difference in ionic balance between ions in the, plasma and those inside the erythrocytes. To restore the ionic balance the chloride ion diffuse from the plasma into the erythrocytes. This movement of chloride ions is called **chloride shift or Hamburger's phenomenon** reported by **Hamburger in 1918**. The chloride shift maintains an acid base equilibrium of pH 7.4 for the blood and electrical balance between erythrocytes and plasma.

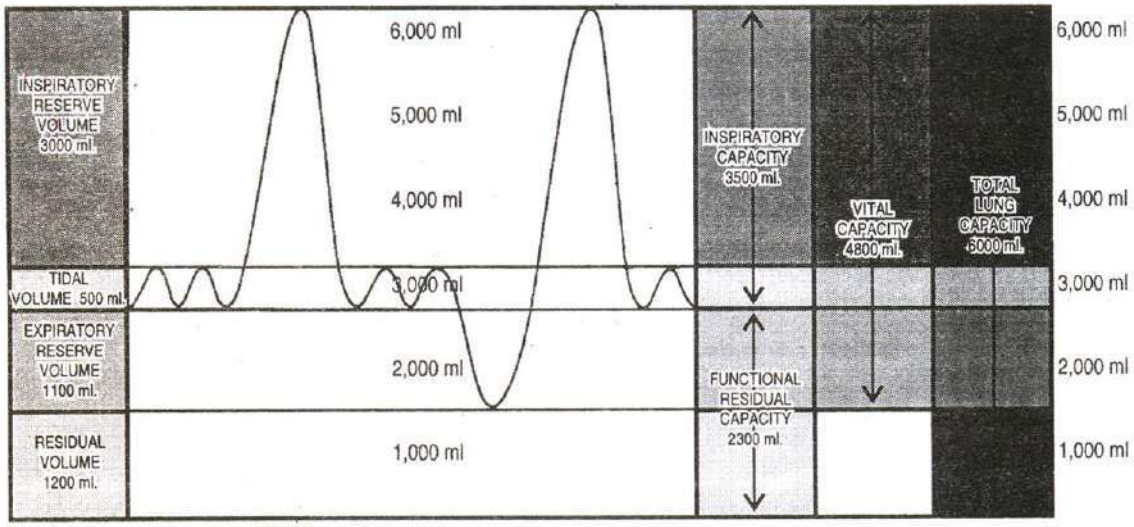
(iv) Some of the bicarbonate is carried in erythrocytes while most of bicarbonate is released into plasma and carried or transported by it



3. As carbaminohaemoglobin

About 23% of CO_2 it transported as carbamino haemoglobin which is formed by the **reversible combination** of CO_2 with amino group of globin part of the haemoglobin.

- **PULMONARY CAPACITY (SPIROMETRY)**



1. Tidal volume

- Volume of air inspired or expired with each normal breath (in voluntarily) is called tidal volume.
- In normal person tidal volume is **500 ml**.

2. Inspiratory reserve volume (IRV) or complimental air volume

- It is the extra volume of air which can be inspired by deepest forced inhalation beyond tidal volume.
- It is about 3000 ml

3. Inspiratory capacity

- It is total volume of air that can be inhaled forcefully after a normal exhalation.

  IC = TV + IRV

  = 500 + 3000 = 3500 mL.

4. Expiratory reserve volume (ERV)

- It is extra amount of air that can be expired forcibly after a normal expiration. It is about 1100 ml.

5. Residual volume (RV)

- It is volume of air which remains still in the lungs even after the most forceful expiration.It is about 1200 ml.

6. Functional residual volume (FRV)

- It is the amount of air that normally remains inside lungs after a normal expiration.
- It is equal to the sum of expiratory reserve volume and the residual volume.

  E.R.V. + R.V. = FRC

- It is about 2300 ml

7. Vital capacity of lung (V.C)

- It is the maximum amount of air that can be expelled from the lungs by forced exhalation after a deepest forced inhalation. It is equal to sum of tidal volume, inspiratory reserve volume and expiratory reserve volume.

  V. C. = TV + IRV + ERV = 500 + 3000 + 1100 = 4600 ml

  Vital capacity is higher in mountain dwellers, atheletes, young person and men.

8. Total lung capacity (TLC)

- It is the total amount of air that can be present in the lungs after a maximum inhalation effort.

TLC = VC + RV OR TV + IRV + ERV + RV

= 5-6 liter (Average 5800 ml)

- **Respiratory pigment**

Name of pigment	Colour (oxidised)	Metal	Place	Example
Haemoglobin	Red	*Fe*	RBC	Chordata (Vertebrate)
Haemocyanin	Blue	*Cu*	Plasma	Mollusca and arthropoda
Chlorocruorin	Green	*Fe*	Plasma	Annelida, sabella, serpulids
Haemoerythrin	Red	*Fe*	Corpuscle	Annelida, Sipunculoidea, lingula
Venadium	Green	*Va*	Vanadocytes in Plasma	Urochordata
Echinochrome	Red	*Fe*	Coelomic fluid	Echinodermata
Pinnoglobin	Brown	*Mn*	Coelomic fluid	Pinna
Molpedin	Brown	*Mo*	Coelomic fluid	Holothuria
Heamoglobin	Red	*Fe*	Plasma	Earthworm, nereis, arenicola, chironomas insect, planorbis.
Erythrocruonin	Red	*Fe*	Plasma	Leech

RESPIRATORY QUOTIENT

Respiratory quotient is the ratio of the volume of carbon dioxide produced to the volume of oxygen consumed over a period of time in respiration.

$$\textbf{RQ} = \frac{\text{Volume of } CO_2 \text{ evolved}}{\text{Volume of } O_2 \text{ absorbed}}$$

- Respiratory quotient varies with different foods utilized in respiration.
- For **glucose**, RQ is 1 (RQ = 6 $CO_2/6O_2$ = 1), for **fats** it is about 0.7, for **proteins** it is about 0.9 and for organic acids it is about 1.3 or 1.4.
- In anerobic respiration, there is no consumption of oxygen. Carbon dioxide is produced in most of the cases. Therefore **R.Q. is infinity.**
- The respiratory quotient indicates the type of food oxidized in the body of the animal during respiration.
- R.Q. is determined by **Ganong's respirometer**.

COMMON RESPIRATORY DISEASES

1. **Pharyngitis -** It is an inflammation of the pharynx, often called sore throat. It may accompany the common cold and it usually involves inflammation of the tonsils.
2. **Laryngitis -** It is an inflammation of the larynx that often accompanies pharyngitis. In laryngitis, inflammation of the larynx disturbs the vibration of vocal cords and speaking is difficult or impossible.
3. **Bronchitis-** It is an inflammation of the bronchi. Bronchitis is caused by an infection or some other forms of irritation.

4. **Asthma -** It is caused by an allergic reaction to foreign substances that affects the respiratory tract. Allergens stimulate. the release of histamine from the mast cells. Histamine cause bronchial smooth muscle to contract. Exhaling is more difficult than inhaling.
5. **Emphysema -** In this respiratory disorder, many septa between the alveoli are destroyed and much of the elastic tissue of the lungs is replaced by connective tissue. Major causes are cigarette smoking and inhalation of other smoke or toxic substances over a period of time.
6. **Hypoxia -** It is an insufficiency of oxygen reaching the tissues of the body.
7. **Yawning -** A deep inspiration through widely opened mouth producing an exaggerated depression of the lower jaw. May be stimulated by drowsiness or fatigue.
8. **Pleurisy -** In this disease pleural membranes surrounding the lungs get inflammed and scrape against each other during breathing.
9. **Coughing -** Coughing is a protective reflex to getrid of the irritation in the throat and respiratory passage. The irritation may be caused by illhaled dust, food, smoke, mucus from lungs or nasal passages.
10. **Sneezing -** It is a protective relex to get rid of the irritation in the nasal passage.
11. **Whooping cough -** Whooping cough is caused by Haemophilus pertussis. It spreads by discharge from the throat of infected persons.
12. **Tuberculosis -** It is caused by bacteria-Mycobacterium tuberculosis. It spreads through sputum of infected persons. Sputum is mucus expelled from trachea via mouth. It contains the mucus trapped dust particles and bacteria. The bacteria of T .B. release tuberculin, a toxin which causes fever, loss of weight and general weakness. The bacteria damage the lung alveoli and cause coughing. Tuberculosis can be cured by BCG vaccine.
13. **Influenza or flu -** It is a viral disease. The common symptoms are fever, pain in the body arid discharge through nose.
14. **Mountain sickness -** Persons living in plains, when ascend mountains above 8000 ft.. from sea level, develop symptoms of mountain sickness within 8-24 hours. The symptoms are breathlessness, headache, dizziness, nausea, vomiting, mental fatigue and even bluish tinge on skin, nails and lips. This is because partial pressure of oxygen Po_2 falls with the fall of atmospheric pressure and rise of altitude. This lowers Po_2 in alveolar air and consequently reduces diffusion of oxygen into the blood. The fall in oxygenation of blood produces mountain sickness.
15. **Hiccough -** (Hiccup). Inspiratory spasm caused by sudden contraction of diaphragm accompanied by loud closure of glottis.
16. **Cyanide poisoning (Histotoxic anaemia)**

    Causing inactivation of cytochrome oxidase enzyme of mitochondria leading to asphyxia & death
17. **CO poisoning**

    Carbon monoxide affinity for haemoglobin is about 300 times more than O_2. It forms a stable carboxy haemoglobin (chery red in colour) hence decreasing oxygen carrying capacity of Hb.

IMPORTANT TIPS

- Protoplasmic respiration refers to the respiration of proteins.
- Polarography is employed to measure the concentration of oxygen in fluid.
- Accumulation of blood in pleural cavity is called haemothorax.
- All pulmonary volume and capacities are about 20-25% less in females than males.
- Accumulation of water is called hydrothorax.
- Accumulation of pus is called pyothorax.

- Accumulation of air is called pneumothorax.
- If chest wall is punctured, then pressure inside the pleural cavity become equal to atmospheric pressure so breathing stops.
- Besides lungs, the term alveolus is associated with bony socket for tooth, and in mammary glands also.
- In general, a man respires about 16 - 18 time in a minute.
- A new born child respires 32/min.
- A five year old child respires 26/min.
- A fifty year old man respires 18/min.
- Respiratory rate is lowest while sleeping (10 minute in human), respiratory rate during sitting (12 minute in human).
- Orthinolarynology - The branch of medicine deals with the diagnosis and treatment of diseases of the ears, nose and throat.
- Rhinoplasty - or 'Nose job' surgically change in shape of external nose.
- Smaller the animal higher the respiratory rate.
- Rate of respiration is directly proportional to concentration of CO_2 in blood.
- Inspired air has 20.48 ml. O_2 in its 100 ml.
- Expired air has 15.70 ml. O_2 in its 100 ml.
- In pregnant woman diaphragm does not take part in breathing.
- After 6 months, formation of alveoli of lungs.
- In embroys of mammals, respiration takes place by chorion.
- In snakes, only right lung in functional, left lung is reduced.
- Rate of breathing of a normal man during heavy exercise is 40-50 times/minute.
- Diaphragm plays 75% part in breathing (abdominal breathing).
- Ribs and sternum plays 25% part in breathing (thoracic breathing).
- In pregnant females most part during breathing is played by intercostal muscles.
- In monkeys, kangaroo and other jumping animals, intercostal muscles play important role in breathing.

SARS - Severe Acute Respiratory Syndrome -

- SARS is a highly infectious disease caused by corona virus.
- Corona virus in RNA virus, its genome was sequenced with in 15 days.
- The origin of SARC is from South China, from South China this disease spread to Hongkong.
- Bird sellers and presous in contact with birds to suffer from SARS.
- Symptoms of infections are flue like symptoms. Fever occurs with dry cough. There is difficult in breathing. Fluid filled in lungs and death occurs with in one week of infection from respiratory failure.
- Rate of death was initially 4% but now death rate has increased to 10%.
- Line of treatment is quarnatine and ribovinin durgs.
- The causative agent of SARS was identified by Dr. Malik Peiris of Microbiology Department of Honkong University.

EXERCISE - 1

Q.1 Oxygenated blood from lungs is carried to the heart by-
(1) Pulmonary artery (2) Pulmonary vein
(3) Coronary vein (4) Pre-cavals

Q.2 A person met with an accident and died instantly without any injury to heart, brain, stomach and kidney. One of the following is a reason for his death-
(1) Intestine got twisted
(2) RBC became coagulated
(3) Stomach stopped digestion
(4) Diaphragm got punctured

Q.3 The function of nasal cavity & nasopharynx is to-
(1) Warm the inspired air
(2) Moisten the inspired air
(3) Filter out the dust particles from the inspired air
(4) All of the above

Q.4 The breathing controlling centre of medulla oblongata is mainly under
(1) Chemical control (2) Physical control
(3) Neural control (4) All of the above

Q.5 Schneiderian epithelium is found in
(1) Trachea (2) Nasal passage
(3) Palate (4) Buccal cavity

Q.6 Much developed larynx of human male is called
(1) Aristole's lanttern (2) Syrinx
(3) Adam's apple (4) Muller's organ

Q.7 What is the cause for the movement of oxygen through the alveolar blood capillaries of lungs
(1) Difference in the O_2 tension and partial pressure of these chambers
(2) Partial pressure of CO_2
(3) Union of O_2 with haemoglobin
(4) All of the above

Q.8 One of the following is a difference between pulmonary respiration of frog and human-
(1) Diaphragm and ribs play role in respiration in frog
(2) Lungs are respiratory organs
(3) Respiration occurs due to pressure gradient in human
(4) None of the above

Q.9 Asphyxia occurs due to-
(1) Rise in level of CO_2
(2) Fall in level of CO_2
(3) Rise of O_2 level (4) Fall in O_2 level

Q.10 The tissue respiration refers to-
(1) Inspiration (2) Expiration
(3) External respiration (4) Internal respiration

Q.11 Cellular respiration depends upon the
(1) Availability of carbohydrates in cells
(2) Concentration of O_2 in atmosphere
(3) Presence of nitrogen with O_2 in air
(4) Transport of O_2 to the cells

Q.12 Respiratory quotient (R.Q.) is equal to one when
(1) Proteins are metabolised
(2) Carbohydrates are metabolised
(3) Fats are metabolised
(4) Mixture of all the three is metabolised

Q.13 Lungs in addition to the respiratory function also help in-
(1) Excretion
(2) Temperature regulation
(3) pH regulation
(4) Maintaining balance of body

Q.14 Impulses for voluntary muscles forced breathing start in
(1) Vagus nerve (2) Spiral cord
(3) Cerebrum (4) Medulla oblongata

Q.15 When the oxygen supply to the tissues is inadequate the condition is-
(1) Hypoxia (2) Asphyxia
(3) Pleurisy (4) Anoxia

Q.16 If the thoracis wall but not lungs is punctured-
(1) The lungs get inflated
(2) The man dies as the lungs get collapsed
(3) The breathing rate decreases
(4) The breathing rate increases

Q.17 During transportation of CO_2 when bicarbonate ions diffuses from RBC into plasma, the increased hydrogen ion concentration RBC is balanced by the entry of which substance from plasma into
(1) Water (2) Oxygen
(3) Hydroxyl ions (4) Chloride ions

Q.18 During respiration in Rabbit atmospheric oxygen is first accepted by
(1) Lungs (2) Alveoli
(3) RBC (4) Trachea

Q.19 The surface of lungs is covered by
(1) Mesentery (2) Serous membrane
(3) RBC (4) Trachea

Q.20 The lungs of Rabbit expand due to
(1) Contraction of muscles in lung walls
(2) Contraction of diaphragm muscles
(3) Relaxation of ribs
(4) Relaxation of abdominal muscles

Q.21 The cartilaginous incomplete rings supporting the trachea are made up of
(1) Elastic cartilage (2) Hyaline cartilage
(3) Fibrous cartilage (4) Calcified cartilage

Q.22 Number of alveoli in the human lungs is-
(1) 300-400 million (2) 100-150 million
(3) 1-2 million (4) 100,000-150,000

Q.23 In human beings, rib case and sternum move upwardly and out wardly during-
(1) Exercise (2) Sudden back injury
(3) Expiration (4) Inspiration

Q.24 Expiration involves-
(1) Relaxation of diaphragm and intercostal muscles
(2) Contraction of diaphragm and intercostal muscles
(3) Contraction of diaphragm muscles
(4) Contraction of intercostal muscles

Q.25 Residual volume refers to the volume of
(1) Air inspired in one breath
(2) Air expired in one breath
(3) Air left in lungs after expiration
(4) Oxygen take in one breath by blood

Q.26 The cavity of the nose is divided into two lateral halves known as
(1) Vibrissae (2) Conchae
(3) Vestibules (4) Fossae

Q.27 The quick energy we get is stored in the
(1) Glucose (2) A.T.P.
(3) ADP (4) Mitochondria

Q.28 Intercostal muscles in Rabbit extend between its
(1) Thoracic ribs (2) Vertebrae
(3) Neck and shoulder (4) Diaphragm

Q.29 If the concentration of CO_2 in blood increases, the process of breathing will
(1) Have no effect (2) Increase
(3) Decrease (4) Irregular

Q.30 During inspiration, air passes into lungs due to-
(1) Increase in volume of thoracic cavity and fall in pressure
(2) Fall in pressure inside the lungs
(3) Increased volume of thoracic cavity
(4) Muscular expation of lungs

Q.31 Expiratory muscles contract at the time of-
(1) Deep inspiration
(2) Normal inspiration and expiration
(3) Forceful expiration
(4) Normal expiration

Q.32 Reduction in respiratory surface of the lungs due to break of partition in the alveoli is known as-
(1) Asphyxia (2) Bronchitis
(3) Asthma (4) Emphysema

Q.33 The rate and depth of breathing will in crease when in blood concentration of
(1) O_2 increases (2) HCO_3 increases
(3) CO_2 increases (4) HCO_3 decreases

Q.34 The function of tracheal hair (cilia) is to pass
(1) Air (2) Air out
(3) Mucous in (4) Mucous out

Q.35 In lungs of Rabbit the alveoli are the sub divisions of
(1) Trachea (2) Bronchioles
(3) Alveolar ducts (4) Infundibulum

Q.36 In the lungs of man the total respiratory surface is about, how many square meters
(1) 10 (2) 100
(3) 1000 (4) 10000

Q.37 Respiration is a
(1) Chemical process
(2) Physical process
(3) Destructive process
(4) Physiochemical process

Q.38 Tidal volume in human beings is-
(1) 1000ml (2) 1500ml
(3) 500ml (4) 4.5 litres

Q.39 Residual volume in the lungs of an average human is-
(1) 500 ml (2) 3–4.5 litres
(3) 1000 ml (4) 1500 ml

Q.40 Vital capacity of lungs of an average human is-
(1) 3000–4500 ml (2) 1500–1800ml
(3) 2000–2500ml (4) 500–1000ml

Q.41 The chemical formula of oxyhemoglobin is
(1) Hb_4O_8 (2) Hb_4O_6
(3) $H_2b_2O_4$ (4) $H_3b_2O_8$

Q.42 Which of the following equations represents respiratory quotient ratio correctly
(1) $\frac{CO_2}{O_2}$ (2) $\frac{O_2}{CO_2}$
(3) $\frac{CO_2 - O_2}{O_2}$ (4) $\frac{O_2}{CO_2 - O_2}$

Q.43 If a Rabbit utilizes fats and proteins as respiratory materials then its respiratory quotient respectively is likely to be
(1) One & one (2) 0.71 & 0.82
(3) 0.12 & 0.72 (4) 0.62 & 0.53

Q.44 We can compare the metabolic rates of mammals directly without any reference of environmental temperature because they
(1) Have mammary glands
(2) Have very much developed brain
(3) Are poikilothermic animals
(4) Are homiothermic animals

Q.45 Haemocyanin is
(1) Always found in blood corpuscles
(2) Always found dissolved in blood plasma
(3) Found dissolved in some kinds of water
(4) Some times found in blood corpuscles & some time dissolved in plasma

Q.46 Partial pressure of oxygen in the inspired and expired air is respectively-
(1) 158 and 116 mm Hg
(2) 158 and 40 mm Hg
(3) 100 and 95 mm Hg (4) 40 and 95 mm Hg

Q.47 In human beings, CO_2 concentration in the inspired and expired air is respectively-
(1) 0.03% and 5.3% (2) 0.4% and 5.0%
(3) 0.04% and 3.0% (4) 0.03% and 4.0%

Q.48 Haemoglobin is-
(1) Always found in RBC
(2) Always found dissolved in plasma
(3) Found in RBC or dissolved in plasma
(4) Always found as respiratory pigment

Q.49 Oxygen dissociates from the oxymyoglobin at-
(1) Very high atmospheric pressure
(2) Very high oxygen pressure
(3) Moderately high oxygen pressure
(4) Low oxygen pressure

Q.50 Oxygen dissociation curve expresses-
(1) Proportion between the haemoglobin & oxyhaemoglobin
(2) Concentration of O_2 & haemoglobin
(3) Proportion between with oxygen concentration
(4) Ratio of O_2 and CO_2 at the tissue level

Q.51 The oxyhaemoglobin dissociation curve -
(1) Is not the same for all animals
(2) Will be shifted to left by an increase in CO_2 concentration
(3) Will be shifted to right if concentration of O_2 increases
(4) Is the same for all animals

Q.52 Oxygen dissociation j-curve of myoglobin is-
(1) Hypobolic (2) Hyperbolic
(3) Linear (4) Sigmoid

Q.53 Mammalian lungs have numerous alveoli for-
(1) Increasing volume of inspired air
(2) Keeping the lungs in proper shape
(3) Higher number of muscles to provide greater elasticity
(4) Increasing surface area for gaseous diffusion

Q.54 The shifting of oxyhaemoglobin dissociation curve to right due to increased CO_2 concentration in blood is also called-
(1) Haburger phenomenon
(2) Bohr's effect
(3) Donanum equilibrium
(4) Chloride shift

Q.55 Beside breathing the diaphragm of mammals also helps in-
(1) Defaecation (2) Micturition
(3) Parturition (4) All of the above

Q.56 The respiratory centre in the brain is stimulated by all except-
(1) High level of CO_2 in blood
(2) Excess of lactic acid in blood
(3) High blood pressure
(4) Excess of oxyhaemoglobin in blood

Q.57 Anaerobic respiration is likely to occur in -
(1) Cockroach (2) Earthworm
(3) Tapeworm (4) Rabbit

Q.58 Which of the following contain inner lining of ciliated epithelium-
(1) Trachea (2) Ureter
(3) Uterus (4) Vasdaferens

Q.59 During the period of emergency the breathing quickens to-
(1) Prevent the collapsing of lungs
(2) Supply more oxygen to the tissues
(3) Control the heart beat
(4) Prevent collapsing of heart

Q.60 Major part of CO_2 is transported to respiratory surface as-
(1) HCO3 ions (2) H_2CO_3
(3) Hb-CO_2 (4) Free CO_2

Q.61 Forced deep breathing during rest for some time is followed by temporary stoppage of breating because of-
(1) Little CO_2 in blood
(2) High CO_2 content in blood
(3) High oxygen content in blood
(4) Little O_2 content in blood

Q.62 Hamburger's phenomenon is also known as-
(1) HCO_3 shift (2) Na^+ shift
(3) H^+shift (4) Chloride sift

Q.63 Most of CO_2 from cell respiration is transported to lungs in the form of-
(1) Carbonic acid
(2) Dissolved CO_2
(3) Bicarbonates of K & Na
(4) Sodium bicarbonate

Q.64 The lungs of Rabbit are-
(1) Non elastic and contractile
(2) Sac like structure, having no power of contraction and relaxation of their own
(3) Bulbular structures and non contractile
(4) Soft, Bulbus and Contractile

Q.65 The trachea is prevented from collapsing by-
(1) Complete cartilaginous rings
(2) Incomplete cartilaginous rings at intervals
(3) Bony rings
(4) Chitinous rings

Q.66 One of the following structures closes the respiratory passage during ingestion of food-
(1) Larynx (2) Glottis
(3) Epiglottis (4) Palate

Q.67 The inspired air ultimately reaches in lungs in-
(1) Alveolar sacs (2) Bronchioles
(3) Bronchi
(4) Respiratory bronchioles

Q.68 Respiratory movements are controlled by-
(1) Cerebellum (2) Cerebrum
(3) Medulla oblongata (4) Crura cerebri

Q.69 At higher CO_2 concentration, oxygen dissociation curve of haemoglobin will-
(1) Move to left (2) Move to right
(3) Become irregular (4) Move upwardly

Q.70 Lungs are enclosed by a double layered membrane known as-
(1) Pericardium (2) Meninges
(3) Pleura (4) Mesorchium

Q.71 The muscles which help in breathing are known as-
(1) Intercostal muscles (2) Thoracic muscles
(3) Transverse muscles
(4) Inter mammary muscles

Q.72 In a person living at high altitude, where the atmosphere is deficient of oxygen, which inference is more likely to occurs in his body-
(1) Liver produces more oxygenating compounds
(2) Spleen get enlarged
(3) Liver destroys RBC more quickly
(4) Bone marrow produces RBC more quickly

Q.73 The mode of respiration in Rabbit is-
(1) Cutaneous (2) Tracheal
(3) Branchial (4) Pulmonary

Q.74 Which one of the following events takes place during inspiration in rabbit-
(1) The internal intercostal muscles relax
(2) The stomach muscles contract
(3) Due to contraction of external intercostal muscles & flattening of diaphragms the volume of thoracic cavity increases
(4) Due to contraction of external intercostal muscles, and flattening of diaphragm the volume of thoracic cavity decreases

Q.75 The alveolar epithelium in the lung in humans-
(1) Nonciliated columnar
(2) Nonciliated squamous
(3) Ciliated columnar (4) Ciliated squamous

Q.76 Which is correct?
(1) Respiratory centres are not affected by CO_2
(2) In humans vital capacity is just double the expiratory volume
(3) A human lung has 10^3 alveoli
(4) During inspiration the lungs act at suction pump.

Q.77 Presence of large number of alveoli around alveolar ducts opening into bronchioles in mammalian lungs is-
(1) Inefficient system of ventilation with little of residual air
(2) Inefficient system of ventilation with high percentage of residual air
(3) An efficient system of ventilation with no residual air
(4) An efficient system of ventilation with little residual air

Q.78 The transverse muscular wall present in between thoracic cavity and abdominal cavity in mammals is called-
(1) Visceral epithelium (2) Parietal epithelium
(3) Diaphragm (4) Mesentary

Q.79 The ribs of rabbit are attached to-
(1) Cervical vertebrae (2) Caudal vertebrae
(3) Sacral vertebrae (4) Thoracic vertebrae

Q.80 Glottis is the opening which leads to-
(1) Oesophagus (2) Trachea
(3) Stomach (4) Duodenum

Q.81 Chemical energy is-
(1) The energy released when the chemicals react
(2) Energy contained in certain molecules which can be converted into other form of energy
(3) Heat energy (4) Light energy

Q.82 Very small animals donot have specially developed respiratory organs because-
(1) They are too small to posses these organs
(2) Small animals do not need much O_2
(3) They are inactive, so do not need special organs for respiration
(4) Their oxygen absorbing external surface area is large as compared with their internal volume

Q.83 Maximum amount / 70–75% of CO_2 transport occurs as-
(1) Dissolved in plasma
(2) Carbamino haemoglobin complex
(3) Bicarbonate
(4) None of above

Q.84 Haldane believes oxyhaemoglobin to act as-
(1) Acid (2) Alkali
(3) Buffer (4) None of the above

Q.85 Inner/alveolar surface area of human lungs is-
(1) $1m^2$ (2) $10m^2$
(3) $100m^2$ (4) 1000m2

Q.86 The rate of breathing means-
(1) The amount of respiration, that has taken place in a given time
(2) The speed of ventilation movements
(3) The comparison between respiration rates of two animals
(4) The way in which the animals respiration is typed

Q.87 Which of the following will take more part in breathing of pregnant women-
(1) Ribs (2) Diaphragm
(3) Intercostal muscles (4) Neck muscles

Q.88 Metal contained in haemoglobin is-
(1) Copper (2) Iron
(3) Zinc (4) Magnesium

Q.89 When a fish is taken out of water it dies because-
(1) It gets too much oxygen of air
(2) It is unable to drink water and die of thrust
(3) It is unable to utilize oxygen found in air
(4) Its body temperature rises to high

Q.90 The structures which mainly participate during breathing are -
(1) Ribs & abdominal muscles
(2) Larynx and ribs
(3) Diaphragm & intercostal muscles
(4) Belly & abdomen

Q.91 A child was killed through asphyxiation. Post mortem confirmed it because a piece of lung put in water-
(1) Settled down (2) Kept floating
(3) Had blood spots (4) None of the above

Q.92 In lungs, air is separated from venous blood by-
(1) Squamous epithelium + tunica externa of blood vessel
(2) Squamous epithelium + endothelium of blood vessel
(3) Transitional epithelium + tunica media of blood vessel
(4) Columnar epithelium + 3 layered wall of blood vessel

Q.93 'Hiccough (hiccup) is due to activity of-
(1) Intercostal muscles
(2) Food in air tract
(3) Diaphragm
(4) Inadequate oxygen in environment

Q.94 A singer breaths as much air as possible with his-
(1) Larynx (2) Ribs
(3) Intercostal muscles (4) Diaphragm

Q.95 Which of the following is not a strong stimulus comparatively for the respiratory centre of brain-
(1) Shortage of oxygen in blood
(2) Excess of CO_2 in blood
(3) Excess of lactic acid in blood
(4) Lowering of pH

Q.96 Condition during which the respiratory centre is inhibited is called-
(1) Suffocation (2) Anoxia
(3) Asphyxia (4) None of the above

Q.97 The narrowest and most numerous tubes of the lungs are-
(1) Bronchi (2) Bronchioles
(3) Respiratory bronchioles
(4) Alveolar ducts

Q.98 If diaphragm of rabbit is punctured then breathing is-
(1) Increased (2) Decreased
(3) Stopped (4) Not effected

Q.99 Apnoea is-
(1) Decreased ventilation
(2) Absence of breating
(3) Laboured breathing
(4) Increased ventilation

Q.100 Book lungs are respiratory structures of-
(1) Arachnida (2) Mollusca
(3) Mammals (4) Earthworm

Q.101 Cartilage of Santorini is found at the end of which of the following cartilage of larynx -
(1) Cricoid (2) Arytenoid
(3) Thyroid (4) Hyoid

Q.102 Exchange of gases takes place through the walls of-
(1) Bronchioles
(2) Respiratory bronchioles
(3) Alveolar ducts (4) Alveoli

Q.103 Scroll like turbinals are found in-
(1) Nasal chambers (2) Buccal cavity
(3) Pharynx (4) Palate

Q.104 The trachea & chief bronchi of Rabbit's lung are lined by-
(1) Stratified ciliated epithelium
(2) Pseudo stratified columnar ciliated epithelium
(3) Columnar epithelium
(4) Stratified epithelium

Q.105 How many pairs of ribs are found in rabbit-
(1) 13 (2) 10
(3) 12 (4) 11

Q.106 Bicarbonic formed inside erythrocytes passes out into plasma while chloride of plasma pass into erythrocytes. The phenomenon is called-
(1) Bicarbonate shift
(2) Carbonation
(3) Hamburger phenomenon
(4) None of the above.

Q.107 Vital capacity of lung is equal to-
(1) IRV + ERV + TV
(2) IRV+ERV+TV+RV
(3) IRV+ERV+TV+RV
(4) IRV+ERV

Q.108 Carbon monoxide contained in Tobacco smoke-
(1) Is carcinogenic
(2) Causes gastric
(3) Reduces oxygen carrying capacity of blood
(4) Raises blood pressure

Q.109 Upper part of trachea bears a cylindrical cartilagenous box like structure called-
(1) Pharynx (2) Larynx
(3) Palate (4) Syrinx

Q.110 Respiratory pigment of Rabbit is-
(1) Haemoglobin (2) Haemocyanin
(3) Erythrocrurin (4) Chlorocuroin

Q.111 CO_2 is released from bicarbonates in lungs with the help of enzyme called-

(1) Cytochrome oxidase

(2) Decarboxylase

(3) Carbonic anhydrase

(4) Dehydrogenase

Q.112 Trachea after entering into lungs divides into two branches called-

(1) Bronchi

(2) Bronchioles

(3) Respiratory bronchioles

(4) Alveolar ducts

Q.113 How many lobes are found in right lung of rabbit-

(1) Two (2) Three

(3) Four (4) Only one

Q.114 The exchange between CO_2 & O_2 between atmospheric air & the blood of lung alveoli is called-

(1) Internal respiration (2) External respiration

(3) Tissue respiration (4) Respiration

Q.115 The process of breathing is-

(1) Completely involuntary

(2) Completely voluntary

(3) Essential involuntary but is influenced voluntary with in certain limits

(4) None of the above

Q.116 Which of the following structures of Rabbit represent segmentation-

(1) Two pairs of limbs

(2) Paired eye & nostrils

(3) Vertebral column & ribs

(4) None of the above

Q.117 Which of the following perform the function of respiration in a mammal-

(1) Livers cells (2) Blood cells

(3) All body cells (4) Cells of lung alveoli

Q.118 Mammalian lungs have enormous alveoli which help in-

(1) Providing more space for air

(2) Providing more surface area for exchange of gases

(3) Keeping lungs more spongy

(4) Increasing area for more nerve supply

ANSWER KEY

Exercise - 1

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Ans.	2	4	4	1	2	3	1	3	1	4	4	2	3	3	1	2	4	4	2	2

Ans.	2	4	1	2	1	3	2	3	2	1	3	1	3	3	3	3	3	2		

EXERCISE - 2

Q.1 In expiration, diaphragm becomes
(1) Flattened (2) Relaxed
(3) Straightened (4) Arched.

Q.2 Rate of respiration is directly affected by:
(1) Concentration of carbon dioxide
(2) Oxygen in trachea
(3) Concentration of oxygen
(4) Diaphragm expansion

Q.3 Carbon dioxide is transported from tissue to respiratory surface by only
(1) Plasma and erythrocytes
(2) Plasma
(3) Erythrocytes
(4) Erythrocytes and leucocytes

Q.4 Respiratory system is derived from :
(1) Endoderm (2) Mesoderm
(3) Ectoderm (4) None of these

Q.5 Which is correct ?
(1) Respiratory centres are not affected by CO_2
(2) In humans vital capacity is just double the expiratory volume
(3) A human lung has 10^3 alveoli
(4) During inspiration the lungs act as suction pump

Q.6 Common feature of human and insect trachea is
(1) Noncollapsible wall (2) Supporting rings
(3) Ectodermal origin (4) Endodermal origin

Q.7 Which is false :
(1) Blood from Right side of heart is carried to lungs by pulmonary artery
(2) Pleura is double covering of kidney
(3) Pancreas is both exocrine and endocrine gland
(4) Scurvy is due to vitamin C deficiency

Q.8 Pericardial fluid is secreted by :
(1) Myocardium (2) Parietal peritoneum
(3) Visceral peritoneum (4) None of these

Q.9 Vocal cords occur in -
(1) Larynx (2) Pharynx
(3) Glottis (4) Bronchial tube

Q.10 Body tissues obtain oxygen from haemoglobin because of its dissociation in tissues caused by-
(1) Low oxygen concentration and high carbon dioxide concentration
(2) Low oxygen concentration
(3) Low carbon dioxide concentration
(4) High carbon dioxide concentration

Q.11 Lungs have a large number of alveoli for :
(1) Having spongy texture and proper shape
(2) More surface area for diffusion of gases
(3) More space for increasing volume of inspired air
(4) More nerve supply

Q.12 Respiratory organs in scorpion are :
(1) Gills (2) Booklungs
(3) Skin (4) Bookgills

Q.13 Which energy is consumed in breathing ?
(1) Mechanical (2) Chemical
(3) Bioelectrical (4) Physical energy

Q.14 During inspiration, the diaphragm:
(1) relaxes (2) contract
(3) expands (4) shows no change

Q.15 In which form CO_2 is carried in blood?
(1) Sodium bicarbonate
(2) Sodium carbonate
(3) Potassium carbonate
(4) Magnesium carbonate

Q.16 How the transport of O_2 and CO_2 by blood happens ?
(1) with the help of RBCs and blood plasma
(2) with the help of RBCs and WBCs
(3) with the help of WBCs and blood serum
(4) with the help of platelets and corpuscles

Q.17 When 1200 mL air is left in the lungs, it is called
(1) Vital capacity (2) Tidal volume
(3) Residual Volume
(4) Inspiratory reserve volume

Q.18 Mitochondria are yellow in colour due to the presence of :
(1) Xanthophyll (2) Riboflavin
(3) Carotene (4) Anthocyanin

Q.19 The vital capacity of human lung is equal to :
(1) 3500 ml (2) 4800 ml
(3) 500 ml (4) 1200 ml

Q.20 The type of respiration in mammals is called:
(1) Pulmonary respiration
(2) Gill respiration
(3) Cutaneous respiration
(4) Tracheal respiration

Q.21 Complete oxidation of one gram of glucose yields energy in calories :
(1) 6860000 (2) 68600
(2) 686000 (4) 686

Q.22 Normal breathing is called
(1) Apnoea (2) Dyspnoea
(3) Eupnoea (4) Hyperpnoea

Q.23 Trachea is lined with incomplete rings of
(1) Fibrous cartilage (2) Calcified cartilage
(3) Elastic cartilage (4) Hyaline cartilage

Q.24 Which one protects the lungs :
(1) Ribs (2) Vertebral column
(3) Sternum (4) All the above.

Q.25 Glycolysis is represented by :
(1) $C_6H_{12}O_6+6O_2 \rightarrow 6CO_2 +6H_2O$
(2) $C_6H_{12}O_6 \rightarrow 2C_2H_5OH + 2CO_2$
(3) $C_6H_{12}O_6 \rightarrow 2C_3H_4O_3+4H$
(4) $6CO_2+6H_2O \rightarrow C_6H_{12}O_6+6O_2$

Q.26 Compound soluble in water which does not impede oxygen transportation is :
(1) SO_2 (2) SO_3
(3) CO (4) NO

Q.27 In lungs, the air is separated from the venous blood through :
(1) squamous epithelium + endothelium of blood vessel
(2) squamous epithelium + tunica media of blood vessel
(3) transitional epithelium + tunica externa of blood vessel
(4) none of these.

Q.28 Hb most strongly combines with :
(1) CO (2) O_2
(3) CO_2 (4) O_3

Q.29 Tissue respiration is process by which :
(1) Carbohydrates are synthesized
(2) Proteins are broken down
(3) Fat molecules are metabolised
(4) Energy is liberated

Q.30 Biological oxidation of Krebs cycle involves:
(1) N_2 (2) CO_2
(3) O_2 (4) SO_2

Q.31 Anaerobic process after glycolysis is called:
(1) TCA (2) Calvin cycle
(3) Krebs cycle (4) Fermentation

Q.32 How does carbon monoxide, a poisonous gas emitted by automobiles, prevent transport of oxygen to body tissues ?
(1) by obstructing the reaction of oxygen with haemoglobin
(2) by destroying the haemoglobin
(3) by changing oxygen into carbon dioxide
(4) by forming a stable compound with haemoglobin

Q.33 Inspiratory air in lungs ultimately reaches
(1) trachea (2) alveoli
(3) bronchi (4) bronchioles

Q.34 If carbohydrate is subjected to anaerobic respiration, RQ will be :
(1) infinity (2) 1.7
(3) 1.2 (4) zero

Q.35 In which animal, diaphragm has no role in respiration ?
(1) Rat (2) Frog
(3) Rabbit (4) Camel

Q.36 Exchange of gases in lung alveoli occurs through
(1) Active transport (2) Osmosis
(3) Simple diffusion (4) Passive transport

Q.37 CO_2 is mainly transported by-
(1) Respiratory pigment
(2) Dissolution of gases
(3) O_2 taken by tissues
(4) Bicarbonates

Q.38 In which form iron is present in haemoglobin -
(1) Ionic (2) Unionic
(3) Fe^{2+} (4) Fe^{+3}

Q.39 Ventilation/respiratory control is present in-
(1) Medulla oblongata (2) Cerebellum
(3) Cerebrum (4) Diencephalon

Q.40 Haemoglobin is :
(1) Vitamin (2) Skin pigment
(3) Blood carrier
(4) Respiratory pigment

Q.41 Match the columns :

Column I	Column II
a Larynx	p lid of larynx
b Trachea	q Air sacs
c Alveoli	r Voice box
d Epiglottis	s Wind pipe
	t Common passage

(1) a – r, b – s, c – q, d – p
(2) a – t, b – s, c – p, d – q
(3) a – r, b – s, c – q, d – t
(4) a – r, b – t, c – q, d – p

Q.42 The process of migration of chloride ions froms plasma to RBC and of carbonate ions from RBC to plasma is
(1) Atomic shift (2) Ionic shift
(3) Na^+ pump (4) Chloride shift

Q.43 The most relativity of CO than CO_2 in which compound -
(1) Carboxy haemoglobin
(2) Oxygen
(3) oxyhaemoglobin
(4) Haemoglobin

Q.44 Respiratory centre is present where-
(1) cerebrum (2) hypothalamus
(3) cerebellum (4) medulla oblongata

Q.45 Which of the following is shift in chloride-shift?
(1) O_2 and CO_2 (2) Bicarbonate ions
(3) CO_2 (4) O_2

Q.46 Voice in mammal is produced :
(1) by syrinx (2) during inhalation
(3) by bronchus (4) during exhalation

Q.47 Which one of the following is capable of carrying oxygen ?
(1) Plasma (2) Blood
(3) Serum (4) Lymph

Q.48 Bicarbonate ions can be generated in :
(1) lymphocytes (2) neutrophil
(3) basophil (4) RBCs

Q.49 Ciliated cells are found in :
(1) liver (2) bronchus
(3) uterus (4) pancreas

Q.50 Adam's apple represents :
(1) Crioid cartilage (2) Thyroid cartilage
(3) Both (4) None

Q.51 Amount of oxygen which is present in one gm of Hb is :
(1) 1.34 ml (2) 13.4 ml
(3) 134 ml (4) 20 ml

Q.52 Alveoli increase the surface area by ..... m^2.
(1) 10 (2) 100
(3) 150 (4) 200

Q.53 Volume of air inspired or expired in relaxed position is
(1) 500 ml (2) 300 ml
(3) 150 ml (4) 115 ltr

Q.54 In which of the following animal respiration occurs without any respiratory organ ?
(1) Cockroach (2) Fish
(3) Frog (4) Earthworm

Q.55 Automobile exhaust causes respiratory problem because of the presence of
(1) CO (2) CH_4
(3) Chlorine (4) NO_2

Q.56 Book lungs are respiratory organs of
(1) mollusca (2) mammals
(3) archnida (4) earthworm

Q.57 The respiratory centre in the brain is stimulated by-
(1) CO_2 concentration in venous blood
(2) O_2 concentration in artery blood
(3) CO_2 concentration in artery blood
(4) O_2 concentration in venous

Q.58 The energy currency of a cell is
(1) 10 AMP (2) ATP
(3) Carbohydrates (4) NAD

Q.59 The net energy yield from aerobic respiration in eukaryotic cells is
(1) 10 ATP (2) 30 ATP
(3) 36 ATP (4) 38 ATP

Q.60 The volume of air breathed in end out during effortless respiration is referred to as
(1) vital volume (2) residual volume
(3) ideal volume (4) tidal volume

Q.61 What can determine the percentage of oxygen carried by Hb?
(1) pH of blood
(2) Percentage of CO_2
(3) Partial pressure of oxygen
(4) All of above

Q.62 Hamburgers effect is also known as
(1) Sodium shift (2) Chloride shift
(3) Lead shift (4) None of these

Q.63 Fully mature larva of frog respire by :
(1) Skin (2) Gills
(3) Lungs (4) Buccal cavity

Q.64 The correct order of structures through which the air passes in the body is :
(1) nasla cavity, larynx, trachea, bronchi air sacs
(2) bronchi, nasal cavity, larynx, trachea air sacs
(3) larynx bronchi, nasal cavity, trachea air sacs
(4) nasal cavity, trachea, larynx, bronchi air sacs

Q.65 The trachea is prevented form collapsing by the presence by rings of :
(1) striated muscles (2) cartilage
(3) adenoids (4) sinuses

Q.66 The process of breathing is controlled by respiratory centre located in the :
(1) spinal cord (2) cerebellum
(3) medulla oblongata (4) hypothalamus

Q.67 When the carbon dioxide concentration in blood increases, the rate of breathing will-
(1) remain unaffected (2) decrease
(3) stop (4) increase

Q.68 During inspiration :
(1) The diaphragm gets raised and ribs get lowered
(2) Both diaphragm and ribs get lowered
(3) Both diaphragm and ribs get lowered
(4) The diapghragm get flattered and ribs get raised

Q.69 Which one of the following can respire in the absence of oxygen ?
(1) *Amoeba* (2) Tapeworm
(3) House fly (4) *Hydra*

Q.70 The breathing rate gets increased by the increase in the content of :
(1) nitrogen (2) oxygen
(3) carbon dioxide (4) carbon monoxide

Q.71 The normal rate of respiration in man per minute is about :
(1) 10 to 15 times (2) 16 to 20 times
(3) 19 to 21 times (4) 23 to 25 times

Q.72 A normal man at rest inspires and expires about 500 millilitres of air, this amount is known as-
(1) complimental volume of air
(2) tidal volume of air
(3) reserve volume of air
(4) residual volume of air

Q.73 One of the following is not respiratory pigment?
(1) Anthocyanin (2) Haemoglobin
(3) Haemoerythrin (4) Haemocyanin

Q.74 The disease that occurs when the haemoglobin content of the blood goes down is :
(1) plurisy (2) emphysema
(3) anaemia (4) pneumonia

Q.75 The percentage of carbon dioxide, oxygen and nitrogen in exhaled air of man are about :
(1) 0.04 : 16 : 79 (2) 0.4 : 20 : 70
(3) 4.0 : 20 : 79 (4) 4.0 : 16 : 79

Q.76 The transport of oxygen by the blood takes place by :
(1) leucocytes (2) thrombocytes
(3) plasma (4) erythrocytes

Q.77 Lungs are surrounded by
(1) Pleura (2) Pericardium
(3) Epineurium (4) Perineurium

Q.78 The toxic effect of CO is due to its greater affinity for haemoglobin as compared to O_2, approximately by -
(1) 2 times (2) 20 times
(3) 200 times (4) 1000 times

Q.79 One haemoglobin carry how many molecule of O_2
(1) 4 (2) 2
(3) 6 (4) 8

Q.80 Volume of air breathed in and out during normal breathing is called
(1) vital capacity (2) IRV
(3) ERV (4) tidal volume

Q.81 Respiratory quotient of which diet is less than unity ?

(1) Carbohydrate (2) Fats

(3) Organic acid (4) Sugar

Q.82 Aerobic respiration is related with-

(1) Mitochondria

(2) Plasma membrane

(3) Golgi bodies

(4) Endoplasmic reticulum

Q.83 During hibernation, frog's respiration is-

(1) Cutaneous (2) Pulmonary

(3) Buccopharyngeal (4) Pharyngeal

Q.84 Blood carries CO_2 mainly in which form-

(1) $Hb.CO_2$ (2) $NaHCO_3$

(3) Carbonic acid

(4) Hb. CO_2 and carbon monoxide

Q.85 Book lungs are the respiratory organs in-

(1) Protozoans (2) Cnidarians

(3) Arthropods (4) Amphibians

Q.86 When CO_2 concentration in blood increases, breathing becomes-

(1) Slow and deep (2) Faster and deeper

(3) Shallower and slow

(4) There is no effect on breathing

Q.87 After deep inspiration maximum expiration of lungs is called-

(1) Vital capacity (2) Total lung capacity

(3) Inspiratory capacity

(4) Functional residual capacity

Q.88 Ascent of high mountains may cause altitude sickness in men. Prime cause of this is-

(1) Excess of CO_2 in blood

(2) Decreased efficiency of haemoglobin

(3) Decreased partial pressure of oxygen

(4) Decreased proportional of oxygen in air

Q.89 In lungs, there is definite exchange of ions between RBC and plasma. Removal of CO_2 from blood involves-

(1) Efflux of Cl^- ions from RBC

(2) Influx of Cl^- ions into RBC

(3) Influx of HCO_3^- ions into RBC

(4) Efflux of HCO_3^- ions from RBC

Q.90 Lungs ventilation movement is due to-

(1) Intercostal muscles and diaphgram

(2) Wall of the lungs

(3) Costal muscles

(4) Diaphragm

Q.91 Part of brain which control respiration is-

(1) Cerebrum (2) Cerebellum

(3) Spinal cord (4) Medulla oblongata

Q.92 Which enzyme is most abundantly found in RBC-

(1) Carbonic anhydrase (2) Haemoglobin

(3) Albumin (4) Thrombinase

Q.93 Sum total of constructive activities in the body is called-

(1) Catabolism (2) Anabolism

(3) Metabolism (4) Active transport

Q.94 The oxygenated blood leaving the heart & reaching the tissues gives up its some oxygen to the tissues because-

(1) Oxyhaemoglobin undergoes reduction

(2) O_2 concentration in tissues is lower & CO_2 concentration is higher

(3) The tissues are capable of absorbing O_2 from the oxyhaemoglobin

(4) O_2 concentration in tissues is higher & CO_2 concentration

Q.95 Which one has the smallest diameter-

(1) Right bronchus

(2) Left bronchus

(3) Secondary bronchiole

(4) Respiratory bronchiole

Q.96 When man takes in air containing normal concentration of O_2 as well as CO_2 he suffers from suffocation because -

(1) CO affects the nerves of the lungs

(2) CO affect diaphgram and costal muscles

(3) CO reacts with O_2 & prevent the entry of O_2 in blood in lungs

(4) Haemoglobin combines with CO_2 instead of O_2 & the product so formed cannot dissociated easily

Q.97 The combination of O_2 with haemoglobin can be increased mostly by-
(1) Decreasing O_2 concentration in blood
(2) Increasing O_2 concentration in air
(3) Increasing CO_2 concentration in air
(4) Decreasing CO_2 concentration in air

Q.98 Breathing in rabbit is mainly controlled by-
(1) Enzymes
(2) Sympathetic nervous system
(3) Central nervous system
(4) Hormones

Q.99 The capacity of lungs to expire maximum volume of air after a deep inspiration is called-
(1) Vital capacity
(2) Total lungs capacity
(3) Tidal capacity (4) Residual capacity

Q.100 In mammalian lung tidal means-
(1) Total number air that can be drawn in
(2) The amount of air that can be expelled out forcibly by normal expiration
(3) The amount of air that normally enters the lungs and comes out by expiration
(4) The amount of air which is left lungs after normal expiration

Q.101 BMR (Basal metabolic rate) of rabbit is controlled by the secretion of-
(1) Pancreas (2) Thyroid
(3) Liver (4) Pituitary

Q.102 The capacity for doing work is called-
(1) Energy (2) Power
(3) Heat (4) Life

Q.103 The release of energy in the living cells is the process of-
(1) Oxidation (2) Respiration
(3) Digestion (4) Assimilation

Q.104 The ultimate of all kinds of respiration is-
(1) Formation of CO_2 (2) Oxidation of food
(3) Release of energy (4) Formation of water

Q.105 The elastic cartilage which acts as a lid for glottis is called-
(1) Cricoid (2) Epiglottis
(3) Arytenoid (4) Thyroid

Q.106 The contraction of internal intercostal muscles in rabbit cause-
(1) Inspiration (2) Expiration
(3) Aspiration (4) Assimilation

Q.107 The vocal cords of Rabbit are-
(1) Membranous (2) Thread like
(3) Cartilagenous (4) Bony

Q.108 When temperature of a mammals rises the rate of breathing-
(1) Increases (2) Decreases
(3) Remains unaffected
(4) Stops

Q.109 Carbodioxide rapidly dissolves in blood due to the presence of-
(1) Haemoglobin
(2) Carbonic anhydrase enzyme
(3) RBC (4) Blood plasma

Q.110 Converse of Bohr's effect is called-
(1) Root effect (2) Chloride shift
(3) Haldane effect
(4) Hamburger phenomenon

Q.111 SARS is caused by variant of-
(1) Pneumococcus pneumonia
(2) Common cold Corona virus
(3) Asthma (4) Bronchitis

Q.112 When the blood passes from lungs to tissues & back, in this one circuit the capacity of haemoglobin to give off O_2 is about -
(1) 25% (2) 50%
(3) 75% (4) 100%

Q.113 Pleurisy is the disease of-
(1) Liver (2) Heart
(3) Lungs (4) Kidneys

Q.114 The blood leaving the lungs is richer than the blood entering in lungs in the -
(1) Number of RBC per ml of blood
(2) Amount of haemoglobin per ml. of blood
(3) Amount of nutrients per ml of blood
(4) Amount of oxygen per ml of blood

Q.115 Direct respiration occurs in-
(1) Human beings (2) Prawn
(3) Insects (4) Fish

Q.116 At higher altitudes a man suffers much from-
(1) Cold (2) Oxygen deficiency
(3) Higher atmospheric pressure
(4) Ultraviolet radiations

Q.117 Tuberculosis in man is caused by-

(1) Tuberculosis virus (2) Streptococci

(3) Staphylococci

(4) Tuberculosis bacillus

Q.118 Asthma is a respiration disease caused due to-

(1) Infection of lungs (2) Tracheal infection

(3) Bleeding in the pleural cavity

(4) Cramps in the bronchial muscles obstructing the air passage

Q.119 When a mammal takes in atmospheric air, the diaphragms becomes-

(1) Domb shaped (2) Conical

(3) Flat (4) Unchanged

Q.120 Which has more affinity for haemoglobin?

(1) Cabon monoxide

(2) Carbon dioxide

(3) Oxygen

(4) Both 2 and 3.

Q.121 Person living at higher altitude have more haemoglobin than peoples of plains because at high altitude there is low-

(1) Temperature (2) Pressure of air

(3) O_2 concentration in air

(4) All of the above

Q.122 In fever a patient breaths at faster rate than to his normal healthy condition because-

(1) O_2 carrying capacity of blood is lowered in fever

(2) High temperature stimulates the respiratory centre of the brain

(3) Fever requires more O_2 to fight germs

(4) Increased temperature enhances the metabolic rate of body which requires more energy

Q.123 When some food particle enters the trachea inseted of esophagus we get rid of it by the process of-

(1) Sneezing (2) Coughing

(3) Yawning (4) Forced breathing

Q.124 The most characteristic feature of haemoglobin is-

(1) Its red colour

(2) Presence of iron

(3) Presence of basic protein globin

(4) Its reversible association with O_2

Q.125 Stretch receptors of bronchi send information to inspiratory area of respiratory centre through-

(1) Vagus (2) Glossopharyngeal

(3) Sympathetic nerve

(4) Parasympathetic nerve

EXERCISE - 3 PREVIOUS YEAR'S QUESTIONS

Q.1 The aveolar epithelium in the lung is – **[C.B.S.E. 1990, B.H.U. 1996]**

(1) Nonciliated colomnar
(2) Nonciliated squamous
(3) Ciliated columnar
(4) Ciliated squamous

Q.2 Respiratory centre is situated in– **[C.B.S.E. 1999]**

(1) Cerebellum (2) Medulla oblongate
(3) Hypothalamus (4) Cerebrum

Q.3 Air is breathed through– **[Pb. P.M.T. 1999 C.B.S.E. 1994]**

(1) Trachea → lungs → laryns → pharynx → alveoli
(2) Nose → larynx → pharynx → bronchus → alveoli → bronchioles
(3) Nostrils → Pharynx → larynx → trachea → bronchi → bronchioles → alveoli
(4) Nose → mouth → lungs

Q.4 Carbonic anhydrase is mostly active in – **[C.E.T. Chd. 2000, Manipal 2001]**

(1) RBC (2) WBC
(3) Blood Plasma (4) Blood Platelets

Q.5 At high altitude, RBC of human blood will – **[C.B.S.E. 1995, Pb. P.M.T. 1999]**

(1) Increase in number
(2) Decrease in number
(3) Decrease in size
(4) Increase in size

Q.6 About 1200 ml of air left in lungs is called– **[C.B.S.E. 1996]**

(1) Tidal volume
(2) Ispiratory reserve volume
(3) Residual volume
(4) Vital capacity

Q.7 Which one protects the lungs– **[B.H.U. 1996]**

(1) Rib (2) Vertebral colum
(3) Sternum (4) All above

Q.8 Which one has the lowest value – **[B.H.U. 1996]**

(1) Tidal volume (2) Vital capacity
(3) Inspiratory reserve volume
(4) Expiratory reserve volume

Q.9 Amount of oxygen present in one gram of haemoglobin is– **[A.I.I.M.S. 1997, Har, PMT 2000]**

(1) 20 ml (2) 1.34 ml
(3) 13.4 ml (4) None of these

Q.10 Compound soluble in water which does not impede oxygen trasportation is– **[A.I.I.M.S. 1997]**

(1) SO_2 (2) SO_3
(3) CO (4) NO

Q.11 In lungs air is separated from venous blood by– **[C.B.S.E. 1997]**

(1) Squamous epithelium + tunica externa of blood vessel
(2) Squamous epithelium + endothelium of blood vessel
(3) Transitional epithelium + tunica media of blood vessel
(4) Columnar epithelium + 3 layered wall of blood vessel

Q.12 In carbon monoxide poisoning there is– **[A.F.M.C. 1997]**

(1) Increase in carbon dioxide concentration
(2) Decrease in oxygen availability
(3) Decrease in free haemoglobin
(4) None of these

Q.13 Exchange of gases in lung alveoli occurs through– **[C.B.S.E. 1998]**

(1) Active transport (2) Osmosis
(3) Simple diffusion (4) Passive transport

Q.14 Vocal cords occur in – **[M.P. P.M.T. 1999]**

(1) Pharynx (2) Larynx
(3) Glottis (4) Brronchial tube

Q.15 Match the columns– **[karnataka 1999]**

	Column I		Column II
(a)	Laynx	(p)	Lid of larynx
(b)	Trachea	(q)	Air sacs
(c)	Alveoli	(r)	Voice box
(d)	Epiglottis	(s)	Wind pipe
		(t)	Common passage

(1) a–r, b–s, c–q, d–p (2) a–t, b–s, c–p, d–q
(3) a–r, b–s, c–q, d–t (4) a–r, b–t, c–q, d–p

Q.16 Adam's Apple represents– **[Pb. P.M.T. 2000]**

(1) Arytenoid cartilage of larynx
(2) Cricoid cartilage of larynx
(3) Thyroid cartilage of larynx
(4) All the above

Q.17 Hiccough (Hiccup) is due to activity of– **[Manipal 2001]**

(1) Intercostal muscle
(2) Food in air tract
(3) Diaphragm
(4) Inadequate oxygne in environment

Q.18 respiratory centre of brain is stimulated by– **[A.I.I.M.S 2000]**

(1) Carbon dioxide content in venous blood
(2) Carbon dioxide content in arterial blood
(3) Oxygen content in venous blood
(4) Oxygen content in arterial blood

Q.19 Carbon dioxide entering erythrocytes reacts with water to form carbonic acid. The enzyme is– **[H.P.P.M.T. 2001]**

(1) Carbonic anhydrase
(2) Carhboxypeptidase
(3) Hydrolase
(4) Oxidoreductase

Q.20 Arytenoid cartilage is found in– **[B.H.U. 2000]**

(1) Hyoid (2) Sternum
(3) Larynx (4) Nose

Q.21 Dissociation of xoyhaemoglobin occurs in tissues due to – **[J.I.P.M.E.R. 2002]**

(1) High P_{O_2} (2) Low P_{O_2}
(3) Equal P_{O_2} (4) Irrespective of P_{O_2}

Q.22 At the time of expiration, diaphragm becomes– **[Karnataka 2003]**

(1) Oblique (2) Normal
(3) Flattened (4) Dome-shaped

Q.23 Exchange of bicarbonates and chloride ions beteween RBC and plasma is called– **[CBSE 1999]**

(1) Chloride shift
(2) Bohr's effect
(3) Haldane's effect
(4) Intra cellular respiration

Q.24 When CO_2 concentration in blood increase breathing becomes– **[CBSE 2004]**

(1) There is no effect on breathing
(2) Slow and deep
(3) Faster
(4) Shallower and slow

Q.25 In which part of lungs gaseous exchange takes place in Rabbit– **[RPMT 2001]**

(1) Trachea & alveolar duct
(2) Trachea & bronchi
(3) Alveolar duct & alveoli
(4) Alveoli & Trachea

Q.26 If CO_2 concentration increase in blood then breathing will– **[RPMT 2003]**

(1) Increases (2) Decrease
(3) Stop (4) Remain unchanged

Q.27 Heiring breuer reflex related to– **[RPMT 2003]**

(1) Effect of pH on respiratory centre
(2) Effect of CO_2 on respiratory centre
(3) Effect of nerves on respiratory centre
(4) Effect of temp. on respiratory centre

Q.28 Toxic effect of carbon monoxide is due to its greater affinity for haemoglobin as compared to oxygen– **[RPMT 2003]**

(1) 2 times (2) 20 time
(3) 200 times (4) 300 times

Q.29 Tracheal rins in rabbit are– **[RPMT 2004]**

(1) Complete
(2) Incomplete
(3) Dorsally incomplete
(4) Lateral incomplete

Q.30 Lungs ventilation movements is due to– **[Uttaranchal PMT 2004]**

(1) Costal muscle and diaphragm
(2) Costal muscle
(3) Diaphragm
(4) Wall of the lungs

Q.31 During hibernation period, frog's respiration is – **[Uttaranchal PMT 2005]**

(1) cutaneous (2) pulmonary
(3) pharyngeal (4) buccopharyngeal

Q.32 In alveolar air, the partial pressure of CO_2 is– **[West Bengal JEE 2007]**

(1) 40 mm of Hg (2) 42 mm of Hg
(3) 44 mm of Hg (4) 46 mm of Hg

Q.33 In lung, maximu gaseous exchange is due to– **[Jharkhand 2006]**

(1) Simple diffusion
(2) Active transport
(3) Passive transport
(4) fascilitated diffusion

Q.34 Respiratory centre in brain occurs in– **[Jharkhand]**
(1) Medulla oblongata (2) Cerebellm
(3) Hypothalamus (4) Pericardium

Q.35 CO_2 is transported mainly by– **[Bihar 2005]**
(1) plasma (2) carbonic acid
(3) bicarbonate
(4) carboxyhaemoglobin

Q.36 By which mechanism, oxygen is transported from lungs to cells– **[Bihar 2005]**
(1) Diffusion (2) Fascilitated diffusion
(3) Transpiration (4) Osmosis

Q.37 Repiratory pigment or oxygen carrier in frog's blood is – **[Bihar 2002]**
(1) haemocyanin (2) haemoglobin
(3) haemazoin (4) lymphocytes

Q.38 Why is CO poisonous for man– **[Bihar 2006]**
(1) CO affects the nerves of the lungs
(2) CO affects the diaphragm and intercostal muscles
(3)CO reacts with oxygen reducing percentage of O_2 in air
(4) haemoglobin combines with CO instead O_2 and the product cannot dissociate

Q.39 One haemoglobin carries how many molecules of O_2– **[UP CPMT 2002]**
(1) 4 (2) 2
(3) 6 (4) 8

Q.40 Respiratory centre is present in– **[UP CPMT 2002]**
(1) Cerebellum (2) Cerebrum
(3) Medulla oblongata (4) hypothalamus

Q.41 After deep inspiration, capacity of maximum expiration of lung is called– **[UP CPMT 2004]**
(1) Total lung capacity
(2) Functional residual capicity
(3) Vital capacity (4) Inspiratory capacity

Q.42 Acsent of high mountains may cause altitude sickness in men. Prime cause of this is– **[UP CPMT 2005]**
(1) Excess of CO_2 in blood
(2) Decreased effeciency of haemoglobin
(3) Decreased partial pressure ssof oxygen
(4) Decreased proportion of oxygen in air

Q.43 Pneumotaxic centre is present in– **[UP CPMT 2007]**
(1) Cerebrum (2) Cerebellum
(3) Medulla oblongata (4) Pons varolii

Q.44 Hamburger shift is also known as– **[MP PMT 2007]**
(1) bicarbonate shift (2) chloride shift
(3) Potassium shift (4) All of these

Q.45 Haemoglobin shows maximum affinity with– **[MP PMT 2005]**
(1) Carbon monoxide (2) Carbon dioxide
(3) Oxygen (4) Ammonia

Q.46 Dissociation curve shifts to the right when– **[MP PMT 2002]**
(1) CO_2 concentration decreases
(2) CO_2 concentration increases
(3) O_2 cocentration decrease
(4) Cl^- concentration increases

Q.47 The epithelium of bronchioles is– **[MP PMT 2002]**
(1) Pseudostratified and columnar
(2) Squamous and sensory
(3) Pseudostratified and sensory
(4) Cuboidal and columnar

Q.48 If a man from sea coast goes to Everest peak then **[MP PMT 2002]**
(1) His breathing and heart beat will increase
(2) His breathing and heart beat will decrease
(3) His respiratory rate will decrease
(4) His heart beat will decrease

Q.49 The structure which prevents the entry of food into the windpipe is **[Kerala 2000]**
(1) Gullet (2) Glottis
(3) Tonsil (4) Epiglottis

Q.50 In which of the following animals respiration occurs without a respiratory organ ? **[CPMT 2000]**
(1) Fish (2) Cockroach
(3) Tadpole (4) Earthworm

Q.51 Carbonic anhydrase is found in high concentration in **[PCS 2000, 2001]**
(1) leucocytes (2) blood plasma
(3) erythrocytes (4) lymphocytes

Q.52 What would happen if human blood becomes acidic (low pH) **[BHU 1989]**

(1) Oxygen carying capacity of haemoglobin increases

(2) Oxygen carrying capacity of haemoglobin decreases

(3) RBCs count increases

(4) RBCs count decreases

Q.53 Dissociation of oxyhaemoglobin can be promoted by **[HPMT 1996]**

(1) Low P_{CO_2}

(2) High P_{CO_2}

(3) Low body temperature

(4) High blood pH

Q.54 Which of the following is correct regarding respiration ? **[Punjab 2003]**

(1) no organism can live without respiration

(2) it takes place at every time day and night

(3) it involves production of carbon dioxide and water

(4) all of these

Q.55 Respiratory coefficient is **[CET Chd. 1999]**

(1) The amount of CO_2 produced to O_2 absorbed

(2) The amount of O_2 obtained to the amount of O_2 consumed

(3) Always more than one

(4) Always less than one

Q.56 Dyspnea is the **[Haryana 1998]**

(1) Normal breathing

(2) Difficult breathing

(3) Rapid breathing

(4) Stage without breathing.

Q.57 With reference to human respiration, which is correct ? **[Orissa 2003]**

(1) Pulmonary ventilation is equal to alveolar ventilation

(2) Alveolar ventilation is more than pulmonary ventilation

(3) Alveolar ventilation is less than pulmonary ventilation

(4) Pulmonary ventilation is less than alveolar ventilation

Q.58 Oxyhaemoglobin dissociates into oxygen and deoxygaemoglobin at **[JIPMER 2002]**

(1) low O_2 pressure in tissue

(2) high O_2 pressure in tissue

(3) equal O_2 pressure inside and outside tissue

(4) all times irrespective of O_2 pressure

Q.59 Voice in mammal is produced **[MP 2000]**

(1) by syrinx (2) during inhalation

(3) by bronchus (4) during exalation

Q.60 Oxygen carrier or the respiratory pigment in the blood of frog and other vertebrates is **[AIIMS 1981, CBSE 1999]**

(1) Haemocyanin (2) Cytochrome

(3) Haemoglobin (4) None of these

Q.61 During transport of CO_2, blood does not become acidic due to **[CBSE 1995]**

(1) neutralization of H_2CO_3 by Na_2CO_3

(2) absorption by leucocytes

(3) blood buffers

(4) nonaccumulation

Q.62 The respiratory centre, which regulates respiration, is located in **[CBSE 1994]**

(1) Cerebral peduncle (2) Vagus nerve

(3) Pons (4) Medulla oblongata

Q.63 Respiratory mechanism is controlled by **[AFMC 1982, DPMT 1985]**

(1) Central nervous system

(2) Sympathetic nervous system

(3) Parasympathetic nervous system

(4) Autonomic nervous system

Q.64 During hibernation frog resires through **[CPMT 1991]**

(1) Skin only (2) lung only

(3) Both (4) None

Q.65 Low oxygen tension in the blood causes **[DPMT 1985]**

(1) Coughing (2) Yawning

(3) Hiccuping (4) Sneezing

Q.66 Which one of these statements is correct ? **[CPMT 1981]**

(1) all animals require a medium for cellular respiration

(2) in all animals oxygen is transported by blood

(3) all animals take oxygen from water of air through gills of lungs

(4) all animals need oxygen for respiration

Q.67 Oxy-Haemoglobin dissociation curve is **[BHU 1995]**

(1) Sigmoid (2) Hyperbolic
(3) Straight line (4) Parabolic

Q.68 The affinity of CO with Hb is more than oxygen by **[BHU 1995]**

(1) 2 times (2) 20 times
(3) 200 times (4) 2000 times

Q.69 Exchange of gases in lungs is by **[AFMC 2002]**

(1) Simple diffusion (2) Active transport
(3) Passive transport (4) Osmosis

Q.70 The covering of lungs is called **[AFMC 2002]**

(1) Pleura (2) Pericardia
(3) Peritoneum (4) Mediastenum

Q.71 Hamburger phenomenon is also known as **[AIIMS 1994, JIPMER 2002]**

(1) Calcium shift (2) Bohr effect
(3) Chloride shift (4) Na^+ - K^+ pump

Q.72 Even when there is no air in it, human trachea does not collapse due to presence **[AFMC 1983]**

(1) Bony rings (2) Turgid pressure
(3) Chitinous rings (4) Cartilaginous rings

Q.73 Speciality common in the alveoli of lungs and villi of intestine in mammals is that both **[CPMT 1981]**

(1) provide a large surface area
(2) have ciliated epithelium
(3) are suited for diffusion of gases
(4) have rich supply of blood vessels and lymph ducts

Q.74 The movement of true vocal cords in man is controlled by cartilages **[JIPMER 1999]**

(1) arytenoids (2) cricoid
(3) thyroid (4) both (1) and (2)

Q.75 Presence of large number of alveoli around alveolar ducts opening into bronchioles in mammalian lungs is **[CBSE 1995]**

(1) Inefficient system of ventilation with little of residual air
(2) Inefficient system of ventilation with high percentage of residual air
(3) An efficient system of ventilation with no residual air
(4) An efficient system of ventilation with little residual air

Q.76 Sites of gaseous exchange in lungs are **[CPMT 1991]**

(1) tracheoles (2) alveoli
(3) bronchiloles (4)pulmonary chambers

Q.77 Exposure to carbon monoxide (from coal gas) is extremely dangerous and can kill a patient because **[AFMC 1994]**

(1) The compound carboxy-haemoglobin is formed with haemoglobin which can gradually clot the blood resulting in circulatory failure
(2) Carboxy-haemoglobin reduces the ability of blood to transport oxygen by repturing a vast majority of erythrocytes
(3) Carboxy-haemoglobin greatly modifies the structure of haemoglobin, thus making it lose its affinity for oxygen.
(4) The compound formed, carboxy-haemoglobin does not allow RBCs to act for their respiratory function.

Q.78 During inspiration the diaphragm **[CPMT 1987]**

(1) relaxes to become dome-shaped
(2) contracts and flattens
(3) expands
(4) shows no change

Q.79 Which is correct ? **[MP 1993]**

(1) Respiratory centres are not affected by CO_2
(2) In human vital capacity is just double the expiratory volume
(3) A human lung has 1000 alveoli
(4) During inspiration the lungs act as suction pump

Q.80 In lungs, the air is separated from the venous blood through. **[CBSE 1997]**

(1) Squamous epithelium + endothelium of blood vessel
(2) Squamous epithelium + tunica externa, media & interna of blood
(3) Squamous epithelium + basement membrane + endothelium of blood vessels
(4) None of these

Q.81 Intercostal muscles are found attached with **[AFMC 2002]**

(1) Diaphragm (2) Ribs
(3) plcura (4) Lungs

Q.82 Match the disorders given in column I with symptoms under column II. Choose the answer which gives the correct combination of alphabets with numbers. **[Kerala 2005]**

Column I	**Column II**
A. Asthma	1. Inflammation of nasal tract
B. Bronchitis	2. Spasm of bronchial muscles
C. Rhinitis	3. Fully blown out alveoli
D.Amphysema	4. Omf;a,,atopm pf bronchi
	5. Cough with blood strained sputum

(1) A = 4, B = 2, C = 5, D = 1
(2) A = 5, B = 3, C = 2, D = 1
(3) A = 3, B = 1, C = 5, D = 4
(4) A = 2, B = 4, C = 1, D = 3

Q.83 In lungs, there is definite exchange of ions between RBC and plasma. Removal of CO_2 from blood involves. **[CPMT 2005]**
(1) influx of Cl^- ions into RBC
(2) influx of HCO_3^- ions into RBC
(3) efflux of Cl^- ions from RBC
(4) efflux of HCO_3^- ions from RBC

Q.84 Which one of the following statements is incorrect ? **[CBSE 2006]**
(1) The presence of non-respiratory air sacs, increases the efficiency of respiration in birds
(2) In insects, circulating body fluids serve to distribute oxygen to tissues
(3) The principle of countercurrent flow facilitates efficient respiration in gills of fishes
(4) The residual are in lungs slightly decreases the efficiency of respriration in mammals

Q.85 About 1000 ml of air is always known to remain inside the human lungs. It is described as **[KCET 2006]**
(1) inspiratory reserve volume
(2) expiratory reserve volume
(3) residual volume
(4) tidal volume

Q.86 In the following statements **[Kerala 2006]**
A. Carbonic anhydrase is present in the erythrocytes
B. In erythrocytes the carbon dioxide combine with water and is transported.
(1) statement A is correct and is responsible for statement B
(2) statement A is not correct but statement B is correct
(3) both statement A and B are wrong
(4) statement A is correct but not involved in statement B

Q.87 Carboxyhaemoglobin complex results due to this pollutant ? **[JK 2006]**
(1) CO_2 (2) CO
(3) H_2CO_3 (4) SO_2

Q.88 Besides RBC, blood plasma also carries O_2 in solution. The % is **[Orissa 2006]**
(1) 3 – 9% (2) 1 – 2%
(3) 3 – 6% (4) 2 – 3%

Q.89 Listed below are four respiratory capacities (a-d) and four jumbled respiratory volume of a normal human adult : **[CBSE 2010]**

Respiratory Capacities	***Respiratory volumes***
(a) Residual volume	2500 mL
(b) Vital capacity	3500 mL
(c) Inspiratory reserve volume	1200 mL
(d) Inspiratory capacity	4500 mL

Which one of the following is the correct matching of two capacities and volume ?
(1) (a) 4500 mL, (b) 3500 mL
(2) (b) 2500 mL, (c) 4500 mL
(3) (c) 1200 mL, (d) 2500 mL
(4) (d) 3500 mL, (a) 1200 mL

Q.90 What is true about RBCs in humans ? **[CBSE 2010]**
(1) They do not carry CO_2 at all
(2) They carry about 20-25 percent of CO_2
(3) They transport 99.5 percent of O_2
(4) They transport about 80 percent oxygen only and the rest 20 percent of it is transported in dissolved state in blood plasma

Q.91 Which one of the following is the correct statement for respiration in humans ?

[AIPMT Pre 2012]

(1) Neural signals from pneumotoxic centre in pons region of brain can increase the duration of inspiration

(2) Workers in greinding and stone-breaking industries may suffer, from lung fibrosis.

(3) About 90% of carbon dioxide (CO_2) is carried by haemoglobin as carbamino-haemoglobin.

(4) Cigarette smoking may lead to inflammation of bronchi.

Ans.	2	4	4	2	3	1	2	4	4	2	2									

These questions consist of two statements each, printed as Assertion and Reason. While answering to choose any one of the following four responses.

(1) If both Assertion & Reason are True & the reason is correct explanation of the Assertion.

(2) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.

(3) If Assertion is True but the Reason is False.

(4) If both Assertion & Reason are false.

Q.1 **A :** Oxidation of nutrients releases bond energy.
R : Oxidation of nutrients is done by using molecular oxygen.

Q.2 **A :** Aerobic animals are not truly aerobic.
R : They produce lactic acid anaerobically.

Q.3 **A :** Aerobic respiration involves the exchange of respiratory gases twice.
R : Exchange occurs from lung to heart and then heart to lung.

Q.4 **A :** Respiratory gas exchange occurs through osmosis.
R : Respiratory gas goes from lower partial pressure region to the region of higher partial pressure.

Q.5 **A :** First step of gas exchange occurs through body surface in some animals.
R : Body surface or membrane of amphibia is thick in nature.

Q.6 **A :** Insects develop a complex system of air tubes called trachea for respiratory purpose.
R : Exchange through body surface is not possible in insects.

Q.7 **A :** Abdominal muscle is related with respiration in animals.
R : Relaxation of abdominal muscles draws in air.

Q.8 **A :** Aquatic animals require more energy for the respiratory process.
R : Aquatic animals use dissolved oxygen.

Q.9 **A :** Gill - lamellae in aquatic animals help in exchange of gases.
R : Each gill lamella carries many blood capillaries.

Q.10 **A :** In mammals, complex respiratory system has developed.
R : Mammalian skin is impermeable to gases.

Q.11 **A :** Lungs replace the skin very effectively in mammals as respiratory organs.
R : Respiration by lungs is termed pulmonary respiration.

Q.12 **A :** Forceful expiration occurs through expiratory muscles.
R : Expiratory muscles expires quickly.

Q.13 **A :** Vital capacity is higher in athletes than non-athletes.
R : Vital capacity is about 3.5 - 4.5 litres in a normal adult person.

Q.14 **A :** Oxyhaemoglobin carries 1 - 4 molecules of oxygen in the blood.
R : The capacity of oxyhaemoglobin depends on the degree of (Fe^{2+}) saturation with oxygen.

Q.15 **A :** A person has died because of carbon monoxide poisoning.
R : A person slept in a closed room with a lamp burning.

Q.16 **A :** During inspiration, the volume of thorax increases.
R : This happens due to the relaxation of diaphragm and inspiratory muscles.

Q.17 **A :** Gaseous exchanges continue in the lungs without interruption even during expiration.
R : Residual volume of air can never be driven out by respiration.

Q.18 **A :** Erythrocytes can carry out anaerobic metabolism only.
R : In erythrocytes, carbon-dioxide is converted into bicarbonates.

Q.19 **A :** During expiration, volume of thorax decreases and air is expelled out.
R : This happens due to the contraction of inspiratory muscles.

Q.20 **A :** During inspiration, pressure of air falls in the thorax.

R : There is a rise in volume of thorax during inspiration.

Q.21 **A :** It is beneficial to respire through mouth than through the nasal openings.

R : Air gets filtered when passed through the mouth.

Q.22 **A :** More of oxygen is released from oxyhaemoglobin in a more active tissue than in a less active one.

R : This is because partial pressure of carbon-dioxide is very low in an active tissue than in a less active one.

Q.23 **A :** Symptoms of emphysema develops when a person living on plains ascends and stays on a mountain.

R : Air pressure and partial pressure of oxygen falls with the decrease in altitude.

Q.24 **A :** Oxygenation of blood promotes the release of carbon-dioxide from the blood in the lungs.

R : Carbon-dioxide is carried as bicarbonates in erythrocytes of blood.

Q.25 **A :** One should not sleep in a closed room with a lamp burning inside.

R : This can cause the production of carbon monoxide which renders haemoglobin inactive by binding to it and forming carbamino haemoglobin.

Q.26 **A :** Voice of women and children is high pitched whereas that of men is low pitched.

R : Vocal cords of men are longer than of women and children.

Q.27 **A :** Coughing and sneezing are necessary.

R : Coughing and sneezing are reflex actions..

Q.28 **A :** Most fish when out of water, die of suffocation.

R : Atmospheric air contains far less oxygen content than the dissolved oxygen in water.

Q.29 **A :** Aerobic respiration is more efficient than anaerobic respiration.

R : Aerobic respiration involves complete oxidation of respiratory substance to release more energy, while anaerobic respiration involves only partial breakdown of the food.

Q.30 **A :** Both external and internal respiration are physico-chemical processes.

R : In both of these, diffusion and oxidative phosphorylation of glucose occur.

Q.31 **A :** In annelids and amphibians, cutaneous respiration is main mode of respiration.

R : In these animals, skin is thin, moist, vascular and permeable to O_2 and CO_2.

Q.32 **A :** In cockroach, inspiration is a passive process while expiration is an active process.

R : Tracheae of cockroach form an extensive network and extends upto the body cells.

Q.33 **A :** In cockroach, there is no blood.

R : So transportation materials is by well developed tracheal network.

Q.34 **A :** Alveoli of lung of man are lined by lecithin phospholipid.

R : Lecithin lowers the surface tension and prevents collapsing of alveolar walls.

Q.35 **A :** Phrenic muscles of diaphragm are called principal expiratory muscles.

R : Contraction of these muscles decrease thoracic activity to expel main part of foul air

Q.36 **A :** In prawn, all the 8 pairs of gills are phyllobranchs.

R : In the gills of prawn, gill lamellae are finger-like.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A Question I am unable to solve in first attempt	COLUMN : B Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

DIGESTIVE SYSTEM

ANIMAL NUTRITION

- **Nutrition** - The sum total of the processes starting from taking the food upto its utilisation is called nutrition. Depending upon the mode of nutrition, the organisms can be classified as autotrophs and heterotrophs.
- **Autotrophs** manufacture their own organic food from inorganic raw materials.
- **Heterotrophs** are unable to manufacture their own food. They obtain organic food from outside. Heterotrophs include animals, fungi, protists and monerans.
- Euglena is **mixotrophic** (both autotrophic and saprotrophic).

Based on the methods of procurement or collection of food, **heterotrophic nutrition is of four major types-**

1. **Holozoic** (holotrophic) nutrition is also called **ingestive nutrition**. Depending upon food, animals are

(a) Herbivores- Feeding on plants e.g., Rabbit, Goat, Cow .
(b) Carnivores- Feeding on other animals e.g., Tiger, Lion.
(c) Omnivores- Feeding on all types of food e.g., humans
(d) Detrivores. Feeding on detritius or organic remains e.g, Earthworm.
(e) Scavengers- Feeding on carrions (carrion eaters) e.g., Hawk vulture.
(f) Insectivores- Eating insects e.g., common bats.
(g) Cannibals- Eating other members of own species e.g., Many snakes.
(h) Frugivorous- Feeding on fruits e.g., Parrot.
(i) Sanguivores- Taking meal of blood e.g., Leech, Female mosquito.
(j) Coprophagous - Eats its faecal matter. e.g., Rabbit.

2. **Saprozoic nutrition -** A few animals do **not ingest solid food**. Instead they secrete digestive enzymes directly into their food out side the body their food is **dead or decaying matter**. The food is thus digested out side the body by the digestive enzymes and then the animals suck digested food. This is called saprozoic nutrition.e.g. **Spiders, Housefly**, etc.

3. **Parasitic Nutrition -** Parasites take **liquid food** material from the body of the host. This is called parasitic nutrition. e.g. **Plasmodium, Trypanosoma, Taenia, Ascaris** etc.

4. **Symbiotic Nutrition (= Mutalism)) :** When two organism or animals live in association and **derive food from each other**, they are called symbionts and their nutrition is known as symbiotic nutrition (= mutualism). For example, **Escherichia coli** live in the human intestine and synthesis vitamin B12, which is used by man and the **E.coli** receives, in return, simpler food from human.

DIGESTIVE SYSTEM

INTRODUCTION

The process by which complex food is converted into simplest food with the help of digestive enzymes (Hydrolytic enzymes), hence process of digestion is a hydrolytic process.

- **Types of digestion**

(1) Intracellular : When the process of digestion occurs within the cell in the food vacuole. Examples : Protozoa, Porifera, Coelenterata and free living platyhelminthes. With the help of lysosomal enzymes. Food particle is taken in through endocytosis (phagocytosis). It forms a phagosome which fuses with a lysosome. Digestion occurs and the digested materials are passed on to cytoplasm. The undigested materials is thrown out by exocytosis.

(2) Extracellular : When the process of digestion occurs outside the cell. Examples : Coelenterates and phylum platyhelminthes to phylum chordata. Therefore, coelenterata and free living platyhelminthes (flat worms) perform both intracellular and extracellular digestion.

DIGESTIVE SYSTEM OF HUMAN

Digestion in vertebrates occurs in the digestive tract or alimentary canal. The various parts involved in digestion can be broadly grouped in two groups –

(1) Digestive tract or alimentary canal

(2) Digestive glands

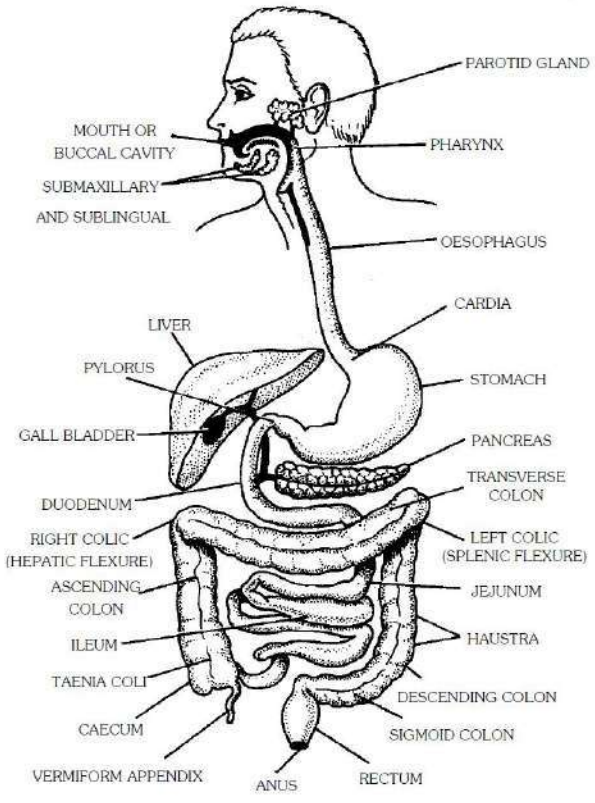
1. Digestive tract or alimentary canal

On the basis of the embryonic origin, the alimentary canal of vertebrates can be divided into three parts –

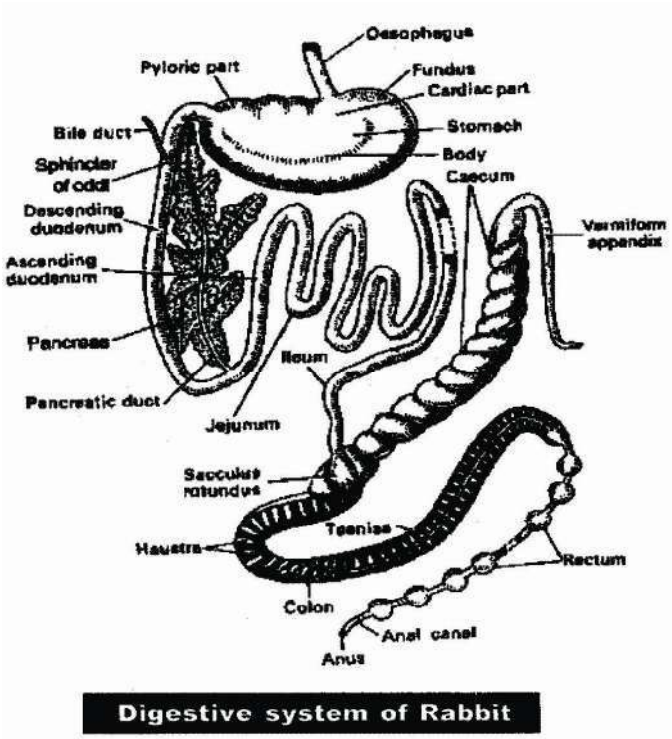
(A) Fore gut / Stomodaeum : Ectodermal. It includes buccal cavity / oral cavity.

(B) Mid gut / Mesodaeum : Endodermal. It includes pharynx, oesophagus, stomach, small intestine, and large intestine.

(C) Hind gut / Proctodaeum : Ectodermal. It includes anal canal and anus.



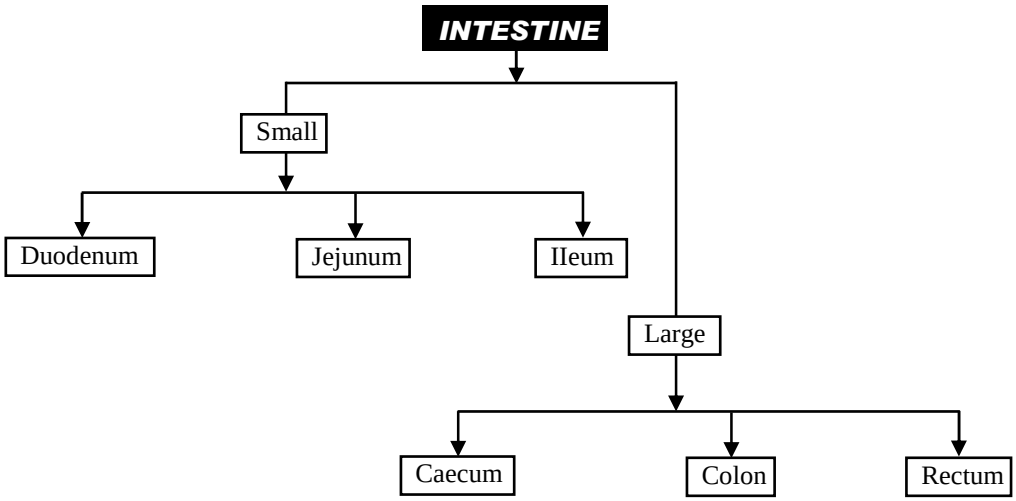
Digestive system of man



Digestive system of Rabbit

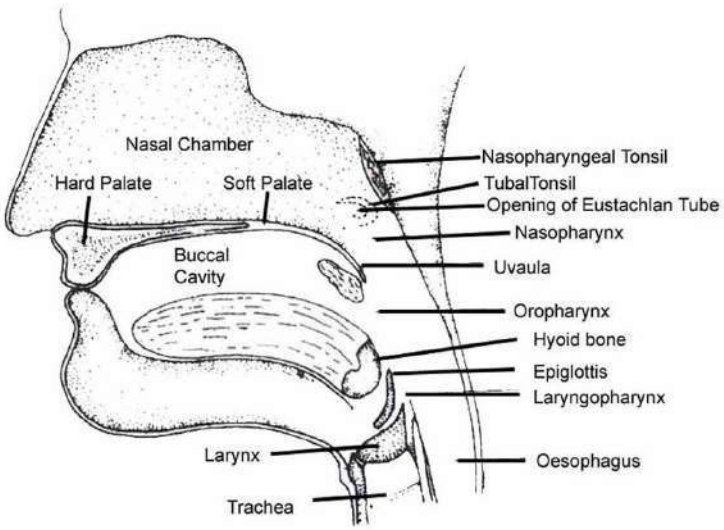
- **The alimentary canal is divided into following parts–**

(1) Mouth and Buccopharygeal cavity
(2) Oesophagus
(3) Stomach
(4) Intestine



(1) Mouth and Buccopharyngeal Cavity – Mouth is a horizontal transverse slit like aperture which is surrounded by upper and lower lip. Orbicualaris oris voluntary muscles. are found in lips. Sebaceous glands are found on the outer part of lip. Serous glands are found on the inner part of lip. Serous glands is the modification of mucus glands. Its secretory substance is watery.

In Rabbit a small cleft is found in the middle part of upper lip, such type of lip is called as **Hare lip.**

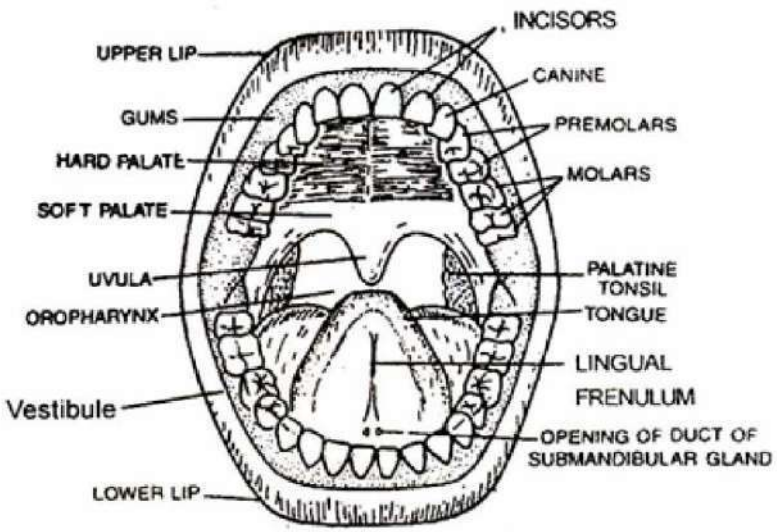


Secation of head showing parts of pharynx

(i) Buccal vestibule – It is a peripheral part which, present between the gums and cheeks where the food is stored temporarily for some time

(ii) Oral cavity – It is inner & central part which, is surrounded by upper and lower Jaw. Lined by stratified squamous epithelium. Upper Jaw is Fixed and Lower jaw is Movable.

The roof of oral cavity is called as **Palate.** This palate is horizontal partition which situated between oral cavity and nasal chamber



Human oral cavity

Palate is differentiated into two parts :

(i) Hard Palate –

It is the anterior part of the palate. It is made up of Maxilla and palatine bone in human. But in Rabbit it is made of Pre-maxilla, maxilla, palatine bone.

On the ventral surface of hard palate, some projection or transverse ridges are present which are called as **palatine rugae.**

These rugae prevent slip out of the food from buccal cavity during mastication.

These rugae are well developed in carnivorous animals.

In rabbit, one pair opening of Nasopalatine duct is present at the anterior part of hard palate, these connect the buccal cavity to the Nasal passage. In Rabbit some olfactory receptor are also found in nasopalatine duct which are called as **Jacobson's organ**. It makes them aware of the smell of food while chewing.

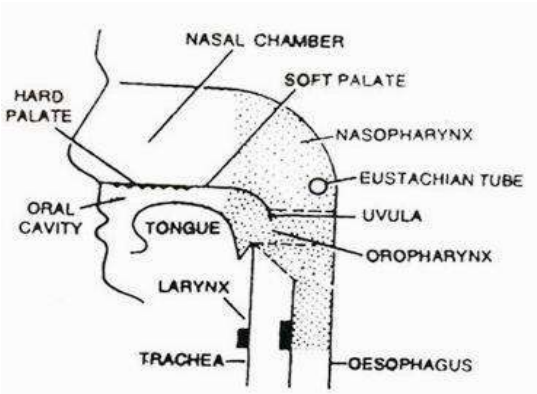


Diagram showing parts of phanyx

(ii) Soft Palate –

It is the posterior part of palate. It is made up of involuntary muscle, fibrous connective tissues and mucous epithelium. (Stratified squamous epithelium)

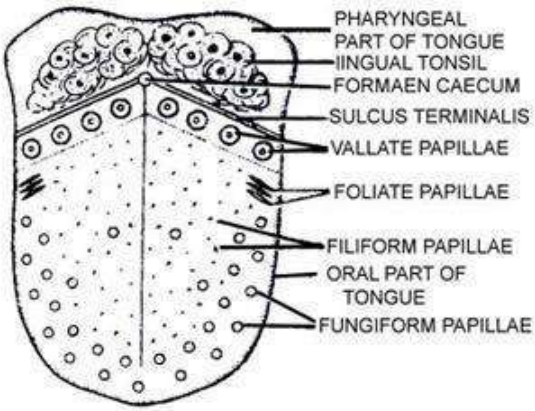
The posterior part of soft palate becomes out grow and hangs down in the form of finger like process called as **Uvula** or **Velum palati**

One pair of large lymph node is present on the posterolateral surface of soft palate, called as **Palatine tonsil** or **Tonsils**

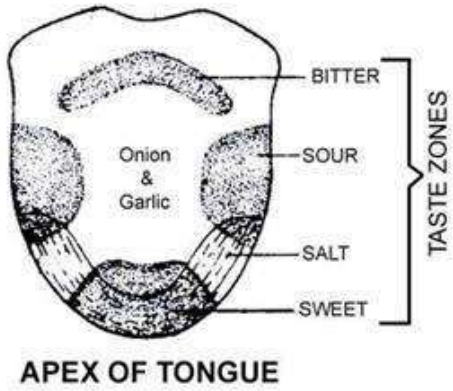
Soft palate is situated in the pharynx and is divided into two parts. Upper and dorsal part of pharynx is called as **Nasopharynx** which is related to the nasal chamber.

The lower and ventral part of pharynx is called **oropharynx** which is related to the oral cavity. One pair of opening of **Eustachian tube** is present in the nasopharynx. This Eustachian tube is related to the middle ear .

TONGUE



Upper surface of human tongua



Human tongue showing four taste arease

On the floor of oral cavity a muscular, flat, fleshy plate like structure is present which is called **tongue.** The anterior part of tongue is free while posterior part of Tongue is connected to the Hyoid bone. The surface of tongue is connected to the floor of buccal cavity through a very flexible membrane/ligamentous fold called as **frenulum linguae**

On the dorsal surface of tongue, it is divided into two unequal parts by a V shaped sulcus, called as sulcus terminalis.

The two limbs of the 'V' meet at a median pit named **Foramen Caecum.**

It is divided into two parts –

(a) Pharyngeal or Lymphoid Part – It is the posterior 1/3 part of the tongue. Many small lymph nodes are present in this part which are called **Lingual tonsil.**

(b) Oral or papillary Part – It is anterior 2/3 part of tongue. Four types of papillae are found in this part in which gustatory or taste receptors are present.

(i) Fungiform Papillae –

It is pink coloured, small & spherical in shape. It is found on the entire surface of tongue but Their maximum concentration at the anterior tip part of tongue. It is attached to tongue with the help of small pedicle. It provides pink colour to the tongue.

(ii) Filliform Papillae (Conical papillae) –

They are thread like, white coloured & conical in shape. They are also found on the entire surface of tongue. They are most numerous.

(iii) Foliate Papillae –

They are found on the mid lateral surface of tongue. They are vestigeal in the human. Their structures is leaf like present in rabbit and other mammals.

(iv) Circumvallate papillae –

They are large spherical shape papillae which are found near to sulcus terminalis. They are least in number (approx 8 to 12)

- **Two type of muscles are present in tongue**

1. **Extrinsic muscle**

   It is found on outer and superficial part of tongue.

   It helps in outward and inward movement of tongue.

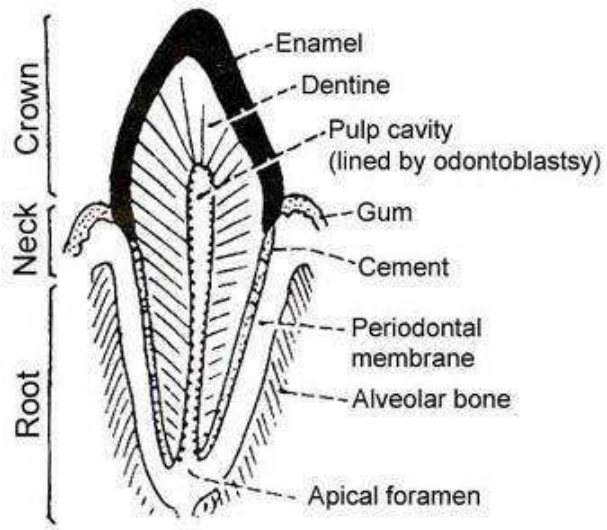
2. **Intrinsic muscle**

   It is situated in the deep part of tongue.

   It help in the change of shape of tongue

TEETH

Teeth are ectomesodermal in origin. Major portion of teeth arises from **Dermis**. Part of tooth present outside the gums only is derived from ectoderm or **Epidermis (Enamel part).**



Parts of Tooth

In human teeth of upper jaw are attached to the maxilla bone. While teeth of lower jaw are attached to Mandible bone. But in rabbit upper incisors are attached to premaxilla. While upper pre molars and molars attached to the maxilla bone. While lower teeth are attached to dentry bone.

- **STRUCTURE OF TEETH**

There are a three parts of the tooth

1. **Crown :** It is the outer part of the tooth, exposed outside gums.
2. **Neck :** It is the middle part of the tooth which is embeded inside the gums.
3. **Root :** It is the part of tooth that is inserted inside the socket of jaw bone. (Alveoli)

The crown part of the tooth is made up of a very hard substance called the Enamel. It is the hardest material of animal kingdom.

Enamel is **ectodermal**. It is secreted by **Ameloblast** cells of the ectoderm. It has maximum amount of inorganic salt (96%) in it, Inorganic salt are mainly found in the form of phosphate and carbonate of Ca, Mg, Na and K. 3% of water is found in the enamel. Along with the keratin & ossein protein (1%) are also found in teeth. Ossein is a protein of bones. Remaining part of tooth develops from mesoderm of embryo.

Dentine is the main part of tooth. Approximately 69% inorganic salts are present in dentine and 65% are present in cement. (62% inorganic salts are present in bones.)

- Dentine surrounds a cavity called **pulp-cavity**. This cavity contains soft connective tissue, blood capillaries, nerve fibres. Pulp cavity is neccessary for the nutrition and survival of the teeth. At the base of pulp-cavity an aperture is present . Through this aperture, blood capillaries and nerve fibres enter inside the teeth. This aperture is called **apical-foramen**. A special type of cells form the lining of the pulp-cavity called the **Odontoblast cells.** These cells are the dentine secreting cells. Cytoplasmic process of odontoblasts are embeded into dentine in the form of fine tubule . These processes are called canaliculi. These canaliculi secretes dentine. The teeth continue to grow till the odontoblast cells remain active. In adults, the adults, the pulp-cavity shrinks and the odontoblasts become inactive so the teeth stops to grow. The cement layer is made up of the cementocytes cells. Between the root and the bones of the teeth a periodontanl membrane is present.
- In Rabbit and rat the pulp-cavity of the incisor remains wide throughout their life, so these teeth grow continuously throughout their life span.

  If one incisor of Rabbit & rat is broken then the opposite incisor grows continuously, finally the animal can neither can close the mouth nor gnaw the food. So the animal dies due to starving.
- **Four type of teeth found in mammals are–**

1. **Incisor** – These are long, chisel like teeth for gnawing the food. They are more developed in gnawing animals e.g. lagomorphs, rodents, tusk of elephant are modification of upper Incisor. Tusk is used to protection from enemies, attack on enemies (not for feeding purpose)
2. **Canines –** These are sharp pointed teeth meant for tearing the food. Canines are most developed in carnivorous animals. canines are absent in herbivorous animals e.g. Rabbits do not have canines. In herbivorous, the space of canine in gums is empty and this empty space is called diastema.
3. **Pre molar** – These teeth are meant for chewing and crushing of food, they are triangular in shape.
4. **Molars (Cheek teeth)** – These also meant for chewing & crushing of food. They are rectangular in shape. Premolar and molar help in the mastication of food. In human teeth of upper jaw are attached to the maxilla bone. While teeth of lower jaw are attached to the mandible bone.

- In animals, except Premolar and Last molar, all type of teeth appear twice in life. Teeth which appear during childhood are called milk teeth or temporary teeth. Due to the activity of osteoclast cells. These milk teeth are shed, off then permanent teeth appear.
- When temporary molars shed, their socket are filled by premolar and new socket are formed for permanent molar. This occurs once in life time.
- In frog, only upper jaw has teeth.
- In Rabbit teeth of upper jaw are attached to the pre maxilla and maxilla bone, while teeth of lower jaw are attached to the dentry bone **Hippocampus, tortoise and birds do not have teeth.**

TYPE OF TEETH

1. **Monophyodont –** The teeth which appear only once in life e.g. Pre Molar & Last molar of man.
2. **Diphyodont –** The teeth which appear twice in life e.g. Incisors, Canines, Molars of human.
3. **Polyphyodont –** The teeth which appear more than twice in life. e.g. Fish, Amphibians.
4. **Thecodont –** The teeth which are present in bony socket of jaw. e.g. Man & crocodile
5. **Pleurodont –** The teeth which are present on the lateral side of jaw bone. e.g. Reptiles
6. **Acrodont** – The teeth which are present on the terminal part of Jaw bone. eg. Fish, amphibian
7. **Heterodont –** When the teeth are of different type in mammals on the basis of structure and function. e.g. Mammal.
8. **Homodont –** Whether all teeth are of similar type in animal on the basis of structures and function e.g. Fish, Amphibians.

Secodont:

These are canine teeth of carnivorous animals.

In this type of structure canine teeth become long and pointed which, is bended towards the backward direction.

Hypsodont (Smiling teeth):

In this type of teeth the crown part is large root is either absent or small such as **incisor** and **canine**. These teeth are also called as smiling teeth.

Brachyodont (Cheek teeth) :

In this type of teeth crown part is small root is long such as **premolar** and **molar**

Wisdom teeth – These are the last molar teeth of humans which appear in the age of 18 to 25 year.

Lophs or Cusps–

The upper surface of premolar & molar is broad and some small projections are present in the upper surface of premolar and molar.

These projections are called Lophs or cusps. On the basis of structure of Lophs, these teeth are of four types–

(i) Lophodont – In this type of teeth the lophs are large, wide and flat such as **rabbit & elephant.**

(ii) Bunodont – In this type of teeth. Lophs are small and spherical in shape , such as **human**

(iii) Solenodont – In this type of teeth the lophs are large and semilunar shape e.g. **Ruminant animals (Cow, Buffalo).**

(iv) Carnesial – in this type of teeth the lophs are long & pointed e.g. **Carnivorous Animal**.

Dental Formula :

Child = $1\frac{2}{2}C\frac{1}{1}PM\frac{0}{0}M\frac{2}{2}=\frac{5}{5}\times 2=\frac{10}{10}=20$

17 yr. old = $1\frac{2}{2}C\frac{1}{1}PM\frac{2}{2}M\frac{2}{2}=\frac{7}{7}\times 2=\frac{14}{14}=28$

Adult = $1\frac{2}{2}C\frac{1}{1}PM\frac{2}{2}M\frac{3}{3}=\frac{8}{8}\times 2=\frac{16}{16}=32$

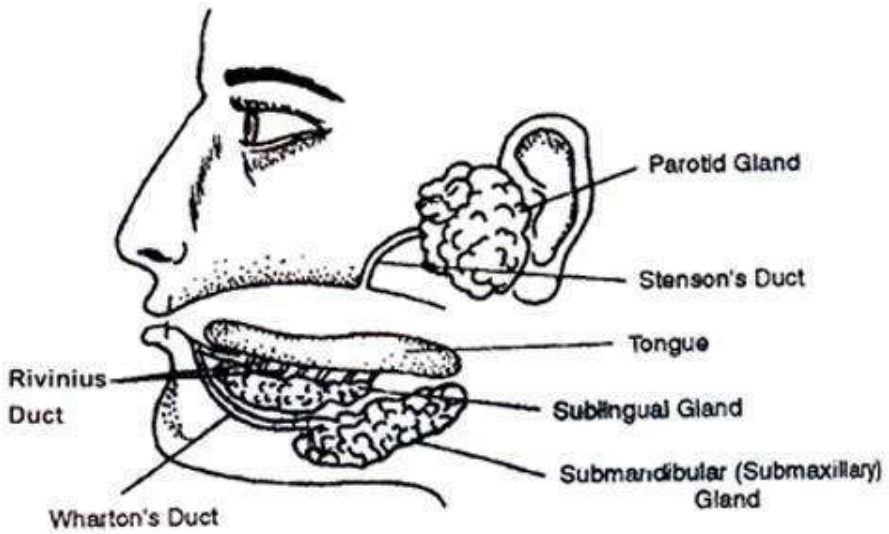
Horse and pig	$\frac{3.1.4.3}{3.1.4.3} = 44$	Cat	$\frac{3.1.3.1}{3.1.2.1} = 30$
Dog	$\frac{3.1.4.2}{3.1.4.3} = 42$	Squirrel	$\frac{1.0.2.3}{1.0.1.3} = 22$
Lemur	$\frac{2.1.3.3}{2.1.3.3} = 36$	Rat	$\frac{1.0.0.3}{1.0.0.3} = 16$
Man	$\frac{2.1.2.3}{2.1.2.3} = 32$	Elephant	$\frac{1.0.0.3}{0.0.0.3} = 14$
Cow	$\frac{0.0.3.3}{3.1.3.3} = 32$	Permanent set milk set	$\frac{2.1.2.0}{2.1.2.0} = 20 / \frac{2.1.0.2}{2.1.0.2} = 20$

Note : In humans, premolar teeth appear in the alveoli of molar teeth while permanent molar teeth are developed in new alveoli.

SALIVARY GLANDS :

In mammals, 4 pair of salivary glands are present

1. **Infra-orbital-glands**
   Gland is located just below the eye-orbit. The duct of these glands open in the upper-jaw near the 2nd molar teeth.
2. **Parotid-glands(largest salivary glands)**
   These glands are located just below the external auditory canal. Their duct is called **Parotid duct/Stenson's duct** which open in the upper jaw i.e. the Buccal-vestibule.
   Whenever in human, these glands are infected by viruses this disease is called as **Mumps**. Due to this, the gland swells up.



Salivary glands of Man

3. **Sub maxillary or submandibular glands** – These are located at the junction of the upper and the lower jaw Their duct is called Wharton's duct (largest salivary duct). These ducts open in the lower jaw just behind the Incisor teeth.

4. **Sublingual glands –** These are the smallest salivary glands. These glands are found in the lower jaw. Many ducts arise from these glands called as the **Ducts of Rivinus** or also the **Bartholin's ducts.** These ducts open in the bucco-pharyngeal cavity on the ventral side of the tongue

- Maximum saliva is secreted by the **Sub-lingual glands** (Smallest salivary duct).

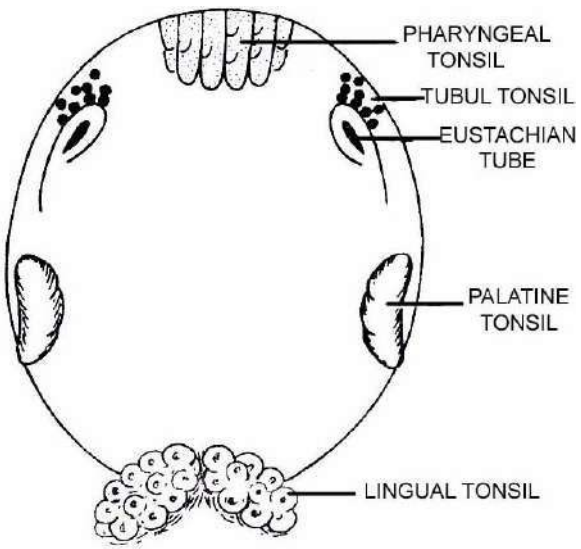
Salivary glands are **Exocrine** glands. The secretion of salivary gland is termed as the saliva. In saliva, water, mucous, starch-digesting **Ptyalin enzyme,** Lysozyme and thiocyanates are present. Ptyalin is secreted only by parotid gland. Lysozyme and Thiocyanates mainly kill bacteria. They also check the growth of bacteria in bucco-pharyngeal cavity.

In addition to it 5^{th} pair of molar gland is found in Cat which is situated near to the upper molar teeth and also open near upper molar teeth.

Waldeyer's Ring :–

The lymphatic tissues of the pharynx and oral cavity are arranged in a ring like manner, which are collectively called Waldeyer's ring (= Waldeyer's lymphatic ring). The ring mainly consists of the following :

(i) Nasopharyngeal Tonsil (= Pharyngeal Tonsil) : - Refer to the nasopharynx. In children nasopharyngeal tonsil may become enlarged and referred as **adenoids.** The resulting swelling may be a cause of obstruction to normal breathing .



Waldeyer's Ring

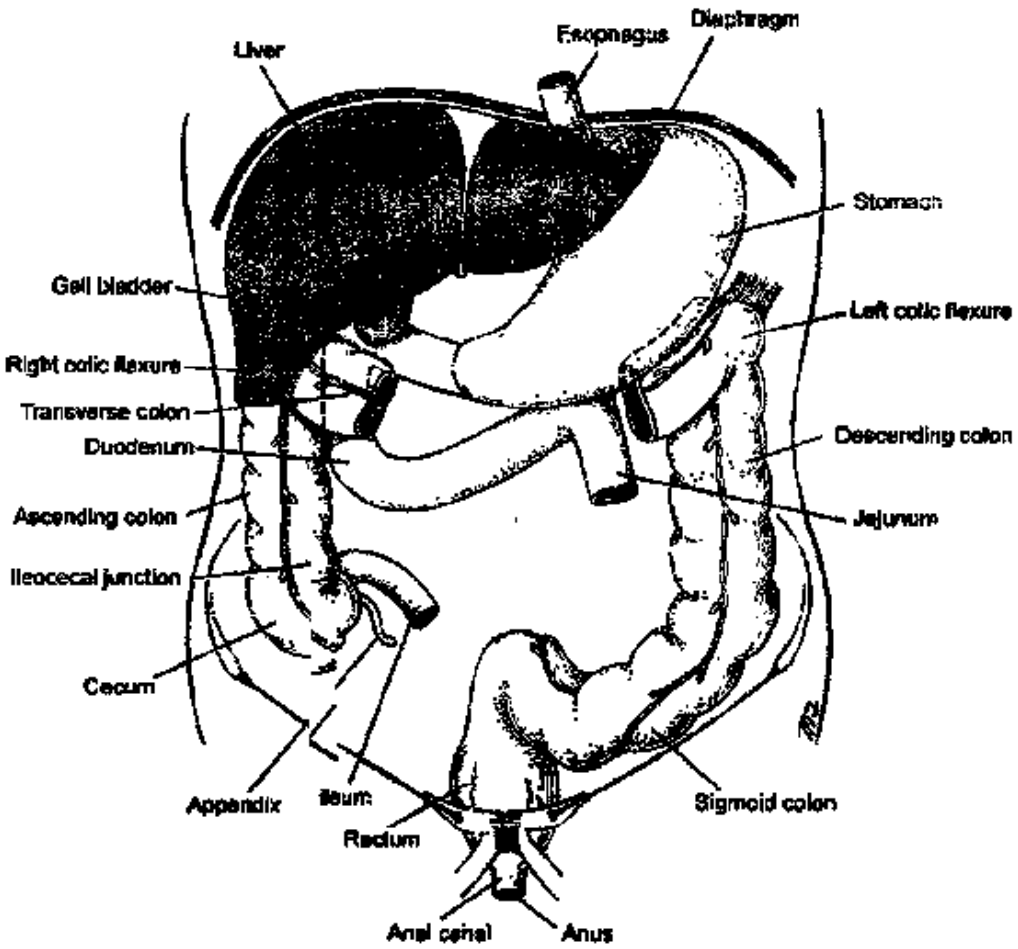
(ii) Tubul Tonsil : – Refer to the nasopharynx.

(iii) Palatine Tonsils (= Faucial Tonsils) : – Refer to the oropharynx. The Palatine tonsils are often infected **(tonsillitis)** leading to sort throat.

Such enlarged tonsils may become a focus of infection and their surgical removal **(Tonsillectomy)** becomes necessary.

(iv) Lingual Tonsil : – They are situated on posterior part of tongue.

ALIMENTARY CANAL



- **Oesopagus :**

  Two apertures are found in central part of Buccopharyngeal cavity

– Ventral or lower aperture is called **Glottis** which is related to the Larynx. Which is guarded by epiglottis
– The Dorsal and upper aperture is called **Gullet** which open into oesophagus.
– Oesophagus is simple uniform tube which runs downward and pierces the diaphragm and finally opens into stomach
– Longitudinal folds are found on the inner surface of Oesophagus
– In it's lumen digestive glands are absent, only mucous glands are present here.
– Voluntary muscles are found on the upper 2/3 part of oesophagus while, involuntary muscles are found in lower 1/3 part of oesophagus.
– The length of oesophagus depends on lengeh of neck so the longest Oesophagus is present in **Giraffe.**

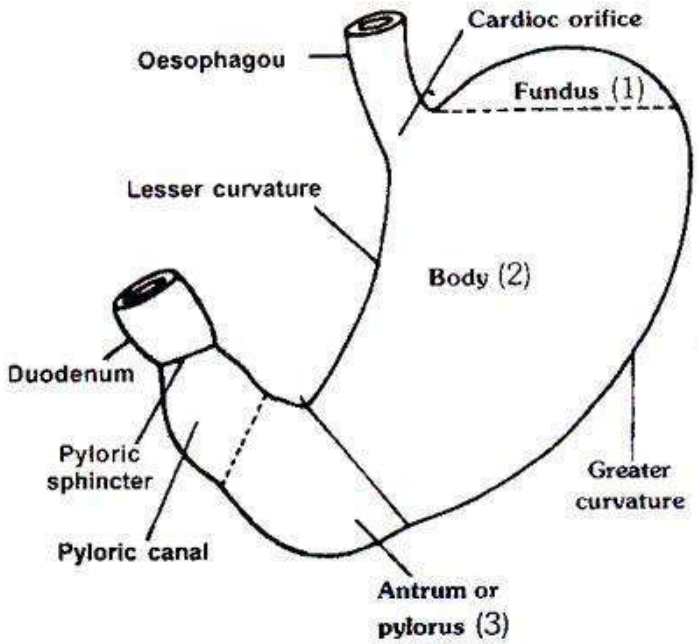
- **Stomach**

  It is situated on left side of abdominal cavity. **It is the widest part of alimentary canal.** It is a bag like muscular structure, J shaped in empty condition. The stomach is divided into three part (Fundus, Body, pylorus or antrum).

  It has two orifices (opening)

(i) Cardiac orifice : It is proximal aperture of stomach which is joined by the lower end of the oesophagus.

(ii) Pyloric orifice : It distal aperture of stomach which opens into the duodenum.



The stomach

Mucous membrane of the stomach is thick. In empty stomach numerous longitudinal folds are found called gastric rugae. They disappear when stomach is distended. Stomach is covered by layer of peritoneum, fat tissue and lymph tissue deposits on the peritoneum. Such type of peritoneum are called Omentum. Left curved surface of stomach is called greater omentum. Right curved surface of stomach is called lesser omentum.

- **Gastric Glands** :

These are numerous microscopic, tubular glands formed by the epithelium of the stomach. The following types of cells are present in the epithelium of the gastric glands.

(i) Chief cells or Peptic cells (=Zymogen cells) are usually basal in location and secrete gastric digestive enzymes as proenzymes or zymogens, **pepsinogen** and **prorennin.** The chief cells are also produce small amount of **gastric amylase** and **gastric lipase**. Gastric amylase action is inhibited by the highly acid condition. Gastric lipase contributes little to digestion of fat. Prorennin is secreted in young mammals. It is not secreted in adult mammals.

(ii) Oxyntic cells : (=Parietal cells) are large and are most numerous on the side walls of the gastric glands. They are called oxyntic cells because they stain strongly with eosin dye. They are called pariental cells as they lie against the basement membrane. They secrete hydrochloric acid and **Castle intrinsic factor**.

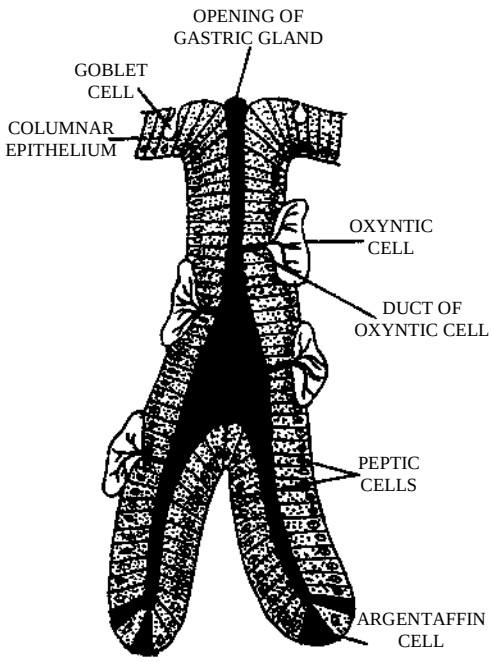


Fig. – L.S. Gastric gland

(iii) Mucous cells : (= Goblet cells) are present through out the surface epithelium and secrete mucus. The epithelium of gastric glands also has the following two parts of cells.

G-cells. **Argentaffin cells** produce **serotonin** (its precursor is 5-hydroxy-tryptamine, 5-HT), **somatostatin** and **histamine** . **Gastrin cells** (G-cells) are present in the pyloric region and secrete and store the hormone **Gastrin.**

Serotonin is vasoconstrictor and stimulates the smooth muscles. Somatostatin suppresses the release of hormones from the digestive tract. Histamine dialates the walls of blood vessels (vasodilator). Gastrin stimulates the gastric glands to release the gastric juice.

(iv) Stomach of ruminants (cud-chewing mammals) :

The stomach of cattles have four parts, as rumen (paunch), reticulum (honeycomb), omasum (psalterium) and abomasum (rennet).

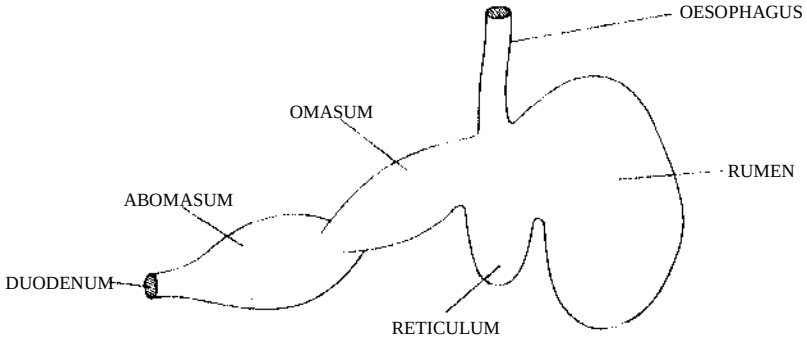

Fig. – The compound stomach of a ruminant

Some authors believe that first three chambers are parts of the oesophagus, the fourth chamber is the real stomach secretes HCl and enzymes.

The embryological studies have proved that all the chambers are parts of the real stomach.

The cattles rumen stores the quickly fed food. So cud chewing animals are called ruminants. *e.g.* cow, buffaloes, goat etc. Rumen is the largest part of stomach. Primitive digestion and bacterial action takes place in rumen.

Which later on moves again to buccal cavity where it is properly chewed, then this food passes into reticulum to omasum which concentrates the food by absorbing water and bicarbonates. Finally, the food reaches in the fourth chamber, abomasum.

First three chamber are lined by cornified epithelium but fourth chamber abomosum is lined glandular epithelium and gastric glands, so it is true stomach. **Camel and deer** lack omasum.

Reticulum is the smallest part and its cells are provided with water pockets for the storage of metabolic water.

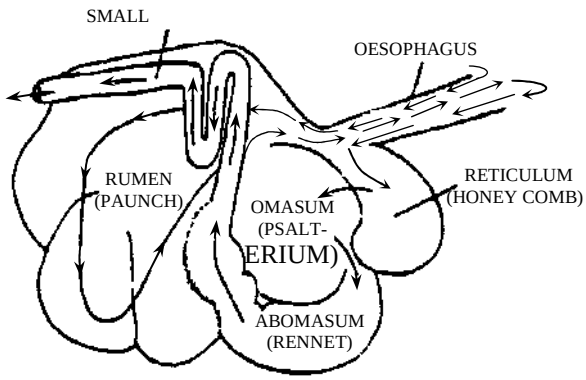

Fig. – Arrow shows course of food

In the rumen, food undergoes mechanical and chemical breakdown. Mechanical breakdown results from thorough churning brought about by muscular contractions and aided by cornified surface of villi.

Chemical breakdown is caused by symbiotic microorganisms (bacteria and ciliates) that release enzymes, cellulase, which act on cellulose and simplify it to short-chain fatty acids, such as acetic acid, butyric acid, propionic acid.

This is called **microbial digestion**. The fatty acids are neutralized by sodium bicarbonate of saliva and are absorbed. These two processes reduce the hard plant food to a pulp.

Intestine (6 to 9 meters) : It is divided into two part

(i) Small intestine (ii) Large intestine

(i) Small Intestine – Small intestine is differentiated in to three part

(a) Duodenum (b) Jejunum (c) Ileum

First part is **duodenum**, it is 25 cm long, c-shaped in humans and has opening of hepatopancreatic duct (bile duct + pancreatic duct)

A small swelling is present at the opening of hepatopancreatic duct and is called 'Ampulla of Vater' or hapatopancreatic ampulla and the opening is regulated by sphincter of oddi.

Next parts of small intestine are **jejunum** and **ileum**. The wall of intenstine has thin layers of longitudinal and circular muscles.Mucosa has folds **plicae circulare** (**folds of Kerkrings** or **Valvulae conniventes**) and **villi** towards lumen of the intestine. Epithelial cells lining the villi have microvilli which further increase the absorptive area. Intestinal glands or **Crypts of Lieberkuhn** have **epithelial cells** (secrete mucus), **Paneth cells** (secrete digestive enzymes) and **argentaffin cells** (probably secrete hormones). In duodenum Brunner's glands are also present (located in submucosa) which secrete mucus. Diffused patches of lymphoid tissue are present through out the small intestine and are aggregated in ileum to form **Peyer's patches**.

Duodenum (Proximal part)	Jejunum (Middle part)	Ileum (Posterior part)
2.5 *cm.* Long Forming *U*-shaped loop before leading to jejunum pancreas lies in the loop.	About 2.4 *m* long and about 4 *cm.* wide. Wall is thicker and more vascular. Villi thicker and tongue-like. Plicae best developed. Peyer's patches are lacking.	About 3.6 *m* long and about 3.5 *cm.* wide. Wall is thinner and less vascular. Villi thinner and finger-like. Plicae less developed. Peyer's patches are present.

- **Glands of small intestine**

Brunner's glands	**Payer's patches**	**Crypts of Leiberkuhn**
Found in duodenum only. Mucus secreating gland as so known as mucus gland.	These are lymph nodules. They produce lymphocytes. Lymphocytes are phagocyte in nature which destroy harmful bacteria.	Known as intestinal gland. Found in duodenum and ilium only. Secrete succus entericus *i.e.* intestinal juice. Formed by folding of lamina propia.

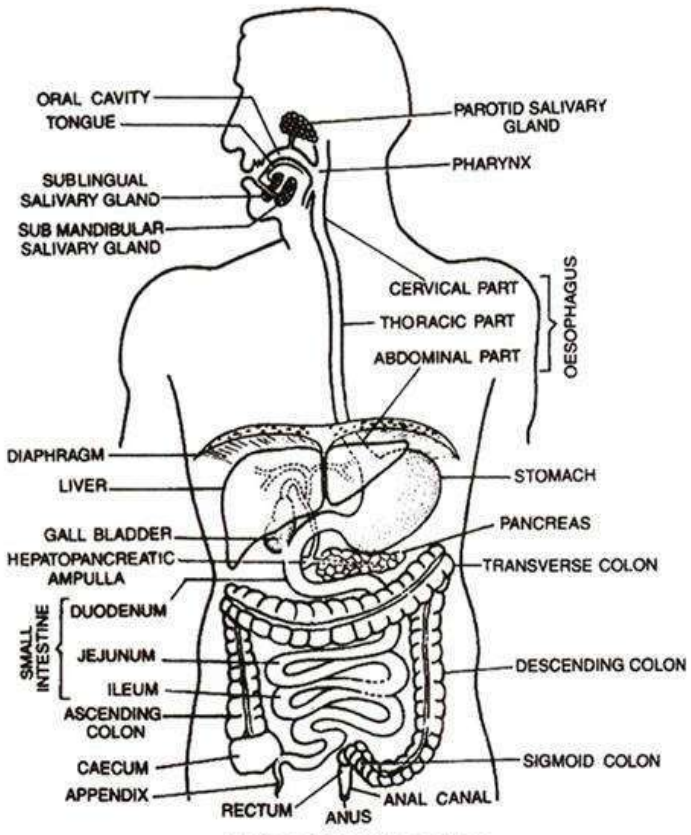
(ii) Large intestine :

It is 1.5 m long and consists of three part **caecum**, **colon** and **rectum**. A blind pounch of caecum is **vermiform appendix**. These parts help in digestion of cellulose in herbivores. Wall of colon has sac like **haustra**. Histologically wall of colon has three bands of longitudinal muscles called taeniae coli. Another

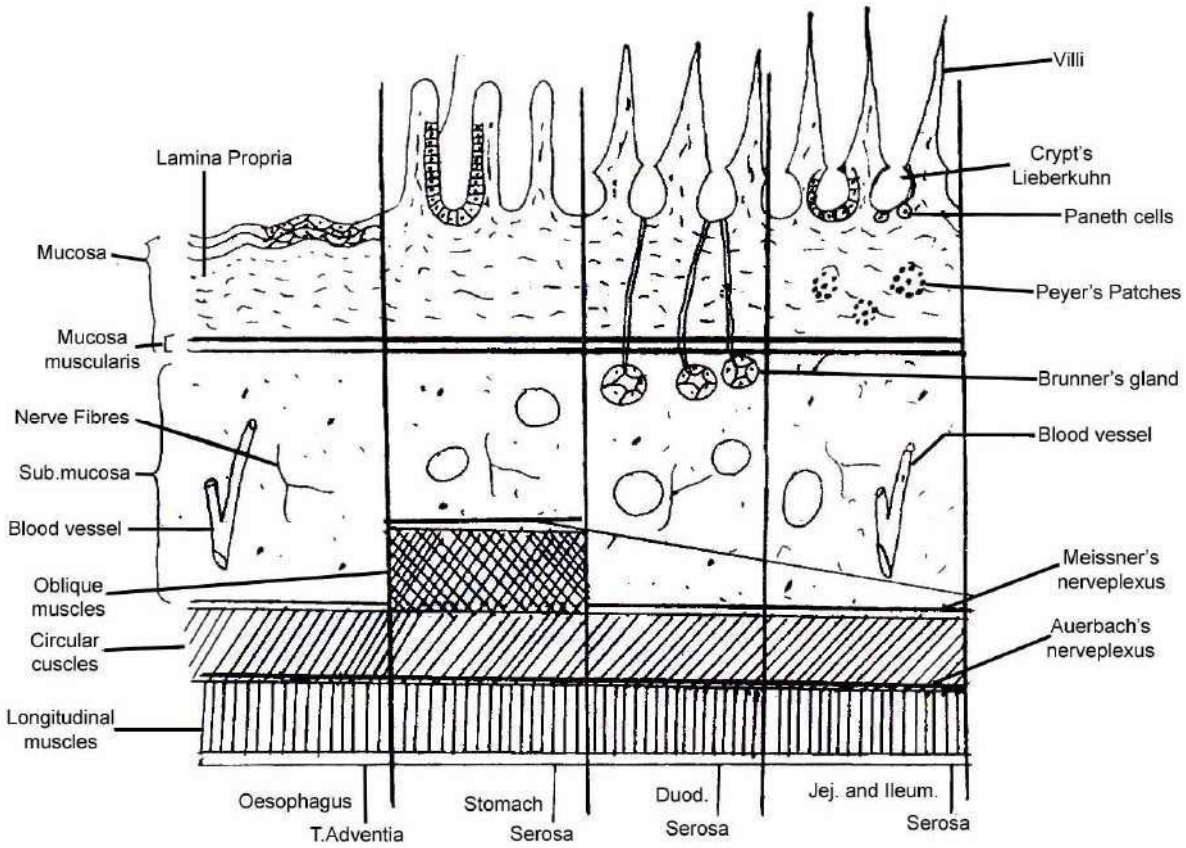
characteristics of colon surface is the presence of small fat filled projections called **epiploic appendages**. The colon part is divisible into ascending, transverse, descending and sigmoid colon. Sigmoid colon is also called as pelric colon .Ascending colon is the smallest and is without mesentry. Last part of rectum is **anal canal** having a strong sphincter. It opens outside by anus. In certain conditions (like persistent constipations) rectal veins can get distanded or enlarged due to weakening of valves of it (varicosity). It leads to swollen areas called **haemorrhoids**.

Differences between small and large intestines

Small intestine	Large intestine
Longer (about 6 *m.*) but narrower than large intestine.	Shorter (about 1.5 *m.*) but wider than small intestine.
Differentiated into duodenum, jejunum and ileum.	Differentiated into caecum, appendix, colon and rectum.
Mucous membrane has plicae circulares and villi.	Mucous membrane is mostly smooth (without plicae and villi). Rectum has longitudinal folds.
Lacks taeniae coli, haustra and epiploic appendages.	Has taeniae coli, haustra and appendices epiploicae.
Peyer's patches are present in the ileum.	Peyer's patches not formed, lymphoid nodules beins scattered.
Completes digestion and absorbs digestion products. Also produces some hormones.	Absorbs water, forms and eliminates faeces, produces vitamins *B* and *K* by bacterial activity and excretes certain inorganic ions.
Mucosal irritation due to infection causes diarrhoea.	Mucosal irritation due to infection causes dysentery.



Human digestive system



HISTOLOGY OF ALIMENTARY CANAL

Wall of alimentary canal is made up of four layer (outer to inner)

(1) **Serosa** : It is outer most layer of alimentary canal , it is called tunica adventia in oesophagus, which is made up of fibrous connective tissue. Except oesophagus, remaining part of alimentary canal in covered by serosa layer which is made up of visceral peritoneum while, tunica adventia is made up of white fibrous connective tissue.

(2) **Muscularis Externa or mucularis coat :** It is made up of two types of muscle outer muscle layer is made up of longitudinal muscle while inner layer is made up of circular muscle. Extra oblique muscles are found in stomach. Thickest muscular coat is found in stomach so maximum peristalsis are found in stomach least muscles are found in rectum so least peristalsis are found in rectum.

(3) **Sub mucosa :** It is made up of loose connective tissue layer with blood lymph vessels and nerves.

(4) **Mucosa** : It is the inner most layer of gut which contains the secretary and absorptive cells.

It is differentiated into 3 parts.

(i) Outer part : Called mucosa muscularis or muscularis interna

– It is made up to longitudinal and circular muscles.

– But these muscles are vestigeal.

– They provide support to the folds of alimentary canal.

(ii) Middle part : Called lamina propria.

– It is made up of reticulate and fibrous connective tissue, dense network of blood capillaries are found in this part.

(iii) Innermost part : Called mucosal layer.

– In oesophagus this layer is made up of non keratinised stratified squamous epithelium.
– Except oesophagus this layer is single layer thick.
– This layer makes the lining of lumen of Alimentary canal.
– This layer is made up of columnar mucous epithelium.
– Folds of oesophagus are less developed
– This layer makes the folds of alimentary canal
– Folds of stomach are finger shaped.
– Folds of small intentine are conical shaped called Villi.
– Small slit like space is found at the base of villi.
– These spaces are called crypts of Lieberkuhn
– Villi of Doudenum are small blunt.
– Villi of jejunum and Ileum are long and pointed.
– Maximum villi are found Jejunum.

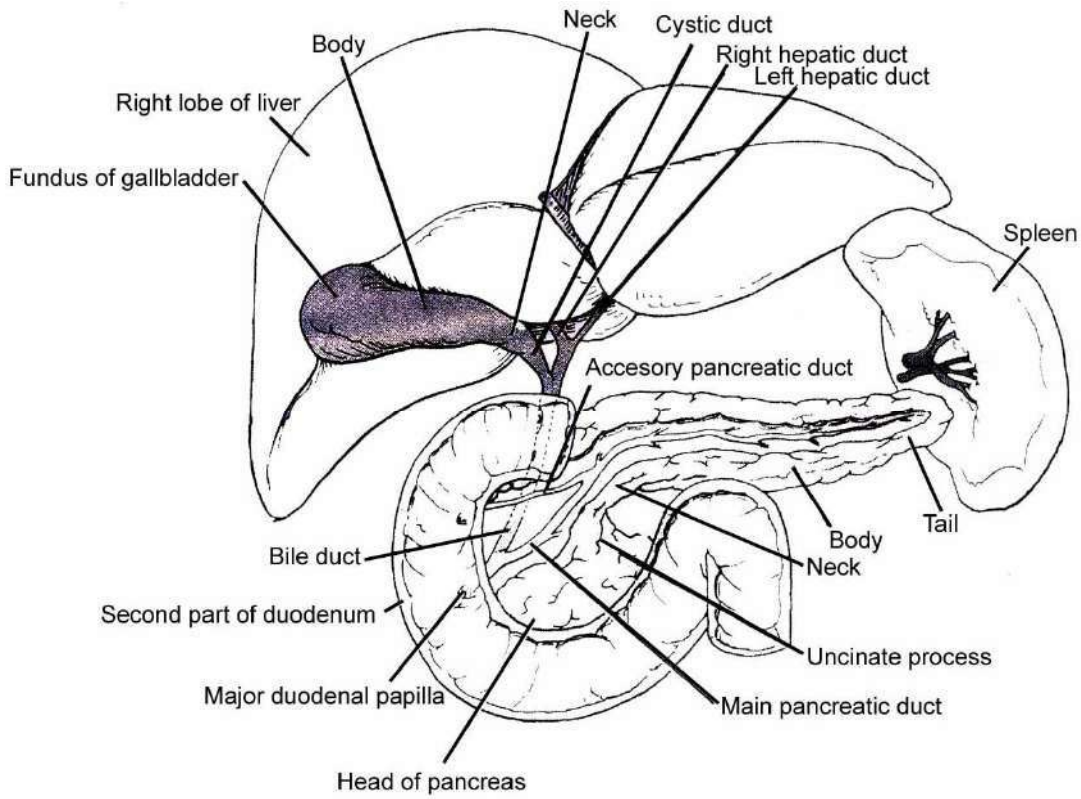
- **Brunner's Gland :**
  – They are small spherical multicellular glands.
  – They open into crypts of lieberkuhn with the help of fine tubules.
  – These glands are found in the submucosa and mucosa of duodenum.
  – They synthesize and secrete the non enzymatic secretion of intestinal juice.
- **Paneth Cells :**
  – These cells are found in mucosal layer of crypts of lieberkuhn of jejunem.
  – They are unicellular gland.
  – They synthesize and secrets enzymes of intestinal juices.
  – The secretory substances of brunner's glands and paneth cells are combindly called intestinal juice or succus entericus.
- **Peyer's patches**
  – They are small lymph nodes which are found in the mucosa of small intestine (Jejunum and Ileum more in number). They are also called intestinal tonsils and provide immunity.
- **Nerve supply :**

  Two types of Nerve plexus are found in muscle of alimentary canal. (These control muscle contraction).

  (1) Auerbach's Nerve Plexus : This nerve plexus is found between longitudinal muscles and circular muscles.

  (2) Meissner's Nerve plexus : Found between circular muscles and sub mucosa but in stomach it is found between oblique muscle & submucosa.

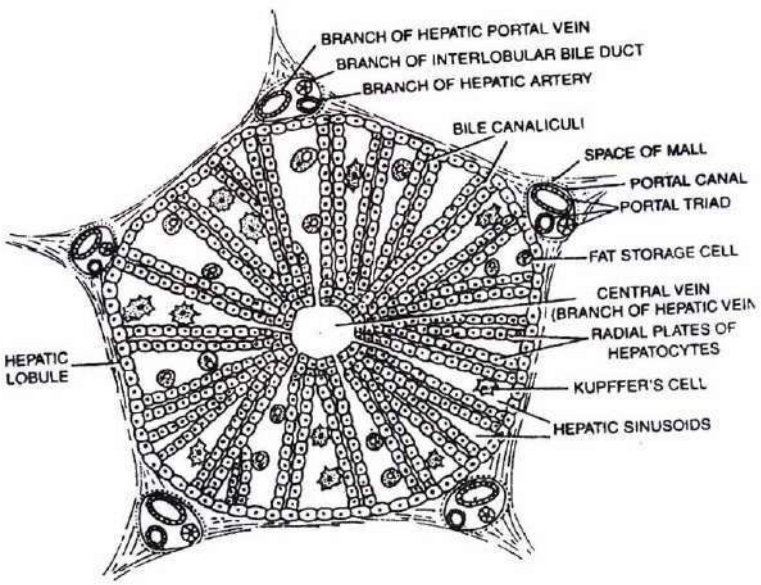
LIVER



In human liver is made up of four lobe. Left lobe is small right proper lobe is large, two addition lobe quadrate and caudate lobe are also found on posterior side of right proper lobe.

It develops from **endoderm.** (Weight 1.5 kg., both exocrine and endocrine)

- In human it is found in right side of abdominal cavity, below the diaphragm.
- The liver is the largest gland of body.
- Right and left liver lobe are separate from each other by the **falciform ligament**, (Fibrous connective tissue) Which is made up of fold of peritoneum.
- Right and left hepatic duct develop from right and left liver lobe Both these ducts combine to form a **Common Hepatic duct**.
- **Gall bladder** is situated below right lobe of liver.
- Cystic duct of gall bladder is connected to common hepatic duct and form a common bile duct which also called **ductus choledocus or common bite duct.**



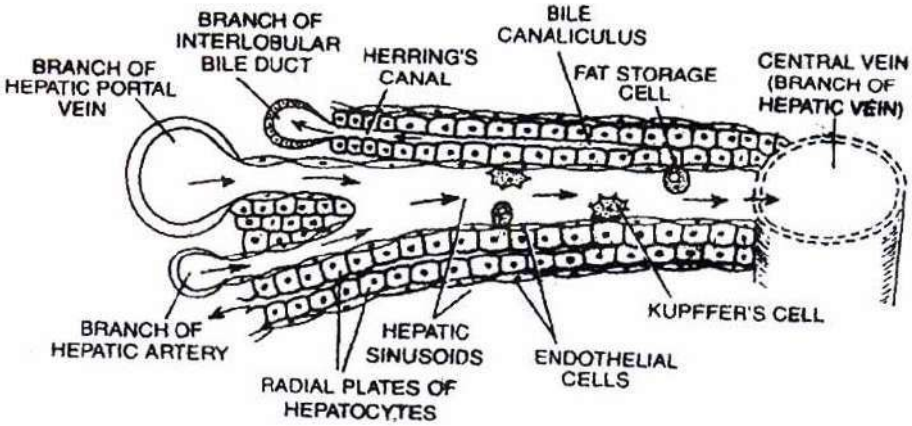
A part of transverse section of mammalian liver

– Internally liver is made up of numerous polygonal lobules. These lobules are covered by fibrous connective tissue, covering layer is called **Glisson's Capsule.**

– Each lobule consists of radial rows of hepatic cells, two row of hepatic cells are combindely called as hepatic cord. Each hepatic cord is lined by endothelial layer.

In between the hepatic cord, a space is present called as hepatic sinusoid. These sinusoids are filled with blood. Sinusoids are lined by the endothelial cells mostly but, a few macrophages cells are also present. These are called as **kupffer's cells**. (Phagocyte cells)

The bile canaliculi run in between the two layers of hepatic cells in each hepatic cord. Hepatocytes (hepatic cells) pour bile into the canaliculi. Canaliculi open into branch of hepatic duct which is situated at the angular part of lobule in the Glisons capsule. All branches of hepatic duct of right and left lobe are combined to form right and left Hepatic duct which come out from the liver and forms a common hepatic duct.



Hepatic artery and hepatic portal vein enter into liver and divide to form many branches. These branches are also found at the angular part of Glisson's capsule. Its fine branches open in to hepatic sinusoids. Branch of hepatic portal vein, branch of hepatic artery and branch of hepatic duct are collectively called as Portal triad. All hepatic sinusoids of one Glisson's capsule are open into central vein or intra lobular vein, all Central veins are combined and form one pair hepatic vein which, comes out from liver and opens into inferior vena cave.

- **Function of liver :** (Liver is known as chemical factory of the body)

Most of the biochemical functions of the body are done by the liver.

1. **Secretion & synthesis of bile** – This is the main function of liver. Bile is yellowish-green, alkaline fluid. In bile juice, bile salts, sodium bicarbonate, glycocholate, taurocholate, bile pigments, cholesterol, Lecithin etc. are present. Bile salts help in emulsification of fats. Bile prevents the food from putrification. It kills the harmful bacteria.
2. **Carbohydrate Metabolism** – The main centre of carbohydrate metabolism is liver. Following steps are related with carbohydrate metabolism.

(a) Glycogenesis – The conversion and storage of extra amount of glucose into glycogen from the digested food is called glycogenesis. The main stored food in the liver is glycogen

(b) Glycogenolysis – The conversion of glycogen into glucose back when glucose level in blood falls down is called glycogenolysis.

(c) Gluconeogenesis – At the time of need, liver converts non-carbohydrate compounds (e.g. Amino acids. Fatty acids) into glucose. This conversion is called gluconeogenesis. This is the neo-formative process of glucose.

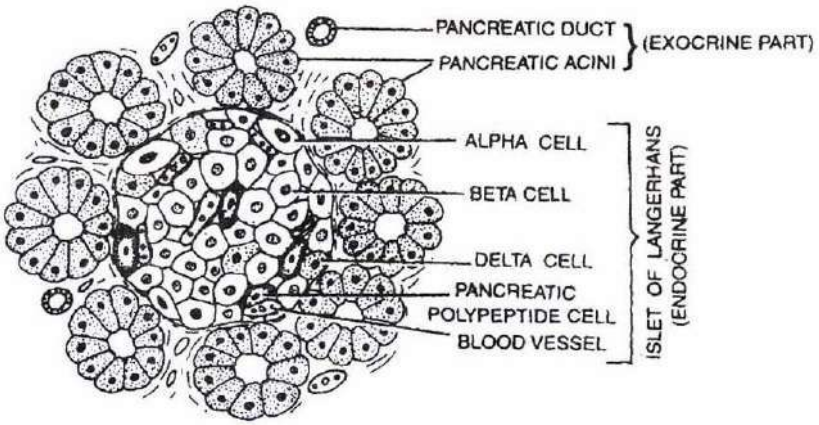
(d) Glyconeogenesis – Synthesis of glycogen from lactic acid (which comes from muscles) is called glyconeogenesis

3. **Storage of fats –** Liver stores fats in a small amount. Hepatic cell play an important role in fat metabolism. The storage of fats is increases in the liver of alcohol addict persons (Fatty liver). This storage of fats decreases the activity of liver. the damage of liver due to alcohol intake is called Alcoholic Liver cirrhosis.
4. **Deamination and Urea formation** – Deamination of amino acids is mainly done by liver (Amino acid $\rightarrow NH_3$ separation of ammonia from the amino acids is done by the liver) Liver converts ammonia (obtained form deamination) into urea through **orinithine** cycle. So after the spoilage of liver, the ammonia level in the animal body is increased and the animal dies.
5. **Purification of blood –** The spleen and liver separate dead blood cells and bacteria from the blood. Kupffer cells in liver and phagocytes in spleen perform this function.
6. **Synthesis of plasma proteins–** Many types of proteins are present in blood plasma. Except gamma globulins all type of plasma proteins are synthesized in the liver.
7. Most of the blood clotting factor are synthesized in the liver.
8. **Synthesis of heparin**– Heparin is an anticoagulant (Mucopolysaccharide).

- Some heparin is also formed by basophills, that are special type of white blood cells

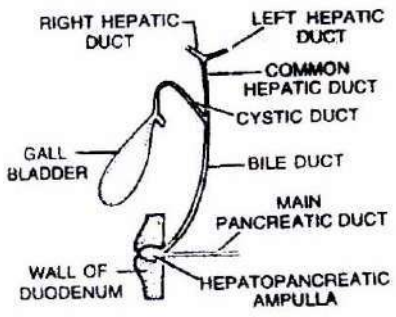
9. **Synthesis of Vitamin A** – The liver converts the β-carrotene into vitamin A : β- caroteine is a photosynthetic pigment which is obtained from plants. It is abundantly found in carrot.
10. Liver stores **vitamin A, D, E, K and B_{12}**
11. **Storage of minerals–** Liver stores iron in the form of ferritin. Liver also stores the, copper, zinc, cobalt, molybdenum etc Liver is a good source of iron.
12. **Detoxification –** In this process liver converts the toxic substances into non-toxic substances. The toxic substances are formed by metabolic activities of the body. e.g. Prussic acid is converted into neutral Potassium sulfocynide (It is a non-toxic salt) by the liver.
13. **Heamopoiesis –** The formation of blood cells is called haemopoesis. In empbryonic stage R.B.C. and WBC are formed by liver.
14. **Yolk synthesis –** Most of the yolk is synthesized in liver.
15. **Secretion of enzymes –** Some enzymes are secreted by liver, participate in metabolism of proteins, fats and carbohydrates e.g. Dehydrogenase, cytochrome oxidase etc.
16. Prothrombin and fibrinogen proteins are also formed in hepatic cells. These help in blood clotting
17. Factors I, II, V, VII, IX and X are formed in liver, which are responsible for blood clotting.

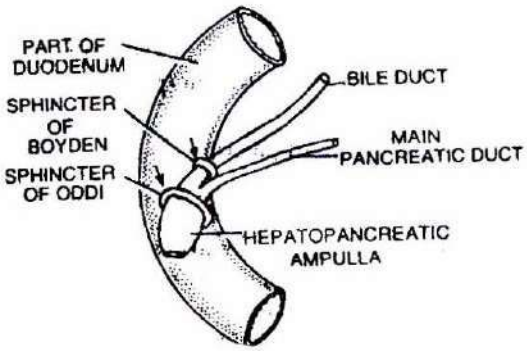
PANCREAS (SWEET BREAD)



Section of pancreas

- Develop from **endoderm.**
- It is soft, lobulated and elongated organ..
- It is made up or numerous acini. Acini is a group of secretory cells surrounding a cavity.
- Each acini is lined by pyramidal shaped cells. These acinar cells secrete the enzyme of pancreatic juice.
- Each acini opens into pancreatic ductule. Many penacreatic ductule combine to from main pancreatic duct **(duct of wirsung**). The main Pancreatic duct is join with the bile duct to form the hepatopancreatic ampulla which opens into duodenum. The accessory Pancreatic duct **(duct of santorini)** opens into duodenum with separate openings located above the opening of main Pancreatic duct.
- Some group of endocrine cells also found in between group of acini called **islets of Langer han's**. These islets secrete insulin & glucagons hormone. So this gland is exocrine as well as endocrine. **Its 99% part is exocrine** while **1% part is endocrine** (Heterocrine)



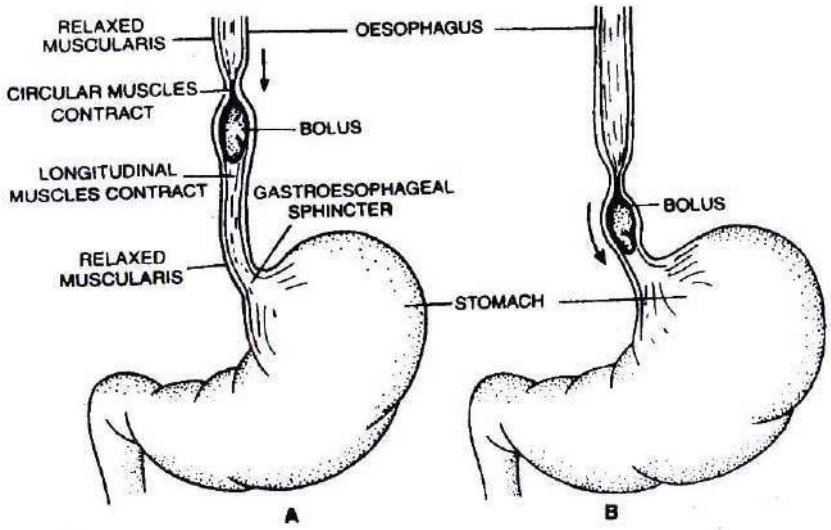


- In rabbit, bile duct and pancreatic duct both are separately open into Duodenum.
- Bile duct opens into proximal limb of duodenum and is controlled by **sphincter choledocus**.
- Pancreatic duct opens into distal limb of duodenum and is controlled by **sphincter pancreaticus**.
- In humans both bile duct and main pancreatic duct combine to form common duct called as **Hepto-Pancreatic duct**. The terminal end of common duct is swollen and is called as **Ampulla of Vater** or **Hepato Pancreatic ampulla. Ampulla of Vater** opens into middle part of Duodenum and is controlled by **sphincter of Oddi** while, bile duct is controlled by **sphincter of Boyden**

PHYSIOLOGY OF DIGESTION

1. DIGESTION IN ORAL CAVITY

Food enters through mouth food is tasted in oral cavity and mixed with saliva, tongue mixes the food with saliva. This food with saliva is called bolus. This saliva (pH 6.8 – 7.0) contains water (99.5 %) and electrolytes (Na^+, K^+, Cl^-, HCO_3^- , Thiocynate)



PERISTALSIS IN OESOPHAGUS

- **Chemical digestion : -**

In this type of digestion saliva act with food particles.

Saliva contain 99.5 % water & 0.5 % salts.

These salts are organic and inorganic type

The main contents are Mucin, Lysozyme, Thiocynate and Ptyalin

(A) Mucin

It is a glycoprotein. It lubricates the food particles. It helps in the swallowing of food.

(B) Lysozyme

It is an enzyme which kills the harmful bacteria. Due to this reason saliva is a antiseptic lotion.

(C) Thiocynate

It is a special salt which kills the harmful bacteria. So it is called bacterioscidal salt.

(D) Ptyalin

$$\text{Starch} \xrightarrow{\text{ptyalin}} \text{Maltose} + \text{Limit Dextrin}$$

Ptyalin is found in human saliva, because human food is mainly made up of starch. Ptyalin digest only ripe and cooked starch. It does not digest the raw starch.

Note: Ptyalin is absent in saliva of rabbit and carnivorous animal, because food of rabbit is mainly made up of cellulose.

Bolus is pushed inward through the pharynx into the oesophagus. The tongue blocks the mouth. Soft palate close off the nasopharynx and larynx rises so that epiglottis bend and closes off the glottis food move downward into the oesophagus A traveling wave of contractions are called peristalsis puhes the Bolus (food) downward. **Peristalsis is produced by involuntary contactions of circular muscles, which is preceded by a simultaneous contraction of the longitudinal muscle and relaxation of the circular**

muscle lining the gut. When a peristaltic wave reaches the end of the oesophagus. (Digestion or digestive enzymes are absent in Oesophagus) The sphincter opens allowing the passage of bolus food to the stomach. Gastroesophageal sphincter of the oesophagus and stomach normaly remains closed and does not allow contents of the stomach to move back.

- Secretion of saliva is mainly controlled by nervous type. Sympathetic nerve decreases the secretion of saliva while secretion of saliva increases by parasympathetic nerve.
- Secretion of saliva also controlled by reflex action e.g. smell of food, sight reflex etc.

2. DIGESTION OF FOOD IN STOMACH

When the food enters into stomach G-cells secrete gastrin hormones which stimulate the secretion of gastric juice by gastric glands.

Secretion of gastric juice is controlled by nerve, hormones and chemical substances.

Secretion of gastric juice is divided into 3 phases–

I. Cephalic Phase – This phase is mediated by parasympathetic. It is the first of step of secretion. When person see the food then due to sight or optic reflex small amount of gastric juice secretes in the stomach.

II. Gastric phase – When food enter into stomach then gastric phase is started. When food particles strikes to the fundic part of stomach then small amount of gastric juice is secreted due to strike reflex action and distension. Gastric juice developes the peristalsis movement in the stomach. Due to peristalsis food particles are rubbed on mucosal layer of stomach.

Due to rubbing process cells stimulates and secretes gastrin hormone. This hormone powerfully stimulate the gastric glands for secretion of gastric juice.

Some drinking substances also stimulates the secretion of gastric juice such a soup, alcohol, caffeine, histamine. These drinking substance and gastric juice stimulate the desire of appetite. So these substances are called Appetiser juice.

III. intestinal phase – When food reaches at the Ileum then mucosal layer of ileum secretes a chemical substance. Its nature is similar to the histamine or gastrin. This chemical substance goes into stomach through blood circulation where it stimulates the secretion of gastric juice.

Its actual cause is yet unknown. But it is believed that this phase starts after 8–10 hour of taking of meal.

Composition of Gastric juice

Water = 99.5 %

HCl = 0.2 – 0.3 %

pH = 1.5 to 2.5 (very acidic)

rest part = mucous water, HCl and gastric enzymes (Pepsinogen, Prorennin, Gastric Lipase Gastic amylase etc.)

Functions of HCl

1. The main function of HCl is to convert inactive enzymes (zymogens) into active enzymes.

$$\text{Pepsinogen} \xrightarrow{\text{HCl}} \text{Pepsin}$$

$$\text{Prorennin} \xrightarrow{\text{HCl}} \text{Rennin.}$$

Pepsinogen and Prorennin are inactive enzymes.

2.. It destroys harmfull the bacteria present in the food.

3. HCl stops the action of saliva on food. In stomach, the medium is highly acidic.

4. It dissolves the hard portions of the food and makes it soft.
5. It releases the fat globules from tissue or cells which found in food
6. $\text{Nucleoproteins} \xrightarrow{\text{HCl}} \text{Nucleicacid} + \text{protein.}$
7. HCl of gastric juice converts Fe^{+3} into Fe^{+2} which makes the absorption of iron possible.

Digestion by Rennin (Chymosin)

Renning is active in the childhood stage of mammals only. It converts milk into curd like substance (clot the milk) .

Rennin, acts on milk protein **casein.** Casein is a soluble protein.

In the presence of Rennin, Casein gets converted into insoluble **Calcium-paracaseinate**, This process is termed as **Curdling of milk**. After becoming insoluble, milk can remain in the stomach for a loger time. Rennin is absent in human (clotting of milk is done by HCl in human).

Digestion by Pepsin–

Inactive pepsinogen on getting proper pH conversts into active pepsin.

Peptidase – An enzyme which breakes the peptide bond. These peptidase are of two types.

(a) Exopeptidase : The peptidase enzyme which breaks the outer and marginal bond of polypeptide called exopeptidase. In this process amino acid and polypeptides are formed.

(b) Endopeptidase : The peptidase enzyme which breaks the inner peptide bond of large polypeptide and forms the small polypeptides such as peptone, proteoses and peptides.

Pepsin is a strongest **Endopeptidase**. It breaks proteins into smaller molecules.

$$\text{Proteins} \xrightarrow{\text{Pepsin}} \text{Peptones} + \text{Proteoses} + \text{Peptides}$$

In stomach, endopeptidases are found so only digestion of proteins can take properly in the stomach.

Digestion by Gastric Lipase –

It converts fats into fatty-acids and glycerol. It is secreted in a less amount so less digestion of fats takes place here.

This lipase acts on emulsified fat and convert it into fatty acid & glycerol. 1% emulsified fat is already present in the food. **Peristalsis.** Continues during the process of digestion so the gastric-juice mixes properly with the food. Due to peristalsis the food is converted into a paste. This form which is thick. Acidic & semi digested in the stomach is called chyme.

After short intervals, the pyloric valves on opening and closing so the chyme is enters the intestine in installments

3. DIGESTION OF FOOD IN DUODENUM

When food leaves the stomach through its pyloric end enters the duodenum it is called chyme (Acidic). The HCl of chyme stimulates the wall of duodenum to secrete hormones. It secretes various hormones–

1. **Hepatocrinin –** It promotes the synthesis and secretion of Bile juice from liver.
2. **Cholecystokinin –** It stimulates the liver and the gall bladder (mainly gall bladder) to secrete bile juice.
3. **Secretin** : It is the most important hormone of digestive tract and also first discovered hormone. This hormone stimulates pancreas for synthesis and secretion of non enzymatic part of pancreatic juice. It also stimulates liver for secretion of bile juice and inhibit the gastric juice secretion in stomach and reduce rate of contraction of stomach.
4. **Pancreozymin** – It stimulates the synthesis as well as secretoion of enzymatic part of pancreatic juices.

- Secretin promotes the sectretion of the non enzymetic part of the pancreatic-juice. While pancreozymin promotes the secretion of enzymatic part of the pancreatic juice.

5. **Duocrinin -** It stimulates the Brunner's gland for synthesis and secretion of non-enzymatic part of intestinal juice.
6. **Enterocrinin -** This hormone stimulated Paneth cells for synthesis and secretion of enzymatic part of intestinal juice.
7. **Villikinin –** It stimulates the activity of villi.
8. **Enterogasterone –** It inhibits the secretion of HCl in stomach.
9. **Gastric inhibitory polypeptide (GIP) –** It inhibits the secretion of gastrin hormone.
10. **Vasoactive intestinal peptide and somatostatin –** They inhibits the motility of stomach

BILE-JUICE :

In the proximal part of the duodenum bile-juice is secreted. The parenchyma cells of the liver produce bile-juice and it is stored in the Gall-bladder. Bile-juice does not contain any digestive enzyme. Therefore it is not a true digestive juice (Pseudodigestive-juice).

Composition of Bile-juice –

Bile juice is a greenish (Biliverdin) yellow (Bilirubin) coloured alkaline fluid.

	Bile juice
pH	8.0
H_2O	98 %

Organic constituent are bile acid, bile pigment, cholesterol, Lecithin, inorganic constituents

Na^+, K^+, HCO_3^- etc

Bile-pigments are the excretory-substances of the liver.

Bile-salts are of two types–

(**a) Inorganic salts –** Bile-juice contains NaCl, Na2CO3, NaHCO3 etc in it. Inorganic salts neutralize the acidity of the food and make the medium basic. It is necessary for the medium to become basic because the pancreatic-juice enzymes can act only in basic medium.

(b) Organic salts – Organic salt like Na-glycocholate and Na-taurocolate are found in Bile juice. The main function of these salts is the emulsification of fats. Because pancreatic **Lipase** can act only on emulsified fats.

Bile salts also help in the absorption of fat and fat-soluble vitamin (A, D, E, K) Bile salts combine with fats and these vitamins to form compounds called **Micelles** which are absorbed rapidly.

Bile-sallts promote-peristalsis in the small-intestine.

Bile-pigments, cholesterol and Lecithin are the excretory substances found in Bile-juice.

Gall Stone–Sometimes the passage inside the bile-duct gets blocked or becomes narrow, so the cholesterol gets deposited or precipitated in the gall-bladder. This is termed as the Gall-stone (Cholelithiasis)

Obstructive Jaundice - If the passage of bile is blocked then the amount of bilirubin increases in the blood. So the yellowish colouration of body like skin, cornea and nails appear yellow. Urine also becomes yellow.

Pancreatic juice :

Pancreozymin stimulates the acini and glandular cells so pancreatic juice are secreted.

The pancreatic-juice is secreted by the exocrine cells of the pancreas.

Pancreatic juice is highly odouriferous, colourless basic fluid which contains enzymes and salts.

- **Compostition of Pancreatic juice-**

  Total amount in man = 500 – 800 ml/day

  Water = 98%, pH = 7.5– 8.3, Salts =2 %

  *Pancreatic juice contains only inorganic-salts

  The action of enzymes present in the pancreatic juice is as follows–

(1) Pancreatic α-Amylase : Amylase or Amylopsin dissociates starch into Maltose. Majority of starch breaks up into the duodenum.

(2) Trypsinogen and Chymotrypsinogen – The step of these enzymes is as follows–

$$\text{Tripsinogen} \xrightarrow[\text{EnterokinaseorEnteropeptidase}]{Ca^{++}} \text{Trypsin}$$

$$\text{Chymotrypsinogen} \xrightarrow{\text{Trypsin}} \text{Chymotrypsin}$$

Ensterokinase is secreted by the **Duodenal mucosa.**

Trypsin and chymotrypsin are **Endopeptidase** type of enzymes. They dissociate protein into peptones and proteoses. Majority of proteins are broken into the stomach and the remaining are broken into the duodenum.

$$\text{Proteins} \xrightarrow[\text{Chymotrypsin}]{\text{Trypsin and}} \text{Large peptide}$$

(3) Procarboxy Peptidase – These are also called zymogens. Trypsin convert it into active **Carboxy-peptidase**.

$$\text{Large peptides} \xrightarrow[\text{peptidase}]{\text{Carboxy}} \text{Amino-acid}$$

(4) Large Peptides $\xrightarrow{\text{Amino peptidase}}$ Oligopeptide

(5) Elastin $\xrightarrow{\text{Elastase}}$ Oligopeptides

(6) Fat Digesting enzyme – In pancreatic-juices various Fat-digesting enzymes are found which are collectively called **steapsin.**

(i) Pancreatic Lipase – It converts triglyceride into monoglyceride, fatty acid, glycerol

(ii) Cholesterol esterase – It digest **cholesterol esters**. These esters are made up of cholesterol and fatty-acid Like- **Lanolin**, (cholesterol and Palmitic acid).

(iii) Phospholipase – These digest phospholipids.

(7) DNase and RNase – For digestion of DNA and RNA.

4. DIGESTION IN JEJUNUM AND ILEUM

These hormones stimulate the crypts of lieberkuhn to secrete **Succus-entericus** or intestinal juice. This **succusentericus** mainly contain water (99%) and digestive enzymes (< 1%). Intestinal juice act on food (chyle).

Succus- entericus mainly contains the following enzymes-

1. **Peptidase or Erepsin -** This is a type of **Exopeptidase.** It converts oligopeptides into amino-acids
2. **Disaccharidases**

$$\text{sucrose} \xrightarrow{\text{Sucrase}} \text{Glucose} + \text{Fructose}$$

Sucrase – It is also known as invertase. It converts sucrose into **glucose** and **fructose.**

Maltase – It convers moltose sugar into **Glucose** molecules.

$$\text{maltose} \xrightarrow{\text{maltase}} \text{Glucose} + \text{Glucose}$$

Lactase – This enzymes is found only in mammals. It converts milk sugar lactose into **Glucose** and **Galactose.**

$$\text{Lactose} \xrightarrow{\text{Lactase}} \text{Glucose} + \text{Galactase}$$

3. **Intestinal Lipase–** This fat-digesting enzyme converts fats into **Fatty-acids and Glycerol**.
4. **Nucleotidase and Nucleosidase** –These act in the following way–

(i) $\text{Nucleotides} \xrightarrow{\text{Nucleotidase}} \text{Nucleosides} + \text{Phosphate}$

(ii) $\text{Nucleosides} \xrightarrow{\text{Nucleosidase}} \text{Pentose} + \text{Nitrogen base}$

* maximum digestion of carbohydrates is done in duodenum, but its digestion is completed in Jejunum.

5. DIGESTION IN CAECUM

In herbivores, the symbiotic bacteria and protozoans present in the caecum help in digestion of cellulose into glucose. So the digestion of cellulose takes place in caecum by the process of **decompostion.** This **decomposition** process is very slow. So very less amount of cellulose is digested at a time in caecum.
In the last part of the large intestine faeces is temporarily stored.

Maximum digestion of food – Duodenum
While digetion of food complete in – Jejunum
Maximum absorption of food in – Jejunum

Millions of microscopic folds or finger like projection are present in the lumen of gut which are called villi. These villi are supplied with a network of blood capillaries and Lymphatic vessels. Largest of which is central Lacteal. The cells that line the surface of villi numerous microscopic bristle like projections are called microvilli or brush border. These further increase the surface area for the absorption of the nutrients/digested food. On the surface of the mucous epithelium are billions of single cell mucous glands called mucous or goblet cells. These cells mainly secrete mucus that acts as a lubricant and protects the epithelial surface from damage and digestion.
The lining cells of the villi are columnar epithelial cells called **enterocytes.** On the surface of entrocytes, numerous **microvilli** are found, they increase the surface area of mucous membrane

Summary of physiology of digestion

Major gastrointestinal enzyme in mammals

Name of gland	Name of digestive juice & optimum pH	Name of enzyme	Site of action	Substrates	Products
Salivary glands	Saliva (6.8)	Ptyalin / Salivary amylase	Mouth	Starch, dextrins, glycogen	Dextrins, maltose, isomaltose and limit dextrin.
Gastric glands	Gastric Juice (1-3)	Pepsin	Stomach	Proteins, casein (Milk)	Peptones, paracasein (curd). Proteases

		Rennin	Stomach	Casein	Paracasein
		Gastric lipase	Stomach	Fats	Fatty acid and Glycerol.
Bile juice	Liver	No enzymes	Duodenum	Fat	Makes the food alkaline, emulsifies fat and kills the harmful bacteria.
Liver	Bile (7.7 – 8.0)	No enzyme but useful digestive juice, provides alkaline medium, stops the action of HCl. Emulsifies fats and kills – harmful bacteria.			
Pancreas	Pancreatic Juice (7.3 – 8.6)	Amylase/Diast-ase	Small intestine	Starch, dextrins, glycogen.	'Limits' dextrins, maltose, isomaltose.
		Trypsin	Small intestine	Proteins, Chymotry-psinogen (inactive) procarboxy pept-idases (inactive) Fibrinogen (blood) Casein (milk)	Peptides, Chymotrypsin (active) carboxy pepti-dases (active) Elastase (active), Fibrin (clot) Para-casein (curd)
		Chymotrypsin	Small intestine	Peptones	Peptides
		Carboxy-peptidases	Small intestine	Peptides	Smaller peptides and Amino acids.
		Lipase / Steapsin	Small intestine	Triglycerides	Mono-glycerides, fatty acids
		DNA ase	Small intestine	DNA	Deoxyribonucleotides
		RNA ase	Small intestine	RNA	Ribonucleotides
Intestinal glands	Intestinal Juice (7.6–8.3)	Enteropeptidase (enterokinase)	Small Intestine	Trypsinogen (inactive)	Trypsin (active)
		Aminopeptidase	Small Intestine	Peptides	Smaller peptides and amino acid
		Dipeptidases	Small Intestine	Dipeptides 'Limit' dextrins	Amino acids
		Isomaltase	Small Intestine	Isomaltose	Glucose

		Maltase	Small Intestine	Maltose	Glucose
		Sucrase/ Invertase	Small Intestine	Sucrose	Glucose, fructose
		Lactase	Small Intestine	Lactose	Glucose, galactose
		Lipase	Small Intestine	Triglycerides	Monoglycerides, fatty acids
		Nucleotidase	Small Intestine	Nucleotides	Nucleosides, inorganic phosphate
		Nucleoside Phosphorylases	Small Intestine	Nucleosides phosphate	Purine, pyrimidine, pentose, phosphate

Gastrointestinal hormones in mammals

Hormone	Source	Stimulus for secretion	Target organ	Action
Gastrin	Mucosa of pyloric stomach	Distension of stomach on food entry	Stomach	Stimulates secretion of gastric juice. Constricts cardiac sphincter.
Enterogastrone	Duodenal epithelium	Chyme entry into duodenum	Stomach	Slows gastric contractions to delay its emptying. Stops secretion of gastric juice.
Secretin	Duodenal epithelium	Acidic chyme entry into duodenum	Pancreas Liver Stomach	Release of sodium bicarbonate in pancreatic juice. Steps up secretion of bile. Inhibits secretion of gastrin.
Cholecystokinin (Pancreozymin)	Duodenal epithelium	Presence of fats in duodenum	Pancreas Gall Bladder	Release of enzymes in pancreatic juice. Release of bile from gall bladder.
Villikinin	Intestinal epithelium	Food in small intestine	Intestine	Accelerates movements of villi.
Duocrinin	Intestinal epithelium (Duodenal mucosa)	Acidic chyme in intestine	Intestine (Brunner's gland)	Release of viscous mucous from Brunner's glands.
Enterocrinin	Intestinal epithelium (Duodenal mucosa)	Acidic chyme in intestine	Intestine (crypts of Lieberkuhn's)	Release of enzymes from Lieberkuhn's crypts.

Summary of chemical digestion of food

Chemical digestion of protein	Chemical digestion of carbohydrates	Chemical digestion of fats	Chemical digestion of nucleic acid
Protein Food ↓ ← Pepsin (gastric juice) **Proteoses and Peptones** ↓ Trypsin and Chymotrypsin (pancreatic juice) **Tri and Dipeptides** ↓ Peptidases (intestinal juice) **Amino acids** (monopeptides)	**Polysaccharides** (starches) ↓ ← Ptyalin (saliva) ← Amylase (pancreatic juice) **Disaccharides** (sugars) ↓ ← Maltase, Lactase Sucrase (intestinal juice) **Monosaccharides** (glucose, fructose, galactose)	**Fat** ↓ ← Bile salts (bile) **Emulsified Fats** ↓ Lipase (pancreatic and intestinal juice) **Fatty acids and glycerol**	**Nucleid acid** ↓ (DNA and RNA) Pancreatic nucleases (DNAase & RNAase) **Nucleotides** ↓ Intestinal Nucleotidases and Nucleosidases **Nitrogen bases** Pentose sugars and inorganic phosphate

ABSORPTION OF DIGESTED FOOD

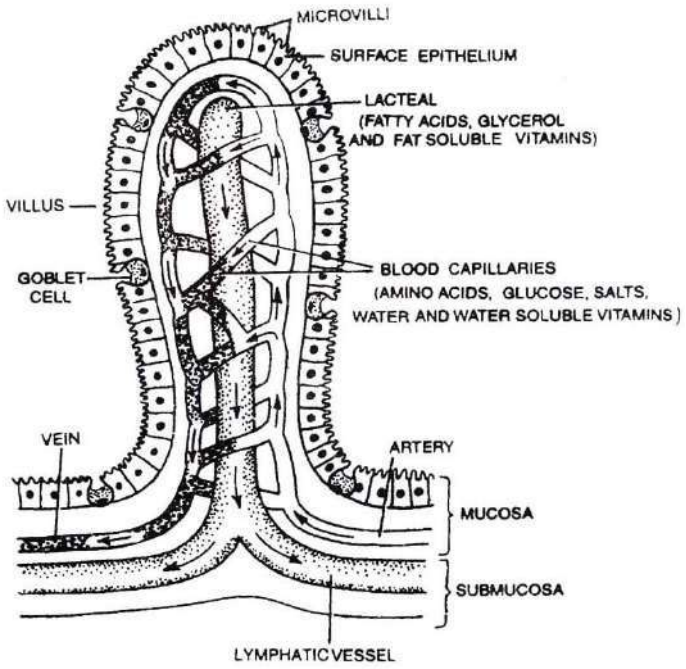
The process through which the food stuff diffuses through the intestinal mucous membrane and reaches the blood, is termed as **absorption**. The process of absorption. The process of absorption in different parts of the alimentary takes place in the following manner.

(1) Absorption in Buccal-Cavity

No absorption of food takes place in the oropharynx and the oesophagus. Only some chemicals/medicines and alcohol are absorbed in oro-pharyngeal cavity.

(2) Absorption in stomach

In the stomach, absorption of water, some salts, alcohol and glucose takes place, complete absorption of alcohol takes place in the stomach.



VILLUS AND ABSORPTION OF DIGESTED NUTRIENTS IN IT

(3) Absorption in duodenum–

Iron & calcium ion are absorbed in the duodenum.

(4) Absorption in Jejunum–

Maximum absorption take place in jejunum.

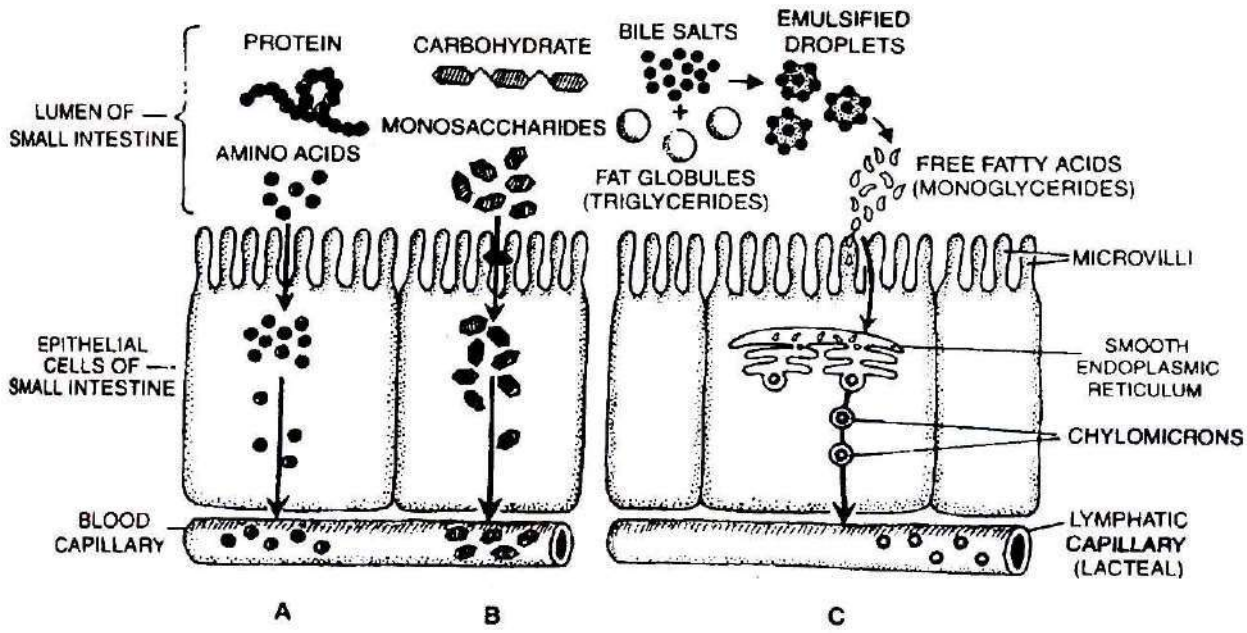
Carbohydrate

The principal carbohydrate of our food is usually starch (from rice or wheat) which is broken down by the pancreatic amylase. Disaccharides are broken down to their monsaccharide by enzymes of the succus-entricus. Monosaccharides are absorbed via the capillary blood with in the villus to finally reach into portal vein. **Absorption of glucose molecules occurs along with Na+ by active symport. Fructose is absorbed passively.**

Digestion and absorption of amino acid–

All these proteins are exposed to pepsin, trypsin, chymotrypsin, carboxypeptidases etc and as a result they are converted into tri and dipetides or free amino acids. Amino acid are of two types L-amino acid & D-amino acid. The **L-amino** acids are absorbed by **active** process against the concentration gradient while **D-amino acid** are absorbed **passively** by diffusion.

Di–and tripeptide enter the enterocytes where they are hydrolyzed to amino acids by dipeptidases and then absorbed via portal blood.



Digestion and absorption of Fat–

One molecule of triglyceride is hydrolyzed into one molecule of monoglyceride and two molecule of fatty acids by pancreatic lipase.

After hydrolysis, the bile salt, monoglyceride and the fatty acid together produce a complex called a **mixed micelle.** These are water soluble & enter in the enterocytes. Monoglyceride and fatty acid

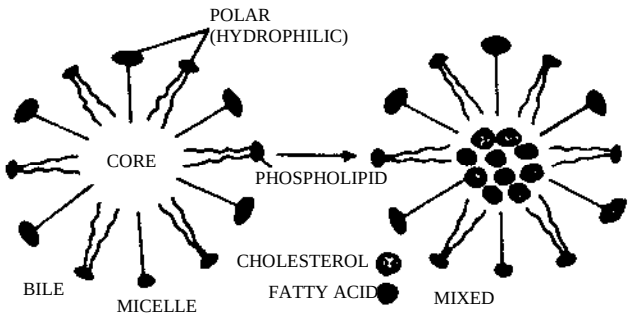


Fig. – Formation of micelle

are resynthesized with in enterocyte to form a molecule of trigylyceride (T_G).T_G combines with a small amount of protein Phosphate and cholesterol and resultant complex is called **chylomicron** (150μm, white) Chylomicron enters the lacteal.

Fat soluble vitamins are absorbed along with dietary fat whereas water soluble vitamins are absorbed by passive diffusion. Vit. B_{12} is absorbed with intrinsic factor by forming a complex.

In ileum Vit. B_{12} & Bile salt are absorbed. In colon only metabolic water is absorbed.

All lymph-capillaries coming out of the alimentary canal and unite to form **Lymph-vessels.** All lymph-vessels coming from the alimentary canal open into **the Left Thoracic Lymph Duct**. This duct now opens into the **Left Subclavian vein.** Through the blood, fats reaches the heart and from here it is distributed throughout the body.

** Besides fats, other substances of the digested food like-sugars, amino-acids, vitamins, minerals-salts after being absorbed, enter the blood capillaries. All blood-capillaries coming out of the alimentary canal, join together to form the **Hepatic portal vein.** This vein takes the digested food material into the liver. From the liver, the Hepatic vein and the inferior or post – caval vein takes them to the heart. Heart distributes them throughout the body. Liver performs some necessary and important actions on the digestive food.

Maximum water absorption occurs from upper part of small intestine passively.

(5) Absorption in colon – Colon absorbs metabolic water form the undigested food. Due to **Haustra** the water-absorbing surface of colon increases and it efficiently increases absorption of water.

(6) Assimilation :

The use of absorbed digested food by the body is termed as **assimilation.** Amino-acids synthesise proteins, which in turn synthesis enzymes and new protoplasm. Glucose fatty-acids and glycerol on oxidation provide energy.

(7) Defaecation –

** The excreta of rabbit is given out of the body in the form of small **Pellets.** The process of removal of undigested food from the body is termed as the **Defaecation.** The process of defaecation is **involuntary** in rabbit**,** thought it is voluntary in most animals.

Symbiotic bacteria found in colon. Bacteria synthesis vitamin-K, B_1 , B_2 ect.

Undigested food goes into rectum where it gets converted into faeces contains – water and solid matter. Solid matter contains dead bacteria 30%, fat 10-12%, proteins 2-4% and others.

These faeces ejected outside through anus.

In the morning the excreta of rabbit is in the form of semi-solid pellets. It has more amount of undigested cellulose in it. Cellulose is a colloid substance, Colloid have the capacity to bind water on their surfaces, so complete absorption of water is not possible in intestine . To completely digest the cellulose rabbit again ingests the semi-solid excreta so again digestion of cellulose takes place in the caecum.

In the evening the excreta of rabbit is in the form of solid, dry pellets. These have less amount of undigested cellulose in them. This nature of rabbit of eat is own excreta is termed as **Coprophagy** or **Caecotrophy** or also **Pseudorumination.** Double Circulation of food through the alimentary-canal is termed as **Caecotrophy**. Food of rabbit mainly consists of cellulose so this activity is necessary for rabbit.

Brown colour of the excreta is due to 2 pigments-**Sterobilin** and **Urobilin.** Both of them are formed due to the degradation of **Bilirubin.** Foul smellof the excreta is due to **Indole, Scatole** and **Typtophan**. CH_4 ,

NH_3 , H_2S. These are found in the colon due to the decomposition of undigested protein by bacteria. Pellets of rabbit don't have a foul smell because it has minimum amount of proteins in its diet. Carnivores have excess protein-rich diet so there is highly foul-smelling.

Calorific Value :

The amount of heat liberated from complete combustion of 1 gm food in a bomb calorimeter (a closed metal chamber filled with O_2) is its gross calorific value or gross energy value (G.C.V.).

The actual amount of energy liberated in the human body due to combustion of 1 gm of food is the physiologic calorific value (P.C.V.) of food.

Food substance	G.C.V. (in K.cal/gm)	P.C.V. (In K. cal/gm)
Carbohydrate	4.1	4.0
Protein	5.65	4.0
Fats	9.45	9.0

Nutritional imbalances and disorders

(i) Balanced diet : The diet which contain the various nutrients in such proportions as can satisfy all the various needs of our body, is called a "balanced diet". The proportion of carbohydrates, proteins and fats into fulfill energy requirement is 4 : 1 : 1 *i.e.* 65% of energy is obtained from carbohydrates and 10–20% each from proteins and fats. This amount of energy is fulfilled by intake of 400–600 gm of carbohydrates, 80–100 gm of proteins and 50–60 gm of fats. The balanced diet must also contain sufficient amount of minerals and vitamins.

(ii) Metabolic rates :

(a) **Basal metabolic rate :** Amount of energy required daily by a person to maintain its basal metabolism and is about 1600 *k cal*/day.

(b) **Routine metabolic rate :** Amount of energy required daily by a person to do his routine work. It is about 2800 k cal/day for males and 2300 k cal for female.

(c) **Active metabolic rate :** Amount of energy required daily by a person to maintain its high metabolic rate during heavy physical work and is about 6000 k cal/day for males and 4500 k cal for females. It has been scientifically determined that a child of 4–6 years approximately requires 1500, a child of 13–15 years requires 2500 and a youth of 16–18 year requires 3000 k cal of energy per day. The average metabolically available energy for each gram of carbohydrate is 4.0 k cal, for proteins is 4.0 k cal and for fats, it is 9.1 k cal.

(iii) Nutritional disorders : Every organism requires an adequate supply of nutrients in proper proportion in their diet for proper growth and development. There are two types of nutritional disorders

(a) Under nutrition (malnutrition)

(b) Over nutrition

(a) Diseases due to deficiency of nutrition (malnutrition)

Name of the Deficiency	Deficient Nutrient	Symptoms
Anaemia (microcytic)	*Fe*	Haemoglobin and number of erythrocytes gets reduced.
Megaloblastic anaemia	Folic acid and B_{12}	Presence of immature erythrocytes in blood.
Pernicious anaemia	Vitamin B_{12}	Immature RBC without Hb. This may be fatal unless treated with vitamin B_{12} injection.
Xerophthalmia	Vitamin *A*	Thickened, keratinised, opaque ulcerated cornea. Prime cause of blindness in India, especially among children.
Night Blindness	Vitamin *A*	Less rhodopsin in rod cells of retina. So no vision in dim light.
Rickets (in children)	Vitamin *D*	Weak, soft, thin bones due to poor deposition of Ca and P. Bent long bones and painful swelling on wrist, elbow and knee joints.
Osteomalacia (adults)	Vitamin *D*	Weak bones of vertebral column, pelvis gets bent and deformed by body weight.
Sprue	Folacin	Ulceration of mouth, inflammation of bowel, indigestion, diarrhoea, weakness.
Pigeons breast	Vit. – D	Incomplete ossification at the end of limb bone, deformed ribs leading to pigeons breast.
Beri – beri	Vitamin B_1 (Thiamine)	Reduces aerobic carbohydrate metabolism. So peripheral nerves inflammed causing pain, numbness and weakness of limb muscles. Paralysis. Fluid accumulation in tissues or oedema of hands and legs. Cardiac oedema.
Scurvy	Vitamin *C*	Fragile blood vessels because of defective collagen fibres in their walls. Bleeding gums, teeth fall, bones fragile. Wound healing delayed, vitamin C recommended in serious injury.
Bleeding disease (Hypoprothrombin anaemia)	Vitamin *K*	Delayed blood clotting (s) so profuse bleeding.
Marasmus	Protein / Malnutrition	Growth and replacement of tissue proteins imparted so emaciated body with their limbs and prominent ribs, dry, thin and wrinkled skin, Diarrhoea.
Kwashiorkor	Protein	Wasting muscles, thin limbs, Retarded growth of body and brain, Oedema, Diarrhoea.
Pellagra	Nicotinamide	Swollen lips, thick pigmented skin of hands and legs. Irritability.
Osteoporosis	*Ca*	Weakning of bones, tooth decay.
Goitre	I_2	Enlargement of thyroid gland.
Muscular cramps	*NaCl*	Pulling of muscles due to dehydration.
Dental cramps	Fluorine	Tooth decay.

Daily Dietary Requirements of Nutrients

(Recommended by Indian Council of Medical Research)

Individual	Total *kcal*	Protein (*gms.*)	Calcium (*gms.*)	Iron (*mgs.*)	Vitamin *A* (*µg.*)	Thiamin (*mgs*)	Riboflavin (*mgs.*)	Niacin (*mgs.*)	Folacin (*µg.*)	Vitamin B_{12} (*µg.*)	Vitamin *C* (*mgs.*)	Vitamin *D* (IU)
(1) Man Moderately active	2800	55	0.4-0.5	24	750	1.4	1.7	19	100	1	40	
(2) Woman	2200	45	0.4-0.5	32	750	1.1	1.3	15	100	1	40

(4) Girl (16-18 years)	2200	44	0.5-0.6	35	750	1.1	1.3	15	100	1	40	200

(b) Diseases due to over nutrition

(1) **Fluorosis :** Caused due to excess of fluorides. It results in tooth and bone decay.

(2) **Obesity :** This is over–nutritional disorder. It is caused when "energy inputs exceeds energy output". It results in deposition of excess fat in the body.

(3) **Constipation :** Slow movement of faeces down the large intestine causes accumulation of dry and hard stool is colon. It is generally caused by irregular bowel habits.

(4) **Diarrhoea :** Rapid movement of faecal matter down the large intestine causes loose stools called diarrhoea. It may be also caused by viral or bacterial infections of intestinal tract, particularly of large intestine and by nervous tension.

(5) **Piles or haemmorhoids :** Enlargement of the anal veins. It may be either hereditary or may be caused due to rapid changes in the diet.

(6) **Hypercholesterolemia :** Caused due to excess of saturated fats like butter, ghee, hydrogenated vegetable oils and eggs etc. It results in increased level of cholesterol in blood, arteriosclerosis, coronary thrombosis, heart attack etc.

(7) **Hypervitaminosis *A* :** It results in loss of appetite, body hairs, painful swelling etc.

(8) **Hypervitaminosis *D* :** It results in deposition of calcium ion in the soft tissues of the body.

Differences between Kwashiorkor and Marasmus

Kwashiorkor	*Marasmus*
(1) It is caused by deficiency of protein in the diet.	(1) It is caused by prolonged deficiency of proteins and calories in the diet.
(2) It commonly affects babies between 1-3 years of age.	(2) It affects infants under one year of age.
(3) Subcutaneous fat persists.	(3) Subcutaneous fat is used up, making ribs very prominent.
(4) Oedema affects legs and face.	(4) No oedema occurs

(5) Skin and hair change colour.	(5) No change in skin and hair colour.
(6) Body becomes under weight.	(6) Body becomes very under weight.
(7) Appetite is reduced.	(7) Appetite is not effected.
(8) Patient needs proteins to recoup.	(8) Patient needs proteins as well as carbohydrates and fats to recover.

REGULATION OF FOOD INTAKE

1. Hunger :

Hunger is defined as the intrinsic (involuntary) desire or craving for food. Hunger is associated with a number of objective sensations. For instance, food deprival for many hours causes intense rhythmic hunger contractions in stomach, which even causes intense pain (hunger pangs) send sensory impulses to a "hunger or feeding centre", located in the lateral regions of hypothalamus.

When glucose levels fall in blood, hunger centre stimulated. Hunger centre transmits impulses to wall of stomach and wall of empty stomach start contraction or hunger pangs. After taking meal satiety centre which located in hypothalamus stimulates and feeding is stopped. During high fever person does not feel like taking meal because high temperature shuts off the appetite centre.

2. Thirst :

Subconscious desire for water is called thirst. It is also induced by a hypothalamic "thirst centre". When amount of water decreases in body fluids (blood, lymph, tissue fluid, cerebrospinal fluid etc.) due to fever, exercise and sweating, copious urination, diarrhoea, etc. This induces the feeling of thirst. Presumably, a fall in glucose level in the blood also induces thirst.

3. Theory of regulation of food intake : They are following –

(a) Neuronal theory : According to this theory, two different type of centers are present in the hypothalamus which regulates hunger. These centre are appetite and satiety. Appetite centre is often used to imply a conscious desire for specific or selected type of food. Interoceptors of stomach wall, stimulated by the muscular contraction, send sensory impulses to the hunger centre located in the lateral region of hypothalamus. Satiety is the conscious sensation of food sufficiency leading to a voluntary cessation of eating. The centre is located in the ventromedian regions of hypothalamus.

(b) Glucostatic theory : When the blood glucose level decreases we feel hungry. It is also caused due to low level of amino acids and fatty acids, and when the level of these substances increases in blood, satiety centre stimulates.

(c) Thermostatic theory : Decrease in body temperature increases hunger due to increased metabolic rate. Conversely, an exposure to heat, or increases in body temperature reduces hunger due to decreased metabolic rate. These conditions are caused by interactions between hypothalmic temperature regulating and food intake–regulating system.

PROTEIN ENERGY MALNUTRITION

1. Kwashiorkor –

- it is a protein deficiency disease.
- it commonly affects infants and children between 1 to 3 year of age.

Symptoms –

Underweight, stunted growth, poor brain development, loss of appetite, anaemia, oedema on lower leg and face.

Cure –

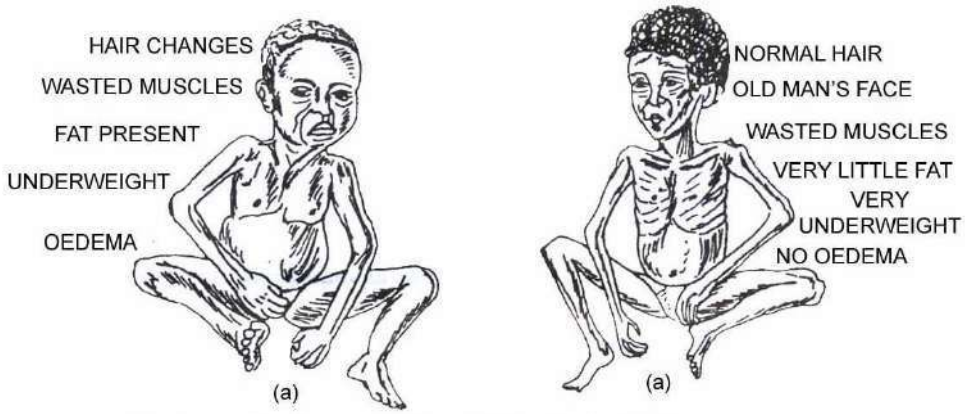
Proteins are necessary for growth, repair of tissue and for body defence therefore adequate amount of proteins must be present in the diet.

Daily requirement –

1 gm protein per kg. body weight in adult.

2 gm protein per kg body weight in growing children.

Sources in food – Cereals pulses, meat, fish, milk, groundnut, peas, leafy vegetables etc.



Two types of inadequate nutrition. (a) Kwashiorkor (b) Marasmus

2. **Marasmus –**

It is caused by Protein-Energy-Malnutrition (PEM) or deficiency of protein and total food caloric value.

Symptoms –

Impairs physical growth, subcutaneous fat diseappears, ribs become very prominent, limbs become thin and skin becomes dry, thin & wrinkled. There is no oedema on leg and face but loss of weight occurs.

Cure –

Diet with adequate proteins and proper caloric value should be given to the infants.

Source in food – Same as kwashiorkor.

3. **Hypercholesterolemia –**

It is caused due to intake of excess of saturated fat such as butter, ghee, red meat, egg. Cholesterol level in blood rises abnormally (hypercholesterolemia) this may cause thrombosis and heart attack.

4. **Obesity –**

It is caused by excessive intake of high caloric nutrients such as sugar, honey and saturated fat. Fat accumulates in the tissue. This may cause high blood pressure, diabetes and heart diseases. Regular exercise and taking of green leafy vegetable are recommended to such persons.

5. **Hypervitaminosis –**

It is caused by excessive intake of vitamin. Such as excess of vitamin D causes deposition of calcium in soft tissue. Excess of vitamin A causes lack of appetite, itching rash etc. Hypervitaminosis of vitamin 'D'- Nausea, anorexia, hypocalcaemia, hyperphosphetemia, calcification of soft tissue.

6. **Fluorosis –**

It is caused by excessive intake of fluorine. It is characterized by mottled (brownish discolouration) teeth.

7. Constipation –

Because of show reaching of excreta into the large-intestine hard and dry excreta deposits in the colon.

8. Diarrhoea –

Fast and rapid removal of excreta from the large-intestine is called Diarrhoea. It may be due to viral or bacterial infection in the intestine.

Types of food relative to their nature of Nutrients and Basic Functions

Major Food	**Nutrient**	**Function**
Sugar, glucose , sugarcane, honey and milk	**Carbohydrates**	
	Sugars	
Wheat, bread, maize, corn, rice and potatoes	Starch	
Butter, sunflower oil, seeds and vegetable oils, nuts, almonds, cheese, liver oils and egg yolk	**Lipids**	
	Fats and oil	**Energetic**
Flesh (meat, chicken, fish), milk, pulses, cereals, egg (albumen and yolk) and cheese	**Proteins**	
	Amino acids	
Table salts, pickles and butter	**Minerals**	
	Sodium	
Table salts, pickles and butter	Chlorine	**Constructive**
Jaggary, banana, date palm and potato	Potassium	
Milk, cheese, curd, fish, eggs, pulses, carrot, cabbage and dark green leaves	Calcium	
Meat, fish, milk, cheese, egg, pulses and cereals	Phosphorus	
Meat, liver, egg-yolk, fish, green leaves, nuts, fig, and pulses	Iron	
Sea-fish, sea-weed, onion and iodised table salt	Iodine	
Cod and shark liver oil, kidneys, egg-yolk, green and yellow vegetables, (carrot, mango, lettuce, cabbage), tomato, yeast, milk and butter	**Vitamins**	
	A (Retinol)	
Whole cereals, dried beans, pork meat, egg-yolk, yeast	B_1 (Thiamine)	
Meat, liver, fish, milk, egg, cheese, legumes and green leafy vegetables	B_2 (Riboflavin)	
Pulses, cereals, meat, liver, fish, intestinal bacteria and yeast (Also synthesized in the human body from the amino acid, tryptaphan)	PP (Pellagra preventing) or nicotinamide	**Protective**
Citrus fruits, vegetables, tomato, and peppers	C (Ascorbic acid)	
Cod and shark liver oil, chicken, egg-yolk, milk, butter, etc. (Also synthesized in human skin in presence of sunlight.)	D (Calciferol)	

VITAMINS

- The study of vitamins is called as vitaminology.
- Vitamins were discovered by "Lunin" **.**
- The term "Vitamin" was given by "Funk" and "Hopkins" (B_1 from unpolished rice – 1912)
- Vitamins are micronutrients, biological regulators and metabolic regulators (Vitamin theory)
- Vitamins are important to maintain health, but cannot synthesize in the body.
- Earliest known vitamin - vitamin 'C' (James Lind – Scottish naval surgeon – 1747.)
- Earliest extracted vitamin = Vitamin - B_1

Vitamins are following types –

(1) Fat soluble

(2) Water soluble vitamin

1. FAT – SOLUBLE VITAMIN

Vitamin- 'A' (Retinol) –

- Can be synthesized in liver from yellow and red carotenoid pigment.
- It is also known as anti-infectious and anticancer vitamin.
- It is also known as anti-xeropthalmic vitamin.
- Isomer of vitamin 'A' are –
- (i) A_1 – Retinol for vision.

  (ii) A_2 – Dehydro retinol which is essential for epithelial lining of glands and tear production. It is essential for growth and epithelical cell division.

Deficiency diseases –

(1) Night blindness – Due to deficiency of A_1

It is also known as Nyctolopia (Inability to see in dark)

(2) Xeropthalmia – due to deficiency of A_2

Tear formation is absent.

In this disease conjunctiva & cornea become dry due to keratinzation of conjunctiva & cornea .

It is the main problem of blindness in children throughout the world.

Source – Good source is carrot, other sources are Guava, papaya, mango, spinach etc.

(3) Vitamin – ''D'' (Calciferol)

It is also known as "Sunshine vitamin" or "Anti Ricket" vitamin.

Synthesized in skin from cholesterol by UV light.

It is necessary for bone & teeth.

It regulates the absorption of calcium & phosphorous.

It organize the calcium in bone and teeth.

Deficiency diseases –

Rickets in children and osteomalacia in adult.

Source – Good source cod liver oil and shark liver oil for both 'A & 'D', Other sources are meat, liver, egg, milk etc

Vitamin 'E' (Tocopherol) –

- It is also known as "antisterility" vitamin or "beauty"' vitamin.
- This vitamin removes scar & wrinkles from skin.
- It is essential for gametogenesis, pregnancy and muscular work.
- It maintains the cell membrane of RBCs.

Deficiency diseases – Sterility, Fragile anaemia.

Source – Egg, meat, cotton, seed oil.

Vitamin 'K' (Naphthoquinone) –

- It is alos known as "antihaemorrhagic" vitamin.
- Essential for synthesis of prothrombin.

Menadione is the important source of the synthetic vitamin K.

Deficiency diseases – Bleeding or delayed blood clothing. (Hypoprothrombinemia).

Source – Carrot, tomato, liver, cabbage etc.

2. WATER – SOLUBLE VITAMIN

Vitamin B_1 (Thiamine) –

- It is also known as "anti beri-beri" factor or antineuritic factor.
- Beri-Beri affects peripheral nervous system, alimentary canal & cardiovascular system.
- It is essential for formation of coenzyme carboxylase in carbohydrate and amino acid metabolism.

Deficiency disease – Beri-Beri, Wernicke's encephalopathy. Anorexia, constipation, weak-Heart best muscle catrophy.

Source – Rice, wheat, egg and fish etc.

Vitamin B_2 (Riboflavin)

- It is also known as vitamin "G" or lactoflavin or yellow enzyme.
- It is essential for formation of FMN & FAD.
- It maintain the oral epithelial lining.

Deficiency Diseases – Cheliosis (Cracked lips at the corner of mouth) sore mouth and ulceration, digestive disorder, Pellagra like, beri-beri like.

Source – Cow's milk, egg, liver, yeast etc.

Vitamin B_3 (Niacin or Nicotinic acid) –

It is also known as "antipellagra" factor or vitamin PP (Pellagra preventing factor)

It forms essential component of NAD & NADP.

It maintains the epithelial lining of lumen of alimentary canal.

Deficiency Diseases – Pellagra in human beings (diarrhoea, dermatitis, dementia) and black tongue (hyper pigmentation) disease in dogs.

Source – Kidney, liver, milk, yeast, egg etc.

Vitamin B_5 (Pantothenic acid) – greek work pantothen = everywhere

– It is also known as yeast factor or chick antidermatitis factor.

– It is help in formation of acetylcholine and co enzyme A. It regulated the secretion of steroid hormones.

Deficiency Diseases – Burning feet syndrome, fatigue & paralysis of muscles.

Source – Liver, meat, yeast, milk, egg, meat etc.

Vitamin B_6 (Pyridoxine)

Function as co-enzyme. It is also known rat **antidermatitis factor.**

Deficiency diseases – Dermatitis, Anaemia, nervousness.

Source – Liver, meat, yeast, egg etc.

Vita B_7 (Biotin)

It is also known as vitamin 'H' or antiegg white injury factor (egg white contain avidin protein which is antagonist to vit. B_7) – Dermatitis, hair loss, nervous symptom).

It is essential for fat synthesis and energy production

Deficiency Diseases – Dermatitis

Source – Vegetables, yeast, wheat egg etc.

Vitamin B_{12} (Cyanocobalamine) – Extrinsic factor of castle

It is also known as " antipernicious anaemic" factor or " RBC maturing" factor

It promotes DNA synthesis & Maturation of RBCs.

Deficiency Diseases – Pernicious anaemia.

Source – meat, liver etc.

Folic Acid –

It is also known as folacin or Vitamin M.

It is needed for formation of RBC & synthesis of DNA

Deficiency disease – Anaemia.

Source – green foliage of plant – cabbage, cauliflower.

Vitamin ' C' (Ascorbic Acid)

It is also known as **'' anti-scurvy''** or anti-viral, anti-cancer vitamin.

It is necessary for healing of the wound and formation of collagen fibre

Deficiency disease – Scurvy (deficient formation of collagen fibres).

Source-Amla, Tomato, orange, Guava, Lemon (citrus fruit).

Fat Soluble Vitamin				
Name of vitamins and chemical formula	**Vitamin K** or Phylloquinone or anti haemorrhagic vit-amin $C_{31}H_{46}O_2$	**Vitamin E** or α Tocopherol or anti sterility vitamin $C_{29}H_{50}O_2$	**Vitamin D** or Ergocalciferol or sunshine vitamin or anti rachitic vitamin $C_{28}H_{44}O$	**Vitamin A** or **Retinol** or anti xero-phthalmic or anti infection vitamin $C_{20}H_{20}O$
Discovery	Dam and Droisy **(**1935**)**	Evan and sore **(**1922**)**	Steenbock and Hess 1924**)**	Mc-Collumn and Davis (1913)
Sources	Fresh green vegetables. to matoes, liver, soyabean, cheese, egg.	Fresh green vegetables, meat, yolk, vegetable oils, butter and cheese, peanuts	Cod liver oil, butter, fish, eggs, milk, brain, lung, and spleen.	Vegetables butter liver oils egg yolk, mango and orange, carrot.
Daily requirement per day	0.07 – 0.14 mg	20 mg	0.01 mg	2 mg
Functions	Synthesis of prothrombin for normal clotting of blood.	Antioxidant and some role in ETS.	Facilitates absorption of calcium and phosphorus by intestine and their retention in body and deposition in	Part of visual pigment, maintenance of epithelia and prevention of keratini-zation of epithelium.
Name of Deficiency Disease	Haemorrhage	Anaemia Sterility Muscular atrophy	Rickets in children Osteomalacia in adults.	Xerophthalmia Night blindness or nyctalopia Keratomalacia. Dermatosis
Symptoms	Reduced ability of blood to clot and also leads to haemorrhages.	Destruction of RBC. In male causes sterility and in female abortion may occur of offspring. Effect not proved in man.	Deformities of bones like bowlegs pigeon chest Weak bones liable to easy fracture	– Drying of eyeball – Unable to see in dim light – Epithelium keratinised – Dry scaly skin
Other Features	Vitamin K is synthesised by intestinal microbes present in the intestine. Destroyed by–prolonged use of antibiotics.	Destroyed by UV – rays. It is also used for curing tumour and cancer	Synthesized in the body on exposure of skin (7-hydroxy cholesterol) to light. Destroyed by – oral contraceptives	Synthesized and stored in the liver. Destroyed by - strong light.

Vitamin B_3 Yeast factor or pantothenic acid or anti graying factor on chick antidermatitis factor $C_9H_{17}O_5N$	**Vitamin** B_2 or G or yellow enzyme or Riboflavin or Lactoflavin or $C_{17}H_{26}N_4O_6$	Vitamin B_1 or Thiamine or anti neuritic or antiberiberi $C_{12}H_{16}N_4SO$	**Name of Vitamins and Chemical Formula**
Williams **(**1933**)**	Warburg and Christain	C. Funk **(**1926**)**	**Discovery**
All foods, more in yeast, kidney, liver, egg, meat, milk, ground nut	Cheese, egg, yeast, meat, liver, cereals, green, vegetable.	Branrice, whole wheat flour, egg, meat, liver yeast etc.	**Sources**
5-10 mg	1-2 mg	1-1.5 mg	**D.R.**
Part of co-enzyme A. needed for cell respiration, necessary for normal skin and nerves.	Required for cell growth. Form pair of coenzyme (FMN, FAD).	Act as co-enzyme in cellular respiration, role in nutrition of nerve cells. Essential for carbohydrate metabolism, protein synthesis and control water balance in body.	**Function**
Burning feet syndrome, Nervous disorder	Cheilosis Glossitis Keratitis	Beri- beri – or Dry beri - beri (man) Polyneuritis or (animals) wet beri - beri Cardiovascular atrophy	**Name of Deficiency Disease**
Nerve degeneration	Cracking of skin at corners of mouth Inflammation of tongue Inflammation of skin	Loss of appetite and weight, retarded growth, muscular dystrophy. Nerves to become extremely irritable. Heart enlargement	**Symptoms**
It occurs in all types of plants and animal tissues. Its deficiency cause graying of hair	Stored in liver, Excess of this is eliminated in urine. It is associated with the physiology of vision	Beri-beri disease was discovered by Eijkman Destroyed by – cooking	**Other Features**

Folic Acid or Vitamin M or folacin or Anti anaemic factor	**Vitamin H** or **B_7** or Biotin or coenzyme R or Avidin $C_{10}H_{16}N_2O_3S$	**Vitamin B_6** or pyrido-xine or Rat anti dermat-ities factor $C_8H_{11}O_3N$	**Vitamin** B_5 or Niacin or Nicotinic acid or pellagra preventing factor $C_6H_5NO_2$
Day **(**1935**)**	Bateman and Allison **(**1916**)**	Gyorgyi **(**1928**)**	Goldberger (1912)
Green vegetable (spinach) Banana, orange and Liver.	Yeast, vegetables and egg yolk	Brewer's yeast, liver, egg, yolk, kidney, milk, and vegetables.	Fresh meat, liver, fish, milk, cereals, pulses, yeast etc.
0.4 mg	150-300 mg	2 mg	16-20 mg
It forms coenzymes and play essential role in cell metabolism, Necessary for erythropoiesis, required for DNA synthesis.	It acts as coenzymes and essential for fat synthesis and energy production.	It is essential component of coenzyme pyridoxal phosphate. It promotes growth in rats used for curing tuberculosis.	It is an essential component of NAD and NADP thus form coenzymes, metabolism of carbohydrates, functioning of gastrointestinal tract and nervous system
Megaloblastic anaemia. Sprue	Dermatitis	Anaemia Dermatitis, paralysis & death of rats. Mental disorder Dermatitis	Pellagra, Dermatitis, Diarrhoea Dementia Death (4-D syndrome)
Enlarged RBCs Ulceration of mouth	Scaly and itchy skin	Nausea, lack of RBC (blood) Disturbance of central nervous system Skin leisons	Rough skin Inflammation of skin which becomes scaly and papillated Dehydration Neural deterioration which may lead to madness
It is also synthesized by intestinal bacteria Destroyed by - cooking	It is synthesized by intestinal bacteria Destroyed by – prolonged use of antibiotics	Term B_6 was coined by Gyorgy. Destroyed by – cooking and oral contraceptives	It is characterised by 3D's *i.e.* dermatitis diarrhoea and dementia Destroyed by – cooking Pellagra preventing factor Goldberger also called Goldberger's p-p factor It is also synthesized by colon bacteria

Vitamin C or Ascorbic Acid $C_6H_6O_6$	Szent Gyorgyi (1928)	Citrus fruits such as lemon, mango, amla, plumes, guava.	40-60 mg	Functions as part of oxidation-reduction system. Helps in secretion of collagen cement dentine. Helps body to develop resistance to diseases. Helps in absorption of Ca and Fe in the intestine. Wound healing.	Scurvy.	Spongy and bleeding gums, fragile blood vessels and bones.	Required by primates, all other vertebrates and some other invertebrates can synthesize vitamin C. It is the earliest known vitamin. It is wound healing vitamin. Destroyed by – Heating
Vitamin B_{12} or Cyanocobalamine or Animal protein factor (APF) or Intrinsic factor of castle $C_6H_6O_{14}N_{14}PCO$	Rickets (1948)	Meat, egg, liver, fish, synthesized by intestinal bacteria.	0.003 mg	Required for chromosome duplication and formation of blood corpuscles.	Pernicious anaemia	Reduced formation of erythrocytes in bone marrow	It is also known as anti pernicious factor Also synthesized by intestinal bacteria in human colon Destroyed by– excessive heat

Name of Vitamin	Function	Symptoms of deficiency
Inositol or mouse antialopecia factor	Stimulate growth of mice. Spectacle-eye condition in rat can be treated keep a limit on the cholesterol level in the blood of man.	Causes reduced growth and alopecia (loss of hair) in the mice. Also causes hemorrhagic degeneration of the adrenal gland.
Choline	It is an important lipotropic factor which prevent excessive development of fatty liver. It takes part in the formation of acetylcholine which involved conduction of nerve impulse.	Chronic deficiency causes cirrhosis in the liver also causes haemorrhagic changes in kidney.
Vit.P or citrin	Control the permeability and fragility of the capillary wall to plasma protein.	Its deficiency causes subcutaneous bleeding due to break down of capillary walls.

POINT TO REMEMBER

1. Spoil hay of Sweet clover (melilotus indica) (Fodder and green manure) contains a substance called dicumarol. Dicumarol prevents the action of vitramin 'K'.
2. Non-secretion of HCl is called as achlorhydria condition.
3. Chalogogues are substances which cause. The contraction of gall bladder.
4. Choloretic are substances which increase bile juice from liver.
5. "Achalasia Cardia" condition is characterized by failure of cardiac sphincter to relax completely on swallowing causing accumulation of food in oesophagus and proximal oesophagus dialates.
6. One pair of vomerine teeth is found in the palate of frog.
7. Fangs are the poison teeth of snakes, these are the maxillary teeth.
8. Upper incisor teeth are modified in tusk in elephant.
9. Upper canine teeth are modified in tusk in walrus.
10. Homodont type dentition are found in toothed whale.
11. Enamel is absent in sloth and Armadillo.
12. Salivary glands are absent in whale.
13. The tongue is non-motile in whale.
14. Gall bladder is absent in lemprey, whale, rat and horse.
15. The main pancreatic duct is also known as **duct of wirsung** while accessory pancreatic duct is known as **duct of santorini.**
16. Citrin is also known as vitamin 'P' and controls vascular permeability.
17. Vitamin B_{17} – It is recently discovered anticancer vitamin.
18. Vitamin Q – helps in blood clotting.
19. Vita B_{15} – It is also known as pogonic acid, deficiency causes disorder in liver.
20. Vitamin B_6 also used in the treatment of tuberculosis.
21. Thecodont teeth are also found in crocodile.

Comparative Study of digestive system of Rabbit & Human

Rabbit	Human
1. It is herbivorous animal, depends cellulose based food.	It is omnivorous, and depends on vegetarian and non-vegetarian food.
2. A small cleft is present in mid part of upper lip.	Cleft is absent.
3. Canine teeth are absent.	Canine teeth are present.
4. Dental formula : $i-\frac{2}{1}c\frac{0}{0}pm\frac{3}{2}m\frac{3}{3}\times 2=28$	Dental formula : $i-\frac{2}{2}c\frac{1}{1}pm\frac{2}{2}m\frac{3}{3}\times 2=32$
5. Infraorbital, Parotid, Sublingual and Submaxillary glands are present.	Parotid, Sublingual, Submaxillary glands are present but infraorbital is absent.
6. Caecum and Vermiform appendix are present where digestion of cellulose takes place.	Caecum & Vermiform appendix are vestigeal.
7. Rectum is beaded.	Rectum is non-beaded.
8. Faeces are ejected outside in form of pelletes.	Faeces are ejected out side in form of semi solid stool.
9. Coprophagy nature is present.	Coprophagy nature is absent.

EXERCISE - 1

Q.1 Gastric juice contains which of the following enzymes

(1) Pepsin and renin

(2) Amylase & pepsin, and lipase

(3) Amylase & pepsin

(4) Insulin & glucagon

Q.2 Which of the following kinds of papilla (taste buds) occur over the tip of tongue of Rabbit-

(1) Fungiform and fili form

(2) Circumvallate

(3) Circumvallate

(4) Foliate

Q.3 Absorption of a solution against a concentration gradient by the intestinal epithelium is accompanied by

(1) Osmotic pressure

(2) Active transport

(3) Brownian movement

(4) Donanum equilibrium

Q.4 Which of the following teeth appear only once in the life of a man-

(1) Incisors (2) Canines

(3) Premolars (4) Molars

Q.5 Hydrolysis of phospholipids yields

(1) Glycerol, phosphoric acid and fatty acids

(2) Glycerol, phosphoric acid and nitrogen base

(3) Glycerol & fatty acids

(4) Acetyl Co A

Q.6 The food that gives more calories per unit mass of food is

(1) Protein (2) Carbohydrates

(3) Fat (4) Water

Q.7 Which is the element that hardens the tooth enamel ?

(1) Calcium (2) Fluorine

(3) Iodine (4) Sodium

Q.8 Canine teeth are absent in rabbit because it is-

(1) Herbivorous (2) Carnivorous

(3) Omnivorous (4) Saprophytic

Q.9 The secretions that mix with food in the small intestine are

(1) Saliva, gastric juice & bile

(2) Gastric juice, bile & pancreatic juice

(3) Bile, pancreatic juice & intestinal juice

(4) Pancreatic juice, intestinal juice and gastric juice

Q.10 Essentially the work digestion means

(1) Breaking food for energy

(2) Building of proteins from amino acids

(3) Changing organic molecules

(4) Breaking complex organic molecules into smaller ones

Q.11 Which of the following part in Rabbit have hare lip or cleft lip

(1) Lower lip (2) Upper lip

(3) Both of these (4) None of these

Q.12 When teeth are different in shape, size & function then these are called

(1) Acrodont (2) Pleurodont

(3) Homodont (4) Heterodont

Q.13 Dental formula of Rabbit is

(1) $\frac{2}{2}\frac{1}{1}\frac{2}{2}\frac{3}{3}$ (2) $\frac{1}{1}\frac{0}{0}\frac{2}{1}\frac{4}{3}$

(3) $\frac{2}{1}\frac{0}{0}\frac{3}{2}\frac{3}{3}$ (4) $\frac{1}{1}\frac{0}{0}\frac{2}{0}\frac{0}{3}$

Q.14 The incisor teeth are meant for

(1) Biting & cutting

(2) Mulching

(3) Munching and chewing

(4) Chewing

Q.15 The enormously long tusks in elephant are-

(1) Upper incisors (2) Upper canines

(3) Lower canines (4) Lower incisors

Q.16 How many teeth in man are monophyodont ?

(1) 4 (2) 12

(3) 22 (4) 32

Q.17 In Rabbit incisor teeth keep on growing because of

(1) Persistence open pulp cavity

(2) Open apical pore

(3) Constant division of odontoblasts

(4) All of the above

Q.18 Due to the absence of canines in Rabbit a gap is left in between incisor and premolar teeth, it is called

(1) Dental lamina (2) dental groove

(3) Diastema (4) Dental cavity

Q.19 Which of the following food reserves would be first used in a starving person-

(1) Muscle proteins (2) Skin adipose tissue

(3) Liver glycogen (4) Liver proteins

Q.20 The digestions of starch in alimentary canal of human starts in

(1) Buccal cavity (2) Ileum

(3) Stomach (4) Duodenum

Q.21 Which of the following substance can be assimilated unchanged

(1) Vitamin (2) Starch

(3) Proteins (4) Lipids

Q.22 Root of tooth contains all the following except-

(1) Cementum (2) Enamel

(3) Dentine (4) Pulp cavity

Q.23 Which of the following part of gut does not posses mesentery ?

(1) Jejunum (2) Ileum

(3) Appendix (4) Ascending colon

Q.24 Which is true about parotid gland ?

(1) Stenson's and Wharton's ducts join and open at upper 2nd molar

(2) Stenson's duct open opposite upper 2nd molar

(3) Parotid duct pierces master

(4) Developed from mesoderm

Q.25 Oxyntic cells are found in-

(1) Kidney and secrete renin

(2) Gastric epithelium and secrete HCl

(3) Gastric epithelium and secrete pepsin

(4) Islets of langerhans & secrete glucagon

Q.26 Which of the following is not a salivary gland

(1) Brunner's gland (2) sublingual gland

(3) Submaxillary gland (4) Parotid gland

Q.27 Maltose on digestion gives

(1) Two molecules of glucose

(2) One molecule of glucose and fructose

(3) Two molecules of fructose

(4) One molecule of glucose and galactose

Q.28 The foul smell of faeces is due to

(1) Skatol, Indole (2) Ammonia

(3) Small and large intestine

(4) Methyl mercaptan

Q.29 Maximum ammonia is formed during metabolism in

(1) Stomach (2) Liver

(3) Large intestine (4) Small intestine

Q.30 The main purpose of large intestine is to absorb

(1) Alcohol (2) Water

(3) Fatty acids (4) Disaccharides

Q.31 Hydrolysis of lactose yields

(1) Glucose and fructose

(2) Glucose and galactose

(3) Fructose and galactose

(4) Glucose and xylose

Q.32 Pepsin differ from trypsin in that it digests-

(1) Protein in alkaline medium in stomach

(2) Protein in acidic medium in duodenum

(3) Protein in acidic medium in stomach

(4) Protein in alkaline medium in duodenum

Q.33 Man cannot digest cellulose but cow and other herbivorous animals can take food containing cellulose because-

(1) They have enzyme cellulase in their stomach

(2) They masticate it well by chewing teeth

(3) They have bacteria in their alimentary canal which digest cellulose

(4) None of the above

Q.34 Enzyme responsible for coagulating milk in stomach of calves-

(1) Lactase (2) Trypsin

(3) Rennin (4) Pepsin

Q.35 The receptors for the bitter taste on our tongue are located on its
(1) Posterior portion (2) Middle part
(3) Lateral portion (4) Tip part

Q.36 Pseudormination is a process of
(1) Eating own faeces
(2) Egesting faecal matter
(3) Swallowing the bolus
(4) Chewing the regurgitated food

Q.37 Which of the following acts both as an endocrine as well as exocrine glands
(1) Thymus (2) Ovary
(3) Pancreas (4) All of the above

Q.38 Gastric glands are
(1) Simple tubular
(2) Simple coiled tubular
(3) Branched tubular
(4) Compound tubular

Q.39 Referred pain of gall bladder is felt at the tip of-
(1) Left shoulder (2) Right shoulder
(3) Sternum (4) Cystic duct

Q.40 Jaundice may be caused by retarded function of-
(1) Lungs (2) Liver
(3) Heart (4) Kidneys

Q.41 Which cells of liver act as phagocytes ?
(1) Acinar cells (2) Kupffer cells
(3) Hansen's cells (4) Dieter's cells

Q.42 Dentition of most of the mammals is
(1) Heterodont (2) Diphyodont
(3) Thecodont (4) All of the above

Q.43 The normal method of feeding in Rabbit is called
(1) Gnawing (2) Rumination
(3) Pseudo rumination (4) Coprophagy

Q.44 Which of the following substances is most quickly absorbed by buccal cavity
(1) Alcohol (2) Morphine
(3) Sugar (4) Salts

Q.45 Crypts of Lieberkuhn are the examples of which kind of glands
(1) Simple coiled tubular
(2) Simple alveolar
(3) Tubular alveolar
(4) Compound tubular

Q.46 Duct of Santorini is-
(1) Accessory pancreatic duct
(2) Main pancreatic duct
(3) Parotid duct
(4) Bile duct

Q.47 If liver becomes functionless, percentage of which will increase in blood ?
(1) Uric acid (2) Ammonia
(3) Urea (4) Proteins

Q.48 Surgical removal of gall bladder in Rabbit would lead to
(1) Jaundice
(2) Impairment of digestion of fats
(3) Increased acidity in the intestine
(4) Stop the process of glycogenesis in liver

Q.49 Sacculus rotundas is found at the junction of
(1) Oesophagus & stomach
(2) Small & large intestine
(3) Ileum, colon & caecum
(4) Duodenum & ileum

Q.50 The liver lobe is an aggregation of
(1) Glisson's capsules (2) Lobules
(3) Lobes (4) Hepatic chords

Q.51 Food and air passages in buccal cavity are separated by
(1) Palate (2) Tongue
(3) Upper jaw (4) None of the above

Q.52 Right and left lobes of human liver are separated by falciform ligament. The right lobe is differentiated into-
(1) Right lobe proper (2) Quadrate lobe
(3) Caudate lobe (4) All of these

Q.53 A common site of gall stones is-
(1) Cystic duct
(2) Ampulla of gall bladder
(3) Fundus of gall bladder
(4) Hepatic duct

Q.54 Assimilation of food takes place in
(1) Stomach (2) Ileum
(3) Duodenum (4) Body tissues

Q.55 In people addicted to alcohol the liver gets damaged because liver
(1) Has to detoxify the alcohol
(2) Is over stimulated to secrete bile
(3) Stores much glycogen
(4) Accumulates excess fats

Q.56 Wharton's ducts are associated with
(1) Salivary glands (2) Caecum
(3) Sacculus rotandus (4) Colon

Q.57 Stenson's ducts carry saliva from which salivary glands
(1) Infra orbital (2) Parotid
(3) Sub lingual (4) Sub maxillary

Q.58 Jacobson's organ in Rabbit is located
(1) On the floor of buccal cavity
(2) On the roof of buccal cavity
(3) Inside nasopalatine ducts
(4) Over the tongue

Q.59 Caecum is meant for
(1) Digestion of cellulose
(2) Digestion & absorption of cellulose
(3) Storage of fats
(4) Storage of faecal matter

Q.60 The movement in the alimentary canal is known as-
(1) Systole (2) Diastole
(3) Peristalsis (4) Metachronal

Q.61 The human intestine is long because-
(1) Bacteria in food can be killed gradually
(2) It provides more space for food storage
(3) It increases surface area for absorption of food
(4) None of the above

Q.62 Outer most layer of crown part of a tooth is
(1) Dentine (2) Enamel
(3) Cement (4) Pulp

Q.63 Gall bladder of Rabbit is located in which lobe of liver
(1) Right central lobe (2) Left central lobe
(3) Caudate lobe (4) Spigelian lobe

Q.64 Kupffer's cells are found in
(1) Pancreas (2) Liver
(3) Kidney (4) Spleen

Q.65 Teeth forming cells are called
(1) Chondroblasts (2) Osteoblasts
(3) Odontoblasts (4) Osteoclasts

Q.66 The sphincter of Boyden surrounds the-
(1) Opening of the bile duct before it is jointed with the pancreatic duct
(2) Opening of the hepatopancreatic ampulla into the duodenum
(3) Opening of the pancreatic duct into the hepatogen creatic ampulla
(4) Opening of the accessory pancreatic duct into the duodenum

Q.67 Digestion of proteins is necessary because-
(1) Proteins are not absorbed as such
(2) Proteins are large molecules
(3) Proteins have complex structure
(4) Proteins are made up of amino acids

Q.68 Which one of the following does not aid in increasing surface area in the small intestine ?
(1) Plicae circularis (2) Taenia coli
(3) Villi (4) Microvilli

Q.69 Three longitudinal muscular bands found in the wall of colon are called
(1) Haustra (2) Taeniae
(3) Beads (4) Acini

Q.70 Largest gland found in the body of Rabbit is
(1) Spleen (2) Liver
(3) Pancreas (4) Sebum

Q.71 The secretory units of pancreas are called
(1) Alveoli (2) Acini
(3) Crypts (4) Lobules

Q.72 The toxic substances of diet are detoxified in body by
(1) Stomach (2) Liver
(3) Spleen (4) Kidney

Q.73 Drowsiness after a heavy meal is due to-
(1) Increased blood pressure
(2) Decreased pulse rate
(3) Reduced blood pressure
(4) Increased pulse rate

Q.74 Deficiency of calcium causes-
(1) Rickets (2) Scurvy
(3) Gigantism (4) Addison's disease

Q.75 Which of the following minerals is responsible to control our heart beat-

(1) Sulphur (2) Sodium

(3) Potassium (4) Iron

Q.76 The centre of liver lobule is formed by

(1) Portal vein (2) Hepatic artery

(3) Bile duct (4) Intralobular vein

Q.77 The portal tract or radical or canal is composed of

(1) Central vein, portal vein and hepatic artery

(2) Central vein, bile duct, lymphatics & artery

(3) Portal vein, hepatic artery, bile duct & lymphatics

(4) Arteries, veins & bile ducts

Q.78 The sinusoids found between radical cords of hepatic cells connect

(1) Portal vein to hepatic artery

(2) Hepatic artery & Portal vein to the intralobular vein

(3) Central vein to the bile duct

(4) Hepatic artery to bile duct

Q.79 Deficiency of Riboflavin causes-

(1) Beri-beri

(2) Cheilosis

(3) Pellagra

(4) Megaloblastic anaemia

Q.80 Most important property of water for which it is needed in the body is-

(1) It is tasteless, colourless and odourless

(2) It is a universal solvent

(3) It is a liquid

(4) Its O_2 is used in cellular metabolism

Q.81 Xerophthalmia in children and nyctalopia (night blindness) in adults is caused by the deficiency of vitamin-

(1) A (2) D

(3) E (4) K

Q.82 Liver sinusoids are lined by

(1) Kupffer's cells (2) Paneath's cells

(3) Peyer's patches (4) Goblet cells

Q.83 Peyer's patches manufacture

(1) Erythrocytes (2) Lymphocytes

(3) Mucous (4) Digestive enzymes

Q.84 The enzyme invertase converts

(1) Lactose into glucose & galactose

(2) Sucrose into glucose & fructose

(3) Maltose into glucose

(4) Starch into maltose

Q.85 Enzymes in the body of Rabbit occur

(1) Only in pancreas (2) Only in liver

(3) Almost in all cells (4) Only in kidney

Q.86 Secretin is

(1) An enzyme (2) A hormone

(3) A vitamin

(4) An excretory product

Q.87 Pellagra is caused due to deficiency of vitamin-

(1) Thiamine

(2) Calcified

(3) Nicotinic acid (Niacin)

(4) Ascorbic acid

Q.88 Which of the following pair is characterized by swollen lip, thick pigmented skin of hands and legs and irritability ?

(1) Thiamine – Beri beri

(2) Protein – Kwashiorkor

(3) Nicotinamide – Pellagra

(4) Iodine – Goitre

Q.89 Vitamin containing cobalt is-

(1) A (2) B_1

(3) B_6 (4) B_{12}

Q.90 Inner most surface of small intestine of Rabbit has

(1) Only epithelial tissue

(2) Only muscular tissue

(3) Both of the above

(4) Muscles & connective tissue

Q.91 Dental formula of Homo sapiens is

(1) $\frac{2}{2}\frac{1}{1}\frac{2}{2}\frac{3}{3}$ (2) $\frac{2}{1}\frac{1}{1}\frac{1}{1}\frac{3}{4}$

(3) $\frac{2}{2}\frac{1}{1}\frac{2}{2}\frac{4}{3}$ (4) $\frac{1}{1}\frac{2}{2}\frac{3}{2}\frac{3}{3}$

Q.92 Glycogen is stored in Rabbit's body in

(1) Muscles only

(2) Liver cells only

(3) Muscles & spleen

(4) Liver & muscle cells

Q.93 If the intake of food in Rabbit is more than its energy use, it will be deposited in the form of
(1) Proteins (2) Fats
(3) Glycogen (4) Fats & glycogen

Q.94 In digestion of food some energy is produced in the form of
(1) Kinetic energy (2) Potential energy
(3) Heat (4) Radiant energy

Q.95 Hormone responsible for initiating the secretion of pancreatic juice is
(1) Enterogastrones (2) Cholecystokinin
(3) Secretin & pancreozymin
(4) Gastrin & pancreozymin

Q.96 Scurvy which is caused by the lack of vitamin C is characterised by-
(1) Nervous disorders
(2) Haemorrhage in the gums
(3) Intestine disorders
(4) Malfunction of kidney

Q.97 Antihaemorrhagic vitamin is also known as-
(1) Vitamin A (2) Vitamin B
(3) Vitamin E (4) Vitamin K

Q.98 Lamina propria is
(1) A connective tissue component of mucosa
(2) An epithelium
(3) A fibrosa
(4) A connective tissue component of muscular is mucosae

Q.99 Salivary secretion in Rabbit is controlled by
(1) Reflex action (2) Hormones
(3) Pressure (4) Will power

Q.100 Glisson's capsules in Rabbit are present
(1) In cortex of kidney
(2) In seminiferous tubules
(3) Between two adjacent hepatic lobules
(4) Between two adjacent hepatic lobes

ANSWER KEY

EXERCISE - 1

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

EXERCISE - 2

Q.1 Cannibals feed on-
(1) Carcases
(2) Blood
(3) Carnivores
(4) Member of own species

Q.2 Detrivores are-
(1) Parasite
(2) Blood sucking
(3) Feeding on decaying organic matter
(4) Feeding on living

Q.3 Which of the following process does not occur when glucose is eaten-
(1) Ingestion (2) Digestion
(3) Absorption (4) Assimilation

Q.4 Two roots are found in which kind of teeth-
(1) Incisors (2) Canine
(3) Premolar (4) Molar

Q.5 Histiocytes found in liver sinusoids, lymphoid tissue and bone marrow of Rabbit are functionally-
(1) Degenerative (2) Regenerative
(3) Connective (4) Phagocytic

Q.6 The secretion of liver consists of -
(1) No enzymes and no hormones
(2) Digestive enzymes
(3) Hormones
(4) Succus entericus

Q.7 Transverse rugae occur on -
(1) Hard palate (2) Soft palate
(3) Tongue (4) Stomach

Q.8 Bunodont teeth occur in-
(1) Elephant (2) Giraffe
(3) Horse (4) Humans

Q.9 Secretion of gastro- intestinal juices and movements after ingestion are mostly controlled by-
(1) Brain
(2) Sympathetic
(3) Hormones
(4) Parasympathetic nerves

Q.10 Acidic medium of stomach is due to-
(1) Gastric juice (2) Bile
(3) Saliva (4) None of these

Q.11 Normally in ruminants the stomach has four chambers, but in camel, which of the following chamber is missing-
(1) Reticulum (2) Rumen
(3) Ommasum (4) Abomassum

Q.12 Little fluoride is added to drinking water to strengthen our-
(1) Bones (2) Teeth
(3) Muscles (4) Hair

Q.13 In which part of Rabbit's stomach digestion occurs mainly-
(1) Cardiac (2) Pyloric
(3) Fundic (4) All of the above

Q.14 Chewing of food is regarded good for digestion because-
(1) Enzymes only act on grinded food
(2) It increases the time and surface area of exposure to enzymes
(3) Enzymes are only activated during chewing
(4) Chewing mixes food well with enzymes

Q.15 Intracellular digestion occurs in-
(1) Sponges (2) Molluscs
(3) Insects (4) Vertebrates

Q.16 Extracellular digestion takes place in-
(1) Amoeba (2) Sycon
(3) Paramecium (4) Man

Q.17 The teeth which bear transverse ridges on the are called-
(1) Thecodont (2) Lophodont
(3) Diphyodont (4) Pleurodont

Q.18 In rabbit cellulolytic bacteria are found in-
(1) Caecum (2) Colon
(3) Rectum (4) Ileum

Q.19 Find out the correct sequence of enzyme, substrate & end product-
(1) Peptidases – Proteins – Amino acids
(2) Peptidases – Glycogen – Amino acids
(3) Trypsin – Fats – Amino acids
(4) Maltase – Maltase – Glucose & Galactose

Q.20 Which of the following teeth are not deciduous-
(1) Incisors (2) Canines
(3) Premolars (4) Molars

Q.21 Teeth of Rabbit are-
(1) Living structures (2) Dead structures
(3) Partly dead & partly living
(4) Exact nature is not known

Q.22 The pulp of a tooth is surrounded by-
(1) Dentine (2) Crone
(3) Enamel (4) Root

Q.23 The quick movement of food into oesophagus is due to-
(1) Lubrication of food by saliva
(2) Peristalsis
(3) Gravitational pull (4) All of the above

Q.24 The lamina propria & muscularis mucosa belong to-
(1) Serosa (2) Sub mucosa
(3) Mucosa (4) None of these

Q.25 The neck of tubular gastric glands consist mainly of-
(1) Zymogen cells (2) Parietal cells
(3) Oxyntic cells (4) Mucous glands cells

Q.26 The folds of mucosa of the empty contracted stomach are known as-
(1) Taeniae (2) Rugae
(3) Ceacae (4) Favolae

Q.27 Parotid salivary glands are present-
(1) Below the tongue (2) Below the ears
(3) In the angle between two jaws
(4) Below the eye orbits

Q.28 A sensitive fleshy, soft process hanging in the throat of mammals is called-
(1) Rugae (2) Rumen
(3) Tonsil (4) Uvula

Q.29 After absorption of digested lipids by lymphatics of small intestine, these become milky, then these lipoprotein droplets are called as-
(1) Chyme (2) Chyle
(3) Chylomicron (4) Micelles

Q.30 The conversion of harmful substance prussic acid into potassium sulphocyanide takes place in-
(1) Liver (2) Lymph glands
(3) Spleen (4) Bone marrow

Q.31 The swallowing of food from buccal cavity into oesophagus is a reflex action controlled by-
(1) Brain (2) Medulla oblongata
(3) Hormones (4) Peripheral nerves

Q.32 The gastric mucosa of rabbit is protected from damage by HCl, because-
(1) HCl is too dilute
(2) It is covered with a mucous coat
(3) It is resistant to action of HCl
(4) HCl is neutralized by alkaline bile

Q.33 Digestion of proteins, fats and carbohydrate is completed in-
(1) Stomach (2) Duodenum
(3) Ileum (4) Ilium

Q.34 Teeth of carnivores are-
(1) Solenodont (2) Secodont
(3) Lophodont (4) Pleurodont

Q.35 Odontoblasts produce-
(1) Dentine (2) Cement
(3) Enamel
(4) Peridontal membrane

Q.36 The chief function of bile is to-
(1) Digest fats by enzymatic action
(2) Eliminate excretory products
(3) Regulate digestion of proteins
(4) Emulsify the fats

Q.37 A good source of lipase is-
(1) Pancreatic juice (2) Gastric juice
(3) Bile (4) Succus entericus

Q.38 The products of protein digestion the amino acids are absorbed in the ileum through-
(1) Lacteals of villi
(2) Blood capillaries of villi
(3) Both of the above
(4) Muscularis mucosa of villi

Q.39 Succus entericus is secreted by-
(1) Villi of intestine (2) Brunner's glands
(3) Crypts of lieberkuhn
(4) Brunner's glands and crypts of lieberkuhn

Q.40 The ductus choledochus in Rabbit carries -
(1) Bile (2) Saliva
(3) Sperm (4) Ova

Q.41 Cardiac sphincter protects back flow of-
(1) Food into oesophagus
(2) Blood into heart
(3) Blood into auricle
(4) Blood into venae cavae

Q.42 Haemorrhoids are-
(1) Small pouches of colon
(2) Enlarged rectal veins
(3) Outgrowths of anal canal
(4) Longitudinal folds of rectum

Q.43 The centre of hunger or centre which regulates the amount of food we eat or out appetite is located in-
(1) Medula (2) Cerebrum
(3) Hypothalamus (4) Alimentary canal

Q.44 The functional units for the absorption of digested food in Rabbit are-
(1) Brunner's glands (2) Villi
(3) Peyer's patches
(4) Crypts of Lieberkuhn

Q.45 The lymph vessels called lacteals are found in-
(1) Mammary glands (2) Pancreas
(3) Mucosa of intestine (4) Villi of ileum

Q.46 Pylorus occurs between -
(1) Ileum and rectum
(2) duodenum and ileum
(3) stomach and deodenum
(4) Oesophagus and stomach

Q.47 The bony sockets of Rabbits jaw in which the teeth are enclosed, are as-
(1) Fossae (2) Alveoli
(3) Dentaries (4) Diastema

Q.48 Which is different from others-
(1) Gastrin (2) Secretin
(3) Insulin (4) Pepsin

Q.49 The stimulation of gastric glands to produce gastric juice is a process mainly under the control of-
(1) Nerves (2) gastrin
(3) Wish of animals
(4) Sense of smell & taste

Q.50 By the rhythmical contractions of stomach the solid food is converted into a semifluid state, it is called-
(1) Chyle (2) Bolus
(3) Chyme (4) Chylomicron

Q.51 Which of the following contents of bile are concerned with digestion-
(1) Bile salts (2) Bile pigments
(3) Cholesterol (4) Phospholipids

Q.52 In the small intestine of Rabbit the optimum pH, for digestion is-
(1) 6.8 (2) 7.2
(3) 8.2 (4) 1.2

Q.53 Mumps is infection of salivary glands-
(1) Submandibular (2) Submaxillary
(3) Sublingual (4) Parotid

Q.54 Chymotrypsin is a component of-
(1) Bile (2) Pancreatic juice
(3) Succus entericus (4) Gastric juice

Q.55 Brunner's glands open at the -
(1) Bases of villi (2) Tips of villi
(3) Bases of crypts of Lieberkuhn
(4) Base of pylorus

Q.56 The watery emulsion of food found in small intestine is termed-
(1) Chyle (2) Chyme
(3) Bolus (4) Jelly

Q.57 The gastrointestinal hormones namely secretin and cholecystokinin secreted by duodenal epithelium activate respectively which organs to discharge their secretions-
(1) Pancreas & gall bladder
(2) Gall bladder & pancreas
(3) Pancrease & stomach
(4) Stomach & small intestine

Q.58 Polysaccharides are converted into monosaccharides by-
(1) Bile and lipase (2) Insulin & glucagon
(3) Glycosidases (4) Peptidases

Q.59 Bilirubin and biliverdin are the pigments found in-
(1) Blood of mammals (2) Bile of mammals
(3) Rods and cones of cycas
(4) Skin and hair

Q.60 Caloric value of carbohydrate per gram is-
(1) 9.45 kcal (2) 5.65 kcal
(3) 4.1 kcal (4) 9.0 kcal

Q.61 Keratomalacia is deficiency symptom on-
(1) Vitamin A
(2) Protein energy malnutrition
(3) Phylloquinone (4) Nicotinamide

Q.62 Lower jaw of mammals is composed of-
(1) One bone only (2) Three bones
(3) Five bones (4) Six bones

Q.63 Parietal (oxyntic) cells of gastric mucosa secrete-
(1) Pepsin (2) Mucin
(3) Dil HCl (4) All of these

Q.64 The enzymes present in saliva of rabbit acts mainly upon-
(1) Proteins (2) Fats
(3) Carbohydrates (4) Vitamins

Q.65 Gastric glands develop from which of the parts of stomach-
(1) Submucosa (2) Mucosa
(3) Serosa
(4) Muscularis mucosae

Q.66 If stomach doesnot produce HCl then which enzyme will work for longer period than its usual time-
(1) Pepsin (2) Ptyalin
(3) Rennin (4) Trypsin

Q.67 The concentration of HCl in gastric juice is nearly-
(1) 2% (2) 4%
(3) 0.4% (4) 0.04%

Q.68 Zymogen cells (chief cells) of gastric glands secrete-
(1) Mucin (2) HCl
(3) Pepsinogen (4) All of the above

Q.69 Regurgitation of food from stomach is normally prevented by-
(1) Pyloric sphincter (2) Cardiac sphincter
(3) Muscularies mucosae
(4) Circular muscles

Q.70 The roof of buccal cavity contains-
(1) Throat (2) Glottis
(3) Epiglottis (4) Palate

Q.71 Marasmus differs from kwashiorkor in-
(1) Absence of oedema
(2) Match stick legs
(3) Protruded belly
(4) Anaemia

Q.72 Osteomalacia is deficiency disease of-
(1) Infants due to protein energy malnutrition
(2) Adults due to protein energy malnutrition
(3) Infants due to vitamin D/calcium deficiency
(4) Adults due to vitamin D/calcium/phosphorus deficiency

Q.73 Enterokinase help in the conversion of -
(1) Pepsinogen in to pepsin
(2) Caseinogen into casein
(3) Trypsinogen into trypsin
(4) Proteins into polypeptides

Q.74 Cholesterol, sodium taurocholate and sodium glycocholate are found in-
(1) Pancreatic juice (2) Bile
(3) Succus entericus (4) Gastric juice

Q.75 Gastrin-
(1) Helps in digestion of fats
(2) Helps in digestion of milk protein
(3) Influences secretion of gastric juice
(4) Repairs gastric glands

Q.76 Lacteals found in intestinal villi help in the absorption of digested-
(1) Proteins (2) Lipids
(3) Carbohydrate (4) Vitamin

Q.77 Gluconeogenesis is the process in which-
(1) Sugars are converted into glycogen
(2) Sugars are converted into fats
(3) Amino acids and fatty acids are converted into carbohydrates
(4) None of the above

Q.78 The enzymes which help in digestion are called-
(1) Desmolases (2) Oxidases
(3) Dehydrogenase (4) Hydrolases

Q.79 Duodenum produces hormones-
(1) Renin and gastrin
(2) Epinephrine and norepinephrine
(3) Enterogastrone and cholecystokinin
(4) Pituitrin

Q.80 The swallowing of food from bucco-pharyngeal cavity to stomach is called -
(1) Deglutition (2) Mastication
(3) Peristalsis (4) None of the above

Q.81 The pancreatic juice contains-
(1) Trypsin, amylase and pepsin
(2) Trypsin, erepsin and amylase
(3) Pepsin, erepsin and amylase
(4) Trypsinogen, chymotrypsinogen, amylase and steapsin

Q.82 Rennin helps in the digestion of-
(1) Proteins (2) Milk protein
(3) Lipids (4) Milk carbohydrate

Q.83 The enzyme that takes part in the digestion of carbohydrate is-
(1) Trypsin (2) Chymotrypsin
(3) Amylase (4) Pepsin

Q.84 Cystic duct is found in-
(1) Liver (2) Stomach
(3) Salivary glands (4) Gall bladder

Q.85 The toothless space found in buccal cavity of rabbit is called-
(1) Diastema (2) Mitral space
(3) Chiasma (4) Vestibule

Q.86 Rabbit is a-
(1) Omnivorous animal (2) Herbivorous animal
(3) Carnivorous animal (4) Insectivorous animal

Q.87 Ptyalin is secreted by-
(1) Pancreas (2) Stomach
(3) Salivary glands (4) Liver

Q.88 The wall of colon in rabbit is constricted into a series of chambers called-
(1) Taeniae (2) Haustra
(3) Crypts of Lieberkuhn
(4) Alveoli

Q.89 Gastric digestion takes place efficiency in-
(1) Acidic medium (2) Alkaline medium
(3) Neutral medium
(4) Highly alkaline medium

Q.90 Which one is a common passage in swallowing food and breathing-
(1) Larynx (2) Gullet
(3) Glottis (4) Pharynx

Q.91 Mammals may drink water and also get it from-
(1) Breakdown of glycogen into glucose
(2) Secretion of saliva
(3) Oxidation of glucose
(4) Conversion of oxyhaemoglobin to haemoglobin

Q.92 How many pairs of salivary glands are found in rabbit-
(1) One (2) Two
(3) Three (4) Four

Q.93 Teeth of Rabbit are of diphyodont type because they-
(1) Appear twice in life
(2) Are divisible into two parts
(3) Are present in both the jaws
(4) Are arranged in two rows

Q.94 In rabbit liver is divided into how many lobes-
(1) Two (2) Four
(3) Five (4) Six

Q.95 Which prevents the digestive enzymes from digesting the cells of the alimentary canal itself-
(1) Secretion of protease in inactive stage
(2) Regular replacement of gut wall
(3) Mucous covering the inner gut wall
(4) All of the above

Q.96 Fatty acids cannot be absorbed in the absence of-
(1) Bile acid (2) Bile pigments
(3) Bile salts (4) Glycerol

Q.97 Which of the following teeth have regular growth in rabbit-
(1) Incisors (2) Canines
(3) Molars (4) Premolar

Q.98 Functionally goblet cells are-
(1) Protective (2) Secretory
(3) Sensory (4) Absorptive

Q.99 Function of HCl in stomach is to-
(1) Give acidic medium for gastric digestion
(2) Dissolve hard parts of food
(3) Convert pepsinogen into pepsin and to inhabit bacterial growth
(4) All of the above

Q.100 Paneth's cells are found in-
(1) Crypts of Lieberkuhn
(2) Peyer's patches
(3) Organ of corti
(4) Islets of Langerhans

Q.101 Which one of the following is not the function of liver-
(1) It helps in digestion
(2) It helps to store excess glucose
(3) It manufacture urea
(4) It secrets digestive enzymes and hormones

Q.102 Bile pigments are mostly formed from degradation of-
(1) Dead liver cells (2) Dead RBC
(3) Dead WBC (4) All of these

Q.103 Polyhedral cells are found in
(1) Liver (2) Intestine
(3) Lung (4) All of these

Q.104 Succus entericus is
(1) A connection between ileum & colon
(2) Gland of Gut
(3) An intestinal juice
(4) None of these

Q.105 Auerback's plexus is present in-
(1) Oesophagus (2) Stomach
(3) Small intestine (4) Colon

Q.106 A man is said to be starving when-
(1) Stomach is not being filled by food
(2) Food is stored as reserved food
(3) Food taken does not meet the loss of energy
(4) Food taken meet loss of energy

Q.107 In which region of alimentary canal is the digested food is absorbed mostly
(1) Oesophagus (2) Stomach
(3) Ileum (4) Rectum

Q.108 Which word should be used to describe the action of bile on food
(1) Digestion
(2) Emulsification or saponification
(3) Dissolution
(4) None of these

Q.109 The large intestine of Rabbit is divided into
(1) Colon and rectum (2) Coon and taeniae
(3) Colon & haustra (4) Anus & colon

Q.110 Absorptive surface of small intestine is increased due to the presence of
(1) Crypts of Lieberkuhn
(2) Villi
(3) Brunner's glands (4) All of the above

Q.111 The small intestine is adapted for efficient absorption of digested food because it has
(1) A good nerve supply
(2) Short length
(3) Muscular wall (4) Folds and villi

Q.112 The inhibition of gastric secretion and peristalsis is brought about by
(1) Pancreozymin (2) Cholecystokinin
(3) Gastrin (4) Enterogastrone

Q.113 Among the enzymes digesting proteins some act on the peptide links in the interior of the protein molecules. They are called
(1) Exopeptidases (2) Endopeptidases
(3) Proteases (4) Peptidases

Q.114 Space between the gums and the lips is called-
(1) Ovula (2) Foramen caecum
(3) Vestibule (4) Sulcus terminalis

Q.115 The first temporary tooth to erupt is-
(1) Upper central incisor
(2) Lower central incisor
(3) Canine
(4) First molar

ANSWER KEY

EXERCISE - 2

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

Ans.	4	2	1	3	2	3	3	2	1	2	4	4	2	3	1					

Q.1 Point out the one – **[MP-PMT-90]**
(1) Rennin (2) Secretin
(3) Calcitoin (4) Oxytocin

Q.2 Which one is not an enzyme of digestive system– **[CPMT-90]**
(1) Enterokinase (2) Amylase
(3) Trypsin (4) Enterogasterone

Q.3 Mainly Secretin stimulates the production of – **[AIPMT-90, CPMT-90]**
(1) Saliva (2) Gastrin
(3) Bile (4) Pancreatic juice

Q.4 Peyer's patches produce – **[RPMT-87, CPMT-90]**
(1) Enterokinase (2) Lymphocyte
(3) Mucous (4) Trypsin

Q.5 In pancrease, pancreatic juice and hormone are secreted by – **[AIPMT-90]**
(1) Same cells (2) Different Cells
(3) Same cells at different times
(4) None of these

Q.6 Def. of Vit E brings about – **[CPMT-91]**
(1) Scurvy (2) Beri-Beri
(3) Slow clotting of blood
(4) Impotence

Q.7 Which teeth are absent in rabbit – **[CPMT-91]**
(1) Incisor (2) Canine
(3) Molar (4) Premolar

Q.8 In mammals carbohydrate are stored in the form of – **[CPMT-91]**
(1) Lactic acid in muscles
(2) Glycogen in liver and muscles
(3) Glucose in liver and muscles
(4) Glycogen in liver and spleen

Q.9 The cells in the wall of intestine are stimulated to produce secretin by – **[CPMT-91]**
(1) Cholycystochynin (2) Bile juice
(3) Acid in Chyme (4) Gastrin

Q.10 Pancreatic lipase acts upon – **[CPMT-91]**
(1) Glycogen (2) Triglycerides
(3) Disaccharides (4) Polypeptides

Q.11 Types of teeth in Rabbit – **[CPMT-91]**
(1) Thecodont (2) Acrodont
(3) Pleurodont (4) Homodont

Q.12 In whose milk percentage of lactose is highest– **[CPMT-92]**
(1) Human mother (2) Cow
(3) She buffalo (4) She goat

Q.13 Which of these will leave the stomach first in Man – **[CPMT-92]**
(1) Bear (2) Proteins
(3) Fats (4) Carbohydrates

Q.14 Amount of fat increases in the body due to excess intake of – **[CPMT-92]**
(1) Vitamins (2) Minerals
(3) Carbohydrates (4) None of these

Q.15 In frog, the surface of attachment of tongue is– **[CPMT-92]**
(1) Hyoid apparatus (2) Pterygoid
(3) Palatine (4) Sphenoid

Q.16 Bile is formed in – **[CPMT-92]**
(1) Gall bladder (2) Liver
(3) Spleen (4) Blood

Q.17 Cholecystokinin is secretion of – **[MP-PMT-92]**
(1) Duodenum that causes contraction of gall bladder
(2) Goblet cells of ileum stimulates secretion of succus entericus
(3) Liver and controls secondary sex characters
(4) Stomach that stimulates pancreas to release juice

Q.18 Enzyme trypsinogen is changed to trypsin by – **[JKCEE-92, RPMT-90]**
(1) Gastrin (2) Enterogastrone
(3) Enterokinase (4) Secretin

Q.19 Castle's intrinsic factor is connected with internal absorption of – **[AMU-92]**
(1) Pyridoxine (2) Riboflavin
(3) Thiamine (4) Cobalamine

Q.20 Aminopeptidase, a digestive enzyme produces– **[AMU-92]**
(1) Dipeptides (2) Smaller peptides
(3) Peptones (4) Amino acids

Q.21 Highest BMR occurs in – **[AMU-92]**
(1) Elephant (2) Rabbit
(3) Human (4) Whale

Q.22 Beri-Beri, Scurvy and Rickets are respectively caused by def. of – **[CPMT-93]**
(1) B_1, D & C (2) B_1, C & D
(3) D, B_1 & A (4) A, D & C

Q.23 Vit K is a required for – **[AIPMT-93]**
(1) Change of Prothrombin to thrombin
(2) Synthesis of Prothrombin
(3) Change of Fibrinogen to Fibrin
(4) Formation of thromboplastin

Q.24 Which of the following pair is characterised by swollen lips, thick pigmented skin of hands and legs and irritability - **[AIPMT -93]**
(1) Thiamine-Beri-Beri
(2) Protein-Kwashiorkor
(3) Nicotinamide-Pellagra
(4) lodine-goitre

Q.25 Maximum number of enzymes occur in – **[CPMT - 93]**
(1) Omnivores (2) Herbivores
(3) Carnivores (4) None of the above

Q.26 Excessive intake of alcohol caused – **[MP-PMT-93]**
(1) Jaundice (2) Dermatitis
(3) Liver Cirrhosis (4) Lung Fibross

Q.27 Inhibition of gastric and stimulation of gastric, Pancreatic and bile secretion are controlled by– **[AIPMT-94]**
(1) Gastrin, secretin, Enterokinin and CCK
(2) Enterogasterone, gastrin, pancreozymin and CCK
(3) Gastrin, Enterogasterone, CCK and pancreozymin
(4) Secretin, Enterogasterone, Secretin and enterokinin

Q.28 Lacteals take part - **[CPMT-94]**
(1) Digestion of Milk
(2) Absorption of fat
(3) Digestion of lactic acid
(4) None of the above

Q.29 Muscular contraction of Alimentary canal are – **[MP-PMT-94]**
(1) Circulation (2) Deglutition
(3) Churning (4) Peristalsis

Q.30 Vit-D is produced in human body by – **[J.K.M. CEE-94]**
(1) Muscles (2) Nerves
(3) Skin (4) None of these

Q.31 Fatty acids and glycerol are first absorbed by – **[AFMC-94]**
(1) Lymph Vessels (2) Blood
(3) Blood Capilaries
(4) Hepatic portal Vein

Q.32 During rest, metabolic requirements are minimum. This is indicated by - **[AFMC-94]**
(1) Pulse
(2) Breathing
(3) O_2 take and CO_2 output
(4) All the above

Q.33 During Prolonged fasting - **[AFMC-94]**
(1) First fats are used up, followed by carbohydrate from liver and muscles, and protein in the end
(2) First carbohydrate are used up, followed by fat and proteins towards end
(3) First lipids, followed by proteins and carbohydrates towards end.
(4) None of the above

Q.34 Which of the following is absorbed in ileum – **[BHU-95]**
(1) Fat (2) Bile salts
(3) Vit-K (4) Carbohydrate

Q.35 A dental disease characterised by mottling of teeth due to ingredient in drinking water, namely - **[AIPMT-95]**
(1) Fluorine (2) Chlorine
(3) Boron (4) Mercury

Q.36 In rabbit the Hard palate is formed of - **[CPMT-90]**

(1) From Premaxilla, Vomer and dentary bones
(2) Premaxilla, maxilla and Palatine Bones
(3) Sphenoid, nasal and dentary bones
(4) From nasal, maxillae and ethanoid bone

Q.37 Posterior part of soft palate, hangs down in pharynx, called - **[RPMT-88]**

(1) Palatine (2) Tonsils
(3) Velum Palati (4) Jacobson's organ

Q.38 Nasal chambers and buccal cavity are separated by - **[RPMT-86]**

(1) By uvula (2) By palate
(3) By Palatine (4) None of these

Q.39 Cheek teeth are - **[RPMT-86]**

(1) Incisors and Canines
(2) Canines and Premolars
(3) Premolars and Molar
(4) Canines and Molars

Q.40 Presence of water amount in enamel cell is- **[RPMT-90]**

(1) 90 – 92 % (2) 75 – 80 %
(3) 40 – 50 % (4) ≈ 3%

Q.41 Jacobson's organs are related with – **[RPMT-90]**

(1) With touch (2) With pressure
(3) With smell (4) With hearing

Q.42 In which animal tongue control the temperature – **[RPMT-90]**

(1) Rabbit (2) Dog
(3) Man (4) Cow

Q.43 How many lobes of liver are present in rabbit – **[RPMT-84]**

(1) 2 (2) 4
(3) 5 (4) 6

Q.44 In which part of stomach mainly digestion occurs - **[RPMT-84]**

(1) Cardiac Region (2) Fundic Region
(3) Pyloric Region (4) All above

Q.45 Largest gland of body – **[RPMT-90]**

(1) Pancreas (2) Duodenum
(3) Liver (4) Thyroid

Q.46 Which food substance is absorbed during digestion - **[RPMT-91]**

(1) Carbohydrates (2) Proteins
(3) Vitamins (4) Fats

Q.47 Insulin in secreted by pancreatic cells – **[RPMT-89]**

(1) α-cells (2) β-cells
(3) Delta cells (4) Gama Cells

Q.48 Which substance of saliva destroy the harmful bacteria - **[RPMT-91]**

(1) Cerumin (2) Chyme
(3) Lysozyme (4) Secretin

Q.49 Hormone which control the secretion of intestinal juice is - **[RPMT-88]**

(1) Enterogasterone (2) Enterocrinin
(3) Duo-crinin (4) Both (2) and (3)

Q.50 Parietal cells of mucosa in stomach is secretes:- **[RPMT-89]**

(1) Mucin (2) Pepsin
(3) HCl (4) All of these

Q.51 Contraction in gall bladder stimulated by : - **[AIPMT-98]**

(1) CCK (2) PZ
(3) Secretin (4) Enterogasterone

Q.52 Enamel of teeth is secreted by : - **[AIPMT-98]**

(1) Ameloblast (2) Odontoblast
(3) Osteoblast (4) Osteoclast

Q.53 Deficiency of protein leads to : - **[AIPMT-98]**

(1) Rickets (2) Scurvy
(3) Kwashiorker (4) Carotenemia

Q.54 Lactose composed of : - **[AIPMT-98]**

(1) Glucose + galactose
(2) Glucose + fructose
(3) Glucose + glucose (4) Glucose + mannose

Q.55 Vitamin which induces maturation of R.B.C. : **[AIPMT-98]**

(1) B_1 (2) A
(3) B_{12} (4) D

Q.56 Lower jaw composed of in Rabbit : - **[AIPMT-98]**

(1) Dentry (2) Maxilla
(3) Premaxilla (4) Palatine

Q.57 Which of the following stimulates the secretion of gastric juice : - **[AIPMT-98]**

(1) Gastrin (2) Enterogasterone

(3) Secretin (4) Hepatocrinin

Q.58 CCK and secretin secreted by : - **[AIPMT-99]**

(1) Stomach (2) Ileum

(3) Duodenum (4) Colon

Q.59 Suspensory ligaments are found in : - **[AIPMT-99]**

(1) Brain (2) Eyes

(3) Liver (4) Pancreas

Q.60 In stomach after physical and chemical digestion food is called : - **[AIPMT-99]**

(1) Chyme (2) Chyle

(3) Amino acid (4) Bolus

Q.61 A normal human being requires how much calories per day : - **[AIPMT-99]**

(1) 2500 k. cal (2) 4000 k. cal

(3) 5000 k.cal (4) 686 k cal

Q.62 Fully digested food reaches to liver by : - **[AIPMT-99]**

(1) Hepatic portal vein (2) Hepatic artery

(3) Hepatic vein (4) All the above

Q.63 Pantothenic acid & Biotin associated with : **[AIPMT-99]**

(1) Vitamin D (2)Vitamin B complex

(3) Vitamin K (4) Vitamin E

Q.64 Which one is wrong pair : - **[AIPMT-99]**

(1) Scurvy – Vitamin C

(2) Rickets – Vitamin D

(3) Night blindness (Xerophthalmia) – Vit. A

(4) Beriberi – Vitamin K

Q.65 Dental formula of adolescent human being before seventeen year : - **[AIPMT-99]**

(1) $\frac{2122}{2122}$ (2) $\frac{2123}{2123}$

(3) $\frac{2102}{2102}$ (4) $\frac{2023}{1023}$

Q.66 In mammals milk is digested by action of : **[AIPMT-2000]**

(1) Rennin (2) Amylase

(3) Intestinal bacteria (4) Invertase

Q.67 Which food should be eaten in deficiency of Rhodopsin in eyes - **[AIPMT-2000]**

(1) Carrot & ripe papaya

(2) Guava, banana

(3) Mango & Potato (4) None

Q.68 Which one correctly matched : **[AIPMT-2001]**

(1) Vit. E – Tocopherole

(2) Vit. D – Riboflavin

(3) Vit. B – Calciferole

(4) Vit. A – Thiamine

Q.69 Most abundant organic compound on earth is – **[AIPMT-2001]**

(1) Protein (2) Cellulose

(3) Lipids (4) Steroids

Q.70 Continuous bleeding from an injured part of body is due to deficiency of : **[AIPMT-2002]**

(1) Vitamin–A (2) Vitamin–B

(3) Vitamin–K (4) Vitamin–E

Q.71 Stool of a person contain whitish grey colour due to malfunction of which type of organ : - **[AIPMT-2002]**

(1) Pancreas (2) Spleen

(3) Kidney (4) Liver

Q.72 Fluoride pollution mainly affects : - **[AIPMT-2003]**

(1) Brain (2) Heart

(3) Teeth (4) Kidney

Q.73 Which one of the following pairs is not correctly matched : - **[AIPMT-2003]**

(1) Vitamin C — Scurvy

(2) Vitamin B_2 — Pellagra

(3) Vitamin B_{12} — Pernicious anaemia

(4) Vitamin B_6 — Beri–beri

Q.74 Which one of the following mineral elements plays an important role in biological nitrogen fixation : - **[AIPMT-2003]**

(1) Copper (2) Manganese

(3) Zinc (4) Molybdenum

Q.75 Which hormones induce secretion of succus entericus : - **[RPMT-2000]**

(1) Insulin

(2) Secretin and cholycystokinin

(3) Glucagon (4) Secretin

Q.76 In both chordates and non-chordates intestine develops from : - **[RPMT-2000]**

(1) Pharyngeal pouch (2) Ectoderm

(3) Endoderm (4) Mesoderm

Q.77 Which pollutant accumulates in liver and kidney : - **[RPMT-2000]**

(1) Cu (2) Hg

(3) Pb (4) Cd

Q.78 A Rabbit eats a lot of gram. Then its digestion starts in : - **[RPMT-2001]**

(1) Mouth (2) Stomach

(3) Duodenum (4) Ileum

Q.79 If the dental formula of Rabbit is $\frac{2033}{1023}$. What does it show : - **[RPMT-2001]**

(1) Total no. of teeth in Rabbit is 15

(2) No. of total incisors in Rabbit is 3

(3) Diastema is present between incisors & premolars

(4) In the formula 2033 is for adult and 1023is for young ones

Q.80 Which of the following is a disaccharide : - **[RPMT-2002]**

(1) Glucose (2) Fructose

(3) Sucrose (4) Galactose

Q.81 Which is correct about the bile of rabbit : - **[RPMT-2002]**

(1) It is synthesised by gall bladder & also stored there

(2) It is an enzyme which emulsify the fats

(3) It contain bile salts & bile pigments

(4) Bilirubin present in it decomposes fats

Q.82 If all the peptide bonds of protein are broken, then remaining part is : - **[RPMT-2002]**

(1) Amide (2) Oligosaccharide

(3) Polypeptide (4) Amino acid

Q.83 Hydrolysis of lipid yields : - **[RPMT-2002]**

(1) Fats

(2) Fatty acids and glycerol

(3) Mannose and glycerol

(4) Maltose and fatty acid

Q.84 Which of the following vessel in rabbit starts with capillaries and ends in capillaries: - **[RPMT-2002]**

(1) Pulmonary artery (2) Renal vein

(3) Hepatic portal vein (4) Renal artery

Q.85 Function of vitamin B_1 is : **[RPMT-2003]**

(1) Formation of R.B.C

(2) Absorption & metabolism of Ca

(3) In the form of Prosthetic group of ATP

(4) In Pyruvate dehydrogenase system

Q.86 Which cells of mucous layer of stomach secrete pepsinogen **[RPMT-2003]**

(1) Chief cell (2) Goblet cell

(3) Parietal cell (4) Oxyntic cell

Q.87 Glucose and galactose unite to form **[RPMT-2003]**

(1) Maltose (2) Sucrose

(3) Isomaltose (4) Lactose

Q.88 Dental formula in adult man is : - **[RPMT-2003]**

(1) $\frac{2123}{2123}$ (2) $\frac{2123}{2124}$

(3) $\frac{2122}{2122}$ (4) $\frac{2132}{2132}$

Q.89 Numbers of pairs of salivary glands present in Rabbit : - **[RPMT-2004]**

(1) One (2) Three

(3) Four (4) Five

Q.90 Vitamin–C is : - **[RPMT-2004]**

(1) Ascorbic acid (2) Citric acid

(3) Phosphoric acid (4) Glutamic acid

Q.91 Injury to vagus nerve in humans is **not** likely to affect - **[AIPMT-2004]**

(1) Gastrointestinal movement

(2) Pancreatic secretion

(3) Cardiac movements

(4) Tongue movements

Q.92 Which one of the following is the correct matching of a vitamin, its nature and its deficiency disease : **[AIPMT-2004]**

(1) Vitamin K-Fat-soluble-Beri-Beri

(2) Vitamin A-Fat-soluble-Beri-Beri

(3) Vitamin K-Water-soluble-Pellagra

(4) Vitamin A-Fat-soluble-Night blindness

Q.93 In man there are about 35,000,000 gastric pits at about : **[CPMT 1992]**

(1) 200/mm^2 (2) 300/mm^2

(3) 1000/mm^2 (4) 100/mm^2

Q.94 Brunner's gland are found in which of the following layers : **[MP PMT 2003]**

(1) Submucosa of stomach

(2) Mucosa of ileum

(3) Submucosa of duodenum

(4) Mucosa of oesophagus

Q.95 The chief function of bile is to : **[BHU 2003]**

(1) Digest fat by enzymatic action

(2) Emulsify fats for digestion

(3) Eliminate waste products

(4) Regulate digestion of proteins

Q.96 The toxic substance are detoxicated in the human body by : **[AIIMS 2001]**

(1) Lungs (2) Kidney

(3) Liver (4) Stomach

Q.97 Crypts to Leiberkuhn are found in between the villi. They secrete : **[MP PMT 2003]**

(1) Glucagon (2) Succus entericus

(3) Insulin (4) None

Q.98 Function of HCl in stomach is to : **[CPMT 1995]**

(1) Kill micro-organisms of food

(2) Facilitate absorption of food

(3) Dissolve enzymes

(4) Activate pepsinogen to pepsin

Q.99 Parotid salivary gland are present : **[MP PMT 1993]**

(1) Below the tongue

(2) Below the external auditory canal

(3) Below the eye orbit

(4) In the angle between two jaws

Q.100 The end product of carbohydrate metabolism is: **[AIIMS 1993]**

(1) CO_2 and H_2O (2) NH_3 and CO_2

(3) NH_3 and H_2O (4) CO_2

Q.101 In rabbit, the digestion of cellulose takes place in : **[MP PMT 2000]**

(1) Colon (2) Ileum

(3) Caecum (4) Rectum

Q.102 The muscular contraction in the alimentary canal is known as : **[RPMT 1999]**

(1) Systole (2) Diastole

(3) Peristalsis (4) Metachronal

Q.103 How many teeth in man grows twice in life: **[AFMC 2002]**

(1) 32 (2) 28

(3) 20 (4) 12

Q.104 End products of protein hydrolysis are : **[NCERT 1964, RPMT 2002]**

(1) Mixture of amino acids

(2) Sugars

(3) Peptides

(4) 25 amino acid

Q.105 Ptyalin is an enzyme of **[CPMT 2003]**

(1) Salivary juice (2) Pancreatic juice

(3) Intestinal juice (4) None of these

Q.106 The hormone 'Secretin' stimulates secretion of **[BHU 2000]**

(1) Pancreatic juice (2) Bile juice

(3) Salivary juice (4) Gastric juice

Q.107 Kupffer cells are found in : **[MP PMT 2002]**

(1) Liver (2) Kidney

(3) Heart (4) Blood

Q.108 Which of the following is not true in digestive system of Rabbit ? **[AIIMS 2003]**

(a) Rectum is beaded

(b) Canine teeth are absent

(c) Five of salivary glands are found

(1) Only a (2) Only c

(3) a and b (4) b and c

Q.109 Brunner's glands are present in : **[MP PMT 2001; AFMC 03]**

(1) Ileum (2) Duodenum

(3) Stomach (4) Oesophagus

Q.110 Which one of the following is fat-soluble vitamin and its related deficiency disease ? **[AIPMT-2007]**

(1) Ascorbic acid – Scurvy

(2) Retinol – Xerophthalmia

(3) Cobalamine – Beri – beri

(4) Calciferol – Pellagra

Q.111 Chymotrypsinogen is produced by **[Uttarachal 2004]**

(1) Liver (2) Pancreas

(3) Stomach (4) Duodenum

Q.112 Scurvy is caused due to deficiency of vitamin : **[Uttarachal 2005]**

(1) 'B' complex (2) C

(3) K (4) D

Q.113 Contraction of gall bladder is carried by : **[Uttarachal 2004]**

(1) citric acid + acetyl Co-A

(2) gastrin

(3) cholecystokinin

(4) none of these

Q.114 In human teeth, which help in cutting **[Bihar 2004]**

(1) Canine (2) Incisor

(3) Molar (4) Premolar

Q.115 HCl is secreted by which of the following cell of stomach **[Bihar 2004]**

(1) Chief cells

(2) Parietal cell (Oxyntic cells)

(3) Peptic cells

(4) Goblet cells

Q.116 Fatty liver syndrome is due to excessive intake of **[Bihar 2003]**

(1) Morphine (2) Alcohol

(3) Tobacco (4) both 1 and 2

Q.117 Carnesial teeth are modified for : **[Bihar 2006]**

(1) Crushing (2) Tearing

(3) Grinding (4) Cutting

Q.118 Glisson's capsules are present in **[UP CPMT 2003]**

(1) LIver (2) Lung

(3) Kidney (4) Stomach

Q.119 Osteomalacia occurs due to the deficiency of **[UP CPMT 2001]**

(1) Vitamin A (2) Vitamin B

(3) Vitamin C (4) Vitamin D

Q.120 Pulp cavity of teeth is lined by **[UP CPMT 2002]**

(1) Odontoblast (2) Chondroblast

(3) Osteoblast (4) Amyloblast

Q.121 Secretion of gastric juice is controlled by **[UP CPMT 2002]**

(1) Gastrin (2)Chlolecystokinin

(3) Enterogastrin (4) None of these

Q.122 Enzyme present in saliva is **[UP CPMT 2003]**

(1) Maltase (2) Ptyalin

(3) Sucrase (4) Invertase

Q.123 Which of the following metal is present in vitamin B_{12} **[UP CPMT 2003]**

(1) Cobalt (2) Copper

(3) Zinc (4) Magnesium

Q.124 Kupffer cells are present in **[UP CPMT 2003]**

(1) Liver (2) Pancreas

(3) Small intestine (4) Large intestine

Q.125 Teeth of rabbits are **[UP CPM 2004]**

(1) Thecodont (2) Diphyodont

(3) Heterodont (4) All of these

Q.126 Crypts of lieberkuhn are present in : **[UP CPMT 2006]**

(1) Intestine (2) Stomach

(3) Oesophagus (4) All of these

Q.127 Succus entericus is also called : **[UP CPMT 2006]**

(1) Gastric juice (2) Intestine juice

(3) Bile juice (4) Saliva

Q.128 Dental formula of rabbit is : **[UP CPMT 2007]**

(1) $\frac{2}{1}\frac{0}{0}\frac{3}{2}\frac{3}{3}$ (2) $\frac{2}{1}\frac{1}{0}\frac{3}{2}\frac{3}{3}$

(3) $\frac{2}{1}\frac{0}{0}\frac{2}{2}\frac{3}{3}$ (4) $\frac{1}{1}\frac{3}{2}\frac{0}{0}\frac{3}{3}$

Q.129 Deamination occurs in **[UP CPMT 2007]**

(1) Kidney (2) Liver

(3) Nephron (4) Both 1 and 2

Q.130 Digestion of protein is completed in **[UP CPMT 2007]**

(1) Stomach (2) Duodenum

(3) Ileum

(4) Duodenum and ileum

Q.131 Enterogasterone is **[UP CPMT 2007]**

(1) Hormone secreted by mucosa

(2) Enzyme secreted by mucosa

(3) Hormone secreted by duodenal mucosa

(4) Secreted by endocrine gland related to digestion

Q.132 Part of bile juice useful in digestion is **[UP CPMT 2007]**

(1) Bile salt (2) Bile pigment
(3) Bile matrix (4) All of them

Q.133 bile secretion is proportional to the concentration of **[MP PMT 2007]**

(1) Protein (2) Fat
(3) Carbohydrate (4) None of these

Q.134 Secretion of pancreatic juice is stimulated by **[MP PMT 2007]**

(1) Gastrin (2) Secretion
(3) Enterogastrone (4) Enterokinase

Q.135 Just as hydrochloric acid is for pepsinogen, so is the : **[MP PMT 2004]**

(1) haemoglobin oxygen
(2) enterokinase to typsinogen
(3) bile juice to fat
(4) glucagons to glycogen

Q.136 What is the function of globlet cells **[MP PMT 2004]**

(1) Production of enzyme
(2) Production of mucin
(3) Production of hormone
(4) Production of HCl

Q.137 Where the lysozymes are found **[MP PMT 2004]**

(1) In saliva and tears both
(2) In tears
(3) In saliva (4) In mitochondria

Q.138 The hormone which lowers the secretion of hydro chloric acid and gastric juice is **[MP PMT 2005]**

(1) Secretin (2) Enterogastrone
(3) Enterokinin (4) Gastrin

Q.139 Which of the following is different from other : **[MP PMT 2005]**

(1) Gastrin (2) Ptyalin
(3) Glucagon (4) Secretin

Q.140 Trypsin differs from pepsin because it digests : **[MP PMT 2005]**

(1) Carbohydrate in alkaline medium in stomach
(2) Protein, in alkaline medium in stomach
(3) Protein, in acidic medium of stomach
(4) Protin, in alkaline medium in duodenum

Q.141 Pancreatic juice is : **[MP PMT 2005]**

(1) Alkaline in nature
(2) Acidic in nature
(3) Enzymatic in nature
(4) Both acidic and alkaline in nature

Q.142 Scurvy disease is due to the **[MP PMT 2005]**

(1) Presnce of h-factor in blood
(2) Deficiency of vitamin E
(3) Virus
(4) Deficiency of vitamin C

Q.143 The chemical name of vitamin D is **[MP PMT 2005]**

(1) Riboflavin (2) Ascorbic acid
(3) Niacin (4) Calciferol

Q.144 From which of the following pepsin is secreted **[MP PMT 2007]**

(1) Lungs (2) Stomach
(3) Salivary gland (4) Sebaceous gland

Q.145 Crypts of Lieberkuhn involved in : **[MP PMT 2006]**

(1) Secretion of succus entericus
(2) Secretion of rennin
(3) Secretion of ptyalin
(4) digestion of food

Q.146 Which of the following vitamin synthesized in animal body by bacteria **[MP PMT 2006]**

(1) B_1 (2) A
(3) E (4) B_{12}

Q.147 Vitamin-C is mainly helpful in :**[MP PMT 2006]**

(1) Growth of bones
(2) Formation of connective tissue
(3) Treatment of anaemia
(4) Formation of visual pigment

Q.148 A person addict for alcohol gets his liver destroyed because : **[MP PMT 2006]**

(1) Liver stores excess of protein
(2) Liver stores excess of fat
(3) Liver stores excess of starch
(4) Liver stores excess of glycogen

Q.149 Bilirubin and Biliverdin are present in : **[MP PMT 2001]**

(1) Pancreatic Juice (2) Saliva
(3) Bile juice (4) Intestinal juice

Q.150 Dental formula of man is : **[MP PMT 2001]**

(1) $\frac{2}{2}\frac{1}{1}\frac{2}{2}\frac{3}{3}$ (2) $\frac{1}{1}\frac{2}{2}\frac{2}{2}\frac{3}{3}$

(3) $\frac{2}{2}\frac{1}{1}\frac{3}{3}\frac{2}{2}$ (4) $\frac{2}{2}\frac{2}{2}\frac{1}{1}\frac{3}{3}$

Q.151 Which of the following vitamins is essential for D.N.A. synthesis and cells division : **[MP PMT 2001]**

(1) Vitamin E (2) Vitamin D

(3) Folic Acid (4) Vitamin K

Q.152 Marasmus disease is caused due to **[MP PMT 2001]**

(1) Protein deficiency (2) Obesity

(3) Dwarfism

(4) Deficiency of vitamins

Q.153 Brunner's gland are found in : **[MP PMT 2001]**

(1) Submucosa of stomach

(2) Submucosa of duodenum

(3) Mucosa of oesophagus

(4) Mucosa of ileum

Q.154 Specific cells found in liver are : **[MP PMT 2001]**

(1) hepatic cells (2) beta cells

(3) Kupffer's cells (4) Islets of Langerhans

Q.155 Which of the following does not belong to vitamin B group : **[MP PMT 2002]**

(1) Riboflavin (2) Nicotin

(3) Cyanocobalamine (4) Tocopherol

Q.156 Deficiency of which vitamin causes night blindness : **[MP PMT 2002]**

(1) Vitamin C (2) Vitamin B

(3) Vitamin A (4) Vitamin D

Q.157 Certain B vitamins are : **[MP PMT 2002]**

(1) Enzymes (2) Co-enzymes

(3) Hormone (4) Digestive substance

Q.158 Deficiency of thiamine causes : **[MP PMT 2002]**

(1) Beri-beri (2) Rickets

(3) Caries (4) Pellagera

Q.159 Anti-sterility vitamin is : **[MP PMT 2002]**

(1) Vitamin B_{12} (2) Vitamin D

(3) Vitamin E (4) Vitamin A

Q.160 Vitamin C is helpful in the : **[MP PMT 2002]**

(1) Formation of visual pigment

(2) Growth of bones

(3) Treatment of pernicious anaemia

(4) Wound healing

Q.161 Secretin hormone stimulates : **[MP PMT 2007]**

(1) Gastric glands (2) Pancreas

(3) Gall bladder

(4) Crypts of Lieberkuhn

Q.162 The longitudinal muscular folds of inner wall of stomach are called : **[MP PMT 2007]**

(1) Papilla of vater (2) Rugae

(3) Villi (4) Fissure

Q.163 Cells of liver which act as phagocytes are : **[MP PMT 2002]**

(1) Dieter's cells (2) Kupffer's cells

(3) Hensen cells (4) Aciner cells

Q.164 The crypts of lieberkuhn secret : **[MP PMT 2003]**

(1) gastrin (2) rennin

(3) cholecystokinin (4) succus entricus

Q.165 The amount of gastric juice secreted per day from man's stomach is about : **[MP PMT 2003]**

(1) 500 ml. to 1000 ml.

(2) 2000 ml to 3000 ml

(3) 100 ml to 500 ml (4) 10 ml to 15 ml

Q.166 In adults the deficiency of vitamin D causes: **[MP PMT 2003]**

(1) Rickets (2) Beri-beri

(3) Scurvy (4) Osteomalacia

Q.167 The function of enterogasterone hormone is: **[MP PMT 2003]**

(1) to control excretion

(2) to inhibit gastric juice secretion

(3) regulate the absorption of food

(4) to stimulate gastric glands to release gastric juice

Q.168 Brunner's glands are located in : **[MP PMT 2003]**

(1) Oesophagus (2) Duodenum

(3) Intestine (4) Stomach

Q.169 Which of the following inhibits secretion of gastric juice : **[MP PMT 2003]**

(1) Enterogasterone (2) Gastrin

(3) CCK (4) PZ

Q.170 Pepsinogen is secreted from : **[MP PMT 2002]**
(1) argentaffin cells (2) goblets cells
(3) chief cells (4) parietal cells

Q.171 Cells of the pancreas is not digested by their own enzymes because : **[MP PMT 2003]**
(1) enzymes are secreted in inactive form
(2) cells are lined by mucous membrane
(3) enzymes are released only when needed
(4) none of the above

Q.172 Continuous bleeding from an injured part of body is due to deficiency of : **[MP PMT 2003]**
(1) Vitamin A (2) Vitamin B
(3) Vitamin K (4) Vitamin E

Q.173 Carrier ions like Na^+ facilitate the absorption of substances like – **[CPMT-2010]**
(1) amino acids and glucose
(2) glucose and fatty acids
(3) fatty acids and glycerol
(4) fructose and some amino acids

Q.174 If for some reason our goblet cells are non-functional, this will adversely affect – **[CPMT-2010]**
(1) production of somatostatin
(2) secretion of sebum from the sebaceous glands
(3) maturation of sperms
(4) smooth movement of food down the intestine

Q.175 Consumption of which one of the following foods can prevent the kind of blindness associated with vitamin 'A' deficiency ? **[AIPMT Pre 2012]**
(1) Canolla
(2) Golden rice
(3) Bt-Brinjal
(4) 'Flaver Savr' tomato

Q.176 Cirrhosis of liver is caused by the chronic intake of : **[AIPMT Pre 2012]**
(1) Alcohol (2) Tobacco(Chewing)
(3) Cocaine (4) Opium

Q.177 Anxiety and eating spicy food together in an othewise normal human, may lead to : **[AIPMT Pre 2012]**
(1) Jaundice (2) Diarrhoea
(3) Vomiting (4) Indigestion

Q.178 Where do certains symbiotic microorganisms normally occur in human body ? **[AIPMT Mains 2012]**
(1) Caecum
(2) Oral lining and tongue surface
(3) Vermiform appendix and rectum
(4) Duodenum

These questions consist of two statements each, printed as "ASSERTION" and "REASON". While answering these Questions you are required to choose any one of the following responses.

(1) If both Assertion and Reason are True and the Reason is a correct explanation of the Assertion.
(2) If both Assertion and Reason are True but Reason is not correct explanation of the Assertion
(3) If Assertion is True but the Reason is False.
(4) If both Assertion and Reason are false.

Q.1 **A :** Maximum absorption of food occur in jejunum
R : Villi & microvilli abundantly present in small intestine

Q.2 **A :** Intrinsic plexus of alimentary canal regulate the peristalsis movement of alimentary canal
R : Muscles of alimentary canal are multiunit type

Q.3 **A :** The second largest digestive gland in our body is pancreas
R : Pancreas function both as an exocrine & endocrine gland

Q.4 **A :** Bile juice is stored mainly in the gall bladder
R : Gall bladder is necessary for digestion

Q.5 **A :** Small intestine is very l9ong and has plica circulares & villi
R : All these increase internal surface area of small intestine for efficient food absorption.

Q.6 **A :** The alcohol in alcohol addict person is converted into protein in the liver
R : Liver cells can produce protein from alcohol by fermentation

Q.7 **A :** Vitamins are not essential for healthy life.
R : Vitamin does not regulate metabolism

Q.8 **A :** G - cells of gastric gland secrete intrinsic castle's factor.
R : This factor help in vita. B_2 absorption.

Q.9 **A :** The second largest digestive gland in our body is liver.
R : Liver functions as in endocrine gland.

Q.10 **A :** Tonsils are also located in the digestive tract.
R : Tonsils produce digestive enzymes.

Q.11 **A :** Removal of gall bladder does affect the protein digestive.
R : Bile juice break the peptide bond.

Q.12 **A :** Gastric glands occur throughout the alimentary canal
R : Gastric juice inhibits movement food through the alimentary canal

Q.13 **A :** Faeces are brown coloured
R : Faeces contain brown pigment named urobilin formed by reduction of bile pigment

Q.14 **A :** Small intestine is very short and has longitudinal fold
R : All these decrease the internal surface area of small intestine for food absorption

Q.15 **A :** Tonsils are located near the of the alimentary and respiratory tract
R : Tonsils produces digestive enzymes

Q.16 **A :** Mucous glands occur throughout the alimentary canal
R : Mucous substances facilitate movement of food through the alimentary canal

Q.17 **A :** Vitamins are essential for healthy life.
R : Vitamins regulate metabolism.

Q.18 **A :** In human, maximum digestion occurs in duodenum.
R : Amupla of vater opens in duodenum.

Q.19 **A :** Chief cells of gastric gland secrete intrinsic castle's factor.
R : This factor help in vita. B_2 absorption.

Q.20 **A :** Emulsification is necessary for the digestion of fat.

R : After fats are emulsified, the action of enzyme amylase gets significantly increase.

Q.21 **A :** Abomassum of alimentary canal of reminant animals harbour numerous bacteria & protozoa.

R : Bacteria & protozoa help in the secretion of gastric juice in abomassum.

Q.22 **A :** Vitamin 'C' occurs only in animal tissue.

R : The vegetarian patients are suggested to take carrot & green vegetables when they suffer from Vita. 'C' deficiency.

Q.23 **A :** Pancreatic amylase digest protein to amino acids.

R : Pancreatic amylase the peptide bond of protein.

Q.24 **A :** Digestion is necessary for the absorption of all macro elements.

R : Digestion makes large complex molecule to simple smaller molecule which can be easily absorbed.

Q.25 **A :** Rumen is regarged as the true stomach in ruminant animal.

R : Fermentation of protein takes place in Rumen.

Q.26 **A :** Carbohydrates are more suitable for the production of energy in the body than protein and fats.

R : Carbohydrate can be stored in epithelial tissue as glycogen for use in the production of energy, whenever necessary.

Q.27 **A :** Gastrectomy causes iron deficiency anaemia

R : Hydrochloric acid secreted by oxyntic cells converts ferric into ferrous and iron is absorbed as ferrous ions.

Q.28 **A :** Cholagogues are substance that cause contraction of gall bladder.

R : These substance cause release of CCK-PZ from duodenum.

Q.29 **A :** Aptyalism patients have higher than normal incidences of dental caries.

R : Aptyalism is caused by the action of Parasympathetic nervous system.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	**Good / Important questions**
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

Contents

Module - 9
Animal Physiology–II

Chapter Name	Page No.

Exercise – 4	211 – 212
Quick Review Table	213

EXCRETORY SYSTEM

DEFINITION

(i) Elimination of metabolic waste from body is called **excretion**.

(ii) Due to metabolic activity in the body numerous waste substances are produced.

Carbohydrate metabolism, Produces CO_2 and H_2O. Protein metabolism produces nitrogenous wastes– **ammonia, urea** and **uric acid**.

HOMEOSTASIS

Maintenance of steady state (Walter Cannon).

Homeostatic mechanism are important for normal life as they maintain condition within a range in which the animals metabolic processes can occur. The process which is concerned with removal of nitrogenous waste materials (e.g.. urea, uric acid, CO_2 , Ammonia, salts, excess water etc.) is termed excretion.

OSMOCONFORMERS & OSMOREGULATORS

Osmoregulation : The regulation of solute movement and hence water movement (which follows solutes by osmosis)

On the basis of osmoregulation, animals are either osmoconformer or ormoregulators.

Osmoconformers : These animals can not actively control the osmotic condition of their body fluids. Instead of this, they change or adapt the osmolarity of body fluids according to the osmolarity of the surrounding medium.

Example :

- All marine invertbrates and some fresh water invertebrates.
- Hagfish (myxine) which is marine cyclostome fish, is the only vertebrate osmoconformer.

Osmoconformes show an excellent ability to tolerate a wide range of cellular osmotic environments.

Osmoregulators :

These animals maintain an internal osmolarity different from the surrounding medium in which they inhabit. Osmoregulator animals must either eliminate excess water if they are in hypotonic medium or they should continously take in water to compensate for water loss if they are in hypertonic medium. Due to this the osmoregulator animals have to spend energy

Strict osmoregulators : Are animals which maintain the composition of body fluids within a narrow osmotic range.

Eg. most vertebrates (except Hag fish and elasmobranch like shark & rays fish)

Water and solute regulation in freshwater environment :

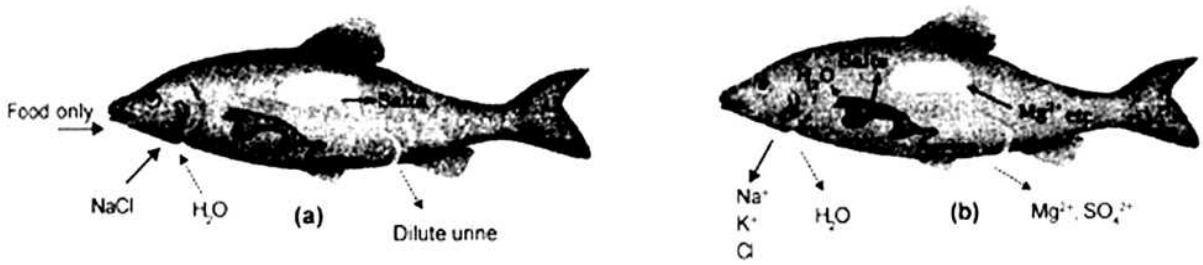
Body fluids of fresh water animals (osmolarity 200-300 m osm L^{-1}) are hypertonic to surrounding medium (osmolarity 50 m osm L^{-1}). Due to this, the freshwater animals constantly face two problems:

(i) They gain water passively due to osmotic gradient

(ii) Continuous loss of body salts to surrounding low salt containing medium occurs.

To encounter these problems the fresh water fishes perform following acts :

- They do not drink water
- Specialised cells called ionocytes or chloride cells are present in the gill membrane of fresh water fish. These cells can actively import Na^+ & Cl^- from surrounding water (containing less than 1mM NaCl against concentration gradient.



Water and solute balance in

(a) freshwater (b) marine bony fish

Water and solute regulation in Marine environmemt :

Body fluids of marine bony fishes is hypotonic to seawater (osmolarity 1000 m osm L^{-1}). So the osmoregulatory problems are opposite here :

(i) Marine fishes loose water from the body through permeable surfaces (like gill membranes, oral and anal membranes.)

(ii) To compensate this water loss the marine fishes have to drink water, this drinking results in gain of excess salts.

These problems are encountered by marine bony fishes by following acts :

(i) The ionocytes or chloride cells of the gill membrae eject out excess of monovalent ions.

(ii) Excess of Divalent cations are excreted with faeces.

- When fishes like Hilsa & Salman (which live in both sea & fresh water) migrate from fresh water to sea water they drink water and excrete excess salts through gill membranes.
- Body fluids of marine invertebrates, ascidians and hag fishes are isosmotic to sea water.
- Elasmobranch fishes (shark & rays) and coelacanths (lobe fin fish) reduce the osmoregulatory challenges by raising the osmolarity of body fluids. This is done by accumulation of osmolytes like urea & trimethylanmine oxide (TMAO). This makes the body fluids of shark and coelacanths slightly hyperosmotic to sea water.
- Osmolarity of human blood is about 300 mosm L^{-1}.

Water and solute regulation in terrestrial environment :

Land animals continuosly loose water through oral, nasal or respiratory surface during breathing. A loss of 12 percent of body water may lead to death in humans. The water loss is compensated by drinking and eating moist food. Some example of water conservation in different animals are as follows.

- Kangaroo rats loose very little water, because they can recover 90 percent of the loss by using metabolic water.
- When water is not available, the camels do not produce urine but store urea is tissues and solely depend on metabolic water. When water is available they rehydrate themselves by drinking upto 80 litres of water in 10 minutes.

Water balance in humans and desert kangaroo rats

		Kangaroo rat	Human
Water gain ($ml\ d^{-1}$)	ingested in	0	1500 (60%)
	Liquid ingested in food	6 (10%)	750 (30%)
	Derived from metabolism	54 (90%)	250 (10%)
		60 (100%)	2500 (100%)
Water loss ($ml\ d^{-1}$)	Evaporation	43.9 (73%)	900 (36%)
	Urine	13.5 (23%)	1500 (60%)
	Faeces	2.6 (4%)	100 (4%)
		60 (100%)	2500 (100%)

ELIMINATION OF NITROGENOUS WASTES

On the basis of type of excretory products (ammonia, urea or uric acid) three types of animals are present.

(1) Ammonotelics : Most aquatic animals excrete nitrogenous water as ammonia, the water soluble ammonia molecules diffuse across the body surface into surrounding water. In fishes most of the ammonia (NH_3) is lost as ammonium ions (NH_4^+) across the gill epithelium.

eg. of ammonotelic animals are teloest (modern bony fish), tadpoles and aquatic insects.

(2) Ureotelics : Animals like mammals, most adult amphibians living on land, marine fish and turtles, face the problem of conserving water. Excretion of urea is beneficial for these animals than ammonia becuase of following reasons.

(i) Urea can be tolerated in much more concentrated form because it is 100000 times less toxic than ammonia.

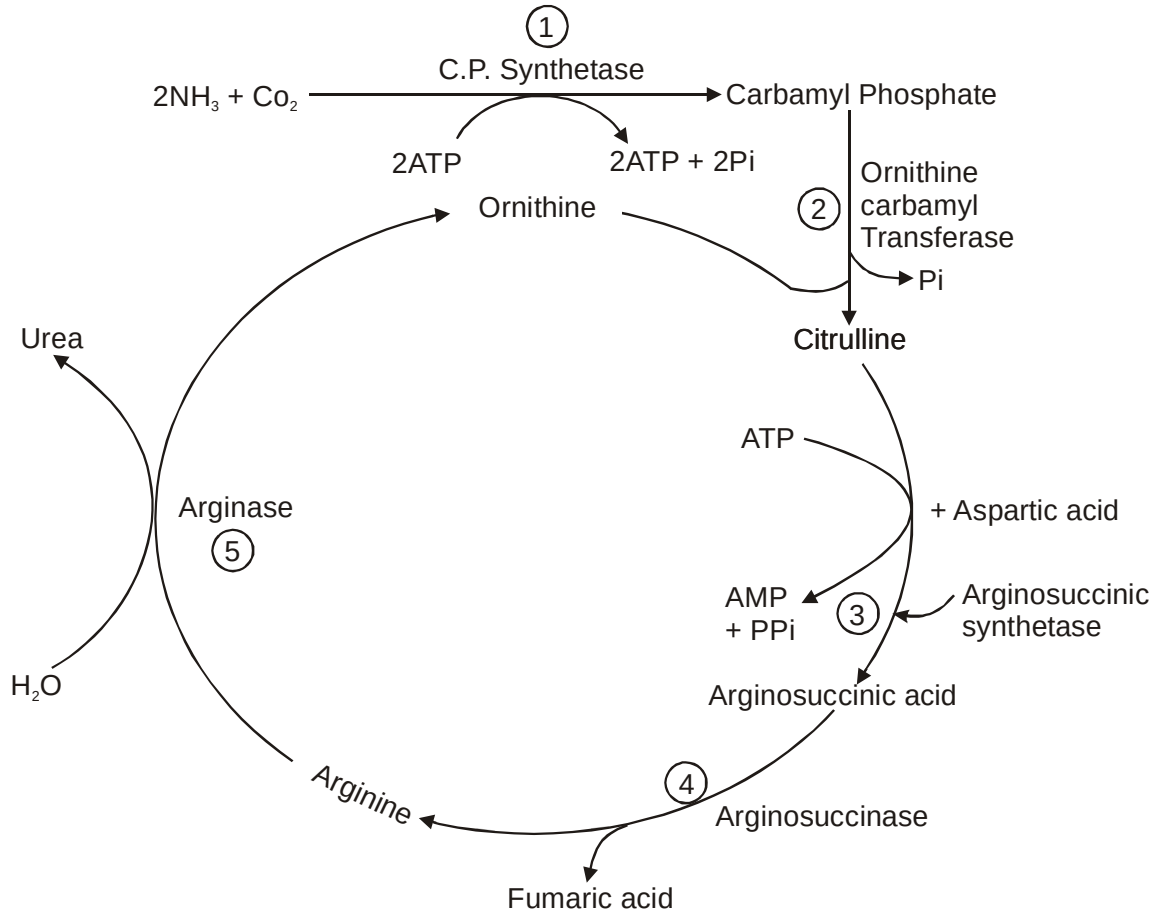
(ii) Urea excretion helps to sacrifice less water while disposing off the nitrogenous wastes.

For excretion of 1 gm of urea 50 ml of water is required.

In mammals **urea is excreted by kidney**. However entire amount of urea produced is not excreted immediately but some portion of it is retained in the kidenys for osmoregulation. (important for water reabsorption)

- Sharks retain some amount of urea produced to balance the osmolarity of body fluids with surrounding sea water. Thus urea here acts as an osmolyte.
- Urea produced in the liver by urea cycle.

Ornithine Cycle : It is also termed as the **Kreb-Henseleit cycle.** In this cycle, 2 molecules of NH_3 react with 1 molecule of CO_2, as a result a molecule of urea is formed. The formation of urea through this cycle takes place by the following steps -



- **Firstly** - 2 molecule of NH_3, 1 molecule of CO_2 combine to form carbamyl-Phosphate. This reaction is catalysed by the carbamyl-phosphate synthetase enzyme. 2 ATP's are used in this reaction.
- **In next step** - carbamyl-phosphate reacts with ornithine amino-acid to form the Citrulline amino-acid.
- **In next step** - Citrulline reacts with Aspartic acid to form Argino-succinnic acid. This reaction is catalysed by Argino-succinic synthetase. 1 moleucle of ATP is used in this process.
- **In next step** - Argino-succinic acid converts into Arginine and Fumaric-acid in the presence of Argino-succinase enzyme
- **Arginine,** now dissociates into ornithine and urea in presence of Arginase enzyme. Ornithine again enters the cycle.

(3) Uricotelics : These animals excrete uric acid as waste products.

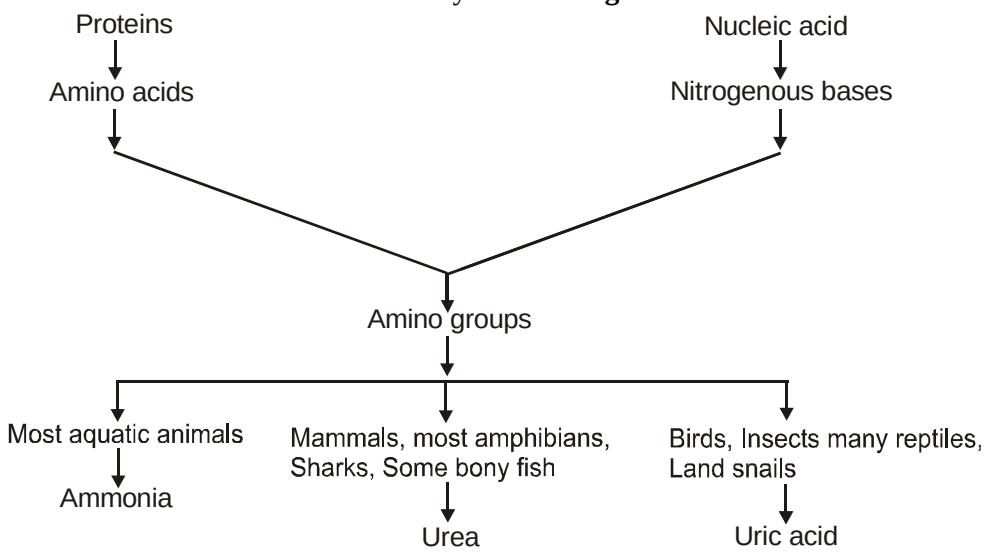
eg. Land snails, insects, birds & many reptiles.

Excretion of wastes in the form of uric acid is particularly advantageous for land vertebrates which lay shelled eggs. This is because shelled eggs of reptiles & birds possess many fine pores which are permeable to gases only.

It is formed mainly in liver from **ammonia and purine**. An enzyme **xanthine oxidase** is needed for its production.

If the embryo would have produced ammonia or urea inside the shelled egg, the soluble nitrogenous waste would have accumulated to toxic concentration levels. But because the wastes are in the form of uric acid which is thousand times less soluble than NH_3 or urea, this uric acid precipitates out of the solution and can be stored in the shell as a solid waste which is left behind when the animals hatches.

- In birds and reptiles urine is eliminated in a paste like form along with faeces.
- Tadpole and aquatic amphibians excrete ammonia, while their terrestrial adult forms excrete urea.
- Aquatic turtles excrete both urea & ammonia. Some tortoise can change their nitrogenous wastes when the environment is changed.
- Most terresterial reptiles excrete uric acid but crocodiles excrete ammonia in addition to uric acid.
- Uricotelics excrete uric acid as solid white crystal called **guano**.



SOME OTHER EXCRETORY PRODUCTS

Other wastes :

(i) Guanine - It is excretory waste of spider.
(ii) Ornithinic acid - It is excretory waste of birds.
(iii) Purine - It is excretory waste of butterfly.
(iv) Hippuric acid
(v) Creatine
(vi) Creatinine
— Excretory waste of mammals

(vii) Allantoin - It is excretory waste of foetus of **reptiles, aves** and **mammals**.

(viii) TMA (Trimethyl Amine oxide) - Marine Teleosts.

(ix) Amino acid - Some Molluscs **(*Pila, Unio*),** some Echinoderms **(Star fish, *Holothuria*)**.

CARBON DIOXIDE

It is formed during cellular respiration, upto annelida it is eliminated by general body surface through diffusion. In higher animals it is excreted by specialized respiratory organs.

MINERAL SALT

The excessive mineral salt like, potassium, calcium, magnesium, sodium are excreted in urine, sweat and faeces.

(i) Water

Excessive water is eliminated in faeces, urine, sweat and expired air.

(ii) Pigments

Pigments like bilirubin and biliverdin are eliminated in faeces, whereas, urochrome is eliminated in urine.

(iii) Drugs

Drugs are mainly removed through kidney.

Excretory organs of different organisms

S.No.	***Phylum***	***Excretory/osmoregulatory Organ/Organelle and principal N_2-waste***	***Function***	***Example***
I. Invertebrates				
(1)	Protozoa	Contractile vacuole Ammonia	Ammonotelic Osmoregulatory	Amoeba Paramecium
(2)	Porifera	General surface of body	Ammonotelic	Sycon, Leucon
(3)	Coelenterata	Ammonia, General surface of body	Ammonotelic	Hydra
(4)	Platyhelminthis	flame cells (=Solenocytes) form the protonephridial system	Ammonotelic	Taenia, fasciola
(5)	Nematoda	H-shaped excretory organ, Renette cells	Ammonotelic	Ascaris
(6)	Annelida	Nephridial system, (Metameric), various types	Ammonotelic	Pheretima
(7)	Arthropoda			
a.	Class-Insecta	Malpighian tubule (Uric acid)	Uricotelic	Periplaneta
b.	Class crustacea	Antennary (=green) gland Uric acid	Uricotelic	Palaemon
c.	Class Arachnida	Coxal glands Malpighian tubule Hepato pancreas Nephrocytes	Uricotelic	Spider
(8)	Mollusca	(a) Kidney (=organ of Bojanus) or Renal organ (b) Keber's organ Aquatic forms excrete Ammonia Terrestrial forms Excrete uric acid	 Ammonotelic Uricotelic	Pila Pulmonate Mollusc Limax
(9)	Echinodermata	Dermal branchiae (primitive gills) tube feet, body surface (Ammonia)	Ammonotelic	Cucumaria Asterias

HUMAN EXCRETORY SYSTEM

Excretory organ are also termed as organs of homeostasis.

The main excretory organ in humans is kidney.

Other excretory orgains are skin, liver, lungs & large intestine.

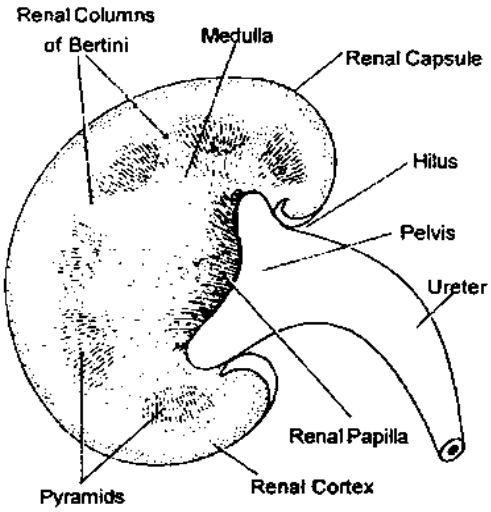
- Two kidney their blood supplies.
- A pair of ureters.
- urinary bladder
- Urethra

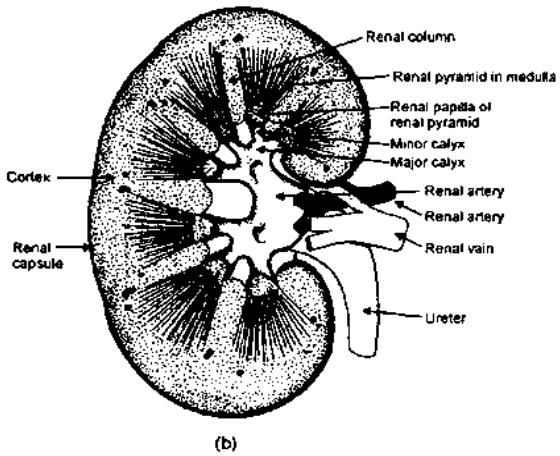
LOCATION AND STRUCTURE OF KIDNEYS

Each individual normally has two kidneys located lateraly on either side of vertebral column at the level to T_{12}, L_1 & L_2

Origin, location, form, size and external structure

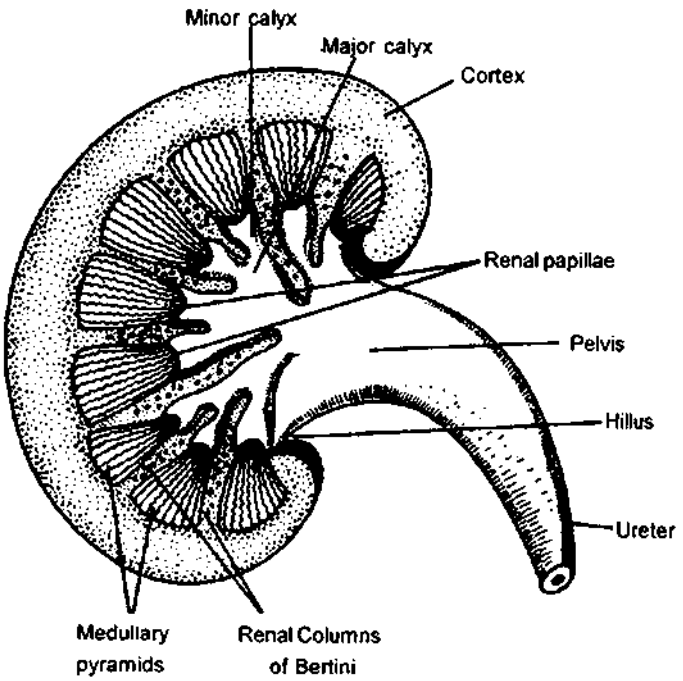
- Kidney is mesodermal in origin and retroperitoneal i.e. covered by peritoneum on ventral side.
- Kidney is found in pair. It is **bean shaped**, dark red, sized. (10 cm long × 5 cm broad × 4 cm thick)





HUMAN KIDNEY

- Both kidneys are situated in the anterior part of the abdominal cavity on either side of the median line (vertebral column). Last two pairs of ribs called floating ribs protect the kidney.
- In man the left kidney is slightly higher than the right kidney. In rabbit left kidney is slightly lower than right kidney.
- The concave side of each kidney faces inward whereas convex side faces outwards.
- Artery, vein, nerve and ureter enter or leave the kidney through the **hilus**.
- Externally kidney is covered by a layer of fibrous connective tissue called **renal capsule.**
- The structural & functional unit of kidneys is the Nephron.



These nephrons are arranged in a radiating fashion within the renal pyramids.

Urine produced by each nephron empties into **collecting duct.**

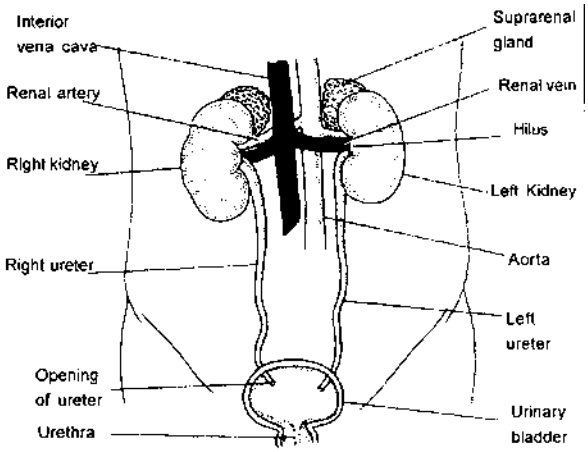
The collecting duct passes through a **papilla** into the **renal calyx** (Pleural-calyces).

The renal calyces drain urine in the central cavity of renal pelvis.

In rabbit, renal pelvis is unbranched, so the calyces and renal column of Bertini are absent.

Post Renal Urinary Tract

Urine passes from the pelvis into the **ureter**. Both the ureters open through separate oblique openings into **urinary bladder.** The obliquity of the openings prevent the backflow of urine. Externally, the bladder is lined by transitional epithelium or urothelium. This epithelium has great capacity to expand so that large volume of urine can be stored if required. Opening of urinary bladder is controlled by sphincters made of circular muscles. These normally remain contracted and during micturition these relax to release urine. (In rabbit a single sphincter is present while in human two sphincters, inner involuntary & outer voluntary, are present.)



External Structure of Urinary System

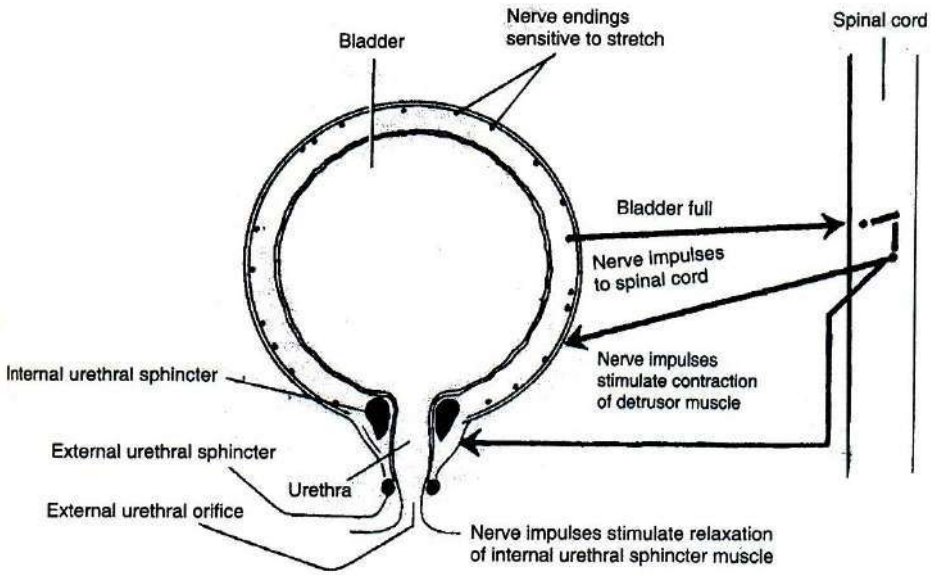
Passage of urine :

Nephron → Collecting duct → Papilla → Renal calyx → Penal pelvis → Ureters → Urinary bladder → Urethera

During act of micturition urine leaves the urinary bladder and enters the membranous duct called **Urethra.** The urethra leads to end of the penis in males and into the vulva in females. In males the urethra has three parts, prostatic, membranous & penile urethra prespectively. (Prostatic urethra & penile urethra are absent in females, therefore both sphincters are present in membranous urethra)

CONDUCTION OF URINE AND MICTURITION

(i) The urine produced in nephrone passed into the collecting tubules which opens in the **duct of Bellini**. Duct of Bellini converage towards hilium and pass through 15-16 conical renal pyramid which through minor and major calyxes pour their urine in renal pelvis of ureters. Both ureters carries the urine by peristalisis to urinary bladder.



(ii) The process of passing out urine is called micturition.

(iii) When urine get collected in urinary bladder muscular wall of urinary bladder get distended or expanded. Distension of wall of urinary bladder stimulates the sensory nerve endings in the bladder wall causing detrussor muscle to contract.

(iv) Micturition may voluntarily initiated or postponed. Urge for micturation starts when the bladder is little more than half full of urine.

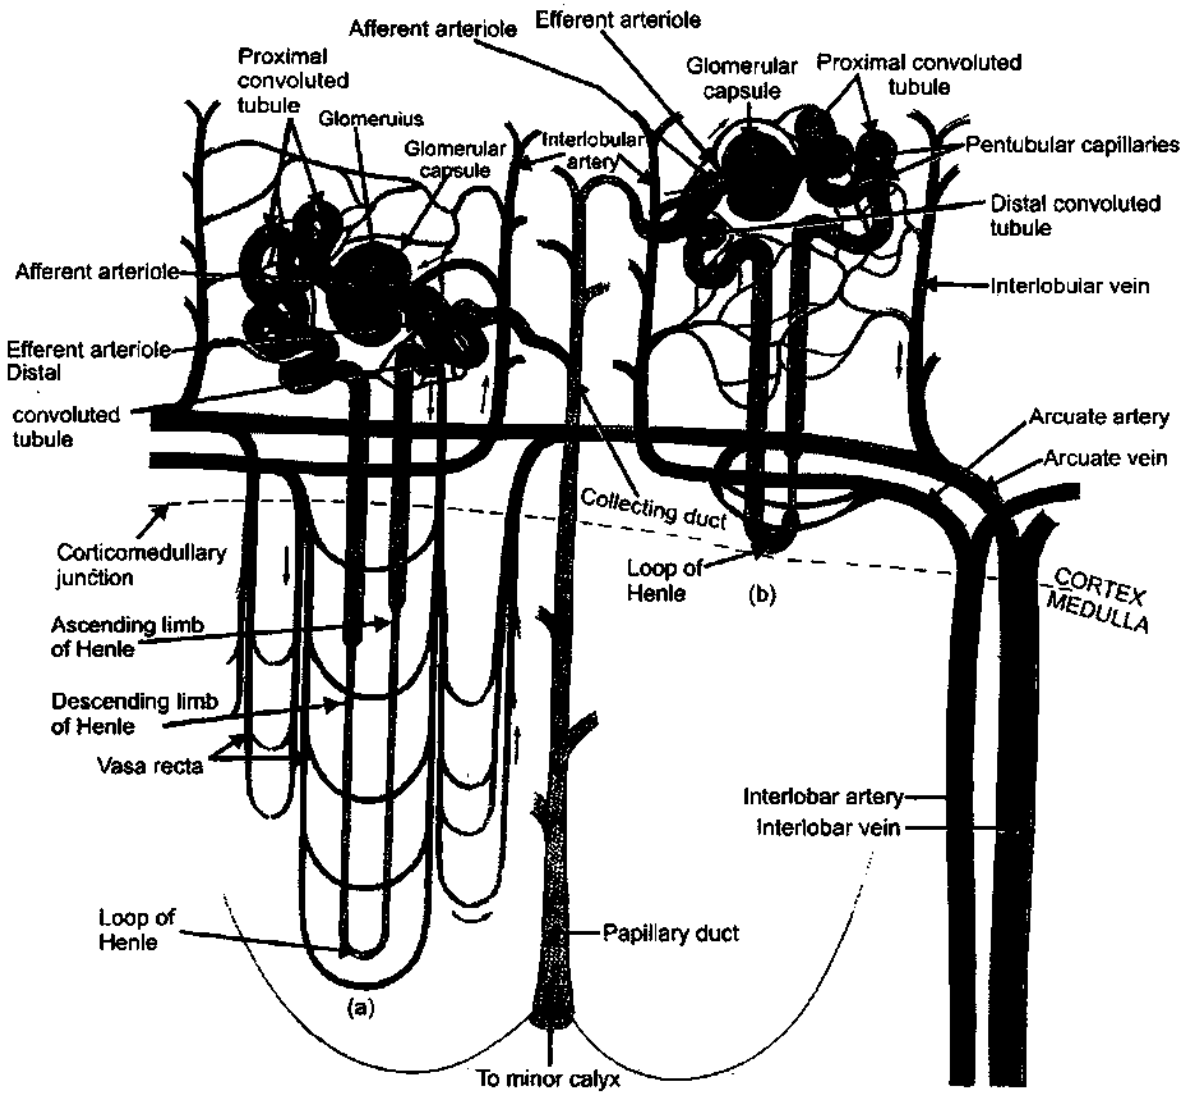
(v) A person feels desire of micturition when quantity of urine in the bladder is about 220 ml.

Note :

Sympathatic nerve fibre help in filling of bladder, whereas, parasympathatic helps in emptying of urinary bladder.

STRUCTURE OF NEPHRON

Nephron is the structural and functional unit of kidney. It is an epithelial tube which is about 3 cm long and 20-60 μm in diameter. (Each kidney has about one million nephrons in humans & 2 lakh in rabbit.



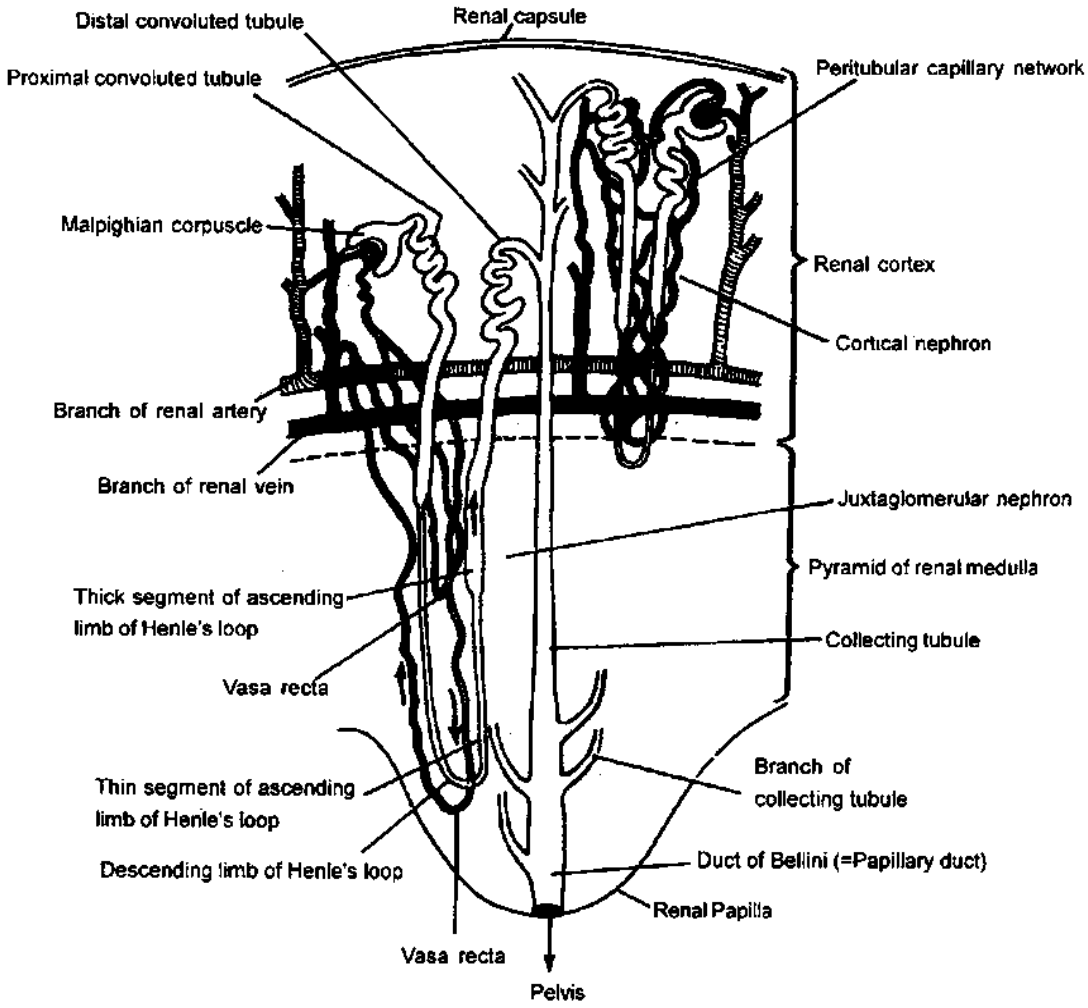
(a) Juxtamedullary nephron **(b) Cortical nephron**

A nephron can be divided into three regions :

(I) Proximal nephron (Bowman's capsule + Proximal convoluted tubule)

(II) Loop of Henle (Ascending + Descending limb)

(III) Distal nephron (Distal convoluted tubule which opens into collecting duct)



(I) Proximal nephron : Nephron tubule is closed at its proximal (starting) end but its distal end is open and continues into the loop of Henle. At the proximal or closed end the nephron is expanded and curved inwardly to form a double walled cup shaped **Bowman's capsule.** within bowman's capsule a network or tufts of capillaries is present, It is called **Glomerulus.** Diameter of afferent arteriole is greater than efferent arteriole.

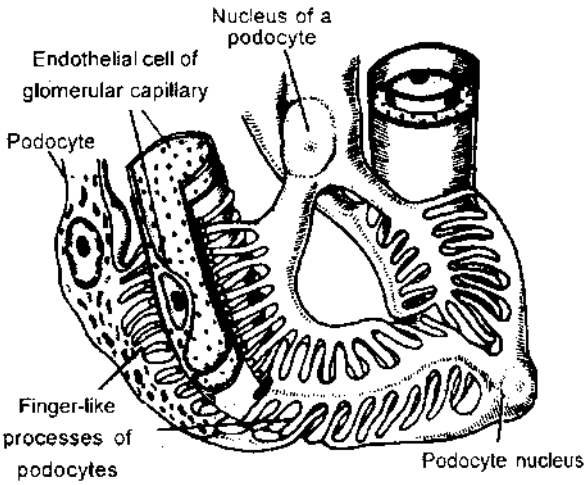
Malpighian corpuscles : Glomerulus and its surrounding Bowman's capsule together form this specialised structure.

The outer wall of Bowmans capsule is composed of flattened squamous cells.

The inner, invaginated wall that lines the concavity of bowmans capsule is composed of a special type of cells called **Podocytes.**

These cells bear finger like projections which are coiled around the capilaries of glomerulus.

The Bowmans capsule is followed by a short neck part lined by ciliated epithelium.



Proximal convoluted tubule : The epithelial cells of this region are specialised for transport of salts and other substances from the lumen to the interstitial fluid.

The membranes of these cells facing the tubule lumen has numerous microvilli (finger like projections

or Brush Borders) which increase the surface area. Near its basolateral surface, the mitochondria are concentrated, to allow of reabsorption of salts by active transport.

(II) Loop of Henle : It starts after the proximal convoluted tubule, It ends before the distal convoluted tubule. This hairpin like loop has a descending limb, followed by an ascending limb.

Descending limb : Its upper part - constitutes thick segment has the same diameter as PCT and is also lined by cuboidal epithelium.

Its lower part - constitutes thin segment and is lined by flat epithelial cells

Ascending limb : This part too has a **thin segment** first which widens abruptly at medullary zone to form **thick segment.** Lower thin segment is lined by simple squamous epithelium while upper thick segment is lined by cuboidal epithelium.

(**III) Distal nephron :** The ascending limb of henle's loop merges into **distal convoluted tubule.** This is lined by cuboidal epithelial cells with a few microvilli. Coils of both PCT & DCT are intermingled.

The distal convoluted tubules of a number of adjacent nephrons open into a common **collecting duct** or tubule.

Collecting ducts (present in medullary pyramids) are long tubules which travel through the medulla in the pyramids. In the papilla of the medulla (in rabbit) or papilla of the individual medullary pyramid (in human), Several adjacent collecting ducts converge to open into a common short and thick **duct or Bellini.** (present in papilla or medulla)

All ducts of Bellini then open at the tip of the papillae into the pelvis.

Renal cortex : The malpighian corpuscle, PCT & DCT of the nephrons are located here.

Renal medulla : Loop of henle, collecting duct and ducts of Bellini are found in this region.

TYPE OF NEPHRONS

According to their position, nephrons are of two types.

(i) Cortical nephrons :

- These consitute about 85% of total. (75-85%)
- Malpighian corpuscles of cortical nephrons are located close to the kidney surface.
- Their loops of Henle are small and a very small part of it runs in the medulla.
- Only peritubular capillary network is present & vasa recta is absent.

(ii) Juxtamedullary nephrons :

- About 15% of total. (15 - 25%)
- Malpighian corpuscles of these nephrons are located at the junction of cortex and medulla.
- The loop of Henle of these nephrons are long, dipping deep down into the medulla.
- Both, PTC network and vasa recta are present.

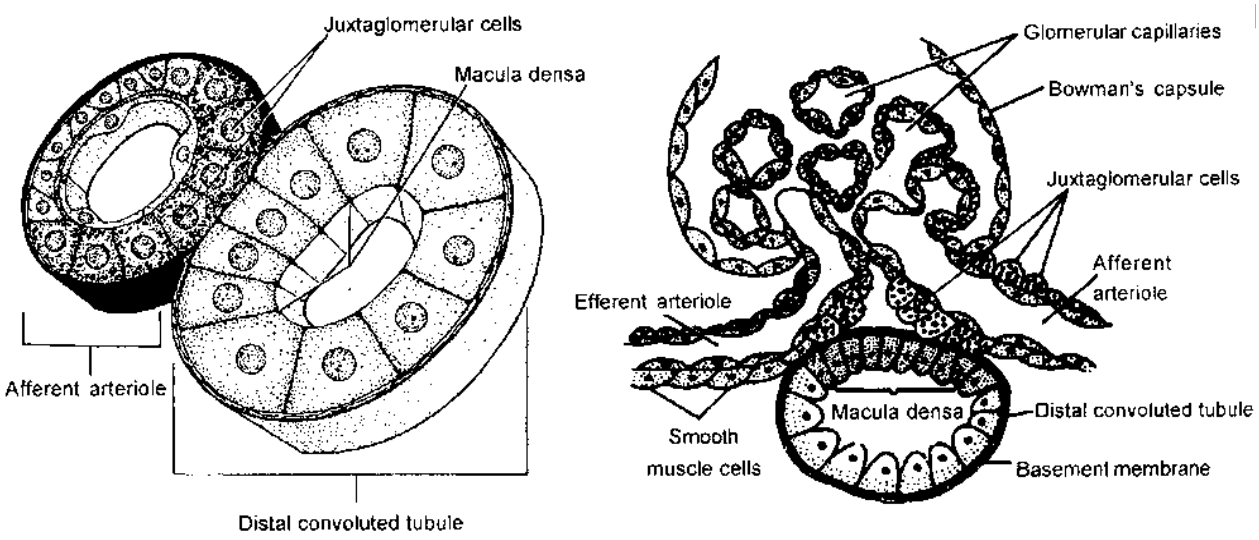
In these nephrons the initial part of the DCT is located close the mouth of Bowman's capsule, in contact with both afferent and efferent arterioles.

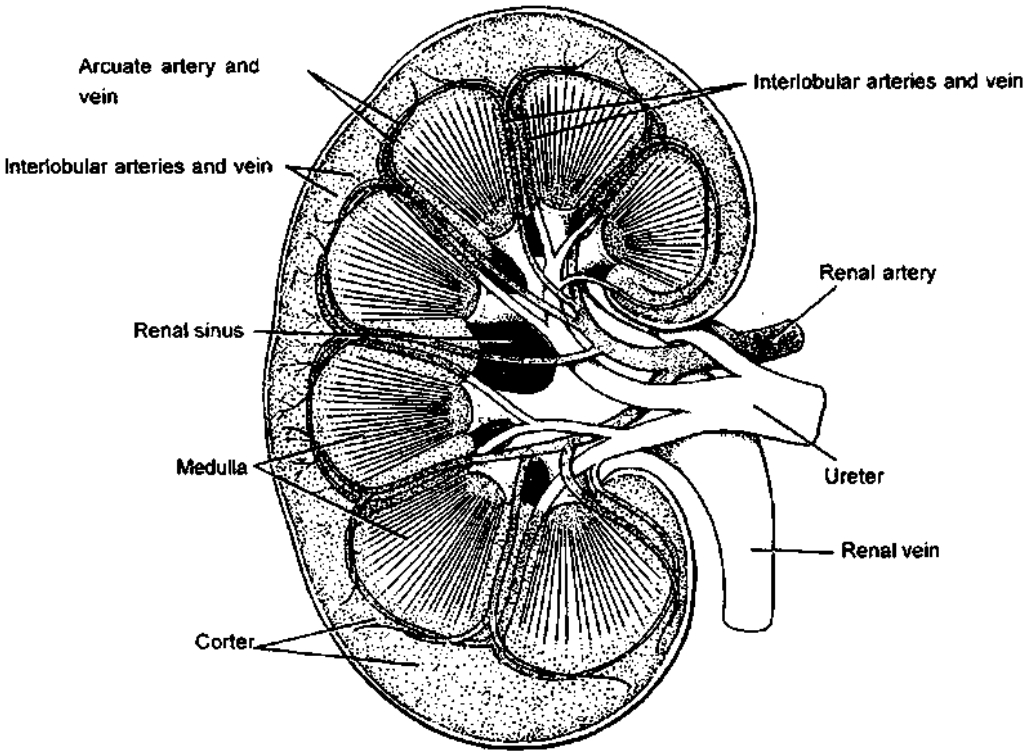
Juxtaglomerular apparatus : Juxtaglomerular cells + Macula densa.

Macula densa : The cells of DCT epithelium in contact with the arteriolar wall are denser than other epithelial cells. These are collectively called macula densa.

Juxtaglomerular cells : The smooth muscle cells of the wall of both arterioles in contact with DCT epithelium are swollen and contain dark granules of inactive renin. These are called juxtaglomerular cells.

Juxtaglomerular apparatus secretes **renin** and **erythropoitein**.





Blood Supply of the right kidney seen in coronal section

BLOOD VESSELS OF KIDNEY

Each kidney receives its blood supply by a single **renal artery** from dorsal aorta, and is drained off by a single **renal vein,** which opens in the inferior vena cava.

As the artery enters into the medulla after traversing through the hilum, it divides into a number of branches. These branches enter into renal cortex through the columns of Bertini and subdivide into **afferent arterioles** which form **glomerular capillaries.** These capillaries are drained, not by venules, but by **efferent arterioles. In Cortical nephrons :**

The efferent arterioles break up into dense **Pertitubular network of capillaries** around their tubules.

In Juxtamedullary nephrons :

The efferent arterioles break up into a network of thin capillaries which form hair pin like loops called vasa recta.

This vasa recta dips into the medulla or its pyramids along side the loops of Henle.

Both peritubular capillaries of cortical nephrons and vasa recta of juxtaglomerular nephrons lead into venules which join and rejoin to form small and large veins, all of which ultimately join to the form renal vein.

MECHANISM OF URINE FORMATION

The mechanism of urine formation involves three steps or processes :

(I) Ultrafiltration or Glomerular filtration

(II) Selective tubular reabsorption

(III) Tubular secretion

(I) Ultrafiltration or Glomerular filteration :

This process occurs in the Malpighian corpuscles of the nephrons. The glomerulus of a Malpighian corpuscle is a network of several (about fifty in man) parallel capillaries. From the blood flowing through glomerular capillaries, about 20% of plasma fluid filters out into the Bowman's capsule through a thin **glomerular-capsular membrane** due to a net or **effective filtration pressure (EFP)** of about 10 to 25 mm Hg.

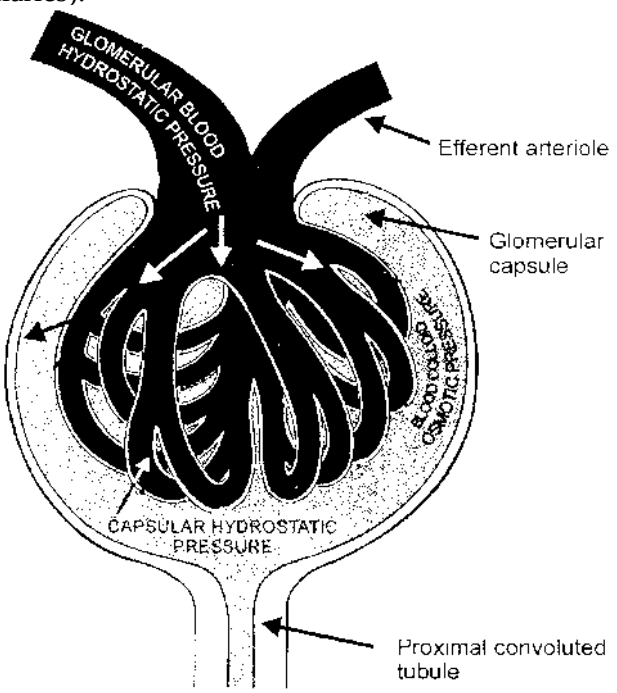
The glomerular-capsular membrane through which ultrafiltration occurs comprises three layer, **(I) endothelium, (2) basement membrane** of the wall of glomerular capillaries and **(3) squamous epithelial layer** of the finger-like processes ('foot processes' or pedicels) of podocyte cells of capsular wall entwining the walls of capillaries.

A special characteristic of glomerular-capsular membrane is that it is about 100 to 500 times more permeable than the walls of blood capillaries in other tissues of body. Such a tremendous permeability of this membrane is because of the presence of literally thousands of small pores, called **fenestrae,** in the walls of glomerular capillaries (fenestrated capillaries).

The effective filtration pressure that causes ultrafiltration is determined by three pressures : (1) glomerular hydrostatic pressure, (2) colloid osmotic pressure of blood and (3) capsular hydrostatic pressure.

The glomerular hydrostatic pressure is the blood pressure in glomerular capillaries. It is the chief determinant of effective filtration pressure, i.e. the main driving force to cause filtration. (it is 60 to 75 mm Hg)

The **colloid osmotic pressure** is the osmotic pressure created in the blood of glomerular capillaries due to plasma proteins. It resists the filtration of fluid from the capillaries. (it is 30 to 32 mm Hg)



The **capsular hydrostatic pressure** is the pressure caused by fluid (filtrate) that reaches into Bownman's capsule and resists filtration. (It is about 10 to 18 mm Hg)

Normally, the blood pressure in an arteriole that feeds a typical systemic capillary network is about 30 to 40 mm Hg. The pressure in afferent arteriole of glomerulus is about 60 to 75 mm Hg and since the efferent arteriole is thinner in diameter than afferent arteriole, this blood pressure (glomerular hydrostatic pressure) is maintained throughout the glomerulus. The colloid osmotic and capsular hydrostatic pressures, which resist ultrafiltration , are respectively about 30 to 32 mm and 10 to 18 mm Hg. Thus, the **net effective effective filtration pressure is about 10 i.e. (60) – (32 + 18) mm hg.** That is why, the glomerulus is called a '**high pressure capillary bed',**

EFP = GHP – [COP + CHP]

- **EFP ranges from 10 to 25 mm Hg.**

The plasma fluid that filters out from glomerular capillaries into Bowman's capsules of nephrons is called **glomerular filtrate.**

The quantity of glomerular filtrate, formed each minute in all the nephrons of both kidneys is called **Glomerular filtration rate (GFR).** In a normal adult human being, a glomerular filtration pressure of 1 mm Hg causes filtration of about 12.5 mL of plasma fluid from glomerular capillaries per minute. Thus the GFR in a normal adult person is 125 (12.5 × 10) mL of plasma fluid per minute. As already described in the chapter of circulatory system, an average adult person of about 70 kg possesses about five litres of blood all of which is pumped by the heart (cardiac output) into the arteries and received back through veins each minute. About 1250 mL (25% of total blood) of this blood circulated through kidneys each minute, and of this blood, about 650 mL is the blood plasma (52%). This 650 mL is called **renal plasma flow (RPF).** Obviously, 125/650 i.e. about one-fifth (20%) of the blood plasma, therefore, filters out into kidneys nephrons per minute. This is the ratio of GFR to RPF, and it is called **filtration fraction.**

With a glomerular filtration rate (GFR) of 125 mL per minute, about 180 litres of plasma fluid from about 1800 litres of blood circulating through both kidney of an average person each day filters out into kidneys nephrons. But only about 1.45 litres (about 0.8% part) of the total glomerular fitlrate is excreted out as **urine** per day, the rest is reabsorbed into the blood from the nephrons.

Due to continuous beating of the cilia of neck cells, the glomerular filtrate is continously made to flow behind from Bowman's capsules into the proximal convoluted tubules of the nephrons.

(II) Selective tubular reabsorption :

The glomerular filtrate is like blood plasma minus plasma proteins (colloids) in chemical composition. Thus, it is mostly water with all soluble and diffusible solutes of plasma which include nutrients (glucose, amino acids, etc,) electrolytes of salts (Na^+, K^+, Cl^-, HCO_3^-, H^+ etc) and waste products of protein metabolism (urea, uric acid, creatinine, etc). In contrast to glomerular filtrate, the urine which is ultimately extracted from the filtrate in nephrons, contains water, urea, uric acid, creatinine and useless elctrolytes in considerably higher concentrations, whereas nutrients are almost absent in it. This proves that, while the filtrate flows through a uriniferous tubule, not only its volume is reduced, but its composition is also considerably changed. These changes are obviosuly due to an exchange of materials between the filtrate and the blood of Peritubular capillaries.

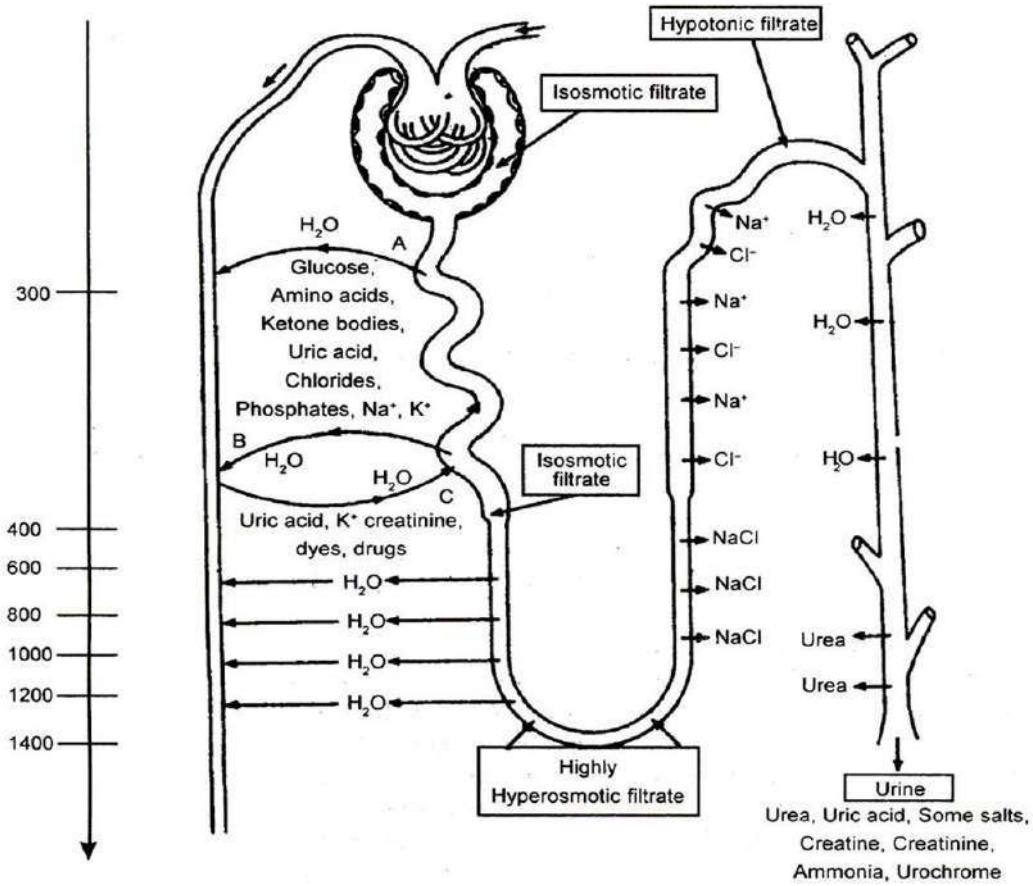
This exhange involves, (1) a **selective reabsorption** of useful materials into the blood form the filtrate and (2) Absorption of remaining unfiltered amount of excretory substance from blood flowing in the peritubular capillaries, by the cells of uriniferous tubules and then subsequent **secretion** of these substances into the filtrate. This selective reabsorption and secretion are finely tuned to maintain homeostatic balances in body fluids.

The blood flows rapidly in peritubular capillaries and with a very low pressure (only about 13 mm Hg). Due to this reason fluid can diffuse into these capillaries from surrouding tissue fluid, but cannot filter out of them. this reabsorption involves both active and passive processes.

(III) Tubular secretion :

In addition to its role in selective reabsorption of material from the glomerular filtrate back into the blood of peritubular capillaries via the renal interstitium, the distal part of proximal convoluted tubule also alters the composition of filtrate by a process of secretion. Epithelial cells in this part extract certain excretory substances from the blood of peritubular capillaries and secrete these into the filtrate. For example, uric acid filtered by glomerulus is almost completely reabsorbed in the first part of proximal tubule, but is later withdrown from blood and secreted into the filtrate in distal part of proximal tubule, Other secreted substances include H^+, K^+ , NH_4^+, creatinine, etc and certain dyes and drugs, like phenol red, penicillin, hippuric acid and its derivatives etc. Secretion of H^+ helps in controlling blood pH.

Permeability chart
PCT ⟶ Water, NaCl
Descending loop ⟶ Water only
Thin ascending loop ⟶ NaCl only and urea (inwards)
Thick ascending loop ⟶ Na^+, K^+ Pumps and Cl^- follows passively



Changes occurring stepwise in the filtrate while it flows through the tubules :

(1) Bownman's capsule : Since all plasma solutes, except proteins, freely enter into glomerular filtrate from blood, the total solute concentration (osmolality 300 milliosmoles per litre) of the filtrate is essentially the same as that of plasma. Here the filtrate is thus **isotonic** (isosmotic) to the plasma.

Concentration ↔ , Volume ↔

(2) Proximal convoluted tubule : The microvilli of the "brush-border" columnar cells of the epithelium of this tubule increase the internal surface of the epithelium about 20 times. Hence, this epithelium becomes most suitable for reabsorption . About 65 % to 80% of the filtrate is reabsorbed into the blood of peritubular capillaries through this epithelium and surrounding tissue fluid (renal interstitium). Most of the solutes like glucose, amino acids, vitamins, ketone bodies, acetoacetic acid, uric acid, chlorides, sodium. potassium, phosphates etc of the filtrate are reabsorbed into the blood by diffusion and active transport. Some urea is also reabsorbed. Sulphates, creatinine, inulin and PAH (para amino hippuric acid) are not reabsorbed. As most of the solutes are reabsorbed, water automatically goes back into the blood by osmosis leaving the osmotic pressure in the filtrate unchanged . Thus, the filtrate is reduced in volume, but it **still remains isotonic** to the plasma.

- Concentration ↔ , volume ↓

(3) Descending limb of henle's loop : The loop of Henle is divisible into four parts, namely Thick descending limb, the Thin descending limb, the Thin segment of ascending limb, and the Thick segment of ascending limb.

In mammalian kidneys, the osmolality of renal interstitium is different in renal cortex and medulla. Where as the cortical interstitium has the normal osmolality of 300 mL osmol/liter, the medullary interstitium has a gradient of increasing osmollity from the cortex upto the tips of the papillae. (300 to 1400 mL osmol/ liter).

The thin wall of descending limb of Henle's loop is *permeable to water, but not to the solutes.* As the isotonic tubular fluid flows down this limb, it gradually loses water by exosmosis due to increasing osmolality of medullary interstitium through which this limb extends. This leaves a small volume of concentrated (**hypertonic** to blood plasma)tubular fluid to enter into the ascending limb of Henle's loop.

- Concentration ↑ , Volume ↔

(4) Ascending limb of Henles loop : The thin segment of the ascending limb of henle's loop is structurally like the descending limb, but its permeability is different. It is *quite permeable to NaCl but not to water.* Due to decreasing osmolality of medullary interstitium towards cortex, the tubular fluid, therefore, loses Na^+ and Cl^- by diffusion, again becoming diluted and **isotonic** to plasma without changing in volume.

- Concentration ↑ , Volume ↔

The wall of the thick ascending limb of Henle's loop is virtually *impermeable to both water and solutes*, but the plasma membrane of its cells is very rich in $Na^+ - K^+$ *pumps*. These pumps pump out Na^+ by active transport, and Cl^- passively diffuse out following the outflux of Na^+ . Thus the process of dilution of the tubular fluid continues in this limb. Consequently, the tubular fluid becomes considerably **hypotonic** to blood plasma without a change in its volume.

- Concentration ↑ , Volume ↔

(5) Distal convoluted tubule (DCT) : In the distal convoluted tubule, active reabsorption of Na^+ and that of Cl^- continues by facilitated diffusion and hence the tubular fluid becomes still more diluted . It also helps to regulate blood pH by reabsorption of HCO_3^- which is an important buffer.

- In proximal DCT Concentration ↑ , Volume ↔ While in distal DCT Concentration ↑ , Volume ↓

(6) Collecting duct : From the distal convoluted tubule, the hypotonic tubular fluid flows into a collecting duct. This duct is *quite permeable to water but not to salt* (in presence of some ADH). Hence the tubular fluid loses considerble amount of water by exosmosis as the duct runs down through the hypertonic medullary interstitium to empty into the calyx. The distal part of collecting duct is permeable

to urea also. Hence same urea is also reabsorbed from tubular fluid and it adds to the hyperosmolality of medullary interstitium .

- Concentration ↑ , Volume ↔

After loosing considerable amount of water and some urea, while flowing through the collecting ducts, the filtrate ultimately becomes **urine.**

Chemical composition and physical characteristics of urine : Normal urine contains about 95% water 2% electrolytes (ions of salts, mainly chlorides, sulphates, phosphates and bicarbonates of sodium, potassium, ammonium, etc), 2.6% urea, 0.3% uric acid and traces of creatinine, ammonia, creatine etc. It is transparent but pale yellow due to the presence of a trace of urochrome pigment. Urochrome is a by product of haemoglogin degradation found in blood and filtered into glomerular filtrate Normal urine is slightly acidic with a pH of 6.00 (range is 4.5 to 8.2). Its specific gravity is 1.015 to 1.02. On standing, it becomes cloudy an acquires ammonia odour due to formation of ammonium carbonate.

OSMOREGULATION BY KIDNEYS

Kidneys also perform the important function of omoregulation (regulation of osmolality) by regulating the amount of water in body fluids. The normally functioning kidneys produce a large volume of dilute urine when more water is taken, and a small volume of concentrated urine when water intake by the body is poor or there is considerable loss of water from the body. This function of kidneys is regulated by the antidiuretic hormone **(ADH or Vasopressin)** secreted by the posterior lobe of pituitary gland. This hormone increases the water permeability of the last part of distal convoluted tubules and proximal part of the collecting ducts. In a absence of ADH, these parts are almost impermeable to water and therefore the urine is dilute. But in presence of ADH, these parts becomes quite permeable to water, so that much of the water present in tubular fluid is reabsorbed and the urine becomes concentrated. Besides ADH, the hormone **aldosterone**, secreted by adrenal glands, also plays important role in osmoregulatory function of kidneys by increasing Na^+, K^+ and Cl^- reabsorption from the filterate.

DILUTION MECHANISM (CORTICAL NEPHRONS)

The osmolality of body fluids normally remains about 300 mL osmol per litre of water. When amount of water increases, this osmolality decreases. This switches off the secretion of a ADH from pituitary gland, but stimulates secretion of aldosterone from adrenal glands. Absence of ADH makes the walls of distal convoluted tubules and collecting ducts almost completely impermeable to water. Contrarily, due to secretion of the aldosterone the walls of ascending limb of Henls's loop. distal convoluted tubule and collecting duct become quite permeable to sodium, postassium and chloride ions. As a result of this Na^+ and Cl^- ions are reabsorbed from the filtrate flowing up the ascending limb of Henle's loop and mostly water and waste products remain in the filtrate. By the time this filtrate reaches into the distal tubule, it becomes very hypo-osmotic with only about 100 mL osmol/litre osmolality. Then, as this diluted fluid passes through the distal tubule and collecting duct, some more of the remaining ions, especially of sodium (Na^+) are reabsorbed actively so that the osmolality of ultimate dilute urine is decreased to as low as about 65 to 70 mL osmol/litre. Dilution of urine mainly occurs in cortical nephrons.

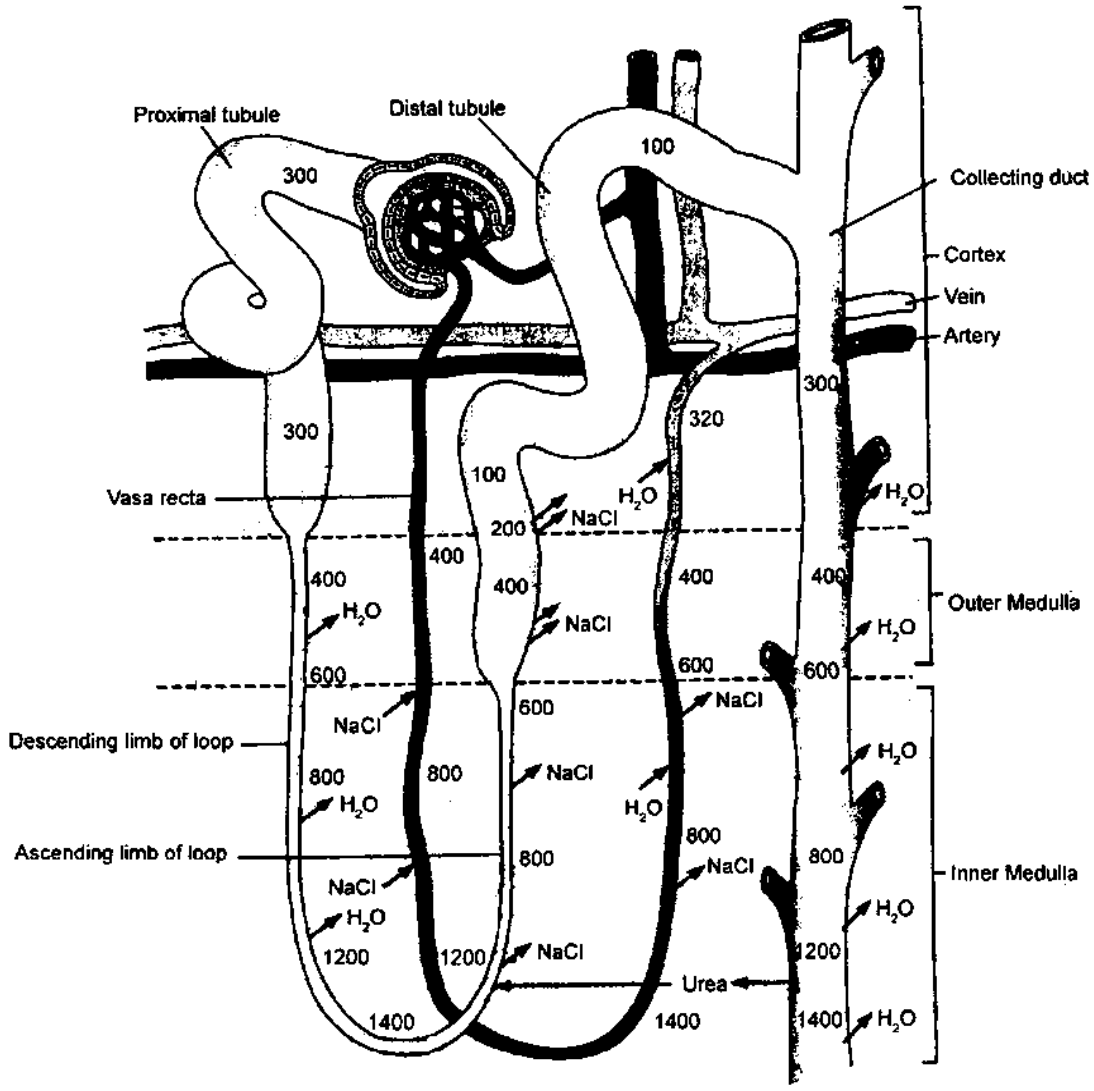
Diuresis and Hypertension : Normally, we excrete about 1.5 litres of urine per day. Diluted urine is excreted in larger volumes a condition called **diuresis.** When due to the inefficient regulation, the kidneys fail to adequatly dilute the uine, the body fluids are diluted and their increased volume cause hypertension (↑ BP).

Glucose, urea, mannitol and other diuretic substances are administered to such patients. The kidneys

excrete these substances and water is automatically excreted out with these. Caffeine of tea is also diuretic. That is why, urination becomes more frequent when more tea is taken . contrarily, if secretion of ADH is permanently hampered or blocked in a patient, the urine becomes very dilute and tasteless (insipid),. This condition is called **diabetes insipidus**. intermittent urination at short intervals and thirst are the only discomforts in this condition.

CONCENTRATION MECHANISM (JUXTAMEDULLARY NEPHRONS)

During times of low water intake or excessive water loss, for example, due to heavy perspiration , diarrhoea, vomiting, etc the kidneys must conserve water while still eliminating wastes and excess ions. The kidneys accomplish this by producing concentrated urine. It is primarily the long-looped juxtamedullary nephrons which establish the conditions for producing concentrated urine which may be four to five times more concentrated (1200 to 1400 osmol/litre) than plasma. concentrating the urine is under regulation of ADH and depends on presence of a steep gradient of increasing hyperosmolarity in the interstitial fluids of medullary pyramids.



Medullary heper osmolality : The osmolality of renal cortical interstitium is the same (300 mL osmol/ litre) as in other tissues, but that of the interstitium of renal medulla is hypertonic with a gradient of hyperosmolality from renal cortex to the tips of medullary papillae. Under the conditions in which a concentrated urine is to be produced the hyperosmolality of medullary interstitium near the tips of the papillae is as high as 1200 to 1400 mL osmol/litre.

Countercurrent mechanism to maintain medullary hyperosmolality : The gradient of increasing hypersomolality of medullary interstitium is maintained by a peculiar countercurrent mechanism operated by the Henle's loops of juxtamedullary nephrons and vasa recta. About 15% to 20% of the nephrons in mammalian kidney are situated at the level where cortex and medulla meet and, hence called **juxtamedullary nephrons.**

The Henle's loops of these nephrons are thin and long and extend almost upto the tips of medullary papillae. The peritubular capillaries associated with these Henle's loops are also very thin and in the form of thin loops extending almost upto the tips of medullary papillae. These capillary loops are called **vasa recta.** A counter current can be defined as the flow of a fluid in opposite directions in the two arms of a U-tube if the arms are rather very close together. Thus, the Henle's loops of juxtamedullary nephrons and vasa recta are anatomically ideal for the operation of countercurrent mechanism.There are two aspects of this mechanism, **(1) countercurrent multiplication** and **(2) countercurrent exchange.** The Henle's loops play the role of contercurrent multipliers. The vasa recta plays the role of countercurrent exchanger.

Since the concentration of tubular fluid in descending limb reflects the concentration of medullary interstitium, and since the concentration in the interstitium is raised by extrusion of salt from ascending limb, a positive feedback mechanism is created. *The more salt the ascending limb extrudes, the more concentrated will be the fluid that enters into it from descending limb.* Obviously, this feedback mechanism is the key point in the **countercurrent multiplier system.**

Countercurrent exchange : In order for the countercurrent multiplier system to be effective in creating the gradient of medullary hyposmolality, most of the salt extruded by the ascending limb of Henle's loop must remain in medullary interstitium, while most of the water coming out of the descending limb must be drained off into the blood. This is accomplished by the vasa recta by means of the mechanism known as countercurrent exchange. **Salt** is thus recirculated and trapped within the medullary interstitium, But contrarily, the **water** diffuses into the blood of ascending limb of vasa recta and is carried away into general blood circulation.

Significacne of urea :

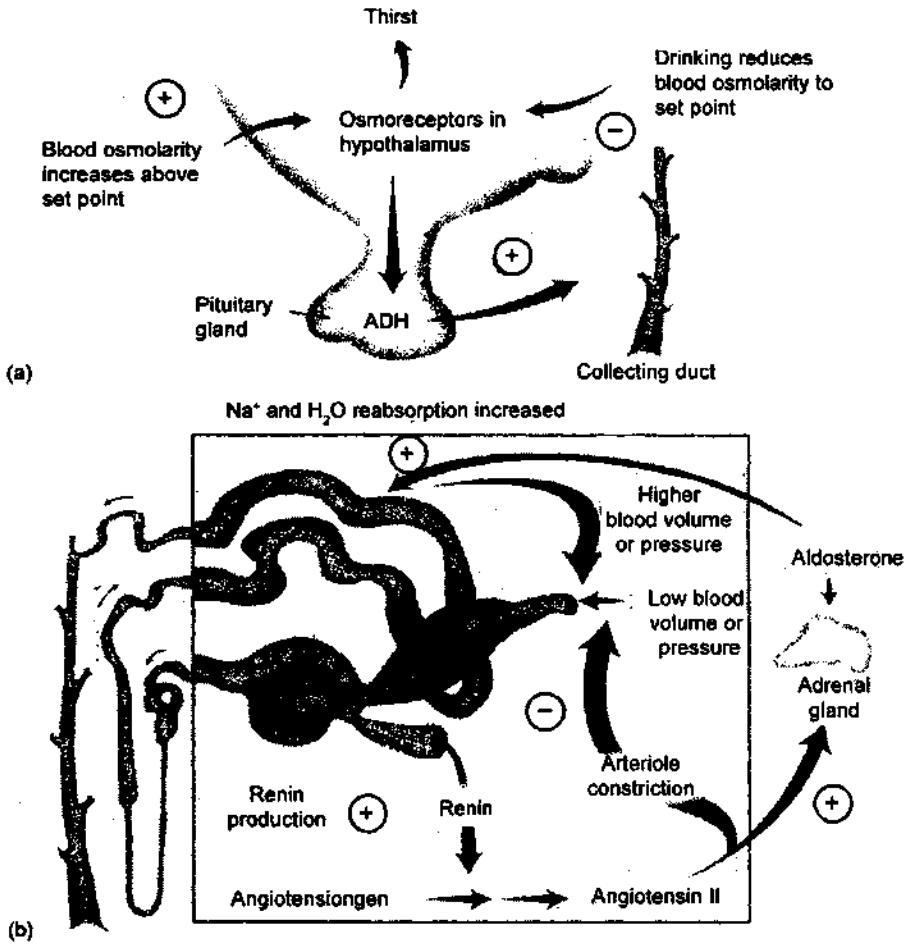
Permeability to urea is found only in the deeper parts of thin ascending limbs of Henle's loops and collecting ducts. urea diffuses out of the collecting ducts and enters into the thin assending limbs down its concentration gradients. A certain amount urea recycle in this way is trapped in medullary interstitium.

Role of distal convoluted tubule, collecting duct and ADH : As described above, the role of countercurrent mechanism is to proudce a small volume of highly hypotonic (osmolality only about 100 mL osmol/litre) tubular fluid which enters from the thick ascending limb of Henle's loop into the distal convoluted tubule and, thereafter into the collecting duct. To finally produce a very small volume of highly concentrated urine from this hypotonic tubular fluid is the role of distal convoluted tubule and collecting duct under the influence of the antidiuretic hormone (ADH). ADH triggers synthesis of a large number of molecules of a specific protein, named **aquaporin,** in the epithelial cells of distal convuled tubule and more particularly of collecting duct. Molecules of aquaporin become incorporated in the plasma membrane of these cells as integral proteins and act as water channels. Consequently some water is lost from hypotonic tubular fluid by exosmosis while it flows through the distal convoluted tubule, but most of the water of tubular fluid is lost across the wall of collecting duct via aquaporin as this duct traverses through the medullary interstitium to empty into a calyx, Due to this, the osmolality of the urine emptied into the calyx becomes 1200 to 1400 mL osmol/litre.

REGULATION KIDNEY FUNCTION BY FEEDBACK CIRCUITS

Two important hormonal controal of the kidney function by negative feedback circuits. These ara as follows :

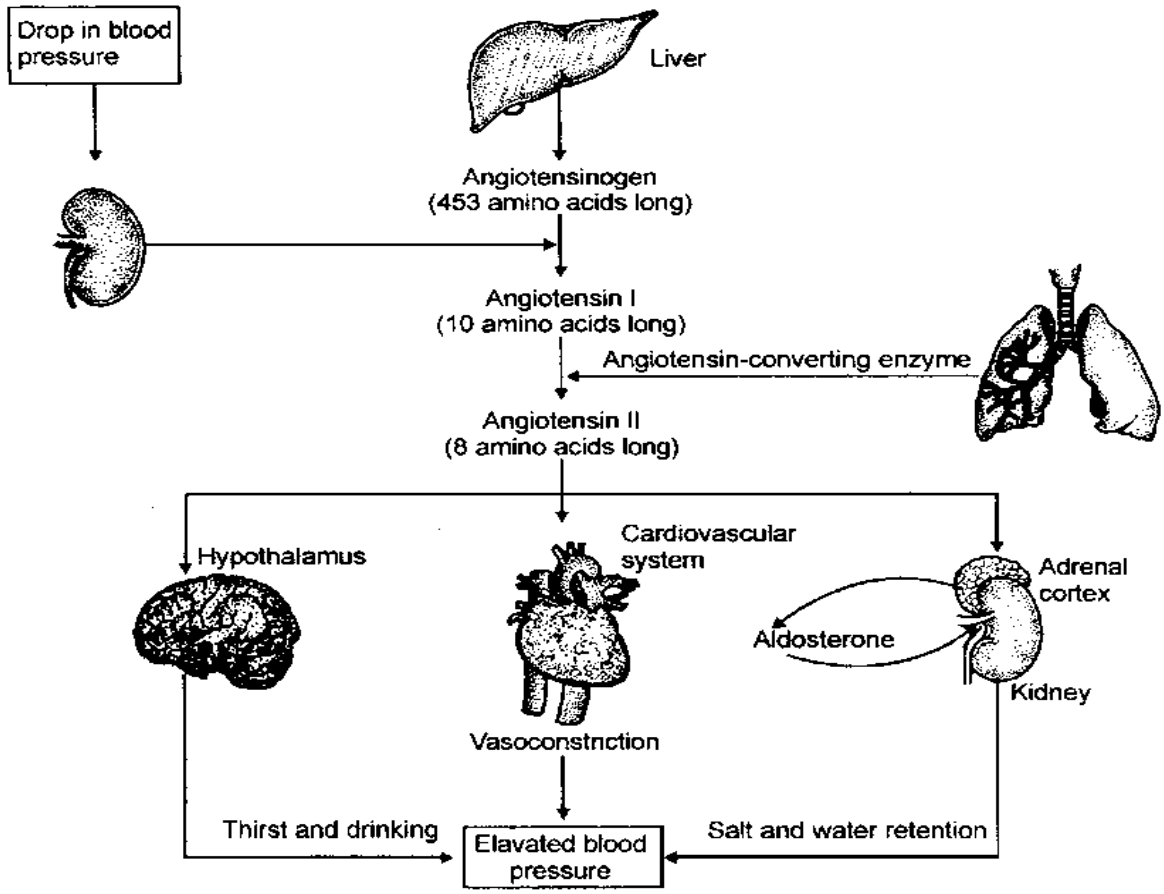
(i) Control by Antidiuretic Hormone (ADH) : ADH is produced in the hypothalamus from the pituitary glands. ADH enhances fluid retention by making the kidneys reabsorb more water. The release of ADH is triggered when osmorecepotors in the Hypothalamus detect an increase in the osmolaity of the blood above a set pont of 300 mosm L^{-1}. In this situation, the osmoreceptor cells also promote thirst. Drinking reduces the osmolarity of the blood, which inhibits the secretion of ADH, thereby completing the feedback circuit.



(ii) Control by Juxtaglomerular Aparatus (JGA) : JGA operates a multi-hormonal **Renin-Angiotensin-Aldosterone System** (RAAS). Whenever there is a fall in BP or blood volume, the JGA responds to this decrease in blood pressure or blood volume in the afferent arteriole of the glomerulus and releases an enzyme called **renin,** into the blood stream. In the blood, renin initiates chemical reactions that convert a plasma protein, called **angiotensinogen** to a peptide, called **angiotensin II**, which works as a hormone. Angiotensin II increases blood pressure by causing arterioles to constrict. It also increases blood volume in two ways.

(1) Firstly, by signaling the proximal convoluted tubules to reabsorb more NaCl and water.

(2) Secondly, by stimulating the adrenal gland to release **aldosterone,** a hormone that induces the distal convoluted tubule to reabsorb more Na^+ and water. This leads to an increase in blood volume and pressure, completing the feedback circuit by supporting the release of renin.



Still another hormone, a peptide called **Atrial Natriuretic Factor** (ANF), opposes the regulation by RAAS. Whenever there is rise in the BP or blood volume , the walls of the atrial of the heart release ANF in response to this increase in blood volume and pressure. ANF inhibits the release of renin from the JGA, and thereby, inhibits NaCl reabosorption by the collecting duct and reduces aldosterone release from adrenal gland. Thus ADH, the RAAS and ANF provid an elaborated system of checks and balance the regulate the kidney functioning, to control body fluid osmolarity, salt concentrations, blood pressure and blood volume.

Role of lungs in excretion :

Human lungs eliminate around 18 L of CO_2 per day and about 400 mL of water per day in normal resting condition. Water loss via the lungs is small in hot humid climate and large in cold dry climates. The rate of ventilation and ventilation pattern (ie.e. breathing through mouth or nose) also affect the water loss through the lungs. Different volatile materials are also readily eliminated throgh the lungs.

Role of skin in excretion :

Human possess two types of glands :

(1) **Sweat glands :** These excrete sweat, Sweat contain 99.5%, Water, NaCl, Lactic acid, Urea, Amino acid and glucose. Volume of sweat may vary from negligible to 14 litres a day.

(2) **Sebaceous glands :** These secrete sebum which conain waxes, sterols, other hydorcarbons and fatty acids.

Integument in many aquatic animals excretes ammonia in surrounding medium by diffusion.

Role of liver in excretion :

Liver is the main site for elimination of cholesterol, bile pigments (bilirubin & bilivirdin), inactivated products of steroid hormones, some vitamins and many drugs. Bile carries these materials to the intestine from where they are excreted with the faeces.

FUNCTIONS OF KIDNEY

- Regulation of water and electrolyte balance.
- Regulation of body fluid osmolality and elctrolyte concentration.
- Regulation of acid base balance.
- Regulation of arterial pressure.
- Excretion of metabolic waste and foreign chemicals
- Secretion of hormones like erythropoeitin and renin.
- Gluconeogenesis from amino acids.

DISORDERS OF KIDNEYS

(i) Artificial kidney : Artificial kidney, called haemodialyser, is a machine that is used to filter the blood of a person whose kidneys are damaged. The process is called haemodialysis. It may be defined as the separation of small molecules (crytalloids) from large molecules (colloids) in a solution by interposing a semipermeable membrane between the solution and water (dialyzing solution). It works on the principle of dialysis, i.e. diffusion of small solute molecules through a semipermeable membrane (G. dia = = through, lyo = separate). Haemodialyser is a cellophane tube suspended in a salt-water solution of the same composition as the normal blood plasma, except that no urea is present. Blood of the patient is pumped from one of the arteries into the cellophane tube after cooling it to 0oC and mixing with an anticoagulant (heparin). Pores of the cellophane tube allow urea, uric acid, creatinine, excess salts and excess H+ ions to diffuse from the blood into the surrounding solution. the blood, thus purified, is warmed to body temperature, checked to ensure that it is isotonic to the patient's blood, and mixed with an antiheparin to restore its normal clotting power. It is then pumped into a vein of the patient. Plasma proteins remain in the blood and the pores of cellophane are too small to permit the passage of their large molecules. The use of artificial kidney involves a good deal of discomfort and a risk of the formation of blood clots. It may cause fever, anaphylaxis, cardiovascular problems and haemorrhage. Kidney transplant is an alternative treatment.

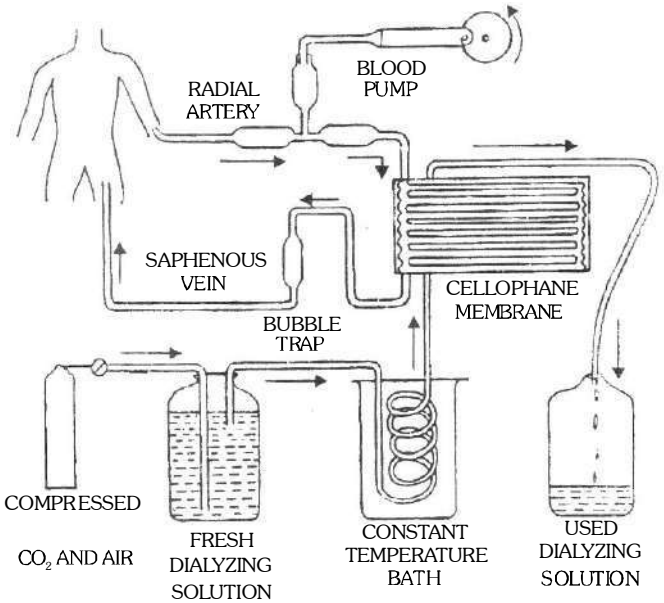


Fig. – Flow of blood through an artificial kidney for haemodialysis

C.A.P.D. : Continuous ambulatory peritoneal dialysis.

(ii) Kidney (Renal) Transplantation

Meaning : Grafting a kidney from a compatible donor to restore kidney functions in a recipient suffering from kidney failure is called renal transplantation.

History : First kidney transplant was performed between identical twins in 1954 by Dr. Charles Hufnagel, a Washington surgeon, India's first kidney transplant was done on December 1, 1971 at Christian Medical College, Vellore, TamilNadu. The recipient was a 35 years old person Shaninughan.

Eligibility : All patients with terminal renal failure are considered eligible for kidney transplantation, except those at risk from another life-threating disease.

Donors : A living donor can be used in a kidney transplant. It may be in identical twin, a sibling, or a close relative. If the living donors are not available, a cadaveric donor may be used (cadaver is a dead body). Over half of the kidney transplants are from cadavers.

Success rate : A kidney transplant from an identical twin, called isogeneic graft or isograft, is always successful. A renal transplant from a sibling or a close relative or a cadaver, termed allogeneic graft or homograft, is usually successful with the use of an immunosupressant that prevents graft rejection by body's immune response. Many renal transplant recipients are known to have retained functional grafts for over 20 years. Earlier, renal transplantation was limited to patients under 55 years. Now, however, with better techniques, kidney grafting has been done in selected patients in the 7th decade of life.

Pretransplant preparation : It includes haemodialysis to ensure a relatively normal metabolic state, and provision of functional, infection-free lower urinary tract.

Donor selection and kidney preservation : A kidney donor should be free of hypertension, diabetes, and malignancy. A living donor is also carefully evaluated for emotional stability, normal bilateral renal function, freedom from other systematic disease, and histocompatibility. Cadaveric kidney is obtained from previously healthy person who sustained brain death but maintained stable cardiovascular and renal function. Following brain death, kidneys are removed as early as possible, flushed with special cooling solutions, such as mannitol and stored in iced solution. Preserved kidneys usually function well if transplanted within 48 hours.

Recipient-Donor Matching : Recipient and donor are tested for 3 factors :

- **Blood groups :** Recipient's blood group should be compatible with donor's blood group.
- **Human leucocyte antigen (HLA) :** It is a genetic marker located on the surface of leucocytes. A person inherits a set of 3 antigens from the mother and three from the father. A higher number of matching antigens increases the chances that the kidney graft will last for a long time.
- **Antibodies :** Small samples of recipient's and donor's blood are mixed in a tube. If no reaction occurs, the patient will be able to accept the kidney.

Transplant procedure : Transplantation is done under general anaesthesia. Operation takes 3 or 4 hours. Cut is given in the lower abdomen. Donor's kidney is transplanted retroperitonealy in the iliac fossa. Artery and vein of new kidney are connected to the iliac artery and vein of the recipient. Ureter of the new kidney is connected to the urinary bladder of the recipient. Often the new kidney starts producing urine as soon as blood flows through it, but sometimes it may take a few weeks before it starts working. A week's stay in the hospital is necessary to recover from surgery, and longer if there are complications. The new kidney takes over the work of two failed kidneys. Unless they are causing infection or high blood pressure, the old kidneys are left in place.

Immunosupression : Immunosupression means to depress the immune response of the recipient to graft rejection. Prophylactic immunosuppressive therapy is started just before or at the time of renal transplantation. An ideal immunosuppressant suppress immunity against foreign tissue but maintains

immunity against infection and cancer. The drug, named cyclosporin, in such an immunosupressant. Use of antiserum to human lymphocytes is equally useful. It destroys T-cell mediated immune responses, but spares humoral antibody responses.

During embryonic development, nephrotome plate develops from mesoderm which is made up of fine tubules called **nephros.**

Nephrotome develops into kidney while neprons develops into Nephrons or Uriniferous tubules. On the basis of development, kidney are of 3 types.

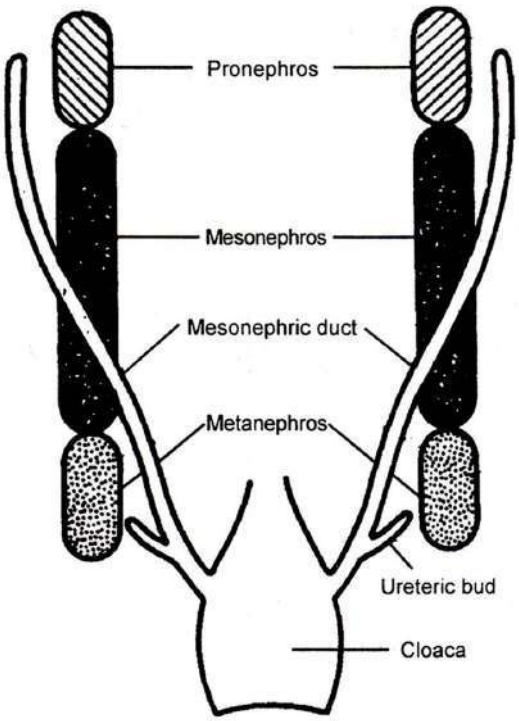
(1) Pronephric Kidney : Develop from anterior part (Pronephros) of Nephrotome plate, Its nephrons are in simple tubular shape. Nephrons are not differentiated Eg. Cyclostomates & Tadpole of frog.

(2) Mesonephric Kidney or opisthonephros : Develop from middle part (Mesonephros of) Nephrotome plate & remaining part of nephtotome is destroyed.Only Bowman's capsule is found in nephrons while remaining part is simple tubular.

Eg. Most of the fishes & adult Amphibians.

(3) Metanephric Kideny : Develops from posterior part (Metanephros) of nephrotome while remaining part is destoyed. Nephrons are will diffrentiated into Bowman's capusle PCT, DCT & loop of Henle's

Eg. Reptile, Aves, Mammals



Pronephros, Mesonephros & Metanephros

Henle's Loop :

- Less development in Reptiles
- Incompletely Developed in Aves
- Mammals have most developed Henles loops.

Autoregulation of GFR

Two important intrinsic mechanisms provide autoregulation of glomerular filtration rate :

(a) Myogenic mechanism : An increase in blood pressure will tend to stretch the afferent arteriole, which would be expected to increase the blood flow to the glomerulus. The wall of the afferent arteriole, however, responds to stretch by contraction, this reduces the diameter of the arteriole, and therefore causes increase in the resistance to flow. This myogenic mechanism, thus, reduces variations in flow to the glomerulus in case of fluctuations in blood pressure.

(b) Juxtaglomerular apparatus (JGA) : This specialised cellular apparatus is located where the distal convoluted tubule passes close to the Bowman's capsule between the afferent and efferent arterioles.JGA cells secrete enzymes like renin that modulate blood pressure, and thus renal blood flow and GFR are regulated. This discused earlier in the sheet.

Thus myogenic and Juxtaglomerular mechanisms work together to autoregulate the GFR Over a wide range of blood pressure.

REGULATION OF URINE FORMATION

HORMONAL REGULATION

1. Antidiuretic hormone or vasopressin

(i) It is secreted by posterior lobe of pituitary gland.

(ii) It inhances the reabsorption of water in the distal convoluted tubule and collecting duct.

2. Thyroxine

Deficiency of thyroxine leads to reduction in urine output.

3. Parathormone

It is secreted by parathyroid gland. It increase calcium reabsorption in renal tubule. It also reduces the reabsorption of phosphate in the renal tubules.

NERVOUS REGULATION

(i) Nerves arising from central nervous system are connected with both kidneys. The central nervous system sends impulse to the kidneys.

(ii) Nerve impulses regulates constriction and dilation of blood vessels of renal tubule. All these changes regulates urine formation.

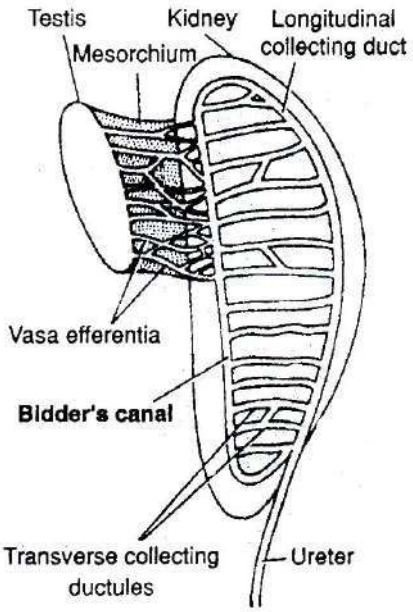


Diagram showing relationship of collecting ducts

IMPORTANT TIPS

Anuria - Failure of kidney to form urine.

Oligourea - is less urine output.

Cystitis - Inflammation of urinary bladder.

Filtration fraction - Ratio between GFR (glomerular filtration rate) and RPF (renal plasma flow).

Gout - Painful great toe (arthiritis) due to deposition of uric acid.

Haematuria - Presence of blood cells in urine.

Oedema - Increased volume of interstitial fluid.

Polynephritis - Inflammation of large number of nephrons.

Renal stone - Stone formation in the nephrons of kidney due to accumulation of mainly calcium oxalates some phosphates and uric acid.

Trimethylamine - Excretory product of marine teleosts (bony fishes).

Uraemia - High concentration of urea (about 10 times) in blood.

Chloragogen cells - Found in coelomic fluid of earthworm and are analogous (functionally similar) to human liver as are excretory in function.

Contractile vacuole - Osmoregulatory apparatus of fresh-water protozoans like Amoeba, Parmaecium etc. So contractile vacuole is functionally analogous to vertebrate kidney.

Glomerulonephritis - Chronic inflammation of glomeruli due to streptococcal infection.

Aminoaciduria - Urine with amino acids like cystine, glycine, etc.

Polyuria - Increased urine volume.

Allantoin and allantoic acid are nitrogenous excretory products formed during embryonic development of amniotes with shelled eggs. Allantoin is also called embryonic waste by allantoic acid is stored in allantois foetal membrane.

Chances of infection of urinary tract are more in women due to shroter urethra.

Urate cells - These are excretory cells of fat body of insects. These store excretory waste permanently called storage excretion.

Bright disease - Characterised by nephritis caused by streptococal infection.

Ptosis - Displacement of kidney.

Dysuria - Painful urination.

Certain animals are both ammonotelic and ureotelic e.g. Ascaris, earthworm, lung fish (African toad), etc.

Aminotelism - Expelling of amino acids as nitrogenous waste e.g. molluscs like Unio, Echinoder like Asterias, etc.

Chordate with flame cells is Branchiostoma (also called Amphioxus).

Nocturia - Increased volume of urine at night.

Abnormal constituent of urine - (i.e. Not present in normal condition)

1. **Protein -** If protein is present in urine it may be due to infection or injury in kidney. (Mainly albumin is filtered)
2. **Blood -** Due to infection and injury of kidney blood may appear in urine.
3. **Sugar -** In diabetes mellitus sugar appear in urine.
4. **Bile of bile pigment -** In jaundice bile pigment appear in urine.
5. **Ketone bodies -** In starvation and diabetes. Ketone bodies appear in urine.

Diabetes mellitus - Sugar appear in urine due to hyposecretion of insulin.

Diabetes incipidus - Tasteless more urine passing due to hyposecretion of A.D.H.

EXERCISE - 1

Q.1 The retroperitoneal kidney is -

(1) Kidney of fish

(2) Kidney covered by Peritonium on ventral side

(3) Kidney covered by Peritoneum on Dorsal side

(4) Kidney uncovered by Peritoneum on Dorsal Side.

Q.2 Difference between glomerular filtrate and plasma is of -

(1) Proteins

(2) Potassium

(3) First is white where as later is yellow

(4) First is yellow whereas later is white

Q.3 Excretory products of mammalian embryo are eliminated by -

(1) Placenta (2) Amniotic fluid

(3) Allantois (4) Ureters

Q.4 Workers in deep mines usually suffer from dehydration because -

(1) Water is lost due to evaporation

(2) Water is lost due to defeacation

(3) Water is lost in the form of urines

(4) Water is lost along with salts in the form of

Q.5 A condition of failure of kidney to form urine is called

(1) Diuresis (2) Hematuria

(3) Anuria (4) Ketonuria

Q.6 Diuresis is the condition in which -

(1) The excretory volume of urine increases

(2) The excretory volume of urine decreases

(3) The kidney fails to excrete urine

(4) The water balance of the body is disturbed

Q.7 Net filtration pressure in the glomerulus in kidney of man is about :–

(1) +75 mm Hg (2) +80 mm Hg

(3) +25 mm Hg (4) +50 mm Hg

Q.8 Loops of Henle occurs in -

(1) Cortex (2) Medulla

(3) Pelvis (4) Ureter

Q.9 Separation of amino and carboxylic groups from an amino acid is -

(1) Animation (2) Lysis

(3) Digestion (4) Deamination

Q.10 In frog nitrogenous waste Products are eliminated mainly as -

(1) Urea in tadpole & ammonia in adult frog

(2) Ammonia in tadpole and urea in adult frog

(3) Urea in both tadpole & adult frog.

(4) Urea in tadpole and uric acid in adult frog

Q.11 Which blood vessel contains the least amount of urea

(1) Hepatic Vein (2) Renal Vein

(3) Hepatic portal vein (4) Renal artery

Q.12 Ammonia is the main nitrogenous excretory material in -

(1) Amphibians (2) Turtles

(3) Tadpoles (4) Reptiles

Q.13 Presence of RBC in urine is called -

(1) Anuria (2) Haematuria

(3) Glycosuria (4) Ketonuria

Q.14 The blood vessel taking blood into Bowman's capsule is

(1) Afferent arteriole (2) Efferent arteriole

(3) Renal vein (4) Renel portal vein

Q.15 A man has taken large amount of protein in his diet. He will excrete more of

(1) Urea (2) Uric acid

(3) Sugar (4) Salts and water

Q.16 Ornithine cycle is related to -

(1) Respiration (2) Excretion

(3) Digestion (4) Nutrition

Q.17 In ornithine cycle, enzyme arginase breaks down arginine into -

(1) Citrulline and ammonia

(2) Ornithine and ammonia

(3) Ornithine and urea (4) Citrulline adnurea

Q.18 Cause of glomerular filtration is -
(1) Dialysis (2) Osmosis
(3) High hydrostatic pressure
(4) Diapedesis

Q.19 In glomerulus ultrafiltration occurs through
(1) Endothelial pores
(2) Basement membrane
(3) Podocytes.
(4) Inter podocytic spaces

Q.20 Trimethylamine is the excretory product in-
(1) Marine teleosts (2) Fresh water fishes
(3) Molluscs (4) Amphibians

Q.21 In mammals the urinary bladder opens into -
(1) Ureter (2) Urethra
(3) Vestibule (4) Uterus

Q.22. In rabbit and humans, the kidney is -
(1) Metanephric (2) Mesonephric
(3) Pronephric (4) Opisthonephric

Q.23 Urea is derived from
(1) Fats (2) Amino acids
(3) Carbohydrates (4) Uric acid

Q.24 Ammonia is excretory material in -
(1) Cartilaginous fishes (2) Fresh water fishes
(3) Whale (4) Camel

Q.25 Animals which excrete large amount of ammonia are
(1) Terrestrial (2) Amphibians
(3) Egg laying (4) Aquatic

Q.26 Ureotelic animals are those in which the main nitrogenous waste product is
(1) Amino acids (2) Urea
(3) Uric acid (4) Ammonia

Q.27 Excretory product of mammals is
(1) Salts (2) Glucose
(3) Urea (4) Ammonia

Q.28 Volume of urine is regulated by
(1) Aldosterone
(2) Aldosterone and ADH
(3) Aldosterone, ADH and testosterone
(4) ADH

Q.29 Urine of a human being suffering from diabities insipidus is
(1) Tasteless and thick (2) Sweet and thick
(3) Tasteless and watery
(4) Sweet and watery

Q.30 Malpighian corpuscles occur in -
(1) Medulla (2) Cortex
(3) Pelvis (4) Pyramid

Q.31 Reabsorption of glucose from glomerular filtrate occurs in
(1) Collecting tube
(2) Loop of Henle
(3) Proximal convoluted tubule
(4) Distal convoluted tubule

Q.32 Blood fraction remaining unchanged after circulation through kidney is
(1) Urea and uric acid
(2) Urea and Proteins
(3) Urea and glucose
(4) R.B.C. and proteins

Q.33 Which one is uricotelic
(1) Frog and toads
(2) Lizards and birds
(3) Cattle, money and man
(4) Molluscs and teleost fishes

Q.34 Which one is the most soluble in water
(1) Uric acid (2) Urea
(3) Fatty acids (4) Casein

Q.35 Brush border is characteristic of
(1) Neck of Nephron
(2) Collecting tube
(3) Proximal convoluted tubule
(4) All the above

Q.36 ADH controls water permeability of
(1) Collecting tube
(2) Proximal convoluted tuble
(3) Distal convoluted tuble
(4) Both 1 & 3

Q.37 What will happen if one kidney is removed from the body of a human being
(1) Death due to poisoning
(2) Ureamia and death
(3) Stoppage of urination
(4) Nothing the person will survive and remain normal

Q.38 Occurrence of excess urea in blood due to kidney failure is -
(1) Urochrome (2) Uraemia
(3) Uricotelism (4) Ureotelism

Q.39 What is true about distal convoluted tubule
(1) Na^+ reabsorption requires energy Na^+
(2) K^+ reabsorption does not require energy K^+
(3) Ammonia is excreted
(4) Water reabsorption requires energy

Q.40 Total filtrate formed in 24 hours in human kidney is
(1) 1.8 litres (2) 8.0 litres
(3) 18 litres (4) 180 litres

Q.41 In cockroach, the excretory product is
(1) Ammonia (2) Uric acid
(3) Urea (4) Both 1 and 3

Q.42 In kidney glomerulus is involved in
(1) Reabsorption of salts
(2) Urine collection
(3) Urine formation by blood filtration
(4) All the above

Q.43 The mechanism of urine formation in nephron involves
(1) Ultrafiltration (2) Secretion
(3) Diffusion (4) Osmosis

Q.44 Glomerular filtrate contains glucose in comparison to plasma
(1) More (2) Same
(3) Less (4) Nill

Q.45 In diabetes mellitus the patient drinks more water as there is urinary loss of
(1) Salt (2) Insulin
(3) Protein (4) Glucose

Q.46 The hormone that promotes reabosorption of water from glomerular filtrate is
(1) Oxytocin (2) Vasopressin
(3) Relaxin (4) Calcitonin

Q.47 Glucose is taken back from glomerular filtrate through
(1) Active transport (2) Passive transport
(3) Osmosis (4) Diffusion

Q.48 Which of the following is totally reabsorbed in renal tubules :-
(1) Na (2) K
(3) H_2O (4) $C_6H_{12}O_6$

Q.49 Part not belonging to uriniferous tubule is
(1) Glomerulus (2) Henle's loop
(3) Distal convoluted tuble
(4) Collecting duct

Q.50 Ornithine cycle operates in
(1) Stomach (2) Pancreas
(3) Liver (4) Oral cavity

Q.51 Reabsorption of chloride ions from glomerular filtrate in uriniferous tubule occurs by-
(1) Active transport (2) Diffusion
(3) Osmosis
(4) Brownian movement

Q.52 Main functions of kidney is
(1) Passive absorption
(2) Ultrafiltration
(3) Selective reabsorption
(4) Both 2 & 3

Q.53 Ornithine cycle performs
(1) ATP synthesis
(2) Urea formation in spleen
(3) Urea formation in liver
(4) Urine formation in liver

Q.54 If benzoic acid is present in the food of mammals, it is excreted out in the form of-
(1) Ornithuric acid (2) Aspartic acid
(3) Uric acid (4) Hippuric acid

Q.55 Person suffering from muscular dystrophy eliminate in urine a great amount of-

(1) Glucose (2) Sulphate

(3) Water (4) Creatinine

Q.56 Urea is formed in liver cells from

(1) Ammonia and Nitrogen

(2) Ammonia and carbon dioxide

(3) Ammonia carbon dioxide and aspartic acid

(4) Ammonia and carbon monoxide

Q.57 The stage of ornithine cycle at which arginase enzyme is used-

(1) Ornithine-citrulline

(2) Citrulline-arginosuccinic acid

(3) Arginine-ornithine

(4) Ornithine-urea

Q.58 In man the two kidneys lie-

(1) At the level of ovaries

(2) At the same level

(3) Left kidney at a higher level than the right one

(4) Right kidney at a higher level than the left one

Q.59 Which one is the diluting segment of uriniferous tubules

(1) Ascending loop of Henle

(2) Descending loop of Henle

(3) PCT

(4) DCT

Q.60 Vasa rectae are peritubular capillaries around

(1) Posterior part of alimentary canal

(2) PCT

(3) Loop of Henle

(4) DCT

Q.61 Micturition is

(1) Removal of urea from blood

(2) Removal of uric acid

(3) Passing out urine

(4) Removal of Fats

Q.62 Glomerular filtration rate would be decreased by-

(1) Constriction of the efferent arteriole

(2) An increase in afferent arteriolar pressure

(3) Compression of the renal capsule

(4) An increase in renal blood flow

Q.63 Diameter of the renal afferent vessel is

(1) Same as that of efferent

(2) Smaller than that of efferent

(3) Larger than that of efferent

(4) There is no efferent vessel

Q.64 The afferent and efferent vessels are

(1) Arterial in nature

(2) Venous in nature

(3) One is arterial and the other is venous

(4) None of the above

Q.65 Physiologically urea is produced by the action of an enzyme.

(1) Uricase (2) Urease

(3) Arginase (4) None

Q.66 A notch present on the medial side of kidney is known as

(1) Ureter (2) Pelvis

(3) Hilus (4) Pyramid

Q.67 The narrow apex of pyramid is called

(1) Column of bertini

(2) Calyx

(3) Papillary duct of Bellini

(4) Pelvis

Q.68 Bowman's capsule is lined by

(1) Ciliated cuboidal epithelium

(2) Squamous epithelium

(3) Nonciliated cuboidal epithelium

(4) Non ciliated columnar epithelium

Q.69 Functional & structural unit of kidney is

(1) Nephron (2) Seminiferous tubule

(3) Acini (4) None

Q.70 Nephron is also known as
(1) Juxto glomerular tubule
(2) Seminiferous tubule
(3) Uriniferous tubule (4) All

Q.71 Nephron is made up of
(1) Malpighian body (2) Tubule
(3) Both (4) None

Q.72 If we remove the pressure receptors from urinary bladder wall.
(1) There will be no micturition
(2) Micturition will continue
(3) Urine will collect in the bladder
(4) None

Q.73 Filtration fraction is the ratio of-
(1) GFR and RPF (2) Hb and HbO_2
(3) O_2 and CO_2 (4) HCO_3 and H_2CO_3

Q.74 Out of the following which is the abnormal condition of urine
(1) Diuretic (2) Alkaptonuria
(3) Haematomesis (4) None

Q.75 Urea is transported by
(1) Plasma (2) RBC
(3) WBC (4) All

Q.76 One is increased in blood of a person whose kidney is not working properly
(1) Urea (2) Ammonia
(3) Sodium chloride (4) None

Q.77 One is found in blood not in Nephric filtrate
(1) Urea (2) Glucose
(3) Amino acids (4) Globulin

Q.78 Uraemia is a disease when there is an excess of
(1) Cholesterol in the blood
(2) Glucose in the blood
(3) Urea in the blood (4) Urea in Urine

Q.79 Excretion in the form of uric acid and urates in birds is helpful in
(1) Conserving body heat
(2) Eliminating excess water
(3) Conserving body water
(4) Eliminating body water

Q.80 Maintenance of internal body tissue fluid is
(1) Excretion (2) Osmoregulation
(3) Homeostatis (4) None

Q.81 Urine is acidic due to presence of
(1) HNO_3 (2) HCI
(3) NaH_2PO_4 (4) H_2SO_4

Q.82 Discharge of bile pigments in urine indicates
(1) Anaemia (2) Diabetes
(3) Jaundice (4) Rickets

Q.83 Uric acid excretion is carried out by-
(1) Ultrafiltration
(2) Selective reabsorption
(3) Secretion (4) None

Q.84 One of the following in impermeable to H_2O
(1) PCT (2) DCT
(3) Descending limb (4) Ascending limb

Q.85 The snakes living in deserts are mainly
(1) Ammonotelic (2) Aminotelic
(3) Ureotelic (4) Uricotelic

Q.86 What is the pH value of human urine
(1) 2.00 (2) 6.00
(3) 7.5 (4) 8.00

Q.87 Which of the following is not a structure of kidney?
(1) Cortex (2) Medulla
(3) Calyx (4) Ureter

Q.88 Keto uria is
(1) Albumin in urine (2) Globulin in urine
(3) Ketone bodies in urine
(4) None of the above

Q.89 Glycosuria is the term used for-
(1) Loss of blood in urine
(2) Loss of glucose in urine
(3) Loss of salt in urine (4) None of these

Q.90 One is not the function of kidney
(1) Osmoregulation (2) Salt retention
(3) Excretion (4) Synthesis of urea

Q.91 The elimination of the insoluble $CaPO_4$ takes place by
(1) Kidney (2) Liver
(3) Large intestine (4) All

Q.92 The yellow colour of urine of vertebrates is due to-
(1) Cholestrol (2) Urochrome
(3) Urinod (4) None

Q.93 Which is the simplest excretory organs :-
(1) Alveoli (2) Flame Cells
(3) Nephridia (4) Kidney

Q.94 Characteristic smell of urine is due to
(1) Urea (2) Uric acid
(3) Urinod (4) None

Q.95 One of the following excrete urea
(1) Snakes (2) Birds
(3) Insects (4) None

Q.96 Uric acid excretion is an adaptation for
(1) Water conservation (2) Water removal
(3) Osmoregulation (4) None

Q.97 NH_3 is
(1) Less toxic (2) Toxic
(3) Highly toxic (4) None

Q.98 NH_3 change into urea in presence of
(1) Arginase enzyme (2) Urinase enzyme
(3) Xanthine oxidase (4) None

Q.99 In embryonic kidney 1st stage of development is
(1) Pronephric (2) Mesonephric
(3) Metanephric (4) None

Q.100 Loop of Henle is found in
(1) Pronephric kidney
(2) Meta nephric kidney
(3) Both (4) None

Q.101 Incomplete loop of Henle is found in
(1) Frog (2) Lizzard
(3) Bird (4) Mammal

Q.102 Complete loop of Henle is found in
(1) Amphibia (2) Reptilia
(3) Birds (4) Mammals

Q.103 Mammals are characterised by
(1) Metanephric kidney with loop of Henle
(2) Mesonephric kidney with out Henle loop
(3) Metanephric kidney with out Henle loop
(4) Proanephric without Henle loop

Q.104 Duct of Bellini concerned with
(1) Filtration of urine
(2) Purification of urine
(3) Conduction of urine
(4) All the above

Q.105 G.F. at the base of Henle's loop is
(1) Isotonic (2) Hypotonic
(3) Hypertonic (4) Insoluble

Q.106 Which vitamin is excreted out in high quantity through urine in man
(1) Vit C. (2) Vit D
(3) Vit E (4) Vit K

Q.107 Ornithine cycle discovered by
(1) Kreb and kornberg
(2) Hans kreb
(3) Kred and Henseleit
(4) Embden

Q.108 "Homeostasis" term proposed by
(1) Clude Bernard (2) Water cannon
(3) Marcello Malpighi (4) Henle

Q.109 Which part of Nephron composed of ciliated epithelium
(1) P.C.T. (2) D.C.T.
(3) Neck (4) 1 & 2 both

Q.110 Ureotelic kidney is found in
(1) Man (2) Frog
(3) Rabbit (4) All

Q.111 Contractile vacuole of Amoeba is equal to
(1) Kidney (2) Liver
(3) Intestine (4) Skin

Q.112 Urine contains How much water
(1) 96% (2) 90%
(3)70% (4) None

Q.113 Which secretes Renin
(1) Stomach
(2) Juxta glomerular body
(3) Juxta cortical cell
(4) Juxta medullary cell

Q.114 Podocytes are present in
(1) Afferent arteriole (2) Efferent arteriole
(3) Peritubular network
(4) Bowman's cup

Q.115 Which excretory material is least toxic
(1) Ammonia (2) Urea
(3) Uric acid
(4) Trimethylamine oxide

Q.116 Which is absent in Glomerular filtrate
(1) Blood corpuscles (2) Fats
(3) Proteins (4) All

Q.117 Inner wall of Urinary bladder composed of
(1) Unstriped muscles (2) Striped muscles
(3) Statified epithelium
(4) Transitional epithelium

Q.118 Changeable threshold material in Renal tubules
(1) Water and Glucose (2) Urea & Uric acid
(3) Glucose & Amino acids
(4) Water & salts

Q.119 Which material composed the "Gall stone from layered
(1) $CaCO_3$ (2) Oxalates
(3) Cholesterol (4) $CaSO_4$

Q.120 Excretory material are formed in
(1) Kidney (2) Rectum
(3) Liver (4) Everybody cell

Q.121 Sulphates phosphates and carbonates of calcium are excreted by
(1) Kidney (2) Liver
(3) Spleen (4) Colon

Q.122 Which regulates reabsorption of salts from Glomerular filtrate
(1) Oxytocin (2) Vassopressin
(3) Glucocorticoides (4) Mineralo corticoids

Q.123 Patients of diabeties have glucose in urine because
(1) Glucose is not absorbed from G.F.
(2) Glucose is absorbed from G.F.
(3) Glandular cells secreted glucose in G.F.
(4) Concentration of glucose is more in G.F. as compared to its normal amount

Q.124 Mesonephric kidney develops from
(1) Anterior part of nephrotome
(2) Middle part of Nephrotome
(3) Posterior part of nephrotome
(4) None

Q.125 Kidney is
(1) Ectodermal (2) Mesodermal
(3) Endodermal (4) None

Q.126 In male frog ureter transfer
(1) Urine (2) Sperms
(3) Both (4) None

Q.127 Pyramids in both kidneys of rabbit are
(1) 2 (2) 4
(3) 6 (4) 10

Q.128 Pyramids in kidney of man are
(1) 4 (2) 6
(3) 8 (4)12

Q.129 Na^+ and Cl^- both are removed by-
(1) Ascending limb of Henle's loop
(2) Proximal convoluted tubule
(3) Both (1) and (2)
(4) Descending limb of Henle's loop

Q.130 Trimethylamine oxide (TMO) is excreted by certain-
(1) Elasmobranches (2) Seashore birds
(3) Marine teleosts (4) Freshwater teleosts

EXERCISE - 2

Q.1 Excretion involves process in which –
(1) Harmful substance are stored in cells before being eliminated
(2) Expulsion of urine from the urinary bladder and sweat from the skin
(3) Harmful substance in the body are chemically changed
(4) Substance of no further use or those present in excessive quantities are thrown out of the body

Q.2 In aquatic organisms the waste end product of nitrogen metabolism is –
(1) Urea (2) Ammonia
(3) Nitrogen (4) Allantois

Q.3 Ammonotelic animals are predominantly –
(1) Terrestrial (2) Parasitic
(3) Volant (4) Aquatic

Q.4 Which of the following is likely to accumulate in dangerous proportion in the blood of a person whose kidney is not working properly–
(1) Urea (2) Sodium chloride
(3) Ammonia (4) Lysine

Q.5 Urea is transported by –
(1) Blood plasma (2) Leucocytes
(3) RBCs (4) Haemoglobin

Q.6 Which of the following sets of animals are uricotelic –
(1) Fish, frog, lizard and fowl
(2) Fish, snake, fowl and man
(3) Camel, dog, monkey and man
(4) Crow, snake, cockroach and lizard

Q.7 Major nitrogenous waste product in ureotelic animals like rabbit and other mammals is –
(1) Ammonia (2) Amino acids
(3) Urea (4) Uric acid

Q.8 Which of the following sets of animals produce the same substance as their chief excretory product –
(1) Camel, housefly and snake
(2) Fish, pigeon and frog
(3) Amoeba, ant and antelope
(4) Frog, monkey and dog

Q.9 The blood which leaves the liver and moves to the heart has higher than the usual contents of–
(1) Oxygen (2) Urea
(3) Bile (4) Water

Q.10 Urea is a nitrogenous waste. Which of the following substance contribute to the nitrogen–
(1) Mineral salts (2) Amino acids
(3) Vitamins (4) Lipids

Q.11 A man, has taken a large amount of protein in his diet. He will excrete more of –
(1) Uric acid (2) Salt and water
(3) Urea (4) Sugar

Q.12 Most insects are –
(1) Uricotelic (2) Ammonotelic
(3) Aminotelic (4) Ureotelic

Q.13 Uric acid is chief excretory product in –
(1) Insects (2) Earthworms
(3) Amphibians (4) Mammals

Q.14 The snakes living in deserts are mainly –
(1) Ammonotelic (2) Aminotelic
(3) Uricotelic (4) Ureotelic

Q.15 The least toxic nitrogenous waste is –
(1) Ammonia + urea (2) Ammonia
(3) Uric acid (4) Urea

Q.16 In reptiles, uric acid is stored in –
(1) Anus (2) Cloaca
(3) Liver (4) Fat bodies

Q.17 If benzoic acid is present in the food of mammals, it is excreted out in the form of–
(1) Hippuric acid (2) Ornithinic acid
(3) Uric acid (4) Aspartic acid

Q.18 The excretory product of excess metabolism of creatine is
(1) Oxalic acid (2) Uric acid
(3) Creatinine (4) Urea

Q.19 Column of Bertini is found in –
(1) Liver (2) Kidney
(3) Ovaries (4) Testes

Q.20 Man is –
(1) Ammonotelic (2) Ureotelic
(3) Uricotelic (4) None of these

Q.21 The retroperitoneal kidney is –
(1) Kidney covered by peritoneum on ventral side
(2) Kidney of fish
(3) Kidney uncovered by peritoneum on dorsal side
(4) Kidney covered by peritoneum on dorsal side

Q.22 The position of kidney is –
(1) Inter peritoneal (2) Retroperitoneal
(3) Intraperitoneal (4) None of these

Q.23 The kidneys not only remove the waste products from the blood but also play a very important role in maintaining –
(1) Constant composition of the blood irrespective of the nature of the food or fluid intake
(2) Blood pressure constant
(3) Temperature of the body
(4) Equilibrium of the body

Q.24 The functional part of the kidney of adult reptiles, birds and mammals is –
(1) Holonephros (2) Pronephros
(3) Mesonephros (4) Metanephros

Q.25 Kidney is not distinguished into cortex and renal medulla in
(1) Frog (2) Man
(3) Rabbit (4) Camel

Q.26 The main function of pyramids of kidney is to-
(1) Direct the urine to flow in ureter
(2) Contain collecting tubules of kidney
(3) Store fats and protein
(4) Support the openings of collecting canals

Q.27 Which of the following influences the activity of kidney –
(1) Vasopressin and adrenalin
(2) Gonadotrophins
(3) Thyroxine (4) Vasopressin

Q.28 Which feature enables the mammalian kidney to concentrate urine in the medullary region –
(1) Rapid removal of sodium ions form the medullary tissues
(2) Maintaining a high osmotic pressure in the tissues between the tubules
(3) High oxidative metabolism of medullary cells
(4) Rapid flow of blood through the medulla

Q.29 In the kidney of the rabbit, the Loop of Henle is the part of –
(1) Collecting duct (2) Glomerulus
(3) Uriniferous tubule (4)Bowman's capsule

Q.30 Trimethylamine oxide (TMAO) is excreted by–
(1) Molluscs (2) Fresh water fishes
(3) Marine teleosts (4) Amphibians

Q.31 In the kidney, the formation of urine involve the following processes arranged as –
(1) Reabsorption, filtration and secretion
(2) Glomerular filtration, selective reabsorption and tubular secretion
(3) Filtration, secretion and reabsorption
(4) Secretion, absorption and filtration

Q.32 Which one is not the function of kidney –
(1) Acid-base balance (2) Osmoregulation
(3) Urea synthesis (4) Salt balance

Q.33 Kidney are not only the organs of excretion their work is supplemented by –
(1) Large intestine (2) Lungs
(3) Liver (4) Skin

Q.34 A severe fall in blood pressure disturbs the function of kidneys and reduces –
(1) Reabsorption of useful substances
(2) Glomerular filtration
(3) Secretion of nitrogenous waste
(4) Renal filtration

Q.35 The loop of Henle is most highly developed in-
(1) Mammals (2) Desert lizards
(3) Fresh water fishes (4) Salamanders

Q.36 The animal that excretes amino acids without deamination is –
(1) Spider (2) Unio
(3) Housefly (4) Frog

Q.37 Ammonia is the chief nitrogenous excretory material in –
(1) Cartilaginous fishes (2) Fowl
(3) Fresh water fishes (4) Mosquitoes

Q.38 A nephron does not have loop of Henle in –
(1) Rabbit (2) Dog
(3) Frog (4) Man

Q.39 In a glomerulus –
(1) Afferent capillaries are thicker than efferent capillaries
(2) Afferent arteriole is thicker than efferent arteriole
(3) Afferent arteriole is thinner than efferent arteriole
(4) Afferent capillaries are thinner than efferent capillaries

Q.40 Malpighian body is constituted by –
(1) Glomerulus, Bowman's capsule and efferent vessel
(2) Glomerulus and efferent vessel
(3) Glomerulus and Bowman's capsule
(4) Glomerulus only

Q.41 Which one of the following substance is completely reabsorbed from the filtrate in the renal tubule under normal condition –
(1) Urea (2) Uric acid
(3) Salt and water (4) Glucose

Q.42 High blood pressure is maintained in glomeruli than in other capillaries because –
(1) The variability of the diameters of arterioles causes higher resistance to blood flowing out of the glomeruli than to out of the capillaries
(2) Glomeruli has low hydrostatic pressure than capillary
(3) Capillary has less diameter than glomeruli
(4) All the above

Q.43 The afferent and efferent vessels are –
(1) Arterial in nature
(2) Venous in nature
(3) One is arterial and the other is venous
(4) None of the above

Q.44 Blood vessel leading to glomerulus is called
(1) Afferent arteriole (2) Renal artery
(3) efferent arteriole (4) Renal vein

Q.45 Juxtaglomerular cell of the kidney secrete –
(1) ADH (2) Aldosterone
(3) Renin (4) Angiotensin

Q.46 Ultrafilatration occurs in a glomerulus when-
(1) Osmotic pressure exceeds hydrostatic pressure
(2) Hydrostatic pressure exceeds osmotic pressure
(3) Colloidal osmotic pressure plus capsular pressure remain less than glomerular hydrostatic pressure
(4) Capsular hydrostatic pressure exceeds glomerular hydrostatic pressure

Q.47 Workers in deep mines usually suffer from dehydration because –
(1) Water is lost due to defecation
(2) Water is lost due to evaporation
(3) Water is lost along with salts in the form of sweat
(4) Water is lost in the form of urine

Q.48 If humidity is high in the presence of high temperature, we feel unpleasant due to –
(1) More sweating
(2) No sweating
(3) Less sweating
(4) Failure of sweat to evaporate due to excessive humidity

Q.49 The yellow colour of urine is due to –
(1) Urea (2) Melanin
(3) Uric acid (4) Urochrome

Q.50 Excretion is a continuous process but urine is not passed out continuously because of –

(1) Ureter (2) Rectum

(3) Urinary bladder (4) Cloaca

Q.51 The effect of antidiuretic hormone (ADH) on the kidney is to –

(1) Increase the excretion of Na^+

(2) Increase the excretion of water

(3) Increase the glomerular filtration rate

(4) Increase the permeability of the distal convoluted tubule of nephron to water

Q.52 ADH will be released from the posterior pituitary when there is a decrease in –

(1) Plasma potassium concentration

(2) Plasma pH

(3) Plasma sodium concentration

(4) Plasma volume

Q.53 If we remove the pressure receptors from the urinary bladder wall –

(1) Micturition will continue

(2) Their will be no micturition

(3) Urine will collect in the bladder

(4) There will be no collection of urine in bladder

Q.54 Mammalian kidney serve to excrete –

(1) Excess salts, urea and excess water

(2) Excess water, urea and amino acids

(3) Excess salts, urea and glucose

(4) Excess salts, excess water and excess amino acids

Q.55 Aquatic animals are mostly ammonotelic because –

(1) Excretion of ammonia requires large amount of water which is available to these animals

(2) Ammonia helps in checking inflow of water into body

(3) These get less light

(4) Water contains less nitrogen

Q.56 Aldosterone stimulates the reabsorption of–

(1) Keto acids (2) Glucose

(3) K^+ ions (4) Na^+ ions

Q.57 Percentage of which increases in blood if liver becomes functionless –

(1) Uric acid (2) Proteins

(3) Urea (4) Ammonia

Q.58 Which blood vessel carries least percentage of urea –

(1) Renal artery (2) Pulmonary vein

(3) Hepatic portal vein (4) Renal vein

Q.59 Glomerular filtration rate would be decreased by –

(1) an increase in renal blood flow

(2) Compression of the renal capsule

(3) An increase in afferent arteriolar pressure

(4) Constriction of the efferent arteriole

Q.60 One of the following substance is not found in mammalian urine –

(1) Ammonium salt (2) Sucrose

(3) Sodium chloride (4) Water

Q.61 In which part of excretory system of mammals can you first use the term 'urine' for contained fluid –

(1) Urinary bladder (2) Collecting tubule

(3) Bowman's capsule (4) Loop of Henle

Q.62 In public urinals, the urine on standing gives a pungent smell, due to –

(1) Conversion of uric acid into ammonia by ornithine cycle

(2) Conversion of both urea and uric acid into ammonia

(3) Conversion of urea into ammonia by bacteria

(4) None of these

Q.63 A person who is starving, that is not having food, water and beverages will have –

(1) Less urea in his urine

(2) Less fats in his urine

(3) More glucose in his blood

(4) More urea in his blood

Q.64 When certain marine organisms are placed in distilled water, they ultimately die. Which could be the most likely explanation –
(1) Excess of water in the tissues
(2) Loss of water from the tissue
(3) Loss of permeability of some membranes
(4) Loss of salts

Q.65 An advantage of excreting nitrogenous wastes in the form of uric acid is that –
(1) The formation of uric acid requires a great deal of energy
(2) Uric acid can be excreted in almost solid form
(3) Uric acid may be excreted through the lungs
(4) Uric acid is the first metabolic breakdown products of acids

Q.66 The amount of the original filtrate volume which is reabsorbed by the time the tubular fluid enters the Henle's loop is approximately–
(1) 75% (2) 95%
(3) 85% (4) 90%

Q.67 What is "renal threshold" –
(1) The highest concentration of substances upto which it is totally reabsorbed from glomerular filtrate
(2) At which all the substances are reabsorbed
(3) At which the filtration of a substance starts
(4) At which no substance is filtered in the glomerulus

Q.68 Which group of the following contains the final excretory product –
(1) Allantois, hippuric acid, ornithinic acid
(2) Ornithine, cytosin, citruline
(3) Trimethyl aminoxide, citruline, arginine
(4) Creatine, cretinine, citruline

Q.69 The glomerular filtrate contains –
(1) Blood minus cells
(2) Blood minus cell and proteins
(3) Plasma minus cells and proteins
(4) Blood minus proteins

Q.70 The vessel leading blood (containing nitrogenous waste) into the Bowman's capsule is known as –
(1) Afferent arteriole (2) Renal vein
(3) Efferent arteriole (4) Renal artery

Q.71 High threshold substances are the substances which can be –
(1) Excreted by the nephrons
(2) Ultrafiltered in the glomerulus
(3) Reabsorbed actively
(4) Secreted actively

Q.72 Which of the following is not an intermediate product in the biosynthesis of urea –
(1) Orinithine (2) Citrulline
(3) N-acetyl glutamate (4) Arginine

Q.73 Ornithine is converted into citrulline by an enzyme –
(1) Aspartic glutamic transaminase
(2) Glutamic dehydrogenase
(3) Ornithine carbamyl transferase
(4) Carbamyl phosphate synthetase

Q.74 Urea cycle in liver was discovered by –
(1) Bowman and Krebs
(2) Krebs and Henseleit
(3) Landsteiner and Weiner
(4) Bayliss and Sterling

Q.75 Which of the following terms refer to painful urination –
(1) Enuresis (2) Dysuria
(3) Anuria (4) Ketosis

Q.76 In diabetes mellitus, the patient drinks more water as there is urinary loss of –
(1) Protein (2) Salt
(3) Insulin (4) Glucose

Q.77 Presence of RBCs in urine is called –
(1) Glycosuria (2) Pyuria
(3) Albuminuria (4) Haematuria

Q.78 A patient who excretes large quantity of sodium in urine has –
(1) Diseased adrenal cortex
(2) Diseased adrenal medulla
(3) Diseased parathyroid
(4) Diseased thymus

Q.79. A kidney stone is –

(1) Deposition of sand in kidney

(2) Blockage by fats

(3) Blockage by proteins

(4) A salt such as oxalate crystallised in pelvis

Q.80 Glycosuria is the terms used for –

(1) Loss of glucose in urine

(2) Loss of blood in the urine

(3) Loss of salts in the urine

(4) None of these

EXERCISE - 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Part not belonging to uriniferous tubule is– **[AIPMT 94]**

(1) Glomerulus (2) Henle's

(3) Distal convoluted tuble

(4) Collecting duct

Q.2 Which pair is correct– **[AIPMT 2000]**

(1) Sweat = temperature regulation

(2) Saliva = sense of food taste

(3) Sebum = sexual attraction

(4) Humerus = Hind leg

Q.3 Malpighian corpuscles are present in– **[RPMT 2001]**

(1) Cortex (2) Medulla

(3) Germinal cells (4) None of them

Q.4 In rabbit and humans, the kidney is– **[BHU 82, CPMT 91]**

(1) Metanephric (2) Mesonephric

(3) Pronephric (4) Opisthonephric

Q.5 Brush border is characteristic of **[AIPMT 90]**

(1) Neck of nephron

(2) Collecting tube

(3) Proximal convoluted tuble

(4) All the above

Q.6 Which type of kidneys are found inamphibian– **[RPMT 2002]**

(1) Holonephric (2) Mesonephric

(3) Pronephric (4) Meta nephric

Q.7 Difference between glomerular filtrate and plasma is of– **[DPMT 85]**

(1) Proteins

(2) Potassium

(3) First is whit where as later is yellow

(4) First is yellow whereas later is white

Q.8 Effective filtration pressure in the glomerulus in kidney of man is about **[CPMT 90]**

(1) + 75 mm Hg (2) + 10 mm Hg

(3) + 35 mm Hg (4) + 50 mm Hg

Q.9 Nitrogenous waste products are eliminated mainly as– **[AIPMT 91]**

(1) Urea in tadpole & ammonia in adult frog

(2) Ammonia in tadpole and urea in adult frog

(3) Urea in both tadpole & adult frog

(4) Urea in tadpole and uric acid in adult frog

Q.10 Reabsorption of useful substances from glomerular filtrate occurs in **[AIPMT 89]**

(1) Collecting tube (2) Loop of henle

(3) Proximal convoluted tuble

(4) Distal convoluted tuble

Q.11 Blood fraction remaining unchanged after circulation through kidney is –**[MP PMT 88]**

(1) Urea and uric acid

(2) Urea and Proteins

(3) Urea and glucose

(4) Glucose and proteins

Q.12 Which one is the most soluble in water. **[MP PMT 90]**

(1) Uric acid (2) Urea

(3) Fatty acids (4) Casein

Q.13 ADH controls water permeability of– **[BHU 90]**

(1) Collecting tube (distal part)

(2) Proximal convoluted tuble

(3) Distal convoluted tuble (distal part)

(4) All the above

Q.14 What will happen if one kidney is removed from the body of a human being **[MP PMT 98]**

(1) Death due to poisoning

(2) Ureamia and death

(3) Stoppage of urination

(4) Nothing, the person will survive and remain normal kidney will become hypertrophied

Q.15 Occurance of excess urea in blood due to kidney failure is– **[CPMT 91]**

(1) Urochrome (2) Uraemia

(3) Uricotelism (4) Ureotelism

Q.16 What is true about distal convoluted tubule **[MP PMT 91]**

(1) Na^+ reaborption requires energy

(2) K^+ reabsorption does not require energy

(3) Ammonia is excreated

(4) Water reabsorption requires energy

Q.17 Total filtrate formed in 24 hours in human kidney is – **[BHU 92]**

(1) 1.8 litres (2) 8.0 litres

(3) 18 litres (4) 180 litres

Q.18 In kidney glomerulus is involved in – **[CPMT 92]**

(1) Reabsorption of salts

(2) Urine collection

(3) Urine formation by blood filtration

(4) All th above

Q.19 Glomerular filtrate contains glucose in comparison to plasma **[CPMT 92]**

(1) More (2) Same

(3) Less (4) Nill

Q.20 Which of the following is totally reabsorbed in renal tubes **[CPMT 93]**

(1) Na (2) K

(3) H_2O (4) $C_6H_{12}O_6$

Q.21 Ammonia is converted into urea in **[RPMT 95, Manipal 95]**

(1) Heart (2) Spleen

(3) Liver (4) Brain

Q.22 Which vitamin is excreted out in high quantity through urine in man– **[RPMT 2000]**

(1) Vit. C (2) Vit. B

(3) Vit. E (4) Vit. K

Q.23 If the afferent arteriole diameter is less than efferent arteriole than what happen **[Manipal CET 2000]**

(1) No effect

(2) Ultrafiltration reaction is slow

(3) Ultrafiltration is not possilbe.

(4) Ultrafiltration will stop & tubular secretion is start

Q.24 Concentration of urine depends upon which organ– **[AIPMT 2000]**

(1) Bowman's capsule

(2) Length of Henle's loop

(3) P.C.T.

(4) Network of capillaries arising from glomerulus

Q.25 Conversion of ammonia to urea is done by ..... **[AIPMT 2000]**

(1) Ornithine cycle (2) Arginine cycle

(3) Fumaric cycle (4) Citrulline cycle

Q.26 The movement of Ions against the concentration gradient will be–**[AIPMT 200]**

(1) Active transport (2) Osmosis

(3) Diffusion (4) All

Q.27 If henle's loop wer absent from mammalian nephron, which of the following is to be expected– **[AIPMT 2003]**

(1) There will be no urine formation

(2) There wil be hardly any change in the quality and quntity of urine formed

(3) The urine will be more concentrated

(4) The urine will be more dilute

Q.28 Correct order of excretory organs in Cockroach, Earthworm and Rabbit respectively– **[PRMT 2001]**

(1) Skin, malpighi tubules, kidney

(2) Malpighi tubules, kidney

(3) Nephridia, malpighi tubules, kidney

(4) Nephridia, kidney, green gland

Q.29 Which one does not filter out from blood to Bowmans capsule in glomerular ultrafiltration– **[RPMT 2001]**

(1) Amino acids (2) Polypeptide

(3) Glucose (4) Fatty acids

Q.30 Which one of the following body functions is not performed by kidneys **[RPMT 2002]**

(1) Excretion

(2) Osmoregulation

(3) Regulation of blood volume

(4) Detruction of dead blood copuscles

Q.31 Which of the following is excreted in mammals in the form of nitrogen– **[RPMT 2003]**

(1) Ammonium ion (2) Ammonia

(3) Uric acid (4) Urea

Q.32 The net pressure gradient that causes the fluid to filter out of the glomeruli into the glomeruli into the capsule is– **[AIPMT 2005]**

(1) 20 mm Hg (2) 50 mm Hg

(3) 75 mm Hg (4) 30 mm Hg

Q.33 Whic one of the following blood vessel in mammals contains least amound of urea– **[RPMT 2005]**

(1) Hepatic portal vein (2) Hepatic vein

(3) Dorsal aorta (4) Renal vein

Q.34 A person who is on a long hunger strike and is surviving only on water, will have : - **[AIPMT 2007]**

(1) Less urea in his urine

(2) More sodium in his urine

(3) Less amino acids in his urine

(4) More glucose in his blood

Q.35 Water reabsorption in the distal parts of kidney tubules is regulated by : **[CPMT 2002]**

(1) STH (2) TSH

(3) ADH (4) MSH

Q.36 Due to insufficient filtration in the Bowman's capsule, all are likely to happen except : **[AIIMS 1992]**

(1) Accumulation of fluid in the body

(2) Increase in blood pressure

(3) Incrase in blood urea level

(4) Loss of glucose through urine

Q.37 The appearance of albumin in the urine is most likely due to : **[AIIMS 1987]**

(1) Increase in the blood pressure

(2) Decrease in the blood osmotic pressure

(3) Damage to the Malpighian corpuscles

(4) Damage to the proximal convoluted tubules

Q.38 Urinary excretion of Na is regulated by : - **[AIIMS 1992]**

(1) Anterior pituitary (2) Posterior pitultary

(3) Anrenal cortex (4) Adrenal medulla

Q.39 Kidney crystals are solid clusters of : **[AIPMT 1990]**

(1) Calcium nitrate and uric acid

(2) Phosphate and uric acid

(3) Clacium carbonate and uric acid

(4) Calcium metabisulphite and uric acid

Q.40 The yellow colour of urine of vertebrates is due to : **[DELHI PMT 2004]**

(1) Cholesterol (2) Urochrome

(3) Uric acid (4) Melanin

Q.41 Which one of the four parts mentioned below does not constitute a part of a single uriniferous tubule: **[AIPMT 1994]**

(1) Bowman's capsule

(2) Distal convoluted tubule

(3) Loop of Henle (4) Collecting duct

Q.42 Diuresis s a specific pathological condition which lead to : **[MP PMT 2001]**

(1) Increased volume of urine excretion

(2) Decreased volume of urine excretion

(3) Increased glucose excretion

(4) Decreased electrolyte concentration

Q.43 Which one of the following pair of waste substances is removed from blood in ornithine cycle : **[BHU 2001]**

(1) CO_2 and urea
(2) Ammonia and urea
(3) CO_2 and ammonia
(4) Urea and sodium salt

Q.44 Maximum basorption of water in mammals is in : **[BHU 1996]**

(1) Lunge (2) Skin
(3) Kidneys (4) Small intestine

Q.45 The term haematuria is used to describe : **[DELHI PMT 2004]**

(1) Internal bleeding (2) Blood in urine
(3) Blood cancer (4) Blood poisoning

Q.46 Match the following : **[CPMT 1989]**

	'A'		**'B'**
I	Loop of Henle	1.	Carries blood the kidney
II	Renal artery	2.	Area where a considerable amount of reabsorption takes place
III	PCT	3.	Area of secretion
IV	Glomerulus	4.	Filtration of blood
V	DCT	5.	Plays a role in concentration of urine

(1) 5, 1, 2, 4, 3 (2) 5, 1, 2, 3, 4
(3) 1, 5, 3, 4, 2 (4) 2, 1, 3, 5, 4

Q.47 Which of the following is not a function of kidneys : **[Pune CET 2001]**

(1) Regulation of blood pressure
(2) Removal of urea
(3) Regulation of acidity of fluids
(4) Secretion of antibiotics

Q.48 In the kidney, the formation of urine involve the following processes arranged as **[NCERT 1979]**

(1) Glomerular filtration, reabsorption and tubular secretion
(2) Reabsoption, filtration and secretion
(3) Secretion, absorption and filtration
(4) Filtration, secretion and reabsorption

Q.49 The urine of man suffering from Diabetes insipidus is : **[CPMT 1988]**

(1) Sweaty and watery
(2) Sweaty and thick
(3) Tasteless and watery
(4) Tasteless and thick

Q.50 Anadvntage of excreting nitrogenous wastes in the form of uric acid is that : **[AIEEE 2003]**

(1) Uric acid can be excreted in almost solid form
(2) The formation of uric acid requires a great deal of energy
(3) Uric and is the first metabolic breakdown products of acids
(4) Uric acid may be excreted through the lungs

Q.51 Which of the following is correct : **[CPMT 1984]**

(1) Afferent arteriole is narrower than efferent arteriole
(2) Afferent venule is narrower than efferent venule
(3) Efferent arteriole is narrower than afferent arteriole
(4) Efferent venule is narrower than afferent venule

Q.52 What for the ascending limb of Loop of Henle is permeable? **[JIPMER [MED.] 2002]**

(1) Glucose (2) NH_3
(3) Na^+ (4) Water

Q.53 Why do we pass more urine in wet and cold season? **[MP PMT 1997]**

(1) Impairment of water absorption by nephrons
(2) Kidney becomes mor active
(3) Sweating is much reduced
(4) ADH seretion is increased

Q.54 Aquatic reptiles are– **[CPMT 2003]**

(1) Ammonotelic
(2) Ureotelic over land
(3) Ureotelic (4) Ureotelic in water

Q.55 If Henle's loop were absent from mammalian nephron. Which of the following is to be expected– **[AIPMT PMDT 2003]**

(1) The urine will be more in volume

(2) There will be no urine formation

(3) There will be hardly any change in the quality and quantity of urine formed

(4) The urine wll be more concentrated

Q.56 All Bowman's capsules of the kidney are found in – **[JIPMER [MED] 2001]**

(1) Cortex (2) Medulla

(3) Pelvis (4) None of these

Q.57 A conditon of failure of kidney to form urine to form urine is caled– **[AIPMT 1998]**

(1) Deamination (2) Entropy

(3) Anuria (4) None of these

Q.58 Two examples in which the nitrogenous wastes are excreted from body in the form of uric acid are– **[CPMT 2002]**

(1) Birds and lizards

(2) Mammals and mollusc

(3) Insects and bony fishes

(4) frogs and cartilaginous fishes

Q.59 In micturition– **[PB. PMT 1999]**

(1) Uretha relaxes (2) Ureter contracts

(3) Ureter relaxex (4) Urethra contracts

Q.60 What is the characteristic of metanephric kidney– **[MP PMT 2000]**

(1) Hypotonic urine production

(2) Excess secretion of uric acid

(3) Loop of Henle

(4) Hormone production

Q.61 The hormone sereted by kidney is– **[MP PMT 2001]**

(1) Gastrin (2) Secretin

(3) Erythropoietin (4) Aldosterone

Q.62 Which one do not filter out from blood to bowman's capsule in glomerular utrafiltration – **[RPMT 2001]**

(1) Amino acids (2) Polypeptide

(3) Glucose (4) Fatty acids

Q.63 Which type of kidney are found in amphibian– **[RPMT 2002]**

(1) Holonephric (2) Mesonephric

(3) Pronephric (4) Metanephric

Q.64 Which one of the following body functions is not performed by kidneys– **[RPMT 2002]**

(1) Excretion

(2) Osmoregulation

(3) Regulation of blood volume

(4) Destruction of dead blood corpuscles

Q.65 Which of the following are uricotelic animals– **[AIIMS 2002]**

(1) Rohu and frog (2) Lizard and crow

(3) Camel and frog

(4) Earthworm and eagle

Q.66 Marine teleosts, undergoing putrefaction, emit sharp characteristic foul odour, which is due to the production of– **[MP PMT 2002]**

(1) Trimethylamine

(2) Hydrogen sulphide

(3) Ammonia

(4) Lactic Acid

Q.67 Fresh water bony fishes maintain water balance by– **[BHU 2002]**

(1) Excreting a hypotonic urine

(2) Excreting salt across their gills

(3) Drinking small amount of water

(4) Excreting wastes in the form of uric acid

Q.68 Which is mismatched– **[Delhi PMT 2003]**

(1) Bowman's capsule-Glomerular filteration

(2) PCT-Absorption of Na^+ and K^+

(3) DCT-Absorption of glucose

(4) None of these

Q.69 Duct of Bellini opens on– **[BVP 2003]**

(1) Collecting duct (2) Ureter

(3) Renal papilla (4) DCT

Q.70 Uric acid is the main excretory product in – **[Bihar 2002]**

(1) Insects (2) Earthworm

(3) Amphibains (4) Mammals

Q.71 Main function of glomerulus is –**[Bihar 2004]**

(1) Filtration of blood

(2) Reabsorption of H_2O

(3) Reabsorption of Na^+

(4) Concentration of urine

Q.72 If ADH level of blood is less –**[Bihar 2005]**

(1) Volume of urine increases

(2) Volume of urine decreases

(3) Volume of urine is normal

(4) Volume of urine is unaffected

Q.73 Urea formation takes place through **[MP PMT 2003]**

(1) Nitrogen cycle (2) Ornithne cycle

(3) Cori cycle (4) Kreb's cycle

Q.74 Aquatic reptiles are : **[Jharkhand 2003]**

(1) Ammonotelic (2) Ureotelic

(3) Ureotelic in water

(4) Ureotelic over land

Q.75 Loop of Henle is associated with – **[Bihar 2002]**

(1) Uriniferous tubules

(2) Seminiferous tubules

(3) Neurons (4) Muscle fibres

Q.76 Loop of Henle is associated with : - **[Uttarancal PMT 2004]**

(1) Excretory system

(2) Respiratory system

(3) Reporducitve system

(4) Digestive system

Q.77 The complete reabsorption of glucose takes place in - **[MP PMT 2003]**

(1) Collecting tubule (2) Distal tubule

(3) Proximal convoluted tubule

(4) Henic loop

Q.78 Duct of Bellini opens on – **[Bihar 2004]**

(1) Ureter (2) Renal papilla

(3) Duodenum (4) DCT

Q.79 Which of the following is concerned formation of urea in rabbit – **[UP CPMT 2004]**

(1) Blood (2) Kidney

(3) Spleen (4) Liver

Q.80 Loop of Henle is found in – **[UP CPMT 2004]**

(1) Lung (2) Liver

(3) Neuron (4) Nephron

Q.81 Absorption of H_2O in DCT is controlled by - **[UP CPMT 2004]**

(1) ADH (2) ACTH

(3) LH (4) Oxytocin

Q.82 Which of the following is metabolic waste of protein metabolism : - **[MP PMT 2002]**

(1) NH_3, urea and CO_2

(2) Urea, oxygen and N_2

(3) Urea, ammonia and alanine

(4) Urea, ammonia and creatinine

Q.83 A condition in which body's internal environment remains relatively constant within limits is called **[UP CPMT 2004]**

(1) Homeostasis (2) Hemostasis

(3) Cematoma (4) Haemopoiesis

Q.84 The presence of arginase confirms that : **[UP CPMT 2004]**

(1) Urea cycle is operating

(2) Urea cycle may be operating

(3) Arginine is being converted into omithin

(4) Arginine is being converted into citruline

Q.85 The most abundant, harmfual and universal waste product of metabolism is : **[UP CPMT 2004]**

(1) CO_2 (2) Uric acid

(3) H_2O (4) C_2H_5OH

Q.86 Glomerular filtrate contains : - **[UP CPMT 2005]**

(1) Blood without blood cells and proteins

(2) Plasma without sugar

(3) Blood with proteins but without cells

(4) Blood without urea

Q.87 Urea is directly produced in mammals from : - **[UP CPMT 2005]**

(1) Ammonia released by oxidative deamination
(2) Oxidative deamination of purines
(3) Breakdown of ornithine
(4) Breakdown of arginine

Q.88 Glomerular hydrostatic pressure is present in- **[UP CPMT 2007]**

(1) Tubule of kidney
(2) Bowman's capsule
(3) Glomerulus or uriniferous tubule
(4) Malpighian tubule

Q.89 Diruresis is condition, which is characterized by **[MP PMT 2004]**

(1) Increase in urine volume
(2) Increased sugar excretion
(3) Decrease in urine volume
(4) Decrease in ionic balance

Q.90 Renin is released from :- **[MP PMT 2002]**

(1) Juxta glomerular apparatus
(2) Cortical nephron
(3) Collecting duct (4) Pelvis

Q.91 Liquid which collects in the cavity of Bowmans' Capsule is :- **[MP PMT 2004]**

(1) Blood plasma minus blood protiens
(2) Glycogen and water
(3) Urea, glycogen and water
(4) Urea

Q.92 The cavity of Bowman's caspule contain :- **[MP PMT 2001]**

(1) Urea, glycogen and water
(2) Urea and water
(3) Blood plasma except blood protein
(4) Concentrated blood

Q.93 Mammalain kidney resemble contractile vacuole of Amoeba in excretion of : - **[MP PMT 2006]**

(1) Glucose (2) Excess water
(3) Urea (4) Ammonia

Q.94 The hormone secreted by kidney is : - **[MP PMT 2001]**

(1) Gastrin (2) Secretin
(3) Erythropoietin (4) Aldosterone

Q.95 ADH acts on the : - **[MP PMT 2004]**

(1) Collecting tubule of kidney
(2) Loop of Henle
(3) Collecting ducts of tests
(4) None of the above

Q.96 Enzyme 'Renin' is secreted by : - **[MP PMT 2001]**

(1) Cells of stomach (2) Cells of intestine
(3) The cortical cells of kidney
(4) The cells of juxtaglomerular apparatus of kidney

Q.97 Absorption Na^+ and K^+ ions does not occur in : - **[MP PMT 2004]**

(1) Bowman's capsule
(2) Loop of henle
(3) Distal convoluted tubule
(4) Proximal convoluted tubule

Q.98 Loop of Henle is primarily meant for absorption of : - **[MP PMT 2002]**

(1) Potassium (2) Glucose
(3) Urea (4) Water

Q.99 Glomerular filtrate is : - **[UP CPMT 2004]**

(1) Blood minus blood corpusles and plasma protein
(2) Blood minus corpuscles
(3) Mixture of water, ammonia and corpuscles
(4) Urine

Q.100 Blood vessel leading into Bowman's capsule are called : - **[MP PMT 2001]**

(1) Renal vein (2) Renal artery
(3) Efferent arteriole (4) Afferent arteriole

Q.101 Urea synthesis takes place in :- **[MP PMT 2005]**

(1) Urinary bladder (2) Alimentary canal
(3) Liver (4) Kidney

Q.102 Human urine as compared to human blood is normaly : - **[Bihar 2004]**
(1) Hypotonic (2) Hypertonic
(3) Isotonic (4) All of these

Q.103 Kidney of frog is : - **[Bihar 2001]**
(1) Pronephric (2) Mesonephric
(3) Metanephric (4) None of these

Q.104 In the nephron of rabbit, reabsorption of glucose occcurs in : **[JKCMEE 2008]**
(1) distal convoluted tubule
(2) proximal convoluted tubule
(3) ascending limb of Henle's loop
(4) descending limb of Henle's loop

Q.105 Juxtaglomerular cells of renal cortex synthesises an enzyme called : **[Pb.PMT 2008]**
(1) ADH (2) Oxytoxin
(3) Renin (4) Urochrome

Q.106 Glycosuria is the condition, where a man : **[DUMET 2009, W.b. JEE 2010]**
(1) eats more sugar
(2) excretes sugar in urine
(3) sugar is excreted in faeces
(4) has low sugar level in blood

Q.107 Find the incorrect statement regarding mechanism of urine formation in man : **[Kerala PMT 2009]**
(1) Tubular secretion takes place in the PCT
(2) Aldosterone induces greater reabsorption of sodium
(3) The counter current systems contribute in diluting the urine
(4) The glomerular filtration rate is about 125mL per minute

Q.108 If one litre of water is introduced in human blood, then : **[DUMET 2009]**
(1) BMR increases
(2) BMR decreases
(3) RBC collapses and Urine production increases
(4) RBC collapses and Urine production decreases

Q.109 The size of filtration slits of glomerulus : **[W.B. JEE 2010]**
(1) 10 nm (2) 15 nm
(3) 20 nm (4) 25 nm

Q.110 This is not a nitrogenous waste :**[AMU 2010]**
(1) creatinine (2) purines
(3) allantoin (4) citrulline

Q.111 In which of the following organisms its excretory organs are correctly stated? **[CBSE 2010]**
(1) Human – Kideneys, Sebaceous glands and Tear glands
(2) Earthworm – Pharyngeal, Integumentary and Septal nephridia
(3) Cockroach – Malpighian tubules and Enteric caeca
(4) Frog – Kidneys, Skin and Buccal epithelium

Q.112 Urea synthesis takes place primarily in liver because : **[DUMET 2010]**
(1) Enzyme arginase is present in liver only.
(2) NH_3 and CO_2 are present in liver only.
(3) Hormone ADH is found in liver only.
(4) Kidney is smaller than liver.

Q.113 The average quantity of urea excreted in urine by man per day is : **[Kerala PMT 2010]**
(1) 1 – 5 gm (2) 25 – 30 gm
(3) 1 – 1.5 gm (4) 80 gm

Q.114 A large proportion of oxygen is left unused in then human blood even after its uptake by the body tissues. This O_2 : **[CPMT 2011]**
(1) acts as a reserve during muscular exercise
(2) raise the pCO_2 of blood to 75 mm of Hg.
(3) is enough to keep oxyhaemoglobin saturation at 96%.
(4) helps in releasing more O_2 to the epithelial tissues.

Q.115 Which one of the following correctly explains the function of a specific part of a human nephron? **[CPMT 2011]**
(1) Podocytes : create minute spaces (slite pores) for the filtration of blood into the Bowman's capsule.
(2) Henle's loop : most reabsorption of the major substances from the glomerular filtrate.
(3) Distal convoluted tubule : reabsorption of K^+ ions into the surrounding blood capillaries.
(4) Afferent arteriole : carries the blood away from the glomerular towards renal vein.

Q.116 Uricotelic mode of passing out nitrogenous wastes is found in : **[CPMT 2011]**

(1) Reptiles and Bird

(2) Birds and Annelids

(3) Amphibians and Reptiles

(4) Insects and Amphibians

Q.117 Ureters act as urogenital ducts in : **[CPMT 2011]**

(1) human males

(2) human females

(3) frog's both males and females

(4) frog's males

Q.118 The maximum amount of electrolytes and water (70-80 percent) from the glomerular filtrate is reabsorbed in which part of the nephron ? **[AIPMT Pre 2012]**

(1) Distal convoluted tubule

(2) Proximal convoluted tubule

(3) Descending limb of loop of Henle

(4) Ascending limb of loop of Henle

Q.119 Which one of the following options gives the correct categorisation of six animals according to the type of nitrogenous wastes (A, B, C) they give out ? **[AIPMT Mains 2012]**

	A AMMONO TELIC	**B UREOTELIC**	**C URICOTELIC**
(1)	Pigeon, Humans	Aquatic Amphibia, Lizards	Cockroach, Frog
(2)	Frog, Lizards	Aquatic Amphibia, Humans	Cockroach, Pigeon

Q.120 A fall in glomerular filtration rate (GFR) activates : **[AIPMT Mains 2012]**

(1) juxta glomerular cells to release renin

(2) adrenal cortex to release aldosterone

(3) adrenal medulla to release adrenaline

(4) posterior pituitary to release vasopressin

Q.121 Which one of the following characteristics is common both in humans and adult frogs? **[AIPMT Mains 2012]**

(1) Four - chambered heart

(2) Internal fertilisation

(3) Nucleated RBCs

(4) Ureotelic mode of excretion

Ans.	4																			

Q.1 **A :** When water has to be conserved in the body, ADH is secreted from the posterior pituitary.
R : ADH renders the walls of DCT, collecting duct and tubule impermeable to water.

Q.2 **A :** Renal threshold of glucose is said to be 180 mg per 100 ml.
R : Glucose starts appearing in the urine when its blood level exceed 180 mg per 100 ml of blood.

Q.3 **A :** Camels can go without water for long periods.
R : Camel stores water in the pouches of their rumen and fat in their hump.

Q.4 **A :** Tissue fluid contains much less protein than the blood plasma.
R : Blood capillary wall is impermeable to plasma proteins.

Q.5 **A :** Death ensues if waste products are not removed from the body.
R : Excretory system removes the nitrogenous waste products from the body.

Q.6 **A :** Earthworms excrete urea instead of ammonia in drier environments.
R : Synthesis of urea requires energy than the synthesis of ammonia.

Q.7 **A :** Kidneys of the vertebrates are retroperitoneal and extra-coelomic.
R : Structural and functional units of the kidneys are nephrons.

Q.8 **A :** Aquatic mammals like whales and seals are said to be ureotelic animals.
R : It is because of the fact that their main nitrogenous waste product is urea.

Q.9 **A :** Large cells performing excretory function in tapeworm, liver fluke and *Planaria* are named as flame cells.
R : Soluble waste products diffuse from neighboring cells into flame cells.

Q.10 **A :** In vertebrates, the liver is also referred as an accessory excretory organ.
R : Liver helps kidneys in the secretion of urine.

Q.11 **A :** Land snails excrete urea instead of uric acid as the major nitrogenous waste product.
R : Synthesis of uric acid involves for lower expenditure of energy than the synthesis of urea.

Q.12 **A :** Birds are obliged to be uricotelic.
R : Birds have very limited access to water.

Q.13 **A :** Urinary bladder and ureters are lined by transitional epithelium.
R : Ureters carry the urine to urinary bladder where it is stored temporally.

Q.14 **A :** The integument of land animals is far less permeable than that of aquatic animals.
R : This is because of the presence of sweat glands and sebaceous glands on the skin surface.

Q.15 **A :** Glucose and amino acids, unlike creatinine & ketone bodies, are rapidly absorbed by passive reabsorption from the tubules of nephrons in kidney.
R : Creatinine and amino acids are importance to the body.

Q.16 **A :** Secreting hypotonic urine is effective in reducing urinary loss of water.
R : Hypotonic urine is more concentrated and higher in osmotic pressure than the blood.

Q.17 **A :** The glomerular filtrate resembles the protein free plasma in composition and osmotic pressure.
R : The glomerular capillary wall and inner membrane of Bowman's capsule are impermeable to large molecules.

Q.18 **A :** During micturition, urine is prevented from flowing back into the ureters.
R : Urethral sphincters relax during micturition.

Q.19 **A :** Uric acid and creatinine can be detected in the normal urine of an adult man.
R : Uric acid and creatinine are the chief components of human urine.

Q.20 **A :** Kidneys maintain the osmotic concentration of the blood.
R : Kidneys eliminate either hypotonic or hypertonic urine according to the need of the body.

Q.21 **A :** Birds can considerably reduce water loss in the urine.

R : Birds store urine along with faces in the cloaca.

Q.22 **A :** The amount of lactic acid in sweat significantly increase after heavy or strenous work.

R : Body needs to excrete out extra lactic acid produced by glycolysis during heavy work.

Q.23 **A :** Some water is eliminated from the body.

R : Water elimination from body is only necessary to prevent the body from oedema.

Q.24 **A :** ADH reduces chloride loss in urine.

R : ADH decreases water absorption.

Q.25 **A :** Ammonia should be eliminated from the body as rapidly as it is formed.

R : Ammonia is insoluble in water.

Q.26 **A :** Excretion of urea is much helpful than ammonia.

R : The synthesis of urea requires energy.

Q.27 **A :** Earthworms excrete both ammonia and urea.

R : Excretion in earthworms depends on the environment.

Q.28 **A :** Birds drink very little water and insects never consume water.

R : Birds and insects are uricotelic with negligible water requirement to eliminate nitrogenous waste.

Q.29 **A :** Extracellular fluid serves as the 'sanitary drainage line' of the body.

R : Extracellular fluid collects excess water, CO_2, nitrogenous and other metabolic waste products from all tissues.

Q.30 **A :** Gout and kidney failure in man occurs due to excess uric acid.

R : Man is ureotelic.

Q.31 **A :** Invertebrates especially flatworms excrete through flame cells.

R : Flame cells have cilia.

Q.32 **A :** In birds and reptiles, main excretory product is the combined form of urine and faeces.

R : Birds and reptiles have no separate chamber of excretion of urine and faeces.

Q.33 **A :** Micturition is done by urinary bladder.

R : Urinary bladder stores urine.

Q.34 **A :** Liver has some role in excretion.

R : Liver excretes ammonia.

Q.35 **A :** If human urine is allowed to stand for some time, it smells strongly of ammonia.

R : Main constitutent of human urine is ammonia.

Q.36 **A :** Aquatic animals are generally ammonotelic in excretion.

R : Ammonia is highly toxic due to its high pH but is highly soluble in water.

Q.37 **A :** Excretory organs of annelids are protonephridia.

R : In annelids, protonephridia are mainly osmoregulatory and not excretory.

Q.38 **A :** Insects, birds and most reptiles are uricotelic in excretion.

R : In uricotelic animals, excretory organs are Malpighian tubules.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

ENDOCRINE SYSTEM

INTRODUCTION

- The branch of biology which deals with the study of endorcine system and its physiology is known as **''Endocrinology''**.
- **''Thomas Addision''** is known as father of Endocrinology.

Glands of body : A cell, a tissue or an organ which secretes certain useful chemical compounds is called a gland. Animals have three types of glands :

(i) **Exocrine gland (Gr., *ex* = out + *krinein* = to secrete) :** These glands have ducts for discharging their secretions. Therefore, they called duct glands. *ex* – Liver, Sweat gland, Sebaceous gland, Gastric glands and some intestinal glands.

(ii) **Endocrine glands (Gr., *endo* = within + *krinein* = to secrete)** : These glands lack ducts and pass secretions into the surrounding blood directly. Therefore they called ductless glands. *ex* – Thyroid, parathyroid, adrenal, pituitary, pineal body and thymus.

(iii) **Heterocrine glands :** These glands consist of both exocrine and endocrine tissue. The exocrine discharge its secretion by a duct and the endocrine tissue discharge its secretion into the blood. Pancreas and gonads are heterocrine glands. These are also called mixed glands.

- Co-ordination in the body of almost all the higher vertebrates is controlled by two systems **Nervous system** and **endocrine system.**
- Nervous system and endorcine system are called **Integrative system** of the body.
- Nervous system carries informations in the form of impulses to the different parts of body. High speed services are offered by this system.
- Where as, the work of co-ordination by endocrine system is slowly by secretion of some chemical substances.
- Substances secreted by these glands are known as hormones. The meaning of work 'hormone' in Greek is **''to excite'' = hormaein.**

Differences between Nervous and Endocrine Coordinations

	Nervous Co-ordination	Endocrine Co-ordination (Chemical Co-ordination)
1.	Information passes as electrical impulses along nerve fibres.	Information passes as a chemical substance through the blood and lymph.
2.	There is rapid transmission of information.	There is slow transmission of information.
3.	Response is immediate.	Response is usually slow.
4.	Response is very exact.	Response is usually widespread.
5.	Response is short lived.	Response is long-lasting

HORMONE

- The term hormone was coined by **Starling**.
- Hormones are also called "Primary messengers" or chemical messengers."
- First discovered hormone is **secretin.** It was discovered by **Bayliss & Starling in 1902.**

Source & Chemical Nature : - Hormones are chemical messengers which are secreted by one part of body and are poured directly into the blood stream, and they reach at their target place with the help of blood. A small amount of hormone affects some specific cells or physiology of cells of organ according to atmospheric conditions.

Chemical Nature of Hormone :

The animal hormones may be classfied into 6 categories :

1. **Amino acid derivatives :** The hormones epinephrine and norepinephrine from the adrenal medulla and thyroxine from the thyroid gland are derived from amino acid.
2. **Short peptides :** The hormones oxytocin and vasopression from the posterior lobe of the pitutary gland are short peptides of 9 amino acid. The melanocyte stimulating hormone (MSH) from the intermediate lobe of the pituitary gland is also short peptide of 13 amino acids.
3. **Long peptides :** The hormones insulin from the pancrease, adrenocortico tropin (ACTH) from the anterior lobe of the pituitary gland, calcitonin from the parathyroid gland consists of 84 amino acids.
4. **Protein :** The gonadotropic, thyrotropic and somatotropic hormones from the anterior lobe of pituitary are protein with high molecular weights.
5. **Steroids (Fat soluble) :** The hormones like cortisol and aldosterone from adrenal cortex, testosterone from interstitial cells of testes, estrogen and progesterone from Graaffian follicles of ovary and placenta are the examples of steroid hormones. The hormones contain cholesterol and bile salts.
6. **Fatty acid derivative : -** Prostaglandin

Physical & Chemical Specialities of Hormones : -

The moleucles of most of the hormones are small, and their molecular weight is low.

- Hormones are soluble in water and are easily diffusible in tissues.
- The secretion of hormone is always in very small quantity because these are most reactive substances
- Hormones are destroyed after use.
- Hormones can not be stored in the body except Thyroxine.
- Hormones are soluble in water and blood.
- Liver and kidneys separate them from blood and decompose them. The waste product formed after decomposition, hormones are excreted with urine. It can not be reutilized.
- Hormones are non-antigenic & non species specific substances.
- Usually, hormones do not participate in the metabolic activities of target cells but they affect and control the activity level of these target cells. Due to the effect of hormones, not only the rate of metabolic activites is effected but also the permeability of cell membrane is changed so the nature of reaction is also changed. so the nature of reaction is also changed.

Differences between Hormone & Enzyme

	Hormones	Enzymes
1.	They are produced at one site and are passed by blood to another site for action.	They may act at site where they are produced or carried to another site for action.
2.	They have low molecular weight.	They have very high molecular weight.
3.	Hormones may be steroids, proteins, Peptides or amino acid derivatives.	Enzymes are simple proteins.
4.	They are used up in their action	They are not used up in their action.
5.	They are effective in low concentration. Their excess or deficiency may cause disorders.	They also act in low concentration. However, the rate of enzyme catalyzed reactions steadily increase with an increase in their concentration
6.	They may act slowly or quickly.	They act slowly.
7.	They may accelerate or retard the specific recations.	They speed up the reactions.
8.	Hormone controlled reactions are not reversible.	Enzyme controlled reactions are reversible.

Differences between Hormone & Vitamins

	Hormones	Vitamins
1.	Hormones may be steroids, proteins, peptides or amino acid derivaties.	They are never proteins but simple organic compounds such as amines, esters, alcohol, aldehyde or organic acids.
2.	They are effective in low concentration. Their excess or deficiency may cause hormonal disorders.	They are needed in small quantity. Excess vitamins are excreted. Their deficiency causes malfunctioning called deficiency diseases or avitaminosis.
3.	They are secreted by the animal in its own body.	They are rarely synthesized in the body. They are moslty taken with food.
4.	Hormones influence the genes to produce Specific	They act as co-enzymes and help emzymes to perform their function.
5.	enzymes required during metabolism. They do not influence the working of those organs which have secreted them.	They are not produced by body organs (except vitamin D)

MECHANISM OF HORMONAL REACTIONS

- **MECHANISM OF HORMONE – Two types**

– Once hormone enter into blood stream it can reach almost to any cell in the body.

– However, each hormone effects only certain kind of cell which is called as **target organ.**

– All hormone do not act in the same way due to location of receptor.

- Hormones are two types :

(i) Water solbule hormone **(ii)** Lipid soluble hormone

- Water soluble hormones interact with a surface receptor, normally a ***glycoprotein*** and initiate a chain events within it where as lipid soluble hormone (Steroid hormones) readily pass through the plasma membrane to cytoplasm of the target cell. Molecular mechanism of hormones are of following types :
  (1) At Gene level
  (2) At Plasmalemma level

1. AT GENE LEVEL : -

In this type of mechanism steroid hormone and Thyroxine hormones are involved.

(a) Steroid hormones_: In this process steroid hormones enter into target cell where they combine with receptor protein, this Receptor protein conveys the hormone from cytoplasm to nucleus this hormone stimulates the DNA for synthesis of protein. Now DNA synthesises the m-RNA and this m-RNA goes into cytoplasm, where Ribosome synthesize the protein by translation. This new protein in an enzyme, which affects the vital activity of target cell.

(b) Thyroxine hormone_: The thyroid hormone thyroxine and tri-iodothyronine cause increase transcription by certain gene in nucleus. To accomplish this, These hormones first bind directly with receptor protein in nucleus. Receptor protein is located on chromosome. Advantage of intranuclear receptor the thyroxin hormone can continue they express their control function for weeks :

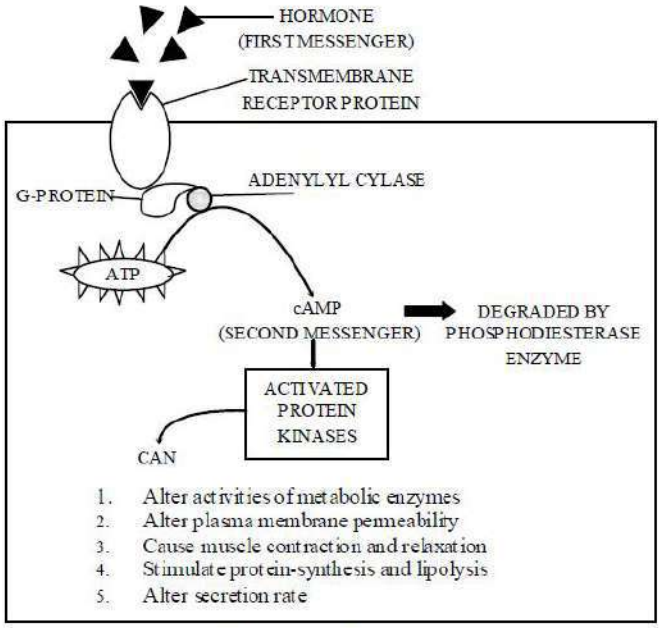

Fig. – Mechanism of Hormone action on cell surface

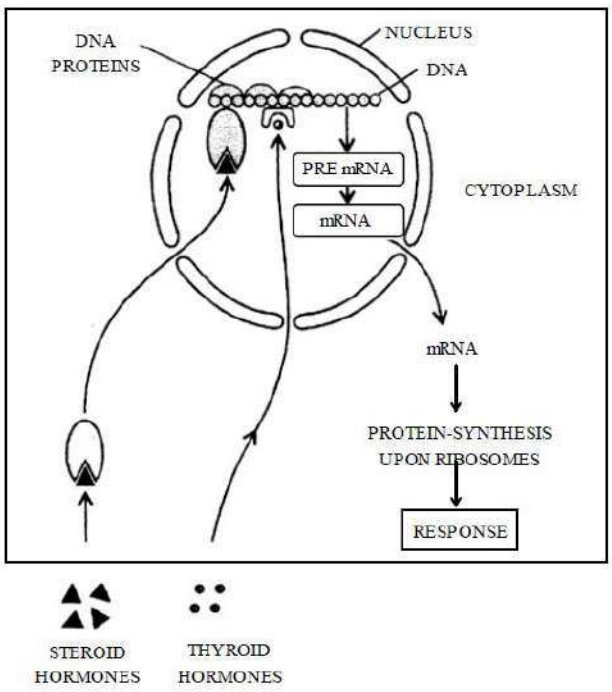

Fig. – Mechanism of cell surface within a cell

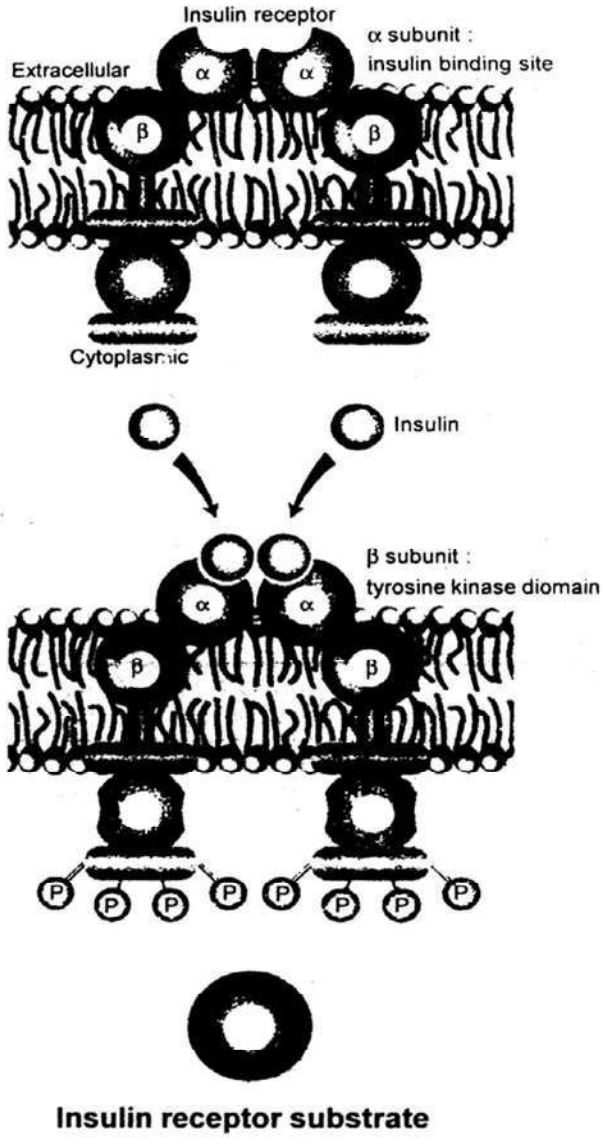
2. PLASMALEMMA LEVEL : - Following hormones an example of this mechanism :

(a) Tyrosine kinase mechanism : A good example of this is the effect of insulin. For transport of insulin hormone, **insulin** receptor is found in cell membrane, which is made up of 4 sub-unit. 2 sub-units (α-protein) are α-protein which are situated towards the outside of cell membrane this sub unit binds the insulin hormone, 2 sub-unit (β-Protein) protrude into the cytoplasm of the cell. The intra celluar portion of the β units has **tyrosine kinase activity**. These receptors are usually less than 100 in most of our body cells but may be more than 1,00,000 as in some liver cells.

Binding to the receptor – Binding of insulin to the outer 2α sub units of receptor triggers tyrosine kinase activity of the intra cellular portion of β-sub units. This causes a structural change in β-sub units. to become an activated tyrosine kinase. The activated tyrosine kinase produces autophosphorylation of the cytoplasmic receptor as well as phosphorylation of some cytoplasmic protein **(Insulin receptor subtrate, IRS)**.



Insulin receptor substrate

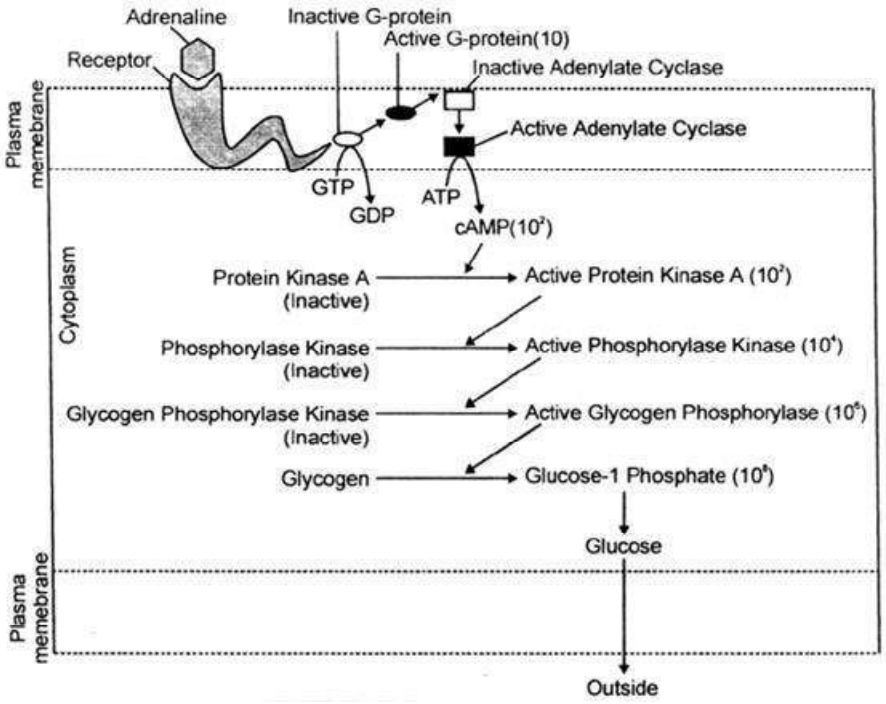
(b) C-AMP or Second messenger system : This C-AMP mechanism has been shown by following hromones :

- Adreno Corticotropin (ACTH)
- Thyroid stimulating hormone (TSH)
- Luteinizing hormone (LH)
- Follicle stimulating hormone (FSH)
- Parathyroid hormone (PTH)
- Secretin
- Catecholamines
- Most hypothalamic releasing hormone
- Vasopressin/ADH
- Glucagon

In this type of mechanism when adrenaline is attached to the surface receptor protein which found on the plasmalemma then first of all it forms a complex which is called as hormone receptor complex (HRC). A

transducer protein is found on inner surface of receptor protein which is called as G-Protein. This G-Protein consist of α, β, γ-sub unit. GTP is also found on G-Protein.

- After formation HRC than GTP change into GDP, in this process phosphate group is released which activates the G-Protein.
- After activation of G-Protein their sub units are divided into two group (i)-α-subunit and (ii)-β, γ-subunit (β, γ-subunit both are not separated with each other)
- Activated α-subunit of G-Protein activate adenylate cyclase.
- Activated adenylate cyclase change ATP to C-AMP on cell membrane.



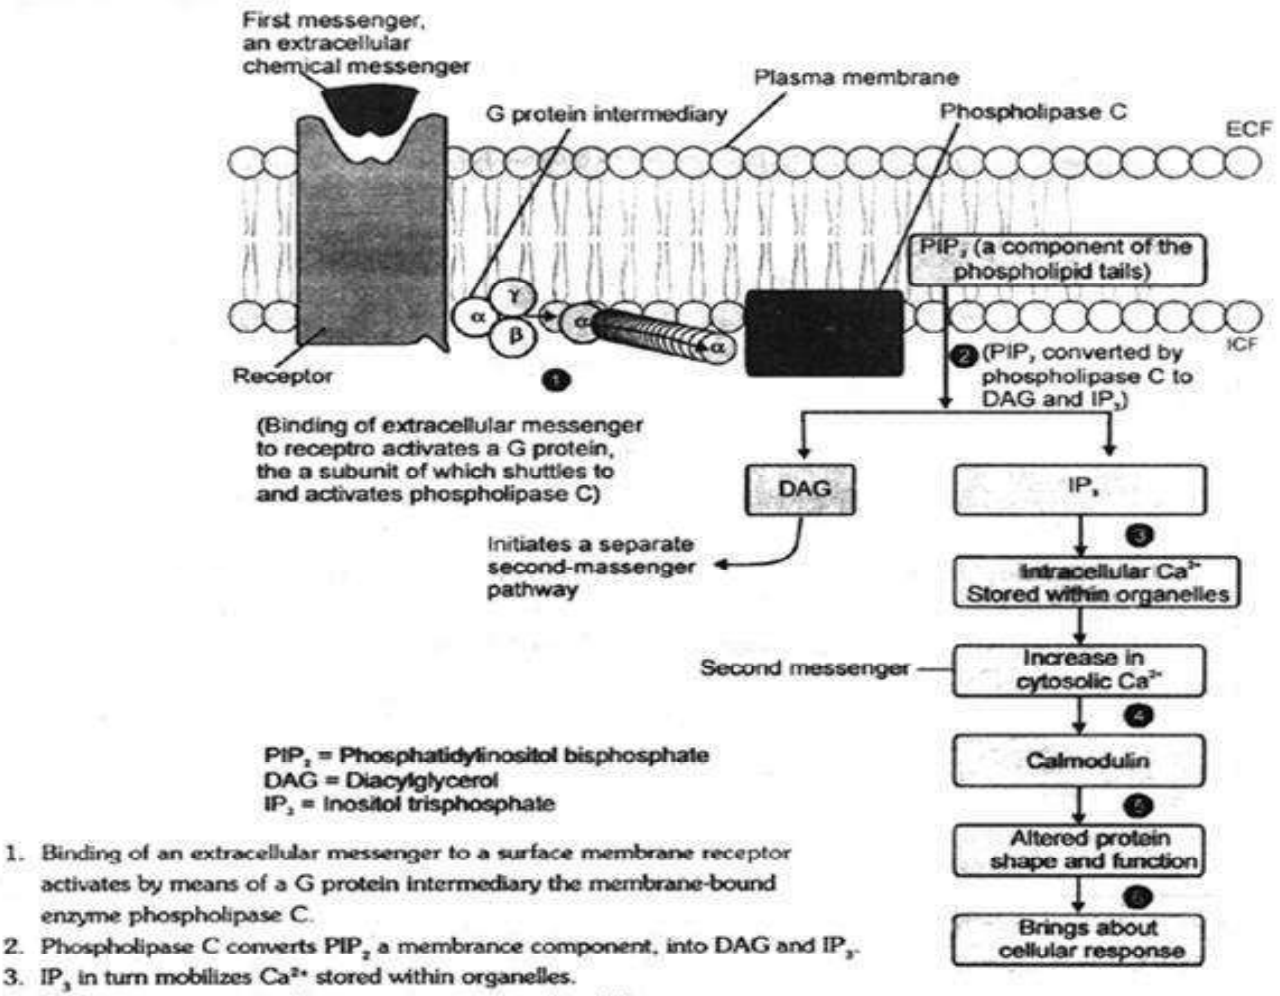
- This C-AMP goes into cytoplasm where it activates the inactive protein kinase-A to active protein kinase-A.
- This active protein kinase A changes inactive phosphorylase kinase into active phosphorylase kinase.
- This active phosphorylase kinase changes inactive Glycogen phosphorylase in to active glycogen phosphorylase.
- This active glycogen phosphorylase changes glycogen into Glucose-1-Phosphate.
- Each molecule of protein kinase-A activates about 100 molecule of enzyme phosphorylase kinase and so on.
- As a result a single molecule of adrenaline releases as many as 100 million molecules of glucose within only 1 minutes **(Amplification)**.

(c) IP_3 & DAG Mechanism : In this type of mechanism local hormones are involved such as prostaglandins, Acetylcholine, Somatostatin etc.

- Same CAMP mechanism transducer G-protein act.
- G-protein activates enzyme phosphodiesterase.
- Phosphodiesterase (Phospholipasec) Enzyme breaks phosphotidyl inositol biphosphate into inositol triphosphate (IP_3) and diacylglycerol (DAG).

- IP_3 is water soluble and diffuses into cytoplasm, IP_3 specialy mobelized Ca^{++} ion endoplasmic reticulam and the Ca^{++} ion promote smooth muscle contraction and changes in secretion by secretory cell and change in ciliary action.
- DG remain in the membrane where is activates an enzyme called protein kinase C, which in turn, activates many other enzyme, Activated protein kinase C plays an important role in cell division and cell proliferation.

The action of lipid soluble hormone are slower and last longer then the action of water soluble hormone.



1. Binding of an extracellular messenger to a surface membrane receptor activates by means of a G protein intermediary the membrane-bound enzyme phospholipase C.
2. Phospholipase C converts PIP_2 a membrance component, into DAG and IP_3.
3. IP_3 in turn mobilizes Ca^{2+} stored within organelles.
4. Ca^{2+}, acting as a second messenger, activates calmodulin.
5. Calmodulin induces a change in the shape and function of a particular intracellular protein. Many of the Ca^{++} dependent cellular events are triggered by activation of calmodulin.
6. The altered protein then prodeces the desired cellular response dictated by the extracellular messenger.

SPECIFIC TERMS

- **Chalones** → The hormones which are secreted from one endocrine gland to stimulate other endocrine gland is called as Chalones.
- **Autocoide** → The hormone which are secreted from one endocrine gland to target organ is called as Autocoide.

- **Diabetogenic** → The hormone which mainly affects or stimulates carbohydrate metabolism is called as diabetogenic.
- **Ketogenic** → The hormone, which mainly affect the fat metabolism.
- **Calorigenic** → The hormone, which mainly affects the basal metabolic rate (BMR) is called as calorigenic.

PITUITARY GLAND

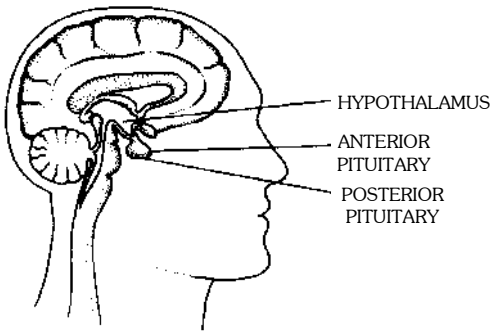


Fig. – Location of pituitary gland

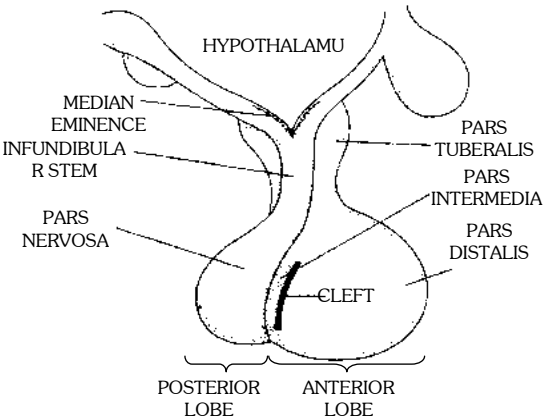

Fig. – Structure of pituitary gland

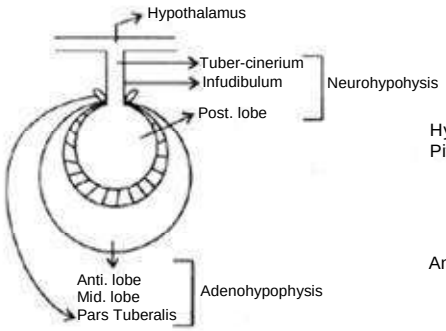

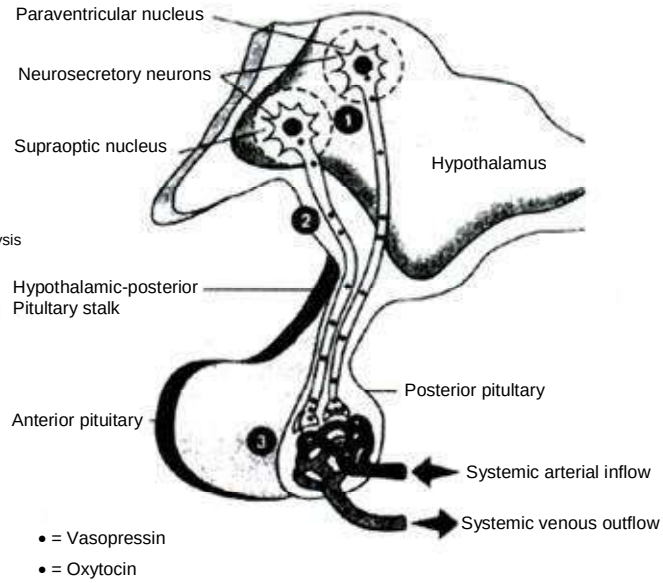

- On the basis of development pituitary gland is completely **Ectodermal**.
- It is situated in the **sella-turcica** of sphenoid bone.
- This gland is atached to the hypothalamus through a stalk which is called as **infundibulum**.
- The upper terminal end of infundibulum which is attached to the hypothalamus is called as **tubercinerium/Median eminence**.
- The lower terminal end of infundibulum is bulging type which is called **as posterior lobe or pars nervosa**.
- Tubercinerium, infundibulum & pars nervosa are collectively called as **Neurohypophysis**.
- A small & fine tube is developed in the foetus which is called as **gut**. This gut is developed into **alimentary** canal. Anterior part of gut is called as ***stomodaeum*** (developed from ectoderm).

- A small projection is developed from dorsal ***surface of stomodaeum*** (the anterior part of gut) this part is separated from stomodaeum and form ***Rathke's pouch***.
- Upper surface of Rathke's pouch is developed into **mid-lobe** which is also known as **pars intermedia**.
- The **upper margin** of **R.pouch**, which surrounds the infundibulum & forms a collar like structure called as **parstuberalis**.
- ***Remaining part*** of R.pouch. is developed into anterior lobe which is also called as pars distalis.
- **Pars distails, pars tuberalis** & **pars intermedia** are collectively called as **adenohypophysis**.
- Neurohypopohysis + Adenohypophysis is called as **hypophysis cerebri** or **pituitary body**.
- A remaining & vestigeal cavity of **R.pouch** is found in the anterior lobe which is called as **Hypophysis recess**.
- **Superior branch** of **hypophyseal artery** supplies blood to the **hypothalamus**.
- **Inferior branch** of **hypophyseal** artery supplies blood to the **pituitary gland**.
- Hypophysal portal vein collects the blood from hypothalamus and supplies to pituitary gland.
- Branches of hypophyseal artery & hypophyseal portal vein combined and form a network of blood capillaries which is called as **circle of Willis**.
- In human, mid lobe is ill developed or membrane like, while mid lobe is absent in elephant & Whale.
- Three types of glandular cells are found in Adenohypophysis.

1. **Basophils** → They are large cells & found in the peripheral part of gland. They are more in number.
2. **Acidophil** → They are small in size & found in the central part of pituitary gland.
3. **Neutrophils** → They are smallest in size and are found in scattered form. They are minimum in number.

- **STH & LTH** are secreted by acidophils.
- Remaining hormone of adenohypohysis are secreted by basophils.
- All hormone of pituitary gland are **protein Hormone**.

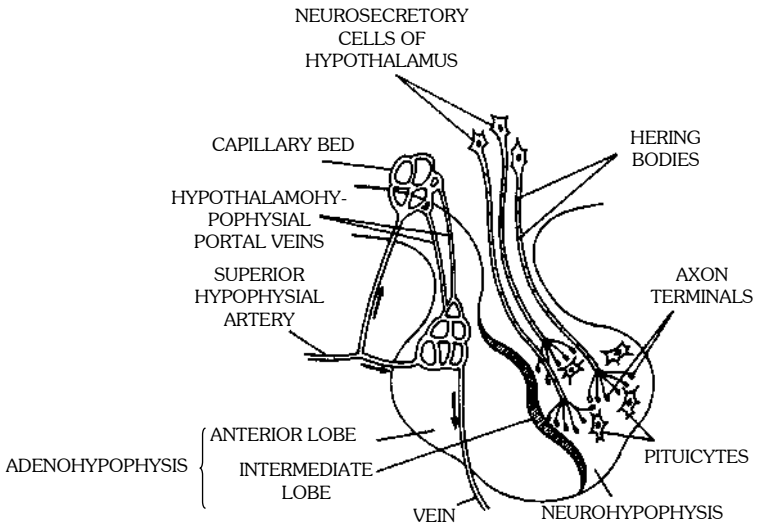

Fig. – Blood supply to pituitary

HORMONS SECRETED BY ADENOHYPOPHYSIS

All these hormones are of proteinaceous nature.

1. GROWTH HORMONE OR SOMATOTROPIC OR SOMATOTROPIN HORMONE

– [G.H. or S.T.H.] : -

By Somatotroph cells or α-acidophil cells

Function : Major effect
- On growth
- On metabolism

– Effect on Growth : -

(1) **On bone :** It increases length of bone.

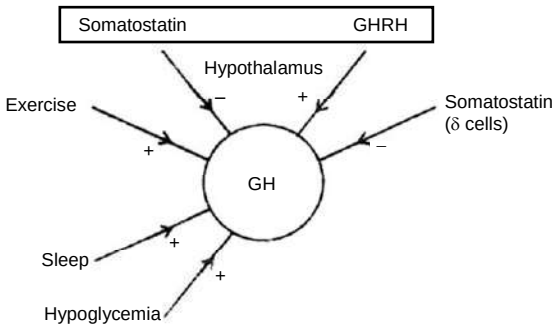
(2) **On soft tissue :**

(i) GH promotes mitosis & increases number of cells in many organs & tisue e.g. liver and muscles.

(ii) GH stimulates growth of muscle and cartilage due to increase synthesis of collagen, muscle grow in bulk.

– Effect on metabolism :

- **Fat :** Increases lipolysis so that free fatty acid level of plasma rises. Under the influence of growth hormone fat is used for energy in preference to carbohydrate and protein, due to this protein deposition is increases.
- **Carbohydrates :** Hyperglycermia develops due to decreased uptake of glucose in the cells, so it is also called diabetogenic hormone.
- **Protein :** GH increases amino acid uptake by the cells of the liver & muscles & helps in protein synthesis.
- In the presence of thyroxines and insulin, growth hormones become more active and stimulates the body growth. In this way this hormone is important for the growth of body.



– Diseases due to hyposecretion or hypersecretion of somatotropin hormone :

(a) Hyposecretion of STH : Due to deficiency of STH in childhood dwarfism is observed.

- Dwarfism due to the defect of pituitary is called Ateliosis. These dwarfs are called as midgets.
- This midget is physically & mentally normal while sexual maturation is delayed.

(b) Hypersecretion of STH : - Due to hypersecretion in childhood and adolescene, a higher quantity of amminoacids is supplied to the body cells.

(i) Epiphyseal cartilage present on the edges of bones does not convert into bone for a long time.

Thus the bones of legs & hands become very long and height of that person increases very much. Body becomes imbalanced. This disease is called **Gigantism**.

(ii) **Acromegaly : -** Due to hypersecretion of STH in adulthood, jaw bones of the affected person become long, cheek bones buldge out, broad hands, legs & fingers of person becomes gorilla like. These symptoms are observed as a result of acromegaly.

2. THYOTROPHIC OR THYROID STIMULATING HORMOONE [T.T.H. OR T.S.H.] :

- T.S.H. is secreted by **basophil cells. (Thyrotroph cell)**.
- It is glycorprotein in nature.
- T.S.H. stimulates thyroid gland to secrete thyroxine. TSH helps in almost all step of the thyroid hormones synthesis & it causes growth of throid gland.
- Secretion of **TSH** is stimulated by Thyrotrophin releasing factor & inhibited by somatostatin of hypothalamus.

3. ADRENO CORTICO TROPHIC HORMONE OR CORTICOTROPINE [ACTH] :

- ACTH is secreted by **basophil** (corticotroph) cells.
- In man, this ACTH is mainly made up of **valine** and **tyrosine** aminoacids,.
- It accelerates the cortex part of adrenal gland to secretes hormones.

4. FOLLICLE STIMULATING HORMONE [FSH] :

- It is also secreted by basophils. (Gonadotroph cell)
- It is glycoprotein in nature.
- This is secreted in male and female both.
- In males, it stimulates spermatogenesis and normal functioning of seminiferous tubules.
- In femables, it stimulates oogenesis and development of Graafian follicles of ovary.
- FSH is also known as **Gametokinetic factor**.
- Estrogen hormone that is secreted Graafian follicles is also affected by FSH.

5. LUTEINIZING HORMONE OR INTERSTITIAL CELL STIMULATING HORMONE – [LH OR ICSH]:

- It is also secreted by basophil (Gonadotroph) cells. It is also glycoprotein in nature.
- It stimulates **ovulation** in female as a result of this corpus luteum is formed.
- Hormone **progesterone** which is secreted by corpus luteum is also stimulated by L.H.
- In men **LH** is called **ICSH**. It affects the Leydig's cells or Interstitial cells of testes and stimulates the secretion of male hormone "**Testosterone**".
- L.H. is also called "**gamete releasing factor**".
- **FSH** and **LH** both are called **gonadotrophic hormone GTH**.
- FSH and LH act in combined form so these are called **synergesic** hormone.
- Gonadotrophic hormones (FSH & LH) are start secreting during puberty. Their secretion is regulated by hypothalamus.

6. LUTEOTROPHIC OR PROLACTIN OR LACTOGENIC OR MAMMOTROPHIN HORMONE (PRL) :

It is secreted by acidophil (Lactoroph) cells.

Function of prolactin hormone.

(1) Lactation (Galactopoiesis) : Prolactin is responsible for lactation in postpartum (after delivery) women.

- **Regulation of Prolactin secretion by Hypothalamus :** Hypothalamus mainly stimulate the production of all pituitary hormone, but it mainly inhibits prolactin production because normally hypothalamus prolactin inhibitory hormone (Dopamine) is greater than the releasing hormone.
- Breast is prepared for lactation by oestrogen (duct growth) and progesterone (lobule growth) but both of these hormone inhibit the actual secretion of milk.
- Dopamine is catecholamine (Biologically active amine) and neurotransmitter in the hypothalamus. It inhibits lactation.
- **During pregnancy :** Prolactin hormone steadly increase until term but due to high level of oestrogen and progesterone (secreated by placenta) lactation is inhibited.
- After expulsion of the placenta at parturition, there is an abrupt decline in circulating estrogen and progesterone.
- The drop in circulating estrogen initiate lactation.
- Nursing stimulates prolactin secretion.
- Prolactin inhibits the action of GnRH on the pituitary and antagonize the action of GnRH on the pituitary and antagonize the action of gonadotrophin on the ovaries. Ovulation is inhibited and the ovaries gets inactive.
- Nursing is important and effective method of birth control.

7. HORMONES SECRETED BY MIDDLE LOBE OF PITUITARY GLAND :

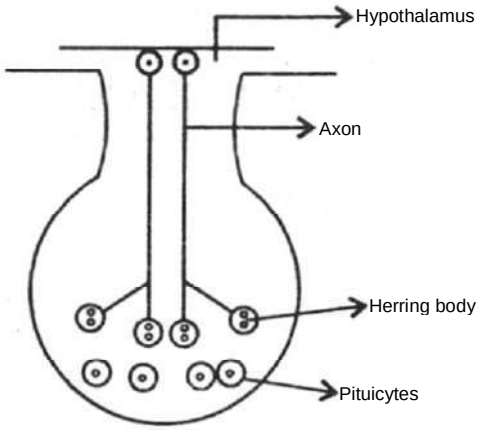
- The part of adenohypophysis of pituitary gland, which is very close to neurohypophysis is a very thin portion, it is called ***pars intermedia*** or ***middle lobe*** of pituitary gland.
- In man it is in the form of a thin membrane only. It is **inactive** in men.

MELANOCYTE STIMULATING HORMONE [MSH] :

- It is secreted by middle lobe. (By corticotroph cell).
- MSH is also called **intermedin**.
- In man, MSH is secreated by anterior lobe, because middle lobe is ill-developed.
- It stimulates the melanochytes to synthesize melanin in mammals.
- This hormone is related with change in the colour of skin in **Amphibian** and **Reptiles**. This phenomenon of colour changing is known as **metachrosis**.
- It darkens the complexion of skin by distributing **melanin** pigment evenly under the skin.
- Just oppsoite to it, **melatonin** secreted by **pineal body**, collects the melanin pigments at one place thus fairing the complexion of skin.
- MSH is found in all the vertebrates, but it is functional in poikilothermic animals e.g. fishes, amphibians, reptiles etc.
- The importance of MSH in man has not been evaluated.

POSTERIOR LOBE OR NEUROHYPOPHYSIS :

Posterior lobe of pituitary gland is $1/4^{th}$ part of total gland. It is just like nervous tissue, because in it, the termnial ends of the axons of neurosecretory cells of hypothalamus are swollen. These swolen ends are called **"Herring bodies"**. Hormones are released in these bodies.



- There are same large, branched fatty neurogilal supporting cells in between axons, that are called **"Pituicytes"**.

1. Posterior pituitary hormones are not synthesised in the gland itself but they are synthesized in the **supraoptic** nuclei and **paraventricular** nuclei of hypothalamus.

2. The hormone are then transported from their origin to posterior pituitary through axons of hypothalamohypo physeal tract and sotred in association with 2 protein i.e. Neurophysin-I, and Neurophysin-II.

(A) Vasopressin or Pitressin or Anti Diuretic Hormone [ADH] :

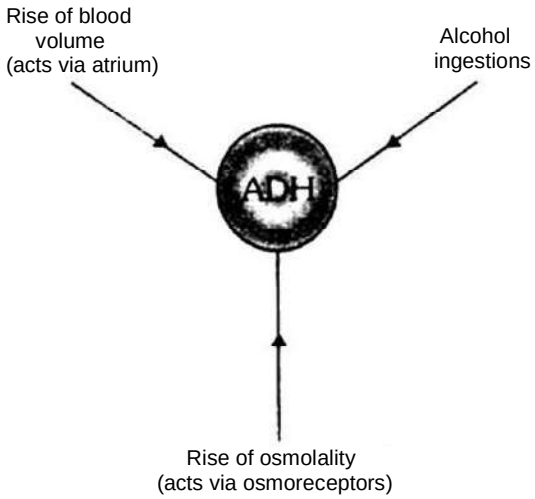
– **Main functions of ADH :**

Its main function is to increase the reabsorption of water in upper part of collecting duct and in distal convoluted part of uriniferous tubules. Due to this, amount of urine is reduced. So it is also called ADH.

- The hormone increases the blood pressure by constriction of blood vessels of tissues.
- Due to **hposecretion** of ADH or vasporessin, the amount of urine increases, this process is called **Diuresis**. Patient feels thristy, Dehydratinon starts in the body. This disease is called **Diabetes insipidus** (taste less urine, polyuria).
- Due to hyposecretion of ADH, deficiency of water starts in Extra cellular fluid (ECF). Blood pressure reduces, urine becomes dilute and blood becomes thick or concentrate.
- Intake of coffee, tea and excess alcohol etc decrease the secretion of ADH.
- Secretion of ADH is maximum in desert fauna (animals of xerophytic region) e.g. camel.
- Kangaroo – Rate (Dipodomys) also shows very high hypersecretion of ADH.

Kangaroo - Rat never drinks water in its life-time

- Hypersecretion of ADH causes dilution of blood and increases concentration of urine and thus blood pressure increases.



Control of ADH

(B) Oxytocin or Pitocin : It is the main **parturition hormone**. It stimulates the fast/rapid contractions and expansions of non-striated muscles of the uterine wall at the last moment of gestation operiod (pregnancy). Due to this uterine constrictions, **labour pains** start jsut before child birth.

- This hormone is secreted by pituitary glands of mother at the time of parturition.
- This hormone also initiates the contractions in uterine wall muscles during copulation/coitus as a result of that semen of man is sweeped out in the fallopian tubes of woman.
- After parturition, this hormone constricts the uterine wall and thus brings back to the normal position.
- Oxytocin hormone contracts the myoepithelial cells present at all the sides of alveoli of mammary glands. Thus it helps in milk ejection so it is also called **milk let down hormone**.
- In female, this hormone related with emotion.
- Even thought, cry or sound of baby can bring about release of this homone in lactating mother.
  This hormone helps during egg laying in birds.
  Injection of oxytocin are initates cows and buffaloes for instant milk release.
- Muller's organ and subneural glands of lower vertebrates are homologus to pituitary gland.

HYPOTHALAMUS

(i) **Position and Structure :** Hypothalamus is the floor of diencephalon. It is formed of masses of grey matter, called hypothalmic nuclei, containing neurosecretory cells. It is connected with anterior pituitary lobe by blood capillaries of hypophyseal portal system and with the posterior pituitary lobe by axons of its neurons, both passing through the pituitary stalk.

(ii) **Hormones of hypothalamus :** Neurosecretory cells of hypothalamus secrete neurohormones called releasing factors (RF) or inhibiting factors (IF). These neurohormones are carried by hypophyseal portal system to adenohypophysis (primary target organ) and stimulate or inhibit the release of trophic hormones from adenohypophysis. These neurohormones are proteinous in nature and formed of 3 – 20 amino acids.

Neurohormones of Adenohypophysis

Neurohormones	Physiological effects
(1) TSH-RF (Thyroid Stimulating Hormone – Releasing Factor)	Increased ACTH secretion from adenohypophysis.
(2) ACTH-RF (Adrenocorticotrophic Hormone-Releasing Factor)	Increased ACTH secretion from adenohypophysis.
(3) STH-RF (Somatotrophic Hormone-Releasing Factor)	Increased STH secretion from adenohypophysis
(4) SOMATOSTATIN (GROWTH INHIBITING HORMONE)	Decreased STH secretion from adenohypophysis.
(5) GTH-RF (Gonadotrophic Hormone-Releasing Factor) It is divided in two parts (i) FSH-RF (Follicular Stimulating Hormone-Releasing Factor) (ii) LH-RH (In female) (Luteinising Hormone – Releasing Factor) or ICSH-RF (In male) (Interstitial Cells stimulating Hormone-Releasing Factor)	Increased FSH secretion from adenohypophysis. Increased LH secretion from adenohypophysis.
(6) Prolactin-Releasing hormone (P-RH)	Increased secretion of prolactin or leutotrophic hormone.
(7) Prolactin-Inhibiting hormone (P-IH)	Increased secretion of prolactin or leutotrophic hormone.
(8) MSH-RF (Melanophore Stimulating Hormone-Releasing Factor)	Increased MSH secretion from intermediate pituitary lobe.
(9) MIF (Melanophore Inhibiting Factor)	Decreased MSH secretion from intermediate pituitary lobe.

(iii) **Hypothalamo – pituitary complex :** Pituitary gland is closely related with hypothalamus. Both together form hypothalamo-pituitary complex.

The hypothalmic-pituitary (hypothalamo-hypophyseal) system is a direct proof of coordination between the hormonal and nervous system. It regulates most of the physiological activities of body and maintains homeostasis inside the body. These neurosecretory cells are known to synthesize two more hormones : Oxytocin and Vasopressin, which are stored in their axons extending in the posterior lobe of pituitary gland.

THYROID GLAND

- It is the **largest endocrine gland in the body**.
- This is situated at the latero-ventral side of the joint of trachea and larynx in the neck region of man. The shape of this gland is like letter H or Butter fly. It is **bilobed** in birds and mammals, but it is single lobed in reptiles. Both of its lobes are connected by non-glandular band, formed of a connective tissue. This band is called **isthmus**. No hormone secreted by isthmus.

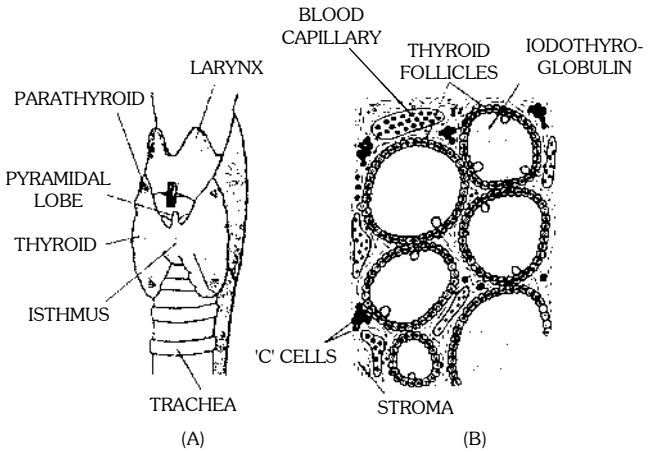


Fig. – (A) Thyroid gland, (B) Follicles suspended in stroma of a lobule

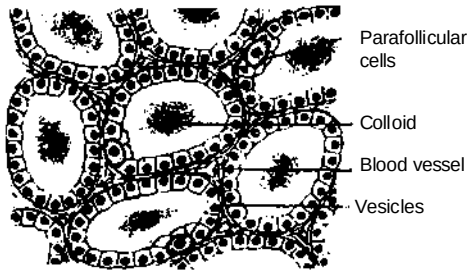
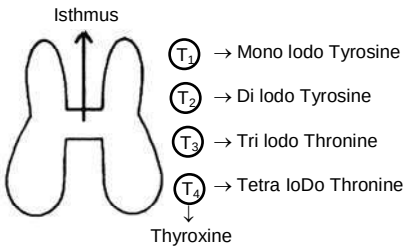
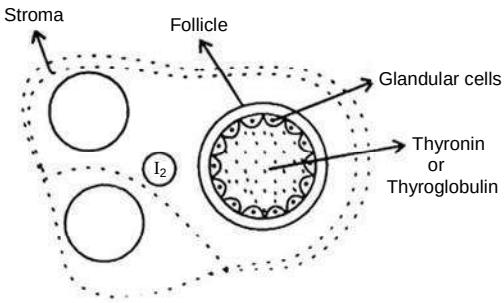


Thyroid Gland

- It is endodermal in origin.
- **Endostyle** of lower vertebrates like **Herdmania, Amphioxus** is homologous of thyroid gland.
- In human, this gland weight, about 25 gm to 35 gm approximately. (This is some what larger in women as compared to men).
- Each lobe of thyroid gland is made up of connective tissue. There are present so many folicles made up of glandular cells in connective tissue.





- These follicles are scattered in loose connective tissue, the stroma. A layer of cuboidal glandular cells is found in the wall of follicles. An iodised colloidal fluid substance **Thyroglobulin** is filled in the cavity of these follicles. **Thyroglobulin** is **glycoprotein** in nature. Parafollicular cells are occasionally found in between basement membrane of the follicle & these cells secrete thyro calcitonin.

  Thyroid is the only endocrine gland in the body which stores its hormone in its inactive state.

Production of Thyroxine :

Thyroxine contains two phenyl rings linked up by an ether bridge.

BIOSYNTHESIS

(1) Iodide trapping – when KI taken up by follicular cells.

(2) Oxidation of Iodide – KI $\rightarrow$ I_2.
The oxidation of iodine is promoted by the enzyme **peroxidase**.

(3) Organification – The binding of iodine with the thyroglobulin molecule is called organification of the thyroglobulin

Tyrosine + I_2 $\rightarrow$ MIT & DIT. (Monoiodotyrosine and Di-iodotyrosine)

(4) Coupling – MIT + DIT = T_3 (Tri-iodothyronine)

DIT + DIT = T_4 (Tetra-iodothyronine)

All of these step of thyroxine biosynthesis are stimulated by TSH hormone.

T_1 = Mono iodo tyrosine

T_2 = Di iodo tyrosine

T_3 = Tri iodo thyronine (20 %)

T_4 = Tetra iodo thyronine (80 %)

- Secretion of T_4 is compartively more than T_3, and T_3 hormone is four times more active than T_4 hormone. T_4 changes into T_3 on reaching in the tissues. After enter into tissue deiodination takes place in T = 4 = which , change into T_3.
- T_4 is called **thyroxine** in this T-chain of hormones.
- Thyroxine or Tetra-Iodo-Thyronine is a derivative of aminoacid.
- Each thryoglobin molecule contain an average of T_3 molecule for every 14 molecule of thyroxine (1 : 14 – T_3 : T_4).
- Thyroid hormones in the form of thyroglobulin are stored in the follicles in an amount sufficient to supply the body with its normal requirements of thyroid hormone for 3 months.

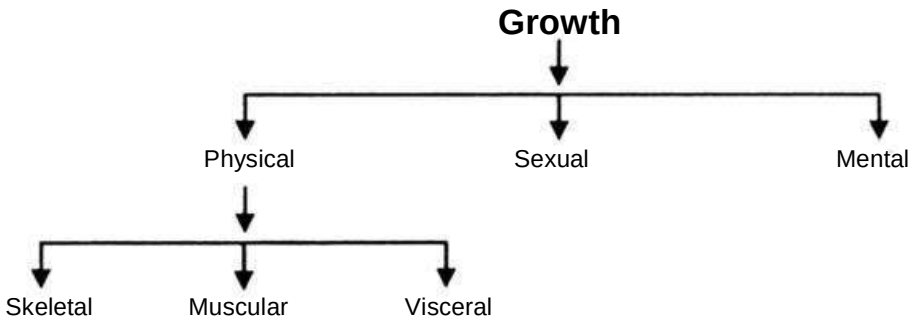
- **E.C. Kendal** first of all crystallised this thyroxine hormone.
- **Harrington and Barger** studied the molecular structure of thyroxine.
- Thyroid gland requires iondine "120 μg" every day for the production of thyroxine.
- Normal recommended minimum intake 200 μgm/day, if iondine in take < 50 μgm /day, then thyroid disorder develops.

- **E.C. Kendal** first of all crystallised this thyroxine hormone.
- **Harrington and Barger** studied the molecular structure of thyroxine.
- Thyroid gland requires iondine "120 μg" every day for the production of thyroxine.
- Normal recommended minimum intake 200 μgm/day, if iondine in take < 50 μgm /day, then thyroid disorder develops.
 If there is deficiency of iodine in food then thyroid try to absorbs more and more iodine from blood and increases its size it is called **simple goitre**.

- Goitre is found more abundently in the persons those live on mountain slopes, because iodine (at that place) flows along with water. When most of the people show the symptoms of this dissease then it is called **endemic goitre** and hill station called as "goitre zone"

- Persons who take sea foods, never show the symptoms of goitre.

1. Growth, Developemnt and Metamorphosis :



- Thyroxine stimulates the metamorphosis of tadpole larva in amphibians.
- Due to its deficiency, larva does not show metamorphosis to be an adult.
- Some amphibian larvae e.g. **Ambystoma** and **Necturus** (Water dog) do not undergo metamorphosis to an adult, and these larva stages start reproducing without gaining adulthood. This process is called as **Paedogenesis**.

2. METABOLISM :

General :

(i) Thyroxine regulates the **Basal Metabolic Rate (BMR)** in the body.

BMR : The rate of **calorie consumption** that is necessary for survive is called basal metabolic rate of body.

The hormone enhances the oxidative metabolism of body cells as a result of it energy production is also increased in the form of calories.

BMR increases $\rightarrow$ Body Temp. increase $\rightarrow$ loses weight.

Due to over production of heat it is called as calorigenic hormone.

(ii) Increase activity of $Na^+ - K^+$ AT Pase. It increases the number of mitochondria in all the cells of body i.e. increases metabolic rate of life. It increases the consumption of oxygen by the cells of body.

- Thyroxine play the both anabolic as well as catabolic role. At optimum concentration it play anabolic role but in oversecretion it play catabolic role.

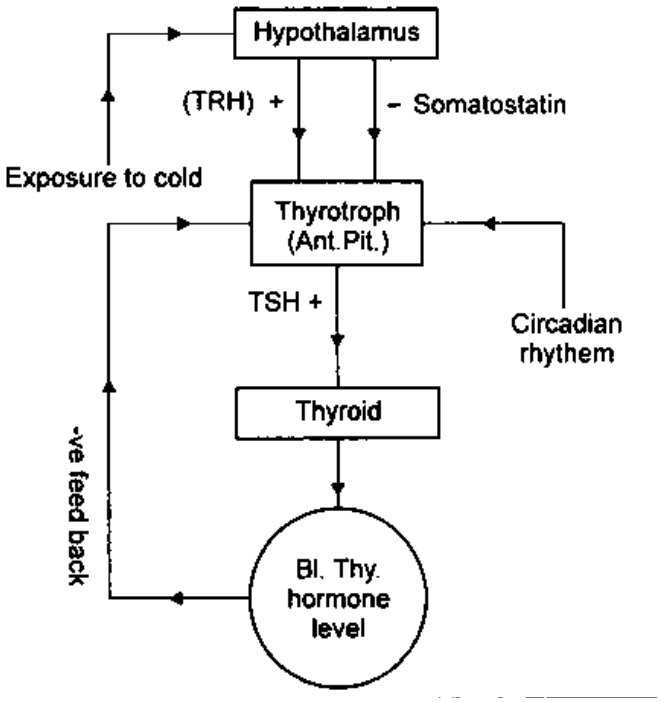
Fat Metabolism :

- Enhances enzyme activity both synthesis & predominantly catabolism of cholesterol.
- **Carbohydrate action** $\rightarrow$
- Blood sugar increase, act as a diabetogenic hormone.
- **Protein** $\rightarrow$ both catabolism & anabolism but at optimum concentration of thyroxine, **anabolism** is dominant.

3. ON INDIVIDUAL SYSTEM : Heart

- Thyroxine increases – Heart beat increases (Tachycardia) – Increases Cardiac output.
- Maintain the contraction of myocardium.
- It regulates the heart-beat because it acts directly on SA-Node.

- **CNS** – optimum conc. of thyroxine is required for developemnt of the nerve fibre & their myelination.
- **GIT** – thyroxine increase motility of GIT causes diarrhoea. Appetite also increase.
- **On blood** – Thyroxine stimulates. The formation and maturation of R.B.Cs

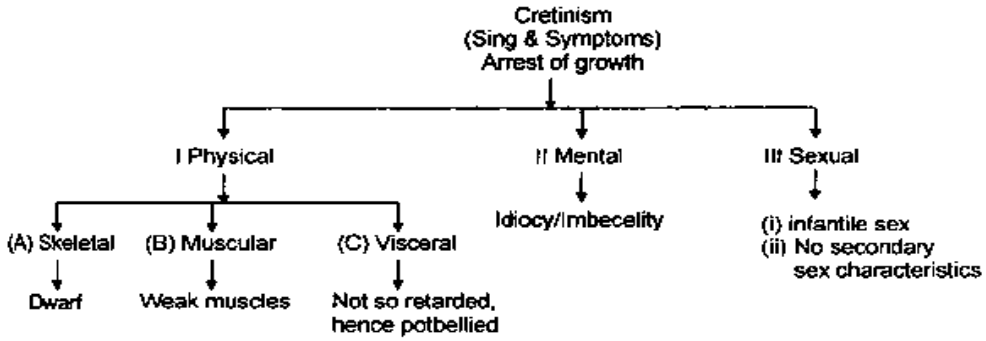


- The hypothalamus and anterior pituitary gland control rate of thyroid secretion.
- Anterior pituitary gland secretes TSH.
- The most important effect of TSH is **proteolysis of thyroglobulin** which causes release of thyroxine into the blood.
- Secretion of TSH is controlled by a hypothalamic hormone. Thyrotropin Releasing Hormone (TRH).
- Increase thyroid hormone in the body fluid decreases the secretion of TSH by anterior pituitary.

IRREGULARITIES OF THYROID GLAND AND IT'S DISEASES :

1. Hyposecretion of thyroid or Hypothyroidism :

- It may be a genetic disorder or due to deficiency of iodine in food or due to excess iondine excretion in urine.
- **In childhood**, hypothyroidism causes **Cretinism**, these children are called **cretin**, they may show such symptoms like : Thick lips, protruding tongue, pot belly, ill developed sex organs & retarded physical & mental growth. The children remain dwarf and become ugly. Their BMR, rate of heart beat and body temperature decreased. They are sterile.



- **In adults**, hypothyroidism causes **Myxoedema**. (Gull's disease) The symptoms of this disease are falling of hair, loose and swollen skin, deposition of adipose fat and mucous beneath the skin so body as a whole becomes obese, BMR and blood pressure are reduced. Patient becomes sensitive to cold and shows loss of sexual power. Mental slowing, **bradycardia**, weight gain occurs and lose of hair from head. Myxoedema is also called as Sporadiac goitre.
- **Simple goitre/Endemic goitre :** It is due to deficiency of iodine in food, and also known as **Colloid goitre**. Thyroid gland enlarges due to swelling. It is not a genetic disorder. The neck also swells up and looks like a collar. It is cured by extra intake of iodine in food or intake of sea food.
- **Hashimoto's disease :** In this disease, there is acute deficiency of thyroxine. Then the medicines given for the treatment of disease or even hormone thyroxine itself acts as antigen. In its reaction, body produes antibodies, which destroy the thyroid gland itself. It is known also as **suicide of thyroid or Autoimmune thyroiditis**.

2. Hypersecretion of thyroid or Hyperthyroidism :

The gland shows enlargement due to some microbial infections or genetic disorders, and this enlarged gland secretes thyroxine in excess amount. As a reuslt of it, BMR, heart beat rate, blood pressure, absorption of glucose in intestine and consumption of oxygen increase. Too much energy is produced in mitochondria, that it is not stored in the form of ATP but it is released in the form of heat in the body . Thus in place of growth unnecessary irritation, exhaustion are observed in the body of patient. Due to excess heat/calorie/energy formation, patient feels extreme hot.

Hyperthyroidism may cause following disorders in the body :

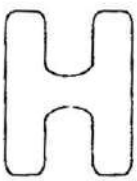
Expohthalmic Goitre or Grave's disease or Basedow's disease or thyrotoxicosis

In this disease, deposition of mucous beneath the eyeball takes place. As a result of that eyes look enlarged and buldging or protruding out side the eye socket, giving the patient a fearful look. In this disease whole gland shows enlargement in the neck region.

Plummer's disease : In this disease, thyroid gland does not show even growth but there become small tumours all over the thyroid just like buds, it is also called **Toxic adenoma**.

Thyroid gland shows enalrgement (swelling) at the time of hypersecretion.

Grave's Disease



Plummer's Disease

Parafollicular cells or C-cells :

Some large and clear cells are found in the stroma of thyroid gland & basal part of follice. These cells are endocrine nature. They are the remains of ultimobranchial bodies made up of fifth branchial pouches of embryo, i.e. para follicular cells are **endodermal** in origin.

These cells secrete **thyroclacitonin (Calcitonin) hormone** which lacks iodine. It is protein in nature.

Thyrocalcitonin reduces the destruction of bones and increases the rate of excretion of Ca^{++} in urin, thus reduces the number of Ca^{++} in extra cellular fluid.

- It enhances the deposition of Ca^{++} in bones thus making bones solid and strong.

- This hormone is antagonistic to **Collip hormone** or **parathormone**.

PARATHYROID GLAND

- These glands remain embedded in the dorsal surface of surface of thyroid gland. They are two pairs in number. They remain embedded in each lobe of thyroid completely or partially.
- It was discovered by **Raynard** and its detailed studied was given by **Sandrom**.
- Total weight about 140 mg and its size is 6 × 3 × 2 mm.

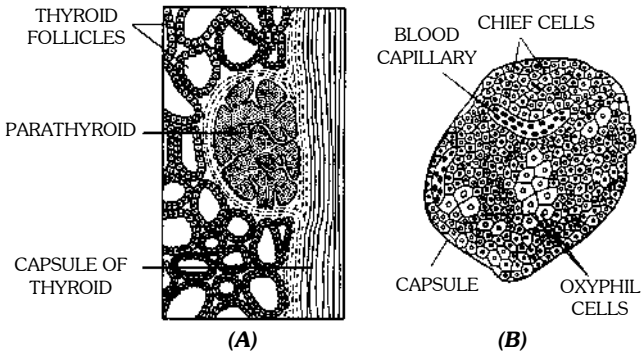


Fig. – (A) Parathyroid gland embedded in the surface of thyroid, (B) Ultrastructure of a parathyroid

- These glands are made by epithelium of third and fourth branchial pouches or pharyngeal puches slite of embryo i.e. these are also **endodermal** in origin.
- These glands secrete only one hormone – parathormone. It is also known as **Collip's hormone** or PTH. Its was obtained by **Collip** in its pure form.
- This hormone is proteinaceous in nature/Polypeptide hormnone.
- Parathormone is essential for survival because it significantly contributes to "homeostatis" by regulating the amount of calcium and phosphate ion in ECF.
- Calcium is key element in many physiological functions like proper permeability of cell membrances, muscular activities, nerve impulse conduction, heart beat, blood coagulation, bone formation, fertilization of ova.
- Calcium is most abundant of all minerals found in the body and about 99 % of calcium and phosphorus are contained in the bones.
- Maintenance of proper calcium level under "homeostatis" is in fact, a combined function of **parathormone, thyrocalcitotnin** and **vitatmin D_3 (cholecalciferol)**.
- Parathormone promotes absorption of calcium from food in the intestine and its reabsorption from nephron in the kidneys.
- Simultaneously, its accelerates elimination of phosphate in urine (phosphaturia action). Thus, calcium level tend to rise in the ECF due to effect of parathormone and phosphate level is decreased in ECF.
- This calcium is then utilized by bone-forming cells, (Osteoblast) in bone formation under the influence of vitamin D_3.
- Parathormone stimulates the osteoclast cells to feed upon bones, these cells remove unnecessary parts of bones by melting, thus change asymmetrical bone into symmetrical one. The remoulding of bone is done by these cells life long. As a result of this, amount of Ca^{+2} remains constant in blood in normal conditions.

Each 100 ml of blood contains 12 mg of Ca^{++}

About 1 kg of calcium is found in an adult man.

- Parathormone maintains the activity of muscles.
- Just opposite to it, **thyrocalcitonin** hormone works **antagonistically** to oppose the **parathormone** and **Vitamin D**. Thyroclacitonin reduces the amount of Ca^{++} in blood by increasing the excretion of Ca^{++} in urine and by reduing destruction of bone.

1. Hyposecretion :

Due to hyposecretion of parathomone or PTH, the amount of Ca^{++} decreases in ECF (It is known as **hypocalcaemia**) and amount of PO_4^{-3} is increased.

- Due to the deficiency of Ca^{++} in blood, muscles and nerves get unnecessarily irritated and start convulsion and cramping. Sometimes voluntary muscles remain contracted for a long time, it is known as **tetany** disease.
- If this tetany appears in intercostal muscles and diaphragm, then animal dies due to **Asphyxia**.
- Removal of parathyroid gland causes quick death. It is the most fatal state/lethal condition.

2. Hypersecretion :

Due to hypersecretion of PTH. osteoclast cells feed excess amount of bone unnecessarily. As a result of this,bones become brittle and weak. This condition is called as **Osteoporosis**.

- When quantity of Ca^{++} is increase in ECF and level of PO_4^{-} is reduced, this condition is known as **hypercalcaemia** and **hypophosphatemia** respectively.
- Due to excess deposition of Ca^{++} in kidneys and gall bladder, **stones** are formed.

C-Cells/Para-follicular cells	Para Thyroid Gland
 It secretes Thyro calcitonin (TCT) hormone It decreases Ca^{+2} level in the blood	 It secretes the parathormone (PTH) hormone It increases Ca^{+2} level in the blood

ADRENAL OR SUPRA RENAL GLANDS

Position, Origin & structure :

- This gland was discovered by a scientist **Eustachius**.
- It is found on the head (anterior most part) of both the kidneys.
- Adrenal gland is **ecto mesodermal** in origin.
- It weights about **4 - 6** gm in man.

- Whole gland is surrounded by a fibrous capsule.

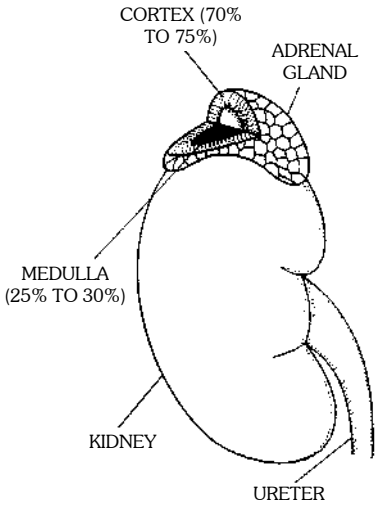

Fig. – Adrenal gland with a part cut to show cortex and medulla

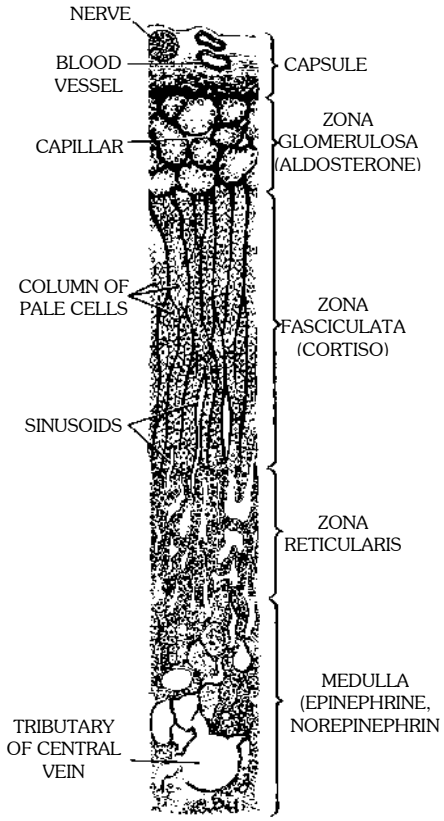

Fig. – Adrenal gland with a part cut to show cortex and medulla

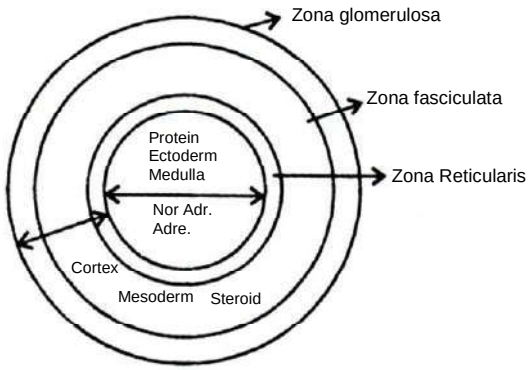
- Each gland has two parts :
  Outer part of gland is called **cortex** and inner part is called **medulla**.
- Cortical portion is 80-90% and is develop from mesoderm of embryo.
- Medullar portion of this gland is mae up of neural-ectoderm of embryo. Only 10-20 % part is medullar part of gland.

Adrenal Cortex :

Most of the cells of this part are fatty. This portion is divided into three regions from periphery to centre.

1. **Outer zone or Zona glomerulosa :**
   Mineralocorticoid hormones are secreted by this zone.
2. **Middle zone or Zona fasciculata :**
   This zone secretes glucorticoid hormones. In this region polyangular cells are arranged in the layers.
3. **Inner zone or Zona reticularis :** Cells of this region are spread in the form of a network, these are arranged in layers. This zone secretes a small amount of sexhormones.



About 40-50 hormones are synthesized in adrenal cortex. All these hormones are of steriod nature. Their basic constituent is chloesterol, these are also called corticoids. Out of these 40-50 hormones, only 7-8 hormones are active.

1. Mineralocorticoids :

2 main hormones fall under this category.

(A) Aldosterone (B) Deoxycorticosterone

Aldosterone -

- These hormoens are related with distribution of water in tissues and balance of **electrolytes** in the body.
- These hormones maintain the ionic balances of Cl^-, K^+, Na^+ and water in the blood and ECF.
- Aldosterone hormone affects distal convoluted parts of uriniferous tubules & upper part of collecting duct.
- It basically activates the Na – K pump.
- It helps in reabosption of Na^+ & Cl^- ions and controls the excretion of K^+ ions.
- Aldosterone hormone is also known as **salt retaining** hormone it increases sodium concentration.
- An increase in Na^+ ion concentration (than normal) in ECF is called **Hypernatremia**.
- In hyposecretion of aldosterone hormone, there is a tremendous loss of ions of Na^+, Cl^- and HCO_3^- by urination and K^+ ions are increased in blood.

2. Glucocorticoids :

Mainly two hormons comes under this categories : - (A) Cortisol (B) Hydrocorticosterone

(A) **Cortisol :** It is an important hormone secreted by zona fasciulata. It is also known as **Hydrocorticosterone**. Cortisol has a small amount of mineralocorticoid activity.

Metabolic Effect :

On Carbohydrate metabolism :

- Increases sugar in blood causes Hyperglycemia. It stimulates the gluconeogenesis in the liver.

Protein metabolism :

Cortisol stimulates the protein break down in some organs like lymphoid tissues (thymus, lymph node etc), muscles, bones, skin etc.

Fat metabolism :

(i) Facilitates lipolysis.

(ii) Promotes deposition of fat, in subcutaneus tissue of the body.

On nucleic acid metabolism :

Cortisol inhibits the synthesis of nucleic acid in all other tissues except liver where (i.e., in the liver) RNA synthesis is increased.

- This hormone controls the activity of collagen fibre and controls the local inflammation or oedema.
- This hormone is "anti-inflammatory.
- Cortisol in used in arthritis/Rheumatism
- Cortisol checks the antigen antibody reaction and controls the local allergy so, it is also called as anti allergic hormone.
- This hormone increases the no. R.B.Cs and decreases the W.B.Cs in the blood so, This hormone is Immuni-suppressive.
- Now a days, contrisols are used in transplantation of organs.

3. Sex – Hormones/Sex corticoids/Gonadocorticoids :

- Sex hormones secreted by adrenals are called **gonadocorticoids**.
- They are secreted in very small amount by zona reticularis.
- Male hormones are called **androgens** and female hormones are called **oestrogens**.
- Both the hormones are secreted by men & women, but sex hormones are mainly secreted by gonads.
- The sex hormone of oppsoite sex secreted by adrenal gland.
- These hormones stimulate the muscles, external genitalia and sexual behaviour.
- Male hormone secreted by adrenal gland is mainly **dehydroepiandrosterone [DHEA]**.
- Female sex hormones progesterone and estrognes are secreted in minute quantities.

Adrenal medulla :

Origin : The adrenal medulla develops from the neuroectoderm of the embryo.

Structure : The adrenal medulla consists of rounded groups of relatively large and glandular cells. These cells are modified of sympathetic nervous system which have lost normal processes and have acquired a glandular function. These cells are called **chromaffin cells or phaeochromocytes**. These cells are connected with the preganglionic motor fibres of sympathetic nervous system, these are dicussed together **as sympatheticoadrenal system**.

Hormones of Adrenal medulla :

Two hormones are secreted by this part. They are collectively called as **catecholamine**.

These hormones are synthesized by chromaffin cells with Tyrosine amino acid.

$$\text{Tyrosine} \xrightarrow[\text{Decarboxylation}]{\text{Hydroxylation}} \text{Dopamine} \xrightarrow{\text{Hydroxylation}} \text{Norepinephrine} \xrightarrow{\text{Methylation}} \text{Epinephrine}$$

Adrenaline or Epinephrine :

- This hormone is 80 % part of the total hormones secreted by Adrenal medulla.
- It was termed as **Emergency hormone** by **Walter Cannon**, because this hormone prepares the body to face unavoidable emergency situations.

Functions of Adrenaline :

- It constricts the blood vessles of skin (Vaso contriction).
- The hormone enhances the flow of blood by vasodilation of blood vessels of brain, heart, liver and skeletal muscles.
- Increases the rate of heart beat, cardiac out put, so increases blood pressure.
- Adrenaline enhances the heart beat and thus increases cardiac output, due to this, circulation of blood becomes faster.
- The hormone stimulates the trachea and bronchi muscles to relax, as a result of it, rate of breathing is increased. So adrenaline hormone is used in asthma.
- It dialates the pupils of eyes. Goose flesh is observed due to its effect. It constricts the erecter pilli muscle of hair, and hair are raised.
- The hormone contraction in spleen, as result of it, spleen pours its stored blood into blood stream and controls the blood volume in body.
- It checks the secretion of saliva and reduces the peristaltic movements in alimentary canal.

- Due to the effect of this hormone, clotting period of blood is reduced, This hormone also stimulates the contraction of Uterus in female at the time of parturition.
- Adrenaline provides the body with an emergent chemical defence mechanism in stress conditions that threaten the physical integrity and chemical consistancy of the body e.g. accident, restlessness, fear, anger, mental tension, pain etc. It immediately prepares the body to face the emergency by a violent stress or alarm reaction.
- The **cortisol** hormones of adrenal cortex serves to maintain the body in living condition and recover it from the servere effects of stress reactions. Thus an increased output of cortisol is **"life saving"** in **"shock conditions"**. So it is also known as **life-saving hormone**.
- The hormones of **adrenal medulla** prepare the animal for fear, fight or flight in emergency conditions. (by excess secretion of these hormones) Adrenaline hormnoe is called **3F = FFF homone** and adrenal gland is called **"triple F gland"** (FFF gland)

Noradrenaline or Norepinephrine hormone :

- It is only 20% part of total hormones secreted by adrenal medulla.
- It acts as vasoconstrictor, thus increases the blood pressure. **Exception – It does not constrict coronary artery of heart**.

IRREGULAR SECRETION OF ADRENAL HORMONE

(i) Hyposecretion :

Addison's disease : Hypoadrenalism

- Caused due to hyposecretion of corticoid homrone of adrenal gland, following are some sympotms of addision's disease dehydration in the body, Blood pressure, BMR and body temperature are reduced, excretion of water and Na^+ increase. The skin of hands, neck and face turns to **bronze colour**.
- Hyposecretion of corticoids causes reduction in amount of glucose in blood, it is called **hypoglycemia**. In this disease, patient may die, so hormones of adrenal gland are called **life-saving hormones**.

(ii) Hypersecretion :

Cushing's syndrome (disease) :

- Due to hypersecretion of Gluco corticoids, body increases breadthwise or body becomes broad because excess deposition of fat under the skin (to cause moon face, fish mouth and buffalo hump). Protein catabolism increases in body. Irregular growth of skin and bones is observed. Hyperglycemia occurs. Amount of Na and water increase in ECF, which is called **oedema**. Due to this B.P. also increases.

Conn's Disease : (Primary aldosteronism)

- Due to excess of mineralocorticoids, an imbalance of Na^+, K^+ is observed. This disease is called **"Conn's disease"**. Due to this disease there occurs irregularity in nervous system, as result of that muscles get contracted, Muscle weakness, hypertension and hypokalemia are observed.

Adrenogenital Syndrome/Adrenal virilism/Pseudohermaphrodite :

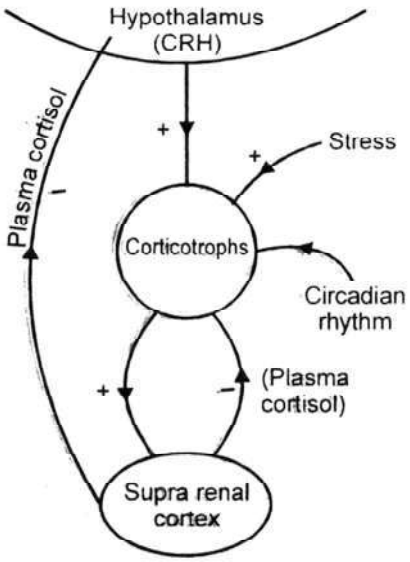
In this case, girls develop male characters, eg. menstrualion cycle is stopped, uterus and ovary are reduced or constricted and clitoris becomes enlarged. Somatic hairs are develops on body, development of Beard and moustache. Only hair symptoms are called as Hirsutism.

- In a man, female sex hormone is secreted by adrenal is in excess amount. he will show feminine characters i.e. development of mammary glands this disorder is called **gynaecomastia**.

- If in a male, androgens are present in excess **amount**, it developes extra enlargement of **penis**. This defect is called **macrogenitosomia** e.g. **manis, Armedillo**.
- Adrenal gland is also known as **4 – S gland**
- 4–S
  - S – Sugar metabolism
  - S – Slat retaining actions
  - S – Sex hormones
  - S – Stress reactions

Control of adrenal Secretion :

- Adrenocorticotropic hormone **[ACTH]** of anterior lobe of pituitary gland controls the hormones secreted by adrenal cortex.
- ACTH controls very little or even does not control the secretion of mineralocorticoids. These are controlled by **Renin hormone** secreted by kidneys.
- Pituitary gland does not control the secretion of adrenal medulla hormones, the adrenal medulla hormones secretion is controlled by nervous system.
- The amount of cortisol and ACTH in blood is maximum in the morning and minimum in early part of night.



Control of ACTH secretion

THYMUS GLAND

This is situated in the anterior part of heart called **mediastinal space**. It is a bilobed gland. It is originated by third branchial pouch of embryo, i.e. it is **endodermal** in origin.

- Thymus gland is well developed in a new born child, but it reduces continuously from adulthood to old age. It remains in the form of a string at last.
- Its structure is just like lymph gland. It is covered by connective tissue coat capsule and internally both the lobes are redividing in to small lobules.
- Each lobule has a dense, darkly staining peripheral **cortex** and a looser lightly staining central **medulla**.
- The cortex consists of densely packed lymphocytes.

- The medulla consists of reticular epithlial cell, a few lymphocytes and the "Corpuscles of Hasslls" thymic corpuscles.
- Thymus gland is related to immune system of body.

Hormones and functions of thymus gland :

- Thymus gland secretes thymosin or thymin hormone, that is proteinaceous in nature/Polypeptide.
- Main-immunity develop upto 9-10 year. If thymosine immunity power very high tymosin myasth gravis develop.

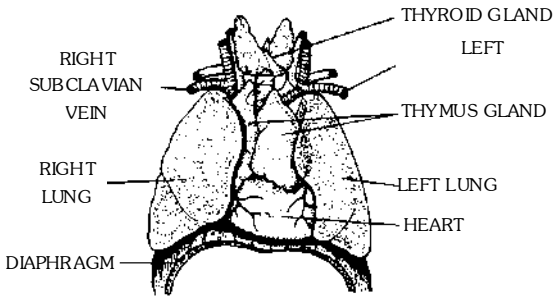


Fig. – Location of thymus gland

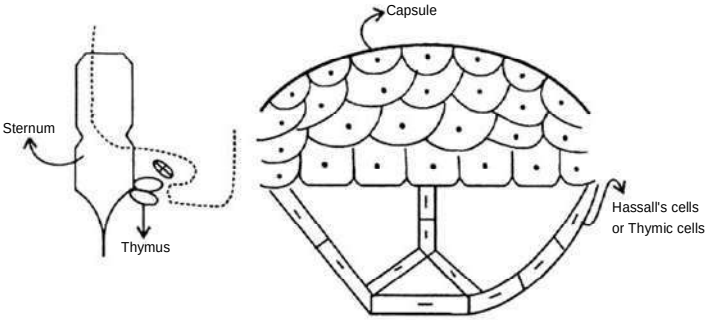

(1) This hormone helps in immune system of the body.

(2) **Hassall's corpuscles** are found in thymus gland, these are also called **thymic corpuscles or eopithelial cell or reticular cell**, they act as phagocytes.

(3) After the birth, **T-Cells** or **T-lymphocytes** are matured in thymus gland, then these lymphocytes are releases by thymus gland, reach to lymphatic organs like spleen, payer's patches and lymph nodes & deposited in it.

(4) Thymosin hormone stimulates the maturation of lymphocytes to destroy the antignes produced by bacteria or pathogen.

(5) According to one of the theories of Ageing the decline and disappearance of Thymus gland by middle age is the primary cause of **ageing**.

(6) Thymosin helps in the development of sex gland but inhibits sexual maturity in early young age.

(7) Thymus provide cell mediated immunity so thymus is also called **"Throne of immunity"** or **"Training school of T-lymphocytes"**.

- Secretion of thymin decreases the neuromuscular transmission, so hypersecretion of thymine may cuase **myasthenia gravis** (may be treated by corticoidesfor short time). It provides the antibody against receptor & block the Neuromuscular junction.

PINEAL BODY

Position :

- It is situated at the dorsal side of diencephalon of anterior part of brain i.e. prosencephalon. It is also known as **Epiphysis cerebri. Pineal** body is a part of brain. It is ectodermal in origin.
- There are found pinealocyte cells (formed by the modification of nerve cells) and supporting interstitial cells or neutroglial cells in pineal body.
- Pineal body called as **third eye in frog**.

Hormone & Functions :

- Pineal body secretes a hormone melatonin, which is an amino acid.
- Melatonin is functional in lower vertebrates only.
- In amphibians and reptiles, this hormone is related with metachrosis (change in the colour of skin). It affects the Melanophores of skin, thus acts antagonistically to the MSH of pituitary i.e. it fairs the complexion of skin.
- Central part of gland secretes antigonadial hormone.
- The hormone controls the sexual behaviour in mammals. It inhibits the sexual irritation, and also inhibits the development of genitalia and their functions.
- If pineal body is removed from rat, these will attain premature adolescence.
- The gland probably controls the sexual behaviour according to light differentiation, thus it acts as a **biological clock**.
- It is proved that the level of melatonin rises during periods of darkness and falls during periods of light.
- Children blind from birth attain puberty earlier than normal.
- Maximum developoment of pineal upto 7yr & then it undergoes involution & at the age of 14 yr interstitial tissue and crystals of $CaCO_3$ or Ca_3PO_4 are deposited in it, these are called **"Brain sand"** or **"Acervuli"**.

PANCREAS

- **Position :** Pancreas is a pink coloured mixed gland
- Endodermal in origin.
- 99% part is exocrine – Acini – Digestive enzymes.
- 1% part in endocrine – Islets of Langerhans – Different hormones.
- Each islet of Langerhans has 4 types of cells

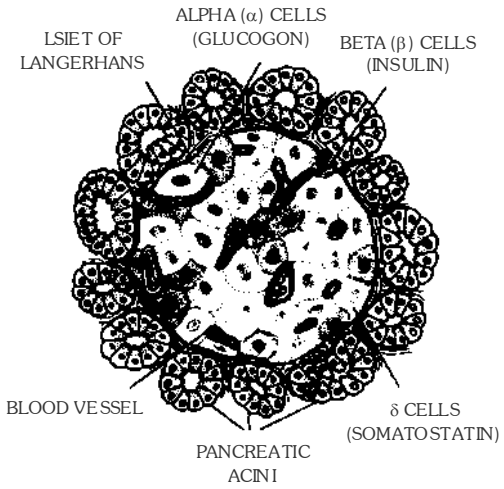

Fig. – T.S. of pancreas

(A) **Alfa cells (α-cells) :** These are the largest cells present in peripheral region these are approximately 25 % of the total cells. They secrete **glucagon** hormone.

(B) **Beta cells (β-cells) :** These are the small cells present in central region. These are about 60–65 % part of total cells. They secrete **Insulin** hormone.

(C) **Delta cells (δ-cells) OR Gamma cells (γ-cells) :**
These cells are found in middle region. These are about 10 % part of total cells. They secrete **somatostatin** hormone which regulates the activities of α-cells and β-cells.

(D) **F-cell or PP-cells :** Along with above mentioned cells, some other cells are also found in islet of Langerhans, these are called PP-cells which secrete pancreatic polypeptide hormone.

Insulin :

- It was first prepared/found by **Benting and Best**.
- Molecular structure of insulin was given by A.F. Sanger (with the help of cow's insulin)
- The term insulin was also given by **A.F. Sanger**.
- Insulin is the first protein that is artifically synthesized in lab and is crystallized.
- Human insulin was synthesized by **"Tsan"**.

- Functional human insulin is made up of 51-amino acids that has 2 chains.

(i) α-chain – It is made up **21** aminoacids

(ii) β-chain – It is made up 30 amino acids. Both chains are bind together with cross bonds of disulphide bonds.

- **"A.F. Sanger"** was awarded by **Noble Prize** for it.

Functions of Insulin hormone :

(I) **Actions on cell membrane permeability.**

(II) **Actions on metabolism of** : Carbohydrate, Protein, Fat, Nucleic acid, Minearl.

On cell membrane permeability : Exept brain cells, R.B.Cs. retina, insulin stimulates the permeability and consumption of glucose in all somatic cells.

Actions on Metabolism :

Carbohydrate :

(1) Insulin inhibits gluconeogenesis.

(2) Promotes glycogenesis. There are two major sites of glycogenesis, **Liver** and the **muscles**.

(3) Enhances peripheral utilization (oxidation) of glucose, causing the blood glucose level to fall.

(4) Inhibits glycogenolysis.

(5) Insulin reduces the glucose level in blood so, it is also called as Hypoglycemic factor.

(6) Insulin is anabolic hormone.

Fat :

(i) Insulin promotes lipogenesis and inhibits lipolysis.

(ii) Due to deficiency of Insulin incomplete oxidation of fats takes place which, is the main cause of ketoacidosis in blood.

Protein : Insulin promotes protein synthesis by promoting uptake of amino acid by liver and muscle cell.

Nucleic acid : Insulin promotes synthesis of DNA and RNA.

Hyposecretion of Insulin :

(1) Due to hyposecretion of insulin, permeability and consumption of glucose is decrease, Glycogenesis decrease in the liver so, glucose level in blood is increase and this disease is called **"Diabetes mellitus"** or sugar disease.

(2) World Diabetes Day – 14 November.

- Glucose is excreted throught urine, if amount of glucose is in excess in the blood, this is known as **"Glycosuria"**. In this stage, amount of glucose in blood increases upto > 180 mg./100 ml of blood plasma.
- The amount of water increased (in this stage) in the urine, so intervals of urination reduced, it is called **polyuria**.
- **Polydipsia -** Due to excess loss of water and minerals through urine. The patient feels thristy.
- **Polyphagia** - Due to deficiency of glucose and energy is somatic cell patient become excessive hunger.
- Due to incomplete oxidation of fats in fatty tissues, ketone and acetone bodies are formed. This ketoacidosin apply toxic effect on brain cells.
- The combined effect of ketoacidosis, dehydration and hyperglycemia may cause diabetic comma to the patient, patient becomes unconscious and even some time may be die.
- Insulin hormone is given to the patient by injection in this disease, Insulin given orally is not effective, because it digest in the alimentary canal like protein.
- Now a days, oral insulin is used in following states :

(A) IZS – Insulin Zinc Suspension. (B) PZI – Protamine Zinc Insulin

Hypersecretion of Insulin :

Or – Hyperinsulinism :

- Due to hypersecretion of insulin amount of glucose decreases in blood. It is called **hypoglycemia**.
- In hypoglycemia state, body cells take more and more glucose from blood So need of glucose for nervous system, retina of eye, genital epithelium is not fulfilled, as a result of that patient looses its reproductive power and sight. Due to excess irritation in brain cells, patient feels exhausted, unconsciousness, Cramps, and at last patient may die.
- **"Insulin shock"** – After physical exercise or fasting, if a diabetic patient takes an inlusin injection, sugar level in blood reduces quickly up to 40 mg/100 ml of blood. It is called insulin shock. The patient may be unconscious or even may die.

Disabetes mellitus are two type

(i) **Type - I Diabetes mellitus :** It is also called as juvenile diabetes or Insulin Dependent Diabetes mellitus (IDDM). It is usually develops before age 40 and it is characterised by loss of β-cells with eventually absence of insulin in the circulation. due deficiency of insulin fatal high level of ketone bodies. increase the blood. Insulin is the metabolic hormone which present ketonebody formation.

(ii) **Type - II Diabetes mellitus :** It is also known as matuarity onset diabests mellitus or Non-Insulin Dependent diabetes mellitus. It is usually develops after age 40 year and is not associatede with total loss of the ability of secrete insulin.

Difference between diabetes mellitus and diabetes insipedus

S.No.	Diabetes mellitus	Diabetes insipidus
1.	It is due to deficiency of insulin.	It is due to deficiency of ADH.
2.	The blood sugar becomes high and glucose appears in urine.	The blood glucose is normal and glucose does not appear in urine.
3.	There is high blood cholesterol and ketone body formation.	There is no such phenomenon.

(2) Glucagon :

- It is secreted by α-cells.
- It was discovered by **"Kimball** and **Murlin"**.
- Glucagon is a **hyperglycemic factor**.
- It is made up of 29 amino acids.
- It is antagonistic to insulin. It is secreted by the gland, when sugar level of blood reduces.
- Glucagon hormone increase the amount of glucose in blood.
- It stimulates gluconeogenesis in liver, as a result of that amount of glucose in the blood increased.
- It stimulates Lipolysis of fats in fatty tissues.
- The secretion of insulin and glucagon is controlled by a limit control feed back. When amount of glucose is increased in blood, then insulin is secreted by β-cells. As a result of it, when amount of glucose is reduced in blood, then glucagon is secreted by α-cells.

(3) Somatostain :

It regulates the secretion of insulin and glucagon.

(4) Pancreatic Polypeptide (PP) :

Its functions are known yet today perhaps it controls the absorptin of digested food in intestine.

OTHER ORGANS WHICH SCRETE HORMONES

(A) Kidney : - Main function of kidney is excretion, but it secretes some hormones also. These are as follows :

1. **Renin :** - It converts a plasma protein is secreted by Juxtaglomerular complex of kidney. Renin hormone acts as an enzyme. It changes the Angiotensinogen into Angiotensin I.

$$\text{Angiotensinogen} \xrightarrow{\text{Renin hormone}} \text{Angiotensin I.}$$

- Renin hormone increase reabsorption of water and Na^+ ions in uriniferous tubules.
- It stimulates the secretion of aldosterone hormone from adrenal cortex.

2. **Erythrogenin :** The hormone reacts with plasmaprotein (Globulin) and forms a new hormone erythropoietin.

- Erythropoietin stimulates bone marrow to form RBCs.

3. **Renomedullary prostaglandins :** It is the most active renal hornone. It makes relaxation in unstriated muscles of blood vessels of kidneys. It enhances the excretion of Na ions by urine (diuretic effect), renal vasodilation & decreases tubular reabsorption.

(B) Skin : Due to the effect of ultraviolet rays of sunlight steroids like Argosterol and cholesterol are changed into Argocalciferol and cholecalciferol vitamin D respectively in the skin, it reaches to its target organ by blood stream.

- **Vit. D is supposed to be a hormone**. It acts as a co-hormone with parathormone.
  It helps in bone formation and teeth formation. It increases the absorption of calcium and phosphorus by intestine.
- 'Rickets' disease is observed in children due to the deficiency of vit. 'D' as a result of which bones become weak and thin.
- In adulthood, its deficiency causes **Osteomalacia**. Bones become weak and brittle.

(C) Gonads : -

(i) Testes (Male gonad) :

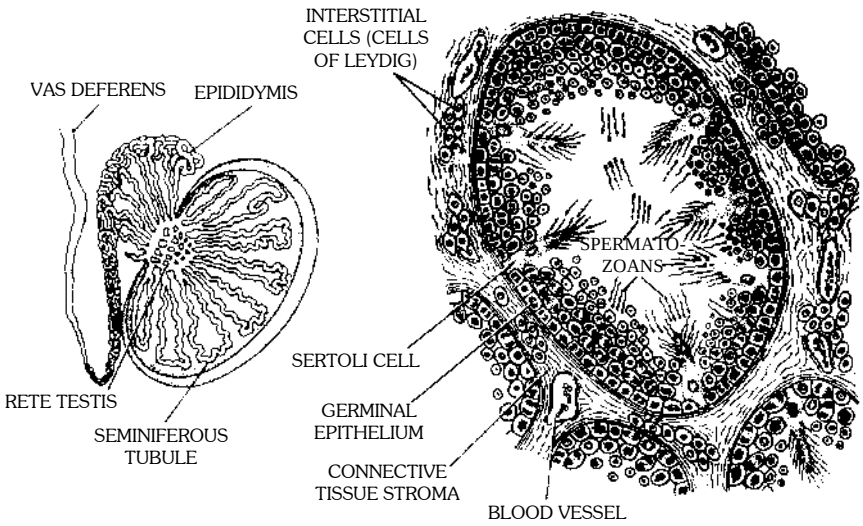

Fig. – Ultrastructure of testes

- Leydig's cells or Interstitial cells of connective tissue of seminiferous tubules of testes secrete male hormones androgens.

- Main androgens are testosterone and androsterone.
- These are steroid in nature.
- Testes also secrete inhibin/activin

WORKS OF TESTOSTERONE

- It increase the diameter of pectoral bone.
- It stimulates the haemopoiesis in bones.
- It increases the cholesterol level in blood.
- Testosterone is the main androgen (30 to 100 ng/ml).
- It changes the sexual behaviour in male eg. deveop the sexual attraction towards the female.
- This Hormone stimulates the development of secondary sex organ. Such as epididymis, vas deferens, seminal vesicle.
- This hormone developes the low pitch of voice which is known as musculizatin of voice.
- This Hormone stimulates the number of sebaceous gland on the face which causes the Acne & pimples.
- It increases the developemnt of beard & moustache.
- It develops the musculization power in muscle.
- It also stimulates the growth of hair on the upper limb, lower limb, thoracic, abdominal part, armpits & near to the external genital organ.
- It stimulates the skeletal growth.
- It also help in the organisation of Ca^{+2} in bones.

(ii) Ovary (Female gonad) :

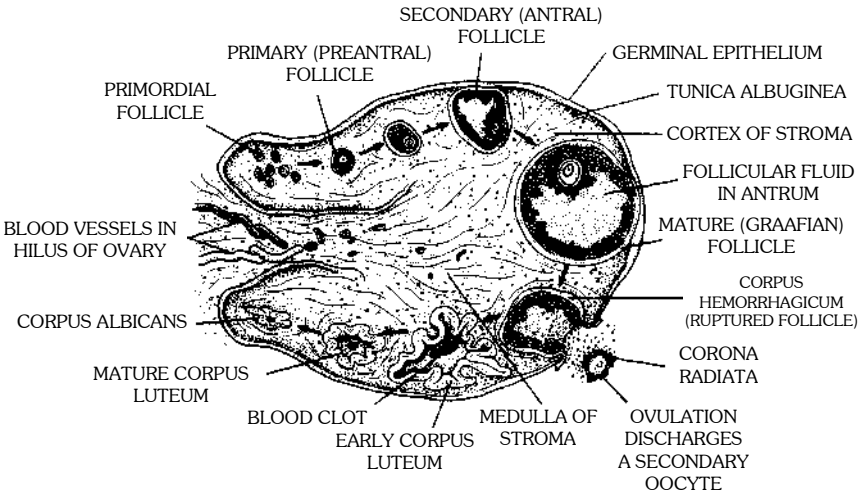

Fig. – V.L.S. of ovary

- **Estrogen/Oestrogen :** The hormone is is secreted by the inner layer – theca interna of graafian follicles.
- Estrogen includes estradiol, estrone and estriol.
- Estrogen is steroid in nature.
- This Hormone stimulates the development of secondary sex organ such as fallopian tube, uterus, vagina.
- Promotes the development of mammary gland. It stimulates the tubular growth.
- It devlops the high pitch of voice which is also called as Feminine of voice.

- This Hormone removes the hair from face, upper & lower limb, thorax & abdominal part. But stimulates growth of hair near the external genital organ & armpits.
- It makes the muscle soften.
- It also develops the growth of skeletal muscle & bone. It help in the organisation of Ca^{+2} in the bone.
- It increase the diameter of pelvic bone.
- It stimulates the blood formation but decreaes the cholesterol level in the blood.
- It stimulates the rate of growth of hair of head.
- It also changes the sexual behaviour, means attraction towards the male.

Corpus Luteum : (Temporary endocrine gland).

After ovulation Graafian follicle changed into a yellow gland in the ovary, it is called **corpus luteum**. Regulation and control of its production is done by L.H. Corpus luteum is an endocrine gland. Following are the hormones secreted by this gland.

(1) Progesterone :

- The hormone stimulates the developemntal characters of pregnancy.
- Due to the effect of this hormone, uterine wall endometrium become thick and blood circulation is increased in it. Fats and glycogen are deposited in its cells.
- This stimulates the alveolar growth of mammary glands become highly developed, as a result of this breasts become enlarged.
- It helps in implantation of embryo in the uterine wall.
- The hormone maintains pregnancy, so it is also called **"Pregnancy hormone"** Progesterone inhibits the contractions in uterine wall muscles, so it is also called **"anti abortion hormone"**.

(2) Relaxin :

Perhaps corpus luteum also secretes it, but it is secreted at the end of pregnancy/gestation period.

(3) Estrogen

(4) Inhibin

(D) Placenta : (Temporary endocrine gland).

Placenta connects the embryo and uterus of mother at the time of embryo development. It secretes some hormones –

(i) **Chorionic gonadotropic hormone (CGH) = Human chorionic gonadotropic (HCG)**

It is a protein hormone. It helps to maintain the pregnancy and controls the secretory action of corpus luteum.

- At the initial stage of pregnancy CGH or HCG is secreted in excess amount by placenta and it is excreted by urine. At this stage pressence of CGH of HCGH in the urine is tested by urin test.
- It is a positive test for pregnancy. It also called Gravidex test.
- HCG or CGH is tested in urine test for pregnancy test.

(ii) **Placental lactogen or human chorionic somatomammotropin :**

It is also a protein hormone, and stimulates the mammary glands for milk production.

(iii) **Estrogen :** It is a steroid. It controls extradevelopment of breast during pregnancy.

(iv) **Progesterone :** It is also a steroid. It controls the slow action of slowly abolishing corpus luteum and maintains the pregnanacy.

(v) **Relaxin :** It is a protein hormone. At the time of parturition, it helps to expand the pubic symphysis of pelvic girdle to facilitate the child birth in females.

Hormones which always remains in tissue fluid :

There are some hormones which never reach upto blood stream but always remains in ECF.

These are as follows :

(1) Neurohormone : These are secreted in the nodes of axons of nerve cells. Acetylcholine and Norepinephrine are the main neurohormones.

(2) Prostaglandin : These are fatty acids. These are most active substances among all the known substances.

- Prostagladin are of so many types. Kidneys, gonads, seminal vesicles, thymus, brain etc. Due to vasodialator this hormone decreases the blood pressure.
- These prostaglandins are first of all observed in semen of man. These stimulate contraction of unstriated muscles.
- These prostaglandins are secreted by seminal vesicles and reach upto vagina of female thorugh semen of male, and then these activate the muscles of uterus of female.

(3) Kinins : These are chemicals which are secreted by any organ of body at the time of chemical change in ECF, and reduce the B.P. by expanding blood vessels. These also reduce th time of blood clotting.

Kinins are also called as **"Firstaid hormone"**.

(4) Pheromones or Ectohormones :

- The term "Pheromone" was coined by **Karlison** and **Butenandt**.
- These are secreted by exocrine glands. These are also called **"Semio-chemical"**. They travell from one place to other place by air.
- These chemicals are secreted by animals and effect the other animal's behaviour and mode of life of the same species.
- Just like hormones, their target place is far from place of origin.
- First of all, pheromone Bombykol was studied. It is pheromone of silk moth. Pheromones are volatile in nature, and travel through air from palce to place.

Pheromones are of 3 types :

(1) Sex – Pheromone :

These attract male and female animals for reproduction. Female silk moth secretes **Bombycol** or **Gyplure** from its body which attracts male for mating.

(a) **Muskone :** It is secreted by **Musk deers**.

(b) **Civetone :** It is secreted by **cats**.

(2) Aggregation pheromone :

This pheromone is secreted by one member of social insects and pheromone sends mesages to other members of that society. Thus helps in aggregation. e.g. : **Geradiol** pheromone in **honey bee**.

(3) Alarm pheromones :

These pheromones are secreted by one members of the insect species and alarm the other members of the same species. e.g. : Secretion of **formic acid** in ants insects etc.

Types of pheromones

Type	Example
(1) Sex pheromones	Bombycol – sillkmoth Queen substance – Honey bee Civetone – Cat Muskone – Muskdeer
(2) Aggregation pheromones	Geradiol – Honey bee
(3) Alarm pheromones	Danger signals
(4) Marking pheromones	Mark the territory in wild animals

SPECIAL POINT

- **Heterocrine gland :** These are those endocrine glands which are involved in hormone secretion as well as some other function eg. pancreas, gonads, placenta, GI mucosa and kidneys.
- In females protactin induce maternalism i.e. strong emotional attachment.
- In male prolactin promotes paternalism i.e. protective attitudes towards family members and intensive food gathering for the family.
- Sporadic cases of simple goitre (sporadic goitre) in a population are normally due to genetic defect.
- **Tropic hormone :** A hormone which stimulates another endocrine gland to secrete its hormone is called trophic hormone.
- **Simmond's diseases :** This condition is due to atrophy of the anterior lobe of pituitary gland.
- **Pheaochromocytoma :** It is due to hypersecretion of adrenaline causes, high blood pressure, high level of sugar in blood and urine, high metabolic rate, nervousness and sweating.
- **True sexual precocity :** True sexual precocity is early maturation of ovaries and testes with production, of ova before the age of 9 years in girls, or sperm before 10 years in boys, occurs without evident cause.
- **Sexual pseudoprecocity** results from adrenal cortex, testes, ovary or from other sources, including extragonadial tumours.
- **Eunuchoidism :** Failure of testoterone secretion in male causes eunuchoidism. (A) eunuch has a undeveloped secondary sex organs like prostrate, seminal vesicle and penis (B) lacks external sex character such as beard, moustache and low pitch of voice and (C) does not produce sperm.
- **Growth hormone :** Stimulate the liver to form **"Somatomedins"** (Insulin like growth factors"). This somatomedins potent effect to bone growth.
- In heart CGMP has antagonistic effect to CAMP, CAMP mediate muscle contractin in response to adrenaline, while CGMP slow down muscle contractin is response to acetycholie (NCERT).
- CGMP used in second messanger in atrial natriuretic peptide and Bronchodilation use as medicine (life saving drug) vasodilation in genital organ nitric oxide.

List of hormones their chemical nature and functions

Name of endocrine gland	Name of hormone and its chemical nature	Functions
(1) Neurosecretory cells of Hypothalamus (Supraoptic Nucleus and Paraventricular Nucleus)	(1) Oxytocin and vasopressin nanopeptide.	(i) Milk ejection and parturition (oxytocic effect). (ii) Vasoconstriction and antidiuretic (vasotocin) effects.
	(2) Gonadotropin releasing hormones	Stimulates FSH and LH sysnthesis.
	(3) Other releasing hormones *e.g.* TSHRH, MSHRH, ACTHRH, GHRH etc. Proteinaceous	Stimulate TSH, MSH, ACTH GH secretions from pituitary.
(2) Pituitary (a) Neurohypophysis (Pass Nervosa) (b) Adenohypehypsis (contains diverse cell types)	Store and release Oxytocin and Vasopressin. Proteincaceous or glycoprotein	Hormone release is related to physiological state and requirements. Affect growth, development differential pubertal changes and other metabolic mechanism.
(3) Pineal	Melatonin-derived from the amino acid tyrosine	(1) Antagonist to FSH / LH (2) Regulates biological / circadian rhythms.
(4) Thyroid gland (amine hormone) having – NH_2 group)	(a) Thyroxine, iodinated amino acid called tyrosine (T_2, T_3, T_4). (b) Thyrocalcitonin (Peptide)	(a) Controls basal metabolic rate (BMR). All organ / system of body responds to thyroxine. (b) Facilitates Ca^{+2} absorption
(5) Parathyroid gland	Parathormane, Peptide	Ca^{+2} and PO^{-}_4 metabolism.
(6) Thymus	Thymosine (polypeptide)	Anti-FSH and LH; delays puberty
(7) Islets of lengerhans (= Endocrine pancrease) (i) α-cells (ii) β-cells (iii) δ-cells	Glucagon Isolated by Insulin Banting Secretin Polypeptide	(i) Gluconeogenesis / Glycogenolys (ii) Glycogenesis (iii) Gastric functions
(8) Adrenal gland (a) Adrenal medulla (Amine hormone have – NH_2) (b) Adrenal cortex	(a) Catecholamines (epinephrine = adrenaline, and norepinephrine = noradrenaline (derived from tyrosine) (b) Mineralcorticoids and glucocorticoids and traces of androgen and estrogen steroids derived from cholesterol	(a) Stresses = emergency = Fright, Fight and Flight Hormone (3F) acclerates cardiac functions muscle activity etc. (b) Electrolyte and carbohydrate metabolism.

(9) Ovary (a) Ganulosa cells steroid, fat soluble have sterol group derived from cholesterol	Estrogen (Steroid) Estrone, estradiol	Secondary sex character primary action on uterine endometrium mitogenic.
(b) Corpus luteum	Estrogen and Progesterone (Steroid)	Secreted during luetal phase of menstrual cycle in human female and oestrous cycle of other mammals. Prepares uterine endometrium for receiving blastocytes for implantation. Progesterone is also called pregnancy hormone and is anti-FSH and anti-LH/anti-LTH.
(c) Placenta temporary endocrine gland formed during pregnancy	(a) Steroid secreted are estrogen and progesterone (b) Relaxin-Polypeptide	(a) Maintenance of pregnant state, prevents lactogenesis folliculogenesis, and Ovulation. (b) Act on pubic symphysis and enlarges the birth canal to facilitate birth. Acts synergestically with oxytocin during this process (parturition)
(10) Testis (i) Sertoli cells (= sustentacular cells) (ii) Leydig cells (= Interstitial cells)	(i) Inhibin – Polypeptide (ii) Estradiol-Steroid Androgens (*e.g.* Testosterone) Steroid and rostenedione)	Inhibits FHS action and attenuates spermatogenesis decrementally –do– (i) Pubertal changes in male (ii) Secy. sex characters in male (iii) Sex drives (iv) Spermatogenesis
(11) Gastro-intestinal hormones (secreted by cells of mucosa of stomach and intestine) also called hormones		Stimulates gastric juices secretion from gastric gland, movement of sphincters of stomach and increased movement of stomach
(a) Pyloric stomach (Argentophil cells) Intestine	Gastrin (i) Secreten (ii) Cholecystokinin (CCK) (iii) Enterogastrone (iv) Duedocrinin (v) Enterokinin (vi) Villikrinin	(i) Stimulates secretion of succus entericus (ii) Bile released from gall bladder (iii) Inhibits gastric secretin (iv) Stimulates secretion of mucous from Brunner's gland (v) Stimulate intestinal gland (vi) Stimulate villi movement

Disease caused by hormonal irregularities

Disease	Hormone	Quantity	Gland
Dwarfism	GH	Deficiency	Pituitary
Gigantism	GH	Excess	Pituitary
Acromegaly	GH	Excess	Pituitary
Simmond's disease	GH	Deficiency	Pituitary
Diabetes incipedus	ADH	Deficiency	Pituitary
Cretinism	Thyroxine	Deficiency	Thyroid
Simple goitre	Thyroxine	Deficiency	Thyroid
Myxaedema	Thyroxine	Deficiency	Thyroid
Exophthalamic goitre	Thyroxine	Excess	Thyroid
Tetani	Parathyroid	Deficiency	Parathyroid
Plummer's disease	Thyroxine	Excess	Thyroid
Addison's disease	Mineralocorticoids	Deficiency	Adrenal cortex
Conn's disease	Mineralocorticoids	Excess	Adrenal cortex
Cushing's disease	Corticosteroid	Excess	Adrenal cortex
Diabetes mellitus	Insulin	Deficiency	Pancrease
Myasthenia gravis	Thymosine	Excess	Thymus

(iii) **Insect endocrine glands :** The endocrine system of cockroach comprises intercerebral gland cells, corpora cardiaca, corpora allata, and prothoracic glands.

(1) **Intercerebral gland cells :** These cells lie in the brain between the two cerebral ganglia. They secrete a hormone called the brain hormone. This hormone activates the prothoracic glands to secrete their hormone.

(2) **Corpora cardiaca :** These are a pair of rod-like bodies situated on the sides of the oesophagus just behind the brain. They secrete a growth hormone.

(3) **Corpora Allata :** These are a pair of small, rounded bodies lying close behibnd the corpora cardiaca. They secrete a juvenile

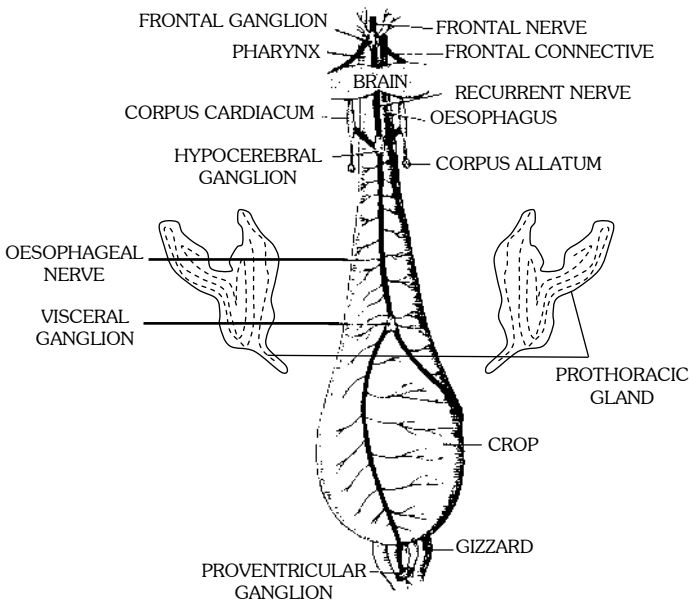

Fig. – Endocrine glands of cockroach

hormone in the nymphal stages. This hormone causes retention of the nymphal characters and checks the appearance of adult characters. In other words, it keep the insect young, hence its name. In the last nymphal form, corpora allata become inactive, thereby resulting in the absence of juvenile hormone. The absence of this hormone permits the appearance of adult features. In the adult, the corpora allata again become active and secrete a gonadotropic hormone, which regulates egg production and development and functioning of the accessory sex glands.

(4) **Prothoracic glands :** These are fairly large, irregular glands situated in the prothorax. They secrete a hormone called ecdyson, which controls moulting of the nymphs. The prothoracic glands degenerate after metamorphosis.

EXERCISE - 1

Q.1 Effect of thyroxine on B.M.R. is-
(1) Increase (2) Decrease
(3) Uncertain (4) No effect

Q.2 Neurohypohysis secretes-
(1) Vasopressin and growth hormone
(2) Oxytocin and estrogen
(3) Vasopressin and oxytocin
(4) Vasopressin and estrogen

Q.3 Adrenal cortex produces-
(1) Adrenaline (2) Epinephrine
(3) Aldosterone (4) Calcitonin

Q.4 Parathyroid gland degenerates.Which activity is disturbed-
(1) Growth
(2) Calcium concentration
(3) Potassium concentration
(4) Sodium concentration

Q.5 Effect of prolactin hormone is on-
(1) Liver (2) Pancreas
(3) Mammary glands (4) Bones

Q.6 Dwarfism is due to-
(1) Absence of insulin
(2) Hyposecretion of GH during childhood
(3) Hyposecretion of GH during adult stage
(4) Excessive secretion of adrenaline

Q.7 Glucagon is produced by-
(1) Peptic cell (2) Oxyntic cells
(3) Alpha cells (4) Beta cells

Q.8 Female sex hormone is-
(1) Estrogen (2) Androgen
(3) Insulin (4) Adrenaline

Q.9 Pancreatic secretion is stimulated by
(1) Secretin
(2) Cholecystokin-Pancreozymin
(3) Duocrinin (4) Enterogastrone

Q.10 Function of enterogastrone is
(1) Regulation of bile flow
(2) Stimulation of pancreatic flow
(3) Inhibition of gastric secretion
(4) Stimulation of gastric secretion

Q.11 Function of thymus is -
(1) Immunity (2) Growth
(3) Formation of RBCs
(4) Emergency hormone

Q.12 Vasopressin performs
(1) Muscle contraction
(2) Increases blood pressure
(3) decreases blood pressure
(4) Both 1 and 2

Q.13 Progesterone is secreted by-
(1) Corpus luteum (2) Thyroid
(3) Thymus (4) Testis

Q.14 Diabetes is a disease in which urine contains
(1) Salt (2) Sugar
(3) Fat (4) Protein

Q.15 Insulin is secreted by
(1) Pituitary (2) Adrenals
(3) Thyroid
(4) lslets of Langerhans

Q.16 Ca^{2+} level is controlled by-
(1) Thyroid (2) Hypothalamu
(3) Pituitary
(4) Thyroid and parathyroids

Q.17 Which one is not secreted by pituitary ?
(1) Thyroxine (2) F.S.H.
(3) G.H. (4) A.C.T.H

Q.18 Iodine is present in the secretion of
(1) Adrenal (2) Thyroid
(3) Pancreas (4) Pituitary

Q.19 Which is correct ?
(1) Glucagon and insulin are secreted by same cells
(2) Glucagon and insulin are secreted by different cells
(3) Glucagon and insulin are secreted by different cells and have opposite effect
(4) None of the above

Q.20 Which gland is often referred in connection with AIDS-
(1) Thymus (2) Thyroid
(3) Adrenal (4) Pancreas

Q.21 A temporary endocrine gland formed in ovary after ovulation is-
(1) Corpus uteri (2) Corpus albicans
(3) Corpus callosum (4) Corpus luteum

Q.22 Reabsorption of water in distal parts of kidney tubules/urine concentration is controlled by
(1) Vasopressin/ADH (2) Oxytocin
(3) Calcitonin (4) Relaxin

Q.23 Endocrine gland for combating emergency is
(1) Adrenal cortex (2) Adrenal medulla
(3) Pancreas (4) Parathyroid

Q.24 Glucagon produced by a-cells of islets of Langerhans-
(1) Converts glucose to glycogen
(2) Converts glycogen to glucose
(3) Decreases concentration of glucose in blood
(4) None of these

Q.25 Basal metabolic rate is under control of
(1) Glucagon (2) Insulin
(3) Thyroxine (4) Both 1 and 2

Q.26 Hormones involved in carbohydrate metabolism are
(1) Insulin, glucagon, epinephrine and parathormone
(2) Insulin, glucagon, epinephrine and glucocorticoids
(3) Insulin, glucagon, glucocorticoid and calcitonin
(4) Insulin, glucagon, norepinephrine and melatonin

Q.27 Which endocrine gland stores its secretion in extracellular spaces before discharging into blood?
(1) Testis (2) Pancreas
(3) Thyroid (4) Adrenal

Q.28 Blood calcium is increased by administration of
(1) Glucagon (2) Thyroxine
(3) Parathormone (4) Calcitonin

Q.29 Parathormone deficiency cause-
(1) Goitre (2) Hypocalcemi
(3) Hypercalcemia (4) All the above

Q.30 Which hormone facilitates child birth?
(1) Oxytocin (2) FSH
(3) LH (4) Prolactin

Q.31 Insulin is-
(1) Vitamin
(2) Proteinaceous hormone
(3) Amine hormone
(4) Steroid

Q.32 FSH is involved in -
(1) Ovulation
(2) Spermatogenesis
(3) Control of blood sugar
(4) Growth

Q.33 Epinephrine is-
(1) Andrenergic (2) Cholinergic
(3) Both 1 and 2 (4) None of the above

Q.34 GH controls growth through-
(1) rRNA (2) tRNA
(3) mRNA (4) None of the above

Q.35 Diabetes insipides is under control of-
(1) ACTH (2) TSH
(3) ADH (4) Aldosterone

Q.36 Thyroxine is a
(1) Vitamin (2) Enzyme
(3) Hormone (4) Excretory product

Q.37 Hormone is
(1) Enzyme
(2) Chemical messenger
(3) Excretory product (4) Glandular secretion

Q.38 Pituitary gland occurs in-
(1) Trachea (2) Abdomen
(3) Gonads (4) Brain

Q.39 Relaxin is produced by-
(1) Testis (2) Adrenals
(3) Pituitary (4) Ovary

Q.40 Thyrocalcitonin
(1) Elevates K^+ level in blood
(2) Lowers Ca^{++} level in blood
(3) Elevates Ca^{2+} level in blood
(4) None of the above

Q.41 Hormone connected with increased rate of glycogenesis, blood pressure and heart beat-
(1) Insulin (2) Glucagon
(3) Adrenaline (4) FSH

Q.42 Secretion is under control of neurosecretory nerve axons is
(1) Pineal (2) Adrenal cortex
(3) Anterior pituitary (4) Posterior pituitary

Q.43 Iodine deficiency in Frog will lead to-
(1) Accelerated metamorphosis
(2) Inhibition of metamorphosis
(3) Development of miniature frog
(4) Development of a giant frog.

Q.44 Secretin hormone is secreted by and stimulates
(1) Duodenum-pancreas
(2) Duodenum-liver
(3) Stomach-gastric glands
(4) Thyroid-thyroid

Q.45 Removal or absence of thymus in early life shall bring about
(1) Lack of lymphocytes
(2) Lack of antibodies
(3) Lack of lymph nodes
(4) All the above

Q.46 Which one controls the secretion of estrogen-
(1) HCG (2) Progesterone
(3) LH (4) FSH

Q.47 Adrenal medulla is derived from-
(1) Ectoderm (2) Mesoderm
(3) Endoderm (4) Both (1) and (3)

Q.48 Removal of thymus gland in the early life of an experimental mammal will cause-
(1) Lack of lymphocytes
(2) Lack of antibodies
(3) Lack of lymph nodes and lymph vessels
(4) All of the above

Q.49 Diabetes insipidus is caused by the deficiency of hormone -
(1) insulin (2) vasopressin
(3) glucagon (4) oxytocin

Q.50 Glomerular area of adrenal cortex is responsible for-
(1) water and electrolyte balance
(2) carbohydrate metabolism
(3) steroid and hormone secretion
(4) blood pressure

Q.51 Pineal body develops from-
(1) Dorsal part of diencephalon
(2) Ventral part of diencephalon
(3) Ventral side of cerebrum
(4) Lateral side of cerebrum

Q.52 The hormones controlling secondary sexual characters include-
(1) Thyroxine
(2) FSH and LH
(3) GH and FSH
(4) Testosterone and estrogen.

Q.53 Which of the following is related to obesity, low plasma Na^+, high K^+ and increased blood pressure?
(1) Growth hormone (2) Cortisol
(3) Thyroxine (4) Adrenaline

Q.54 Endocrine gland **respo**nsible for immunity is
(1) Pineal (2) Thymus
(3) Pituitary (4) Adrenal

Q.55 Disease caused by deficiency of parathormone
(1) Cretinism (2) Hypercalcemia
(3) Tetany (4) Myxoedema

Q.56 Cretinism is due to less secretion of
(1) Thyroid (2) Pituitary
(3) Parathyroid (4) Adrenal

Q.57 Hormone that promotes cell division, protein synthesis and bone growth is
(1) ADH (2) ACTH
(3) PTH (4) GH

Q.58 Which of the following takes part in salt balancing ?
(1) Mineralocorticoid (2) Glucocorticoid
(3) Somatotrophic (4) None

Q.59 Which one exclusively comprises endocrine glands
(1) Pituitary, Salivary, Adrenals, Ovary, Testi
(2) Pituitary, Thyroid, Adrenals, Ovary, Testis
(3) Salivary, Thyroid, Adrenals, Ovary, Testis
(4) Adrenals, Ovary, Testis, Salivary, Liver

Q.60 Thyroxin is secreted by which gland ?
(1) Adrenal (2) Parathyroid
(3) Pituitary (4) Thyroid

Q.61 Which substance is secreted by corpus leuteum?
(1) Hormone (2) enzyme
(3) Pheromone (4) Bile

Q.62 Hormone controlling Na^+–K^+ ion concentration is-
(1) Aldosterone
(2) Anti-diuretic hormone
(3) Progesterone
(4) Pitocin

Q.63 Hormones of adrenal cortex are synthesised from
(1) Tyrosine (2) Tryptophan
(3) Cholesterol (4) Glycoproteins

Q.64 Hormone controlling metabolism is
(1) ACTH from pituitary
(2) FSH from pituitary
(3) Thyroxine from thyroid
(4) Adrenaline from adrenal medulla

Q.65 Hypoglycaemic hormone is
(1) Insulin (2) Glucagon
(3) Thyroxine (4) ACTH

Q.66 Oxytocin is released from :
(1) hypothalamus
(2) adenohypophysis (posterior lobe)
(3) adenohypophysis (anterior lobe)
(4) neurohypophysis

Q.67 What is the molecular weight of insulin?
(1) 6000 amu (2) 5000 amu
(3) 4000 amu (4) 15000 amu

Q.68 Parathormone controls :
(1) calcium and phosphate metabolism
(2) Na and K metabolism
(3) fatty acid metabolism
(4) protein metabolism

Q.69 Nor epinephrin is secreted from :
(1) medulla of adrenal (2) zona fasciculate
(3) zona reticularis (4) zona glomerulosa

Q.70 Thymosine stimulates :
(1) milk secretion (2) erthrocytes
(3) T-lymphocytes (4) melanocytes

Q.71 FSH is :
(1) glycoprotein (2) phospholipid
(3) glycolipid (4) metaprotein

Q.72 Prostaglandins affect :
(1) blood pressure (2) defecation
(3) osmoregulation (4) oxygen metabolism

Q.73 Which one of the following is both hormone and enzyme ?
(1) ADH hormone (2) Acetycholinesterase
(3) Angiotensinogen (4) Rennin

Q.74 Myxoedema is due to-
(1) Decreased production of thyroxin
(2) Increased production of thyroxin
(3) Excess GH
(4) Decreased insulin

Q.75 Injection of glucagon will-
(1) Cause hypoglycemia
(2) Cause galactosemia
(3) Increase blood sugar
(4) Cause goitre

Q.76 Hormone produced more in dark is
(1) Thyroxine (2) Melatonin
(3) Adrenaline (4) Insulin

Q.77 Which is not involved in endocrine secretion ?
(1) Leydig cell
(2) Lutein cell
(3) Para-follicular cells of thyroid
(4) Kupffer cells

Q.78 Metamorphosis of Frog from tadpole to adult is controlled by :
(1) adrenalin (2) thyroxin
(3) secretin (4) lymph

Q.79 The basal metabolic rate of the body is regulated by :
(1) parathyroid (2) thymus
(3) pituitary (4) thyroid

Q.80 An endocrine gland known as 'gland of emergency' is :
(1) pituitary (2) parathyroid
(3) adrenal (4) pancreas

Q.81 One of the hormone, which when secreted increase the blood pressure, heart beat, output of glucose in the blood :
(1) thyroxin (2) aldosterone
(3) adrenalin (4) testosterone

Q.82 Goitre influences-
(1) Speech (2) Excretion
(3) Metabolism (4) Vision

Q.83 Pheromones are-
(1) Produced by endocrine glands
(2) mRNAs
(3) Chemicals used in animal communication
(4) Protein

Q.84 Which one hormone of the pituitary of the Rabbit controls the protein metabolism and growth of skeleton?
(1) Iodo thyroxine
(2) Leutotrophic hormone
(3) Somatetrophic hormone
(4) Oxytocine

Q.85 Goitre is a pathological condition associated with-
(1) Glucagon (2) Thyroxine
(3) Progesterone (4) Testosterone

Q.86 Sex hormones can work without the help of-
(1) Insulin (2) Placenta
(3) Pituitary (4) Gonadotropins

Q.87 Which one of the following statements is correct?
(1) Endocrine glands regulate neural activity, but not vice versa
(2) Neurons regulate endocrine activity but vice versa
(3) Endocrine glands regulate neural activity and nervous system regulates endocrine glands
(4) Neither hormones control neural activity nor the neurons control endocrine activity

Q.88 Sertoli cells are regulated by the pituitary hormone known as-
(1) LH (2) FSH
(3) GH (4) Prolactin

Q.89 Which one of the following is not a second messenger in hormone action?
(1) aAMP (2) aGMP
(3) Calcium (4) Sodium

Q.90 A steroid hormone which regulates glucose metabolism is-
(1) Cortisone (2) Cortisol
(3) Cortieosterone
(4) 11-deoxycorticosterone

Q.91 Withdrawal of which of the following hormones is the immediate cause of menstruation?
(1) progesterone (2) Estrogen
(3) FSH (4) FSH-RH

Q.92 Which of the following is an accumulation and release centre of neurohormones?
(1) Anterior pituitary lobe
(2) Posterior pituitary lobe
(3) Intermediate lobe of the pituitary
(4) Hypothalamus

Q.93 Which hormone causes dilation of blood vessels, increased oxygen consumption and glycogenesis-
(1) Glucagon (2) ACTH
(3) Insulin (4) Adrenaline

Q.94 Which of the following hormone consists of cholesterol-
(1) Sex hormone (2) Adrenaline
(3) Thyroxine (4) GH

Q.95 Growth hormone is produced by-
(1) Pituitary (2) Thyroid
(3) Adrenal (4) Testes

Q.96 Hyposecretion of Adrenal cortex causes-
(1) Addison (2) Cretinism
(3) Hashimoto (4) Simond

Q.97 Secretin & Ecdysone are -
(1) Hormone (2) Enzyme
(3) Lipid (4) Cofactor

EXERCISE - 2

Q.1 A hormone is :-
(1) An enzyme
(2) Chemical messenger
(3) Primary messenger (4) 2 and 3 both

Q.2 Pituitary gland does not control the secretory activity of :-
(1) Thyroid (2) Adrenal cortex
(3) Adrenal medulla (4) Testes

Q.3 Which of the following controls spermatogenesis :-
(1) FSH (2) LTH
(3) LH (4) Vasopressin

Q.4 Carbohydrate metabolism is governed by :-
(1) Thyroxine (2) Insulin
(3) Glucocorticoids (4) All

Q.5 Which of the following does not secrete any hormone:-
(1) Testes (2) Spleen
(3) Stomach (4) Intestine

Q.6 The hyposecretion of pituitary hormone cause
(1) Dwarfism (2) Diabetes insipidus
(3) Goitre (4) Diabetes mellitus

Q.7 Neurohypophysis secretes :-
(1) Vasopressin
(2) Oxytocin
(3) Oxytocin & prolactin
(4) Vasopressin & oxytocin

Q.8 Hormone secreted by pituitary gland in chemical nature are :-
(1) All protein
(2) All steroid
(3) Complex compounds of proteins and carbohydrates
(4) Some steroid and some protein

Q.9 The thyroid gland is homologous to which part of lower chordates :-
(1) Neural gland
(2) Pharyngeal gill pouch
(3) Nerve cord (4) Endostyle

Q.10 Growth hormone is produced in :-
(1) Adrenals (2) Thyroid
(3) Pituitary (4) Thymus

Q.11 In dibetes disease the urine contains :-
(1) Salt (2) Fat
(3) Protein (4) Sugar

Q.12 Gonadotropic hormone is produced in :-
(1) Interstitial cells of testis
(2) Adrenal cortex
(3) Adenohypophysis
(4) Posterior part of thyroid

Q.13 A hormone with seat of activity in liver-changing glucose into glycogen is produced by :-
(1) Pituitary (2) Thymus
(3) Parathyroid (4) Pancreas

Q.14 Estrogen is secreted by :-
(1) Liver (2) Spleen
(3) Ovaries (4) Pituitary

Q.15 If thyroid is removed from tadpole of frog, it will
(1) Die soon
(2) Remains tadpole throughout life
(3) Grows in to giant frog
(4) Grows into dwarf frog

Q.16 Interacting system in the body are :-
(1) Endocrine system (2) Nervous system
(3) Blood vascular system
(4) Both endocrine and nervous system

Q.17 Androgens are secreted by :-
(1) Pituitary (2) Testis
(3) Ovaries (4) Thyroid

Q.18 Who isolated thyroxine hormone:-
(1) Best & Banting (2) F. Sanger
(3) William Buemont (4) E. C. Kendall

Q.19 Adrenaline hormone causes :-
(1) Increase in blood pressure
(2) Increase in heart beat
(3) Both of them (4) None of them

Q.20 Main similarity between hormone and enzyme is :-
(1) Both act at particular pH
(2) Both are protein
(3) Both are required in small amount
(4) Both can be used again and again

Q.21 Ovulation in mammals occurs mainly under the influence of :-
(1) TSH and ACTH (2) FSH and LH
(3) TSH and STH (4) MTH and ACTH

Q.22 The hormones responsible for regulation of calcium and phosphorous metabolism is secreted by :-
(1) Pancreas (2) Thyroid
(3) Thymus (4) Parathyroid

Q.23 Injection of which of the following increases metabolic rate :-
(1) STH (2) Insulin
(3) Thyroxine (4) Testosterone

Q.24 On surgical removal of pituitary gland there is fall of sodium level and rise in potassium in serum, this is due to :-
(1) Oxytocin is no longer available from pituitary
(2) Atrophy of adrenal medulla
(3) Atrophy of adrenal cortex
(4) LTH from pituitary is no longer available

Q.25 Endocrine glands can be defined as those glands which pour their secretion :-
(1) Directly into blood (2) Into blood or ducts
(3) When they are cut
(4) Into particular organ

Q.26 Which gland is both exocrine as well as endocrine:-
(1) Pituitary (2) Mammary gland
(3) Thyroid (4) Pancreas

Q.27 Largest amount of iodine is found in :-
(1) Adrenals (2) Liver
(3) Thyroid (4) Testes

Q.28 Hypothyrodism in adults causes :-
(1) Addison's disease (2) Myxoedema
(3) sterility (4) Cretinism

Q.29 A patient of diabetes mellitus drink more water because he eliminates from the blood, extra amount of which substance:-
(1) Protein (2) Sugar
(3) Salt (4) Hormone

Q.30 Chemical structure of man's insulin was studied by:-
(1) Banting (2) Kendal
(3) Tsan (4) Starling

Q.31 Insulin by chemical nature is :-
(1) Carbohydrate (2) Protein
(3) Steroid (4) Lipid

Q.32 Which hormone stimulates contraction of gall bladder:-
(1) CCK-PZ (2) ACTH
(3) LTH (4) FSH

Q.33 If ovaries from a pregnant woman are removed in 4th month of pregnancy then :-
(1) Development of embryo becomes abnormal
(2) Abortion occurs after some time
(3) Embryo develops normally till birth
(4) None

Q.34 Which of the following has no role in secretion of hormone :-
(1) Rickets and mangolism
(2) Diabetes mellitus and cretinism
(3) Giantism and exophthalmia
(4) Cretinism and diabetes

Q.35 If estrogen and progesterone decrease in blood this causes :-
(1) Release of ova from ovaries
(2) Constriction of uterine blood vessels causing sloughing of uterine epithelium
(3) Loss of endometrium
(4) Growth of myometrium

Q.36 Which gland prepares you for flight, fright and fight during adverse conditions :-
(1) Thyroid (2) Parathyroid
(3) Pituitary (4) Adrenals

Q.37 A person with diabetes mellitus excrete glucose in urine although kept on carbohydrate free diet, what is the most probable reason :-
(1) Glycogen is released from muscles into blood
(2) Fats are catabolised and glucose is formed
(3) Amino acid are discharge into blood by liver
(4) Amino acid are catabolised to from sugar in liver

Q.38 Role of progesterone hormone is to :-
(1) Increase blood supply in uterine wall
(2) Thicken uterus wall
(3) To deposit glycogen and fat in uterus wall
(4) All the above

Q.39 If amount of ADH decrease in blood micturition-
(1) Remains unchanged (2) Decreases
(3) Increases (4) None

Q.40 Which hormone secretion is under nervous control:-
(1) Adrenal cortex (2) Anterior pituitary
(3) Posterior pituitary (4) Pineal body

Q.41 Secretion of estrogen is controlled by :-
(1) HCG (2) Progesterone
(3) LH (4) F.S.H.

Q.42 First discovered hormone :–
(1) Thyroxine (2) Adrenaline
(3) Secretin (4) Insulin

Q.43 Immediate cause of induction of ovulation in human female is large plasma surge of :-
(1) Progesterone (2) LH
(3) FSH (4) Estradiol

Q.44 Parathormone regulates :-
(1) Blood calcium level
(2) Blood calcium phosphate level
(3) Body temperature (4) None

Q.45 Which gland store hormone in intercellular space before its secretion into blood :
(1) Pancreas (2) Thyroid
(3) Testis (4) Ovary

Q.46 Urine concentration is controlled by :-
(1) Oxytocin (2) ADH
(3) MSH (4) ACTH

Q.47 Goiter is caused by the abnormal functioning of :-
(1) Pancreas (2) Adrenals
(3) Pituitary (4) Thyroid

Q.48 The follicle stimulating hormone is secreted from :-
(1) Posterior lobe of pituitary gland
(2) Reproductive gland
(3) Thyroid gland
(4) Anterior lobe of pituitary galnd

Q.49 Parathormone deficiency in man causes-
(1) Hyper calcemia (2) Hypocalcemia
(3) Goitre (4) All

Q.50 Sex hormone will work without the help of -
(1) Gonadotropins (2) Placenta
(3) Pituitary (4) Insulin

Q.51 Creatinism is due to abnormal secretion of:
(1) Thyroid stimulating hormone
(2) Thyroxine
(3) Calcitonin (4) Parathormone

Q.52 Bombycol is pheromone secreted by the body of :-
(1) Wasp (2) House fly
(3) Spider (4) Silk moth

Q.53 Stimulation of uterine contraction during child birth is brought about by :-
(1) Adrenaline (2) Progesterone
(3) Oxytocin (4) Prolactin

Q.54 Hypophysectomy leads to :-
(1) Heart attack (2) Increased digestion
(3) Death
(4) Regression of reproductive function

Q.55 Pituitary gland is under control of :-
(1) Hypothalamus (2) Adrenal galnd
(3) Pineal gland (4) Thyroid gland

Q.56 The receptor for protein hormones are present on :-
(1) Nucleus
(2) Endoplasmic reticulum
(3) Cytoplasm (4) Cell-surface

Q.57 Which of the following is not a steroid hormone
(1) Androgen (2) Aldosterone
(3) Estrogen (4) Relaxin

Q.58 Parathormone induces :-
(1) Increase in blood sugar level
(2) Decrease in serum calcuim level
(3) Increase in serum calcium level
(4) Decrease in blood sugar level

Q.59 Which of following is not a protein hormone :-
(1) Relaxin (2) H.C.G.
(3) Placental lactogen (4) Estradiol

Q.60 Progesterone hormone is secreted from :-
(1) Placenta (2) Corpus luteum
(3) Both 1 and 2 (4) None of these

Q.61 Philips collip discovered which of the following hormones :–
(1) Parathyroid hormone
(2) Thyroxine
(3) A.D.H (4) Oxytocin

Q.62 "Sella turcica" is a :–
(1) Depression in brain enclosing pituitary
(2) Cavity of skull enclosing ears
(3) Covering of testis
(4) Kind of endocrine gland

Q.63 The "erythropoietin" hormone regulates :–
(1) Blood pressure
(2) Water level of blood
(3) Glucose level of blood
(4) Rate of formation of red blood cells

Q.64 The main function of prolactin hormone is to:–
(1) Influence the activity of thyroid gland
(2) Control development of graffian follicles
(3) Initiate and maintain secretion of milk by mammary gland
(4) Cause ejection of milk

Q.65 The hormones of neurohypophysis are formed in
(1) Pars nervosa (2) Pars distalis
(3) Supraoptic and para ventricular center
(4) Hypothalamus

Q.66 Hyposecretion of aldosterone causes :–
(1) Gull's disease (2) Grave's disease
(3) Cushing's disease (4) Addison's disease

Q.67 The gastro-intestinal hormone villikinin is responsible for :–
(1) Initiation of gastric juice
(2) Inhibiting the secretion of intestinal juice
(3) Causing movement of intestinal villi helping in absorption of digested food
(4) Protecting gastrointestinal tract from its auto digestion

Q.68 Hormones produced by adrenal cortex and gonads (sex hormone) are chemically :–
(1) Protein
(2) Steroids
(3) Glycoprotein
(4) Phenolic compound

Q.69 I.C.S.H. in male acts on :–
(1) Cells of leydig (2) Sertoli cells
(3) Spermatids (4) Spermatogonia

Q.70 Melatonin is a hormone produced by :–
(1) Adrenal gland (2) Pituitary gland
(3) Pineal gland (4) Thymus gland

Q.71 Hypophysis cerbri is the other name of :–
(1) Adeno hypophysis
(2) Islets of Langerhans
(3) Neurohypophysis (4) Pituitary

Q.72 Which of the following is not an endocrine gland :–
(1) Pancreas (2) Adrenal gland
(3) Thyroid gland (4) Salivary gland

Q.73 Exopthalmic goitre is caused due to hypersecretion of :–
(1) Adrenal (2) Thyroid
(3) Parathyroid (4) Thymus

Q.74 The main function of thyroid gland is to control-
(1) Growth (2) Reproduction
(3) Secondary sexual characters
(4) Basal metabolic rate

Q.75 Hassal's capsules are found in :–
(1) Pineal body (2) Thymus gland
(3) Thyroid gland (4) Adrenal gland

Q.76 The two lobes of thyroid gland are joined by a horizontal connection called :–
(1) Inter thyroidal connective
(2) Inter thyroidal commissure
(3) Intermediary lobe (4) Isthmus

Q.77 Hormone of hypothalamus-are called :–
(1) Regulatory hormones
(2) Growth hormons
(3) Tropic hormones (4) Angiotensins

Q.78 Diabetes insipidus disease is caused due to the deficiency of hormone produced by :–
(1) Pituitary (2) Adrenal
(3) Pancreas (4) Thyroid

Q.79 The function of norepinephrine is :–
(1) Almost similar to epinephrine
(2) Similar to ADH
(3) Opposite to epinephrine
(4) Opposite to ADH

Q.80 The vitamin which works along with para thyroid hormone is :–
(1) Vitamin C (2) Calciferol
(3) Tocopherol (4) Vitamin – B_{12}

Q.81 Hormones are :–
(1) Produced in low amount
(2) Easily diffusible
(3) Non - antigenic (4) All

Q.82 Epinephrine and norepinephrine together known as:–
(1) Steroid (2) Protein
(3) Catecholamine (4) None

Q.83 One of the following is antagonistic :–
(1) FSH & LH
(2) Oxytocin & Vasopressin
(3) Nor adrenaline & adrenaline
(4) Insulin & Glucagon

Q.84 Storage gland is :–
(1) Pancreas (2) Testis
(3) Thyroid (4) Adrenal

Q.85 Presence of "HCG" in urine of female confirm
(1) Addison's disease (2) Gynacomastia
(3) Virlism (4) Pregnancy

Q.86 "Thyroglobulin" is :–
(1) Protein (2) Glycoprotein
(3) Steroid (4) Amino acid

Q.87 Deficiency of which of the following may cause bone deformation :–
(1) PTH (2) Vitamin D
(3) STH (4) Thyroxine

Q.88 Hashimoto's disease is due to :–
(1) Hyposecretion of thyroxine
(2) Hyper secretion of thyroxine
(3) Hyposecreation of adrenaline
(4) None of the above

Q.89 One of the following is volatile :–
(1) Enzymes (2) Hormones
(3) Pheromones (4) All

Q.90 Mammals born without a thymus gland fail to manufacture :–
(1) B - Lymphocytes (2) T – Lymphocytes
(3) Plasma cells (4) Basophils

Q.91 Removal of parathyroid in human beings result in:–
(1) Tetany (2) Simmond's disease
(3) Myxoedema (4) Addison's disease

Q.92 Retension of sodium in body depends up on hormone from :–
(1) Adrenal cortex (2) Adrenal medulla
(3) Parathyroid (4) Thyroid

Q.93 Injection Insulin to Rabbit leads to increased:–
(1) Glucose level of blood
(2) Glucose level of urine
(3) Glucose level of cells
(4) None of these

Q.94 Simmond"s disease is :–
(1) Hyperthyroidism (2) Hypothyroidism
(3) Hypopituitarism (4) Hyperpituitarism

Q.95 Hyper secretion of STH leads to :–
(1) Dwarf & Acromegaly
(2) Goitre& Sterility
(3) Cretinism& Myxoedema
(4) Gigentism & Acromegaly

Q.96 Which part of adrenal secretes hydrocorticosterone hormone :–
(1) Zona reticularis (2) Zona glomerulosa
(3) Zona fasciculata (4) Medulla

Q.97 The structure and amino acid sequence of the hormone insulin was discovered by :–
(1) Benting (2) Sanger
(3) Pauling (4) Cullen

Q.98 Which of the following pituitary hormone does not have another endocrine gland as its target organ :–
(1) Melanophore stimulating hormone
(2) Follicle stimulating hormone
(3) Adrenocorticotropic hormone
(4) Thyroid stimulating hormone

Q.99 Pheromones secreted by :–
(1) Endocrine gland (2) Exocrine gland
(3) Apocrine gland (4) Mixed gland

Q.100 FSH & LH is a :–
(1) Catecholamine (2) Glycoprotein
(3) Polypeptide (4) None

Q.101 Which hormone has anti insulin effect :–
(1) Cortisol (2) Oxytocin
(3) Aldosterone (4) Glucagon

Q.102 Term "Hormone" was coined by :–
(1) W.M. Baylis (2) E.H. Schally
(3) E.H. Starling (4) Harris

Q.103 Ectodermal in origin is :–
(1) Pituitary gland (2) pineal body
(3) Lens of eye (4) All of the above

Q.104 "Geradiol" is a pheromone of :–
(1) Honey bee (2) Silk moth
(3) Butterfly (4) All

Q.105 One of the following is homologus to pituitary gland of vertebrates :–
(1) Muller's organ of Amphioxus
(2) Subneural gland of Ascidian
(3) Both of the above
(4) None of the above

Q.106 "Anti abortion" hormone is :–
(1) Relaxin (2) Oxytocin
(3) Progesterone (4) Oestrogen

Q.107 Diabetic comma is due to hyposecretion of insulin in which :–
(1) Glucose level increased in blood
(2) Ketoacidosis take place
(3) Dehydration process start
(4) All the above

Q.108 "Brain sand" is found in :–
(1) Thyroid (2) Thymus
(3) Pineal body (4) All

Q.109 One molecule of insulin contains :–
(1) 30 Amino acid (2) 41 amino acid
(3) 51 amino acid (4) 70 amino acid

Q.110 Which is largest endocrine gland of the body-
(1) Thyroid (2) Liver
(3) Pituitary (4) Thymus

Q.111 Epiphysis (pineal body) atrophies at the age of
(1) 5 - years (2) 7 - years
(3) 9 - years (4) 19 - years

Q.112 "Pinealocytes cells" occurs in :–
(1) Pineal body (2) Pituitary gland
(3) Adrenal gland (4) Thyroid gland

Q.113 Renin is produced by kidney :–
(1) Stimulate haemopoisis
(2) Change angiotensinogen into angiotensin
(3) Influence ultrafiltration
(4) All of the above

Q.114 One of the following is oral dose of insulin :–
(1) IZS only (2) PZI only
(3) Both of the above (4) None of the above

Q.115 Conn's disease is due to :–
(1) Hyposecretion of aldosterone
(2) Hyper secretion of aldosterone
(3) Hyposecretion of STH
(4) None of the above

Q.116 "4s gland" is :–
(1) Pancreas (2) Liver
(3) Thyroid (4) Adrenal

Q.117 Ca^{++} acts as :–
(1) 1^{st} messenger (2) 2^{nd} messenger
(3) 3^{rd} messenger (4) None

Q.118 Structure which has no role in endocrine secretion:–
(1) Duodenal epithelium
(2) Testes
(3) Adrenal medulla
(4) Submaxillary gland

Q.119 MSH is secreted in man by which part of pituitary :–
(1) Anteriro Pituitary
(2) Middle lobe of pituitary
(3) Posterior lobe of pituitary
(4) None of these

Q.120 Oxytocin is used in :-
(1) Milk secretion (2) Parturition
(3) K^+ Excretion (4) All of the above

Q.121 Hormone that decrease calcium level in blood
(1) Thyroxine (2) Parathormone
(3) Thyrocalcitonin (4) Cortisol

Q.122 MSH Produced by the pars intermidia of pituitary causes in lower vertebrates :–
(1) Darkening of skin
(2) Light colouration of skin
(3) Both (4) None of these

Q.123 LTH is also known as :–
(1) Lactogenic Hormone
(2) Prolactin
(3) Mammotropic Hormone
(4) All

Q.124 Adrenaline increases :–
(1) Heart beat (2) Blood pressure
(3) Both (4) None

Q.125 The diabetes mellitus is caused by :–
(1) Hyper secretion of Insulin
(2) Hyposecretion of Insulin
(3) Hyposecretion of ADH
(4) Hyper secrection of ADH

Q.126 BMR is increased due to :–
(1) Sympathetic nervous system
(2) Adrenaline
(3) Parasympathetic nervous system
(4) Thyroxine

Q.127 Life saving hormone are secreted by :–
(1) Pituitary (2) Pineal
(3) Adrenals (4) Thyroid

Q.128 Which of these is not a ketone bodies :–
(1) Acetoacetic acid (2) Succinic acid
(3) Beta hydroxy butyrate
(4) Acetone

Q.129 Growth hormone of pituitary is more effective in :–
(1) Presence of thyroxine
(2) Absence of thyroxine
(3) Absence of Insulin
(4) Presence of adrenaline

Q.130 "Secondary messenger" is :–
(1) Cyclie A.M.P. (2) ATP
(3) ADP (4) DNA

Q.131 Function of renin is :–
(1) To reduce blood pressure
(2) Vasodilation
(3) Degradation of angiotensinogen to angiotensin II
(4) Urination

Q.132 Which gland does not originate from embryonic Endoderm :–
(1) Thymus (2) Parathyroid
(3) Adrenal Cortex (4) Thyroid

Q.133 Gonado tropic hormone is :–
(1) FSH (2) LH
(3) LTH (4) FSH, LH, LTH

Q.134 Which of the following Hormone is secreted by kidney :–
(1) Renin
(2) Renomedullary Prostaglandin
(3) Erythropoietin (4) All of these

Q.135 Endocrine structure of kidney is :–
(1) Cortex (2) Medulla
(3) Juxtra-medullary node
(4) Pelvis

Q.136 Adrenaline causes-
(1) Hypoglycemia (2) Hyperglycemia
(3) Diabetes insipidus (4) Diabetes mellitus

Q.137 Nor-epinephrine functions as both hormone and-
(1) Fuel for cellular respiration
(2) Neurotransmitter
(3) Ions to promote action potential
(4) Solutes to promote osmotic

Q.138 The main function of norepinephrine is to increase-
(1) Urine formation
(2) Cellular respiration
(3) Release of epinephrine
(4) Blood pressure

Q.139 Which of the following hormones is responsible for the emotional state such as fear, anger, pain and causes rise to blood pressure and rate of heart beat-
(1) Insulin (2) Adrenaline
(3) Progesterone (4) Thyroxine

Q.140 Both ectoderm and mesoderm contribute in the development of-
(1) Thyroid (2) Pancreas
(3) Adrenal (4) Pituitary

Q.141 Destruction of adrenal cortex leads to-
(1) Simmond's disease (2) Cushing syndrome
(3) Graves disease (4) Addison's disease

Q.142 Treatment with alloxan destroys-
(1) STH cells
(2) Alpha cells of islets of Langerhans
(3) Beta cells of islets of Langerhans
(4) Cells of Leydig

Q.143 Which of the following is not a ketone body-
(1) Acetone (2) Acetoacetic acid
(3) Beta-hydroxybutyrate
(4) Succinic acid

Q.144 Which hormone possesses anti-insulin effect-
(1) Cortisol (2) Calcitonin
(3) Oxytocin (4) Aldosterone

Q.145 Compression of gallbladder is enhanced by-
(1) Secretin (2) Cholecystokinin
(3) Gastrin (4) Enterogastrone

Q.146 Hormones taken in the form of drugs for contraception are-
(1) Aldosterone
(2) Estrogens and progesterone
(3) Cortisol
(4) Testosterone

Q.147 Relaxin is chemically-
(1) Steroid (2) Protein
(3) Carbohydrate (4) Both (1) and (3)

Q.148 The hormone that stimulates the stomach to secrete gastric juice is-
(1) Gastrin (2) Enterogastrone
(3) Enterokinase (4) Renin

Q.149 Injection of glucagon will-
(1) Cause goitre
(2) Cause galactosemia
(3) Cause hypoglycemia
(4) Increase blood sugar level

Q.150 Which of the following hormones is a derivative of amino acid-
(1) Estrogen (2) Epinephrine
(3) Progesterone (4) Prostaglandin

ANSWER KEY

Exercise – 2

EXERCISE – 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Oxytocin mainly helps in **[CBSE-1999]**
(1) Milk production (2) Child birth
(3) Diuresis (4) Gametogenesis

Q.2 Which hormone is concerned with the concentration of urine **[CBSE-2002]**
(1) Oxytocin (2) Vassopressin
(3) Prolactin (4) Cortisol

Q.3 Acromegaly is caused by **[CBSE-2002]**
(1) Excess of S.T.H.
(2) Excess of Thyroxine
(3) Deficiency of Thyroxine
(4) Excess of Adrenaline

Q.4 Oxytocin is released from **[RPMT-2000]**
(1) Adenohypophysis (Anterior lobe)
(2) Adenohypophysis (Posterior lobe)
(3) Hypothalamus
(4) Neurohypophysis

Q.5 FSH is **[RPMT-2000]**
(1) Glycoprotein (2) Metalloprotein
(3) Glycolipid (4) Phospholipid

Q.6 The synthesis of Vasopressin is done by **[RPMT-2001]**
(1) Hypothalamus (2) Kidney
(3) Anterior pituitary (4) Post. pituitary

Q.7 Which one of the pituitary of the rabbit controls the protein metabolism and growth of skeleton **[RPMT-2002]**
(1) lodo thyroxine
(2) Leutotrophic hormone
(3) Somatotrophic hormone
(4) Oxytosine

Q.8 Function of thyrocalcitonin **[CBSE-1998]**
(1) To reduce the calcium level in blood
(2) To increase the calcium level in blood
(3) Oppose the action of thyroxine
(4) Maturation of gonads

Q.9 Parathormone deficiency leads to **[CBSE-1999]**
(1) Decrease of Ca^{+2} level in blood
(2) Increase of Ca^{+2} level in blood
(3) Osteoporosis
(4) Hypercalemia

Q.10 Parathormone controls **[RPMT-2000]**
(1) Fatty acid metabolism
(2) Sodium and potassium metabolism
(3) Calcium and phosphate metabolism
(4) Protein metabolism

Q.11 Parathyroid hormone **[NCERT]**
(1) is produced by the thyroid gland
(2) is released when blood calcium levels fall
(3) stimulates osteoblasts to lay down new bone
(4) Stimulates calcitonin release

Q.12 Melatonin is secreted by **[CBSE-2000]**
(1) Pineal body (2) Skin
(3) Pituitary Gland (4) Thyroid

Q.13 M.S.H is secreted by in human – **[CBSE-2000]**
(1) Anterior lobe of pituitary
(2) Middle lobe of pituitary
(3) Posterior lobe of pituitary
(4) Endostyle

Q.14 Thymosin stimulates **[RPMT-2000]**
(1) Milk secretion (2) Erythrocytes
(3) T-lymphocytes (4) Melanocytes

Q.15 Norephinephrin hormone is secreted from **[RPMT-2000]**
(A) Zona glomerulosa (2) Zona fasiculata
(3) Zona reticularis (4) Medulla of adrenal

Q.16 Which gland is concerned with salt equilibrium in body **[RPMT-2001]**
(A) Anterior pituitary (2) Pancreas
(3) Adrenal (4) Thyroid

Q.17 Norepinephrine leads to increase in **[RPMT-2004]**
(1) Blood pressure
(2) Urine production
(3) Cellular respiration
(4) Release of epinephrine

Q.18 Steroid hormones **[NCERT]**
(1) have only cell surface receptors
(2) are lipophobic
(3) act through altering the activity of proteins in the target cell
(4) are produced by only adrenal cortex

Q.19 Both adrenaline and cortisol are secreted in response to stress. Which of the following statements is also true for both of these hormones ?
(1) They act to increase blood glucose
(2) They are secreted by the adrenal cortex
(3) Their secretion is stimulated by adrenocorticotropin
(4) They are secreted into the blood within seconds of the onset of stress.

Q.20 Which of the following act as both hormone and enzyme **[RPMT-2000]**
(1) ADH hormone
(2) Acetylcholinesterase
(3) Angiotensinogen (4) Renin

Q.21 What is the molecular weight of Insulin **[RPMT-2000]**
(1) 15000 (2) 5000
(3) 4000 (4) 6000

Q.22 Prostaglandins affect
(1) Blood pressure (2) Defaection
(3) Osmoregulation (4) Oxygen metabolism

Q.23 Which cells of pancreas secrete the hormone insulin **[RPMT-2001]**
(1) Alpha-cells of langerhans
(2) Beta-cells of langerhans
(3) Interstitial cells
(4) Gamma-cells of langerhans

Q.24 In Rabbit, which of the following organ acts as both endocrine & exocrine gland **[RPMT-2001]**
(1) Testes (2) Ovary
(3) Pancreas (4) Stomach

Q.25 Which temporary endocrine gland forms in ovary after ovulation **[RPMT-2003]**
(1) Corpus callosum (2) Corpus albicans
(3) Corpus luteum (4) Corpus striata

Q.26 Insulin differs from Growth hormone in **[CBSE-1999]**
(1) Increases activity of m-RNA and Ribosomes
(2) Increase the permeability of cell membrance
(3) Affects metabolism of fats by inducing lipogenesis
(4) Increasing protein synthesis

Q.27 Which gland decreases in size with increasing age **[CBSE-1999]**
(1) Thyroid (2) Adrenal
(3) Thymus (4) Pituitary

Q.28 Reason, why hair loss is more in old age **[CBSE-2000]**
(1) Reduction of blood supply
(2) Decrease in protein synthesis
(3) Low energy production
(4) Reduced storage of glycogen

Q.29 Melanin protect from **[CBSE-2002]**
(1) U.V. rays (2)Visible rays
(3) Infrared rays (4) X-rays

Q.30 Which one of the following pairs correctly matches a hormone with a disease resulting from its deficiency **[CBSE-2002]**
(1) Relaxin – Gigantism
(2) Prolactin – Cretinism
(3) Parathyroid hormone – Tatany
(4) Insulin – Diabetes insipidus

Q.31 Which of the following act as local messenger **[RPMT-2000]**
(1) Carrier protein (2) Glycoprotein
(3) Phospholipid (4) Glycolipid

Q.32 Sodium-potassium pump is **[RPMT-2001]**
(1) A hormone (2) An enzyme
(3) A protein carrier (4) An organelle

Q.33 Why thyroxine is a hormone, not an enzyme **[RPMT-2001]**
(1) It is secreted in small quantity
(2) It is not a polypeptide
(3) It has not special effect
(4) It is directly poured into blood

Q.34 Which one of the following pair's correctly matches a hormone with a disease resulting from its deficiency **[CBSE-2004]**
(1) Insulin – Diabetes insipidus
(2) Thyroxine – Tetany
(3) Parathyroid hormone – Diabetes mellitus
(4) Luteinizing hormone – Failure of ovulation

Q.35 Which hormone causes dilation of blood vessels, increaed oxygen consumption and gluconeogenesis ? **[CBSE-2006]**
(1) Adrenalin (2) Glucagon
(3) ACTH (4) Insulin

Q.36 Sertoli cells are regulated by the pituitary hormone known as **[CBSE-2006]**
(1) Prolactin (2) LH
(3) FSH (4) GH

Q.37 A steroid hormone which regulates glucose metabolism is **[CBSE-2006]**
(1) 11-deoxycorticosterone
(2) Cortisone
(3) Cortisol
(4) Corticosterone

Q.38 Which one of the following is not a second messenger in hormone action? **[CBSE-2006]**
(1) Sodium (2) cAMP
(3) cGMP (4) Calcium

Q.39 Tadpoles of frog can be made to grow as giant sized tadpoles, it they are: **[AIIMS-2006]**
(1) Administered antithyroid substance like thiourea
(2) administered large amounts of thyroxine
(3) reared on a diet rich in egg yolk
(4) reared on a diet rich in both egg yok and glucose

Q.40 Thyroid hormone has regulatory effect on **[AMU-2000]**
(1) Protein metabolism
(2) Carbohydrate metabolism
(3) Fat metabolism (4) All of the above

Q.41 Which of the hormone is polypeptide : **[AMU-2000]**
(1) LH (2) FSH
(3) Insulin (4) Thyroxine

Q.42 A group of compounds now recognised as local hormones are **[AMU-2002]**
(1) Prostaglandins (2) Prostacyclins
(3) Cytokinins (4) Substance 'P'

Q.43 The fate of hormone bound to the specific receptors on the cell surface can be traced through **[AMU-1999]**
(1) X-ray
(2) Laser-photo-bleaching
(3) Ultra scanning
(4) Resonance imaging

Q.44 Reabsorption of Na^+ is controlled by which one the folowing hormones **[AMU-2002]**
(1) Aldosterone (2) Oestrogen
(3) Glucocorticoids (4) Testosterone

Q.45 Insulin is secreted by **[HPPMT-2006]**
(1) α-cell of islets of langerhans
(2) δ-cell of islets of langerhans
(3) β-cell of islets of langerhans
(4) pancreatic acinur cell

Q.46 ADH responsible for reabsorption of water and reduction of urine secretion is synthesize by **[HPPMT-2006]**
(1) Posterior pituitary gland
(2) Juxtaglomerular apparatus
(3) Anterior pituitary gland
(4) Hypothalamus

Q.47 The lorain-levi syndrome is due to **[JK-CET-2006]**
(1) Hyper functioning of pituitary
(2) Hypothyroidism
(3) Hyperthyroidism
(4) Deficiency of growth hormone

Q.48 The excessive secretion of mineral ocorticiods independent of renin-angiotensin-aldosterone system results in **[J.K.CET-2006]**
(1) Cushing's disease (2) Conn's disease
(3) Addison's disease (4) Grave's disease

Q.49 Steroid hormones transmit their information by **[UPCPMT-2006]**
(1) Stimulating the receptors present on cells membrane
(2) Entering into the cell and modifying cellular contents.
(3) Entering into the cell modifying nuclear organisation
(4) The help of an intracellular second messenger.

Q.50 Metamorphosis in tadpole can be increased by treatment of water with **[UPCPMT-2006]**
(1) NaCl (2) Thyroxine
(3) Iodine (4) GH

Q.51 The hormones that initiates ejetion of milk stimulates milk production and grwoth of ovarian follicles are respectively known as **[KERALA-PMT-2006]**
(1) PRL, OT and LH
(2) OT, PRL and FSH
(3) LH, PRL and FSH
(4) PRH, OT and LH

Q.52 In heart cells, which one serves as a second messenger, speeding up muscel cell contraction in response to adrenaline?
[KERALA-PMT-2006]
(1) CAMP (2) CGMP
(3) GTP (4) ATP

Q.53 Which one of the following endocrine gland functions as a biological clock and neurosecretory transducer ?
[KERALA-PMT-2006]
(1) Adrenal gland (2) Thyroid gland
(3) Pineal gland (4) Thymus gland

Q.54 Match the hormone in column I with their function in column II **[KERALA-2006]**

Column I	Column II
(a) FSH	(i) Prepare endometrium for implantation
(b) LH	(ii) Develop female secondary Sexual characters
(c) Progesterone	(iii) Contraction of uterine wall
(d) Estrogen	(iv) Development of corpus luteum
	(v) Maturation of graafian follicle

(1) a-v, b-iv, c-i, d-ii (2) a-iii, b-iv, c-i, d-ii
(3) a-iv, b-iii, c-ii, d-i (4) a-i, b-ii, c-iii, d-iv

Q.55 LH and FSH are collectively called
[BHU(screening) 2006 , MPPMT-2002]
(1) Oxytocin (2) Somatotrophins
(3) Luteotrophic (4) Gonadotrophins

Q.56 Who is known as "father of endocrinology"
[BHU(Screening)-2006, RPMT 2008]
(1) R.H. Whittakar (2) Pasteur
(3) Einthoven (4) Thomas Addison

Q.57 Mammalina thymus is mainly concerned with
[BHU(Screening)-2006]
(1) Regulation of body temperature
(2) Regulatrion of body growth
(3) Immunological functions
(4) Secretion of thyrotropin

Q.58 During emergency which of of the following hormone is secreted **[BHU(Screening)-2006]**
(1) Aldosterone (2) Thyroxine
(3) Adrenaline (4) Calcitonin

Q.59 The Islets of langerhans are found in
[BHU(Screening)-2006]
(1) Pancreas (2) Stomach
(3) Liver (4) Alimentary canal

Q.60 Which of the following gland is both endocrine as well as exocrine **[MPPMT-2002]**
(1) Thyroid (2) Pancreas
(3) Payers patches (4) Thymus

Q.61 Insulin is proudced from **[MPPMT-2001]**
(1) α-cells (2) β-cells
(3) Adrenal cortex (4) testes

Q.62 Which of the following is secondary messenger **[MPMT-2002]**
(1) ATP (2) Cyclic AMP
(3) GTP (4) ATP and AMP

Q.63 Corticosteroids are secreted by
[MPPMT-2006]
(1) Adrenal gland (2) Pineal gland
(3) Pituitary gland (4) Thyroid gland

Q.64 Melatonin is secreted by **[MPPMT-2006]**
(1) Pineal gland (2) Parathyroid gland
(3) Pituitary gland (4) Thyroid gland

Q.65 Corpus luteum secretes **[MPPMT-2006]**
(1) LH (2) FSH
(3) Progesterone (4) Testosterone

Q.66 Insulin is related with **[MPPMT-2006]**
(1) Diabetes (2) Migrain
(3) Jaundice (4) All of the above

Q.67 Blood pressure is controlled **[MPPMT-2004]**
(1) Thyroid gland (2) Thymus gland
(3) Adrenal gland (4) Parathyroid gland

Q.68 Hormone responsible for metamorphosis in tadpole is **[UGET MANIPAL-2005]**
(1) Adrenaline (2) Thyroxine
(3) Aldosterone (4) Vasopression

Q.69 Hormone responsible for ovulation is
[UGET MANIPAL-2005]
(1) LH (2) GSH
(3) Progesterone (4) Testosterone

Q.70 Aldosterone is secreted by
[UGET MANIPAL-2005]
(1) Zona glomerulosa (2) Zona faciculata
(3) Zona reticularis (4) Zona pellucida

Q.71 Which of the following is gonadotrophic hormone **[UGET MANIPAL 2005, UP-2005]**
(1) Collips hormone (2) Prolactin
(3) Oxytocin (4) Luteinzing hormone

Q.72 Which gland stores hormone before its secretion and then release it **[ORRISSA-JEE-2005]**

(1) Thyroid (2) Pancreas

(3) Pineal (4) Pituitary

Q.73 Abnormal conditon when mammary gland of man become female like **[ORISSA-JEE-2005]**

(1) Gynosism (2) Gynochorism

(3) Feminization (4) Gynaecomastia

Q.74 Which of the following disease is not related to thyroid gland **[AFMC-2005]**

(1) Goitre (2) Cretinism

(3) Myxoedema (4) Acromegaly

Q.75 Match item in column 'A' with those given in column 'B' **[KERALA-PMT-2005]**

Column 'A'	Column 'B'
A ADH	i Pituitary
B ACTH	ii Mineralocorticoid.
C Aldosterone	iii Diabetes mellitus
D Insulin	iv Diabetes insipidus
E Testosterone	v Vasodilator

(1) A = i, B = iv, C = ii, D = iii, E = v

(2) A = iv, B = ii, C = i, D = iii, E = v

(3) A = iv, B = i, C = ii, D = iii, E = v

(4) A = iv, B = i, C = iii, D = ii, E = iv

Q.76 Which of the following is not paired correctly **[KERALA-PMT-2005]**

(1) Myxoedema - swollen facial tissues

(2) Insulin - raises blood glucose

(3) Parathyroid - tetany

(4) Cretinism - mentally retarted

Q.77 A patient of diabetes mellitus excreted glucose in urine even when he kept in a carbohydrate free diet. It is because **[ORISSA-JEE-2005]**

(1) Fats are catabolised to form glucose

(2) Amino acids are catabolised in liver

(3) Amino acids are discharged in blood stream from liver

(4) Glycogen from muscles are discharged in blood stream from liver

Q.78 Match the list I with list II **[MANIPUR-2005]**

A Adenohypophysis	(1) Epinephrine
B Adrenal medulla	(2) Somatotropin
C Parathyroid gland	(3) Thymosin
D Thymus gland	(4) Parathormone

(1) A = 3, B = 1, C = 4, D = 2

(2) A = 1, B = 2, C = 3, D = 4

(3) A = 2, B = 1, C = 4, D = 3

(4) A = 4, B = 3, C = 2, D = 1

Q.79 If receptor molecule is removed from target organ for hormone action , the target organ will **[MANIPUR-2005]**

(1) Continue to respond but require higher concentration of hormone

(2) Continue to respond but in opposite way

(3) Continue to respond without any difference

(4) Not respond to hormone

Q.80 Which gland atrophies in adult **[DPMT-2005]**

(1) Pancreas (2) Thymus

(3) Thyroid (4) Adrenal

Q.81 Grave's disease is due to **[DPMT-2005]**

(1) Hyperactivity of thyroid gland

(2) Hypoactivity of adrenal cortex

(3) Hyperactivity of adrenal medulla

(4) Hypoactivity of islets of langerhans

Q.82 Placenta proudced which hormone **[HAR. -PMT-2005]**

(1) GH (2) Gastrin

(3) ACTH (4) Progesterone

Q.83 Hypothyroidism causes in adult **[HAR. –PMT-2005]**

(1) Obesity (2) Diabetes

(3) Cretinism (4) Myxoedema

Q.84 The hormone that controls the level of calcium and phosphorus in the blood is the secreted by **[AFMC-2005]**

(1) Thyroid (2) Parathyroid

(3) Pituitary (4) Thymus

Q.85 FSH is proudced by **[BHU-2005]**

(1) Adrenal cortex

(2) Anterior lobe of pituitary gland

(3) Middle lobe of pituitary gland

(4) Posterior lobe of pituitary gland

Q.86 Which of the following statement are false/true **[Kerala-2007]**

(A) Calcitonin regulated the metabolism of calcium

(B) Oxytocin stimulates contraction of uterine muscle during birth

(C) Grave's disease is caused by malfunctioning of adrenal gland

(D) ADH stimulates absorption of water and increase the urine production

(1) A and C are true B and D are flase

(2) A and B are ture C andD are flase

(3) A and D are true B and C are flase

(4) A, B and C are true, D only false

Q.87 Which hormone helps in reabsorption of water from kidney **[UTTARANCHAL PMT-2004]**

(1) ADH (2) STH

(3) ACTH (4) TTH

Q.88 Which of the following is largest gland in adult man **[UTTARANCHAL PMT-2005]**

(1) Thymus (2) Liver

(3) Thyroid (4) Pancreas

Q.89 Normal blood calcium level in an adult is **[WEST BENGAL JEE-2007]**

(1) 5 mg/dl (2) 8.5/10.5 mg/dl

(3) 15.5 – 20mg/dl

(4) 20 mg/dl – 30 mg/dl

Q.90 Ketone bodies are formed in **[WEST BENGAL JEE - 2007]**

(1) Liver (2) spleen

(3) kidney (4) heart

Q.91 Addison's disease in caused due to **[WEST BENGAL JEE-2007]**

(1) hypersecretion of adernal cortical hormones

(2) hypersecretion of growth hormone

(3) hypersecretion thymus

(4) none of the above

Q.92 Growth hormone is secreted by **[WEST BENGAL JEE-2007]**

(1) acidophillic α cells

(2) acidophilic β cells

(3) basophilic α cells

(4) basophilic β cells

Q.93 Which hormone is responsible for maintenance of preganancy **[WEST BENGAL JEE-2007]**

(1) HCG (2) progesterone

(3) estrogen (4) prostaglandin

Q.94 Addison's disease results from **[JHARKHAND-2004]**

(1) hypertrophy of gland

(2) hypo-secretion of adrenal cortex

(3) hyperactivity of cells of leydig

(4) none of the above

Q.95 Para-thyroid hormone is a **[JHARKHAND-2004]**

(1) peptide (2) carbohydrate

(3) lipid (4) steroid

Q.96 Vasopressin influences **[JHARKHAND-2002]**

(1) electrolyte efflux

(2) nerve excitability

(3) water reabsorption

(4) all of these

Q.97 Pheromones when secreted upon the skin surface, its oduour generally affects **[JHARKHAND-2004]**

(1) skin colour (2) genitalia

(3) breast

(4) mutual behaviour of members of a species

Q.98 If ADH level of blood is less **[BIHAR-2005]**

(1) volume of urine increases

(2) volume of urine decreases

(3) volume of urine is normal

(4) volume of urine is unaffected

Q.99 Which of the follwing act as secondary messenger in metabolism **[BIHAR-2004]**

(1) ATP (2) C-AMP

(3) ADP (4) NAD

Q.100 Hormone prolactin is secreted by **[BIHAR-2005]**

(1) posterior pituitary (2) thyroid

(3) anterior pituitary (4) hypothalamus

Q.101 Steroid hormone is derived from **[BIHAR-2004]**

(1) corticoid (2) cholesterol

(3) ADH (4) protein

Q.102 Increse glucose level in human is called **[BIHAR]**

(1) hypoglycemia (2) hyperglaycaemia

(3) hyposuria (4) hypersuria

Q.103 Spermatogenesis is influenced by **[BIHAR-2003]**

(1) Progesterone (2) FSH
(3) STH (4) LTH

Q.104 Which hormone is responsible for ovulation **[BIHAR-2003]**

(1) FSH (2) LH
(3) Testosterone (4) Oestrogen

Q.105 Progesterone is secreted by **[BIHAR-2002]**

(1) corpus luteum (2) corpus albicans
(3) corpus callosum (4) corpus striatum

Q.106 Female hormone is **[BIHAR-2002]**

(1) progesterone (2) estrogen
(3) estradiol (4) all of these

Q.107 Which of the following hormones helps in the contraction of uterus during child birth **[UP-CPMT 2001]**

(1) ADH (2) androgen
(3) oxytocin (4) glucocorticoid

Q.108 Which of the following hormones stimulates the secretion of milk from female **[UP-CPMT 2001]**

(1) LH (2) prolactin
(3) oxytocin (4) progesterone

Q.109 The modern idea about ageing is that our body slowly loses the power of defence against the invasion of germs and pathogens. This process starts by the disappearance of which organ **[UP-CPMT 2001]**

(1) spleen (2) thymus gland
(3) pituitary gland (4) parathroid gland

Q.110 Parathormone is secreted during **[UP-CPMT 2002]**

(1) increased blood calcium level
(2) decreased blood calcium level
(3) increased blood sugar level
(4) decreased blood sugar level

Q.111 Chronical disturbance in hormone secretion of thyroid gland causess **[UP-CPMT 2003]**

(1) goitre (2) diabetes
(3) Addison's disease (4) colourblindness

Q.112 The formation of egg and sperm is affected by **[UP-CPMT 2003]**

(1) LH (2) MSH
(3) TSH (4) FSH

Q.113 ACTH is secreted by **[UP-CPMT 2003]**

(1) thyroid gland (2) thymus gland
(3) pituitary gland
(4) Islets of Langerhans

Q.114 Which of the following hormones secreted by pancreas **[UP-CPMT 2003]**

(1) Insulin and glucagon
(2) Epinephrin and nor-epinephrin
(3) Thyroxin and melanin
(4) Prolatin and oxytocin

Q.115 Metamorphosis in frog is hastened by **[UP-CPMT 2003]**

(1) thyroxine (2) insulin
(3) glucagon (4) adrenalin

Q.116 Mammalian prolactin is secreted by **[UP-CPMT 2004]**

(1) adenohypophysis (2) neurohypophysis
(3) adrenla cortex (4) adrenal medulla

Q.117 Hypersecretion of grwoth hormone in the period of growth lead to **[UP-CPMT 2004]**

(1) acromegaly (2) cushing syndrome
(3) midgets (4) Gigantism

Q.118 Which of these is not a ketone body **[UP-CPMT 2004]**

(1) Acetoacetic acid (2) Acetone
(3) Succinic acid
(4) Betahydroxy butyric acid

Q.119 Fight and flight hormone is **[UP-CPMT 2007]**

(1) adrenaline (2) thyroxine
(3) ADH (4) oxytocin

Q.120 Which of the following are correct for axolotal larva **[UP-CPMT 2007]**

(i) it shows neoteny and paedogenesis
(ii) absence of thyroxine affect metamorphosis
(iii) it is the larva of hemichordata

(1) (i), (ii) & (iii) (2) (i) & (ii)
(3) (ii) & (iii) (4) (iii)

Q.121 Blood pressure is controlled by **[MP-PMT 2004]**

(1) Thyroid gland (2) Thymus gland
(3) Adrenal gland (4) Parathyroid gland

Q.122 Hormone which is responsible for maintainance of corpus leuteum is **[MP-PMT 2004]**

(1) Estrogen (2) Aldosteron
(3) Progesterone (4) Testosteron

Q.123 The effect caused by non-functioning of islets of Langerhans **[MP-PMT 2006]**
(1) Heart beat rate increase
(2) Increased BMR
(3) hyperglycaemia
(4) tatani

Q.124 Structure involved in Addison's disease is **[MP-PMT 2006]**
(1) Adrenal medulla (2) adrenal cortex
(3) thyroid (4) pituitary

Q.125 Acromegaly is a disease caused by **[MP-PMT 2001]**
(1) Over secretion of growtth hormone in childhood
(2) Over secretion of growth hormone in adulthood
(3) Under secretion of growth hormone in adulthood
(4) Deficiency of calcium and phosphorous in the diet.

Q.126 If thyroid gland is compppleteloy removed from a tadpole, it will **[MP-PMT 2001]**
(1) Die immediately
(2) Turn into a giant frog
(3) Turn into a dwarf frog
(4) Remain tadpole throughout life

Q.127 'Hashimoto' diseases is caused, when **[MP-PMT 2001]**
(1) Adrenal gland is destroyed by autoimmunity
(2) Thyroid gland is destroyed by autoimmunity
(3) Kidney is destoryed
(4) Pancreas is destroyed

Q.128 The emergency hormone is **[MP PMT 2001]**
(1) Throxine (2) Adrenaline
(3) Insulin (4) Progesterone

Q.129 Insulin is secreted by **[MP-PMT 2001]**
(1) Beta cells of Islets of Langerhans
(2) Alfa cells of Islets of Langarhans
(3) Kuffer cells
(4) Gall bladder

Q.130 In absence of ADH, the disease casused by **[MP-PMT 2001]**
(1) Diabetes mellitus
(2) Diabetes insipidus
(3) Oligouria
(4) Acromegaly

Q.131 In man removal of Parathyroid gland leads to **[MP-PMT 2001]**
(1) Acromegaly (2) Tetany
(3) Polyuria (4) Diabetes insipidus

Q.132 Parathormone induces **[MP-PMT 2002]**
(1) Increase in blood sugar level
(2) Decrease in serum calcium level
(3) Increase in serum calcium level
(4) Decrease in blood sugar level

Q.133 Thyrotropin-releasing factor (TRF) is proudced by **[MP-PMT 2002]**
(1) Cerebrum (2) Optic lobe
(3) Cerebellum (4) Hypothalamus

Q.134 Which one secretes fight and flight hormone **[MP-PMT 2002]**
(1) Pituitary gland (2) Pineal gand
(3) Adrenal gland (4) Thyroid gland

Q.135 Which disease is caused by under secretion of adrnal cortex **[MP-PMT 2002]**
(1) Cretinism (2) Dwarfism
(3) Sterility (4) Addison's disease

Q.136 Gonadotropic hormones are **[MP-PMT 2002]**
(1) Estrogen and progesterone
(2) Luteinizing hormone and follicle stimulatin hormone
(3) Testosterone and androsterone
(4) Prolactin and Luteotropin

Q.137 The name second messenger is given to **[MP-PMT 2002]**
(1) ATP (2) Cyclic AMP
(3) AMP (4) Both ATP and AMP

Q.138 Which gland is both exocrine and endocrine **[MP-PMT 2002]**
(1) Pancreas (2) Thyroid
(3) Pituitary (4) Adrenal

Q.139 The function of glucagon hormone is **[MP-PMT 2003]**
(1) To increase glycogenesis
(2) To decrease blood sugar level
(3) To release glucose from liver cells and glycogenolysis promotion
(4) To increase the absorption of glucose and faty acids through cell

Q.140 Diabetes insipidus is due to **[MP-PMT 2003]**
(1) Hypersecretion of insulin
(2) Hyposecretion of vasopressin
(3) Hypersecretion of vasopressin
(4) Hposecretion of insulin

Q.141 Pineal body originates from **[MP-PMT 2003]**
(1) Dorsla part of diencephalon
(2) Ventral part of diencephalon
(3) Ventral part of cerebellum
(4) Dorsal part of cerebellum

Q.142 Which of the following pituitary hormone is a direct action hormone **[MP-PMT 2003]**
(1) MSH (2) ICSH
(3) ACTH (4) TSH

Q.143 Addisons disease is caused due to **[MP-PMT 2003]**
(1) Hypertrophy of gland
(2) Hyposecretion of adrenal contex
(3) Hyperactivity of Leydig cells
(4) Hypersecretion of pituitary

Q.144 T-cells mature in **[CBSE-2006]**
(1) Peyer's patch (2) Lymph node
(3) Thymus (4) Brusa of fabric

Q.145 Which of the following steriod sex hormone influenced secondary sex organs ? **[MP-PMT 2003]**
(1) Progesterone (2) Oestrogen
(3) LH (4) LTH

Q.146 Progesterone is secreted from **[MP-PMT2003]**
(1) Testes (2) Adrenal gland
(3) Pituitary gland (4) Corpus luteum

Q.147 Adrenal gland is derived from **[MP-PMT 2007]**
(1) Ectoderm
(2) Mesoderm
(3) Ectoderm and mesoderm
(4) Ectoderm and endoderm

Q.148 Which hormone is responsible for milk ejection after the birth of the baby **[MP-PMT 2007]**
(1) Oxytocin (2) Progesterone
(3) Prolactin (4) Estrogen

Q.149 We know that the thryoxine controls metabolism body. An autoimmune disease where the body own antibodies attack the cells of the thyroid is called **[MP-PMT 2007]**
(1) Hyperthyroidism (2) Hashimoto's disease
(3) Grave's disease (4) Turner syndrome

Q.150 Which one of the following pairs of organs includes only the endocrine glands ? **[AIPMT-2008]**
(1) Thymus and Testes
(2) Adrenal and Ovary
(3) Parathyroid and Adrenal
(4) Pancreas and Parathyroid

Q.151 The blood calcium level is lowered by the deficiency of **[AIPMT-2008]**
(1) Both calcitonin and Parathormone
(2) Calcitonin
(3) Parathormone
(4) Thyroxine

Q.152 In human adult females oxytocin **[AIPMT-2008]**
(1) Stimulates pituitary to secrete vasopressin
(2) Causes strong uterine contractions during parturition
(3) is secreted by anterior pituitary
(4) stimulates growth of mamary glands

Q.153 A health disorder that results from the deficiency of thyroxine in adulats and characterised by (i) a low metabolic rate, (ii) increase in body weight and, (iii) tendency to retain water in tissues is : **[CBSE 2009]**
(1) cretinism (2) myxoedema
(3) simple goitre (4) hypothyroidism

Q.154 Goitre can occur as a consequence of all of the following except : **[WB. JEE 2009]**
(1) Grave's disease (2) Iodine deficiency
(3) Pituitary adenoma
(4) Excessive intake of exogenous thyroxine

Q.155 The hormone that increases the blood calcium level and decreases its excretion by kidney is: **[DUMET 2009]**
(1) insulin (2) thyroxine
(3) calcitonin (4) parathormone

Q.156 Obesity of face, hyperglycemia and virilism in females are characteristics of : **[AMU 2009]**
(1) Grave's disease (2) Conn's disease
(3) Cushing's syndrome
(4) Addison's disease

Q.157 Which of the following hormones is not steroid? **[CPMT 2009]**
(1) Androgen (2) Vasopressin
(3) Aldosterone (4) Testosterone

Q.158 Which of the following hormones does not contain a polypeptide? **[Karnataka CET 2009]**
(1) Insulin (2) Oxytocin
(3) Prostaglandin
(4) Antidiuretic hormone

Q.159 Signalling between cells usually results in the activation of protein : **[DUMET 2009]**
(1) lipases (2) kinases
(3) proteases (4) nucleases

Q.160 Steroid hormones easily pass through the plasma membrane by simple diffusion because they : **[DUMET 2009]**
(1) Are lipid soluble
(2) Are water soluble
(3) Enter through pores
(4) Contain carbon and hydrogen

Q.161 Estrogen and testosterone are steroid hormones and are most likely bind to : **[DUMET 2009]**
(1) Cytoplasmic receptors
(2) Membrane ions channels
(3) Enzyme-linked membrane receptors
(4) G-protein linked membrane receptors

Q.162 Match the hormone with is source of secretion: **[Kerala PMT 2009]**
(1) A = 5, B = 1, C = 6, D = 3, E = 2
(2) A = 1, B = 2, C = 4, D = 3, E = 5
(3) A = 2, B = 6, C = 4, D = 5, E = 3
(4) A = 5, B = 1, C = 4, D = 2, E = 3
(5) A = 1, B = 3, C = 4, D = 2, E = 5

Q.163 Match List I with List II and choose the correct answer : **[Kerala PMT 2009]**
(1) A = 4, B = 1, C = 2, D = 3, E = 5
(2) A = 4, B = 1, C = 2, D = 5, E = 3
(3) A = 2, B = 1, C = 4, D = 3, E = 5
(4) A = 2, B = 1, C = 5, D = 4, E = 3
(5) A = 5, B = 1, C = 3, D = 2, E = 4

Q.164 The chemical nature of hormones secreted by α and δ cells of pancreas is : **[WB. JEE 2009]**
(1) steroid (2) glycolipid
(3) polypeptide (4) glycoprotein

Q.165 Which is 32 amino acid water soluble peptide hormone ? **[AMU 2010]**
(1) Gastrin (2) Calcitonin
(3) Glucagon (4) Insulin

Q.166 Which of the following hormones is correctly matched with its deficiency disease? **[AFMC 2010]**
(1) Parathormone — Tetany
(2) Relaxin — Cretinism
(3) Insulin — Diabetes insipidus
(4) Prolactin — Astigmatism

Q.167 Parathormone influences calcium absorption in the small intestine by regulating the metabolism of : **[AMU 2010]**
(1) vitamin C (2) vitamin D
(3) vitamin B_6 (4) enterogastrone

Q.168 Toxic agents present in food which interfere with thyroxine synthesis lead to the development of : **[CBSE 2010]**
(1) toxic goitre (2) cretinism
(3) simple goitre (4) thyrotoxicosis

Q.169 Endemic goitre is a state of :**[WB. JEE 2010]**
(1) increased thyroid function
(2) normal thyroid function
(3) decreased thyroid function
(4) moderate thyroid function

Q.170 The hormone which regulates sleep-wake cycle in man is : **[Keral PMT 2010]**
(1) oxytocin (2) vasopression
(3) thyroxine (4) melatonin
(5) thyrocalcitonin

Q.171 The inability to regulate the concentration of sodium ions in the blood could be due to the improper functioning of one of the following: **[EAMCET 2010]**
(1) Adenohypophysis-It produces ACTH
(2) Adrenal cortex-It produces Aldosterone
(3) Adrenal medulla-It produces Epinephrine
(4) Pars nervosa-It produces ADH

Q.172 Which one of the following pairs is incorrectly matched ? **[CBSE 2010]**
(1) Glucagon — Beta cells (Source)
(2) Somatostatin — Delta cells (Source)
(3) Corpus luteum — Relaxin (Secretion)
(4) Diabetes mellitus (Disease)

Q.173 Which of the following is not the function of inslin ? **[Karnataka CET 2010]**
(1) Increases the permeability of cell membrane to glucose
(2) Increases the oxidation of glucose in the cells
(3) Initiates the conversion of glycogen to glucose
(4) Initiates the formation of hepatic glycogen from excess of glucose

Q.174 Human chorionic gonadotropin is secreted by: **[Kerala PMT 2010]**

(1) chorion (2) amnion

(3) corpus luteum (4) placenta

Q.175 What is correct to say about the hormone action in humans ? **[AIPMT Pre 2012]**

(1) Secretion of thymosins is stimulated with aging.

(2) In females, FSH first binds with specific receptors on ovarian cell membrane.

(3) FSH stimulates the secretion of estrogen and progesterone.

(4) Glucagon is secreted by β-cells of Islets of Langerhans and stimulates glycogenolysis.

Q.176 In a normal pregnant woman, the amount of total gonadotropin activity was assessed. The result expected was : **[AIPMT Pre 2012]**

(1) High level circulating HCG to stimulate endometrial thickening.

(2) High levels of FSH and LH in uterus to stimulate endometrial thickening.

(3) High level of circulating HCG to stimulate estrogen and progesterone synthesis.

(4) Hig level of circulating FSH and LH in the uterus to stimulate implantation of the embryo.

Q.177 A person entering an empty room suddenly finds a snake right in front on opening the door. Which one of the following is likely to happen in his neuro-hormonal control system? **[AIPMT Pre 2012]**

(1) Neurotransmitters diffuse rapidly across the cleft and transmit a nerve impulse.

(2) Hypothalamus activates the parasympathetic division of brain.

(3) Sympathetic nervous system is activated releasing epinephrin and norepinephrin from adrenal cortex.

(4) Sympathetic nervous system is activated releasing epinephrin and norepinephrin from adrenal medulla.

Q.178 Which one of the following pairs of hormones are the examples of those that can easily pass through the cell membrane of the target cell and bind to a receptor inside it (mostly in the nucleus) **[AIPMT Pre 2012]**

(1) Thyroxin, Insulin

(2) Somatostatin, oxytocin

(3) Cortisol, testosterone

(4) Insulin, glucagon

ANSWER KEY

Exercise – 3

Ques.	**1**	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**	**10**	**11**	**12**	**13**	**14**	**15**	**16**	**17**	**18**	**19**	**20**

INSTRUCTIONS FOR Q. NO. 1 TO 63

In the following questions (40 to 57), a statement of assertion (A) is followed by a statement of reason (R).

(1) If both Assertion & Reason are true and the reason is the correct explanation of the assertion, then mark (1).

(2) If both Assertion & Reason are true but the reason is not the correct explanation of the assertion, then mark (2).

(3) If Assertion is true statement but Reason is false, then mark (3).

(4) If both Assertion and Reason are false statements. then mark (4).

Q.1 **A :** Vasopressin is a neurohormone
R : Vasopressin is synthesized by pars nervosa of pituitary gland

Q.2 **A :** Pituitary gland is ectodermal in origin
R : Both parts of pituitary develop from nervous tissue

Q.3 **A :** Thyroxine is presponsible for over all development of animals since childhood.
R : It is diabetogenic hormone and it increases peripheral utilization of glucose

Q.4 **A :** Deficiency of Insulin proudce polyurea conditon
R : Glucagon is antagonastic hormone of Insulin.

Q.5 **A :** Deficiency of vitamine-D is very less known.
R : It is obtained from intrinsic sources regularly.

Q.6 **A :** MSH & Melatonin are antagonistic hormones
R : MSH help in the wide distribution of melanin in melanocytes while melatonin collects the melanin at one place in melanocyte.

Q.7 **A :** Adrenal gland have dual origin.
R : The adrenal cortex develop from endoderm while adrenal medulla develop from mesoderm.

Q.8 **A :** Pineal gland found on the epithalamus of Diencephalon.
R : It is a one type of exocrine gland which is active in later age of life.

Q.9 **A :** Pancrease is heterocrine gland.
R : Pancreas secretes both protein & steroid hormone.

Q.10 **A :** Aldosterone is polypeptide hormone and control the Na^+ & K^+ ratio in body.
R : Aldosterone increase reabsorption of Na^+ from plasma of blood and to check its loss and increase loss K^+ in body fluid.

Q.11 **A :** Thymus gland is found in abdominal region.
R : It is a exocrine gland which secretes lymphocyte.

Q.12 **A :** MSH & Melatonin are similar hormone.
R : MSH help in the collection of melanin in melanocytes while melatonin distribute the melanin at one place in melanocyte.

Q.13 **A :** Two pitutary hormones of the mother take part in feeding the infant on milk.
R : Prolactin from anterior pituitary stimulated mammary glands for the formation of milk, and oxytocin from the post. Pituitary causes the release of milk when the infant sucks breast.

Q.14 **A :** Vasopressin in also called as antidiuretic hormone
R : Vasopressin reduces the loss of water in the urine by increasing water reabsorption in the nephrons.

Q.15 **A :** Aldosterone is known as salt retaining hormone.
R : It reduces Na reabsorption from urine to increase its loss from the body.

Q.16 **A :** Cortisol therapy is useful in organ transplantation
R : Cortisol act as immunosuppresant

Q.17 **A :** Catecholamines (adrenaline) are emergency hormones.
R : Catecholamines are released from adrenal cortex

Q.18 **A :** The hormone FSH stimulates R.B.Cs. maturation.
R : On reaching the red bone marrow FSH stimulate the maturation of RBCs

Q.19 **A :** Thyrocalcitonin & Parathormone have antagonistic effect on blood calcium level.
R : Thyrocalcitonin lower the blood calcium level and parathormone raises the blood calcium level by removal of calcium from bone and reabsorption of calcium from nephrons.

Q.20 **A :** Hormones are said to be similar to enzyme in action and chemical nature
R : Hormones and enzymes are proteinaceous in nature and act as informational nature.

Q.21 **A :** Adrenal cortex can be removed without causing death.
R : Adrenal cortex is not vital for survival.

Q.22 **A :** In recent study, pineal body is called third eye.
R : It is having photosensitive cells and show the response for light.

Q.23 **A :** Growth hormone, Thyroxine and cortisol hormone are called diabetogenic hormone.
R : When the Hypersecretion of thyroxine occurs then produce diabetes mellitus.

Q.24 **A :** Excessive amounts of calcitonin hormone in the blood causes softening of bones.
R : Calcitonin causes mobilisation of calcium from the bones of the blood plasma.

Q.25 **A :** Failure of secretion of somatotropin from an early age cause drawfism in the patient.
R : Somatotropin hormone stimulates the body growth and elongation of long bones.

Q.26 **A :** The dietary deficiency of iodine causes exophthalmic goitre.
R : Iodine is required for the formation of thyroid hormones.

Q.27 **A :** Oxytocin is also known as Anti Diuretic hormone (ADH).
R : Oxytocin can cause an increase in the renal reabsorption of water.

Q.28 **A :** Failure of secretion of thyroid gland hormones from childhood causes cretinism disease.
R : Thyrotropin hormone maintains BMR and promote growth of body tissue .

Q.29 **A :** The tadpoles become giant tadpoles when fed on thiourea.
R : Thiourea is an antithyroid substance.

Q.30 **A :** Hormones are similar to enzymes in their action and chemical nature.
R : Hormones and enzymes are proteinaceous in nature and act as informational molecules.

Q.31 **A :** Failure of secretion of hormone vasopressin causes diabetes mellitus in the patient.
R : Vasopressin reduces the volume of urine by increasing the reabsorption of water from the urine.

Q.32 **A :** The parathyroid glands are said to be under the feedback control of blood calcium levels.
R : Parathormone of parathyroids mobilises calcium form the bones to the blood plasma.

Q.33 **A :** Prolactin is also called the 'Milk ejection hormone'.
R : Prolactin stimulates the smooth muscle contractions of the mammary glands.

Q.34 **A :** Adrenal medulla and sympathetic nervous system are said to function as a closely integrated system.
R : It is because both of them get stimulated in physical and emotional stress conditions.

Q.35 **A :** Prostate and seminal vesicles are said to be primary sex organs.
R : Prostate and seminal vesicles participate and help in reproduction.

Q.36 **A :** A tumour of adrenal cortex may cause Addison's disease.
R : This happens due to over secretion of cortisol by the tumor.

Q.37 **A :** Aldosterone increases the volume of blood and other extracellular fluids.
R : The secretion of aldosterone is stimulated by a fall in the circulating volume of blood.

Q.38 **A :** Adrenal cortex can be removed without causing death.
R : Adrenal cortex is not vital for survival.

Q.39 **A :** Adrenal cortex is called the gland for 'fight, fright and flight'.
R : The hormones adrenaline and noradrenaline help the body to combat against stress and emergency conditions.

Q.40 **A :** FSH is also known as interstitial cell stimulating hormone.
R : It is because of the fact that FSH stimulates the interstitial cells of testis.

Q.41 **A :** Insulin is said to be anabolic hormone.
R : Failure of insulin secretion causes diabetes.

Q.42 **A :** Females have less stature than males after puberty.
R : This happens because of the presence of HCG in the blood of females.

Q.43 **A :** Glucagon is said to lower down the blood sugar level.
R : Glucagon increases the utilization of glucose in the tissues and the synthesis of liver glycogen.

Q.44 **A :** Endocrine glands are called glands of internal secretion.
R : These are ductless and release their hormones in the blood.

Q.45 **A :** Hormones are also called chemical messengers or information molecules.
R : These carry the message of target cells to the endocrine glands.

Q.46 **A :** Hormones differ from the enzymes in a number of properties.
R : Enzymes are always proteinous while hormones may or may not be proteinous.

Q.47 **A :** Hormones show certain similarities with nervous system.
R : Both are electrochemical signals and are conducted towards specific direction.

Q.48 **A :** All hormones act after a lag period.
R : c-AMP is formed after certain lag period.

Q.49 **A :** Adrenal gland is electomesodermal in origin.
R : Adrenal cortex is ectodermal in origin while adrenal medulla is mesodermal in origin.

Q.50 **A :** Metamorphosis of tadpole larva occurs in presence of thyroxine hormone.
R : A thyroidless tadpole larva just increases in size and fails to metamorphosize.

Q.51 **A :** Thyroxine hormone controls BMR and physical, mental and sexual growth.
R : Hypothyroidism in the infants leads to cretinism.

Q.52 **A :** Goitre is very less reported in the persons near the coastal areas.
R : Iodine is abundantly present in the sea water.

Q.53 **A :** TCT and PTH are antagonistic hormones.
R : TCT increases the Ca^{++} level in blood while PTH decreases Ca^{++} in the blood.

Q.54 **A :** Nor-epinephrine is also called Triple F-harmone.
R : It increases the metabolism during fight, flight and fright.

Q.55 **A :** Adrenal gland is also called 4 S-gland.
R : Hormones of adrenal gland regulate salt retention, sugar metabolism, sex-hormones secretion.

Q.56 **A :** Pancreas is a purely endocrine gland.
R : It is totally endocrine and secretes only hormones.

Q.57 **A :** Aldosterone is called salt retaining hormone.
R : Aldosterone increases Na^+ and K^+ reabsorption from nephric filtrate.

Q.58 **A :** Epinephrine is commonly called sympathomimic hormone.
R : Epinephrine and sympathetic nerve fibres both have same actions on same organs.

Q.59 **A :** Diabetes insipidus is due to deficiency of insulin and is characterized by diuresis, polydipsia, hyperglycaemia and glycosuria.

R : In diapedes insipidus, body cells cannot use glucose and liver cells cannot store glucose.

Q.60 **A :** Pituitary gland is cranioepithelial in origin.

R : Its anterior lobe is formed from pharynx while posterior lobe is formed from the hypothalamus of brain.

Q.61 **A :** Pituitary gland is also called master gland.

R : It secretes a number of trophic hormones which regulate secretion from other endocrine glands.

Q.62 **A :** Acromegaly is gorilla-like appearance due to oversecretion of STH from childhood.

R : Acromicria is with smaller hands, feet and face due to less secretion of somatostatin.

Q.63 **A :** FSH is a gonadotrophic and gametokinetic hormone.

R : FSH controls gametogenesis in both testes and ovaries.

Bansal Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	**Good / Important questions**
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

NERVOUS SYSTEM

- System which regulate the various activities of the body through nerve. impulses is called the **nervous system**. Through this system the messages are transmitted at a faster rate.
- The nervous – system controls and also co-ordinates the various activities of the organs of the animals.
- Whole nervous – system of human being is derived from embryonic **Ectoderm**.

NERVOUS SYSTEM

CNS

(1) BRAIN

FORE BRAIN/PROSENCEPHALON

Olfactory/Rhinencephalon
(Smelling)

Cerebrum/Telencephalon
Intellegence/Memory, Language

Diencephalon/Thalamencephalon
(Receives all sensory impulses)

MID BRAIN/MESENCEPHALON

Optic Lobes
(Vision)

Crura Cerepri
(Coordination between For & Mid Brain)

HIND BRAIN/RHOMBENCEPHANON

Cerebellum/Metencephalon
(Posture, Equilibrium, Voluntary Muscles)

Pons Varolii
(Connects lateral cerebellar hemisphere)

Medulla Oblongata
Mylenecephalon
(Metabolism, Involuntary activities)

(2)SPINAL CORD
Arise from foraman of magnum
Length – 25 cm
Weight – 5 gm
Covered with 3 meninges
Durameter (Outermost)
Arachnoid (Middle)
Piamater (Inner)

PNS

(1) CRANIAL NERVES (12 PAIRS)

I →Olfactory (S)
(O-Olfactory lobe, F-smelling)

II Optic →(S)
(O-Optic lobe-F-vision)

III →Occulomotor (M)
(O–Crura Cerebri, F-Eyeball movement)

IV → Trochlear (M)
O-between optic & cerebellum
F-Eyeball movement)

V → Trigeminal
(O-Ponsvarolii, F-skin & Zaw)

VI → Abduence (M)
(O – Medulla, F – Eyeball)

VII →Facial (X)
(O – Medulla, F-facial expression, Tast e)

VIII → Auditory (S)
(O – Medulla, F-Hearing)

IX → Gloss opharyngeal (X)
(O – Medulla, F-Pharynx, Tongue)

X →Vagus (X)
(O – Medulla, F-Heart, Stomach, Lungs)

XI → Spinal accessory (M)
(O – Medulla,F-Neck, Larynx)

XII → Hypoglossal (M)
(O – Medulla, F-Tongu movement)

(2)SPINAL NERVES (37 pairs)

Cervical	**(1 – 8)**	— 8
Thorasic	**(9 – 20)**	— 12
Lumber	**(21 – 27)**	— 7
Secral	**(28 – 31)**	— 4
Caudal	**(32 – 37)**	— 6

O–Origin, F – Function

ANS

(1) SYMPATHETIC

→ **Preganglionic Sympathetic Nerve fibres**
→ **Sympathetic trunk**
→ **Post Ganglionic Symperthetic Nerve fibres**
→ **Prevertebral ganglia**
- → Coeliac
- → Anterior Mesentric
- → Posterior Mesentric

(2) PARASYMPATHETIC

→ **CRANIAL OUTFLOW**
III →Eye
VII → Tear Gland
IX →Salivary Glag
X →Heart, Lungs & other visoral organs

→ **SACRAL OUT FLOW**
II, III, IV → → Rectum, Urinary Bladder & Gonads

CENTRAL NERVOUS SYSTEM :

– It includes the brain and the spinal-cord. These are formed from the neural-tube which develops from the ectoderm after the gastrula stage of embryo.

Development of CNS :

It develops from neural tube in intrauterine life (I.U.L.). Anterior part of neural tube develops into brain while caudal part of neutral tube develops into spinal cord.

Approximately 70-80% part of brain develops by 2 year of age & complete development is achieved in 6 years of age & spinal cord develops completely in 4 to 5 years of age.

BRAIN / ENCEPHALON :

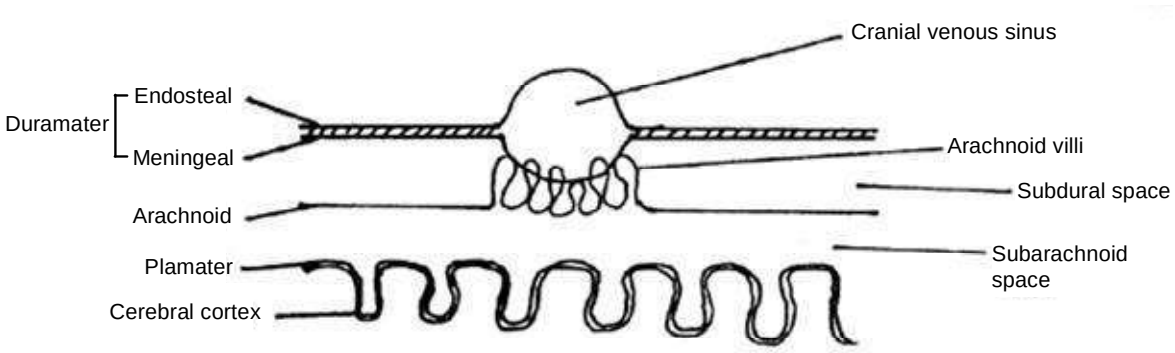
It is situated in cranial box which is made up of 1 frontal bone, 2 parietal bone, 2 temporal bone, 1 occipital bone. The weight of brain of an adult man is 1400 gm and of female is 1250 gm.

BRAIN

(A) Fore brain	(B) Mid brain	(C) Hind brain
(Prosencephalon)	(Mesencephalon)	(Rhombencephalon)
(1) Rhinencephalon (Infront)	(1) Optic lobe	
(2) Telencephalon or	(2) Crura - Cerebri	(1) Cerebellum
Cerebrum (middle)		(metencephalon)
(3) Diencephalon or		(2) Pons varolii
(Behind) Thalamencephalon		(3) Medulla - oblongata
		(Myelencephalon)

BRAIN MENINGES :

Brain is covered by three membrances of connective tissue termed as **meninges** or **menix**.



Meningeal layer

(1) Duramater :

This is the first and the outermost membrane which is thick, very strong and non-elastic. It is made up of collagen fibres. This membrane is attached with the innermost surface of the cranium.

– It is double layer – **outer Endosteal layer** which is closely attached with inner most surface of carnium & no space is found between skull & Duramater (No Epidural space).

Inner meningeal layer which is related with other meninges of brain.

Both are vascular.

Generally both layers are fused with each other, but at some places these are separated from one another & from a sinus called cranial **venous sinus**. These sinuses are filled with venous blood.

(2) Arachnoid :

It is middle, thin and delicate membrane, made up of connective tissue.

It is found only in mammals.

It is non vascular layer.

Infront of cranial venous sinus, it becomes folded, these folds called **Arachnoid villi.**

These villi reabsorb the cerebrospinal fluid (CSF) from sub arachnoid space & pour it into cranial venous sinuses.

(3) Piamater :

It is Innermost, thin and transparent membrane, made up of connective tissue.

Dense network of blood capillaries are found in it, so it is **highly vascular**.

It is firmly adhere to the brain.

Piamater & arachnoid layer at some places fuse together to form **leptomeninges**.

Piamater merges into sulci of brain & densely adhere to it.

At some places it directly merges in the brain and called **telachoroidea**.

Telachoroidea form the choroid plexus in the ventricles of brain.

Sub Dural Space :

Space between duramater & arachnoid. It is filled with serous fluid.

Sub Arachnoid Space :

Space between Arachanoid & Piamater is filled with C.S.F.

Cranial nerves also pass through this space.

Menigitis : any inflammation of menix is called as meningitis. It may be caused by viruses, bacteria or protozoa.

DIVISIONS OF HUMAN BRAIN : Human brain divided into three parts -

⇒ **Fore brain –** Cerebrum, Diencephalon.

⇒ **Mid brain –** Consist of many groups of nerve cells called "Nuclei".

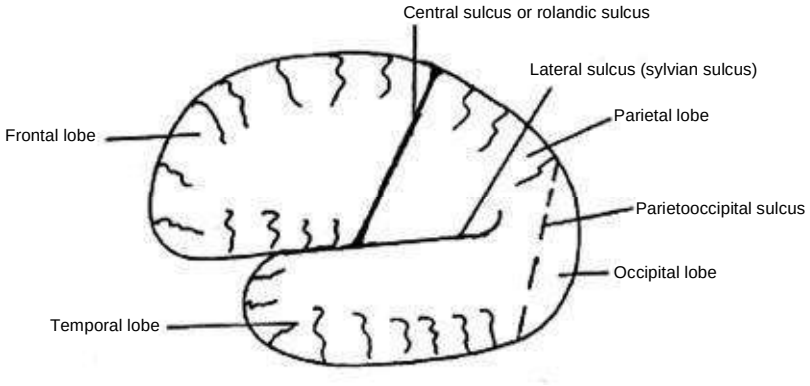
⇒ **Hind Brain –** Pons. Cerebellum, Medulla.

During embryonic stage, brain develops from three hollow vesicles -

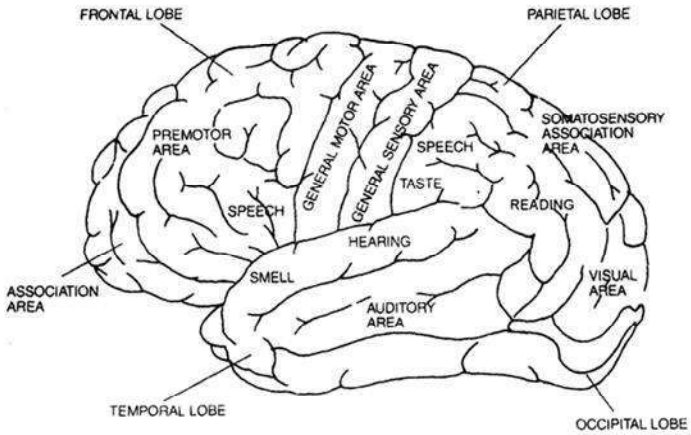
Forebrain develops from **prosencephalon.** → Telencephalon [Cerebrum], Diencephalon

Mid brain develops from **mesencephalon.**

Hind brain develops from **rhombencephalon** → Metencephalon (Pons, Cerebellum), Myelencephalon (Medulla oblongata (M.O.))



DORSAL SURFACE OF CEREBRAL HEMISPHERE



Human brain inside view showing location of certain functions

One pair of **olfactory lobes** are small spherical & solid in human brain.

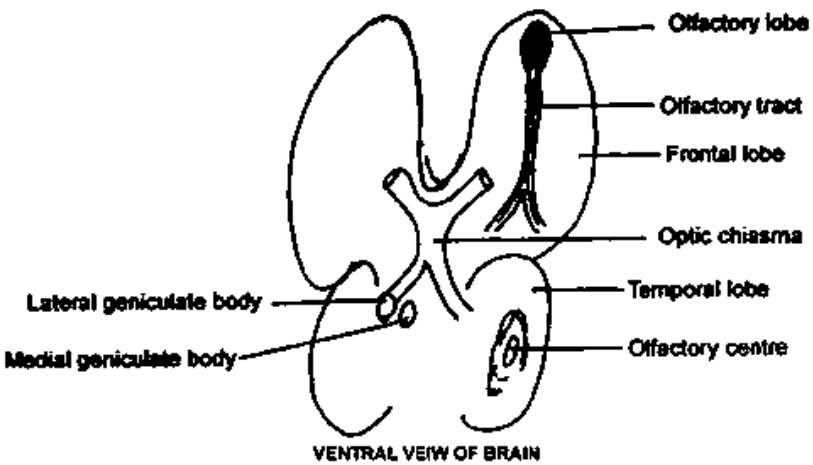
No ventricle is found in it.

Both olfactory lobe are separate with each other & are embedded into ventral surface of the both Frontal lobe of cerebral Hemisphere.

Olfactory centre is situated in temporal lobe.

Functions : It is supposed to be centre of smelling power.

Its size is small in mammals comparatively because most of its parts becomes a part of cerebrum some animals like sharks and dogs have well developd olfactory lobes.



VENTRAL VEIW OF BRAIN

CEREBRUM :

- It is first & most developed part of brain.
- It makes 2/3 part of total brain.
- Cerebrum consist of two cerebral hemispheres on the dorsal surface. A longitudinal groove is present between two cerebral hemispheres called as **median fissure.** Both the cerebral hemispheres partially connected with each other by curvede thick nerve fibres called **corpus callosum.**
- Each cerebral hemisphere is divided into 4 lobes – Anterior, middle, posterior and lateral.

  Anterior lobe is also called frontal lobe (largest lobe). Middle lobe is also called parietal lobe.

S.No.	Name of Area	Location	Relation or Analysis
1.	Prefrontal cortex	Frontal lobe	Seat of intelligence, knowledge, creative ideas, ability to abstract, memory. **(organ of mind).**
2.	Premotor area	Frontal lobe	– **Written centre** – Associated Movement of eye. head & body – Control complex movement of jaw, tongue, pharynx, larynx
3.	Motor area	Frontal lobe	Analysis of all type of voluntary muscle
4.	Frontal Eye field	Frontal lobe	Responsible for conjugate movement of eye. Opening & closing of eye lid
5.	Broca's Area In Rt handed person In Lt handed person	Frontal lobe present of Lt. side present of Rt. side (Motor speech area)	Analysis for speak if injury to this region inability to speak (**aphasia**) even though muscle concerned are no paralysed
6.	Auditory area	Temporal	Analysis for sound.
7.	Olfactory	Temporal or Hippocampal gyrus	Analysis for smell.
8.	Wernicke's area (Sensory area of speech)	Temporal	Analysis for **language** Sensory analysis for speech
9.	Gustatory area	Parietal	Analysis for Taste
10.	Somesthestic area	Parietal	Analysis for touch, pressure, pain, knowledge about position in space taking in information from environment etc.
11.	Angular gyrus	Parietal	Sansory analysis for writing
12.	Occipital area	Occipital	Analysis for vision

Central sulcus separates frontal lobe from parietal lobe. Lateral lobe or temporal lobe is separated from frontal lobe & parietal lobe by incomplete sulcus called **lateral sulcus.**

Posterior lobe is also called occipital lobe, it is separated from parietal lobe by a sulcus called **parieto occiptal sulcus.**

In right handed person, left hemisphere is dominant while in left handed person right hemisphere is dominant.

Many ridges & grooves are found on dorsal surface of cerebral hemisphere. Ridges are known as gyri while grooves are called **sulci**. These cover the 2/3 part of cerebrum.

⇒ Gyri & sulci are more developed in human being so human being are most intelligent living beings.

Intelligency quotienent (I.Q) = $\frac{\text{mental age}}{\text{chronological age}} \times 100$		
Idiot	–	0–24 %
imbecile	–	25–49 %
Moron	–	50–69 %
Borderline	–	70–79 %
Low normal	–	80–89 %
Normal	–	90–109 %
Superior	–	110–119 %
Very superior	–	120–139 %
Genius	–	140–More

Corpus callosum :

It is largest commissure of Brain.

Exclusive feature of mammals.

Curved thick band of white nerve fibre situated between two cerebral hemispehre in the median fissure.

Anterior truncated part of corpus callosum is called **Genu** while posterior truncated part is called **splenium.**

An oblique band is formed by body of corpus callosum & it goes towards Genu called **fornix.**

A small cavity is developed enclosed by callosum, Genu & fornix called as **V^{th} ventricle or pseudocoel.** This ventricle is covered by a thin membrane called as **septum lucidum.**

Functions : It is the most developed part in mammals.

It is the most important part of brain because it controls and regulates different parts of brain.

This is the centre of conscious senses, will power, voluntary movements, knowledge, memory, speech and thinking, reasoning etc.

Different sense organs send impulses here, and in this part of brain analysis and coordination of impulses is done then messages are transferred according to the reactions through voluntary muscles. **All the voluntary actions are controlled by cerebral hemispheres**.

Diencephalon :

It is small and posterior part of fore brain. It is covered by cerebrum. It consists of **Thalamus, hypothalamus, Epithalamus.**

(i) Thalamus : It forms upper lateral walls of Diencephalon.

It forms 80 % part of Diencephalon.

It acts as a **relay centre**.

It receives all sensory impulses from all part of body & these impulses are send to the cerebral cortex.

(ii) Hypothalamus : It forms lower lateral wall of Diencephalon.

A cross like structure is found on anterior surface of hypothalamus called as **optic chiasma**.

Pituitary body is attachd to middle part of hypothalamus by infundibulum.

(iii) Corpus mammillare or Corpus albicans or **mammilary body.**

It is found on the posterior part of hypothalamus.

It is a character of mammalian brain.

It integrates and controls the visceral activities.

The hypothalamus, through its connection with brain stem, maintains homeostasis and the body's internal equilibrium, specialising in involuntary behaviour control.

The nuclei in it signal the body to eat, drink, get angry, keep cool, and make love and so on.

Hyothalamus organises behaviour related to survival of species : fighting, feeding, fleeing and mating.

It keeps body temperature of roughtly 37ºC by means of a complex thermostat system.

It also influences respiration and heartbeat and sends out signals to correct them when they are wrong.

Through connections with the pituitary glans, the hypothalamus controls growth and sexual behaviour.

Epithalamus :

It forms the roof of diencephalon. Pineal body is found in epithalamus.

Functions : Its dorsal side is called **epithalamus** in which pineal bod is situated, that controls the sexual maturity of animal.

- **Thalamus :** Act as relay centre for sensory stimulation.

  In lower animal, Cerebral cortex is not developed then **Thalamus act** as **sensory centre**.

  It is related with RAS.

  It is also act as limbic part.

- **Functions of Hypothalamus :**

  (1) Thermoregulation

  (2) Behaviour and emotion

  (3) Endocrine control

  (4) Biological clock system

  (5) ANS control.

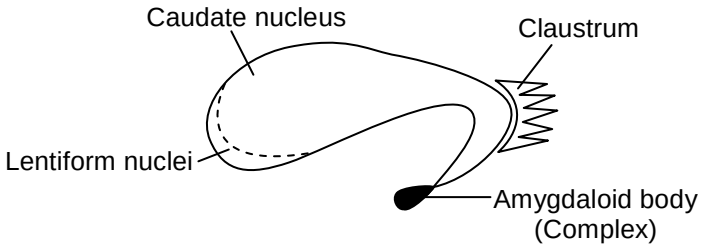
  These are found centres of animal feelings/Emotions like sleep, anger, intercourse, hate, love, affection, and temperature control emotional, pain, hunger, thirst and satisfaction in thehypothalamus.

- The regulatory hormones of hypothalamus control the acitivty of endocrine glands.
- Modern scientists suppose that **hypothalamus is the "master gland" not the pituitary**.
- Optic chiasma found in the hypothalamus carry optic impulses received from eyes to the cerebral hemispheres.
- Animal becomes blind if this part is destroyed by chance.

Basal Nuclei :

Situated in the wall of cerebral hemisphere.

Corpus striatum (Caudate nucleus + lentiform nucleus) + Amygdaloid body + claustrum.



BASAL NUCLEI

Function :

(1) It maintains muscle tone.

(2) It regulates automatic associated movement like swinging of arms during walking.

(3) In lower animals, when cerebral cortex is not developed basal nuclei acts as motor centre

Lesion in basal nuclei leads to a disease called as **parkinsonism** (Rigidity, Tremor at rest, mask like face).

Reticular activating system :

It is special sensory fibre which is situated in Brain stem & further go into Thalamus. It is related with **consiousness, alertness** & **awakening**. Therefore it is also called **gate keeper of consiousness.**

Limbic system : It is visible like a wish bone. tuning fork or liplike.

Limbic lobe (area of temporal Lobe)

+

Hippocampus + Hypothalamus including septum + Part of Thalamus + Amygdaloid complex.

Function of Limbic system :

(1) Behaviour, Emotion, rage and anger (Hypthalamus, amygdaloid body)

(2) Receni memory & short term memory converts into long term memory (Hipopocampal lobe)

(3) Food habit (Hypothalamus) (4) Sexual Behaviour (Hypothalamus) (5) Olfaction (Hippocampal lobe and Limbic lobe)

Mid brain :

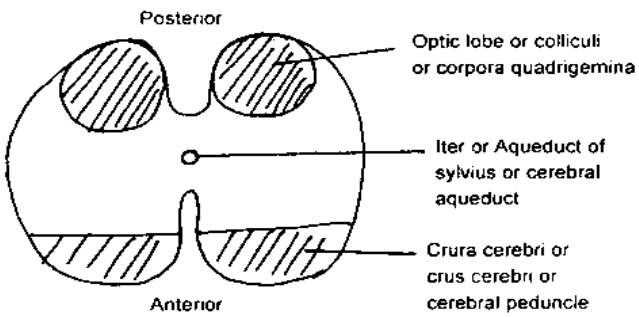
It is small & contracted part of brain.

Anterior par tof mid brain contains two longitudinal myelinated nerve fibres peduncles called **Cerebral peduncles** or **crus cerebri or crura cerebri**.

On the posterior part of mid brain are found four spherical projection called **colliculi** or **optic lobes**.

Four colliculi are collectively called as **corpora quadrigemina** (2 upper & 2 lower).

Only 2 colliculi or optic lobes are found in mid brain of frog called as **corpora bigemina**.



T. S. OF MID BRAIN

Functions :

- Four optic lobes or colliculus present, superior optic lobes are the main centres of **pupillary light reflexes**. Inferior optic lobes are related **accoustic (sound) reflex action**.
- Crura cerebri controls the muscles of limbs.

Hind Brain :

3 Parts – **(1)** Pons **(2)** Cerebellum **(3)** Medulla Oblongata (M.O.)

(1) Pons or Pons varolli :

It is small spherical projection, which is situated below the midbrain & upper side of the M.O.

It consists of many transverse & longitudinal nerve fibres.

Transverse nerve fibres connect with cerebellum.

Longitudinal fibres connect cerebrum to M.O.

Functions : It regulates the breathing reation through pneumotaxic centre.

(2) Cerebellum :

Made up of 5 lobe [2 lateral lobe, 1 vermis and 2 floccular lobes.

Both lateral lobes becomes enlarged & spherical in shape, so lateral lobe of cerebellum are also called as **cerebellar heimisphere**.

Due to this reason, regulation & Coordination of voluntary muscle is more developed as compared to other animals.

In **terminal part of vermis, one pair of floccular lobes are found.**

Three cerebellar peduncle are formed.

Superior cerebellar peduncle attach with mid brain.

Middle cerebellar peduncle attach with pons.

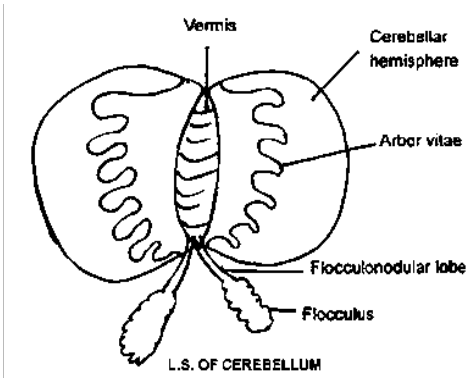
Inferior cerebellar peduncle attach with M.O.

Functions : Impulses are received from different voluntary muscles and joints and then controlling of the their movements and their regulation and coordination accordingly.

Maintains the body balance.

Persons which take alcohol in excess, their cerebellum gets affected, as a result of that they can not maintain their balance and their walking is disturbed.

Thus It is related with fine & skillful voluntary movement & also related with body balance. equillibrium, posture & tone.



L.S. OF CEREBELLUM

(3) Medulla Oblongata (M.O.) :

Posterior part of brain is conical in shape.

- In this respiratory, cardiovascular and vomiting centres are present
- Vagus nerve originates from here.
- Roof is thin, non-nervous and forms **posterior choroid plexus.**
- There are present three pores below plexus.
- One pair of posterior pere called foramen of lushka and a single median formen of megendie
- These poses join external and internal parts of brain.
- Most of the sensory and motor nerves cross at medulla, and therefore right cerebral hemisphere controls left half of body and left cerebral hemisphere controls body's right half.

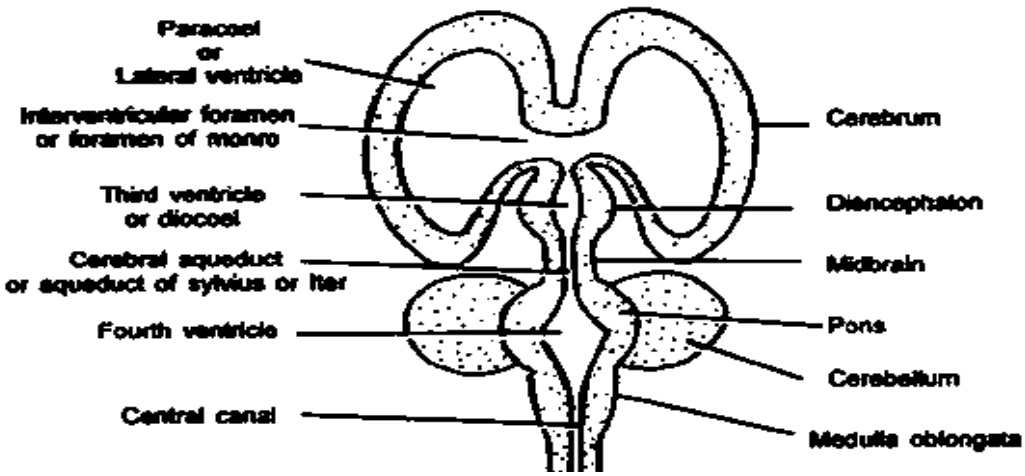
Functions : It is the most important part of brain which controls all the involuntary activities of the body e.g. heart beats, respiration, metabolism, secretory actions of different cells rate of engulfing food etc.

It acts as conduction path for all impulses between spinal cord and remaining portions of brain.

- It is also concerned with **Reflex**-Sneezing reflex, salivation reflex, coughing reflex, swallowing reflex, vomiting reflex, yawning reflex.

Mid brain, pons &medulla are situated in one axis and called as Brain stem.

Internal Structure of Brain

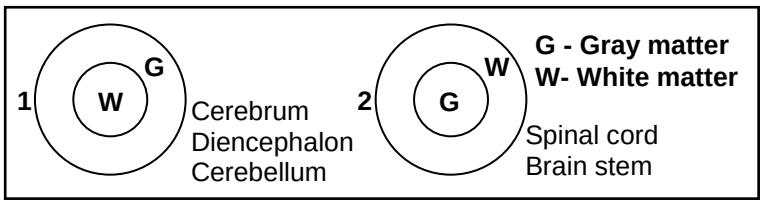


L.S. OF BRAIN

- **Except Midbrain, Cerebellum, Pons & olfactory lobe** complete brain is internally hollow. Its cavity is lined by **ependymal epithelium**. (Ciliated Columnar Epithelium)
- Cavities of brain are known as ventricles, filled with cerebrospinal fluid (C.S.F.).
- **In Rabbit, Cavity of olfactory lobe is hollow called as 1st ventricle or Rhinocoel. Both Rhinocoel continue in cavity of cerbral hemisphere, know as 2nd ventricle or paracoel or latealventricle.**
- On the posterior side, both paracoel combine with each other & open into cavity of Diencephalon through an aperture known as **Foramen of Monro**.

- Cavity of diencephalon is known as 3rd ventricle or Diocoel.
- A tent shape space or cavity present between anterior pons, medulla & posterior cerebellum called IVth ventricle.
- 3rd and 4th ventricle are connected with each other through a hollow tube **known as Iter or Aqueduct of sylvius**. IVth ventricle continues in the metacoel and metacoel continues in the cavity of spinal cord called **neurocoel or central canal**.
- One aperture is found on dorsal surface of metacoel known as **foramen of Magendie**. Two apertures are found on lateral sides of metacoel know as **Formen of Luschka [1–1]**.

HISTOLOGY OF BRAIN :



- On dorsal surface of cerebral hemisphere, gray matter becomes more thick, this thick layer of gray matter is known as **Cerebral cortex/Neopallium/Pallium**.
- Outer part of cerebellum is made up of gray matter while inner part is white matter.
- White matter projects outside & forms a branched tree like structure known as **Arbor Vitae**.

Choroid plexus : Tela choroidea (Part of Piamater)

+

Blood capillaries + Ependymal Epithelium

Site : Two major plexuses in Lateral ventricles.

2 minor plexuses in IIIrd ventricle

1 minor plexus in IVth ventricle

Function : Formation of CSF by secretion of plasma

Sometime (Congenitally or infection) Iter or aqueduct become blocked therefore improper circulation of CSF or blockage of CSF circulation occur and Intracranial pressure increases, head becomes enlarged, this condition called **Hydrocephalus**.

Cerebrospinal-fluid (CSF) :

This fluid is clear and alkaline in nature just like lymph.

It has protein (Albumin, globluin), glucose, cholesterol, urea, bicarbonates, sulphates and chlorides of Na, K. **Protein & cholesterol concentration is lesser than plasma & Cl^- conc. is higher than plasma.**

- In a healthy man, in 24 hrs, 500 ml of C.S.F. is formed & absorbed by arachnoid villi. At a time total volume of C.S.F. is 150 ml.
- CSF is present in ventricle of brain, subarachnoid space of brain & spinal cord.

Formation : Mainly in choroid plexus of lateral ventricles, minor quantity is formed in IIIrd ventricle & IVth ventricle.

Collection of CSF for any investigation is done by lumbar puncture (L.P.). It is done at **L_3–L_4 region.**

Spinal anaesthesia is also given by L.P.

Functions of C.S.F. :

- Protection of Brain : It act as shock absorbing medium and work as cushion.
- It provides buoyancy to the brain, so net weight of the brain is reduced from about 1.4 kg to about 0.18 kg.
- Excretion of waste products.
- Endocrine medium for the brain to transport hormones to different areas of the brain.

Circulation : From the ventricles CSF comes into subarachnoid space through **foramen of Magendie & foramen of Luschka.**

In subarachnoid space, CSF is absorbed by arachnoid villi which pour it into cranial venous sinus. From venous sinus CSF enters in blood circulation.

C.S.F. Circulation

Choroid plexus ⟶ Lateral ventricle ⟶ Foramen of Monro ↓ Diocoel ↓ Iter ↓ IV^{th} ventricle ↓ Metacoel ↓ Foramen of Magendie and Foramen of Luschka ⟵ Arachnoid space ⟵ Arachnoid villi ⟵ Cranial venous sinus ⟵ Blood circulation

SPINAL CORD :

- Medulla oblongata comes out from foramen of magnum & continues in neural canal of vertebral column, the continued part of MO is known as Spinal cord.

  It extends from base of skull to lower vertebra of lumbar. (L_1)

- Its upper part is wide while lower most part is narrow known as **conus-medullaris**.

  Conus medullaris present **upto L_1 vertebra**.

  Terminal part of conus medullaris extend in the form of thread like structure made up of fibrous connective tissue caled **filum terminale**.

- Filum terminale is **non-nervous part**

  Metacoel also continues in spinal cord where it is known as **neurocoel or central canal**.

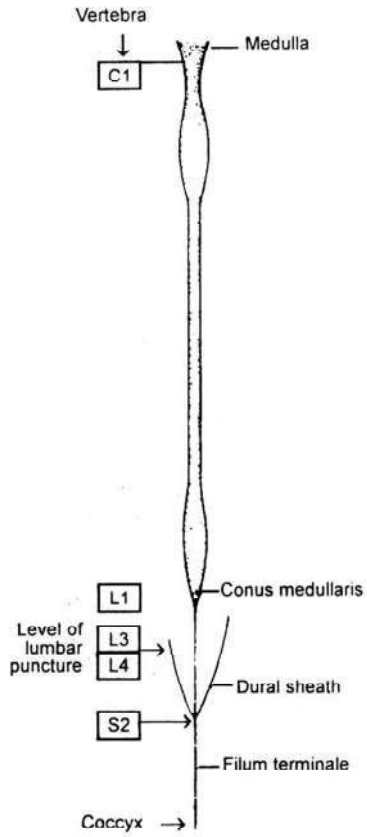
- Spinal cord is also covered by Duramater, Arachnoid & piamater.

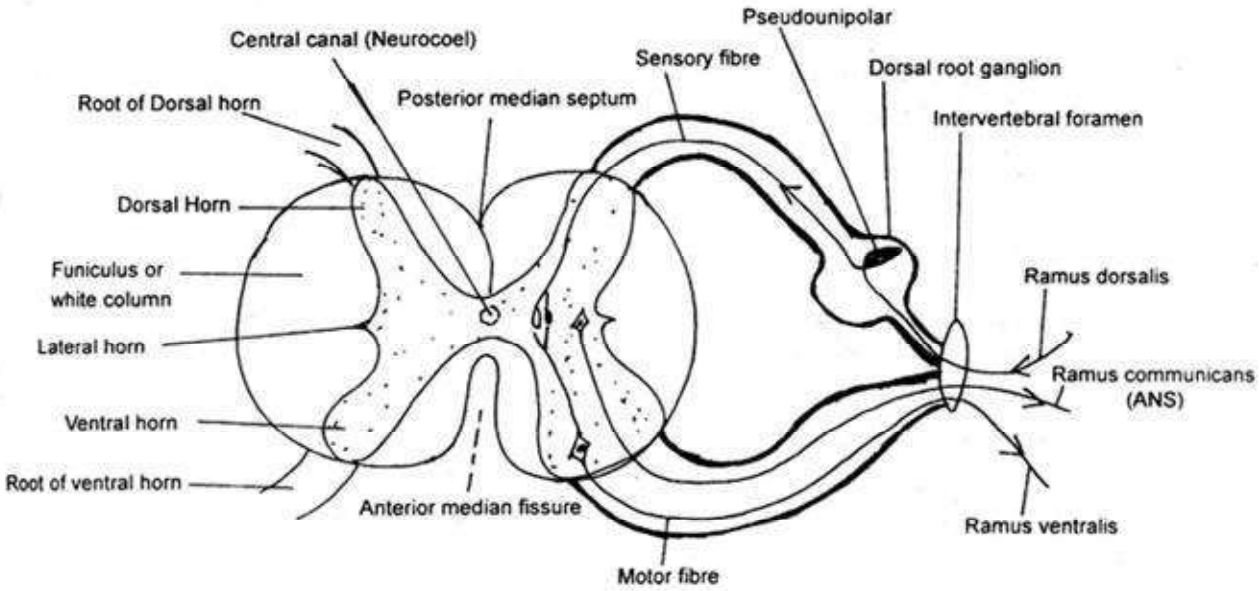
A narrow space is found between vertebra & duramater known as **Epidural space**.

Length of spinal cord is **45 cm**.

Length of filum terminale is **20 cm**.

Weight of spinal cord is approximately **35 gm**.





Transverse section of spinal cord

- The outer-part of spinal cord is of white matter while inner-part contain gray matter.
- On the dorso-lateral & ventro-lateral surface of spnal cord, the gray matter projects outside & forms the one pair dorsal & ventral horn.
- Due to formation of dorsal & ventral horn white matter is divided in 4 segments & segment is known as **Funiculus of white column**.
- Dorsal & ventral horn continue in a tube like (bundle of never fibres) structure known as **root of Dorsal & Ventral Horn**. In root of dorsal horn, ganglia is present called **Dorsal root ganglia**.
- Both roots are combined with each other at the place of **intervertebral foramen**.
- Sensory neurons are found in the dorsal root ganglia which is **pseudounipolar** in nature.
- Motor neurons are found in the ventral roots. Cyton is found in ventral horn while its dendrons are embedded into gray matter of spinal cord where they make synapse with axon of sensory neuron.
- Axon of motor neuron extends upto interverbral foramen.
- Both sensory & motor nerve fibers combindly come out from intervertebral foramen & form spinal nerve.
- In some part of spinal cord on both side.
- Lateral horns are also found & lateral horn cell, are found in these horn, there nerve fibre come through ventral root & futher come into intervertebral foramen. These fibre called **Ramus communicans**.
- The group of spinal nerve at the terminal end (L_1) of spnial cord form tail like structure called cauda equina (horse tail).
- **Ramus communicans foms ANS.**
- **Spnial nerve & its branches are mixed type except Ramus communicans.**

FUNCTIONS OF SPINAL CORD :

(1) It acts as bridge between brain & organs of the body.

(2) It also provides relay path for the impulses coming from brain.

(3) Spinal cord regulates and conducts the reflex action.

PERIPHERAL NERVOUS SYSTEM :

- All the nerves arising from brain and spinal cord are included in peripheral nervous system.
- Nerves arising from brain are called **cranial nerves**, and nerves coming out of spinal cord are called **spnial nerves**.
- 12-paris of cranial nerves are found in reptlies, birds and mammals but amphibians and fishes have only **10 – pairs** of cranial nerves.
- In human, I, II and VIII cranial nerves out of 12-paris of total cranial nervges are pure sensory in nature.
- III, IV, VI, XI and XII cranial nerves are motor nerves and V, VII, IX & X cranial nerves mixed type of nerves.
- Fibres of autonomous nervous system are found in III, VII, IX & X cranial nerves.
- Longest cranial nerve is Vagus nerve.
- Largest cranial nerve is Trigeminal nerve.
- Smallest cranial nerve is Abducens cranial nerve.

Table : Summary of the Human Cranial Nerves

No.	Name	Origin	Distribution	Nature	Function
I.	Olfactory	Olfactory Epithelum	Enters Olfactory lobe, Extends to temporal lobe	Sensory	Small
II.	Optic	Retina	Leads to occipital lobe	Sensory	Sight
III.	Oculomotor	Midbrain	Four eye muscles	Motor	Movement of eyeball
IV.	Trochlear (Pathetic)	Midbrain	Superior oblique eye muscle	Motor	Movement of eyeball
V.	Trigeminal (Dentist nerve) (i) Opthalmic (ii) Maxillary (iii) Mandibular	Pons – – –	– Skin of nose, upper eyelids, forehead, scalp, conjunctiva, larchymal gland. Mucous membrane of cheeks and upper lip and lower eyelid. Lower jaw, lower lip, pinna	Mixed Sensory Senory Mixed	 Sensory supply to concerning part – Muscle of Mastication
VI.	Facial	Pons	Face, neck, taste buds, salivary gland	Mixed	Taste (ant' 2/3 part of Tongue) Facial expression saliva secretion.
VIII.	Auditory (i) Cochlear (ii) Vestibular	Pons	Internal ear	Sensory	Hearing and equilibrium.
IX.	Glossopharyngeal	Medulla	Muscles and mucous Membrane o pharynx and tongue.	Mixed	Taste (post^{r} 1/3 part of Tongue) Facial expression saliva secretion.
X.	Vagus (Pneumogastric)	Medulla	Larynx, lungs, heart, stomach, intestine	Mixed	Visceral Sensations and movements.
XI.	Accessory spnial	Medulla	Muscles of pharynx, larynx	Motor	Movement of pharynx, larynx.
XII.	Hypoglossal	Meduula	uscles of tongue	Motor	Movement of tongue

SPINAL NERVES :

- In rabbit, there are 37 pairs of spinal nerves, while in frog there are 9 or 10 pairs of spinal-nerves.
- In Human only 31 pairs of spinal-nerves are found.

– Each spinal nerve is mixed type and arises from the roots of the horns of gray matter of the spinalcord. In dorsal root only afferent or sensory fibres and in ventral root efferent or motor fibres are found.

– Both the roots after moving for distance in the spinalcord of vertebrates combine with each other and come out from the inter verterbal foramen in the form of spinal nerves.

– As soon as the spinal nerves come out of the inter vertebral foramen they divide into 3 branches :

(i) Ramus - dorsalis ←
Somatic nerve
(ii) Ramus - ventralis ←

(iii) Ramus Communicans ➡ **A.N.S.** → Sympathetic nervous system
→ Parasympathetic nervous system

There are 37 pairs of spinal nerves in rabbit. These are divided into 5 groups according to place –

Rabbit

1.	Cervical spinal nerves	–	8 pairs	1	to	–VIII
2.	Thoracic spinal nerves	–	12 pairs	IX	to	–XX
3.	Lumbar spinal nerves [In human → 21 to 25 (5 pair)]	–	7 pairs	XXI	to	–XXVII
4.	Sacral spinal nerves [In human → 26 to 30 [5 pair]]	–	4 pairs	XXVIII	to	–XXXI
5.	Caudal spinal nerves (In human-1 pair coccygeal nerve)	–	6 pairs	XXXII	to	–XXXVII

– Caudal spinal nerves are absent because human is a tailless animal and only 1 pair coccygeal nerve are present.

REFLEX ACTION :

– "Marshal Hall" first observed the reflex actions.

– Reflex actions are spontaneous, automatic, involuntay, mechanical responses produced by specific stimulating receptors.

– Reflex actions are **involuntary actions**. Reflex actions are completed very quickly as comapred to normal actions. **No adverse effect**.

– It is form of animal behaviour in which the stimulation of sensory organ (receptor) result in the activity of some organ without the intervention of will.

Reflex actions are of 2 types :

(A) Cranial reflex :

These actions are completed by brain. No urgency is required for these actions. These are slow actions e.g. watering of mouth to see good food.

(B) Spinal reflex :

These actions are completed by spinal cord. Urgency is required for these actions. These are very fast actions e.g. Displacement of the leg at the time ofpinching by any needle.

Classification of reflex actions on the basis of previous experiences :

(A) Conditioned reflex :

Previous experience is required to complete these actions e.g. swimming, cycling, dancing, singing etc. These actions were actions were studied first by **Evan Pavlov** on dog.

Initially these actions are voluntary at the time learning and after perfection, these becomes involuntary.

(B) Unconditioned reflex :

These actions do not require previous experience e.g. sneezing, coughing, yawning, sexual behaviour for opposite sex partner, migration in birds etc.

REFLEX ARCH :

- The path of completion of reflex actin is called **reflex arch**.
- Sensory fibres carry sensory impulses in the gray matter.

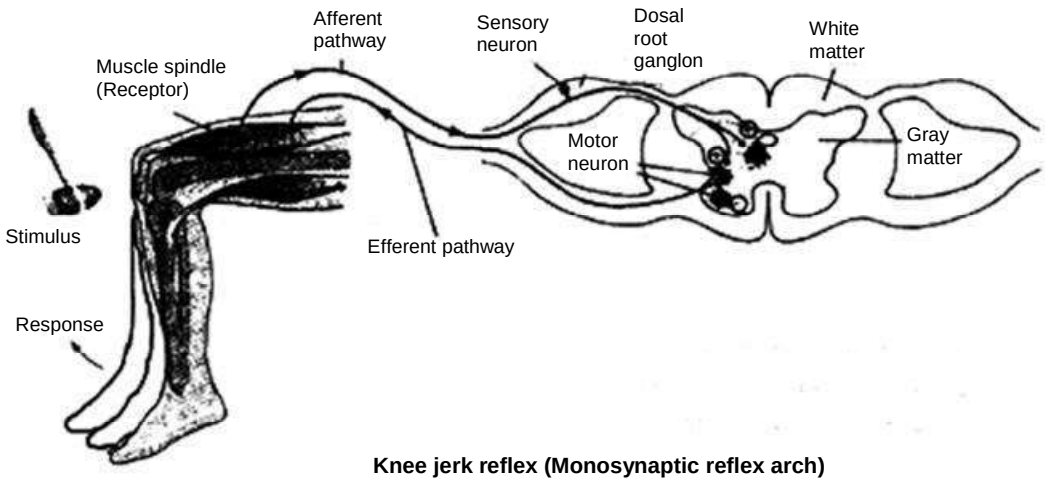
These sensory impulses are converted now into motor impulses and reach up to muscles.

These muscles show reflex actions for motor impulses obtained from motor neurons.

Reflex arch is of two types.

(1) Monosynaptic :

In this type of reflex arch, there occurs direct synapse (relation) between sensory and motor neurons, thus nerve impuse travels through only one synapse. eg.- Stretch reflex.



Knee jerk reflex (Monosynaptic reflex arch)

(2) Polysynaptic :

In this type of reflex arch, there are found one or more small neurons in between the sensory and motor neurons.

These small neurons are called connector neuroun or inter neurons or internuncial neurons e.g. **withdrawal reflex**.

Nerve impulse wil have to travel through more than one synapses in this reflex arch.

With drawal Reflex – Sensory neuron supplied the sensation through dorsal root ganglia & terminal branches of Axon divide in the gray matter & one is supplied agonist muscle & other is supplied antagonist muscle.

EPSP develop in synapse between motor fibre of agonist mucle sensory fibre & due to interconnection of interneuron with antagonist muscle neuron,

IPSP develop in synapse between colateral branch of sensory fibre and antagonist muscle.

Therefore, contraction of agonist muscle and relax the fibre of antagonist muscle.

	Knee jerk reflex	**Withdrawl reflex**
1.	No any involvement of interneuron.	Role of interneuron is important.
2.	It is an example of monosynaptic reflex.	It is an example of polysynaptic reflex.

AUTONOMIC NERVOUS SYSTEM

(1) The autonomic nervous system is that part of the peripheral nevous system which controls acivities inside the body that are normally involuntary, such as heart beat, peristalsis, sweating etc.

(2) It consists of motor neuron passing to the smooth muscle of internal organs.
Smooth muscles are involuntary muscles.
Most of the activties of the autonomic nervous system is controlled within the spinal cord or brain by rreflexes known as visceral reflexes and does not involve the conscious control of higher centres of the brain.

- Overall control of the autonomic nervous system is maintained, however, by centres in the medulla (a part of the hind brain) and hypothalamus.
- These receive and integrate sensory information and coordinate this with information from other parts of the nervous system to produce the appropriate response.
- ANS plays an important role in maintaining the constant internal evironment (homeostasis).
- The autonomic nervous system is composed of two type of neurons, a **preganglionic neuron** (myelinated) which leaves the central nervous systm in the venteral root before synapsing several postganglionic neurons (nonmyelinated) leading to effector (concerning organs).
- **Sites of ANS –**

Involuntary muscles, Exocrine glands, Blood vessels, skin (Pilomotor muscles, Blood vessels, Sweat glands)

There are the two division of the autonomic nervous system the **sympathetic** (SNS) and the **parasympathetic** (PNS).

(i) Sympathetic system is related with such visceral reactons. Which increase the protection of body in adverse atmospheric condictions along with calorie consumption.

(ii) Parasympathetic system is relsated with those reactions in which energy is conserved.

In this way, autonomic nervous system controls the activites of visceral organs double sided i.e. antagonistic to each other.

(a) Sympathetic Nervous system. It is represented by a chain of 21 sympathetic ganglia on either side of spinal cord.

It receives preganglionic sympathetic fibres from the spinal cord which make their exit alongwith thoracic and lumbar nerves and constitue thoraco-lumbar outflow.

These fibres synapse with the neurons present in sympathetic ganglia.

From the sympathetic gangila arise post ganglionic fibres which terminate on the viscera.

Each sympathetic ganglion is connected to the spinal cord by a white communicans and the spinal nerve by a gray communicans.

Some preganglionic fibres pass through the sympathetic chain without synapsing and then join to from splanchnic nerves eminating in some **collateral ganglia** which include a coeliac ganglion, an anterior mesenteric ganglion and a posterior mesenteric ganglion.

The post ganglionic fibres arising from collateral ganglia supply digestive system and urinogential system.

(b) Parasympathetic Nervous system. It consists of preganglionic parasympathetic fibres, parasympathetic ganglia and distganglionic parasympathetic fibres.

Preganglionic parasympathetic fibres make their exit along with the III, VII, IX and X cranial nerves, and II, III, IV scaral nerves.

They together form cranio-sacral outflow.

The parasympathetic ganglia do not form any chains and instead lie on or near the viscera.

The post ganglionic parasympathetic fibres aires from these ganglia and supply the viscera.

The neurotransmitter within the ganglion is **acetylcholine** for both sympathetic and parasympathetic nerves.

However, the neurotransmitter between the terminal autonomic neuronic axon and the target organ is different in the two antagonistic autonomic nervous system.

In the parasympathetic system, the neurotransmitter at the terminal synapse is **acetylchloine**, just as it is in the ganglion.

In the sympathetic system, the neurotransmitter at the terminal synapse is either adrenaline or noradrenaline, both of which have an effect oppsoite to that of acetylcholine.

There is one exception : the sympathetic postanglionic neuron that terminates on the sweat glands, uses **acetylcholine.**

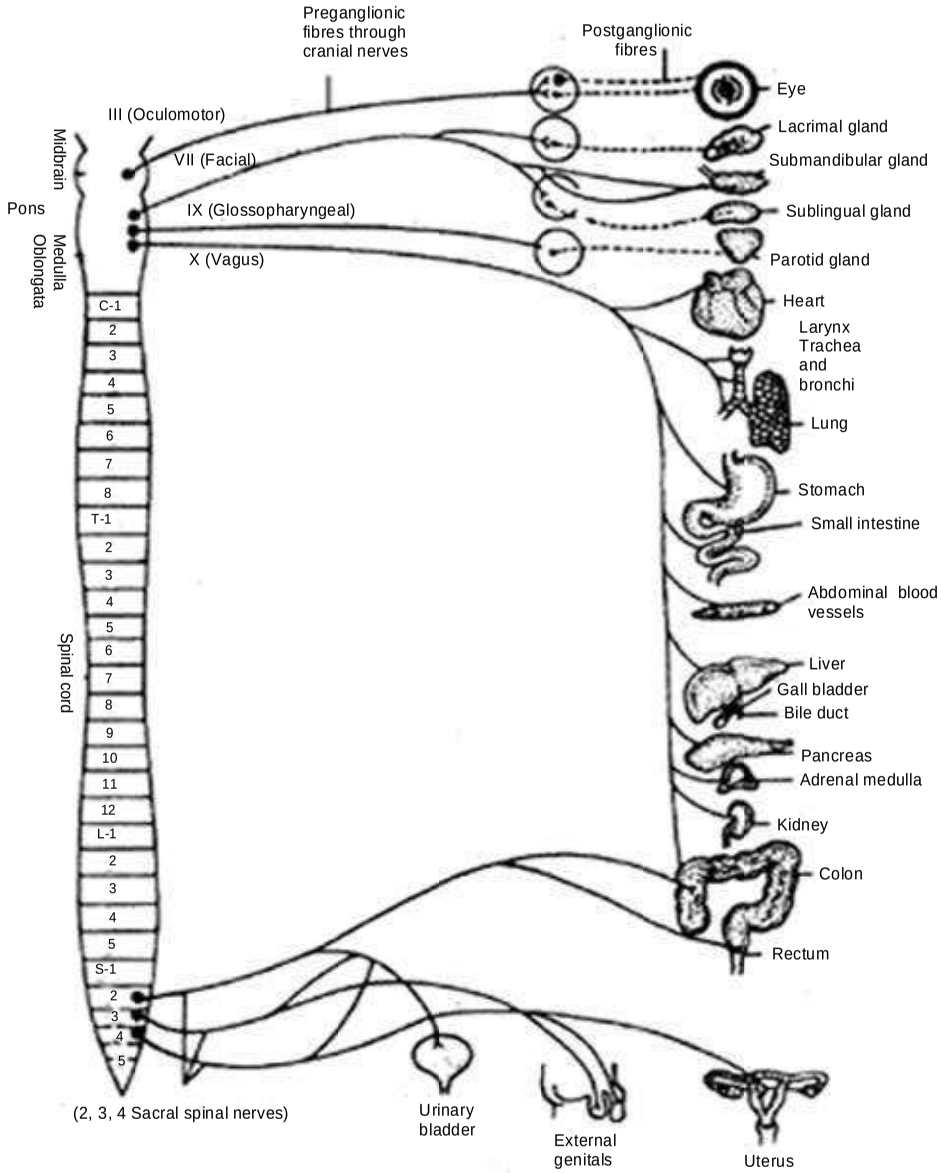
Thus, depnding on which of the two paths is selected by the CNS, an arriving signal will either stimulate or inhibit the organ.

Thus an organ receiving nerves from both nervous system is subjected to the effects of two opposing neurotransmitters.

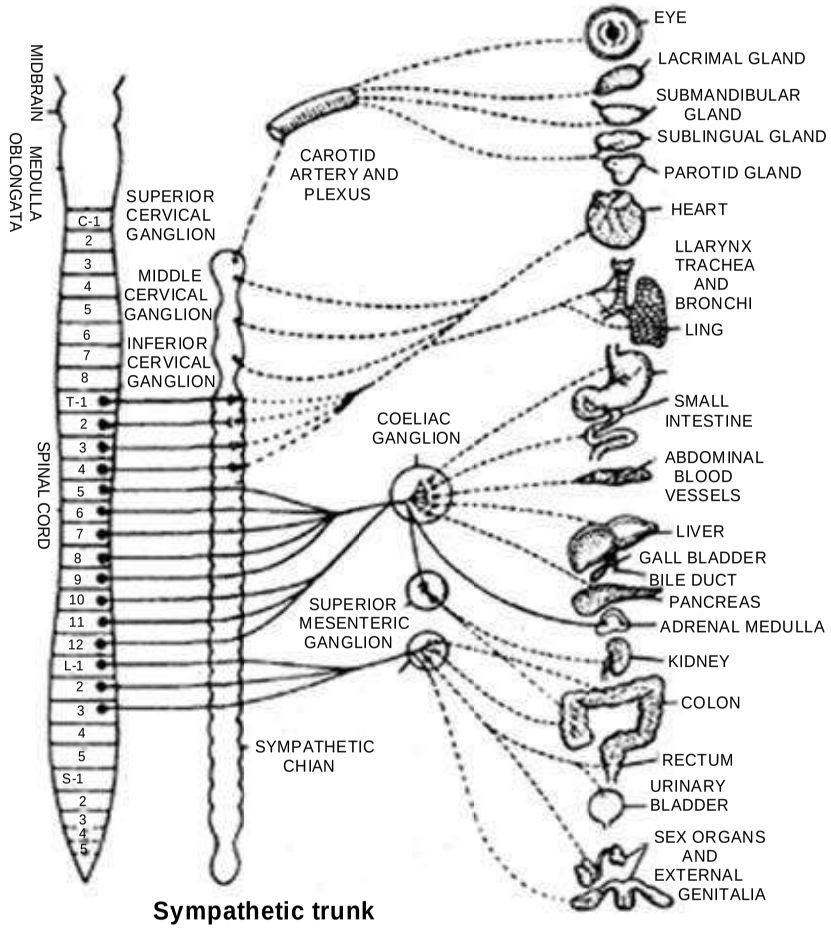
If the sympathetic nerve ending excites a particular organ, the parasympathetic usualy inhibits it.

With few exception, organs of the body are innervated by "dual innervations", and each has a different effect.

Functon of autonomic nervous system is to control and coordinate the activities of visceral organs. The two components work against one another.



Parasympathetic Nervous System



Sympathetic trunk

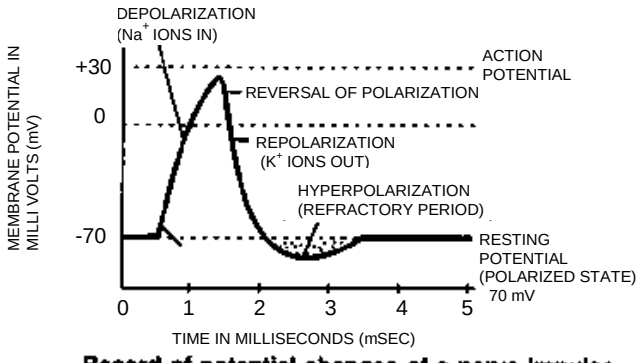
Sympathetic Nervous System

	Sympathetic NS		Parasympathetic NS
1.	Thoracico lumbar outflow (T_1 to L_3) (Ramus communicans of T_1 to L_3)	1.	Cranio sacral outflow (cranial nerves) 3, 7, 9, 10 and sacral's ramus communication 2, 3, 4)
2.	Just lateral to vertebral column sympathetic trunks are there on both sides (each made up of 22 ganglia)	2.	Ganglia are situated separately either near the organ or surface of organ.
3.	Preganglionic nerve fibres (Ramus communicans of spinal nerves) are smaller than post ganglionic nerve fibres (arises from sympathetic trunk or ganglia to organs)	3.	Preganglionic nerve fibres are longer than postganglionic nerve fibres.
4.	Preganglionic nerve fibres ar cholinergic (filled with acetylcholine). and post ganglionic nerve fibres are adrenergic (filled with noradrenaline) except sweat gland which have cholinergic postganglionic nerve fibres.	4.	Both pre and post ganglionic nerve fiber are cholinergic.
5.	Supply (a) **Cervical ganglia** → Head, face (b) **Cervical and thoracic ganglia** → Heart (c) Throacic ganglia → Trachea, bronchi and lungs (d) Preganglionic nerve fibres of abdominal part do not form synapse in sympathetic trunk. They form synapse in prevertebral ganglia (coeliac, superior mesenteric and inferior mesenteric). **Coeliac and superior mesenteric supply** – stomach to proximal colon **Inferior mesenteric asupply** → distal colon, urinogenital organ, rectum and anal canal. **Exception** adrenal medulla receive preganglionic nerve directly. (No any postanglionic fibres)	5.	Supply (a) Cranial nerve iii – iris. ciliary muscles vii – Tear glands, palate, pharynx, submandibular and sublingual glands. ix – Parotid gland, buccal cavity x – Neck to proximal colon. (b) Sacral 2, 3, 4 distal colon, rectum, anal canal and urinogenital organ.
6.	Preganglionic nerve fibres are made up of white ramus communicans and postaganglionic nerve fibres are made up of gray ramus communicans.		

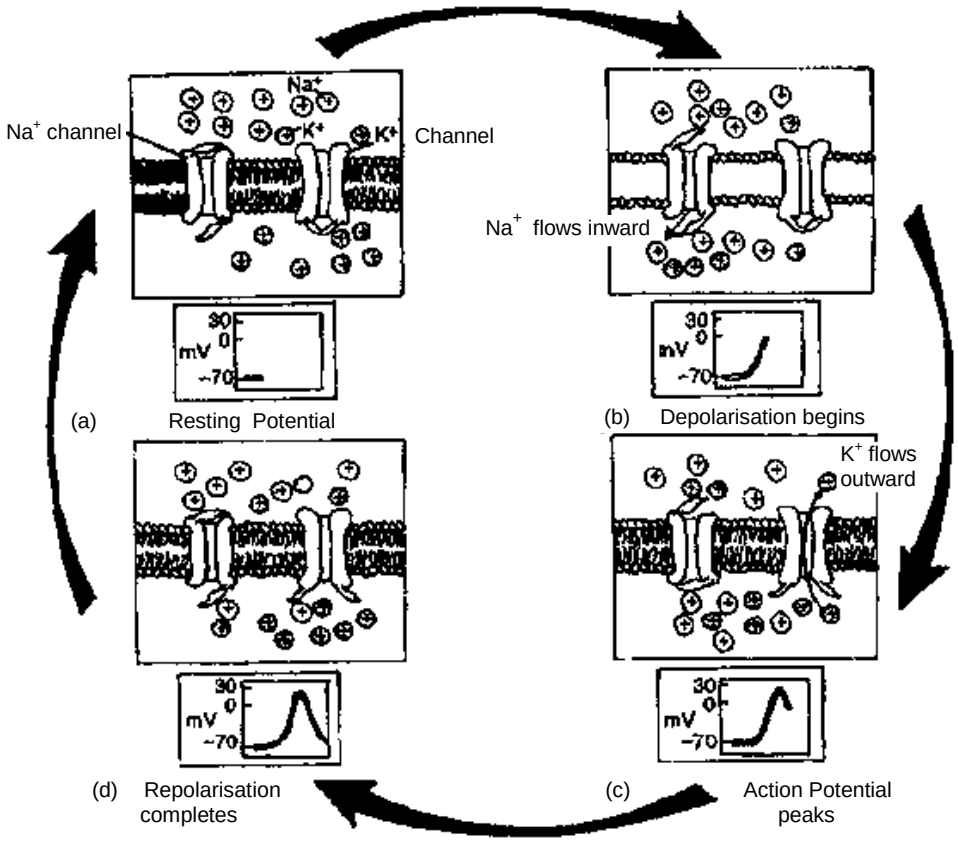
Table of Nervous Control of Visceral Organs

Name of Visceral Organs		Affect of sympathetic nervous system	Affect of parasympathetic nervous system
1.	Secreton	Acetyl chloine + sympathetin	Only acetylcholine
2.	Iris of eye	Dilates pupils	Constricts pupils
3.	Tear glands or lachymal glands	Stimulates secretion of lachrymal glands	Inhibits secretion of lachrymal glands.
4.	Heart	Increases the rate of cardiac contraction i.e. accelrates heart beat	Inhabits the rate of cardiac contrction i.e. retards heart beat.
5.	Secretion of adrenal gland	Stimulates adrenal secretion	Inhibits adrenal secretion.
6.	Salivary secretion	Inhibits the secretion of salivary and digestive glands	Stimulates the secretion of salivary and digestive glands
7.	Blood vessels	Constricts cutaneous blood vessels, which causes increased blood pressure but dilates blood vessels of brain lungs, heart, striated muscles. Incrases RBC count in blood.	Dialte all blood vessels (except coronary vessels) decreasing blood pressure
8.	Lungs, trachea and bronchi	Dilates trachea bronchi & lungs for easy breathing	Constricts these organs during normal breathing.
9.	Alimentary canal	Inhibits peristalsis of alimentary canal.	Stimulates the secretion of the glands
10.	Digestive glands	Inhibits the secretion of these glands	Stimulates the secretion of the glands
11.	Sweat glands	Stimulates secretion of sweat	Inhibits secretion of sweat.
12.	Arrector pilli muscles	Stimulates contraction of these muscles of skin, causing goose flesh	Relaxes Arrector pilli muclses
13.	Urinary bladder	Relaxes the muscles of urnary bladder.	Contracts the muscles for ejaculation of urine Micturition).
14.	Anal sphincter	Closes anus by contracting and sphincters.	Relaxes anal sphincter and opens the anuns (Defaecation)
15.	External genitalia	Ejaculation	Erection
16.	Basal metabolic rate	Accelrates BMR	Retards BMR.

NERVE IMPULSE INDUCTION :



Record of potential changes of a nerve impulse



Stages in axon membrane potential during resting, depolarisation, action potential and repolarisation

The resting membrane potential in resting phase :

⇒ The potential difference (a charge) which exists across the cell surface membrane of nerve cells is always, negative inside the cell with respect to the outside. The membrane is said to be **polarised**.

⇒ The potential difference across the membrane at rest is called the **resting membrane potential** and this is about – 70mV (the negative sign indicates that inside the cell is negative with respect to the outside). (Range → – 60 to – 85 mV)

⇒ The resting potential is maintained by active transport and passive diffusion of ions.

⇒ Resting membrane potential is maintained by the active transport of ions against their electrochemical gradient by **sodium potassium pump**.

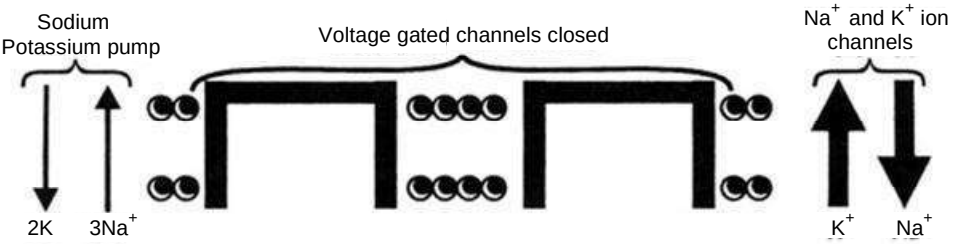
There are **carrier protein** located in the cell surface membrance. They are driven by energy supplied by ATP and couple the removal of three sodium ions from the axon with the uptake of two potassium ions.

The rate of diffusion is determined by the permeability of the axon membrane to the ion.

Potassium ions have a membrane permeability greater than that of sodium ions. Therefore potassium ions loss from the axon is greater than sodium ion gain. This leads to a net loss of potassium ions from the axon, and the production of negative charge within the axon (organic anions).

Due to active transport (mainly) and diffusion process, positive charge is more outside and negative charge is more inside.

Outer covering of axolemma is positively charged and inner membrane of axolemma is negatively charged.



Depolarisation and Action potential :

Once the event of depolarization has occured, a nerve impulse or spike is initiated.

Action potential is another name of nerve impulse.

This is generated by a change in the sodium ion channels. These channels, and some of the potassium ion channels, are known as voltage gated channel, meaning they can be opened or closed with change in voltage.

In resting state these channels are closed due to binding of Ca^{++}.

An action potential is generated by sudden opening of the sodium gates. Opening of gates increases the permeability of the axon membrane to **sodium ions** which enter by diffusion.

This increases the number of positive ions inside the axon.

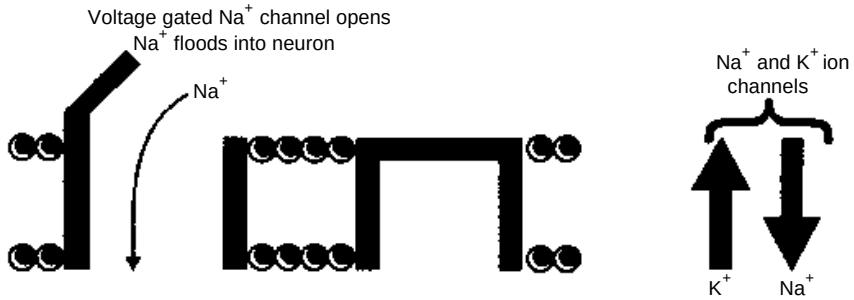
A change of –10mV in potential difference from RMP through influx is sufficiently significant to trigger a rapid influx of Na^+ ions leading to generation of action potential.

This change of –10 mV is called as **threshold stimulus**.

At the point where membrane (Axolemma) is completely depolarised due to rapid influx of Na^+ ions, the negative potential is first cancelled out and becomes 0 (Depolarisation). This axolemma is called as **excited membrane or depolarised membrane**.

Due to further entry of Na^+, the membrane potential "over shoots" beyond the zero and becomes positive upto + 30 to + 45mV.

This "over shoot" peak corresponds to maximum concentration of sodium inside the axon. This potential is called as **action potential or spike potential**. In this state, the inner surface of axolemma becomes positively charged and outer surface becomes negatively charged.



Repolarisation :

⇒ After a fraction of second i.e., 0.5 m.sec, the sodium gates closed, Depolarisation of the axon membrane causes potassium gates to open, potassium therefore diffuse out of cell.

⇒ Since potassium is positively charged, this makes the inside of cell less positive, or more negative and the process of repolarization or return to the original resting potential begins.

⇒ The repolarization period returns the cell to its resting potential (–70 mV). The neuron is now prepared to receive another stimulus and conduct it in the same manner.

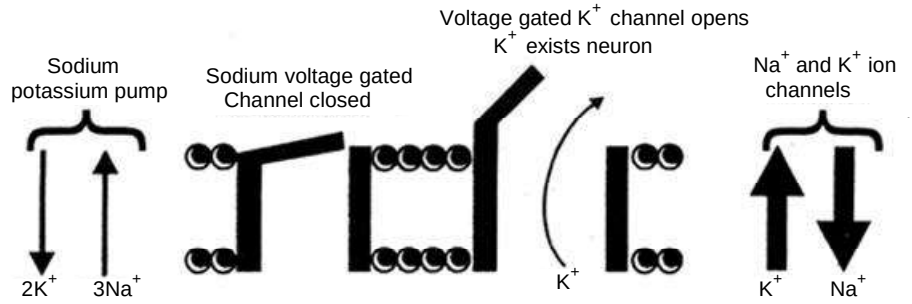
⇒ At this point membrane show hyper polarization.

⇒ Sodium pump starts working to maintain the normal resting membrane potential by expelling Na^+ and in take of K^+.

The time taken for restoration of resting potential is caled **refractory period**, because during this periods the membrane is incapable of receiving & conduicting another impulse.

⇒ Nerve impulse travels as action potential which passes along axon as a wave of depolarization.

⇒ The whole process of depolarisation and repolarisation is very fast. It takes only about **1 to 5 milli second (ms)**.



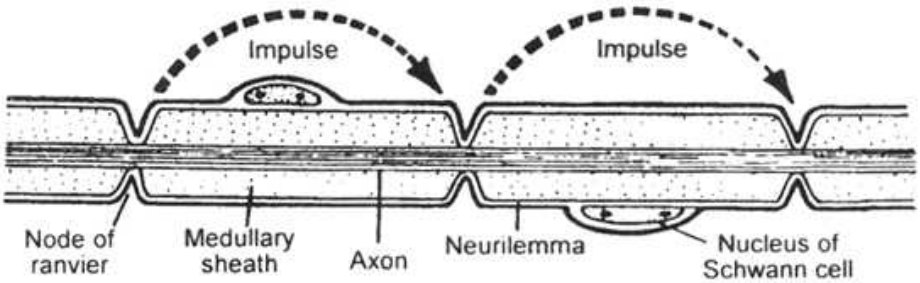
Physiology of Nerve

Process	Na^+ K^+ pump	Passaive diffusion	Na^+ C	K^+ GC	Potential with value	Inside Charge
Polarisation	✓	✓	×	×	RMP (–60 to –85 mv)	Negative
Depolarisation	×	✓	✓	×	AP (overshoot value) (+ 30 to + 45 mv)	Positive
Repolarisation	✓	✓	×	✓	–	Negative
Hyperpolarisation	✓	✓	×	✓	– 90 mV	Negative

Open/Operating → ✓ Closed → ×

Saltatory conduction of nerve impuse :

⇒ This type of conduction occur in **myelinated fibre**. Myelin is fatty material with a high electrical resistance and act as electrical insulator in the same way as the rubber and plastic covering of electrical wiring.



– The combined resistance of the axon membrane and myelin sheath is very high, but where breaks in the myelin sheath occur known as **nodes of Ranvier**, the resistance to current flow between the axoplasm and the fluid outside the cell is low. It is only at these nodes local circuits are setup.

– This means, in effect that the action potential jump from node to node and passes along the myelinated axon faster as compared to the series of small local circuits in a non-myelinated axon. This type of conduction is called **saltatory conduction**.

– Leakage of ions takes place only in nodes of Ranvier and less energy is required for saltatory conduction.

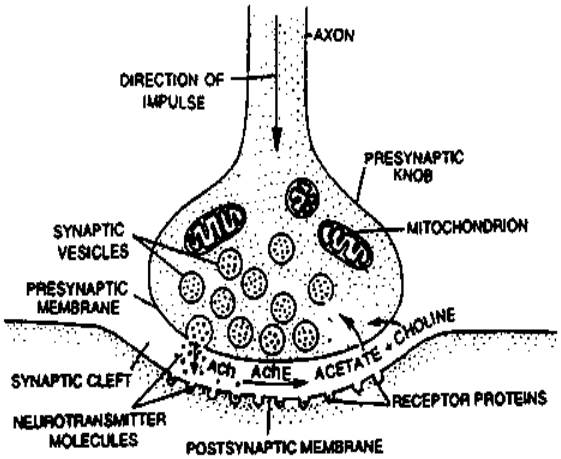
Synaptic Transmission

Telodenria of one neutron form synapse with dendron of next neuron.

It is the junction between two neurons where information is transferred from one neutron to another neuron but no protoplasmic connection.

Synapse = Pre synaptic knob + synaptic cleft + post synaptic membrane

- Telodendria membrane is called **pre synaptic membrane** & membrane of dendron of other neuron called as **post synaptic membrane**. Space between pre and post synaptic membranes is called **synaptic cleft**.
- When the AP develop in pre synaptic membrane. it becomes permeable for Ca^{++}.
- Ca^{++} enter in pre synaptic membrane & vesicles burst due to the stimulation by Ca^{++} and causes release of neurotransmitters (Ach) in synaptic cleft.
- Ach reaches the post synaptic membrane via synaptic cleft & bind to receptors. It develops **excitatory post synaptic potential (EPSP)**. EPSP develop due to opening of Na^{+} gatted channnels.



Transmission of nerve impulse at a chemical synapse

- Cholinesterase enzyme is found in the synaptic fluid of synapse.
- This enzyme decomposes the Ach into choline & Acetate.
- Neuro inhibitory transmitter (GABA) binds with post synaptic membrane to open the Cl^{-} gated channels and hyperpolarization of neutron occurs. Now the potential is called **inhibitory post synaptic potential (IPSP)** & further nerve conduction is blocked.

Physiological properties of nerve fibre are detected by cathode ray oscilloscope :

Type of synapse :

(i) Axodenritic – b/w axon & dendron
(ii) Axosomatic – b/w axon & cyton
(iii) Axoaxonic – b/w axon & axon

SYNAPSE :

	Electrical	Chemical
Conduction	Fast	Slow
Synaptic cleft	Upto 0.2 nm	Upto 20 nm
Neutrotransmitter	Absent	Present
Synaptic delay	Absent	Present
Blocking	Can not be controlled	Controlled by neutrotransmitter

Name synapse was proposed by Charles Sherrington

Neuron conducts the impulse in the form of electro chemical wave.

- Conduction of nerve impulse is unidirectional.
  It follow **all or none law**. Magnitude of response will always be same irrespective of strength of stimulus above threshold stimulus.
- Velocity of nerve impuse $\propto$ Diameterof neuron.
- In mammals, the velocity of nerve impulse is **100 to 130 meter/sec.**
- This velocity is affected by physical & chemical factor, such as pressure, cold, heat, chloroform and ether etc.

Special Points

1. In the brain of **frog** only 2 shkull meninges are presnt. The middle meninge that is the Archnoid is absent.
2. In rabbit, man and mammals-**3** skull menninges are present.
3. Increase in the amount of cerebro-spinal fluid is diseased condition termed as the **Hydrocephalus**.
4. "**Meningitis**". It arises due to infection or inflamation on injury in the meninges. Infection may be due to virus or bacteria or both.
5. Piamater is the most vascular and conducting and provides nutrition.
6. The power of regeneration is very less in a neuron.
7. The optic lobes of frog are hollow and in them **optocoel** cavity is found.
8. In frog, 2 optic-lobes are present. These are hollow and termed as **Corpora-bigemina**. In mammals, 4 solid optic-lobes are present.
9. Around the brain of fishes, only one menix is found called : **Menix-primitiva**".
10. The **vlave of vieussens** joins the optic-lobes with the cerebellum.
11. Cerebral-cortex is made up of gray – matter and is divided into 3 area -
    (i) Sensory area (ii) Motor area (iii) Associated area
12. The sensory and associated areas determine the **shape, colour, sound, taste** and **smell of any object**.
13. Motor area regulaters **muscular-contraction**.
14. **Broca's area :** It is known as motor speech area.
15. Broca's area is present in the lateral part of the **frontal-lobe** of the cerebrum. This area makes aware of language; and **translates the written words into speed**.
16. If Broca's area are gets destroyed the animal beecomes unable to speak.
17. The temporal-lobes of cerebrum regulates the mechanism of hearing.
18. Cerebrum is the centre of following :
    (1) Intelligence (2) Emotion (3) Will-power (4) Memory
    (5) Consciousness (6) Experience (7) Knowledge
    (8) Voluntary control (9) Laughing and weeping (10) Defaecation and micturition.

19. Diencephalon is the centre of carbohydrate – metabolism and fat-metabolism.
20. In rabbit, "**Swammerdam's gland**" are absent. These glands are presenet at the origin place of spinal nerves in vertebrates & present in frog. It provide extra supply of Ca^{++} for synaptic transmission.
21. Cerebellum made up of three layers and in the middle of cerebellum of brain lobes of flask-shaped cells are found called the "**Purkinje-cells**".
22. In the nerve-cells, "centrosome" are absent so once formed in developement, the nerve-cells do not divide and **remain in Inter-phase stage** throughout their life : and grow in size with the growth of the body.
23. The velocity of nerve-impulse is 5 to 50 times more faster in Myelinatd nerve-fibres than in Non-myelinated nerve-fibres.
24. In mammals the speed of nerve impuse is **100-130** m/sec (maximum). In frog, the speed of nerve impulse is 30 m/sec. In reptiles the speed is **15** to **35** m/sec.
25. Acetylcholinesterase enzyme helps in the dissociation of Acetylcholine.
26. In the form of inhibitory neuro-hormons, - GABA are present.
    GABA – gamma amino butyric – acid.
27. Acetylcholine is synthesized by the Mitochondria.
28. For the conduction of nerve-impulses, $\mathbf{Na^{+}}$ is necessary.
29. The marking of brain waves is donie through **E, E, G** i.e. Electro-encephalo gram.
30. In embryonic – stages inside the brain the layer of grey-matter is towards inside and that of white-matter is towards outside.
    In adults, this arrangement continues in the spinal-cord but during the development of the wall of the brain the gray-matter is transferred outside.
31. In 1 minute **750 ml** of blood is conducted to the human-brain.
32. Corpus callosum is the largest commissure of the brain.
33. Largest cranial venous sinus is **cavernous venous sinus** which is situated in the middle cranial fossa.
34. All preganlionic-sympathetic nerve fibre are myelinated while post ganglionic nerve fibre are non myelinated.
35. In PNS myelinogenesis process is occurs by neurilemma (Schwan cells) while in CNS myelinogenesis process is occurs by oligodendrocytes (Neugroglia).
36. **Alzheimer's disease** – In this disease, the cerebral cortex is atrophied and ultimately the ventricle enlarges. Symptoms consist of memory particulary recent memory. Alzheimer disease is more common in down syndrome.
    Treatment – No effective treatement.
37. **Stroke** – May be caused by haemorhage into the brain.
    Symptoms – Unconsiousness.
    Treatment – Intra venous tissue plasminogen activator.
38. **Epilepsy** – Epilepsy is characterized by short, recurrent periodic attack of motor, sensory or opshychological malfunction.

Cause – due to abnormal discharge of cerebral neurons.

Symptons – seizures, unconsiousness, Involuntary contraction of muscle.

Treatment – Anti epileptic drugs.

39. In human brain more than 100 billion neurons are present.
40. Each neuron cell connect with 25,000 other cell.
41. Phrenic nerve is branch of cervical plexues which supply diaphragm.
42. **Malathione :** This substance is used as insecticide and it destroy the acetyl cholinesterease in synapse area.
43. **Botulism :** It is food poisoning disease and it produces by *Clostridium botulinum* bacteria. This bacteria release neurotoxin.
44. **Curare :** is drug blocks acetylcholine receptor on skeletan muscle, so that it can be used by surgeon for keeping a muscle relaxes during operation.
45. Corpus striatum regulates planning and execution of stereotyped movement.
46. The region between the thalamus and spinal cord is referred to as **brain stem**.
47. All impulse traversing a given neuron have the same amplitude, differing only in the frequency of impulse.
48. **Glycine** is neuro inhibitory hormone present in spinal cord.
49. **Glutamate** is excitatory amino acid.
50. Trigeminal nerve is also called " **the dentists nerve**" because the denstists desensitizes this nerve with some anaesthetic before pulling out the troubling tooth.

EXERCISE – 1

Q.1 Which cranial nerves are sensory :–
(1) 1, 2, 8 (2) 3, 4, 6, 11, 12
(3) 5, 7, 9, 10 (4) None of them

Q.2 GABA (gama amino butyric acid) is a :–
(1) Inhibitory neurohumor
(2) Neuro humor
(3) Anti coagulant
(4) None

Q.3 Nissl-bodies found in neurons are :–
(1) Made of DNA
(2) Masses of ribosome and RER
(3) Help in formation of neurofibrils
(4) Masses of mitochondria

Q.4 Control centre of autonomic nervous system :
(1) Diencephalon (2) Hypothalamus
(3) Optic thalami (4) Cerebrum

Q.5 Voluntary activities of body are controlled by :–
(1) Diencephalon (2) Cerebrum
(3) Crura cerebri (4) Cerebellum

Q.6 Nerve fibers of autonomic nervous system run between :–
(1) Receptors and C.N.S.
(2) C.N.S. and effector
(3) Receptor – C.N.S. – effector
(4) None

Q.7 The nervous system is derived from :–
(1) Ectoderm (2) Endoderm
(3) Mesoderm (4) Ecto and Mesoderm

Q.8 Epiphysis and Hypophysis are found attached with–
(1) Fore brain (2) Mid brain
(3) Hind brain (4) None of the above

Q.9 The nerves connected to receptor are called:–
(1) Afferent (2) Efferent
(3) Motor (4) Spinal

Q.10 The number of brain meanings in fishes, amphibians and mammals are respectively :–
(1) 1, 2, 3 (2) 3, 3, 3
(3) 1, 3, 3 (4) 2, 2, 3

Q.11 Foramen of monro is a aperture in :–
(1) Heart (2) Brain
(3) Cranium (4) Eye

Q.12 Ventral root of spinal nerve has :–
(1) Sensory fibers
(2) Motor fibers
(3) Sensory and motor fibers both
(4) None

Q.13 Posterior choroid plexus in brain is found in the wall of :–
(1) Diencephalon (2) Cerebrum
(3) Cerebellum (4) Medulla

Q.14 Which is a solid part of mammalian brain :–
(1) Optic lobes (2) Pons varoli
(3) Cerebellar hemisphere
(4) All the above

Q.15 The cavity of brain is lined by :–
(1) Neural epithelium
(2) Ependymal epithelium
(3) Cerebrospinal fluid
(4) Glandular epithelium

Q.16 Smallest cranial nerve is :–
(1) X-cranial nerve (2) VI-cranial nerve
(3) VII-cranial nerve (4) II-cranial nerve

Q.17 The dorsal wall of cerebrum is very thick and called–
(1) Gyri and Sulci (2) Dura mater
(3) Neopellium (4) Carpus callosum

Q.18 "Filum terminale" is :–
(1) Non-nervous terminal part of spinal cord
(2) Nervous terminal part of spinal cord
(3) Terminal end of cranial nerves
(4) Terminal part of brain

Q.19 Some scientist claim the presence of centrioles in neurons, helps in :–
(1) Cell division
(2) Formation of neurofibrils
(3) Formation of neurites
(4) Formation of cilia

Q.20 "Aque duct of sylvius" found in :–
(1) Heart (2) Eye (3) Brain (4) Ear

Q.21 Cerebral hemispheres of mammals consist of
(1) Outer gray matter and central white matter
(2) Outer white matter and central gray matter
(3) Gray matter and white matter inter mingled
(4) Gray matter only

Q.22 Meninges surrounding the brain of Rabbit from outside to inside are :–
(1) Duramater, arachnoid, piamater
(2) Piamater, arachnoid, duramater
(3) Duramater, piamater, arachnoid
(4) Piamater, duramater, arachnoid

Q.23 Glands of swammerdams are associated with
(1) Nervous system (2) Muscles
(3) Bones (4) All of the above

Q.24 Impulse for voluntary forced breathing starts in:–
(1) Spinal cord (2) Medulla oblongata
(3) Cerebral hemisphere (4) Vagus nerve

Q.25 Tongue is under the control of which nerve :–
(1) Vagus (2) Trigeminal
(3) Glossopharyngeal (4) Both 2 & 3

Q.26 Purely motor cranial nerve includes :–
(1) I, V, VII (2) I, II, IV
(3) III, IV, VI, XI (4) None of these

Q.27 Corpus callosum connects :–
(1) Two cerebral hemisphere
(2) Two optic lobes
(3) Two olfactory lobes
(4) Optic chiasma

Q.28 Cavity in spinal cord is called :–
(1) Entero coel (2) Blasto coel
(3) Schizo coel (4) Neuro coel

Q.29 "Foramen of monro" is an aperture found between
(1) Third ventricle and forth ventricle
(2) Diocoel and metacoel
(3) Brain and spinal cord
(4) Lateral ventricle and third ventricle

Q.30 If heart is stimulated through its vagus supply heart rate will :–
(1) Decrease (2) Increase
(3) Show no change (4) None

Q.31 Parasympathetic system increase activity of
(1) Lachrymal gland, sweat gland, arrector pili
(2) Heart, lachrymal gland, pancreas
(3) Heart, adrenal gland and sweat gland
(4) Gut, iris and urinary bladder

Q.32 Hearing is controlled by :–
(1) Cerebral hemisphere
(2) Temporal lobes
(3) Cerebellum (4) Hypothalamus

Q.33 Conditioned reflex was first explained by :–
(1) Funk (2) Karl von frich
(3) Pavlov (4) William harvey

Q.34 Which nerve is purely motor :–
(1) Abducens (2) Trigeminal
(3) Olfactory (4) Vagus

Q.35 The III, VI and XI cranial nerve in mammals are respectively :–
(1) Occulomotor, abducens and hypoglossal
(2) Occulomotor, abducens and spinal accessory
(3) Trochlear, facial and spinal accessory
(4) Trigeminal, abducens and vagus

Q.36 Heart is innervated by :–
(1) Vagus (2) Trigeminal
(3) Facial (4) Glossopharyngeal

Q.37 Which part of brain is responsible for hearing
(1) Cerebrum (2) Cerebellum
(3) Medulla (4) Hypothalamus

Q.38 Brain of rabbit differs from that of frog in having
(1) Large olfactory lobe
(2) Small hypothalamus
(3) Small cerebellum
(4) Corpus callosum

Q.39 Outer most covering of brain is called :–
(1) Choroid (2) Duramater
(3) Piamater (4) Arachnoid

Q.40 Which of the following processes occur only in animals :–
(1) Hormonal control (2) Respiration
(3) Nervous control (4) Nutrition

Q.41 Thermo regulatory center in human brain is :–
(1) Pituitary (2) Diencephalon
(3) Hypothalamus (4) None

Q.42 Number of spinal nerves in man :–
(1) 31 pairs (2) 32 pairs
(3) 12 pairs (4) 37 pairs

Q.43 Cerebellum of brain is concerned with :–
(1) Balancing during sitting
(2) Coordination of muscular movements
(3) Balancing during active movement
(4) Initiation of muscular contraction

Q.44 Number of cranial nerves in rabbit :–
(1) 12 pairs (2) 10 pairs
(3) 11 pairs (4) 9 pairs

Q.45 Which nerve originates from medulla oblongata:–

(1) Optic (2) Occulomotor

(3) Vagus (4) Acoustic

Q.46 Difference between brain of rabbit and that of frog is–

(1) Presence of corpus callosum

(2) Corpus albicans

(3) Four optic lobes

(4) All of these

Q.47 Total number of spinal nerves in frog are :–

(1) 31 pair (2) 37 pair

(3) 10 pair (4) 12 pair

Q.48 Largest cavity in brain is called :–

(1) Diocoel (2) Paracoel

(3) Metacoel (4) Rhinocoel

Q.49 Saltatory conduction occurs in :–

(1) Non-myelinated fibers

(2) Myelenated fibers

(3) Both of them

(4) None of them

Q.50 Which is the function of parasympathetic nervous system :–

(1) Pupil constriction

(2) Acceleration of heart beat

(3) Stimulation of sweat gland

(4) Contraction of hair muscles

Q.51 The most common chemical substance which take part in synaptic transmission is :–

(1) Adrenaline (2) Epinephrine

(3) Colchicine (4) Acetylcholine

Q.52 Which cell in our body is more than a foot long-

(1) Nerve cell (2) Muscle cell

(3) Bone cell (4) Gland cell

Q.53 "Purkinje cells" occurs in :–

(1) Brain (2) Heart

(3) Liver (4) Muscles

Q.54 Second cranial nerve is distributed in :–

(1) Lens and retina

(2) Eye muscles and retina

(3) Retina alone

(4) Irish and eye-muscles

Q.55 In rabbit autonomic nervous system is composed of–

(1) Sympathetic and parasympathetic nerves

(2) Cranial and spinal nerves

(3) Brain and spinal nerves

(4) Medullated and non-medullated nerves

Q.56 How many pairs of cranial nerves are purely sensory –

(1) Two (2) Three

(3) Four (4) Five

Q.57 Optic nerve is the :–

(1) Fifth cranial nerves

(2) Second cranial nerve

(3) Seventh cranial nerve

(4) Ninth cranial nerve

Q.58 Number of cranial nerve in frog is :–

(1) Ten only (2) Ten pairs

(3) Twenty pairs (4) Twelve pairs

Q.59 Drinking of alcohol affects :–

(1) Cerebrum (2) Cerebellum

(3) Medulla oblongata (4) Both 1 & 2

Q.60 Which part of the brain regulates the body temperature, hunger and water balance :–

(1) Hypothalamus (2) Infundibulum

(3) Medulla oblongata (4) Pons veroli

Q.61 Nerve fibres are surrounded by an insulating fatty layer called :–

(1) Adipose sheath (2) Myelin sheath

(3) Hyaline sheath (4) Peritoneum

Q.62 Which of the following forms the cerebro spinal fluid

(1) Chorid plexus

(2) Duramater

(3) Arachnoid mater

(4) Cerebrum and spinal cord

Q.63 Arbor vitae is composed of :–

(1) Neuroglea cells (2) Grey matter

(3) White matter (4) All of the above

Q.64 Which cell stop dividing after birth :–

(1) Epithelium (2) Neuron

(3) Glial cells (4) Liver

Q.65 Which one of the following is the immediate covering of a nerve fibers :–

(1) Endoneurium (2) Epineurium

(3) Perineurium (4) Sarcoplasm

Q.66 In brain structures genu and splenium are associated with :–

(1) Vermis (2) Cerebrum

(3) Cerebellum (4) Medulla oblongata

Q.67 The parts of the neurons that perform basic cellular functions such as protein synthesis are the

(1) Axons (2) Dendrites

(3) Synaptic knobs (4) Soma

Q.68 Which of the following is a richly vascular layer with lots of blood capillaries :–

(1) Duramater of brain

(2) Piamater of spinal cord

(3) Epidermis of skin

(4) Epithelial lining of trachea

Q.69 I, II, VIII spinal nerves are–

(1) Motor (2) Sensory

(3) Mixed (4) None of the above

Q.70 The nerves leading to the central nervous system are called :–

(1) Afferent (2) Efferent

(3) Motor (4) None

Q.71 The neurotransmitter which is not excitatory in function is :–

(1) Serotonin

(2) Dopamine

(3) Gamma-amino butyric acid (GABA)

(4) Acetyl choline

Q.72 The sympathetic nervous system is otherwise called

(1) Thoracico lumber system

(2) Cervico sacral system

(3) Visceral system

(4) Mesenteric system

Q.73 "Jumping of the action potential" at the nodes of ranvier is known as :–

(1) Saltatory conduction

(2) Neuro transmission

(3) Recovery phase

(4) Active phase

Q.74 The energy required during transmission of impulse is provided by :–

(1) Brain (2) Nerve fiber

(3) Liver (4) Stimulating agent

Q.75 The nodes of ranvier are :–

(1) The points in which the axons is exposed

(2) The contact points found over the non-myelinated nerve fiber

(3) Areas in which the axons swell up

(4) Areas where the nurilema touches the axon

Q.76 In a nerve cell potassium concentration :–

(1) Less on the inside

(2) Greater on the outside of membrane

(3) More concentrated inside

(4) Equal on both sides of membrane

Q.77 Nerve impulses are initiated by nerve fibers only when the membrane shall become more permeable to :–

(1) Adrenaline (2) Phosphorus

(3) Sodium ions (4) Potassium ions

Q.78 Power of regeneration is lowest in :–

(1) Brain cell (2) Liver cell

(3) Bone cell (4) Muscles cell

Q.79 Which part of the brain is more develop in human is

(1) Medulla (2) Cerebellum

(3) Cerebrum (4) Optic lobes

Q.80 Ions needed for nerve conduction :–

(1) Na^{+} (2) Ca^{++}

(3) Mg^{++} (4) None

Q.81 Crura cerbri is located in :–

(1) Fore brain (2) Hind brain

(3) Mid brain (4) None

Q.82 Which of the following is responsible for control of reflex actions :–

(1) Motor nerves

(2) Sensory nerves

(3) Central nervous system

(4) Sympathetic nervous system

Q.83 Last end of spinal cord is called :–

(1) Cauda equina (2) Filum terminal

(3) Funi culus (4) Fasciculi

Q.84 Anterior commissure occurs between :–

(1) Corpus callosum (2) Optic thalami

(3) Optic lobes (4) Corpus striatum

Q.85 Lumber spinal nerve in rabbit :–

(1) 4-pairs (2) 6-pairs

(3) 7-pairs (4) 5-pairs

Q.86 Unit of nervous system :–
(1) Neuron (2) Neuroglia
(3) Axon (4) Cyton

Q.87 How many lobes are present in cerebellum of rabbit–
(1) 1 (2) 3 (3) 5 (4) 7

Q.88 Corpus striata is part of :–
(1) Cerebellum (2) Cerebrum
(3) Diencephalon (4) Medulla oblongata

Q.89 Which of the following fissures is present in brain:–
(1) Sylvian fissure (2) Medium fissure
(3) Rhinal fissure (4) All of these

Q.90 Speed of impulse on nerves in mammals is :–
(1) 1 meter/sec. (2) 100 meter/sec.
(3) 1000 meter/sec. (4) None of these

Q.91 The functional connection between two neurons is called :–
(1) Synapse (2) Synaptid
(3) Chiasma (4) Chiasmata

Q.92 The most abundant lipid found in nervous tissue is –
(1) Phospholipids
(2) Cerebrosides and gangliosides
(3) Cholesterol
(4) Sulpholipid

Q.93 Which of the following nerve helps in maintaining the equilibrium of body :–
(1) Trochlear (2) Abducens
(3) Auditory (4) Facial

Q.94 Conduction of nerve impulse is :–
(1) Faster in non-myelinated fibres
(2) Faster in myelinated fibers
(3) No difference in the rate of conduction in myelinated & non myelinated fiberes
(4) None of above

Q.95 Which of the following amino acid metabolised in brain :–
(1) Glutamic acid (2) Glycine
(3) Leucine (4) Aspartic acid

Q.96 The two additional cranial present in mammals are
(1) Pharyngeal & vagus
(2) Spinal accessory and hypoglossal
(3) Trigeminal and glossopharyngeal
(4) Hypoglossal and sciatic

Q.97 Sylvian fissure divides each cerebral hemisphere into two lobes which are known as :–
(1) Parietal & temporal
(2) Temporal and occipital
(3) Occipital and hippocampal
(4) Frontal and temporal

Q.98 Enzyme acetycholinesterase is concerned with :–
(1) Digestion of protein
(2) Synthesis of protein
(3) Digestion of polypeptide
(4) conduction of nerve impulse

Q.99 A neopallium or cerebral cortex is not found in the brain of :–
(1) Mammals (2) Birds
(3) Reptiles (4) Frogs

Q.100 In brain of crura cerbri is a structure made of
(1) Six bands of nerve fibres
(2) Eight bands of nerve fibres
(3) Two large bands of nerve fibres
(4) Four bands of nerve fibres

Q.101 The Schwann sheath is :–
(1) A non myelinated nerve fibres
(2) Associated with myelin sheath
(3) A connective tissue cell
(4) None of the above

Q.102 The function of an axon is :–
(1) Transformation of nerve inpulse
(2) Reception of stimuli from neurons
(3) Reception of external stimuli
(4) Conduction of nerve impulse

Q.103 The interstitial tissue of nervous tissue is :–
(1) Satellite cells (2) Schwann cells
(3) Neuroglia (4) All the above

Q.104 Leptomenix of brain is formed by the joining of–
(1) Piamatter and arachnoid layer
(2) Piamater and duramater
(3) Duramatter and arachnoid layer
(4) Grey matter and white matter

Q.105 Filum terminal has only :–
(1) Piamater (2) Duramater
(3) Arachnoid (4) All of the above

Q.106 The conduction of nerve impulse is an example of :–

(1) Biophysiological process or bioelectric chemical process

(2) Biochemical process

(3) Physical process

(4) Electro-chemical process

Q.107 Reflex action in rabbit is shown :–

(1) By motor nerve

(2) By sensory nerves

(3) As autonomic & involuntary action

(4) As autonomic & voluntary action

Q.108 In rabbit hippocampal lobes are the parts of :–

(1) Olfactory lobes (2) Cerebrum

(3) Cerebellum (4) Medulla Oblongata

Q.109 A ramus communicans consists of :–

(1) White ramus only (2) Grey ramus only

(3) Both of the above (4) None of the above

Q.110 Which one of the following menix is present only in mammalian brain :–

(1) Duramater (2) Arachnoid

(3) Piamater (4) None of them

Q.111 Find out the correct sequence of a simple reflex are–

(1) Brain-spinal cord-nerves-effector

(2) Effector-CNS-sensory nerves-receptor

(3) Muscles-spinal cord-brain-receptor

(4) Receptor-sensory nerves-CNS-effector

Q.112 Lateral branches of neurons is called :–

(1) Axons (2) Cyton

(3) Collatereals (4) All the above

Q.113 Weight of brain in adult man is :–

(1) 250 gm. (2) 750 gm.

(3) 1400 gm. (4) 2500 gm.

Q.114 The autonomic nervous system does not regulate:–

(1) Excretion

(2) Respiration

(3) Learning and memory

(4) Blood circulation

Q.115 Which of the following spinal nerves does not found in man :–

(1) Caudal nerves (2) Sacral nerves

(3) Cervical nerves (4) Lumber nerves

Q.116 Opticoel cavity found in brain of :–

(1) Rabbit (2) Man

(3) Frog (4) None of these

Q.117 Resting membrane potential in neurons is :–

(1) + 30 mv (2) – 30 mv

(3) –70 to – 85 mv (4) + 70 to + 85 mv

Q.118 Bipolar neurons occurs in :–

(1) Retina of eye (2) Cochlea of ear

(3) Nasal epithelium (4) All the above

Q.119 Which cell-organelle synthesises acetyl choline:–

(1) Golgi complex (2) Ribosome

(3) Mitochondria (4) Lysosome

Q.120 Smallest cavity in brain is called :–

(1) Rhinocoel (2) Paracoel

(3) Diocoel (4) Metacoel

Q.121 Length of spinal cord in man :–

(1) 100 cm. (2) 75 cm.

(3) 45 cm. (4) 30 cm.

Q.122 Synapse name proposed by :–

(1) Charles sherrington (2) Marshall hall

(3) Pavlov (4) None of above

Q.123 Through which aperture the spinal cord passes out of skull–

(1) Foramen of monro

(2) Foramen of paninze

(3) Foramen of magnum

(4) None of the above

Q.124 Cholinergic nerves at synapses secrete :–

(1) Acetyl cholin (2) Adrenaline

(3) Nor adrenaline (4) Sodium ions

Q.125 Which one of the following types of neurons are most numerous in the body :–

(1) Unipolar (2) Multipolar

(3) Bipolar (4) Pseudounipolar

Q.126 Gasserian ganglia are present in which cranial nerce–

(1) X^{th} (2) VII^{th}

(3) V^{th} (4) IX^{th}

Q.127 The ventricles of olfactory lobes are called :–

(1) First and second ventricles

(2) Rhinocoel

(3) Diocoel

(4) Metacoel

Q.128 Habenular commissure connects :–

(1) Two optic thalami

(2) Two optic lobes

(3) Two cerebral hemisphere

(4) Two lateral lobes of cerebellum

Q.129 Cerebellum is a part of :–

(1) Fore brain (2) Mid brain

(3) Hind brain (4) None of the above

Q.130 Most of the involuntary action are controlled by:–

(1) Medulla oblongata (2) Cerebrum

(3) Cerebellum (4) Both 1 & 2

Q.131 The function of cerebrospinal fluid-

(1) Protect the brain from external jerks

(2) Provide nourishment and O_2 to the brain O_2

(3) Take away unwanted substance from the brain

(4) All of the above

Q.132 Septum lucidum is part on the :–

(1) Pseudocoel (2) Metacoel

(3) Diocoel (4) Rhinocoel

Q.133 Small, solid and four optic lobes called corpora quadrigemina are found in :–

(1) Mammals (2) Amphibians

(3) Aves (4) Reptiles

Q.134 Vermis, lateral lobes and floccular lobes constitute–

(1) Cerebrum (2) Cerebellum

(3) Medulla oblongata (4) Diencephalon

Q.135 The nerve cells are :–

(1) Unipolar and bipolar

(2) Always unipolar

(3) Unipolar, bipolar & multipolar

(4) With many axans

Q.136 Hypothalamus is situated on the :–

(1) Dorsal side of diencephalon

(2) Ventral side of diencephalon

(3) Ventral side of optic lobes

(4) Dorsal side of optic lobes

Q.137 Epithalamus is situated on the :–

(1) Dorsal side of diencephalon

(2) Ventral side of diencephalon

(3) Dorsal side of optic lobes

(4) Ventral side of optic lobes

Q.138 When the axons membrane is positively charged outside and negatively charged in side, then the condition is known as :–

(1) Action potential (2) Resting potential

(3) Active potential (4) Differential potential

Q.139 The grey matter differs from white matter in the:–

(1) Absence of axons

(2) Absence of neurilemma

(3) Presence of myelin sheath

(4) Absence of myelin sheath

Q.140 The rate at which a nerve impulse travels along a nerve fibers is dependent up on :–

(1) Length of the nerve fibres

(2) Diameter of the nerve fibre

(3) Presence of connective tissue sheath

(4) None of the above

Q.141 Sheath of Schwann cells found on :–

(1) Neurons (2) Axons

(3) Dendrons (4) Neuroglia

Q.142 Grey matter is situated on the :–

(1) Outer surface of brain

(2) Inner surface of brain

(3) In the middle of brain

(4) Uniformly present

Q.143 Find out the correct statement :–

(1) Axons receives nourishment from the dendrite

(2) Both axons & dendrites receive nourishment from the cell body of neuron

(3) Dendrite receive nourishment from axons

(4) The cell body of a neuron receives nourishment from both axon and dendron

Q.144 Which of the following statement about nerve cell is false :–

(1) Nervous activity controls body functions

(2) Nervous system is constantly active

(3) Dead nerve cell are replaced by new cell

(4) No fresh nerve cell are produced after birth

Q.145 Which cell-organella absent in neurous :–

(1) Mitochondria

(2) Ribosome

(3) Centriole

(4) Nucleus

Q.146 The nodes of renvier refer to :–

(1) A synapse

(2) A synaptic knob

(3) Breaking point of myelin sheath

(4) A synaptic vesicle

Q.147 The cranial and spinal nerves are included under:–

(1) Autonomic nervous system

(2) Peripheral nervous system

(3) Central nervous system

(4) Cutaneous nervous system

Q.148 The main function of acetylcholine is to :–

(1) Increase heart beat

(2) Help in synaptic transmission of nerve impulse

(3) Help in conduction of nerve impulse through axon

(4) Control reflex action

ANSWER KEY

EXERCISE – 2

Q.1 Dorsal root ganglion is –
(1) Motor (2) Mixed
(3) Sensory (4) None of the above

Q.2 CNS is mostly made of –
(1) Motor neurons and sensory neurons
(2) Sensory neurons and association neurons
(3) Association neurons
(4) Motor neurons and association neurons

Q.3 The nerve fibres in lateral funiculus of spinal cord are –
(1) Only sensory
(2) Only motor
(3) Both sensory and motor
(4) Not differentiated

Q.4 Two additional cranial nerves present in rabbit are –
(1) Laryngeal and vagus
(2) Spinal accessory and hypoglossal
(3) Trigeminal and glossopharyngeal
(4) Hypoglossal and laryngeal

Q.5 Nerve impulse for hearing originates in –
(1) Ear drum (2) Auditory nerve
(3) Ear ossicles (4) Cochlear

Q.6 Acetylcholine is –
(1) Toxin
(2) Vitamin
(3) Enzyme
(4) Chemical transmitter

Q.7 Ventral root of spinal nerve is composed of –
(1) Somatic motor and vesceral sensory fibres
(2) Somatic sensory and visceral sensory fibres
(3) Somatic motor and visceral motor fibres
(4) Somatic sensory and visceral motor fibres

Q.8 Nervous band connecting the two cerebral hemispheres is –
(1) Corpus albicans
(2) Corpus callosum
(3) Corpus striatum
(4) Corpus spongiosum

Q.9 Subarachnoid space occurs
(1) Above piamater (2) Above durameter
(3) Inside blastocoele (4) None of the above

Q.10 Hypothalamus is –
(1) Helpful in sleep
(2) Has centres for thirst and hunger
(3) Controls body temperature
(4) All the above

Q.11 Third, sixth and eleventh cranial are –
(1) Oculomotor, Abducens and Accessory spinal
(2) Oculomotor, Trigeminal and Accessory spinal
(3) Optic, Facial and Accessory spinal
(4) Trochlear, Abducens and Vagus

Q.12 What is the effect of parasympathetic nervous system –
(1) Originates heart beat
(2) Decrease heart beat
(3) Increases heart beart
(4) No effect on heart beat

Q.13 Fifth cranial nerve is –
(1) Optic (2) Trigeminal
(3) Abducens (4) Facial

Q.14 Brain ventricles are lined by –
(1) Neurons (2) Schwann cells
(3) Neuroglia (4) Ependymal cells

Q.15 Alcohol affects –
(1) Medulla oblongata (2) Cerebellum
(3) Cerebral cortex (4) Thalamus

Q.16 Meninges form outer envelope in –
(1) Cartilage (2) Muscle
(3) Brain (4) Kidney

Q.17 Brain originates from –
(1) Endoderm (2) Mesoderm
(3) Ectoderm (4) Ectomesoderm

Q.18 Hypophyseal portal system occurs in –
(1) Brain (2) Kidney
(3) Liver (4) Heart

Q.19 Nissl granules of neuron are madeup of –
(1) Proteins (2) Mitochondria
(3) RNA (4) DNA

Q.20 The nerve secreting epinephrine or norepinephrine is called –
(1) Adrenergic (2) Cholinergic
(3) Ammonelic (4) None of them

Q.21 Cranial nerves supplying eyes are –
(1) 3, 4, 5 (2) 4, 6, 7
(3) 4, 5, 6 (4) 3, 4, 6

Q.22 Cerebrospinal fluid is formed by –
(1) Ependymal cells (2) Choroid plexus
(3) Neurons (4) Neuroglial cells

Q.23 Respiration, heart beat and peristalsis are controlled by –
(1) Medulla oblongata
(2) Medulla oblongata and cerebellum
(3) Medulla oblongata and cerebrum
(4) Cerebellum

Q.24 Cytons of both central and autonomic sensory fibres occurs in –
(1) Spinal ganglia
(2) Dorsal part of spinal cord
(3) Ventral part of spinal cord
(4) Autonomic ganglia

Q.25 Vasomotor nerves are –
(1) Sympathetic (2) Parasympathetic
(3) Both 1 and 2 (4) None of the above

Q.26 Which cells do not divide after birth –
(1) Nerve cells (2) Germ cells
(3) Muscle cells (4) Osteocytes

Q.27 Nerve impulse travels as –
(1) Chemical impulse
(2) Electrical impulse
(3) Electrochemical impulse
(4) Physical impulse

Q.28 Simple two-neuron reflex consist of –
(1) Sensory neuron
(2) Effector neuron
(3) Both 1 and 2
(4) Sensory neuron, effector neuron and spinal cord

Q.29 Which one is a slow neuro-transmitter-
(1) GABA (2) Adrenaline
(3) Epinephrine (4) Acetylcholine

Q.30 Which one is the spinal nerve-
(1) Trigeminal (2) Hypoglossal
(3) Olfactory (4) None of the above

Q.31 Sympathetic nerves in mammals develop from –
(1) Sacral region
(2) Cervical region
(3) Thoracico-lumbar region
(4) 3rd, 7th, 9th and 10th cranial nerves

Q.32 Arbor vitae is composed of –
(1) Grey matter (2) White matter
(3) Neuroglia cells (4) All the above

Q.33 Cell bodies of motor nerve fibres occur in –
(1) Dorsal root of spinal nerve
(2) Dorsal horn of spinal cord
(3) Ventro-lateral horn of spinal cord
(4) Ventral root of spinal cord

Q.34 Slow neurotransmission is mediated by –
(1) Adrenalin
(2) Gamma amino butyric acid (GABA)
(3) Acetylcholine
(4) Glutamate

Q.35 Which two extra cranial nerves are present amniotes –
(1) Laryngeal and hypoglossal
(2) Spinal accessory and hypoglossal
(3) Hypoglossal and facial
(4) Trigeminal and glossopharyngeal

Q.36 Blood pressure and activity of non-striated muscles are dependent on the hormone secretion of –
(1) Anterior lobe of pituitary gland
(2) Middle lobe of pituitary gland
(3) Posterior lobe of pituitary gland
(4) Adrenal cortex

Q.37 Cell body (soma) of motor nerves is situated in –
(1) Dorsal root of spinal cord
(2) Dorsal horn of spinal cord
(3) Ventral and lateral horn of spinal cord
(4) Ventral root of spinal nerve

Q.38 Progesteron is a :-
(1) Carbohydrate (2) Steroid
(3) Protein (4) Sterol

Q.39 Fourth cranial nerve is-
(1) Trigeminal (2) Abducens
(3) Trochlear (4) Optic

Q.40 Sympathetic nervous system increases-
(1) Heart beat
(2) Secretion of saliva
(3) Secretion of digestive juices
(4) All the above

Q.41 Main function of cerebellum is-
(1) Balancing (2) Sight
(3) Hearing (4) Remembering

Q.42 Centre for sense of smell is –
(1) Cerebellum (2) Olfactory lobes
(3) Cerebrum (4) Midbrain

Q.43 Nerve related to diaphragm is –
(1) Vagus (2) Phrenic
(3) Trigeminal (4) Glossopharyngeal

Q.44 Which of the following is the largest nerve –
(1) Vagus (2) Olfactory
(3) Hypoglossal (4) Glossopharyngeal

Q.45 In an axon, nerve impulse travels –
(1) Away from ctyon
(2) Towards cyton
(3) Both away and towards cyton
(4) Not known

Q.46 Match the column

Column-I	**Column-II**
a. Bowman's capsule	p. Spinal cord
b. A.V. valves	q. Brain
c. Cerebellum	r. Kidney
d. Alveoli	s. Heart
	t. Lungs

(1) a – r, b – s, c – t, d – q
(2) a – r, b – t, c – s, d – q
(3) a – r, b – s, c – q, d – t
(4) a–p, b – q, c – s, d – t

Q.47 Main function of cerebrum is –
(1) To see (2) To hear
(3) Balancing (4) Remembering

Q.48 The vagus nerve is the cranial nerve numbering–
(1) 9 (2) 10
(3) 5 (4) 7

Q.49 Which of the following is regarded unit of nervous system-
(1) Dendrites (2) Axon
(3) Neuron (4) Myelin sheath

Q.50 The junction between axon of one neuron and dendrites of the next neuron is called-
(1) junction point (2) A joint
(3) A synapse (4) Constant

Q.51 Number of dead brain cells at the age of 70 years constitute –
(1) 40% (2) 30%
(3) 20% (4) 10%

Q.52 The respiratory centre controlling inspiration and expiration are located in –
(1) Medulla oblongata (2) Cerebellum
(3) Diencephalon (4) Spinal cord

Q.53 Which cranial nerve has highest number of branches–
(1) Facial (2) Vagus
(3) Trigeminal (4) None of these

Q.54 Brain depends on blood for the supply of –
(1) Oxygen and glucose
(2) ATP and glucose
(3) Oxygen and ATP
(4) Oxygen and electrolytes

Q.55 In motor neuron the impluse following in which direction ?
(1) In two direction (2) In one direction
(3) In all direction (4) None of these

Q.56 Medulla-oblongata is controls of :
(1) blood pressure (2) smell or odour
(3) high temperature (4) low temperature

Q.57 Origin of nervous system from :
(1) meso-endoderm (2) mesoderm
(3) endoderm (4) ectoderm

Q.58 Snake felt sound from :
(1) tympanum (2) body
(3) internal ear (4) earth

Q.59 Which nerves arise from spinal cord are?
(1) Mixed nerves (2) Motor
(3) Sensory (4) None of these

Q.60 Arachnoid-
(1) Corvers cranium
(2) Surrounds piamater
(3) Surrounds durameter
(4) Surrounds heart

Q.61 During development of action potential in a nerve fibres, positive and negative charges on outer and inner side of axon membrane are reversed due to-
(1) Extension of all K^+ ions
(2) More K^+ ions enter than Na^+ ions leave than axon
(3) More Na^+ ions enter the axon than K^+ ions leaves the same
(4) All Na^+ ions enter the axon

Q.62 Nerve axon takes part in –
(1) Receiving impulse
(2) Transformation of energy
(3) Conduction of impulse
(4) Providing energy for impulse transmission

Q.63 Which is not a reflex action –
(1) Food swallowing
(2) Closing of eyes in bright light
(3) Convulsion in winter seasion
(4) Salivation on tasting food

Q.64 Which one occurs in mesencephalon/midbrin –
(1) Cerebellum (2) Inferior colliculus
(3) Thalamus (4) Mammilary body

Q.65 Neurotrasmitter between neuron and a muscle cell is –
(1) Dopamine (2) Serotinin
(3) Endorphin (4) Acetylcholine

Q.66 Medulla oblongata encloses –
(1) Fourth ventricle (2) Third ventricle
(3) Second ventricle (4) Optic lobes

Q.67 At resting stage nerve cells has –
(1) Low K^+ outside and high Na^+ inside
(2) High K^+ inside and high Na^+ outside
(3) High K^+ inside and low Na^+ outside
(4) High K^+ outside and low Na^+ inside

Q.68 In a human being number of cranial nerves are –
(1) 10 pairs (2) 20 pairs
(3) 6 pairs (4) 12 pairs

Q.69 Depolarization of nerve impulse involves –
(1) Entry of Na^+ only
(2) Entry of K+ only
(3) Entry of Na^+ and exit of K^+
(4) Entry of K^+ and exit of Na^+

Q.70 Corpus callosum is found in the brain of –
(1) Pigeon (2) Crocodile
(3) Frog (4) Elephant

Q.71 Node of Ranvier is found in –
(1) Muscle bundles (2) Dendrite
(3) Axon (4) Right auricle

Q.72 A thin vascular membrane of brain is –
(1) Arachnoid (2) Piameter
(3) Durameter (4) Epineurium

Q.73 In Rabbit what is the number of spinal nerves ?
(1) 37 (2) 30 (3) 32 (4) 38

Q.74 Which of the following nerve innervates upper jaw of frog ?
(1) Maxillary (2) Pathetic
(3) Palatine (4) Occulomotor

Q.75 Structure connected with vision in Rabbit is –
(1) Corpus callosum
(2) Corpora quadrigemina
(3) Corpus albicans
(4) Hippocampus

Q.76 The main cause of paralysis is –
(1) Some defect in muscles
(2) Complete destruction of sensory nerve
(3) Complete destruction of motor nerve
(4) None of the above

Q.77 Which of the following nerve in rabbit enters in geniculate ganglion –
(1) Glossopharyngeal (2) Facial
(3) Hypoglossal (4) Vagus

Q.78 Which of the following is sensory –
(1) Ramus ventralis
(2) Ramus dorsalis
(3) Ramus dorsalis and ramus communicans
(4) Ramus ventralis and ramus communicans

Q.79 The part of the brain which is most developed in higher primates is :
(1) cerebellum (2) cerebrum
(3) medulla oblongata (4) olfactory lobes

Q.80 The cerebellum is concerned with :
(1) memory (2) perception
(3) intelligence
(4) coordination of muscular movement

Q.81 A mass of cytons is called as :
(1) synapse (2) ganglion
(3) motor nerve (4) nerve fibre

Q.82 The pathway of reflex arc as :
(1) sense organ, spinal cord, motor neuron, sensory nerve, muscle
(2) sense organ, sensory, neuron, motor neuron spinal cord, muscle
(3) sense organ, motor neuron, spinal cord, sensory neuron, muscle
(4) sense organ, motor neuron, spinal cord, sensory neuron, muscle

Q.83 The sense of balance maintained with the help of :
(1) hammer (2) strirrup
(3) semicircular canals (4) cochlea

Q.84 The small canal leading from pinna into the head in mammals is :
(1) Haversian canal (2) Ext. auditory maetus
(3) inguinal canal (4) eustachian tube

Q.85 Energy transformation in nervous system is –
(1) Chemical to radiant
(2) Chemical to mechanical
(3) Chemical to electrical
(4) Chemical to osmotic

Q.86 Which of the following is mismatched –
(1) Cerebrum-Memory
(2) Cerebellum-Equilibrium of body
(3) Olfactory lobes - Smell
(4) Medulla - Temperature

Q.87 Name of cranial nerves of human being viz. II, VII, VIII, IX
(1) Optic, auditory, facial, hypoglossal
(2) Oculomotor, auditory, abducens, hypoglossal
(3) Optic, facial, auditory, glossopharyngeal
(4) Optic, facial, abducens, glossopharyngeal

Q.88 Which of the following is not correctly matched?
(1) Rhinoncephalon-olfactory
(2) Hypothalamus-pituitary
(3) Cerebellum-balance
(4) Medulla oblongata-temperature regulation

Q.89 Which of the following nerve supplies organ of corti ?
(1) Auditory (2) Olfactory
(3) Trochlear (4) Vagus

Q.90 Which one of the following is chemical transmitter for neuro impulse conduction-
(1) Glycine (2) GABA
(3) Adrenalin (4) Acetylcholine

Q.91 Nerve impulse initiates with the movements of –
(1) K^+ (2) Na^+ (3) Ca^+ (4) Mg^+

Q.92 Sympathetic nervous system induces-
(1) Heart beat (2) Secretion of semen
(3) Secretion of saliva (4) None

Q.93 Which is not a part of hindbrain-
(1) Thalamus (2) Cerebellum
(3) Pons (4) Medulla

Q.94 Corti's organ is present in-
(1) Reisner's membrane
(2) Scala vestibuli
(3) Basilar's membrane
(4) Middle lamella

Q.95 Reflex action in controlled by-
(1) SANS (2) PANS
(3) CNS (4) PNS

Q.96 IInd cranial nerve goes up to-
(1) Retina (2) Retina & Iris
(3) Ciliary muscle (4) None

Q.97 Parkinson's disease (characterized by tremors and progressive rigidity of limbs) is caused by degeneration of brain neurons that involved in movement control and make use of neurotransmitter-
(1) Acetylcholine (2) Norepincphrine
(3) Dopamine (4) GABA

Q.98 In a man abducens nerve is injured. Which one of the following functions will be affected-
(1) Movement of the eye ball
(2) Movement of the tongue
(3) Swallowing
(4) Movement of the neck

Q.99 One of the following examples of the action of the autonomous nervous system is-
(1) Swallowing of food
(2) Pupillary reflex
(3) Peristalsis of the intestine
(4) Knee-jerk response

Q.100 Left and right part of brain are connected to each other by-
(1) Pons (2) Medulla oblongata
(3) Corpus callosum (4) Cerebrum

Q.101 Which one of the following does not act as a neurotransmitter?
(1) Cortisone (2) Acetylcholine
(3) Epinephrine (4) Norepinephrine

Q.102 Number of cranial nerves in Columba is-
(1) 9 pairs (2) 10 pairs
(3) 11 pairs (4) 12 pairs

Q.103 Nervous system consists of -
(1) Neuron (2) Nephron
(3) Perineocyte (4) None

Q.104 GABA (gama amino butyric acid) is a –
(1) Inhibitory neurohormone
(2) Transmittery neuro humor
(3) Anti co-agulant
(4) None

Q.105 Nissl's bodies found in neurons are –
(1) Made of DNA
(2) Masses of ribosome and RER
(3) Help in formation of neurofibrils
(4) Masses of mitochondria

Q.106 Chemical transmission of nerve impulses from one neuron to another at a synapse is by –
(1) Cholesterol (2) Acetylcholine
(3) Cholecystokinin (4) ATP

Q.107 "Nodes of Ranviers" are found in –
(1) Brain (2) Heart
(3) Axon (4) Eye

Q.108 Afferent nerve fibre conducts impulse from –
(1) C.N.S. to effector
(2) Receptor to C.N.S.
(3) Receptor to effector
(4) Effector to receptor

Q.109 Saltatory conduction occurs in –
(1) Non-myelinated fibers
(2) Myelinated fibers
(3) Both of them
(4) None of these

Q.110 Chemical substance which take part in synaptic transmission is –
(1) Adrenaline (2) Epinephrine
(3) Colchicine (4) Acetylcholine

Q.111 Nissl granules occur in which part and what is their function –
(1) Neurons and help in nutrition & increase metabolic activity of neuron
(2) Blood and help in nutrition and excretion
(3) Sarcoplasm and help in contraction
(4) Cell and secrete mucous

Q.112 When a nerve fibers is stimulated the inside of the membrane becomes –
(1) Filled with acetyl choline
(2) Negatively charged
(3) Positively charged
(4) Neutral

Q.113 The parts of the neurons that perform basic cellular functions such as protein synthesis etc. –
(1) Axons (2) Dendrites
(3) Synaptic knobs (4) Soma

Q.114 The nerves leading to the central nervous system are called
(1) Afferent (2) Efferent
(3) Motor (4) None

Q.115 "Jumping of the action potential" at the nodes of ranvier is known as –
(1) Saltatory conduction
(2) Neuro transmission
(3) Recovery phase
(4) Active phase

Q.116 Nerve impulses are initiated by nerve fibers only when the membrane shall become more permeable to –
(1) Adrenaline (2) Phosphorus
(3) Sodium ions (4) Potassium ions

Q.117 Power of regeneration is lowest in –
(1) Brain cell (2) Liver cell
(3) Bone cell (4) Muscle cell

Q.118 Unit of nervous system –
(1) Neuron (2) Neuroglia
(3) Axon (4) Cyton

Q.119 Speed of impulse on nerves in mammals is –
(1) 1 meter/sec.
(2) 100 meter/sec.
(3) 1000 meter/sec.
(4) None of these

Q.120 The functional connection between two neurons is called –
(1) Synapse (2) Synapsis
(3) Chiasma (4) Chiasmata

Q.121 Conduction of nerve impulse is –
(1) Faster in none-myelinated fibres
(2) Faster in myelinated fibres
(3) No difference in the rate of conduction in myelinated & non myelinated fibres
(4) None of the above

Q.122 Enzyme acetyl cholinesterase is concerned with–
(1) Digestion of protein
(2) Synthesis of protein
(3) Digestion of polypeptide
(4) Conduction of nerve impulse

Q.123 Integrative system in the body are –
(1) Endocrine system
(2) Nervous system
(3) Blood vascular system
(4) Both 1 & 2

Q.124 During refractory period –
(1) Nerve transmits impulse very slowly
(2) Nerve can not transmit impulse
(3) Nerve transmits impulses very rapidly
(4) None of the above

Q.125 The schwann sheath is –
(1) A non myelinated nerve fibres
(2) Associated with myelin sheath
(3) A connective tissue cell
(4) Associated with myelinated & non myelinated nerve fibre

Q.126 The function of an axon is –
(1) Transformation of nerve impulse
(2) Reception of stimuli from neurons
(3) Reception of external stimuli
(4) Conduction of nerve impulse

Q.127 A short period during which a nerve is unable to conduct nerve impulse is called
(1) Synaptic delay (2) Refractory period
(3) Resting potential (4) Critical period

Q.128 Rapid integration of the function activities in human is acheieved by –
(1) Nervous system (2) Endocrine system
(3) Blood (4) Muscular system

Q.129 Which cell-organelle synthesises acetyl choline–
(1) Golgi complex (2) Ribosome
(3) Mitochondria (4) Lysosome

Q.130 Synapse name proposed by –
(1) Charles sherrington (2) Marshall hall
(3) Pavlov (4) None of the above

Q.131 Which one of the following types of neurons are most numerous in the body –
(1) Unipolar (2) Multipolar
(3) Bipolar (4) Pseudounipolar

Q.132 When the axons membrane is positively charged outside and negatively charged in side, then the condition is known as –
(1) Action potential (2) Resting potential
(3) Active potential (4) Differential potential

Q.133 The rate at which a nerve impulse travels along a nerve fibers is dependent up on –
(1) Length of the nerve fibre
(2) Diameter of the nerve fibre
(3) Presence of connective tissue sheath
(4) None of the above

Q.134 Sheath of schwann occurs on –
(1) Neurons (2) Axons
(3) Dendrons (4) Neuroglia

Q.135 Which cell-organellae absent in neurons –
(1) Mitochondira (2) Ribosome
(3) Centriole (4) Nucleus

Q.136 Nerve fibres are surrounded by an insulating fatty layer called –
(1) Adipose sheath (2) Myelin sheath
(3) Hyaline sheath (4) Peritoneum

Q.137 The main function of acetylcholine is to –
(1) Increase heart beat
(2) Help in synaptic transmission of nerve impulse
(3) Help in conduction of nerve impulse through axon
(4) Control reflex action

Q.138 Ions needed for nerve conduction –
(1) Na+ (2) Ca++
(3) Mg++ (4) None

Q.139 Myelogenesis (Myelin formation) process occur in C.N.S. (central nervous system) –
(1) By schwann cells (2) By oligodendrocytes
(3) By Axolemma (4) By neurolemma

Q.140 Repolarisation of Neuron is occured due to –
(1) Influx of Na+ (2) Influx of K+
(3) Efflux of Na+ (4) Efflux of K+

Q.141 If GABA is released at synapse area then what will happens –
(1) Depolarization of neuron
(2) Repolarization of neuron
(3) Hyperpolarization of neuron
(4) No effect

Q.142 Non Myelinated axons differ from myelinated in that they –
(1) Are more excitable
(2) Lack nodes of Ranvier
(3) Are not capable of regeneration
(4) Are not associated with schwann cells

Q.143 If myelin sheath is continue in myelinated nerve fibre than what will happens in neuronal conduction –

(1) Velocity is increased

(2) Conduction is slow

(3) Conduction is stopped

(4) No effect

Q.144 Posterior choroids plexus in brain is found in the–

(1) Diencephalon

(2) Cerebrum

(3) Cerebellum

(4) Space b/w pons & medulla (anteriorly) & cerebellum (Posteriorly)

Q.145 Menings surrounding the brain of Human from outside to inside are –

(1) Duramater, arachnoid, piamater

(2) Piamater, arachnoid, duramater

(3) Duramater, piamater, arachnoid

(4) Piamater, duramater, arachnoid

Q.146 Corpus callosum connects –

(1) Two cerebral hemisphere

(2) Two optic lobes

(3) Two olfactory lobes

(4) Optic chiasma

Q.147 Outer most covering of brain is called –

(1) Choroid (2) Duramater

(3) Piamater (4) Arachnoid

Q.148 The membrane which cover the brain and the spinal cord is –

(1) White matter (2) Grey matter

(3) Peritonium (4) Menix

Q.149 Cerebellum is concerned with –

(1) Co-ordination of muscular movement

(2) Memory

(3) Vision

(4) Reflex action

Q.150 Crura cerebri is located in –

(1) Fore brain (2) Hind brain

(3) Mid brain (4) None

Q.151 Arbor vitae is present in –

(1) Cerebellum (2) Cerebrum

(3) Diencephalon (4) Optocoel

Q.152 How many lobes are present in cerebellum –

(1) 1 (2) 3 (3) 5 (4) 7

Q.153 Piamater is –

(1) Inner most meninge

(2) Middle meninge

(3) Outer meninge

(4) None

EXERCISE – 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Nissl's granules are found in - **[UTTARANCHAL-2005]**

(1) liver cells (2) nerve cells

(3) kidney (4) heart

Q.2 Main function of cerebellum is - **[UTTARANCHAL-2005]**

(1) Balancing (2) Sight

(3) Hearing (4) Memory

Q.3 The correct sequence of meninges from inner to outer side is - **[UTTARANCHAL-2006]**

(1) arachnoid → duramater → piamater

(2) arachnoid → piamater → duramater

(3) piamater → duramater → arachnoid

(4) piamater → arachnoid → duramater

Q.4 Somaethetic or post central area is responsible for - **[UTTARANCHAL-2005]**

(1) initiation of motor impulses for voluntary muscles

(2) initiation of motor impulses for involuntary muscles

(3) perception of pain, touch and temperature

(4) co-ordination of speech

Q.5 Vagus nerve is composed mainly of parasymphathetic fibres. The preganglionic fibres forms a network is known as - **[UTTARANCHAL-2005]**

(1) choroid plexus (2) nervous plexus

(3) auerbach plexus (4) brachial plexus

Q.6 Lateral rectus muscle of the eye is served by which cranial nerve? **[West Bengal - 2007]**

(1) occulomotor nerve (2) pathetic nerve

(3) abducens nerve (4) spinal accessory

Q.7 Synaptic delay last for - **[West Bengal - 2007]**

(1) 0.1 ms (2) 0.3 ms

(3) 0.4 ms (4) 0.5 ms

Q.8 During nerve impulse transmission permeability of membrane is greater for - **[West Bengal - 2007]**

(1) Na^+ (2) K^+

(3) equal for both (1) and (2)

(4) Ca^{2+}

Q.9 Parkinson's disease is associated with - **[JHARKHAND-2002]**

(1) midbrain (2) thalamus

(3) hypothalamus (4) cerebrum

Q.10 The thermoregulatory centre in the body is- **[JHARKHAND-2004]**

(1) thalamus (2) hypothalomus

(3) pons (4)medulla oblongata

Q.11 Nissl's granules are - **[Bihar-2004]**

(1) RNA bodies (2) DNA

(3) carbohydrate (4) protein

Q.12 Which part of the brain is affected first in a drunk person - **[Bihar-2004]**

(1) Cerebrum (2) Olfactory lobe

(3) Cerebellum (4) Medulla oblongata

Q.13 In mammals, the brain centre, which regulates body temperature is situated in - **[UP-CPMT 2001]**

(1) Cerebrum (2) Olfactory lobe

(3) Cerebellum (4) Medulla oblongata

Q.14 The 3^{rd}, 6^{th} and 11^{th} cranial nerves are - **[UP-CPMT 2001]**

(1) optic, facial and spinal nerves

(2) oculomotor, trigeminal and spinal

(3) trigeminal, abducens and vagus

(4) oculomotor, abducens and spinal]

Q.15 The junction between the axon of one neuron and the dendrite of the next is called- **[UP-CPMT 2001]**

(1) a joint (2) a synapse

(3) constant bridge (4) junction point

Q.16 Which one of the following is a motor nerve? **[UP-CPMT 2001]**

(1) auditory (2) abducens

(3) optic nerve (4) trigeminal nerve

Q.17 Nissl's granules are absent in - **[UP-CPMT 2001]**

(1) axon (2) cyton

(3) dendron (4) schwann cells

Q.18 Which of the following is purely motor cranial nerve? **[UP-CPMT 2002]**

(1) Oflactory (2) Optic

(3) Abducens (4) Vagus

Q.19 Trigeminal nerve in case of frog is - **[UP-CPMT 2006]**

(1) I cranial nerve (2) II cranial nerve

(3) IV cranial nerve (4) V cranial nerve

Q.20 In human body muscular co-ordination is controlled - **[MP PMT-2005]**

(1) Spinal cord

(2) Cortex

(3) Cerebellum

(4) Cerebral hemisphare

Q.21 Sense of smell is by - **[MP PMT-2003]**

(1) cerebrum (2) cerebellum

(3) olfactory lobe (4) hypothalamus

Q.22 Third ventricle connects to lateral ventricles through - **[MP PMT-2003]**

(1) foramen magnum (2) foramen monro

(3) foramen magnedie (4) foramen luschka

Q.23 Connection between axon and dendrite is - **[MP PMT-2007]**

(1) synapse (2) synapsis

(3) desmosome (4) tight junction

Q.24 Depolarization of axolemma during nerve conduction takes place because of - **[AIPMT-2000]**

(1) Equal amount of Na^+ & K^+ move out across axolema

(2) Na^+ move inside

(3) More Na^+ outside

(4) None

Q.25 Which of the following statement is correct for node of Ranvier of nerve - **[AIPMT-2002]**

(1) Neurilemma is discontinuous

(2) Myelin sheath is discontinuous

(3) Both neurilemma & Myelein sheath are discontinuous

(4) Covered by myelein sheath

Q.26 What used to be described as Nissl granules in a nerve cell are now identified as - **[AIPMT-2003]**

(1) Cell metabolites (2) Fat granules

(3) Ribosomes (4) Mitochondira

Q.27 The ‘‘Nissle's granules’’ of nerve cells's are made up of - **[RPMT-2003]**

(1) Ribosome (2) Protein

(3) DNA (4) Mitochondria

Q.28 In the resting state of the neural membrane, diffusion due to concentration gradients, if allowed, would drive - **[AIPMT-2004]**

(1) K^+ and Na^+ out of the cell

(2) Na^+ into the cell

(3) Na^+ out of the cell

(4) K^+ into the cell

Q.29 Unidirectional transmission of a nerve impulse through nerve fibre is due to the fact that – **[AIIMS-2004]**

(1) Nerve fibre is insulated by a medullary sheath.

(2) Sodium pump starts operating only at the cyton and then continues into nerve fibre.

(3) Neurotransmitters are released by dendrites and not by axon endings.

(4) Neurotransmitters are released by the axon endings and not by dendrites.

Q.30 Nerve cells donot possess - **[MANIPAL-2005]**

(1) Neurilemma (2) Sarcolemma

(3) Dendrites (4) Axon

Q.31 Myelin sheath covers which of the following - **[MP PMT-2005]**

(1) Muscle fibre (2) Nerve fibre

(3) Collagen fiber (4) Tendons

Q.32 Dendrites are associated with which system **[MP PMT-2006]**

(1) Nervous system

(2) Digestive system

(3) Muscular system

(4) Blood vascular system

Q.33 Nerve impulse travel through nerve with the help of - **[MP PMT-2006]**

(1) Acetylcholine and sympathetin

(2) Choline and acetylcholine

(3) Adrenaline and noradrenaline

(4) None of the above

Q.34 A typical value of resting membrane potential is - **[KERALA PMT-2006]**

(1) - 40 mv (2) - 60 mv

(3) - 70 mv (4) - 80 mv

Q.35 During the transmission of nerve impulse through a nerve fiber, the potential on the inner side of the plasma membrane has which type of electric charge ? **[AIPMT-2007]**

(1) First positive, then negative and continue to be negative

(2) First negative, then positive and continue to be positive

(3) First positive, then negative and again back to positive

(4) First negative, then positive and again back to negative

Q.36 Which of the following is not a part of hind brain - **[RPMT-2004]**

(1) Medulla oblongata (2) Thalamus

(3) Cerebellum (4) Pons

Q.37 The name of nervous band connecting the cerebral hemispheres in rabbit is – **[MANIPAL-2005, MHCET-2004]**

(1) Corpus albicans

(2) Corpus callosum

(3) Corpus striatum

(4) Corpus spongiosum

Q.38 Arobor vitae is part of - **[MANIPAL-2005]**

(1) Cerebrum (2) Cerebellum

(3) Midbrain (4) Forebrain

Q.39 Which has H-shaped gray matter? **[MANIPAL-2005]**

(1) Cerebrum (2) Spinal cord

(3) Cerebellum (4) Medulla oblongata

Q.40 Human brain is covered by an extremely hard layer called - **[MPPMT-2005]**

(1) White matter (2) Duramater

(3) Piamater (4) Gray matter

Q.41 Which of the following is the part of mid brain of rabbit ? **[JIPMER-2004]**

(1) Cerebrum

(2) Diencephalon

(3) Corpora quadrigemina

(4) None of these

Q.42 The function of cerebrospinal fluid does not include - **[HPPMT-2006]**

(1) Protection of brain and spinal cord by containing antibody

(2) Protection of delicate brain and spinal cord from shock

(3) As a medium for excretion of waste product

(4) Buoyancy to brain ?

Q.43 Third ventricle lies in - **[MANIPAL-2003, MPPMT-1999]**

(1) Medulla oblongata (2) Mid brain

(3) Diencephalon (4) Cerebrum

Q.44 Ventricles of brain are lined by the cells called- **[MPPMT-2004]**

(1) Neuroglia (2) Ependymal

(3) Neurocells (4) Schwann cells

Q.45 In man the osmotic centres are situated in- **[MPPMT-2005]**

(1) Cerebrum (2) Hypothalamus

(3) Pituitary gland (4) Medulla oblongata

Q.46 Hypothalamus does not control - **[KERALA PMT-2005]**

(1) Libido (2) Osmoregulation

(3) Creative thinking and consciousness

(4) Thermoregulation

Q.47 Choroid plexus is a network of - **[KERNATAKA CET-2004]**

(1) Nerves (2) Muscle fibres

(3) Capillaries (4) Lymph vessels

Q.48 Cerebral hemisphere is not the centre of - **[RPMT-2003]**

(1) taste (2) smell

(3) balance (4) thinking

Q.49 Which part of brain is supposed to be damaged if in an accident, a person lost control of water balance, hunger and body temp. - **[RPMT-2003]**

(1) Cerebellum

(2) Hypothalamus

(3) Medula oblongata

(4) Corpora quadrigemina

Q.50 Column 'I' list the parts of human brain and column 'II' lists the function. Match the two columns and identify the correct choice from those given – **[KARNATAKE CET-2005]**

Column I	**Column II**
(A) Cerebrum	(i) Controls the pituitary
(B) Cerebellum	(ii) Controls vision and hearing
(C) Hypothalamus	(iii) Controls the rate of heart beat
(D) Midbrain	(iv) Seat of intelligence
	(v) Maintains body posture

(1) A = v, B = iv, C = ii, D = i

(2) A = iv, B = v, C = ii, D = i

(3) A = v, B = iv, C = i, D = ii

(4) A = iv, B = v, C = i, D = ii

Q.51 Which destryos the acetylcholineesterase - **[AIPMT-98]**

(1) Malathione (2) CO

(3) KCN (4) Colchicine

Q.52 Botulism affects - **[AIPMT-98]**

(1) Digestive system

(2) Blood vascular system

(3) Nervous system

(4) Respiratory system

Q.53 Which of the following nerve innervates upper jaw of fog - **[RPMT-2000]**

(1) Maxillary (2) Pathetic

(3) Palatine (4) Occulomotor

Q.54 In Rabbit, the number of spinal nerves are - **[RPMT-2000]**

(1) 30 pairs (2) 37 pairs

(3) 32 pairs (4) 38 pairs

Q.55 If parasympathetic nerve of the rabbit is cut, then heart beat - **[RPMT-2001]**

(1) Unaffected (2) Decreases

(3) Increases (4) Stop

Q.56 How many cranial nerves found in the Amniota - **[RPMT-2001]**

(1) 6 (2) 8

(3) 12 (4) 10

Q.57 In Rabbit, optic lobes are small because the eye sight is controlled by - **[RPMT-2001]**

(1) Temporal lobe

(2) Occipital lobe

(3) Frontal lobe

(4) Parietal lobe

Q.58 Norepinephrine leads to increase in -

(1) Blood pressure **[RPMT-2004]**

(2) Urine production

(3) Cellular respiration

(4) Release of epinephrine

Q.59 Injury to vagus nerve in humans is not likely to affect - **[AIPMT-2004]**

(1) Gastrointestinal movements

(2) Pancreatic secretion

(3) Cardiac movements

(4) Tongue movements

Q.60 In a man, is abducens nerve is injured. Which one of the following functions will be affected? **[AIPMT-2005]**

(1) Movement of the neck

(2) Movement of the tongue

(3) Movement of the eye ball

(4) Swallowing

Q.61 One of the examples of the action of the autonomous nervous system is - **[AIPMT-2005]**

(1) Pupillary reflex
(2) Swallowing of food
(3) Peristalsis of the intestines
(4) Knee-jerk response

Q.62 Excessive stimulation of vagus nerve in humans may lead to - **[AIIMS-2003]**

(1) Hoarse voice
(2) Peptic ulcers
(3) Efficient digestion of protein
(4) Irregular contractions of diaphragm

Q.63 Which of the following cranial nerve is not a motor nerve? **[MPPMT-2004]**

(1) II (2) III
(3) IV (4) XII

Q.64 Match the following human spinal nerves in column I with II and choose the correct options:

Column I	**Column II**
(a) Cervical nerves	(i) 5 pairs
(b) Thoracic nerves	(ii) 1 pair
(c) Lumbar nerves	(iii) 12 pairs
(d) Coccygeal nerves	(iv) 8 paris

[KERALA PMT 2005]

(1) a = ii, b = iv, c = i, d = iii
(2) a = iv, b = iii, c = i, d = ii
(3) a = iv, b = ii, c = i, d = iv
(4) a = i, b = iv, c = ii, d = iii

Q.65 9^{th} Pair of cranial nerve in frog is - **[AFMC-2005]**

(1) Vagus (2) Trigeminal
(3) Hypoglossal (4) Glossopharyngeal

Q.66 Which of the following is not under the control of vagus nerve? **[JIPMER-2005]**

(1) Gastrointestinal movement
(2) Respiratory movement
(3) Salivation
(4) None of these

Q.67 Which of the following is released by parasympathtic nervous system? **[BHU-2005]**

(1) Serotonin (2) Acetylcholine
(3) Epinephrine (4) Norepinephrine

Q.68 Facial nerve arising from medulla is - **[ORISSA JEE-2006]**

(1) Motor (2) Sensory
(3) Motor and sensory (4) None of these

Q.69 The mandibular nerve is the branch of which cranial nerve? **[JKCMEE 2006]**

(1) II (2) III
(3) V (4) VI

Q.70 Vagus nerve is composed mainly of parasympathetic fibres. The preganglionic fibres forms a network in the walls of the gut. This network is known as - **[UTTARANCHAL PMT 2006]**

(1) Choroid plexus (2) Nervous plexus
(3) Auerbach plexus (4) Brachial plexus

Q.71 Given below is a table comparing the effects of sympathetic and parasympathetic nervous system for four features (a-d). Which one feature is correctly matched? **[AIIMS 2006]**

	Feature	**Sympathetic nervous system**	**Parasympathetic nervous system**
(1)	Salivary glands	Stimulates secretion	Inhibits secretion
(2)	Pupil	Dilates	Constricts of the eye
(3)	Heart rate	Decreases	Increases
(4)	Intestinal peristalsis	Stimulates	Inhibits

Q.72 Effect of anaesthetics on body - **[AIPMT-98]**

(1) Inhibits Na-K pump
(2) Kills nerves
(3) Stops brain functions
(4) Inactivates skin cells

Q.73 Deficiency of oxygen affects mainly the - **[AIPMT-99]**

(1) Brain (2) Skin
(3) Kidney (4) Intestine

Q.74 Neuroglial cells associated with - **[AIPMT-99]**

(1) Heart (2) Kidney

(3) Brain (4) Eyes

Q.75 Adrenaline direct affect on - **[AIPMT-2002]**

(1) S.A. Node

(2) β-cells of Langerhans

(3) Dorsal root of spinal cord

(4) Epithelial cells of stomach

Q.76 In which animal, nerve cell is present but brain is absent - **[AIPMT-2002]**

(1) Sponge (2) Earthworm

(3) Cockroach (4) Hydra

Q.77 Which of the following is dominant intracellular anion - **[RPMT-2000]**

(1) Potassium (2) Chloride

(3) Phosphate (4) Calcium

Q.78 Nervous system developes from - **[RPMT-2000]**

(1) Ectoderm (2) Mesoderm

(3) Ectomesoderm (4) Endomesoderm

Q.79 Which of the following is not correctly matched - **[RPMT-2002]**

(1) Rhinon cephalon - Olfaction

(2) Hypothalamus - Pituitory

(3) Cerebellum - Balance

(4) Medulla oblongata - Temperature regulation

Q.80 Internal carotid artery supply blood to - **[RPMT-2003]**

(1) Kidney (2) Liver

(3) Heart (4) Brain

Q.81 Which one of the following characters is not typical of the class Mammalia ? **[AIPMT-2005]**

(1) Seven cervical vertebrae

(2) Thecodont dentition

(3) Alveolar lungs

(4) Ten pairs of cranial nerves

Q.82 Parkinson's disease (characterized by tremors and progressive rigidity of limbs) is caused by degeneration of brain neurons that involved in movement control and make use of neurotransmitter. **[AIPMT-2005]**

(1) acetylcholine (2) norepinephrine

(3) dopamine (4) GABA

Q.83 Which one of the following statements is correct ? **[AIPMT-2006]**

(1) Neither hormones control neural activity, nor the nervous control endocrine activity

(2) Endocrine glands regulate neural activity, but not vice versa

(3) Neurons regulate endocrine activity, but not vice versa

(4) Endocrine gland regulate neural activity, and nervous system regulates endocrine glands

Q.84 Which one of the following does not act as a neurotransmitter? **[AIPMT-2006]**

(1) Norepinephrine (2) Cortisone

(3) Acetylcholine (4) Epinephrine

Q.85 Which of the following two systems are opposite in action to each other ? **[MANIPAL-2004]**

(1) Nervous - Sensory

(2) Nervous - Endocrine

(3) Sensory - Endocrine

(4) Parasympathetic - Sympathetic

Q.86 Which of the following structures is present only in mammalian brain? **[MPPMT-2004]**

(1) Corpus luteum (2) Corpus striatum

(3) Corpus fibrosum (4) Corpus Callosum

Q.87 You are watching a horror movie and you notice your heart is beating fast and mouth is dry. It is because of - **[KERALA PMT-2005]**

(1) Flight and flight response

(2) Autonomic nervous system

(3) Sympathetic nervous system

(4) Both 1 and 3

Q.88 Tongue is under the control of - **[CPMT-2004]**

(1) Trigeminal (2) Facial

(3) Autonomic system (4) Glossopharyngeal

Q.89 Number of cranial nerves in forg is - **[CPMT-2005]**

(1) Ten (2) Twelve

(3) Ten pairs (4) Tweleve pairs

Q.90 Intercellular communication in multicellular organism occurs through - **[CPMT-2004]**

(1) Nervous system only

(2) Digestive system only

(3) Respiratory system only

(4) Both nervous and endocrine system

Q.91 Which of the following substances leads to the inhibition of central nervous system? **[CPMT-2004]**

(1) Glycine (2) GABA

(3) Norepinephrine (4) Both 1 and 2

Q.92 Which one of the following pairs of structures distinguishes a nerve cell from other types of cell ? **[AIPMT-2007]**

(1) Vacuoles and fibres

(2) Flagellum and medullary sheath

(3) Nucleus and mitochondria

(4) Perikaryon and dendrites

Q.93 5^{th} cranial nerve of frog is called - **[BHU-2006]**

(1) Optic nerve (2) Vagus

(3) Trigeminal (4) Opthalmic

Q.94 If dorsal root of spinal cord is broken down then its effect is - **[JIPMER 2006]**

(1) No effect on impulse

(2) Impulse is transmitted fast

(3) Impulse is transmitted but slowly

(4) No impulse is transmitted from receptor

Q.95 Acetylcholinesterase enzyme splits acetyl-choline into - **[Pb. PMT 2005]**

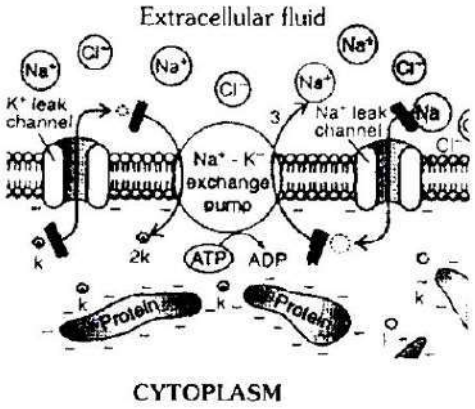
(1) Acetone and choline

(2) Acetic acid and choline

(3) Amino acid and choline

(4) Aspartic acid and acetylcholine

Q.96 In the given diagram which stage of conduction of nerve impulse through nerve fibre is observed? **[Gujrat CET 2006]**



(1) Polarization (2) Repolarization

(3) Depolarization (4) Resting potential

Q.97 Olfactory area is present in : **[MH. CET 2005]**

(1) Frontal lobe (2) Parietal lobe

(3) Temporal lobe (4) Occipital lobe

Q.98 Somesthetic or post central area is responsible for : **[Uttarakhand PMT 2006]**

(1) initiation of motor impulses for voluntary muscles

(2) initiation of motor impulses for involuntary muscles

(3) perception of pain, touch and temperature

(4) coordination of speech

Q.99 Feelings of anger, pain and pleasure are experienced through : **[Gujarat CET 2006]**

(1) Frontal lobe (2) Parietal lobe

(3) Limbic system (4) Reticular system

Q.100 The caranial nerve that supply the external rectus muscle is : **[EAMCET 2006]**

(1) II (2) III

(3) VII (4) VI

Q.101 Dilation of pupil of human eye is caused by: **[CPMT 2006]**

(1) parathormone

(2) sympathetic

(3) parasympathetic nerve

(4) autonomic nervous system

Q.102 Nerve impulse is generated when nerve cell undergoes : **[Chandigarh CET 2006]**

(1) Depolarization (2) Repolarization

(3) Hyperpolarization (4) Pseudopolarization

Q.103 Nerve impulse initiates with the movements of: **[RPMT 2006, BCECE 2007]**

(1) K^+ (2) Na^+

(3) Ca^{2+} (4) Mg^{2+}

Q.104 Which part of brain controls intellectual ability? **[DPMT 2007]**

(1) Frontal lobe (2) Parietal lobe

(3) Temporal lobe (4) Occipital lobe

Q.105 Occipital lobe is connected with : **[MH. CET 2007]**

(1) smell (2) vision

(3) speech (4) hearing

Q.106 **Assertion (A) :** The imbalance in concentration of Na^+, K^+ and proteins generates resting potential.

Reason (R) : To maintain the unequal distribution of Na^+ and K^+, the neurons use electrical energy. **[AIIMS 2007]**

(1) Both (A) and (R) are true and (R) is the correct explanation of (A)

(2) Both (A) and (R) are true but (R) is not the correct explanation of (A)

(3) (A) is true statement but (R) is false

(4) Both (A) and (R) are false

Q.107 During the conduction of nerve impulse, the action potential is the result of movement of: **[Wardha 2007]**

(1) Na^+ from intracellular fluid to extracellular fluid

(2) Na^+ from extracellular fluid to intracellular fluid

(3) Na^+ towards both directions

(4) None of the above

Q.108 Which of the damaged cells cannot be repaired? **[JCECE 2007]**

(1) Liver cells (2) Brain cells

(3) Bone cells (4) Epidermal cells

Q.109 The IV cranial nerve is : **[DPMT 2008]**

(1) facial (2) trochlear

(3) olfactory (4) oculomotor

Q.110 Adrenaline is equivalent to which neurotransmitter ? **[Orissa JEE 2009]**

(1) GABA (2) Serotonin

(3) Epinephrine (4) Norepinephrine

Q.111 All sensory pathways to the cerebral cortex synapse at the : **[AMU 2009]**

(1) pons (2) thalamus

(3) cerebellum (4) hypothalamus

Q.112 A man is admitted to a hospital. He is suffering from an abnormally low body temperature, loss of appetite and extreme thirst. His brain scan would probably show a tumour in : **[Karnataka CET 2009]**

(1) pons (2) cerebellum

(3) hypothalamus (4) medulla oblongata

Q.113 The nerve centres which control the body temperature and the urge for eating are contained in : **[CBSE 2010]**

(1) Pons (2) Thalamus

(3) Cerebellum (4) Hypothalamus

Q.114 The optic lobes in humans are represented by the corpora : **[AMU 2010]**

(1) bigemina (2) arenacea

(3) striata (4) quadrigemina

Q.115 In a medullated nerve fibre, the conduction of impulse is faster due to the presence of : **[Orissa JEE 2010]**

(1) Pericytes

(2) Nissl's granules

(3) Endoneurium and Epineurium

(4) Myelin sheath and Node of Ranvier

Q.116 Which of the following is not an effect of sympathetic nervous system ? **[AMU 2010]**

(1) Dilation of the pupil

(2) Inhibition of peristalsis

(3) Elevation of blood pressure

(4) Stimulation of saliva secretion

Q.117 When a neuron is in resting state i.e. not conducting any inpulse, the axonal membrane is **[CBSE 2011]**

(1) Comparatively more permeable to Na^+ ions and nearly impermeable to K^+ ions

(2) Equally permeable to both Na^+ and K^+ ions

(3) Impermeable to both Na^+ and K^+ ions

(4) Comparatively more permeable to K^+ ions and nearly impermeable to Na^+ ions.

Q.118 The human hind brain comprises three parts, one of which is : **[AIPMT Pre 2012]**

(1) Corpus callosum (2) Cerebelium

(3) Hypothalamus (4) Spinal cord

EXERCISE – 4 AIIMS SPEICAL

These questions consist of two statements each, printed as Assertion and Reason. While answering to choose any one of the following four responses.

(1) If both Assertion & Reason are True & the reason is correct explanation of the Assertion.

(2) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.

(3) If Assertion is True but the Reason is False.

(4) If both Assertion & Reason are false.

Q.1 **A :** All of the cranial nerves are said to be mixed nerves.

R : All cranial nerves carry both sensory and motor nerve fibres simultaneously.

Q.2 **A :** Facilities like intelligence, will power, emotions, learning, etc. are more developed in man.

R : Cerebral cortex of man has large number of gyri and sulci.

Q.3 **A :** Motor neuron terminates on a motor end plate at the neuromuscular junction.

R : Motor end plate acts as receptor for detecting changes in the muscle fibres.

Q.4 **A :** Giant squids possess very thick nerve fibres.

R : The nerve impulse travels faster in a thicker nerve fibre than in a thinner one.

Q.5 **A :** The chemicals stored in the synaptic vesicles are termed as neurotransmitters.

R : Synaptic vesicles release these chemicals in the synaptic cleft.

Q.6 **A :** Nerve impulse can never be transmitted from dendrite or cell body of one neuron to the axon of the next neuron, across a synapse.

R : This happens because of the synaptic delay at each synapse.

Q.7 **A :** Nerve impulses are conducted more rapidly in nonmyelinated nerve fibres than in myelinated ones.

R : Mylein sheath insulates the nerve fibre and prevents its depolarization.

Q.8 **A :** Salivation caused by taste of food is regarded as a conditioned reflex.

R : Conditioned reflex is evoked immediately without any previous encounter with the stimulus exciting it.

Q.9 **A :** Nervous system serves its coordinating role in several ways.

R : Neuron conducts nerve impulses.

Q.10 **A :** White matter is present in the brain.

R : Whiteness of white matter is due to white pigment.

Q.11 **A :** Brain and spinal cord has a common covering.

R : Both the brain and spinal cord possess meninges.

Q.12 **A :** Cerebrospinal fluid is present throughout the central nervous system.

R : CSF has no such function.

Q.13 **A :** A person has lost most of its intelligence, memory and judgement.

R : A person has operated a tumor located in the cerebrum.

Q.14 **A :** The brain stem contains centres for controlling activities.

R : Brain stem is very sensitive.

Q.15 **A :** Spinal cord has a column of both grey and white matter.

R : Grey matter forms the central spinal canal.

Q.16 **A :** After hearing a sound, nerve impulse passes from neurons to the brain.

R : The neurons which pass nerve impulses from the body organ to the brain is called afferent neuron.

Q.17 **A :** Motor end plate is a neuromuscular junction.

R : Motor end plate is the junction between motor neuron and muscle fibre.

Q.18 **A :** Nerve conduction is the one way conduction.

R : Nerve impulse is transmitted from dendrite terminals to axon terminals.

Q.19 **A :** Nerve impulse is originated from threshold stimulus.

R : Threshold stimulus is the minimum strength of stimulus which is applied to the nerve fibre to stimulate it effectively.

Q.20 **A :** Taste of food causes salivation even in a new-born baby.

R : Food causing salivation is an unconditioned reflex.

Q.21 **A :** Corpus callosum is present in the space between the pia and arachnoid maters.

R : It serves to maintain a constant pressure inside the cranium.

Q.22 **A :** With the evolution of multicellularity, it became imperative to develop nervous system.

R : Special senses such as vision, hearing are produced by sense organs associated with the nervous system.

Q.23 **A :** The premotor area of frontal lobe of the cerebral cortex is very important for vision and hearing.

R : The premotor area contains nerve centres for visual and hearing sensations.

Q.24 **A :** All motor neurons are efferent neurons.

R : Motor neurons conduct nerve impulses from the spinal cord to the brain.

Q.25 **A :** All sensory neurons are said to be efferent in nature.

R : Sensory neurons carry nerve impulses from the peripheral tissues to the CNS.

Q.26 **A :** Some areas of the brain and spinal cord look white.

R : This because cell bodies of neurons are situated in those areas.

Q.27 **A :** Nervous system of man is formed of two types of matter-Grey and White matter.

R : In human brain, grey matter is external while white matter is internal.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A Question I am unable to solve in first attempt	COLUMN : B Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

SENSE ORGANS

Animals possess some specialised structures to perceive the different type of changes (= stimuli) occurring in their external environment. These structures are known as **sense organs**. After receiving these stimuli, sensory organs transmit these to the central nervous system through the sensory nerve fibers.

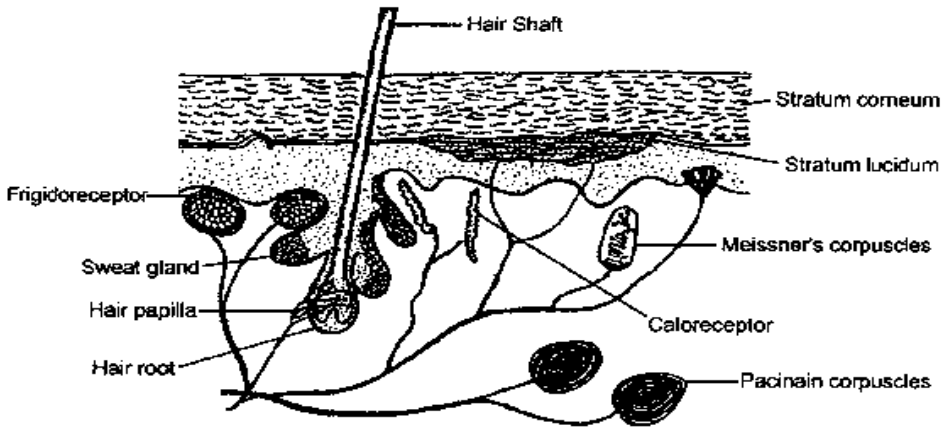
A sensory organ is only sensitive to a specific kind of stimulus to which it is specialized like temperature, chemicals, touch, light etc. Based on their location in the body sensory organs are of three. types :

1. **Exteroceptors : -** These sense organs receive stimuli from external environment because they remain in contact with the external environment. Example – nose, eyes, tongue, ears and skin.
2. **Interoceptors :** These sensory organs are associated with internal environment of body and receive the changes taking place in the internal environment. Examples – changes in the composition of blood, concentration of carbon-dioxide, hunger, thirst, asphyxia etc.
3. **Proprioceptors :** These sensory organs are present in joints, tendons, muscles and connective tissues which perceive the tension and pressure exerted during the activities of equilibrium maintenance and orientations of body.

In human body, five types of exteroceptors are found which are known as sense organs. The main sense organs include skin, eye, nose, ear and tongue.

CUTANEOUS RECEPTORS

Skin envelopes the entire body, and it is considered as tango receptor (fig.) Numerous sensory papillae are found in the dermis of skin to receive the stimuli of touch, pressure, cold, heat, temperature and pain. All these are of simple type of receptors. These sensory structures of skin receive impulses from the nerve endings in skin. These are of following types -

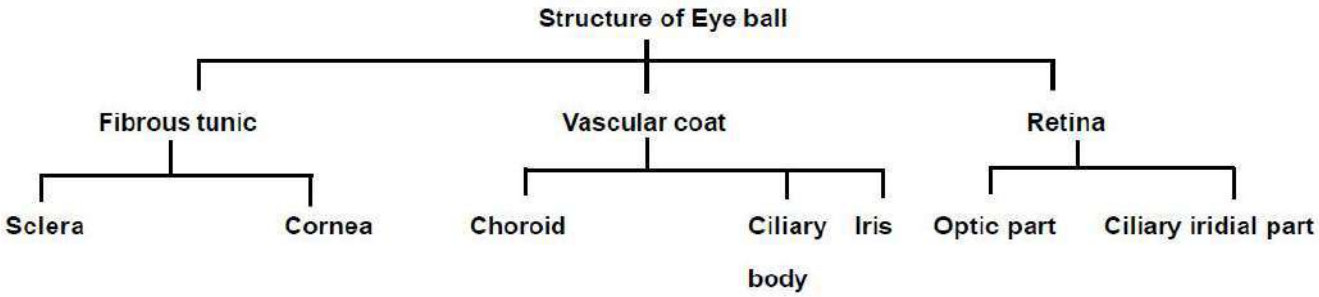


1. **Tactile Receptors : -** These receptors are present nacked endings of sensory nerve fibres on the hair follicles in the dermis of skin. These are excited when the hairs come in contact with some object.
Extensively branched (arborized) endings are of sensory nerves are found in the papillae of dermis. These endings are very small sized encapsulated structures called sensory corpuscles. Those which are cylindrical and sensitive to touch are called **Meissner's corpuscles**. Their number is much more in nipples, lips, glans penis, palm, sole and in fingers. The number of these corpuscles decreases as a person grows

older. The corpuscles sensitive to the strong and sustained contacts (pressure) and situated deep in the dermis and called as **Pacinian corpuscles**.

2. **Pain Receptors (Algesireceptors) :** Numerous branched sensory nerve fibres are scattered among the epidermis as well as dermal cells of skin. These possess nacked nerve endings. These nerve endings are sensitive to chemical, electrical, and mechanical stimuli, which cause the sensations of pain in body.
3. **Thermo Receptors :** A network of sensory nerve fibres is situated closely to the hair follicles in dermis of skin. These nerve fibres are sensitive to the stimuli related to temperature, These thermoreceptors make a person aware to stimuli of cold, heat etc. Because of this sense perception our hairs get erected during excessive cold. The sensory organs excited by cold and heat are known as **frigidoreceptors**.

EYE



- Eye and ear also called **"teleoreceptor"**, because these receive impulse from far places.

(A) Eye (Photoreceptor) : -

- These are photosensitive organs. Eye ball measures about 2.5 cm in diameter.
- Each eye is an empty ball like round structure, it is called eye ball. Each eye ball is situated in the notch of frontal bone of the skull. It is called "Eye orbit". Human eyes are situated in eye orbit lateral to nose.
- Only $1/5^{th}$ part of whole eye is seen from out side the eye orbit, called as cornea.
  Remaining $4/5^{th}$ part is in the eye orbit, called sclera.

(1) Eye lids or palpebrae : -

There are two muscular eyelids for the protection which having lashes at one side. Both the eyelids are named according to their situation i.e. upper & lower eyelids.

- Eyelids are immovable in snakes. Eyelids of fishes are absent.
- There is present one more transparent membrane on the cornea. It is called nictitating membrane or third eye lid. It is actively working in rabbit. It is found form of constricted condition at one corner of eye ball, but at the time of need, it may be expanded over entire eye ball.
- Nictitating membrane is vestigeal in human. It is also called **"Plicasemilunaris"**
- Eye lashes are found at both the eyelids.

(2) Glands : - For the cleaning and for lubrication/moisturising the exposure part of eye.
Following glands are founds in each eye.

(a) Meibomian glands : - These are present at Inner surface of eyelids. They secrete an oily substance, which spread over cornea.

- It prevent firction between two eye lid.
- It also help in frictionless movement of eyelid.

(b) Lacrimal glands : - At outer angle of each eye ball and assoicated with accessory lacrimal gland, which secrete water like substance, which moistures the cornea, eyelids and conjunctiva and cleans it. This water like subatnace is called "Tear". (Slightly alkaline contains bacteriolytic enzyme Lysozyme)

- Tear glands activate after four months of birth in human child.

(c) Gland of zeis : It is situated in margin of eye lid.

Harderian glands : - These are found inside the lower eye lids. These moisten the nictitating membrane.

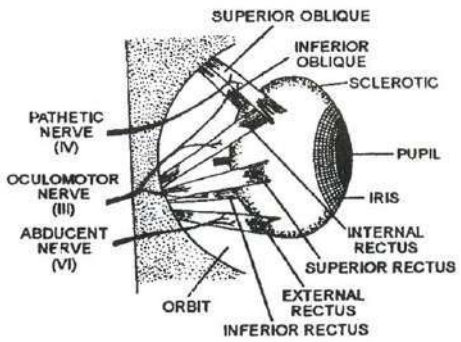
- Harderian glands are absent in rabbit & **human**.
- In place of harderian glands, in mammals, meibomian glands are present. But in some mammals e.g. rats, shrews, whales etc., these harderin glands are found.
- These glands are also found in frog and birds.

(d) Gland of moll : - These are modified sweat gland found in the eye lashes.

(3) Muscles of eye balls : -

There are present 6 voluntary muscles in the eyeball which help to rotate the eye ball into eye orbit. Out of these 4 are rectus muscles and 2 are oblique muscles. They are also called as extra occular muscles.

- Lateral or External Rectus muscle rotates the eyeball towards outside i.e. from nose to ear. Medial or Internal rectus muscle rotates the eyeball toward inside i.e. from **ear** to nose.
- Superior rectus muscle and inferior oblique muscle collectively help the eyeball to rotate upwards.
- Inferior rectus muscle and superior oblique muscle collectively help the eyeball to rotate downwards.
- Rectus and oblique muscles collectively rotate the eye ball to all the sides around its axis.



- Any defect in one of the these eyeball muscles (e.g. muscle may remain small or extra large than required) causes **strabismus** or **squint eyes**. In this defect, eye ball remains inclined to any of the one side. Eye muscles are innervated by occulomotor (III). Pathetic (IV) and Abducens (VI) Nerve.

INTERNAL STRUCTURE OF EYE BALL

The wall of remaining eye ball has three layers.

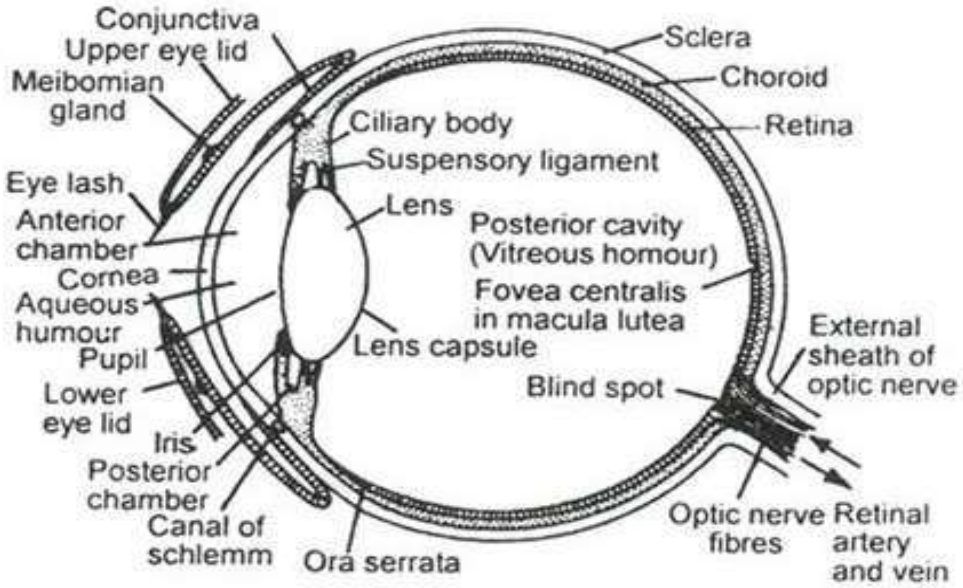
(1) Fibrous tunic : -

- It is mesodermal in origin.
- It is the outermost covering of eye ball. It is made up of hard and thick fibrous connective tissue. It is also called as sclerotic layer
- The layer is divided into 2 parts.

(a) Cornea : -

It is the outer visible part of fibrous tunic.

- The joint between cornea and sclerotic layer is called **"Limbus"** or "Sclero – corneal junction". Cornea transplantation is successful because it lacks blood vessels.



(b) Sclera : -

It is made up of white, hard, opaque thick fibrous connective tissue in mammals but in frog, it is made up of cartilage. It is the inner portion of eye ball. It is non-vascularised. This layer is of white colour, so it is also called "White of eye"

Inner layer of eyelids remain streched over anterior part of sclera (limbus) in the form of translucent membrane. It is called **conjunctiva**. It is made up of epidermis of skin. The thinnest epidermis is extend up to margin of cornea i.e. conjunctiva is the thinnest epidermis in animal body.

(2) Vascular tunic : -

- It is also mesodermal in origin.
- It is made up of network of blood capillaries.
- It is the middle layer of eyeball Due to the presence of network of blood capillaries it is highly vascularized. Melanin pigment is found in this layer. Due to the presence melanin pigment eye looks like green, blue, brown, black in colour. Eyes of rabbit are red due to red melanin pigments, and in man eyes may be brown, black, blue, green according to the melanin present in it.

This layer has three parts : -

(a) Choroid layer : -

Choroid layer is the part of vascular tunic which lie below the sclerotic layer.

It contains abundant pigment cells & blood vessels.

It is dark brown. It darkens the cavity of eyeball to prevent internal reflection of light.

It nourishes the retina.

(b) Ciliary body : -

It is the lower swollen portion below limbus.

It has ciliary processes which project into eyeball.

It has ciliary muscles (i) circular (ii) meridional.

Inner end of meridional is attached to choroid & outer end at the junction of sclera and cornea.

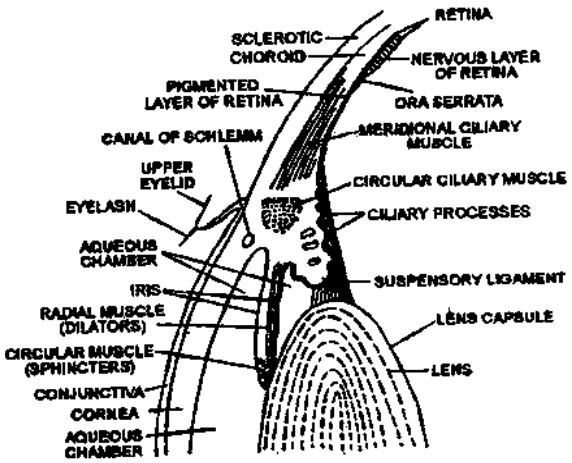
(c) IRIS : -

Choroid layer of vascular tunic separates from sclerotic layer (Just after the cornea) inclines towards inner side and forms a coloured screen, it is called **Iris**. **Muscles of Iris are ectodermal in origin.** There is present an aperture in the Centre of Iris, it is called **Pupil**. Light rays enter in the eye ball through pupil.

2 types of muscles are found with Iris.

(i) Radial dilatory muscles : -

These are outer Involuntary muscles, these are expanded in the iris breadth wise. Iris becomes thick and narrow if these muscles contract and diameter of pupil is increased at that time. It happens in dim light, it is called **Mydriasis**.



(ii) Circular sphincter muscles : -

These are scattered in inner part of iris. Due to the contraction (In bright day light or high flashes of light) of these muscles in high light, Iris expands breadth wise and diameter of pupil is decreased. It is called **miosis**.

Iris controls the intensity of light by increasing or decreasing the diameter of pupil i.e. Iris acts as diaphragm of a camera. Except muscle of iris & ciliary body all vascular tunic of eye ball is **mesodermal** in origin. The parasympathetic fibres constrict & sympathetic fibre dilate the pupil. Colour of eye like blue, gray, brown is layer of pigmented cells.

(3) Neurosensory tunic : -

- This layer is ectodermal in origin.
- It is the inner most layer of eye ball and has 3 parts : -

(a) Pars ciliaris : - This part is attached with ciliary bodies. There are present spine like projections at the surface of ciliary body, these are called **"Orra serrata:**

(b) Pars iridica : - This part lies just after the iris. It has a layer of pigmented cells.

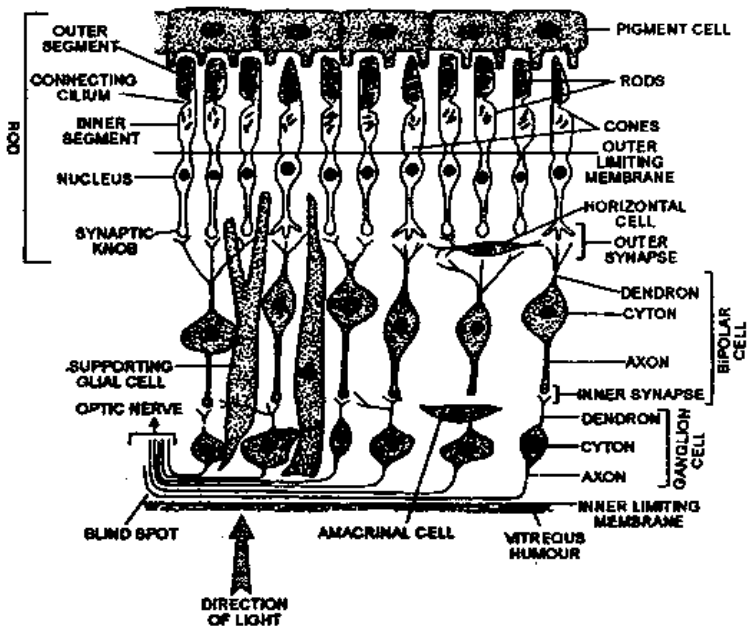
Pars iridica and pars ciliaris are made up of simple cuboidal epithelium.

(c) Pars optica : - It is also called **Retina** It is the part just below the choroid layer.
Structure of retina is complicated. It has following layers.

(i) Pigmented layer : - It is the outer most layer. In the cells of this layer, pigment is found called melanin (receptor cells.)

(ii) Sensory layer : - This layer is made up of specialized sensory cells. Rods and cones are found in this layer. Receptor cells are also known as photoreceptors/visual cells.

- Rods are long, thin, cylindrical structures/cells. These are nmerous in number. (1110 – 1125 Lacs)
- Rods are differentiates the light and dark. They are more sensitive than cones.
- A purple coloured pigment is found in rods called **Rhodopsin/Visual purple.**
- Cones are thick and small cells which differentiate among different colours in full light (65 Lacs) **Iodopsin/Visual violet** is present in cones.
- Only rods are found in the retina of owl, because it is nocturnal animal, unlike hen which has only cones in its retina.
- Cones are absent in the retina of most of the nocturnal mammals like shrews, bats etc. squirrel has only cones in its retina.
- A neurons layer is present just below the rods and cones. The synapse layer which, developes between photo sensory cells and bipolar neurons are called as outer plexiform layer.
- Each bipolar neuron has a dendron and one axon.



- Axons are jointed together by specific nerve cells, called **Amacrine cells**. Such neurons do not have nerve fibres.
- In between bipolar neurons, supporting cells are found which, are called as **Muller's cells**.

(iii) Ganglionic layer : - This layer is made up of multiple nerve. The dendrites of multipolar nerve form synapses with axons of bipolar neurons. This layer of synapse is called as inner plexiform layer.

Axons of all nerve cells combine to form optic nerve. This optic nerve penetrates the retina and goes to brain.

At the point place, at which retina is pierced by optic nerve, cones and rods are absent. So no image will be percieve at that place. This point place is known as **"Blind spot"**.

Just above the blind spot at the optical axis of eye ball, there is a place, where only cones are present. Yellow pigments is found (xanthophyll) in these cones. So this place is known as **yellow spot** or **macula lutea** or **Area centralis**.

- A groove or notch is found in area centralis, called **fovea centralis**. Fovea centralis contain only cone cells.
- Fovea centralis is most sensitive part of eye. Cones are some what obliquely placed at this place. An enlarged image of object is formed here.

Differences between Blind spot and Yellow spot

Blind spot (Optic disc)	Yellow spot (Macula lutea)
It lies a little away from the yellow spot.	It lies exactly opposite the centre of the cornea.
It contains no pigment.	It has a yellow pigment.
Optic nerve starts from this spot.	No nerve starts from this spot.
It lacks a depression.	It has a shallow depression, the fovea centrallis, at its middle.
It lacks visual receptors and is insensitive to light.	It has visual receptors and is sensitive to light.
The eye coats are absent at blind spot.	Eye coats are present at yellow spot.
No image is formed at this place.	Image is formed at this place.

Ora seratta : The function retina terminates anteriorly along an irregular border, the ora seratta.

- **Lens : -** It is ectodermal origin.
- A transparent, biconvex lens is present just after iris. In frog, lens is spherical in eyebal.
- Lens is connected by ciliary body with the help of **"Suspensory ligaments"** also called as **zonula of zinn"** or **zonules**. These ligaments are flexible and this can slide the lens and can change it's focal length. Lens ans suspensory ligament divides the cavity of eyeball into two chambers.

(a) Aqueous chamber : -

The part of eye ball which lies between cornea and lens is filled with an akaline liquid, it is called aqueous humor. It is a type of transparent tissue fluid. It's divided aqueous chamber into two parts.

(i) Anterior chamber : -

This chamber lies between cornea and iris, it is also called as Venous chamber. Veins carry CO_2, metabolic wastes outside from here.

(ii) Posterior Chamber : -

This chamber lies between iris and lens, it is also called as arterial chamber. Arteries supply O_2 and nutrients here.

(b) Vitreous chamber : - Cavity of eye ball which lies between lens and retina is called vitreous chamber. A jelly like liquid (transparent and thick like albumin) is filled in this chamber, This is called vitreous humor.

Differences between Aqueous humour and Vitreous humour

S.No.	*Aqueous humor*	*Vitreous humor*
1.	It occurs in aqueous chambers.	It occurs in vitreous chamber.
2.	It is a watery fluid	It is a jelly-like substance.
3.	It is secreted by ciliary processes.	It is apparently secreted by retina during development of eye.;
4.	It is continuously absorbed into blood and replaced.	It is not absorbed or replaced
5.	It contains most of the diffusible substances of the plasma	It consists of water (99%) protein vitrein, hyaluronic acid and collagen fibres.
6.	Obstruction in its flow may damage retina by increasing intraocular pressure.	It does not flow.

- In this liquid 99% water, some salts, a mucoprotein called vitrin and a mucopolysaccharide-Hyaluronic acid are present. Gelatinous nature of vitreous humor is depend upon fibrillar protein & hyaluronic acid. It is form during embryonic stage. In this chamber Hyalocytes cells are found.
- Aquous humor and vitreous humor both the liquids are secreted by the glands of cilliary body. Canal of Schlemm is present between limbus and ciliary body . Aqeous humor leak out by **canal of schlemm** into blood capillaries and again reach upto their veins.
- Both these liquids maintain proper pressure inside the cavity of eye ball. These check the eye ball from collapsing.
- If this canal of schlemm is blocked by any reason and fluids do not return back to veins liquid is increased in the chambers of eye.
- When amount of this humor is increased in the eye chambers then pressure is increased inside the eye ball . Thus retina pressure is increased. This is known as **glaucoma.**
- A thin **Hyaloid canal or Cloquet's or Cloquet's canal** is also found in vitreous humor from blind spot to central point of lens. It provide nourishment to the developing lens which gradually atrophied.

WORKING OF EYES

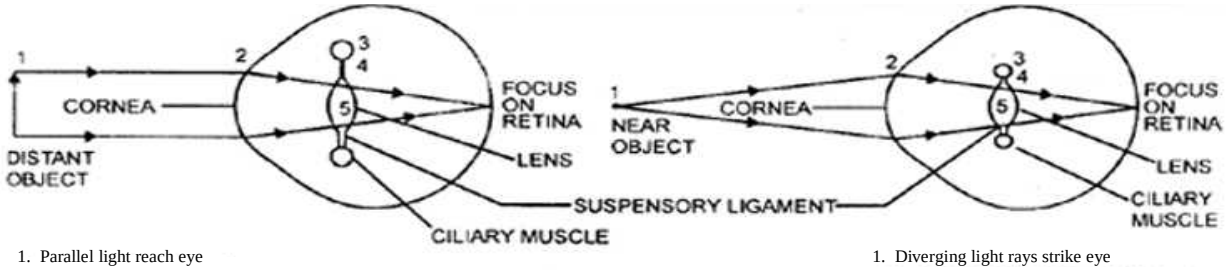
- Light ryas emitted by any object enter the eye. A small, real and inverted image of object is formed at retinal Sensory cells of retina are sensitized, and optic nerve carries this impulse to brain . At this time animal able to see the object.
- Cornea, aqueous humor biconcave lens and vitreous humor completely refract the light rays coming from ojbect. As a result of this an inverted image is formed at retina. Just like diaphragm of a camera. is Iris of eye, decreases or increases the diamter of pupil acoording to amount of light. Iris expands to decrease the pupil in high intensity of light so a small amount of light touches the retina. When light is dim, iris itself constricts to increase the diameter of pupil.

ACCOMODATION OR FOCUSSING -

The ability to change the focal length of lens by changing the curvature of lens, is called **accommodation** power.

- Only mammals and birds have this accommodation power in their eyes.

- This ability is very less in frog and it depends on the sliding of lens forward and backward to some extent.



1. Parallel light reach eye
2. Cornea refracts light rays
3. Ciliary muscle relaxed
4. Suspensory ligament under maximum tension
5. Lens flattened

1. Diverging light rays strike eye
2. Cornea refracts light rays
3. Ciliary muscle contracted
4. Suspensory ligament loose
5. Lens thickened

Diagram showing changes during accommodation

- In normal condition muscle fibres of ciliary body remain relaxed and lens is stretched by its suspensory ligaments, and due to this lens is flat. A flat lens has more focal length. As a result of this eye can see long distant objects easily.
- To see near by objects, sphincter muscles of ciliary body contract and ciliary body becomes broad, suspensory ligaments becomes loose and relaxed. As a result of this relaxation lens becomes biconvex, and now tis focal length is reduced. Now animal is able to see near by object easily.

TYPES OF VISION :

(a) Monocular vision or panoramic vision : - Most of the vertebrates have their eyes situated on the lateral sides of head and due to this animal is capable to see the large area of both the sides. It is called monocular vision.

e.g. rabbit, frog, horse (Most of the herbivorous animals have this type of vision)

(b) Binocular vision : - Most of the carnivores mammals have eyes in front of their heads and side by side, so as to focus on one object by both the eyes. It is called binocular vision e.g. Man, monkeys and apes.

(c) Stereoscopic vision : - It is three dimensional vision found in human.

(d) Telescopic vision : - This is found in birds.

- Largest eyeballs are found in horse.
- Sharpest vision is found in eagle.
- Shortest sight is found in monkeys.

Chemical explanation of vision -

Cones and rods of eye are stimulated by light rays. It is a chemical event.

- A shiny visual purple pigment is found in rods of retina called Rhodopsin. It is formed by a protien **opsin** and a coloured pigment **Retinal,** just like haemoglobin of blood.
- Opsin is also called **scotopsin.**
- In bright light. rhodopsin is decomposed into opsin protein and retinal pigments. This chemical change is sight impulse. This sight impulse is carried by optic nerve to the brain, and animal is able to see.
- In dark, rods synthesize rhodopsin again with the help of opsin, retinal and enzyme.

- This is the reason that we can not see any thing, when we move to dark place from a enlighted place (for some time only) In the same way we are unable to see in light if we are coming from dark place because it will take time to synthesize or decompose the rhodopsin **it is called adaptation of eye.**
- For resynthesis of rhodopsin, animal blinks its eyelids.
- Retinin is fomred by vitamin A so deficiency of vit A caused night blindness.
- Cones able us to differentiable among colours and bright light. Cones have a pigment called Iodopsin in place of rhodopsin of rods. It is decomposed into **photopsin** and **retinal.**
  There are three types of cones in retina : -
  (a) Erythrolab - Red cones (erythropsin – Sensitive to red)
  (b) Chlorolab - Green cones (Chloropsin – Sensitive to green)
  (c) Cynolab - Blue cones. (Cynopsin – Sensitive to blue)
- We are able to acknowledge different colours due to these three types of cones their combination.
- In moon light we cannot see colours because only rods are functioning . Due to low light level cones are not functining.
- **Red, green** and **blue ar the primary colours.**
  Dimlight vision - Scotopic vision
  Bright light vision - Photopic vison
- The eyes of some animals shine at night, because in the eyes of these animals, there is a pigment just outside the retina in the choroid layer of eyeball, which reflects the light rays coming from retina. This layer is called **Tapetum.** Due to this layer, these animals are capable to see in dark also.
- Kangaroo, hoofed mammals, elephants, whales etc. are having a silver shining layer of fibrous connective tissue called Tapetum **fibrosum.**
- In Elasmobranch fishes a reflecting colour pigment called **Guanine** is present is tapetum layer so it is called **tapetum lucidum.**
- Hunters and carnivore mammals like dogs, cats, tiger etc. have a layer in their retina called **tapetum cellulosum.**
- In the eyes of birds a comb like structure of blood vessel is present which, is called **pecten.**
- **Emmetropia : -** Normal vision of eyes is called emmetropia.

Some important defects of eyes : -

1. Hypermatropia (far sightedness) : -

- In this defect of eye, person is able to see object placed at far distance but is unable to clear see obejcts close to him or her.
- This defect is due to small size of eyeball or flatness of lens. In this defect image is formed **behind the retina.** To cure this defect person should wear convex lenses in spectacles.
- Sometimes in old age this defect may occur due to reduction in the flexibility of lens or ciliary body, then it is known as **presbyopia.**

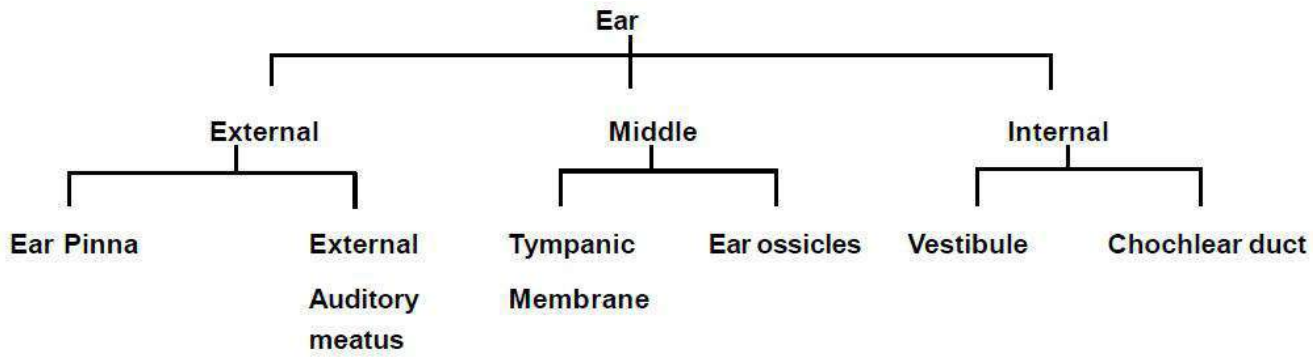
2. Myopia or Nearsightedness or short sightedness : -

- In this defect of eye, person is able to see objects near/close to him or her but is unable to see objects placed at far distance.
- This is due to enlargement of eyeball or increased convexity of lens.
- In this defects image is formed before the retina because light rays coming from distant objects converge before retina.

- To overcome this defect person should wear concave lenses in spectacles.

3. **Astimgmatism : -** In this defect curvature of cornea is changed as a result of that light rays do not focus on macula lutea but somewhere else, causing incomplete blurred vison. This defect may be cured by cylinderical lenses.
4. **Night blindness : -** This is due to deficiency of vit A. In this disorder synthesis of Rhodopsin is decreased.
5. **Xerophthalmia : -** it is due to keratinisation of cunjunctiva and cornea, and conjuctiva becomes thick. It is also due to deficeincy of vit A.
6. **Trachoma : -** In this defect of eye, a watery fluid oozes out from eyes in excess amount so eyes become red due to irritation. It is caused by a mircorbe Chlamydia trachomatis.
7. **Strabismus : -** It is due to loosening or contraction of the any of 6 voluntary muscles which give the proper position to the eye ball in its orbit. Thus eye ball inclines towards one side of orbit. It is strabismus or squint eyes. Particular muscle may be cured by operation and this defect is cured.
8. **Cataract : -** In this defect, lens becomes more solid, brown or more flat. It occurs in old age mostly. The lens becomes opaque, and reduces its power of accommodation. At this stage person can not see. A new lens is administered in place of defective lens by operation.
9. **Glaucoma : -** If the canal of schlemm is blocked in eyeball, aqueous humour can not return to veins again as a result pressure is increased in eye chambers and retina is damaged and person becomes totally blind.
10. **Photophobia : -** In this defect proper image is not formed in bright light.
11. **Colour blindness : -** It is genetic disorfer of X-chromosome. It is due to recessive gene. Colourblind persons can not different in red and green colour.
12. **Night blindness -** Also called nyctalopia. Due to defficiency of vitamin A (Retinol).
13. **Hystagmus** - Pendular movement of eye ball occurs.

EAR



SENSE ORGAN – EAR :

(B) Statoacoustic organ ear : - These are also called phonoreceptors.

- All the vertebrates have one pair of ears back to the eyes,

  There are two main functions of ears : -

(1) To receive sound waves, hearing

(2) To maintain body balance. Main function of ear is to maintain the balance of body.

Structurally ear may be divided into three parts : -

(A) External ear (B) Middle ear (C) Internal ear

(A) External ear : -

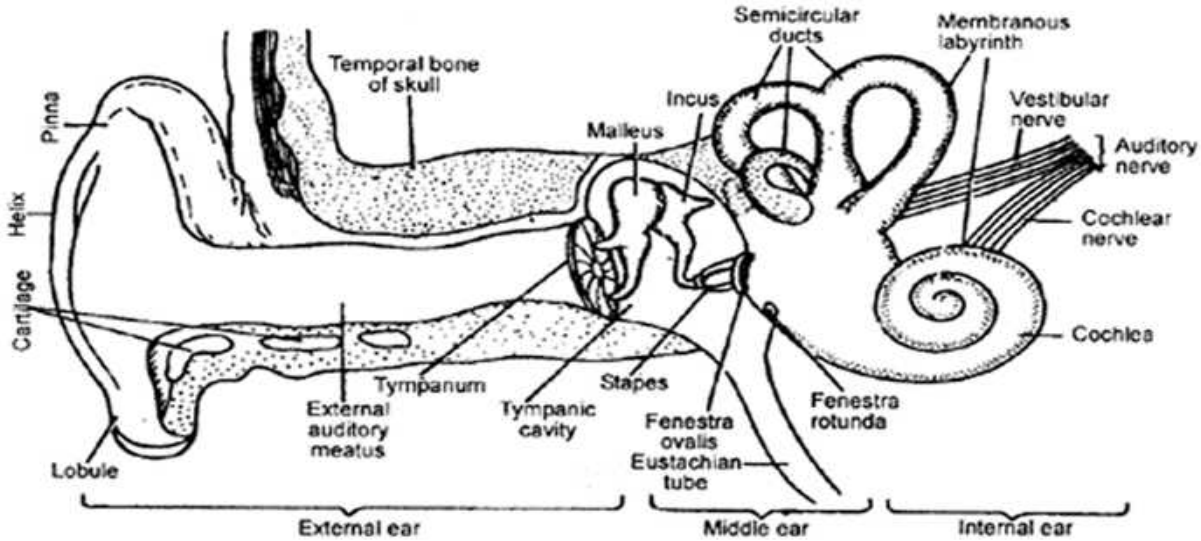
It is the outer part of ear. It is well developed in mammals only. External ear may be divided again into 2 parts :

(I) ear pinna (II) ear canal

(I) Ear pinna : - These may be small or large, **fan like** structure, important featrue of mammals, but absent in **whale, seal, *Ornithorhynchus*** etc. The skin of ear pinna in hairy. These are having yellow elastic cartilage in them. A rabbit can move its pinna accroding to its will, just like dog, cat, cow etc. But a man can not move his pinnae. Muscles of man's ear are vestigeal. Pinna covers some of the ear canal, this part is called **choncha.**

(II) Ear canal or External auditory meatus : - It is a 24 mm long canal which is expanded from base of pinna to inner side.

- Along with mammals, **birds** and **reptiles** also have ill or less developed ear canal.
- At the end of ear canal a stretched, thin obliquely placed membrane is present, it is called **ear drum** or **tympanic mmebrane**.This separates the ear canal to middle ear.
- In the wall of external auditory meatus or ear canal there are found modified sweat glands called **ceruminous glands.** These secrete **cerumen** or ear wax, which moisten the ear drum and protects it.
- Ear drum remians always in stretched position because malleus ear ossicle pulls it towards tympanic cavity by tensor tympani muscle.
- Ear drum is a part middle ear.



(B) Middle ear : - Middle ear is also called tympanic cavity. It is filled with air. This cavity is covered by a flask like bone called tympanic bulla. This bone is a part of temporal bone of skull.

- Middle ear cavity is connected by pharyngeal cavity through a canal. It is called **Eustachian duct.**
  Due to this tube, pressure at both the side of tympanic membrane remains always equal. This duct acts to maintain sound equilibrium. It exples high volume sounds through mouth, to avoid the damage of ear drum.
- Tympanic cavity is connected by internal ear cavity by two aperture.

(i) Oval aperture fenestra ovalis (oval window) and

(ii) Spherical aperture fenestra rotundus (round window). A thin and firm membrane covers each aperture.

- Three ear ossicle are present arranged in a chain with movable joints connected together in tympanic cavity.

These ear ossicles are : -

(a) Malleus : - It is situated towards outer ear. It is the largest of three and of hammer shaped malleus is formed by the modification of articular bone of jaw.

- Inner broad part of malleus is connected by incus. Malleus and incus and Joint together by synovial hinge joint.

(b) Incus : - The ossicle is **anvil** shaped. It is formed by the modification of quadrate bone of jaw. It s outer broad part is connected by malleus and inner thin part is connected by **stapes.** Incus is joint by stapes by **ball and socket joint.**

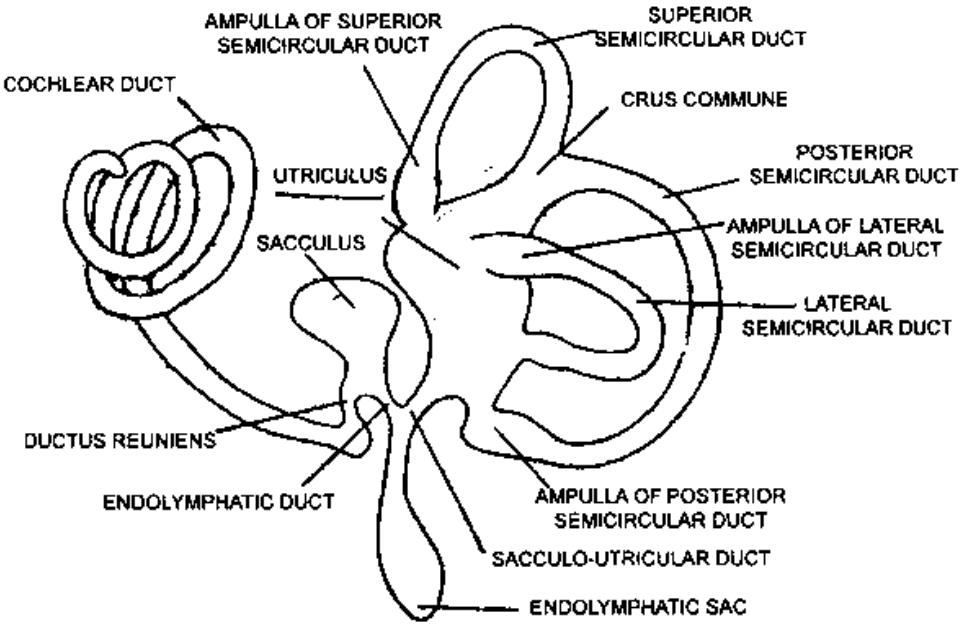
(c) Stapes : - It looks like stirrup of horse. It is formed by the modification of hyomandibular **bone of jaw.**

- It is the smallest bone of body
- Stapes is connected to incus at one side and on the other side it is connected to membrane stretched over fenestra ovalis.
- [In the tympanic cavity of frog only one ear ossicle is found it is called **columella auris.** Malleus and incus are absent here.]

All the three ear ossicles are arranged in ear cavity by ligaments. These carry sound wave from ear drum to internal ear through fenestra ovalis.

(C) Internal ear : -

It consist of (1) Bony Labyrinth (2) Membranous Labyrinth.



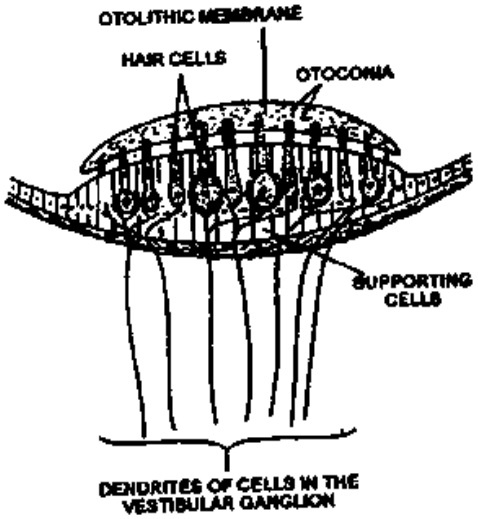
Scheme of membranous labyrinth

- Internal ear is enclosed in the petrous part temporal bone which form a bony capsule out side the internal ear it is called bony labyrinth. It is the cavity of hearing apparatus.
- Internal ear is a complex structure made up of semi transparent membrane. It is called membranous labyrinth.
- Bony labyrinth an membranous labyrinth are connected by a cavity called perilymph cavity. Perilymph liquid is filled in it.
- Endolymph is filled in membranous labyrinth.
- There are two main bag like chambers in membranous labyrinth, **utriculus and sacculus.** Both these chambers are connected together by a thin canal called **sacculo- utricular duct.**

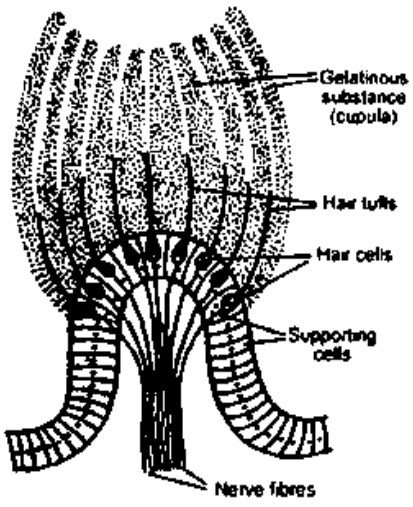
- A thin endolymphatic duct opens into sacculo-utricular duct. This endolymphatic duct opens into **endolymphatic sac** situated at back side of skull on the other side.
  Utriculus is comparatively large. Three semicircular canals arise from utriculus at 90° angle to each other and open into utriculus again these are called
  (i) Anterior or superior semicircular canal
  (ii) Posterior semicircular canal
  (iii) External or lateral or horizontal semicircular canal.
- Anterior and posterior canals arise in the form of a single canal called **''Crus commune''**
- The distal end of each semiciruclar canal is some what swollen, called **Ampulla.**
- Sacculus is smaller than utriculus. Its back side is coiled like spring. It is called **cochlear canal**. it is also known as **lagena.**
- The length of cochlear canal of human, rabbit and whale are $2\frac{3}{4}$, $2\frac{1}{2}$ and $1\frac{1}{2}$ coils respectively.
- Cochlear canal is connected by sacculus by a small duct called **ductus reuniens**.
- All the coils of cochlear canal are connected together by flexible ligaments.
- In the centre of coils of cochlea in human, there are present a pillar like structure called **modiolus.**

(D) Internal structure of inner ear : -

- The inner wall of membranous labyrinth is lined by cuboidal epithelium and outer wall is line dby connective tissue richly supplied with blood capillaries.
- Membranous labyrinth is empty inside. Its cavity is filled by endolymph which is a milky, mucilagenous fluid.
- Distal end of each semicircular canal becomes swollen called ampulla. In this ampulla, internal cuboidal epithelium form a ridge like projection called **acoustic ridge** small immovable microvilli are found at the free edges of sensory cells of acoustic ridge. These microvilli are numerous in number. These are called stereocilia, along with these there are found single movable cilium called **kinocillium.** Otoconia are absent crista of ampulla. All the microvilli of ridge are bind together like a bag and from **cupula.**
- These sensory cells situated in internal ear are in contact with small nerves. All these thin nerve combine to form **vestibular nerve (branch of auditory nerve).**
- Sensory crista and maculae are related with equilibrium of body
- Cristae control and maintain body equilibrium at the time of movement and maculae regulate this at static position.



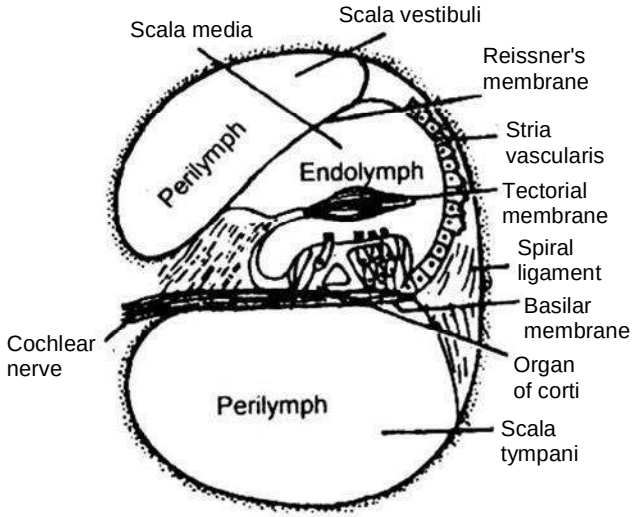
STRUCTURE OF MACULAE



STRUCTURE OF CRISTA

(E) Internal Structure of Cochlea & Cochlear canal

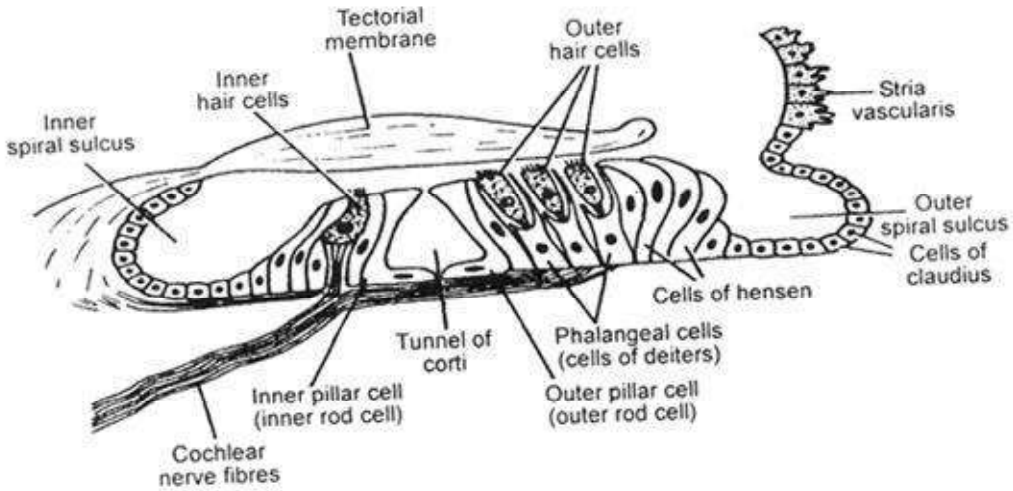
Cochlear duct is connected by bony labyrinth in such a way that it divides the cavity of labyrinth into dorsal and ventral chambers. So in a transverse section of cochlea following three chambers are seen clearly.



TRANSVERSE SECTION OF COCHLEA

(i) Scala vestibuli : - it is situated at dorsal side and is filled with perilymph.

(ii) Scala tympani : - It is situated at the ventral side below the cochlear duct. It is also filled by perilymph.



ORGAN OF CORTI

(iii) Scala media : - It is the triangular cavity of cochlear duct that is situated between scala vestibuli and scala tympani. It is filled with endolymph.

- Thin dorsal wall of cochlear duct is called vestibular membrane or Reissner's membrane.
- Ventral wall of scala media is thick it is called basilar membrane. Scala vestibuli and scala tympani are connected through a small aperture at the free edge of cochlea. This aperture is called **helicotrema.**
- Scala media is blind (closed) at its both the sides.

(F) Organ of Corti : - A sensory ridge is present at the whole of central line at epithelium lining of basilar membrane of scala media. It is called organ of corti. It has two types of cells (i) Sensory cell (ii) Supporting or suspensory cell and three type of suspensory cell

(i) Cells of Dieter's or basal cells (ii) Pillar cells or rod cells (iii) Hensen's cells or rectangular.

- In between the empty spaces of sensory and suspensory cells a lymph like fluid cortilymph is filled. This space is called tunnel of corti.
- Numerous mircrovilli called stereocilia (sensory hair) are present at the free surface of each sensory cell.
- At the ventral surface of sensory cells there are present thin fibres of auditory nerve that form cochlear branch.
- At the organ of corti a thin jelly like membrane is inclined called tectorial membrane. In this membrane, all the sensory hair's free edges are embeded.
- Main credit of hearing goes to "Organ of corti".

(G) WORKING OF EAR : -

- Ears are stato-acoustic organs of body. Thus these help the body to hear and balancing the body.

(a) Equilibrim: - The first and basic function of ears to maintain balance of body.

- This act is done by utriculus, sacculus and three semicircular canals. Equilibrium impulse/sensation is of two types : -

(i) Static balancing : - Its relation is from the point of view of gravity and position of head in static conditions of body and its changes.

- The senses of these changes (of head) are produced and carried mainly by utriculus, sacculus and their sensory cristae i.e maculae.
- Sensory hair of ridge are sensitized by **otoconia or otolith or ear dust.** These sensations or impulses are carried to brain by auditory nerve After it messages of appropriate reactions are send through motor fibres to the skeletal muscles of body.

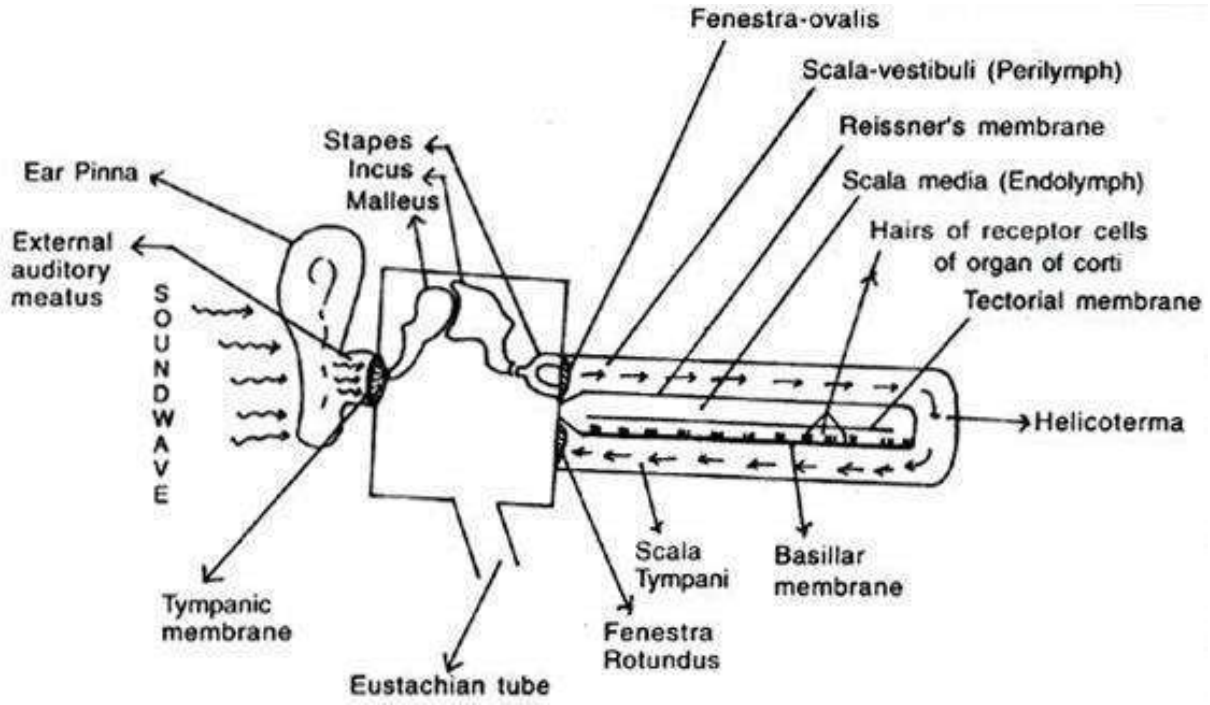
(ii) Dynamic equilibrium : -

- It is the action to maintain balance of body during movement.
- This act is done by sensory ridges of ampula of semicircular canals.
- At the time of movement the endolymph of ampula produces waves in it. Cupula of ampula are effected by these waves and sensory cells cupula are irritated. This sensation or stimulation is carried to brain by auditory nerve and proper messages are send to muscle of legs in reply. Due to this body is balanced at the time of walking.

(b) Hearing : -

- This act is done by "Organ of Corti".
- Sound waves are collected by ear pinnae. These sound waves travel through ear canal and hit the ear drum as a result of it ear drum get vibrated.
- These vibrations reach up to stretched membrane of fenestra ovalis through ear ossicles, ear ossicles work as lever.
- As a result of this travelling (from ear drum to fenestra ovalis) sound waves become more strong.
- When the membrane of fenestra ovalis starts vibrating, perilymph of scala vestibuli also starts vibrating, some vibrations reach up to scala tympani (fenestra rotundus) and its perilymph.

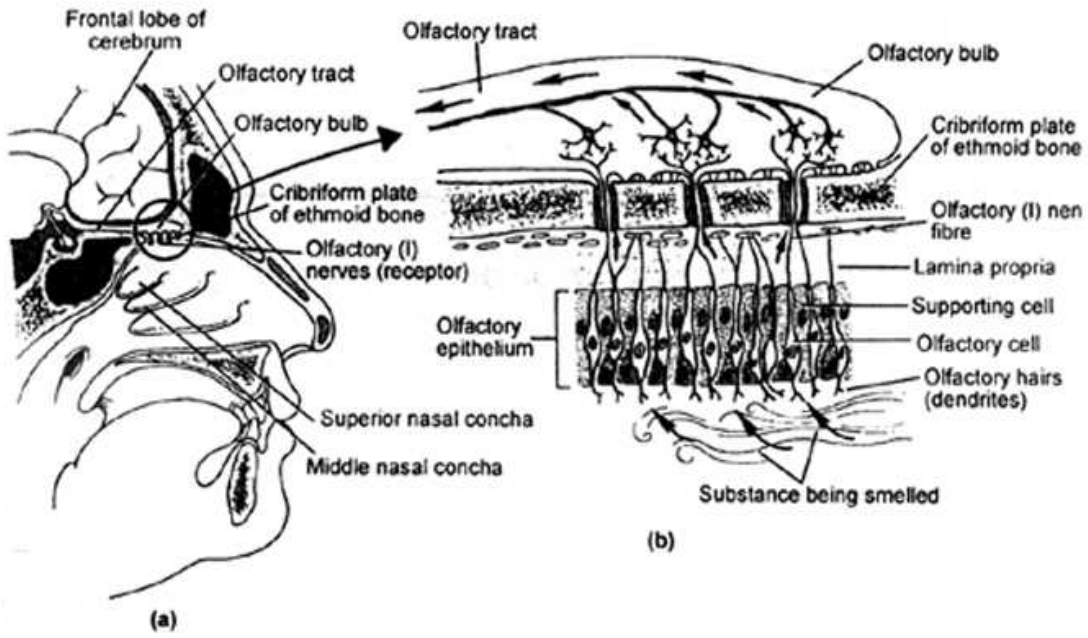
- Due to these vibrating waves, Reissner membrane and Basilar membrane of the walls of scala media also start vibrations. These vibrations travel through endolymph reach upto organ of corti. The organ of corti also starts vibrating.
- Cochlear nerve carries this impulse to brain through auditory nerve. Appropriate messages are send to receptor organs by brain accordingly.
- Vibrations /waves produced by cochlea travel through perilymph, reach up to membrane stretched at fenestra Rotundus and are destroyed.
- Some sound waves are also destroyed, when coming from helicotrema.



DIFFERENCES OF RECEPTORS BETWEEN RABBIT AND MAN

RABBIT	MAN
Eye :	
1. Monocular vision is present.	1. Bionocular vision is present.
2. Both eyes are located on the dorsal and lateral side of head.	2. Both eye are located at anterior part of face.
3. Nictitating membrane is present.	3. Nictitating membrane is vestigeal which is called as plica-semilunaris.
4. Eye is red coloured.	4. Eye is black, blue, brown coloured.
Ear :	
1. Ear pinna is funnel shaped	1. Ear pinna is kidney shaped.
2. Ear pinna is motile	2. Ear pinna is non-motile
3. No. of coiling of cochlear canal is $2\frac{1}{2}$	3. No. of coiling of cochlear canal is $2\frac{3}{4}$

NOSE



Olfactorecptors :

- Olfactoreceptors are situated in the upper part of nasal chamber in olfactory epithelium.
- This membrane is called **as schnederian membrane.**
- Olfactoreceptors are relatd with olfactory bulb. It is the extension of limbic system.
- This bulb is situated below the frontal lobe of cerebral hemisphere and aboev the ethampoid bone of nasalchamber.
- Three types of cells are found in the olfactoreceptors. These are –

(1) Bipolar olfactory nerve cells
(2) columnar epithelial cells
(3) Mucous glands

(1) Bipolar olfactory nerve cells : It is special types of nerve cells

- Sensory hair are found at the anterior end of olfactory cells. They contact with external environment in nasal chamber.
- Sensory hairs are related with dendrites of bipolar nerve cells.
- Middle part of olfactory cell is cyton.
- Posterior part of olfactory cell is axon which is nonmyleinated.

(2) Columnar epithelial cells : It is also called as supporting cells. They are present arounds the bipolar olfactory cells.

- They provides support to the olfactory cells.
- Some small conical cells are also found at the basal part of olfactoreceptor and provide base to the olfactoreceptor.
- A layer of connective tissue lies below the olfactoreceptor. It is also called as Lamina propria.

(3) Mucous glands : It is called as **Bowman's gland.** It is situated in the Lamina propria. It opens at the outer part of olfacto receptor through fine duct. Their secretory mucous substance dissolve the smell particle and carry to the sensory hair of olfactory cells. Unmyleinated axons of all olfacto sensory cells makes the synapse with dendrites of multipolar neurone of olfactory bulb. The number of receptors stimulated indicates the strength of smell.

In addition to smell receptor, a network of nerves is found in the nose, mouth and tongue.

The network formed by trigeminal nerve of V cranial nerve. It is also known as Dentist's nerve, reacts to messages of pain of teeth. It also convey the message of smell to brain. Such as ammonia, vinegar etc.

The trigeminal can protect by warning about harmful chemical in the air. Bowman's glands inside the nose release mucous fluid to get rid of the irritating susbtances.

Loss of the sense of smell is known as **anosmia.**

TONGUE OR ORGAN OF TASTE

A thick, muscular and movable organ, the tongue is found in the mouth cavity. Tongue bears four types of small papillae which are provided with taste buds. Taste buds are much numerous in the circumvallate and foliate papillae. Taste buds are formed by the transformation of epithelial cells of the tongue. A taste bud possesses two types of cells .-

1. **Supporting cells :** These cells are elongated in middle region they do not bear hairs at their free ends.
2. **Sensory cells :** These cells are alongated, buldge in middle part, they bear sensory hair at their free ends.

Each taste bud is flask or barrel shaped. It's size is 70 μm × 50 μm it's upper part opens at the epithelial surface of the tongue through a fine pore. These sensory hairs, exposed to outside through the gustatory pore are stimulated by the food substances. The sensory cells are chemoreceptor in nature and taste the food while it is dissolved in saliva. Food substances get mixed with saliva to enter into the pores of taste buds.

In human different regions of the tongue are sensitive to different taste. Anterior and free end of the tongue are sensitive to sweet and salty, lateral sides to sour taste, while the posterior part is particulary sensitive to bitter taste.

Types of receptors

- **General Senses –**

Touch	–	Tangoreceptors (Thigmoreceptor)
Temperature	–	Thermoreceptor
Heat	–	Caloreceptors
Cold	–	Frigidoreceptors
Pain	–	Algesireceptors
Current of water	–	Rheoreceptors
Electric current	–	Galvanoreceptors
Gravity	–	Georeceptors
Muscle position	–	Proprioreceptors
Equilibrium	–	Statoreceptors
Hunger, thirst etc.	–	Interoceptors
Blood pressure	–	Baroreceptors
Osmotic pressure	–	Osmoreceptors

Chemical changes	–	Chemoreceptors
Vibration	–	Vibroreceptors

- **Special Senses**

Vision	–	Photoreceptors
Hearing	–	Phonoreceptors
Smell	–	Olfactoreceptors
Taste	–	Gustatoreceptors

(1) Receptors of vision, hearing an smell receive stimuli from distance, hence called teleoreceptors.
(2) Tangoreceptors or mechanoreceptors
(i) Merkel's disc (Corpuscles) : Epidermis of non hairy (glabrous) skin, shallow cup shaped disc.
(ii) Meissner's corpulse : Dermis of skin of the finger tip, lips and nipples. Sense of touch and gentle pressure.
(iii) Pacinian corpuscle : Present in subcutaneous tissue of palm, sole of finger etc. stimulated by strong pressure contact.
(iv) Corpuscle of golgi : Sucutaneous tissue of fingers.
(v) Corpuscle of mazzoni : Sub cutaneous tissue of fingers.
(vi) Grandy's corpuscles : Beak of birds
(vii) Herbst corpuscles : Mouth part of birds
(viii) Free never ending : Present of skin, perceive the sensation of touch.

(3) Thermoreceptors
  (i) Ampullae of Lorenzini : Scoliodon (Fishes)
  (ii) Organ of ruffini : Caloreceptor - Heat
  (iii) End bulb of krause : Frigidoreceptor - cold
(4) Tactile receptors in mammals are maximum on face
(5) Current of water : Rheoreceptors lateral line sense organ in fishes and amphibian of tadpole detect the water current

POINTS TO REMEMBER :

1. Red green colour blindness is hereditory
2. Minimum distance for proper vision of eyes is **25 cm.**
3. Anterior - posterior diameter of eyeball is **17.5mm** at the time of birth normally and in adults it is **20-21mm**.
4. The best colour differentiation is found in **primates** (Advanced mammals)
5. In the retina of man's eyes there are found **110-1125 lacs rods** and **65 lacs cones.**
6. Healthy eye of a person can see clearly from **12 inch** to **20 feet.**
7. Image of object is formed on retina and it is always **inverted & real**
8. Hyalocytes cells are found in vitreous humor.
9. Cilliary body secretes aqueous humor and vitreous humor.
10. In frog and other amphibians sclerotic layer of eyeball is **Cartilaginous**
11. The largest eyes are found in **deers** in vertebrates with respect to body surface area.
12. Owls and cats see only with the help of available light from starts or moon at night
13. The lens of man's eye ball has its diameter of **11 mm.**

14. Atropine, Belladona and Cocane medicines are used to **dilate** the **pupil**
15. In a newlyborn child, eye balls are very small, i.e. babies ar always very much hypermatropic.
17. Cornea and lens of eye lack blood supply.
18. Eyes are most sensitive to the light having approx 5000 Å **wavelength.**
19. Internal or inner ear of rabbit is originated by **ectoderm** of embryo and middle ear (Bony part- mesodermal) and eustachian tube are originated by **endoderm** layer of embryo.
20. Frog's vision is **hypermatropic** in **water** and **myopic** on **land.**
21. Light sensitive organ was discovered by **Steven.**
22. Phaco-emulsification techique in cataract surgery – "Stichlesss" technique. Foldable IOL (Intra – ocular Lens) is used..
23. Gland of moll are modified sweat gland.
24. **Stye** is infection of gland of **zeis**
25. Hordeolum is inflammation sebaceous gland of eyelid
26. The relationship of receptor to bipolar cells to ganglion cells is **1 : 1 : 1** with in the fovea.
27. From the fovea to the periphery, cones dimimish and rods increase in number.
28. Electronic activity of retina is record sequence of potential change known as elctroretinogram.
29. The horizontal cells which transmit signals horizontally in the outer plexiform layer from the rods and cones to the bipolar cell dendrites.
30. The bipolar cells which transmit signals from the rods, cones and horizontal cells to the inner plexiform layer where they synapse with ganglion cell and amacrine cells.
31. The amacrine cells which transmit signals in two direction directly from bipolar cells to ganglion.
32. Lack of red cones – Protanope
33. Lack of green cones – Deuteranope
34. lack of blue cones – Tritanope
35. Unlike nerve and muscle rods and cones do not show action potential by depolarization but by electronic conduction.

Q.51 In old age farsightedness is a defect of eye in man, in which :-
(1) Eye ball becomes short
(2) Eye ball becomes elongated
(3) Lens become more concave
(4) Lens become more spherical

Q.52 Stereoscopic vision is found in :-
(1) All mammals (2) All vertebrates
(3) Primates (4) Frog

Q.53 Pigmented connective tissue in rabbit occurs in:-
(1) The eyelids (2) The choroid of eye
(3) The adipose tissue of skin
(4) The choroid & iris of eye

Q.54 Tear is a :-
(1) Secretory fluid (2) Excretory fluid
(3) Pure fluid (4) Lymphatic fluid

Q.55 Fenestra ovalis is the opening of :-
(1) Cranium (2) Tympanum
(3) Tympanic cavity (4) Brain

Q.56 In man the muscles which move the pinna are
(1) Absent (2) Vestigeal
(3) Functional more (4) Functional

Q.57 The nictitating membrane of rabbit is :-
(1) Also called third eye lid
(2) Situated in the inner corner of the eye
(3) Movable across the eye ball to clean it
(4) All of the above

Q.58 The ear ossicles of rabbit lie in the :–
(1) Auditory capsules
(2) External auditory meatus
(3) Tympanic cavity
(4) Tympanic bulla

Q.59 A small region on the retina of the eye which contains only cones is called :–
(1) Area centralis (2) Fovea centralis
(3) Blind spot (4) Ora serrata

Q.60 In rabbit the muscles which move the pinnae are
(1) Absent (2) Vestigeal
(3) Non-functional (4) Functional

Q.61 The middle ear and internal ear of mammals are enclosed in which of the following bones
(1) Mastoid (2) Ethmoid
(3) Tympanic bulla
(4) Tympanic bulla and periotic bone (temporal bone)

Q.62 Middle ear and eustachian tube of rabbit originates from
(1) Ectoderm (2) Endoderm
(3) Mesoderm (4) All the above

Q.63 Hyalocytes cells occurs in :–
(1) Aqueous humor (2) Vitreous humor
(3) Both (4) None of them

Q.64 For the synthesis of rhodopsin, which of the following food is needed :–
(1) Mango (2) Rice
(3) Carrot (4) Tomatoes

Q.65 No image formation occurs on blind-spot of retina because :–
(1) It is not present on the optical axis of the eye
(2) Here cones and rods are absent
(3) On this part only cones are present
(4) The nerve fibres of this region do not contribute in the formation of optic chiasma

Q.66 "Telescopic vision" found in :–
(1) Amphibians (2) Mammals
(3) Birds (4) None of these

Q.67 Highly vascular and pigmented layer of Rabbit's eyes is :–
(1) Retina (2) Sclerotic
(3) Choroid (4) Ciliary body

Q.68 The part of Rabbit's eye which acts like diaphargm of camera is :–
(1) Pupil (2) Iris
(3) Lens (4) Cornea

Q.69 A circular canal which is found in limbus part of eyes is called :–
(1) Hyaloid canal (2) Canal of Schlemm
(3) Canal of Cloquet (4) Eustachian tube

Q.70 Eye and ear are the example of–
(1) Teleo receptor (2) Gustato receptor
(3) Extero receptor (4) Intero receptor

Q.71 Middle ear is filled with :–
(1) Air (2) Endolymph
(3) Perilymph (4) C.S.F.

Q.72 Dieter's cells found in :–
(1) Reissner's membrane
(2) Malleus
(3) Organ of corti (4) None

Q.73 Three layers in eye ball from inside out are-
(1) Retina, choroid, sclerotic
(2) Choroid, retina, sclerotic
(3) Sclerotic, choroid, retina
(4) Sclerotic, retina, choroid

Q.74 Aquous humor and vitreous humor are secreted by :–
(1) Iris (2) Ciliary body
(3) Lens (4) Cornea

Q.75 Pecten a comb like structure is found in the eye of :–
(1) Amphibians (2) Reptiles
(3) Birds (4) Mammals

Q.76 Lens of eye of frog is :–
(1) Oval (2) Biconcave
(3) Circular (4) None of them

Q.77 One of the following is correct :–
(1) Semicircular canal balancing
(2) Cochlea - hearing
(3) Utriculus - & sacculus - balancing & hearing
(4) All of the above

Q.78 In frog eyelids are :–
(1) Functional (2) Non - functional
(3) Absent (4) None

Q.79 In the tympanic cavity there is an aperture in which the stapes is fitted it is :–
(1) Foramen rotundus (2) Foramen triosseum
(3) Fenestra ovalis (4) Fenestra rotandus

Q.80 Colour blindness is due to :–
(1) Deficiency of Vit.A
(2) Deficiency of Vit. D
(3) Deficiency of Vit. C
(4) None of these

Q.81 Cochlea is mainly responsible for :–
(1) Balance only
(2) Hearing only
(3) Both balancing and hearing
(4) Perception of colour

Q.82 Cavity of aqueous humour is :–
(1) Behind the lens
(2) Infront of lens
(3) Between choroid and sclerotic
(4) None of these

Q.83 Ear ossicle from inner side of middle ear are –
(1) Malleus, Incus, stapes
(2) Stapes, Incus, Malleus
(3) Incus stapes & malleus
(4) Malleus, stapes, incus

Q.84 Endolymph is contains white crystals of $CaCO_3$ Called :–
(1) Otoconia (2) Otoliths
(3) Ear dust (4) All of the above

Q.85 The eye defect, Astigmatism can be corrected by using :–
(1) Convex lens (2) Concave lens
(3) Cylindrical lens (4) Surgery

Q.86 In frog's eye the selerotic is made up of :–
(1) Bone (2) Cartilage
(3) Muscles
(4) Fibrous connective tissue

Q.87 Largest eyes amongst vertebrates found in :–
(1) Elephant (2) Deer
(3) Horse (4) Man

Q.88 How many coils are present in cochlear duct of man–
(1) 1¼ (2) 2¼
(3) 2½ (4) 2¾

Q.89 Ear ossicle which present in middle ear cavity of frog's ear is :–
(1) Malleus (2) Incus
(3) Stapes (4) Columella

Q.90 Mucoprotein which found in vitreous humour is:–
(1) Albumin (2) Vitrin
(3) Globulin (4) Lysozyme

Q.91 How many coils are present in cochlear duct of Rabbit:–

(1) 2½ (2) 2¾

(3) 1½ (4) 1¼

Q.92 "Tensor tympani" & "Stapediusmuscles" are found in :–

(1) External ear (2) Middle ear

(3) Internal ear

(4) External auditory meatus

Q.93 The organ of corti is a modification of :–

(1) Tectorial membrane

(2) Reissner's membrane

(3) Basilar membrane

(4) Meissner's membrane

Q.94 Function of eustachian tube is to :–

(1) Provide air to the ear ossicles

(2) Remove dust particles from the middle ear

(3) Keep middle ear in proper shape

(4) To maintain proper air pressure in middle ear and internal ear for protecting them from damage by loud sound

Q.95 Which of the following in rabbits eyes is responsible for frictionless blinking :–

(1) Lachrymal glands (2) Meibomian gland

(3) Harderian gland (4) All of the above

Q.96 The damage to ear by sudden explosion (loud sound) is prevented by :–

(1) Eustachins tubes

(2) Tensor tympani muscles

(3) Stapedius muscles

(4) All of the above

Q.97 Which of the following glands are found in majority of mammals associated with their eyes:–

(1) Harderian and meibomian

(2) Lachrymal and sudorific

(3) Lachrymal and meibomian

(4) Harderian and Lachrymal gland

Q.98 The structure in the internal ear which resembles a "snail shell' is called :–

(1) Organ of corti

(2) Membranous labyrinth

(3) Cochlea

(4) Ear ossicles

Q.99 Serves as "harps of piano" in the ear :–

(1) Ear drum

(2) Endolymph

(3) Ear ossicles

(4) Cells of organ of corti

ANSWER KEY

EXERCISE – 1

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Ans.	1	3	4	1	3	2	4	4	2	4	4	2	2	3	2	3	3	2	2	1

Ans.	1	3	1	2	3	3	4	1	3	4	2	2	2	4	3	2	2	4	4	2
Ques.	41	42	43	44	45	46	47	48	49											
Ans.	1	2	3	4	2	1	3	3	4											

EXERCISE – 2

Q.1 Aperture of an eye can be changed by :-
(1) Aquous humour (2) Vitreous humour
(3) Ciliary muscles (4) Iris

Q.2 Which is responsible for colour detection :-
(1) Cones (2) Rods
(3) Rods and cones (4) Choroid

Q.3 Photosensitive pigment is :-
(1) Similar in all eyes
(2) Different in all eyes
(3) Similar in all vertebrate eyes
(4) Red in all eyes

Q.4 Rhodopsin is a constituent of :
(1) Cornea (2) Choriod
(3) Rods (4) Cones

Q.5 It the source of light infront of eye suddenly become bright :-
(1) Pupil contract
(2) Focus of lens changes
(3) Vitreous humor becomes liquid like
(4) Retina blood supply is cut-off

Q.6 Passage connection middle ear with pharynx is called :-
(1) Cochlear canal (2) Vestibular canal
(3) Tympanic canal (4) Eustachian canal

Q.7 Retina of the vertebrates eye consists of :-
(1) Neurons and neuroglia
(2) Rods, cones, neurons and neuroglia
(3) Rods, cones and neuroglia
(4) Rods and cones

Q.8 The focal length of the lens in eye is controlled by :-
(1) Vitreous humor (2) Ciliary muscles
(3) Iris muscles (4) Pupil

Q.9 During night when the intensity of light is low, it is detected by :-
(1) Rods (2) Cones
(3) Both (4) Crystalline lens

Q.10 To correct myopia vision one should use :-
(1) Convex lens (2) Concave lens
(3) Plane lens (4) None

Q.11 Arrangement of ear ossicles, starting from ear durm is :-
(1) Stapes, malleus,
(2) Malleus, incus, stapes
(3) Incus, stapes, malleus
(4) Stapes, incus, malleus

Q.12 Organ of corti is found in :-
(1) Kidneys (2) Heart
(3) Nasal chamber (4) Internal ear

Q.13 The fluid found in semicircular canals of internal ear of rabbit is :-
(1) Perilymph (2) Endolymph
(3) Hemolymph (4) Lymph

Q.14 Eustachian tube connects :-
(1) Left atrium with right atrium
(2) Left ventricles with right ventricle
(3) Middle ear with external ear
(4) Middle ear with pharynx

Q.15 Chief function of semicircular canals of internal ear :-
(1) Balancing and hearing
(2) To perceive sound vibrations of high frequency
(3) To maintain dynamic equilibrium of the body while the body is in balance
(4) To transmit sound vibration to the auditory nerve

Q.16 Where is the cavity of vitreous humour found
(1) Between sclerotic and choroid
(2) Infront of lens
(3) Behind lens
(4) Between choroid and retina

Q.17 The function of eustachian tube is to :-
(1) Help in vibrating tympanum
(2) Help in hearing
(3) Equalise air pressure in middle ear and external ear
(4) Equalise air pressure in middle ear and internal ear

Q.18 Function of iris is to :-
(1) Alter diameter of pupil
(2) Close eye lids
(3) Alter diameter of lens
(4) Move the lens

Q.19 The pigment found in rods is :-
(1) Retinen (2) Melanin
(3) Photopsin (4) Keratin

Q.20 Which pigment helps some noctural animal to see at night :-
(1) Haemoglobin (2) Porphyrin
(3) Guanin (4) Heparin

Q.21 Organ of corti in rabbit is concerned with the sens of-
(1) Smell (2) Hearing
(3) Taste (4) Equilibrium

Q.22 Eye is most sensitive to :-
(1) 20 Å (2) 1000 Å
(3) 5000 Å (4) 7000 Å

Q.23 Area of most active vision in eye where sharp image is formed is called :-
(1) Blind spot (2) Yellow spot
(3) Lens (4) Pupil

Q.24 Blind spot in the eye is located :-
(1) In the center of pupil
(2) In the center of lens
(3) In fovea centralis
(4) Where optic nerves leaves retina

Q.25 Lens and retina of vertebrate eye develop from-
(1) Mesoderm (2) Ectoderm
(3) Endoderm
(4) Partly from ectoderm and partly from endoderm

Q.26 The common defect of eye which develops in old age is :-
(1) Glaucoma (2) Astigmatism
(3) Presbyopia (4) Myopia

Q.27 The internal ear of rabbit in comparision to that of frog has :-
(1) Smaller cochlea
(2) Longer and coiled cochlea
(3) Fused utriculus and sacculus
(4) No sacculus

Q.28 Ciliary muscles are found in -
(1) junction of choroid and iris in eye ball
(2) Inside larynx to regulate tension in eye ball
(3) Between ribs to assist in breathing movement
(4) At base of cilia in ciliated epithelium

Q.29 Cochlea of mammalian ear is concerned with
(1) Balancing of body (2) Hearing
(3) Preception of atmospheric pressure
(4) Both (1) and (2)

Q.30 How many stimuli from a distant source fall on your eyes
(1) Light, sound and tension
(2) Light sound and odour
(3) Light and sound (4) Light only

Q.31 Myopia is a defect in human eyes in which the image is formed :-
(1) Behind retina and can be corrected by using convex lens
(2) Behind retina and can be corrected by using concave lens
(3) Infront of retina and can be corrected by using concave lens
(4) Infront of retina and can be corrected by using convex lens

Q.32 Iodopsin is related with :-
(1) Brain (2) Spinal cord
(3) Rods and cones (4) Kidney

Q.33 Convex lens is used to correct -
(1) Hyper metropia (2) Myopia
(3) Cataract (4) Glaucoma

Q.34 "Miosis" in eye refers to :–
(1) Reduction in diameter of pupil
(2) Increased diameter of pupil
(3) Reduction division in retina
(4) Shrinkage of eye ball

Q.35 Owls moves freely during night since they have-
(1) Adjustable pupil
(2) Only cones in retina
(3) Only rods in retina
(4) Vitamin A deficiency

Q.36 Our ear can hear sound waves of the frequency:-
(1) Above 20,000 Hz (2) 5-100 Hz
(3) 200-20,000 Hz (4) 20-20,000 Hz

Q.37 Which one of the following diseases in man belongs to the same catagory as haemophilia
(1) Hyper metropia (2) Rabies
(3) Night blindness (4) Colour blindness

Q.38 The eustachian tube which connects middle ear to pharynx is found in :-
(1) All the land vertebrates in general
(2) All vertabrates
(3) Amphibians only (4) Mammals only

Q.39 The fluid surrounding the membranous labyrinth of rabbit is called :-
(1) Perilymph (2) Endolymph
(3) Haemolymph (4) Cerebrospinal fluid

Q.40 Colour blindness in human being is due to :-
(1) Vitamin A deficiency
(2) Sex linked inheritance
(3) Over activity of adrenal gland
(4) Excessive drinking of alcohol

Q.41 How many oblique and rectus muscles are found to move the eye ball in various direction inside the eye orbit
(1) Two (2) Four
(3) Six (4) Eight

Q.42 Rabbit has :-
(1) Monocular vision (2) Binocular vision
(3) Mosaic vision (4) Sterioscopic vision

Q.43 Meibomian gland are associated with :–
(1) Eyes (2) Ears
(3) Reproductive organ (4) Skin

Q.44 Harderian gland occurs in :–
(1) Whale (2) Frog
(3) Birds (4) All the above

Q.45 Which of the following is not an ear ossicle :–
(1) Incus (2) Malleus
(3) Humerus (4) Stapes

Q.46 Cochlea arises from :–
(1) Utriculus (2) Sacculus
(3) Middle ear (4) Semicircular canals

Q.47 The other name of internal ear is :–
(1) Utriculus
(2) Membranous labyrinth
(3) Sacculus
(4) Ductus endolymphaticus

Q.48 External auditory meatus contains which of the following gland :–
(1) Ceruminous gland (2) Lachrymal gland
(3) Harderian gland (4) Meibomian gland

Q.49 How many semicircular canals are found in internal ear of rabbit :-
(1) Two (2) Three
(3) Four (4) One

Q.50 Otolith (otoconia) are $CaCO_3$ particles found in:-
(1) Perilymph (2) Endolymph
(3) Bones (4) Vitreous humour

ANSWER KEY

EXERCISE – 2

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Ans.	4	1	3	3	1	4	2	2	1	2	2	4	1	4	3	3	3	1	1	3

EXERCISE – 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Which regulates the amount of light falling on the lens **[JIPMER 1993]**
(1) Cornea (2) Retina
(3) Pupil (4) Ciliary body

Q.2 Space between cornea and lens is- **[AIIMS 1993]**
(1) Aqueous chamber (2) Vitreous chamber
(3) Canal of Schlemm (4) Fovea centralis

Q.3 In glaucoma- **[JIPMER 1993]**
(1) Eyeball elongates
(2) Eyeball shortened
(3) Lens becomes opaque
(4) fluid pressure increases in eye

Q.4 Meissener's corpuscles are located in – **[AIIMS 1993]**
(1) Pancreas and secrete trypsinogen
(2) Adrenal and secrete epinephrin
(3) Spleen and destroy worn out erythrocytes
(4) Skin and perceive gentle pressure

Q.5 Human eye lens is- **[JIPMER 1993]**
(1) Spherical and can be moved forward
(2) Biconvex and can not be moved forward
(3) Spherical and can not be moved forward
(4) Biconvex and can be moved forward

Q.6 Which is the correct sequence of the parts of the eye that the light rays cross in reaching the retina- **[CMC Vellore 1993]**
(1) Pupil → cornea → aqueous humour → lens → vitreous humour
(2) Lens → cornea → aqueous humour → vitreous humour → pupil
(3) Aqueous humour → vitreous humour → cornea → pupil → lens
(4) Cornea → aqueous humour → pupil → lens → vitreous humour

Q.7 Eye ball will not be moved inward on the damage of which of the following muscles- **[CMC Vellore 1993]**
(1) Internal rectus (2) External rectus
(3) Inferior oblique (4) Superior oblique

Q.8 Vitreous humour is seen in- **[CBSE 1993]**
(1) Ear (2) Eye
(3) Brain (4) Bone Marrow

Q.9 The space between the lens and the cornea of the human eye is- **[AIIMS 1993]**
(1) Vitreous chamber (2) Aqueous chamber
(3) Retina (4) Iris

Q.10 Vibrissae are associated with the function of- **[JIPMER 1993]**
(1) Thermo regulation (2) Gustation
(3) Tactile perception (4) Reproduction

Q.11 Malleus is present in the- **[CBSE 1993]**
(1) Inner ear (2) Outer ear
(3) Middle ear (4) Eye

Q.12 The movement of eye ball is brought about by the- **[Delhi PMT 1993]**
(1) Adductor muscle (2) Rectus muscle
(3) Biceps (4) Peroneus

Q.13 The cavity of the eye is divided into aqueous chamber and vitreous chamber by- **[Delhi PMT 1993]**
(1) Optic nerve (2) Retina
(3) Lens (4) Iris

Q.14 The central opening of iris is called as- **[CBSE 1993]**
(1) Pupil (2) Cornea
(3) Lens (4) Fovea centralis

Q.15 Semicircular canals occur in- **[Bihar PMT 1994]**
(1) Heart (2) Kidney
(3) Intestine (4) Ear

Q.16 Middle ear has- **[JKMCEE 1994]**
(1) Two sets of tiny bones
(2) A set of three tiny bones
(3) Two sets of large bones
(4) Three sets of large bones

Q.17 One of the following bones is found in the region of Jacobson's organ- **[CPMT 1994]**
(1) Vomer (2) Nasal
(3) Squamosal (4) Pterygoid

Q.18 Concave lens corrects - **[CPMT 1994]**
(1) Presbyopia (2) Myopia
(3) Hypermetropia (4) Cataract

Q.19 External ears are characteristic of- **[MPPMT 1994]**
(1) Mammals (2) Reptiles
(3) Amphibians (4) Pisces

Q.20 Osphradium of Pila globosa is- **[BHU 1994]**
(1) Chemoreceptor (2) Photoreceptor
(3) Thermoreceptor (4) Tangoreceptor

Q.21 Scala tympani is connected with scala vestibuli by means by- **[BHU 1994]**
(1) Stapes (2) Helicotrema
(3) Fenestra ovalis (4) Fenestra rotundus

Q.22 Which brain structure in rabbit is directly vision related- **[BHU 1994]**
(1) Hippocampal lobe (2) Corpus callosum
(3) Corpus albicans
(4) Corpora quadrigemina

Q.23 The defective condition of accommodation of the eye in which distant objects are seen distinctly but near objects are indistinct is- **[AFMC 1994]**
(1) Astigmatism (2) Presbiopia
(3) Myopia (4) Hypermetropia

Q.24 Stereoscopic vision is found in- **[JIPMER 1994]**
(1) Frog (2) Fish
(3) Man (4) Snake

Q.25 The lens in human being is- **[SKUMS 1995]**
(1) Concave (2) Biconvex
(3) Planoconvex (4) Convex

Q.26 In uncorrected myopia, the image is formed- **[Manipal M.C.E.E. 1995]**
(1) Infront of the lens
(2) At the back of the lens
(3) Infront of the retina
(4) Behind the retina

Q.27 The receptors found in the muscles, tendons and joints are- [**MPPMT 1996]**
(1) Teloreceptors (2) Proprioceptors
(3) Interoceptors (4) None of the above

Q.28 The iris of the eye is an extension of- **[PCS 1996]**
(1) Cornea (2) Sclerotic
(3) Retina (4) Choroid

Q.29 In the chemistry of vision in mammals, the photosensitive substance is called **[CBSE 1997]**
(1) Sclerotin (2) Retinol
(3) Melanin (4) Rhodopsin

Q.30 Glaucoma is caused by- **[BHU 1997]**
(1) Opacity of lens
(2) Increase in the size of eyeball
(3) blockage of canal of Schlemm
(4) Drying of vitreous humor

Q.31 Find out the right matching from the following pairs- **[PCS 1997]**
(1) Accommodation – pupil
(2) Colour perception – cones
(3) Night blindness – rods
(4) Binocular vision – iris

Q.32 The statocyst of prawn is a - **[PCS 1997]**
(1) Tangoreceptor (2) Chemoreceptor
(3) Gravity receptor (4) Sound receptor

Q.33 Vitamin A combines with a protein in the retina to produce- **[PCS 1997]**
(1) Glaucoma (2) Night blindness
(3) Rhodopsin (4) Colour blindness

Q.34 In human eye, at the blindspot- **[JIPMER 1997]**
(1) Only rods are present
(2) Only cones are present
(3) Both rods and cones are present
(4) Neither rods nor cones are present

Q.35 Jacobson's organ is- **[CPMT 1997]**
(1) Olfactory (2) Auditory
(3) Chemoreceptor (4) Algesireceptor

Q.36 Organ of Corti is found in- [**CPMT 1998]**
(1) Internal ear (2) External ear
(3) Both of these (4) None of these

Q.37 Which one of the following is not a part of ear [**RPMT 1998]**
(1) Eustachian tube (2) Cone cell
(3) Utriculus (4) Sacculus

Q.38 If eyeball is shorter and lens is thin, then probable defect would be- **[RPMT 1998]**

(1) Astigmatism (2) Presbyopia

(3) Short-sightedness (4) Long-sightedness

Q.39 The black pigment in the eye, which reduces internal reflection, is located in- **[AIIMS 1998]**

(1) Iris (2) Sclerotic

(3) Choroid (4) Cornea

Q.40 Deiter's cells (basal cells) occur in- **[AIIMS 1998]**

(1) Utriculus (2) Sebaceous glands

(3) Retina of eyes (4) Organ of Corti

Q.41 The sound reception can be interpreted by- **[RPMT-1998]**

(1) Olfactory lobe

(2) Cerebral hemisphere

(3) Cerebellum

(4) Medulla oblongata

Q.42 Too short eye ball and too flat lens produce- **[RPMT-1998]**

(1) Near sightedness (2) Far slightness

(3) Astigmatism (4) Presbyopia

Q.43 Organ of carti found in :- **[RPMT-1998]**

(1) Ear (2) Eye

(3) Nose (4) Skin

Q.44 Cortex medulla and membrane labyrinth of vertebrates is formed of- **[RPMT-1998]**

(1) Ectoderm (2) Endoderm

(3) Mesoderm (4) Both '2' and '3'

Q.45 Which part of the human eye adjusts the focal length of lens - **[RPMT-1998]**

(1) Cornea (2) Aqueous humour

(3) Conjunctive (4) Ciliary body

Q.46 The photosensitive pigments viz., erythrolobe, chlorolobe and cyanolobe are sensitive to the colours respectively- **[CPMT 1999]**

(1) Red, green and blue

(2) Blue, green and red

(3) Green, red and blue

(4) Blue, red and green

Q.47 One photon of red light contains about..... of radiant energy in the vertebrate photoreceptor cells- **[JIPMER 1999]**

(1) 686 kcal (2) 3×10^{-19} J

(3) 5×10^{-14} (4) None of these

Q.48 Suspensory ligament is part of- **[CBSE 1999]**

(1) Tongue (2) Brain

(3) Heart (4) Eye

Q.49 Iris of eye sensitive for : **[RPMT-1999]**

(1) light (2) chemical

(3) heat (4) all

Q.50 In frog, fenestra ovalis is- **[CPMT 2000]**

(1) The opening in the auditory capsule which separates the middle ear from the inner ear

(2) The communication between the pharynx and the tympanic cavity

(3) The external opening of the tympanic cavity which is covered by the tympanic membrane

(4) The air filled cavity of the middle ear

Q.51 The structure in human that provide balance are located in the - **[CPMT 2000]**

(1) external ear (2) Middle ear

(3) Internal ear (4) Eustachian tube

Q.52 Ora serrata is- **[AIIMS 1997; Har. PMT 2000]**

(1) Oral cavity of protochordates

(2) Anterior edge of sensory portion of the retina

(3) Gland present in oral cavity of frog

(4) A part of utriculus of ear

Q.53 Eustachian tube connects- **[CPMT 1991; PCS 2001; MPPMT 2001]**

(1) Pharynx to middle ear

(2) Middle ear to external ear

(3) Left ventricle to right ventricle

(4) Left atrium to right atrium

Q.54 Area of retina in human eye containing only cone cells is called- **[PCS 1996, 2001]**

(1) Macula lutea (2) Fovea centralis

(3) Pecten (4) Tapetum

Q.55 The fluid present between the lens and the cornea in the eye is : **[RPMT-2001]**
(1) aqueous humor
(2) endolymphatic fluid
(3) vitreous homor (4) perlymphatic fluid

Q.56 The eye disease hypermetropia can be cured by using : **[RPMT-2001]**
(1) concave lens (2) convex lens
(3) concave-conved lens (4) plane lens

Q.57 Only rods are present in the eyes of- **[MPPMT 2002]**
(1) Owl (2) Pigeon
(3) Fowl (4) Squirrel

Q.58 When we migrate from dark to light, we fail to see for sometimes but after a time visibility becomes normal. It is an example of- **[BSE 2002]**
(1) Mutation (2) Adaptation
(3) Photoperiodism (4) Accommodation

Q.59 A person is wearing spectales with concave lenses for correcting vision. While not using the glasses, the image of a distant object in his case wil be formed- **[AIIMS-2003]**
(1) On the blind spot (2) Behind the retina
(3) On the yellow spot
(4) In front of the retina

Q.60 Organ of Corti is found in- **[RPMT-2003]**
(1) Heart (2) Kidneys
(3) Inner ear (4) Nasal chamber

Q.61 Yellow spot is found in- **[RPMT-2004]**
(1) Muscles (2) Nerves
(3) Kidney (4) Eyes

Q.62 Corti's organ is present in- **[RPMT-2004]**
(1) Reisner's membrane
(2) Scala vestibuli
(3) Basilar's membrane
(4) Middle lamella

Q.63 The place in eye of mammals from which optic nerves and blood vessels leaves the eye ball is- **[AFMC-2004]**
(1) blind spot (2) yellow spot
(3) pars optica (4) none of these

Q.64 The muscles surrounding the pupil of rabbit's eye are : **[CPMT-2004]**
(1) striated and voluntary
(2) striated and involuntary
(3) unstriated and voluntary
(4) unstriated and involuntary

Q.65 Internal ear is filled with : **[AFMC-2005]**
(1) perilymph (2) endolymph
(3) lymph (4) both 1 and 2

Q.66 Bowman's glands are located in the: **[AIPMT - 2007]**
(1) anterior pituitary
(2) female reproductive system of cockroach
(3) olfactory epithelium of our nose
(4) proximal end of uriniferous tubules

Q.67 Lysozyme that is present in perspiration, saliva and tears, destroys- **[AIPMT - 2007]**
(1) Certain type of bacteria
(2) all viruses
(3) Most virus - infected cells
(4) Certain fungi

Q.68 Maximum refraction of light takes place at **[WEST BENGAL JEE-2007]**
(1) Cornea (2) lens
(3) iris (4) aqueous humour

Q.69 Which of the following neve supplies for organ of Corti **[JHARKHAND-2003]**
(1) Auditory (2) Olfactory
(3) Trochlear (4) Vagus

Q.70 Vitreous humor is **[BIHAR-2006]**
(1) colloid
(2) watery fluid
(3) mucoid connective tissue
(4) all of the above

Q.71 Accoustic spots in frog are present in **[UP-CPMT-2002]**
(1) ossious labyrinth
(2) carotid
(3) membranous labyrinth
(4) all of these

Q.72 In the internal ear the 'organ of Corti' which bears hairs cells, is located in…….. **[MP-PMT 2004]**
(1) Scala tympani (2) Scala media
(3) Scala vestibuli (4) Sacculus

Q.73 Ear ossicle, incus is modified from of which bone **[MP-PMT 2004]**

(1) Jugal (2) Articular

(3) Quadrate (4) Hyomandibular

Q.74 The vitreous humour, a jelly like substance which is found in posterior part of **[MP-PMT-2005]**

(1) Eye (2) Ear

(3) Nose (4) Heart

Q.75 Pharynx and middle ear are interconnected by **[MP-PMT 2001]**

(1) Tympanic canal (2) Eustachian canal

(3) Cochlear canal (4) Vestibular canal

Q.76 Only rods are present in the eyes of one of the following animals **[MP PMT-2001]**

(1) Pigeon (2) Squirrel

(3) Fowl (4) Owl

Q.77 When the intensity of light is low during night the light is detected by **[MP-PMT 2002]**

(1) Rods (2) Cones

(3) Lens

(4) Both rods and cones

Q.78 The receptors found in the muscles, tendons and joints are : **[MP-PMT-2002]**

(1) Teloreceptors (2) Proprioceptors

(3) Interoceptors (4) Thermoreceptors

Q.79 In mammals ear, a membraneous structure which separate the scala vestibule and scala media is **[MP-PMT-2003]**

(1) Basilar membrane

(2) Reissner's membrane

(3) autolith membrane

(4) Tectorial membrane

Q.80 "Organ of Corti" is found in **[MP-PMT-2003]**

(1) Scala rotundes (2) Scala media

(3) Scala vestibule (4)Scala tympani

Q.81 Merkel's disc in the skin of rabbit are **[CPMT-1992]**

(1) Tangoreceptor (2) Pain receptor

(3) Thermoreceptors (4) Vibroreceptor

Q.82 Pacinian corpuscles occur in the skin of certain parts of body. These are **[AIIMS-1998]**

(1) Pain receptor (2) Types of gland

(3) Nacked tactile receptor

(4) Encapsulate pressure receptor

Q.83 Pacinian corpuscle present in skin detect **[RPMT-1998]**

(1) Pain (2) Temperature

(3) Pressure contact (4) Movement

Q.84 A feeling of pain in one's stomach would be due **[AIIMS-1998]**

(1) Exteroceptors (2) Teloreceptor

(3) Proprioceptors (4) Interoceptors

Q.85 Thermoreceptors are **[CPMT-1992]**

(1) Organ of ruffini (2) Krause end bulb

(3) Ampallae of lorenzini

(4) All of the above

Q.86 Bowman's gland are located in the **[AIPMT-2006, 2007]**

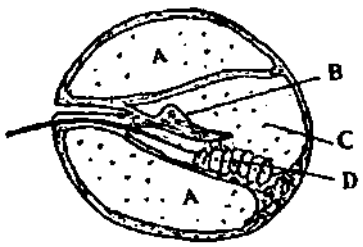
(1) Proximal end of uriniferous tubules

(2) Anterior pituitary

(3) Female reproductive system of cockroach

(4) Olfactory epithelium of our nose

Q.87 Given below is a diagrammatic cross section of a single loop of human cochlea **[AIPMT-2008]**



Which one of the following options correctly represents the names of three different parts ?

(1) D : Sensory hair cells, A : Endolymph B : Tectorial membrane

(2) A : Perilymph, B : Tectorial membrane C: Endolymph

(3) B : Tectorial membrane, C : Perilymph, D : Secretorycells

(4) C : Endolymph, D : Sensory hair cells, A : Serum

Q.88 Which one of the following is the correct difference between Rod Cells and Cone Cells of our retina ? **[AIPMT-2008]**

	Rod Cells	**Cone Cells**
(1)	Overall vision in poor function of light	Colour vision and detailed vision in bright light
(2)	distribution more retina	Evenly concentrated distributed all in centre of over retina
(3)	Visual high acuity	Low
(4)	Visual pigment contained iodopsin	Rhodopsin

Q.89 Cornea transplant in humans in almost never rejected. This is because **[AIPMT-2008]**

(1) It is composed of enucleated cells

(2) It is a non-living layer

(3) Its cells are lest penetrable by bacteria

(4) It has no blood supply

Q.90 The size of aperture of the pupil of one eye is controlled by : **[JEE 2007, DUMET 2009]**

(1) iris (2) retina

(3) cornea (4) conjunctiva

Q.91 Lateral line sense organs occur in : **[MH. CET 2004, 2005]**

(1) Salamander (2) Frog

(3) Water snake (4) *Scoliodon*

Q.92 Organs of Ruffini are receptors of : **[WB. Jee 2006, MPPMT 2007]**

(1) Heat (2) Cold

(3) Pressure (4) Touch

Q.93 Bony labyrinth contains a fluid called : **[Har. PMT 2007]**

(1) Perilymph (2) Endolymph

(3) Haemolymph (4) Lymph

Q.94 Columella auris is found in : **[Har. PMT 2007]**

(1) Rabbit (2) Frog

(3) Man (4) All of these

Q.95 Organ of Corti rests on : **[RPMT 2004]**

(1) Ressner's membrane

(2) Basilar membrane

(3) Schneiderian

(4) Robertsonian membrane

Q.96 Static equilibrium is maintained by : **[Har. PMT 2007]**

(1) Utriculus (2) Sacculus

(3) Both of these (4)Semicircular canals

Q.97 Organ of Corti is found in : **[JIPMER 2004, RPMT 2006]**

(1) Internal ear (2) External ear

(3) Both of these (4) None of these

Q.98 Organ of Corti helps in : **[AFMC 2010]**

(1) maintaining equilibrium

(2) formation of wax

(3) hearing (4) all of these

Q.99 Which of the following is correct pair ? **[RPMT 2001]**

(1) Ant. Pituitary — Synthesis of oxytocin

(2) Hearing — Organ of Corti

(3) Nephron — Endocrine organ

(4) Bipinnaria — Coelenterata

Q.100 Eustachian tube connects : **[Wardha 2008, CPMT 2009]**

(1) Pharynx to middle ear

(2) Middle ear to external ear

(3) Left ventricle to right ventricle

(4) Left atrium to right atrium

Q.101 Which organ of rabbit is concerned with equilibrium ? **[RPMT 2001]**

(1) Cochlea (2) Ear ossicles

(3) Eustachian ducts

(4) Semicircular canals

Q.102 Bowman's glands are found in : **[BHU 2002, CBSE 2006, DPMT 2008]**

(1) olfactory epithelium

(2) external auditory canal

(3) cortical nephrons only

(4) juxtamedullary

Q.103 The correct order of arrangement of ear ossicles starting from tympanum is : **[VMMC-Safdarjung 2008]**

(1) incus, malleus, stapes
(2) malleus, incus, stapes
(3) stapes, malleus, incus
(4) incus, stapes, malleus

Q.104 Taste pores are : **[St. Johns MC 2002]**

(1) ducts (2) papillae
(3) provided with lids
(4) small pores of taste buds

Q.105 Stimulation of which receptors bring about micturition in rabbit ? **[EAMCET 2002]**

(1) Stretch (2) Tango
(3) Olfactory (4) Gustatory

Q.106 The dorsal pit, present in pit vipers is sensitive to : **[PCS 2004]**

(1) Heat (2) Light
(3) Sound (4) Magnetic field

Q.107 In mammalian cochlea, the thin-walled sloping roof of the scala media is referred to as : **[IAS 2002]**

(1) Organ of Corti
(2) Scala tympani
(3) Basilar membrane
(4) Reissner's membrane

Q.108 In the following abnormalities of the eye which one is a serious condition that leads to blindness ? **[VMMC-Safdarjung 2008]**

(1) Myopia (2) Glaucoma
(3) Presbyopia (4) Astigmatism
(5) Hypermetropia

Q.109 The lens and cornea is not having blood supply. So the nutrients are supplied by : **[Kerala PMT 2003]**

(1) retina (2) eye lash
(3) blind spot (4) aqueous humor
(5) vitreous humor

Q.110 Which part of the human ear plays no role in hearing as such but is otherwise very much required ? **[AIPMT Pre 2012]**

(1) Organ of Corti
(2) Vestibular apparatus
(3) Ear ossicles
(4) Eustachian tube

Ans.	4	1	2	4	1	1	4	2	4	2										

These questions consist of two statements each, printed as Assertion and Reason. While answering to choose any one of the following four responses.

(1) If both Assertion & Reason are True & the reason is correct explanation of the Assertion.

(2) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.

(3) If Assertion is True but the Reason is False.

(4) If both Assertion & Reason are false.

Q.1 **A :** Dogs have an acute olfactory sense.
R : Olfactory epithelium is very extensive in dogs.

Q.2 **A :** When one applies a perfume, he soon ceases to smell it, but others approaching him can perceive its aroma.
R : The olfactory receptor cells present in the nose works as chemoreceptors.

Q.3 **A :** Sparrows possess poor night vision.
R : Sparrows eyes are made up of ommatidia.

Q.4 **A :** Auditory function of ear is restricted to external and middle ear only.
R : Internal ear bears sensory hair cells for perceiving changes concerned with posture and equilibrium.

Q.5 **A :** Vitamin A deficiency produces night blindness.
R : Photosensitive pigment rhodopsin is synthesised from vitamin A.

Q.6 **A :** The auditory ossicles help in hearing.
R : Auditory ossicles maintain the balance of air pressure between two sides of the eardrum.

Q.7 **A :** Nerve impulses are carried from gustatory cells of taste buds to the brain.
R : Taste center in brain is responsible for perceiving the taste sensation.

Q.8 **A :** Taste buds are called the sense organs for olfaction.
R : Taste buds bear olfactory receptor cells which get stimulated by certain chemical substances.

Q.9 **A :** All of the cranial nerves are said to be mixed nerves.
R : All cranial nerves carry both sensory and motor nerve fibres simultaneously.

Q.10 **A :** Taste of chillies is not a true sensation.
R : Taste of chillies is perceived only on the upper surface of the front half of the tongue.

Q.11 **A :** No taste sensation is evoked when distilled water is applied on human tongue.
R : Man does not possess taste buds for tasting water.

Q.12 **A :** Motor neuron terminates on a motor end plate at the neuromuscular junction.
R : Motor end plate acts as receptor for detecting changes in the muscle fibres.

Q.13 **A :** The chemicals stored in the synaptic vesicles are termed as neurotransmitters.
R : Synaptic vesicles release these chemicals in the synaptic cleft.

Q.14 **A :** Myopia or short sightedness can be corrected by using spectacles with biconcave lenses.
R : Biconcave lenses diverge the parallel rays before their entry into the eye.

Q.15 **A :** With the evolution of multicellularity, it became imperative to develop nervous system.
R : Special senses such as vision, hearing are produced by sense organs associated with the nervous system.

Q.16 **A :** Image focussed on the fovea is seen most accurately.
R : Fovea of retina contains numerous photoreceptor rod cells.

Q.17 **A :** Blind spot on the retina of the eye is devoid of the ability for vision.
R : The photoreceptor cone cells are absent at the blind spot.

Q.18 **A :** While reading a book, you have to move yours eyes form word to word, although the full page is in view.

R : This is because of the difference in curvature between different meridians of the cornea.

Q.19 **A :** The eye is said to have power of accommodation.

R : Ciliary muscles alters the shape of the lens for near or far vision during accommodation.

Q.20 **A :** In hypermetropia or far sightedness, the objects get focussed beyond the retina.

R : It happens due to the denaturation of lens proteins.

Q.21 **A :** Nocturnal animals are able to see in the dark.

R : Retina of eye of the nocturnal animals bears mainly rod cells as the photoreceptors.

Q.22 **A :** A red flower looks black in the evening.

R : Red pigments of flowers trun black in the evening.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	**Good / Important questions**
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

LIFE CYCLE OF ANGIOSPERM

INTRODUCTION

Each and every organism can live only for a certain period of time. The period from birth to the natural death of an organism represents its life span.

Life spans are not necessarily correlated with their size or complexity of the organisms. i.e., the sizes of crows and parrots are not very different yet their life spans show a wide difference. Similarly, a mango tree has a much shorter life span as compared to a peepal tree. Whatever be the life span, the death of every individual organism is certain, i.e., no individual is immortal, except single-celled organisms.

Reproduction is defined as a biological process of self perpetuation in which an organism gives rise to young ones (offsprings) similar to itself The offspring grows, matures and in turn produces new offspring. Reproduction enables the continuity of the species, generation after generation.

TYPES OF REPRODUCTION

There is a large diversity in the biological world and each organism has evolved its own mechanism to multiply and produce offspring. Habitat and internal physiology of organism and several other factors are collectively responsible for how it reproduces. There are two types of reproduction :

(1) Asexual reproduction

(i) Offspring is produced by a single parent with or without the involvement of gamete formation.

(ii) Gametic fusion is absent.

(2) Sexual reproduction

(i) Offspring is produced by two parents (opposite sex) with the involvement of gamete formation.

(ii) Gametic fusion is present.

DIFFERENCE BETWEEN ASEXUAL AND SEXUAL REPRODUCTION

S.No.	Asexual Reproduction	Sexual Reproduction
(i)	It does not involve the formation and fusion of gametes.	It involves the formation and fusion of two gametes, generally distinguished into male and female.
(ii)	New individual develops from one cell or a part of one parent.	New individual develops from zygote or fusion product of two gametes, which may or may not be produced by two parents.
(iii)	New individuals are genetically similar to the parents.	New individuals or offsprings are generally different from either of the two parents.
(iv)	It involves only mitotic divisions.	It involves meiosis at one or the other stage. In higher plants, it occurs at the time of sporogenesis.
(v)	It does not require the formation of sex organs.	Formation of sex organs is a pre-requisite for sexual reproduction.
(vi)	It does not intorudce variability. Hence, has no evolutionary importance.	It introduces variability and is, hence of evolutionary importance.

1. Asexual Reproduction

1. A single individual (parent) is capable of producing offsprings in this reproduction. As a result, the offsprings that are produced are exact copies of each other and their parents. Such morphologically and genetically similar individuals are called clones.
2. It is common among single-celled organisms, plants and animals vvith relatively simple organisation.
3. It is also called somatogenic reproduction because propagules are formed from somatic cells of the parent.
4. It occurs by fission, budding, sporulation, fragmentation, regeneration and vegetative reproduction.

(A) Binary Fission

(i) In this process, the parent organism divides into two halves, each half forming an independent daughter organism. It means, the parent body as a whole forms the reproductive unit and the parent continues living as two daughter individuals. Therefore the organisms that undergo binary fission are said to be immortal.

(ii) It occurs in Bacteria (Moneran), Amoeba and Paramecium (Protists).

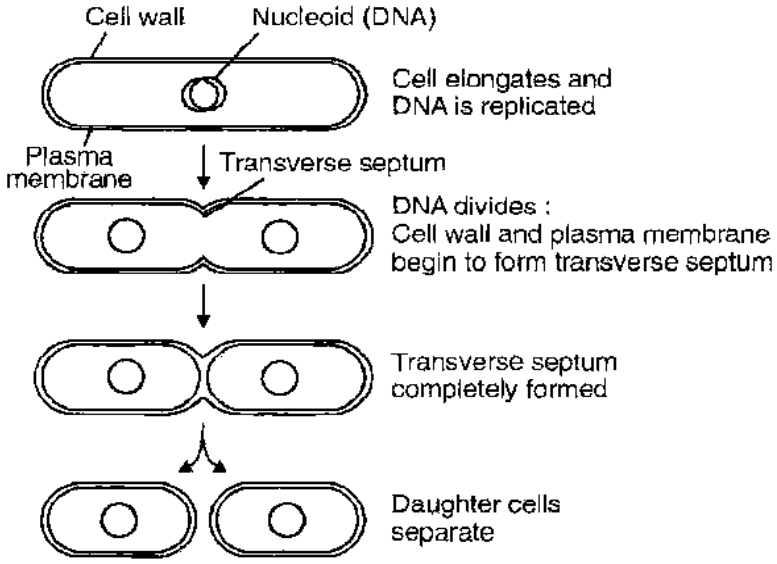

Fig. : Binary fission in bacteria

Depending upon the plane of division, binary fission is of the following types :

(i) Simple Binary Fission (Irregular Binary Fission) : Division can occur through any plane, e.g., Amoeba.

(ii) Longitudinal Binary Fission: The plane of fission passes along the longitudinal axis of the organism, e.g., *Euglena.*

(iii) Transverse Binary Fission: The plane of this division runs along the transverse axis of the individual, e.g., Bacteria, Paramecium, Diatoms.

Life span of some organisms are as follows :

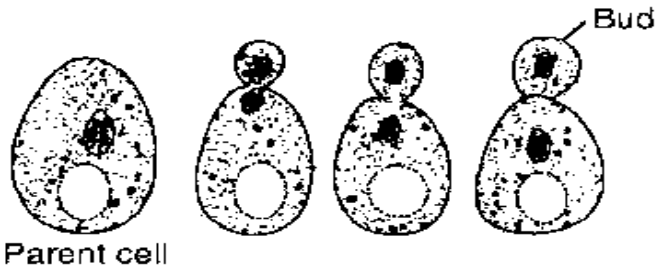
S.No.	*Plant*	*Life span*
1.	Rice	3-4 months
2.	Rose	5-7 years
3.	Banana	25 years
4.	Mango	200 years
5.	Banyan	200 - 300 years
6.	Peepal	2000-3000 years
7.	*Sequoia*	3000-4000 years
8.	*Macrozamia*	10,000-12,000 years

S.No.	*Animal*	*Life span*
1.	Mayfly	1 day
2.	Butterfly	1-2weeks
3.	Fruitfly	30 days
4.	Dog	20-30 years
5.	Crocodile	60 years
6.	Horse	60 years
7.	Elephant	60-90 years
8.	Tortoise	100-150 years

(B) Budding

(i) In yeast, the division is unequal and a small bud (protuberance) is produced that remain attached initially to the parent cell, later on the bud gets separated and mature into new yeast organisms (cells).

(ii) Budding or sporulation is also shown by oidia of *Rhizopus*.



(C) Spores

Members of the kingdom fungi and simple plants such as algae reproduce through special asexual reproductive structure. The most commonly produced structures are conidia and zoospores.

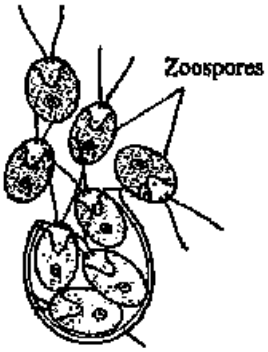
Zoospores

(i) These are motile and flagellated spores produced inside the zoosporangia under favourable conditions.

(ii) In *Chlamydomonas*(n), the protoplast of cell divides to form 8-16 zoospores. They are pyramid shaped and anteriorly biflagellated, resembling the parent cell. The parent cell wall breaks and the zoospores are liberated in water. They enlarge and behave as an adult individual.

(iii) Zoospores are also produced in the asexual life cycle of *Achlya*, *Saprolegnia*, *Phytophthora* and *Ulothrix*.

(iv) Zoospores of *Cladophora* glomerata are diploid.



Zoospores of Chlamydomonas

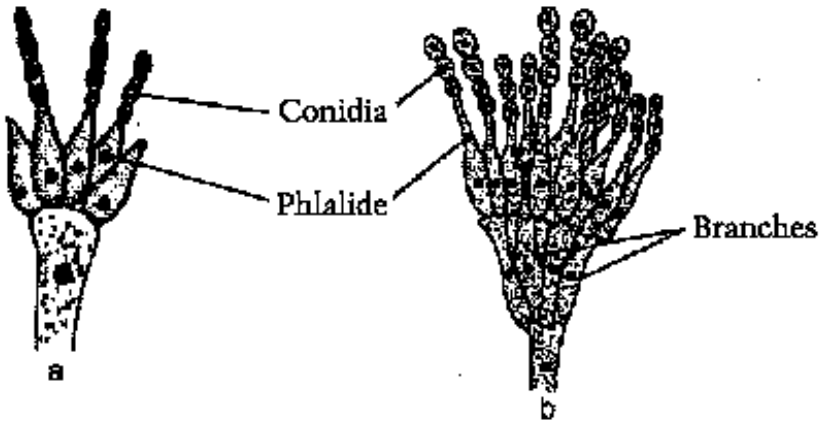
Conidia

(i) In *Penicillium*, these spores are produced at the tips of special hypha I branches, called conidiophores.

(ii) There are two types of conidiophores :

a. Unbranched/monoverticillate

b. Branched Biverticillate



Penicillium

(iii) The branches of conidiophores are called rami and branches of rami are called metulae. Each metula bears 2-6 flask shaped structures called sterigmata (phialides). Each sterigma produces a chain of conidia.

(iv) Features of Conidia:

a. Pigmented

b. Uni or multinucleated

c. The conidia in the chain are arranged in basipetal manner.

(i) Conidia are produced by the members of Ascomycetes (e.g., Aspergillus, Penicillium).

(ii) The conidiophore with its metulae, sterigmata and chain of conidia gives the appearance of a small brush/broom, technically called penicillus.

(D) Vegetative Reproduction

(a) Vegetative reproduction does not involve meiosis and fusion of gametes, therefore it is considered as a type of asexual reproduction.

(b) New plants or individuals are produced from vegetative parts of plants and newly formed individuals are genetically identical to the parent plant.

(c) It is common method of reproduction in the flowering plants.

There are two types of vegetative reproduction.

(I) Natural methods of Vegetative Reproduction :

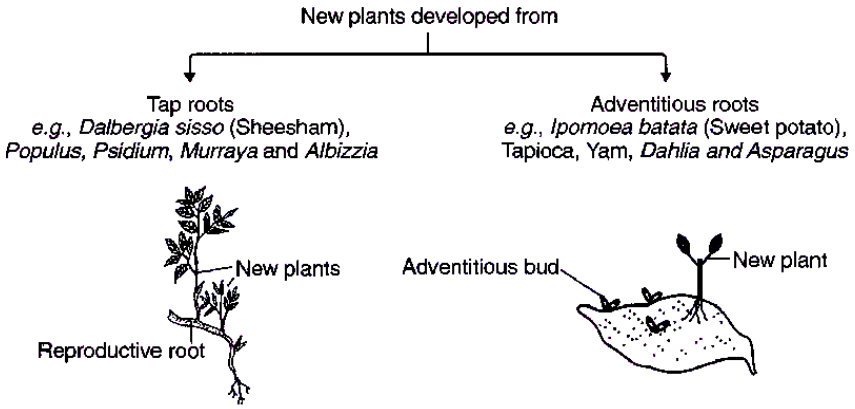
These are methods of plant multiplication occurring naturally in which a somatic part of the plant detaches from the body of the mother and develops into a new independent plant under suitable environmental conditions. The detachable somatic part that functions in vegetative propagation is called vegetative propagule. It carries one or more buds. Natural buds occur over the nodes of the stem. When placed in contact with damp soil, the buds sprout, producing roots and new plants. This potential is exploited by farmers, e.g., tubers of potato, rhizome of banana and ginger, bulbs, runners, offsets, stolons, aerial stems etc. Some propagules carry adventitious buds e.g., normal and storage roots, leaves.

It occurs by following means :

(1) Roots

(i) Both tap roots and adventitious roots takes part in vegetative reproduction due to the presence of bud, known as radicle bud.

(ii) Adventitious buds on root detaches and gives rise to new plant.



(2) Underground stems : Different types of underground stems like **tuber**, **rhizome**, **bulb** and **corm** can take part in vegetative propagation. A portion of underground stem bearing bud forms a new plant.

- **Tuber :** It is terminal portion of underground stem branch which is swollen on account of accumulation of food. e.g., Potato, Artichoke
- **Rhizome : It grows or horizontally under** soil surface. It is well branched and bears nodes, intemodes, buds and scale leaves. e.g., Banana, Turmeric, Aspidium, Adiantum

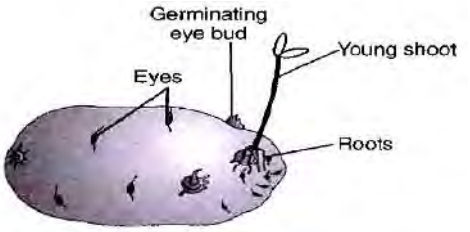


Fig. : Tuber of Potato

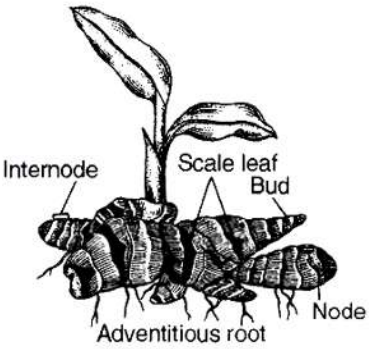

Fig. : Rhiozome of ginger

- **Bulb :** Stem is unbranched, highly reduced and disc shaped. The bud is surrounded by many concentric scale leaves. Leaf bases of inner ones are fleshy and edible and outer ones are dry. e.g., Onion, Garlic, Narcissus
- **Corm :** It grows vertically beneath soil surface. It bears nodes, internodes, buds and scale leaves. e.g., *Colocasia, Gladiolus, Freesia, Crocus*

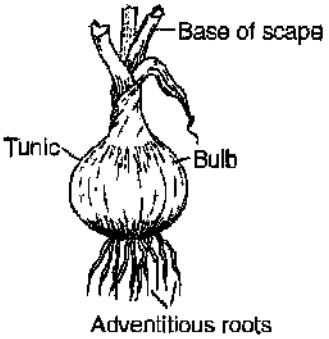

Fig. : Bulb of onion

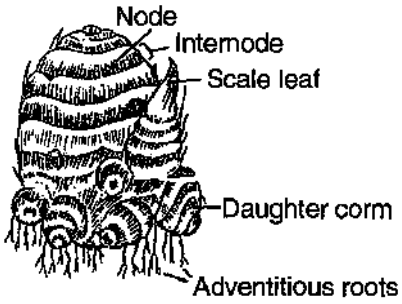

Fig. : Corm of Colocasia

(3) Creeping stems :

- **Runner :** It is elongated, prostrate, sub-aerial branch with long internodes and roots at nodes. e.g., Grasses

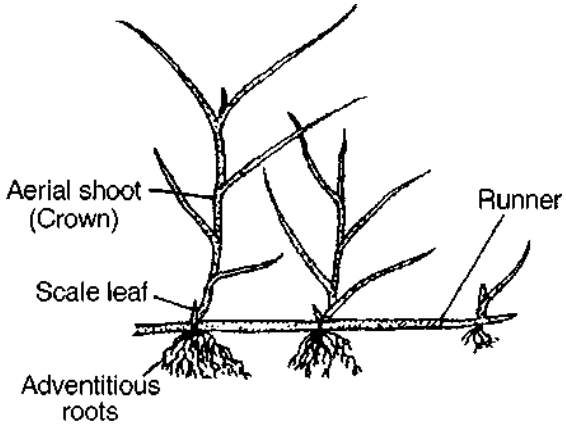

Fig. : Runner of grass

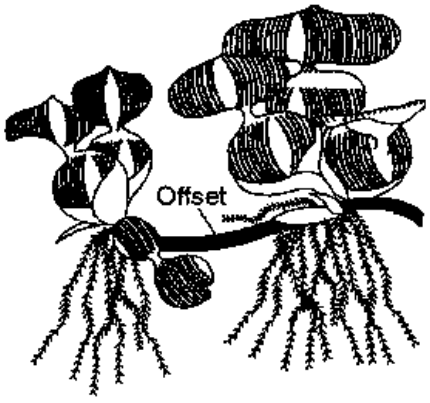

Fig. Water hyacinth

- **Offset :** Short horizontal branch producing a cluster of leaves above and the cluster of roots below is called offset. e.g., *Eichhornial* (Water hyacinth) *Pistia*

  Water hyacinth or 'terror of Bengal' was introduced in Bengal because of its beautiful flowers and shape of leaves. However, it turned out to be highly invasive aquatic weed that not only spread to all water bodies

of Bengal but also throughout India. It drains oxygen from the water, which leads to death of fishes and other animals. It is very difficult to get rid off them since it can propagate vegetatively by offset at a phenomenal rate and spread all over the water body in a short period of time.

- **Stolon :** It is subterranean long lateral branch arising from base of stem. It first grows obliquely upward and then bends down to the ground surface.
  e.g., Strawberry, Vallisneria

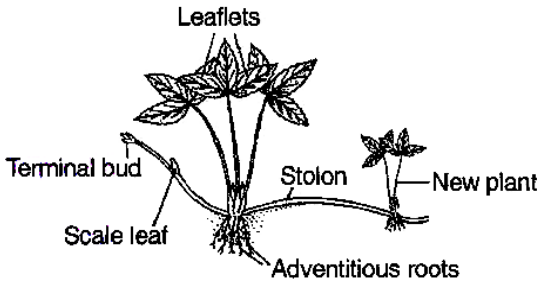

Fig. Stolon of Strawberry

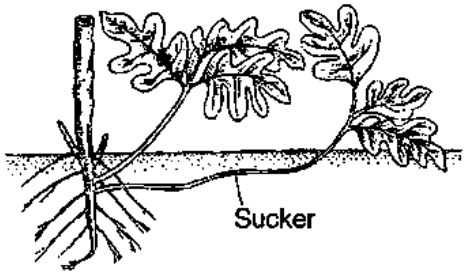

Fig. : Sucker in Chrysanthemum

- **Sucker :** It arises by axillary bud of underground part of stem. This lateral branch creeps below the soil surface and grows obliquely upward and produces new shoot.
  e.g., *Chrysanthemum*, *Pineapple*

(4) Aerial shoots :

Each segment of stem having at least one node can form a new plant. e.g., Sugarcane, Opuntia

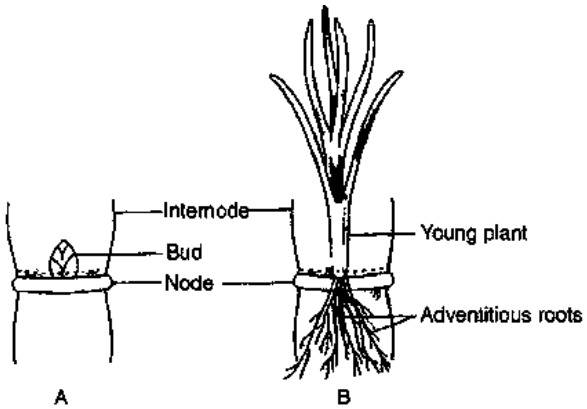

Fig. : propagation from aerial shoot in Sugarcane

(5) Leaves :

Leaves of several plants having adventitious buds help in vegetative reproduction. In Bryophyllum adventitious buds arise from the notches present at margins of leaves.
e.g., *Adiantum* (walking fern), *Begonia*, *Streptocarpus*, *Saintpaulia* and *Kalanchoe*.

Fig. : Bryophyllum

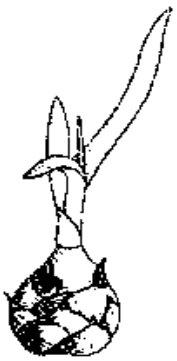

Fig. : Bulbil of Agave

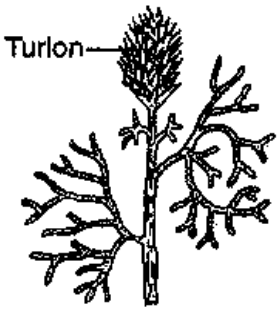

Fig. : Utricularia showing turtion

(6) Bulbils

These are fleshy buds which produce new plant.

e.g., *Agave*, *Oxalis*, *Ananas*, *Oioscorea*, *lily*, *Chlorophytum*

(7) Turions

Fleshy buds in aquatic plants e.g., *Potamogeton*, *Utricularia*.

II. Artificial Methods of Vegetative Reproduction :

Artificial methods are man-made special techniques in which, part of somatic body of a plant is made to develop into new independent plant. Artificial methods are used to propagate desired varieties according to human requirements. Rainy and spring seasons are the best periods for vegetative propagation. The various horticultural methods of vegetative propagation are as follows :

(1) Cuttings : Cuttings are cut pieces of stem, leaves and root which are planted in nurseries in natural polarised fashion. Pre-requisite to successful cutting is induction of rooting. For this, root promoting chemicals like IBA, NAA are used.

(i) Stem Cuttings :

It is a common artificial method of plant propagation. 20-30 cm long pieces of one year old stems are cut and their lower ends are dipped in dilute auxin for several minutes before planting in the soil. The lower ends develop adventitious roots. Buds present over the exposed parts sprout and form the shoot system.

e.g., Rosa, Duranta, Citrus, Clerodendron, Thea, Bougainvillea, Croton and China rose

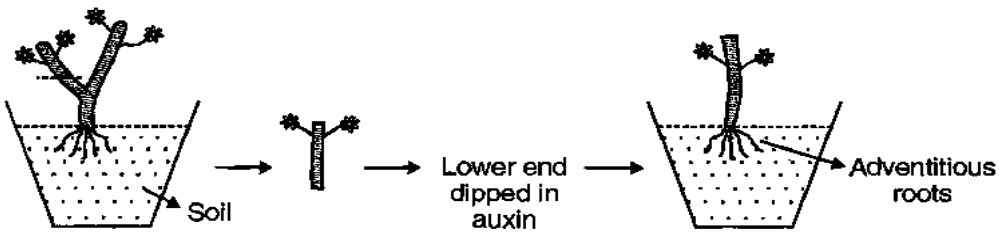

Fig. : Stem cutting

(ii) Leaf Cuttings : Snake plant (Sansevieria) can be propagated by leaf cuttings. Leaves are cut transversely into two or three parts and planted in vertical position in the soil. For successful leaf cutting, besides induction of rooting, formation of adventitious buds is also important.

(iii) Root Cuttings : They are long pieces of roots which are used to artificially propagate new plants. Ability to form adventitious roots and adventitious buds are pre-requisites. Root cuttings are used in propagation of Lemon, Tamarind, Blackberry and Raspberry.

(2) Layering :

(i) It is a type of rooting-cutting method in which adventitious roots are induced to develop on a soft stem while it is still attached to the plant.

(ii) It is carried out on one year old basal shoot branches commonly during early spring or early rainy season.

(iii) A soft basal branch is defoliated in the middle where a small injury or cut is also given, like tongueing (oblique cut), notching (V-shaped cut), ringing (removal of a ring of bark). The injured defoliated part is pegged in the soil to develop adventitious roots. The pegged down branch of the plant is called layer. Later on as the roots develop, the layer is separated and planted.

- Layering is of following types:

(a) Tip Layering :

A shoot is bent down in the soil in such a way that its basal end is slanting while the tip is upright. Soil is pressed. It induces root formation and later growth of shoot tip.

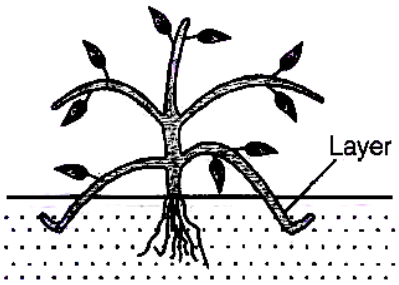

Fig. : Tip layering

e.g., Blackberry, Raspberry.

(b) Trench Layering :

The basal branch is pegged in a horizontal position in a trench made in soil. It develops a number of vertical shoots.

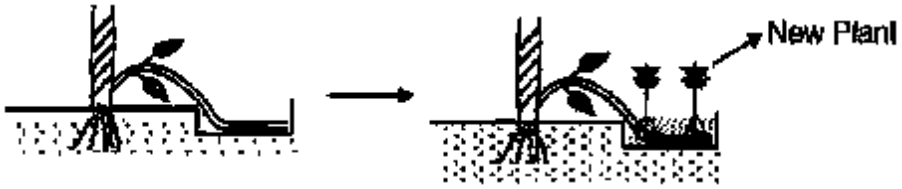

Fig. : Trench layrring

e.g., Walnut, Mulberry.

(c) Serpentine Layering

The basal branch is pegged at several places in soil at regular intervals, so as to form many plants.

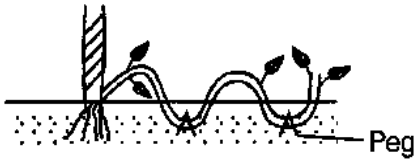

Fig. : Serpentine layering

e.g., Clematis

(d) Mound (Stool) Layering

The shoot is pruned and its lower part is covered by soil but the tip is kept outside the soil. When a number of new shoots develop, soil and saw dust are poured over the base to form a mound. Each shoot develops roots. Rooted shoots are separated and planted.

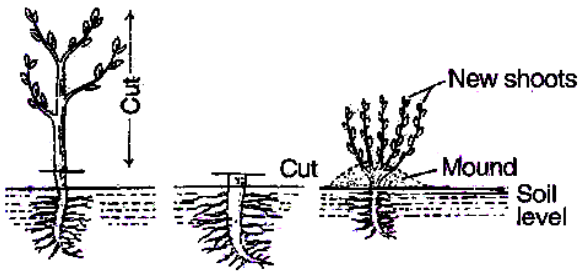

Fig. : Stages in Mound layering

e.g., Currant, Gooseberry, Apple, Pear and Jasmine

(e) Gootee (Air Layering)

(i) It is an ancient horticultural technique for propagation of tropical and subtropical trees and shrubs where soft branches do not occur near the soil.

(ii) During early monsoon rains, 3-5 cm long ring of bark is removed from the basal region of a healthy and woody branch. It is covered by a thick plaster of grafting clay. Grafting clay is made of 1 part cow dung, 1

part finely cut hay or moss and two parts clay. To it is added water and a small quantity of root promoting hormones like 1M, IBA or NAA. It is then wrapped in polythene. After 2-3 months, roots appear. The shoot is now cut below the covered part and used for planting.
e.g., Litchi, Pomegranate.

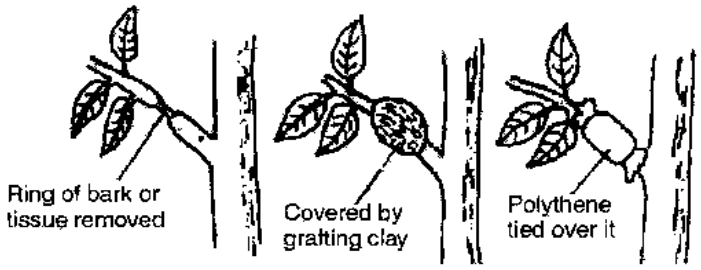

Fig. : Air layering in Rubber plant

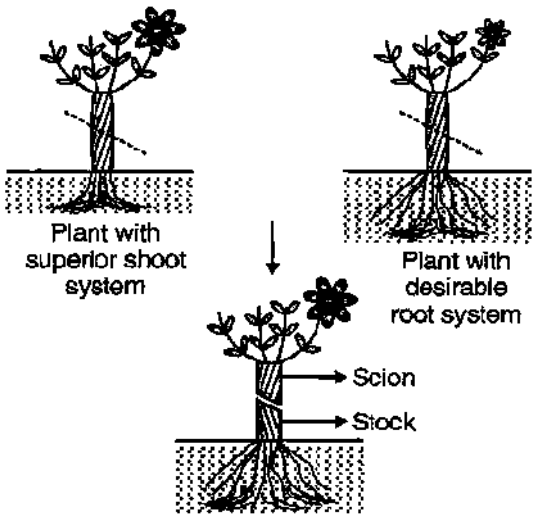
- Soil layering was first discovered by Hartmann.
- In drop layering, a plant capable of forming several branches when it is grown in a deep soil. e.g., Dwarf Rhododendron.

(3) Grafting:

(i) Grafting is a technique of connecting two parts, usually a root system and a shoot system of two different plants in such a way that they unite and later develop as a composite plant.



(ii) It is used only in cambium containing eustelic plants.

(iii) A small shoot of plant with superior traits is employed. It is called **graft or scion**. It should have one to several buds. The root system of the other plant is allowed to remain intact. 1t is called **stock** (understock). The shoot of the stock is often cut 10-30 cm above the base of the root. Leaves and buds present over the stump of stock are removed.

(iv) In grafting, scion is fixed over the stock in a manner that cambia of the two come in contact. The union is covered with grafting wax. It is then tied with the help of a bandage, tape, rubber or nail. The buds of the stock are not allowed to sprout. They are removed as soon as they are noticed.
e.g., Mango, Apple, Pear, Citrus, Guava, Plum, Peach, Pine etc.

- The various types of grafting are as follows :

(a) Tongue (Slice or Whip) Grafting

Oblique sloping cut or notch is given to both stock and scion. The two perfectly fit upon one another. They are tied together.

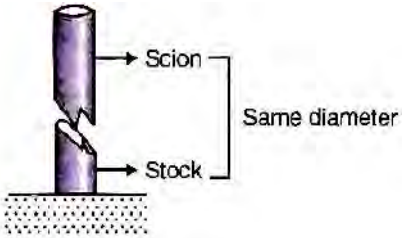


Fig. : Tongue grafting

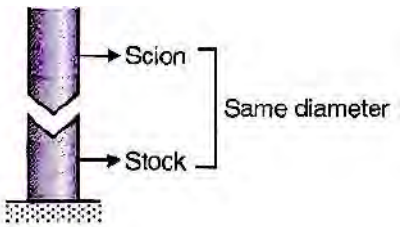

Fig. : Wedge grafting

(b) Wedge Grafting

V-shaped notch is given to stock while wedge like cut is given to scion.

(c) Crown Grafting

Many scions are selected and sl/aped at the base to form wedge. Many slits are formed on the sides of stock. Scions are inserted in the slits and are bandaged.

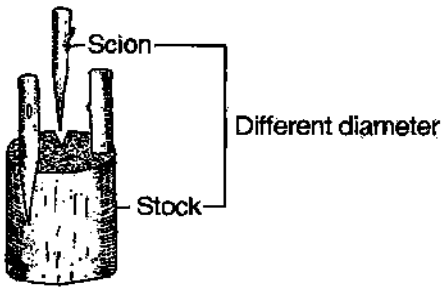

Fig. : Approach grafting

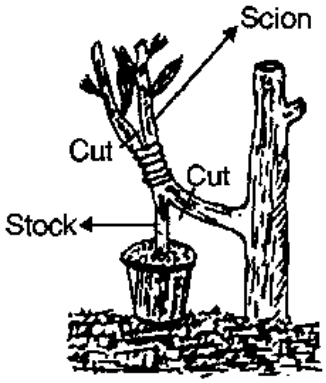

Fig. : Approach grafting

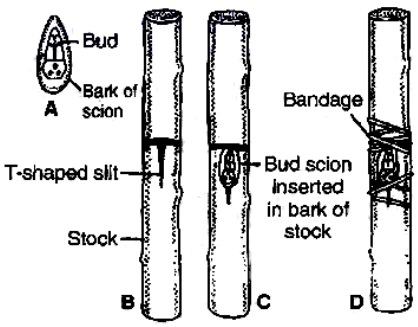
(d) Approach Grafting

Two independently growing plants are brought together. The shoots of the two are given cuts at the same level for a distance of 2.5 - 5.0 cm. The cuts are in the form of smooth slices of bark, tongue shaped cuts or deeper vertical cuts. In this grafting, the scion is cut below the graft while stock is cut above the graft after the establishment of union.

(e) Bud Grafting

Scion is a bud with a small piece of bark and cambium. Stock is given a T-shaped cut. Bark is lifted to expose cambium. Bud is inserted and the bark is allowed to come back to its original position. Only the bud is exposed. The joint is treated with grafting wax and bandaged. Bud sprouts after 3-5 weeks. Bud grafting is commonly practised in apple, peach and rose.



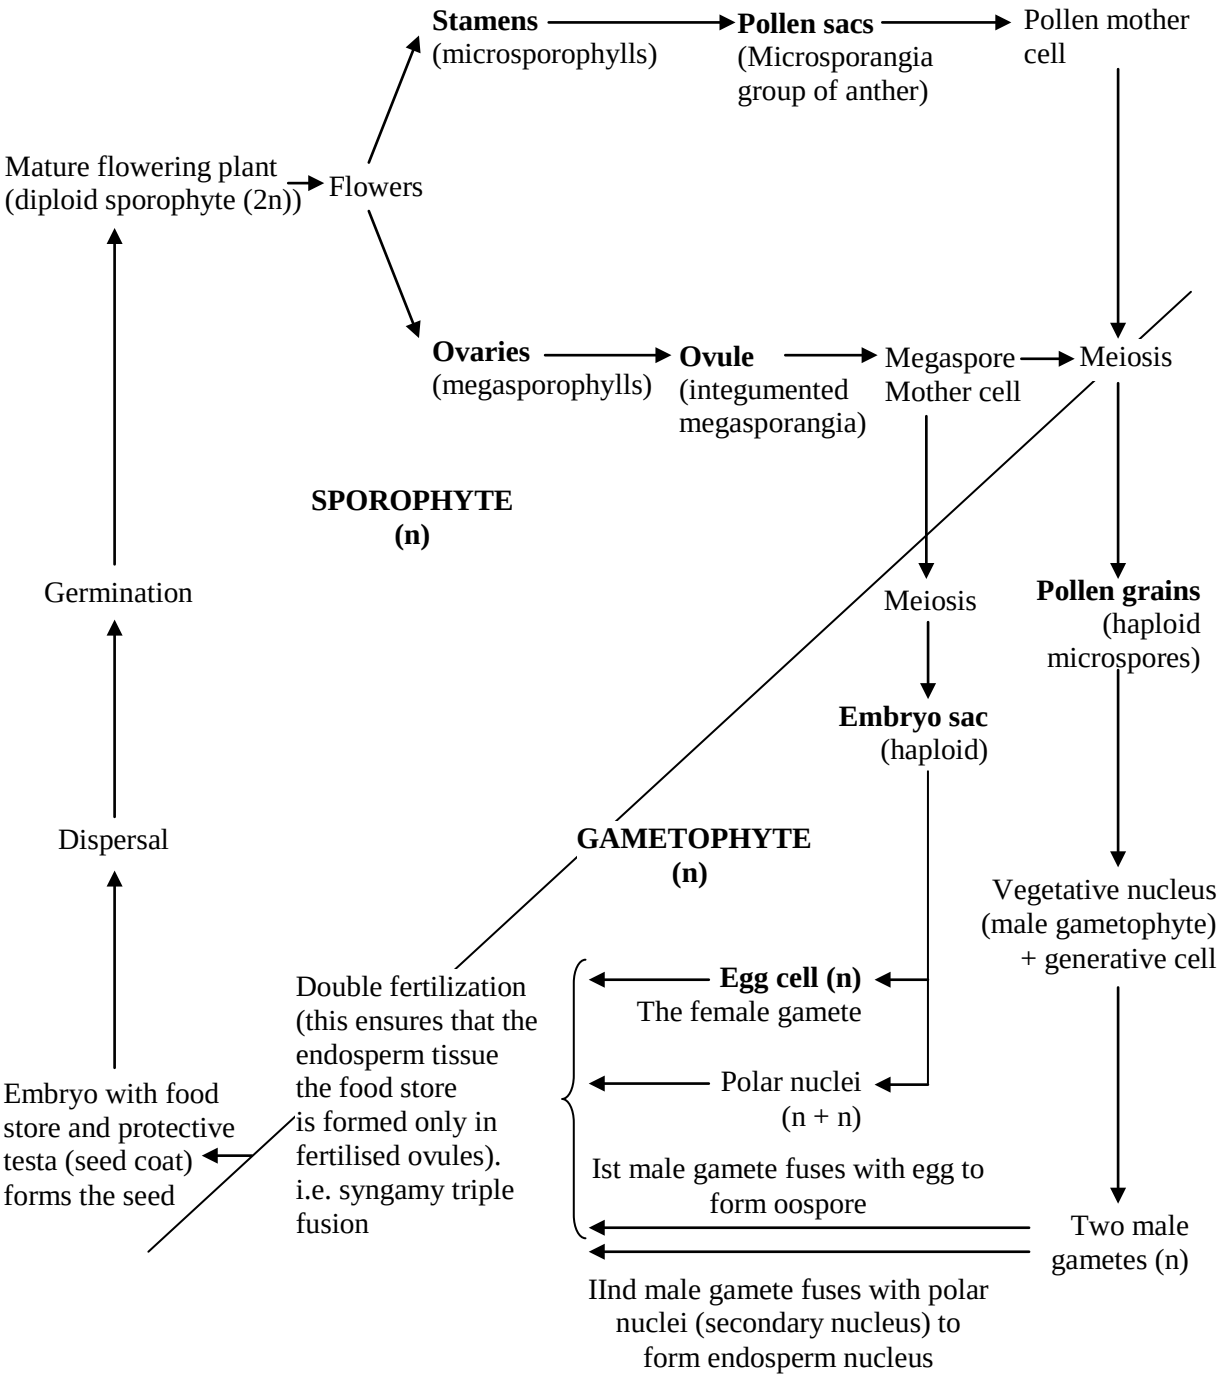
(4) Micropropagation : Micropropagation is the raising of new plants from a small plant tissue with the help of tissue culture technique. Tissue culture is the technique of maintaining and growing cells, tissues, etc. and their differentiation on artificial medium under aseptic conditions inside suitable containers.

(i) Gemmae are small, undifferentiated, multicellular green propagules which separate from parent plant and forms new plants e.g., Marchantia, Funaria.

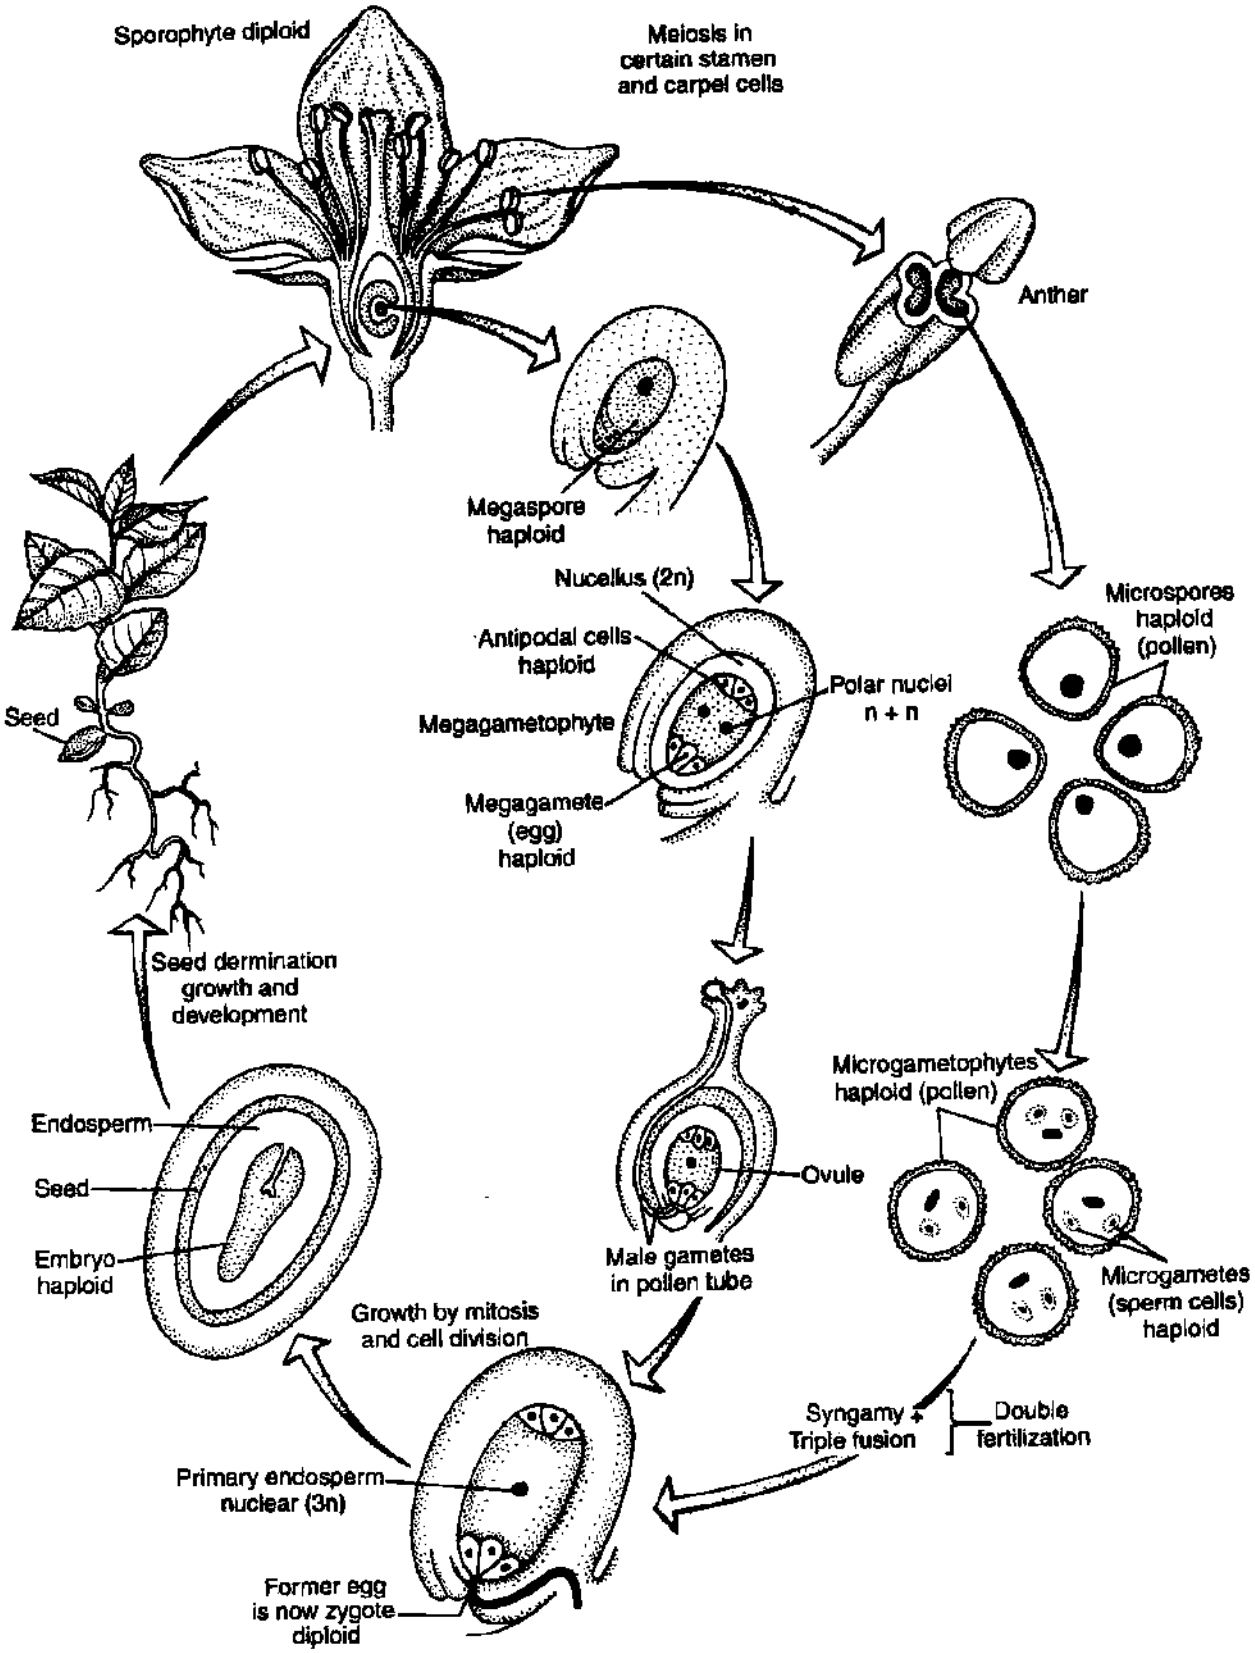
(ii) Resting buds are perennating fleshy buds, as in Selaginella subdiaphana.

SEXUAL REPRODUCTION

In Angiosperms male and female gametes are formed in male and female sex organs by the process of meiosis. Both the gametes fuse together to form a diploid zygote which gives rise embryo. It means the process in which embryo is formed by meiosis and fertilization is called Amphimixis.



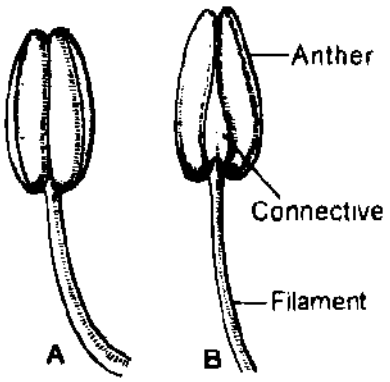
Diagrammatic representation of life history of an angiospermic plant



Life cycle of an Angiospermic plant topographic representation

MALE REPRODUCTIVE ORGAN - ANDROECIUM

Male reproductive organ is called androecium and their unit is called stamen. Stamen is also known as microsporophyll. There are 6 stamens are present in Capsella. A typical stamen is differentiates into three parts –a long, thin structure is called filament which joins the stamen to the thalamus. The free end of the filament, a swollen spore bearing structure is called anther. Anther and filament are attached together with help of small region, called connective. Connective contains vascular tissues. The main parts of the stamen is the anther.Each anther generally bilobed structure i.e. anther has two anther lobes is called dithecous.



Each lobe of anther has two chambers which are called pollen sacs or microsporangia or pollen chambers. Therefore, a typical anther has four pollen sacs is called tetrasporangiate. Pollen grains are formed inside the pollen sac through the meiotic division of pollen mother cells. At the maturity of the pollen grains, sterile tissue degenerate which are present in between the pollen sacs. Both the pollen sac fused together. Because of this reason, only one chamber appears in each anther lobe at maturity. So two chambers are seen in the mature anther at the time of dehiscence.

In *Capsella*, which is member of the cruciferae or Brassicaceae, anther are dithecous and tetrasporangiate type. But in Malvaceae, the anther of stamen has only one anther lobe. This is called monothecous and it contains only two pollen sacs called Bisporangiate. Monothecous anther are also found in Moringa, Wolffia plants. In Arceuthobium where there is only one microsporangium per anther. This condition is called Monosporangiate.

STRUCTURE OF ANTHER :

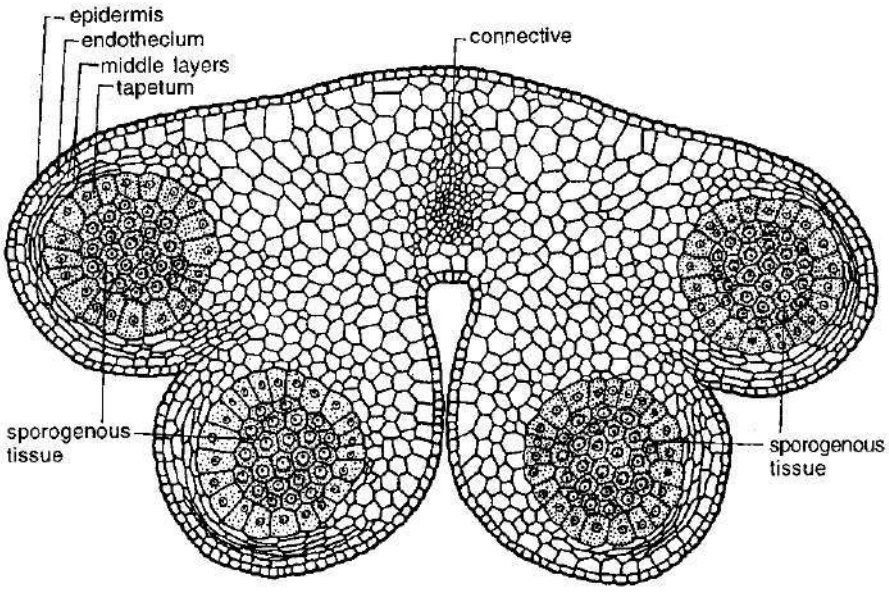


Fig. 3.1 Transverse section of a tetrasporangiate anther to show its various tissues.

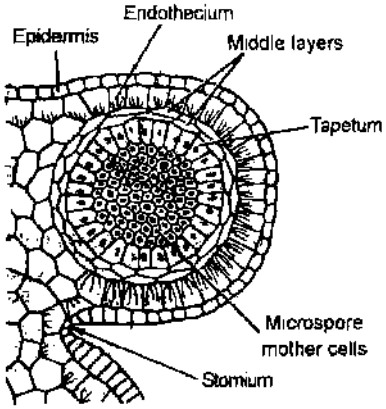
The development of anther in origin is Eusporangiate type i.e. It is developed from more then one archesporial cells. In the transverse section of anther, it is seen almost spherical. The following structures are present in the anther :-

- **Epidermis :-** It is the outermost layer of anther. It is single celled thick and continuous layer but not archesporial in origin. It forms the outermost protective layer. In Arceuthobium (Smallest Parastic Angiosperm) fibrous thickening present in epidermis so it is called exothecium.
- **Endothecium :-** This layer is present below the epidermis. It is single celled thick layer. During the maturation of anther, various changes takes place in different walls of cells of endothecium. The outer wall of these cells remains thin walled, but inner walls and radial walls become thick due to thickening of α-Cellulose fibers. Callose bands are also present along the radial walls. At some places callose bands and fibrous thickening are absent. These places are called stomium. The dehiscence of anther takes palce only from these places. Endothecium becomes hygroscopic nature due to presence of fibrous thickening. So it helps in dehiscence of anther.

  Note : Hydrocharitaceae family – fibrous thickening is absent in endothecium.



T. S. of young anther showing four microsporangia and vascular bundle.

- **Middle layer :-** Middle layer is consist of parenchymatous cells. This layer is one to three celled thick structure. Food is stored by parenchymatous cells of this layer. Middle layer is ephemeral in nature and absent in a mature anther.

  In Holoptelia plant 3 to 4 called thick middle layer is present. In Najadaceae & Lemnaceae families middle layer is absent. In wolffia middle layer is absent.
- **Tapetum :-** It is the inner most layer which acts as nutritive layer. It is known as tapetum. Pollen sacs surrounded by tapetum. This is also single celled thick layer. The cells of the tapetum initially diploid but they become polyploidy due to endomitosis. It means these cells contain many chromosomes. Tapetum absorbs food from the middle layer and provide nutrition to the microspore mother cells or microspores. The cells of tapetum secrete hormones and enzymes. The tapetum layer disappears in the mature anther.

  Note : In Nicodia and Costum plants, tapetum is multilayered.
- **Pollen sacs :** Four Pollen sacs are present in the anther. Pollen sacs are also known as microsporangia. Inside the pollen sacs, microspores are formed by the meiotic divison of microspore mother cells.

TAPETUM IS OF TWO TYPES :-

Amoeboid Tapetum/Invasive Tapetum/Periplasmodial Tapetum :

It is found in primitive Angiosperm. Such type of tapetum absorb all foods from the middle layer. So middle layer immediately degenerates. In the beginning, all food materials stored by tapetum. Tapetal cells convert the absorbed food into special food granules called protoplast bodies. The innermost layer of tapetum dissolve and release its protoplast into the cavity of the microsporangium. Now inside the pollen sacs protoplast bodies are known as periplasmodium. Microspore mother cells are surrounded by periplasmodium and provides nourishment to the developing microspores. This type of tapetum provide nutrition to the microspores after degeneration.Example : *Typha, Alisma* and *Tradescantia.*

- **Glandular or Secretory Tapetum :**

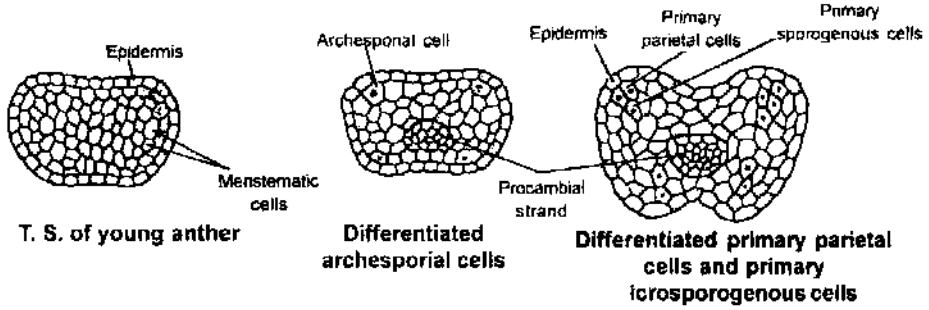
  It is developed type of tapetum. It is not degenerates quickly. It absorbs nutrients from the middle layer and secreted into the cavity of the microsporangia (Pollen sacs) and does not store it e.g. Usually it is found in most of Flowering plants (*Capsella*). Before degeneration of cells of tapetum, they form special granules called Proubisch bodies in cytoplasm. Proubisch bodies transfer between cell wall and cell membrane of tapetal cells.

Here they are surrounded by Sporopollenin. Now they are called Ubisch bodies or orbicules. At last tapetum degenerates and ubisch bodies released into pollen sacs. Generally, sporopollenin participates in the formation of outer covering (Exine) of Pollen grains. Tapetum helps in transfer of food, storage of food, formation of sporopollenin and pollenkitt materials.

MICROSPOROGENESIS :

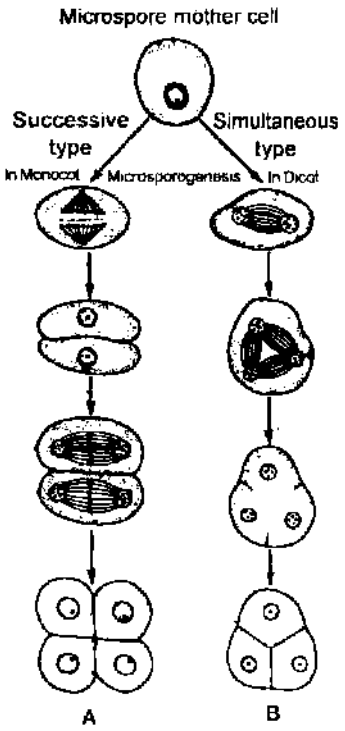
The anther appears as outgrowth like structure in the initial stage which shows spherical or oval shaped structure. At this stage, it is a mass of undifferentiated and homologous meristematic cells which is surrounded by a single cell thick outer layer. This layer is known as epidermis. First of all vascular tissue are formed in middle region Simultaneously four cells located just below the epidermis in vertical rows in the region of hypodermis at the four corners are become large has visible nucleus with dense cytoplasm. Due to this reason they are different from the rest of the cells. These cells are called archesporial cells.

These cells divide periclinally to form primary parietal cells below the epidermis and primary sporogenous cells towards the centre. Both of the cells usually undergo further divisions to form complete structure of anther except epidermis.



Primary parietal cells undergo further periclinal and anticlinal division to form a series of 3-5 layers making the walls of the anther. Out of them outer most layer of anther is formed just below the epidermis by primary parietal cells is called Endothecium or fibrous layer. The endothecium is followed by 1-3 celled thick layer is termed middle layer. The innermost layer of the anther which surrounds pollen sacs, is called tapetum. Later the tapetal cells play a significant role during the meiotic cell division in microsporogenous cells and in pollen development. The primary sporogenous cells divide twice or more than two times by mitotic division to form sporogenous cells and later sporogenous cells differentiated into microspore mother cells (MMC / PMC) during the formation of wall of pollen sac.

Each microspore mother cell divide to form four haploid microspore or pollen grain by meiotic division or reduction division. During this period spherical bodies are formed inside the tapetal cells before their disintegration. These spherical bodies are known as Ubisch-body. Ubisch body is made up of a complex substance called sporopollenin. It is polymer of carotenoids.



TWO DIFFERENT TYPE OF MEIOTIC DIVISION IN MICROSPORES MOTHER CELL.

After the formation of ubisch body, the tapetum layer degenerates. Ubisch bodes participate in the formation of exine of the microspores inside the pollen sacs. Now thick walled microspores are called pollen grains. At the initial state all four microspores are attached together with the help of callose layer. This group of microspores is called tetrad. After some time, this callose layer dissolve by callase enzyme. Which is secreted by tapetum.

Normally each microspore mother cell can form tetrad by meiotic division. But in some plant like Zostera, some microspore mother cells become sterile and provide nutrition to rest of microspore mother cells.

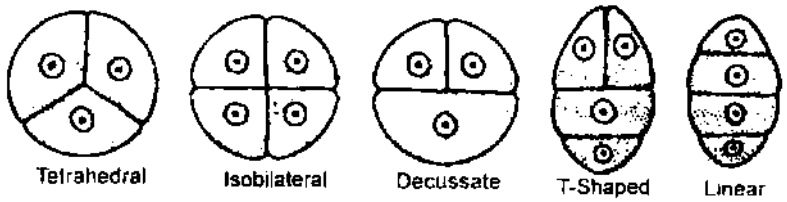
Similarly, tapetum is not well developed in Gentianaceae family so some cells of sporogenous tissue become sterile and provide nutrition to remaining sporogenous cells.

- **Types of tetrads :** The arrangement of the microspores in tetrad condition as follows :-
- **Tetrahedral tetrad :** Four haploid microspores arranged in tetrahedral form.

  Example : *Dicotyledons – (Capsella)*
- **Isobilateral tetrad :** This condition is found in **monocotyledons**. Microspores are arranged at the lateral side of each other.
- **Decussate tetrad :** In this two microspores lies at the right angle of other microspores.

  Example : *Magnolia*
- **T-Shaped tetrad :** Two microspores lie longitudinally and two microspores lie at transversly in this type of tetrad. Example : *Aristolochia* & *Butomopsis*.
- **Linear tetrad :** In this tetrad all four pollens arranged in linear order. e.g., *Halophylla, Halophia.*

  All the above type of tetrads are found in Aristolochia elegans. Most common type of tetrads is Tetrahedral.

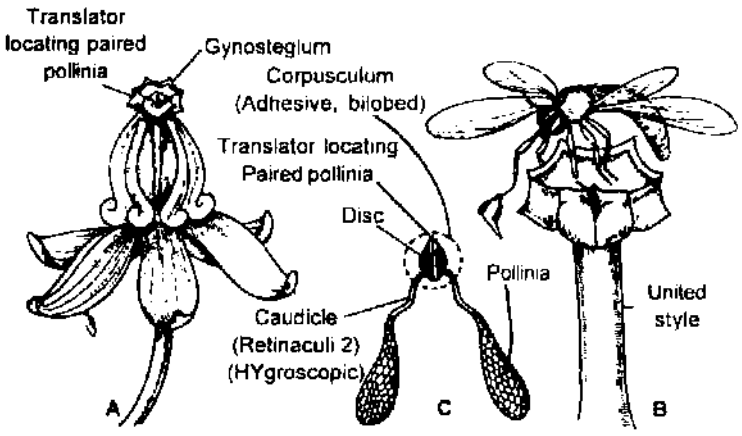


DIFFERENT TYPE TETRAD OF ANGIOSPERM

Facts about types of Pollen grains :

In Asclepiadaceae (Calotropis) and Orchidaceae family, all the pollen grains joined together to form "Pollinium".

More than four pollen grains are found in tetrad called "Polyspory" e.g. *Cuscuta.* In some plants, four pollens of tetrad join together permanently are called "Compound pollens" e.g. *Drosera, Typha, Drimys* and *Elodea.* Pollinium of Calotropis is called "Translator apparatus". Compound pollens of Mimosaceae (Mimosa) family contains 6-8 or 64 pollen grains stick together to form a small unit that is called "Massullae" e.g. *Mimosa* and *Neottia plants.*



TRANSLATOR APPARATUS

Due to the presence of sporopollenin, fossils of pollen grain are always found in good condition. The presence of fossils of pollen grains can forecast the presence of natural resources like petroleum, coals etc. in the earth. Pollen grains of some plants present in air cause allergy are called "aero allergens" e.g. chenopodium, Parthenium, Sorghum and Amaranthus. ["Hay fever" is caused by pollens of Ambrosia]. In Cyperaceae family only one pollen grain is formed from pollen mother cell e.g., *Cyperus.*

Largest pollen – Mirabilis.

Smallest pollen – Myosotis.

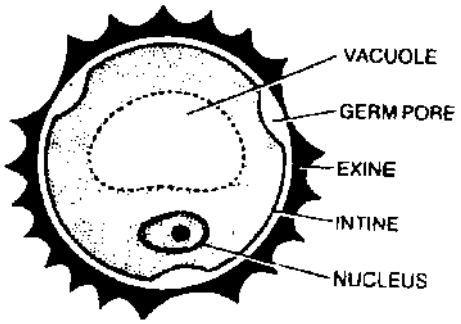
Longest pollen – Zostera (Filiform pollen)

Eight nucleated embryo sac type of pollen is found in Hyacinthus [This type of pollen grain discovered by Nemec. So it is called Nemec phenomenon]. Dumbel shaped pollens are found in Vinca herbacea. Pollen grains are rich in nutrients. It has become a fashion in recent years to use pollen tablets as food supplements in western countries. Large number of pollen products in form of tablets and syrups are available in market. Pollen consumption has been claimed to increase the performance of athletes and race horse. Pollen grains of many plant species cause severe allergies and bronchial disorders in some people leading to chronic respiratory disorders like - asthma, bronchitis. For ex. *Parthenium* (carrot / congress grass) – in India cause pollen allergy and asthma.

Viability of pollen grains is depands on temperature and humidity. In some cereals like rice and wheat – pollen grains loss viability within 30 minutes of their release. In members of Rosaceae, Leguminoseae and Solanaceae pollen grains are viable for months. Pollen grains can be stored like semen of humen being for years by cryopreservation in liquid nitrogen at –196^{o} temperature. Such pollens can be used as pollen banks similar to seed banks in crop breeding programmes.

Structure of Microspore or Pollen Grain :

Pollen grain is the first cell of a male gametophyte. Pollen grain is termed as immature male gametophyte. Usually, they are in round shape. Pollen grain surrounded by two distinct layers. The outer layer (wall) is thick, rigid and ornamented, called **exine**. This layer is formed by cutin and sporopollenin. Sporopollenin is Highly resistant material. It is nonbiodegradable. The internal layer is thin, soft and elastic in nature. It is called **intine**. It is made up of pectin and Cellulose or pecto-cellulose.



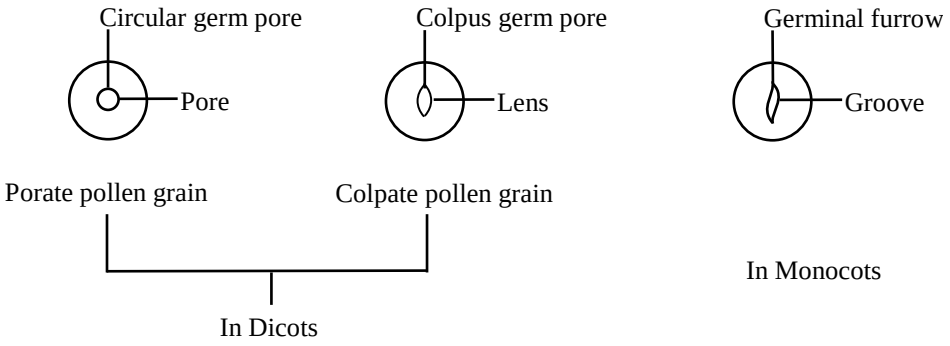
STRUCTUREOF POLLENGRAINS

Usually, at few places on outer surface exine is absent or present in the form of thin layer. These thin places are called **germ pore**. The initine comes out through any one germ pore during the germination of pollen grain in the form of pollen tube. The number of germ pore, structure and ornamentation of exine is a significant feature of taxonomy. A detail study of pollen grains is called **Palynology**. Three colpus type (slit type) of germpore are present in pollen grain of *Capsella*. This type of pollen grains are called tricopalte. Only one germ pore is present in monocots and pollen grain is called monocolpate. The plants in which pollination takes place by insects, their pollen grains having oily layer around the pollen grain. It is called **pollen kitt.** It is composed of lipids and carotenoids.

Function of pollen kitt :

This oily layer protects the pollen grain from the harmful ultraviolet rays. Its sticky surface helps to attach with the insects. Its yellow colour attracts the insects. Pollen kitt is present on the pollens of Capsella.

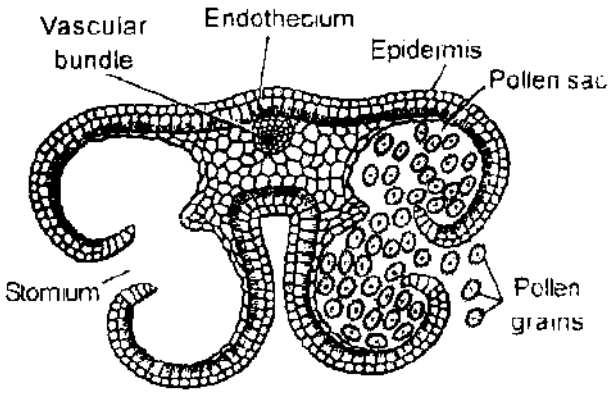
Type of Germpore :



Dehiscence of Anther :

During the maturation of anther, various changes are takes place in walls of anther.

In the begining, middle layer degenerates due to absorption of food by tapetum. When the micropores are formed inside the pollen sacs, at the same time ubisch bodies are formed in cells of tapetum, then after it degenerates. Ubisch bodies participate in the formation of exine of pollens. In this way, in a mature anther only two layers epidermis and endothecium are present in the form of outer covering.

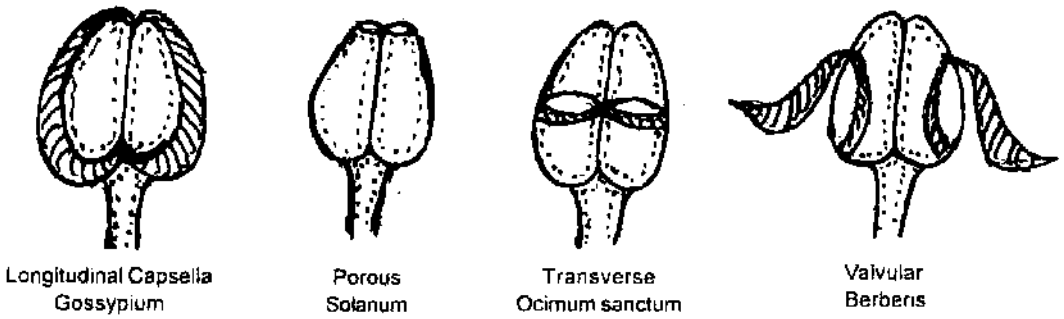


Dehiscence of Anther

The sterile tissues are present between both the pollen sacs of each anther lobe degenerate. So both pollen sacs of the each anther lobe fuse together to form single pollen sac. Therefore, in the T.S. of mature anther only two pollen sacs are present.

Dehiscence of anther takes place during the dry seson. Due to the hygroscopic nature of endothecium loss of water takes place from the cell of endothecium. Walls of endothecial cells try to contract due to the loss of water but inner and radial walls do not contract due to presence of fibrous thickening whereas outer thin walled cells of endothecium contract and become concave or incurved. Incurving of outer walls creates pulling force or tension over the entire surface of anther. Due to tension, thin walled stomial cells breaks off and dehiscence of anther takes place and pollen grains are present in pollen sacs released into the atmosphere.

Dehiscence of anther in Angiosperms either longitudinal or Apical pore or Transverse or Valvular type. Dehiscence of anther of *Capsella* is longitudinal.



MODE OF DEHISCENCE OF ANTHER

Micro-Gametogenesis or Development of Male Gametophyte :

In flowering plants, pollen grain or microspore considered as first cell of male gametophyte. Germination or development of pollen grain takes place before dehiscence of anther is called precocious development.

Development of pollen also takes place at mother place [inside pollen sac of anther] is called **In-situ development**.

Pre Pollination development :

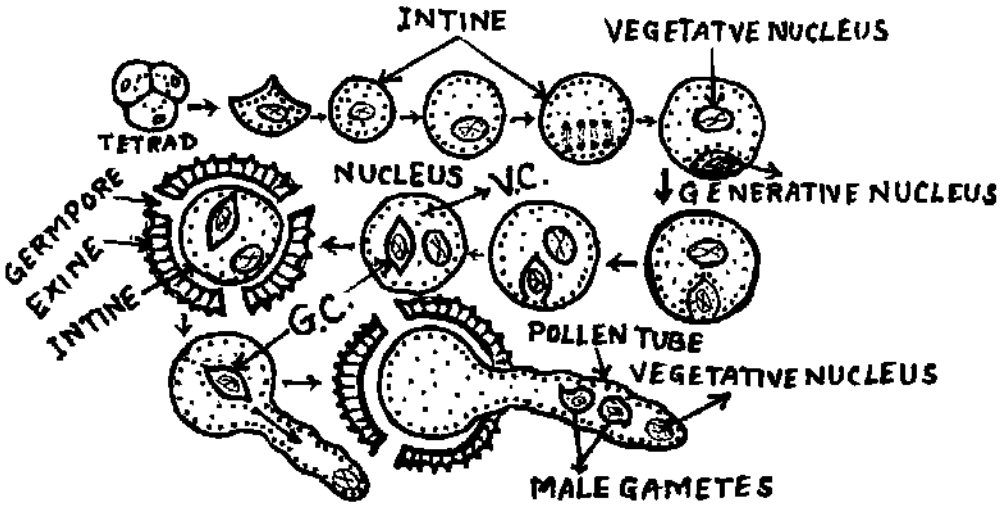
In the beginning of the process, only nucleus of pollen grain divided by unequal mitotic division, resulting two unequal size of nucleus are formed. Small nucleus present near the walls is called generative nucleus and large nucleus present inside the cytoplasm is called **tube** or **vegetative nucleus**. Both the nucleus surrounded by cytoplasm and it becomes dense, then again followed by unequal cytokinesis, resulting two unequal size of the cells are formed. Larger cell in which large nucleus is present known as Vegetative cell and smaller cell in which small nucleus is present, called **generative cell**.

Now pollen grains come in bicelled and binucleated stage. In Angiosperms pollination of pollen grains take place in bicelled and binucleated stage (60%). The development of gametophyte take place inside the pollen grain is also known as endosporic development. This stage of pollen grain is called immature or partially developed male gametophyte. Generative cell detached from the wall and changed into vermiform or spindle shaped structure and enter inside the vegetative cell.

Post Pollination development :

Rest of the further development of pollen grain [Immature male gametophyte] takes place on the stigma of carpel after pollination. Pollens absorb moisture and sugar content from the stigma. Due to this absorption volume of internal contents of cytoplasm increased. It exerts pressure on the both layers. Because of this pressure intine comes out through any one germopore in the form of tube like structure called **pollen tube**. First of all vegetative nucleus enter into the pollen tube and assumes terminal [tips] position. This spindle shaped generative cell now enter into the pollen tube.

Inside the pollen tube, generative cell divides mitotically to form two non motile male gametes. Now male gametophyte comes in three celled structure in which one vegetative cell and two male gametes are present. This three celled stage represents the mature male gametophyte of Angiosperm [*Capsella* also]. Male gametophyte is highly reduced and completely depends on sporophyte. First of all pollen tube discovered by G.B. Amici in Portulaca plant. Longest pollen tube is found in Zea mays.



Development of male gametophyte with the fomation of male gametes.

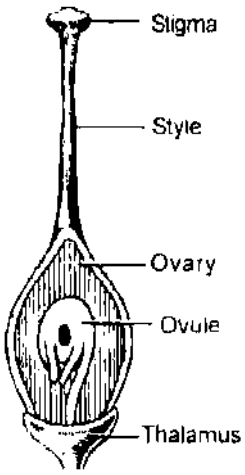
FEMALE REPRODUCTIVE ORGAN - GYNOECIUM

Gynoecium is the female reproductive organ. The free unit of gynoecium is called **pistil** or **carpel**. **Carpel** is also known as megasporophyll.

The carpel is differentiate into three distinct region -

(i) Stigma **(ii)** Style **(iii)** Ovary

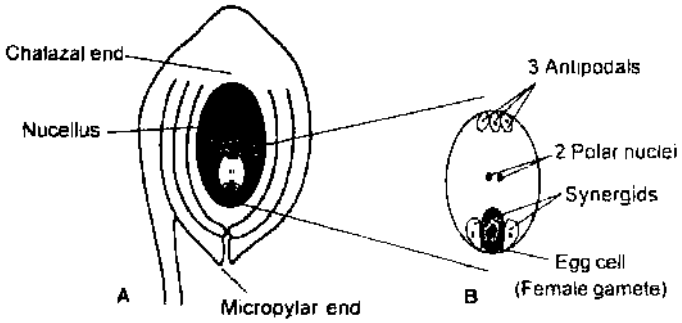
The free end of the carpel which receives pollen grains is called **stigma**. A long, narrow tubular structure is present in between the stigma and ovary called **style**. The basal swollen part of the carpel is called **ovary**. The ovule is also known as megasporangia which are borne on a cushion-like tissue called **placenta** in the ovary**.** One or more than one ovules are present inside the ovary. The gynoecium of the Capsella is bicarpellary, syncarpous, unilocular and superior. It becomes bilocular due to the formation of false septum or replum at maturity.



A typical gynoecium (= pistil)

Structure of Ovule or Megasporangium :

A ridge or stalk like out growth is formed from the placenta of the ovary on which body of ovules are present. Each ovule attached to the placenta by means of a thin stalk called **funicle** or **funiculus/Funiculum**. The point of attachment of the funicle with the ovule is called **hilum**. The main region of the ovule is composed of mass of parenchymatous cells called **nucellus**. Nucellus is the main part of ovule. The nucellus is covered by one or two coats called **integuments**.



(A) Mature ovule and (B) Mature embryosac

Difference between Egg cell and secondary nucleus

S.No.	Egg cell	Secondary nucleus
(i)	It is present near the micropyle, inside the embryo sac	It is present the middle of the embryo sac
(ii)	Generally egg is surrounded by two synergids.	It is not surrounded.
(iii)	Only single nucleus is present in it.	It is formed by fusion of two polar nuclei
(iv)	It is haploid structure.	It is diploid structure
(v)	It is fertilized with one male gamete and to form a diploid zygote (Embryo)	It is fused with one male gamete and to form a triploid primary endosperm nucleus (Endosperm)

In most of the ovule, funicle is attached to the main body of ovule for some distance (at lateral side) to form a ridge like structure known as Raphe. Vascular tissues are present inside the funiculus which supply food material from the placenta to the body of ovule.

Special Integuments :

- **Aril** – It is the type of third integuments which develops from funicle at the base of the ovule. e.g. *Myristica, Asphodelus* and *Litchi.*
- **Arillode** – It develops from the tips of the outer integument and grows downwards and surrounds the entire ovule e.g. *Pitchecolobium* (*Inga dulce*)
- **Sarcotesta** – When outer integument becomes fleshy then it is called **sarcotesta** e.g. *Mangoliaceae (Magnolia).*
- **Operculum** – It is a stopper or break like structure which is formed on the micropyle. It is formed due to the elongation of inner integuments. e.g. *Lemnaceae* family (*Lemna*).
- **Caruncle or strophiole** – It is formed due to the proliferation (out growth) of outer integuments over the micropyle. e.g. *Ricinus communis (Castor)*. It is formed by sugary contents so helps in absorption of water during germination of seeds and dispersal of seeds by ants called **myrmecochory**.
- **Coma** – In some of the plants unicellular filaments like structures are present on the seed which is formed by cells of outer surface of outer integument. Such seeds are known as "Comose seeds". e.g. *Calotropis* and *Gossypium.*

  A place from where funicle and integuments arise is called **Chalaza**. Integument is absent just opposite to the chalaza, so that a narrow passage (pore) is formed which is called **micropyle**. Micropyle in bitegmic ovule has two parts – outer region which is surrounded by outer integument is called **exostome**. The inner part of micropyle which is surrounded by inner integument called **endostome**.

  In most of the Angiosperm entire part of the nucellus is utilized by developing embryo sac but in some of the Angiosperm some part of the nucellus remain inside the ovules that part of the nucellus present inside the seed in the form of a thin layer known as perisperm. Perisperm is commonly found in Piperaceae (*Piper nigrum*) and Zingiberaceae Families (Turmeric, Ginger). Some filaments are attached with funicle [some times placenta] are known as "Obturators". The function of obturators is to guide the passage of pollen tube towards the micropyle inside the ovary.

Types of Ovule on The Basis of Integuments :

A single integumented ovule is called **unitegmic ovule** – example – members of Gamopetalae and Gymnosperm. Two integumented ovule is called **bitegmic ovule**. Example – In most of Angiosperm [Polypetalae – Capsella and Monocots]. The ovule in which integuments are absent is called **Ategmic ovule** e.g. Olax, Liriosma, Loranthus & Santalum.

Types of Ovules on The Basis of Nucellus :

- **Tenuinucellate** – The nucellus is either less developed or present in the form of single layer.
  Example : *Gamopetalae group.*
- **Crassinucellate** – The nucellus is massive type i.e., it is made up of many layers.
  Example : *Polypetalae group* and *Monocots.*

  The nucellus degenerates in plants of Compositae family and integuments becomes active to form a nucellus like tissue. This is called **endothelium or integumentary tapetum**. It is polyploidy structure.

  The nucellus dissolves in the members of Podostemaceae family to form a nutritional cavity. This is termed pseudoembryo-sac.

TYPES OF OVULES :

There are six different types of ovules are found in Angiosperms on the basis of relationship of the micropyle, chalaza, and hilum with body of the ovule and orientation on the funiculus :

Atropous or Orthotropous :

The body of ovule is upright in position. The micropyle, chalaza and hilum lie in one straight line, so that this ovule is called straight or upright ovule. Example : Betel, Piper, Polygonus and in Gymnosperms. It is the most primitive and most simple type of ovule of Angiosperms. Raphe is absent.

Hemitropous or Hemi-Anatropous ovule :

In this ovule, the body of the ovule bent on funcile at 90º angle, i.e., body of ovule present at right angle to the funiculus. This is intermediate type between ortho and anatropous ovules. This ovule is also called horizontal ovule because body of ovule present in horizontal position on the funiculus. Micropyle and chalaza are present in the same line but micropyle is situated away from hilum. Example: *Ranunculus, Primula, Golphimia.*

Campylotropous Ovule :

In this ovule, the body of ovule curved (Curvature is not effective) in this way so micropyle and chalaza do not present in straight line. The embryo sac and nucellus both are present in curved position. Micropyle comes close to the hilum. Example – *Leguminosae, Capparidaceae, Cruciferae* family [*Capsella*].

Anatropous Ovule :

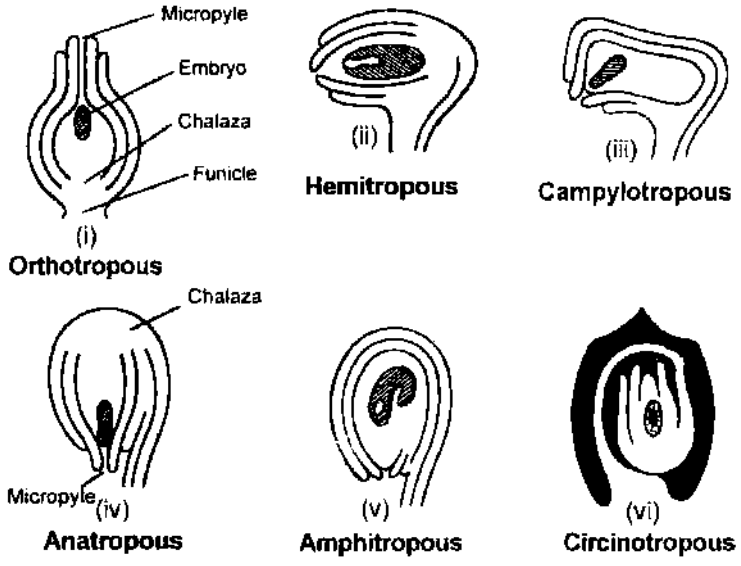
In this type, the body of the ovule completely turned at 180º angle, due to unilateral growth of funiculus, so it is also called inverted ovule. The chalaza and micropyle lie in straight line. The hilum and micropyle lie side by side very close to each other. This type of ovule is found in 80% families of Angiosperms but not in Capsella. In this ovule micropyle facing downward condition. This is the most common type of ovule so that it is considered as a "typical ovule" of Angiosperms. eg. Members of *Malvaceae, Cucurbitaceae, Solanaceae, Compositae* family. It is also called **resupinate** ovule.

Amphitropous Ovule :

In this type of ovule, curvature is more pronounced or effective in the nucellus and due to this effect of nucellus, embryo sac becomes horse shoe shaped. Micropyle comes close to the hilum. It is also called as transverse ovule. e.g. *Mirabilis, Lemna* and *Poppy, Alisma, Butomaceae* family.

Circinotropous Ovule :

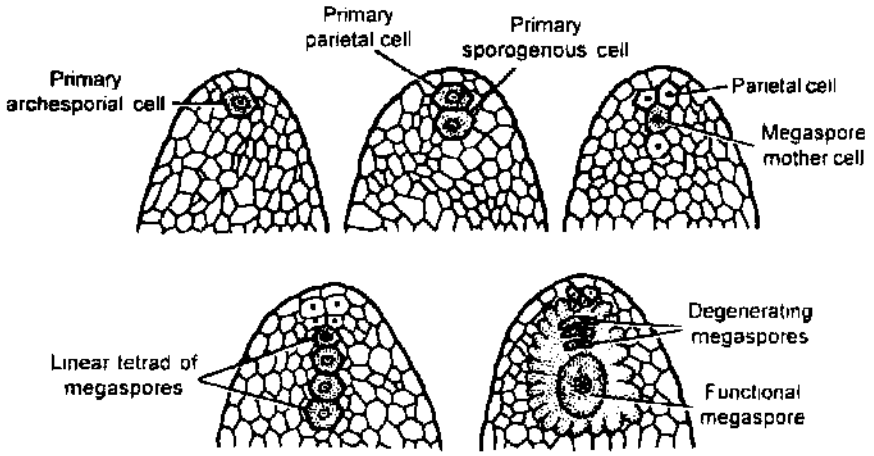
This type of ovule, first of all body of ovule inverted once and again turned into straight position due to the growth of funiculus so that body of ovule present on funicle at 360º. The entire body of ovule is surrounded by funiculus. It is also known as coiled ovule. Micropyle is situated away from hilum e.g. *Cactaceae* family-*Opuntia.*



Different type of Ovules

MEGASPOROGENESIS :

During the development of ovule, in the begining of this process, nucellus develops form the placenta in the form of a small rounded out growth like structure. At this stage, all the cells of nucellus are undifferentiated and homologous and meristematic. This mass of cells surrounded by single celled thick layer of epidermis.



Different type of Megasporogenesis

Any one hypodermal cell of nucellus is differentiated and increase in size. It becomes different from rest of the cells due to presence of distinct nucleus. It is called archesporial cell. Archesporium divides periclinally to form an outer primary parietal cell and inner Primary Sporogenous cell. Activity of primary Parietal cell depends on type of plants. If plant belongs to gamopetalae then it forms tenuinucellate type ovule and if plant belongs to polypetalae then it forms crassinucellate type of ovule is formed. The primary sporogenous cell directly act as a megaspore mother cell (MMC). It divides meiotically to form, four haploid megaspores.

The four haploid megaspores generally arranged in linear tetrad. Generally the lower most or chalazal megaspore remains functional out of tetrad of megaspores and the other three lie towards the micropyle degenerate. This functional megaspore produces female gametophyte. In most of Angiospersm (*Capsella*), Chalazal megaspore remains functional.

DEVELOPMENT OF EMBRYO SAC OR FEMALE GAMETOPHYTE :

Megagametogenesis : Megaspore is the first cell of the female gametophyte. This megaspore grows in size and obtains nutrition from the nucellus. The nucleus of megaspore divides mitotically to form a two nuclei. Each nucleus moves towards the opposite pole and reached at their respective poles. Both the nuclei lie at poles divide twice mitotically. Resulting, four-four nuclei are formed at each poles [Total 8-nuclei]. Out of the four, one-one nucleus migrates from the both poles [one nucleus from chalazal side and one nucleus from micropylar side] towards the centre. They are known as polar nuclei. Both polar nuclei are present in the centre.

Remaining three-three muclei at each pole surrounded by the cytoplasm to form cells as a result of cytokinesis. Three cells are formed towards the micropyle in which one cell is large and more distinct out of three cells. This is called egg cell and remaining two smaller cells are known as synergids. These three micropylar cells collectively known as egg-apparatus. [1 Egg cell + 2 Synergids]. The three cells are formed toward the Chalaza are called antipodal cells. Both the polar nuclei present in the central cell. But just before the process of fertilization they unite or fuse together in the centre to form secondary nucleus. It is diploid in nature [2n] and one in number.

Therefore, seven cells and eight nucleated structure is formed. This eight nucleated and seven celled structure is called female gametophyte or embryo sac of Angiosperms. This type of embryo sac is known as polygonum type because it is discovered by Strassburger in Polygonum plant. Polygonum type embryo sac is most common type in Angiosperms *[Capsella]*. Polygonum type of embryo sac develops from single megaspore so it is also known as monosporic embryo sac. Fingers like processes are produced from the outer wall of the synergids are known as filiform apparatus. With the help of these structures, synergids absorb food from the nucellus and transfer to the embryo sac. Filiform apparatus is less developed in antipodal cells. Filiform also secrete some chemicals which attracts the pollen tube.

In some plants, barrier are present either above or below the female gametophyte. These barrier are made up of thick walled cells of nucellus. They prevent the movement of embryo sac towards the chalaza or micropyle. The barrier which is present towards the chalaza is called hypostase e.g. *Umbelliferae* family, *Zostera* and *Crozophora* plants. The barrier which is present toward the micropyle is called **epistase** e.g. *Costalia* and *Costum*.

TYPE OF EMBRYO SACS :

Monosporic Embryo sac – It is of **two types –**

Polygonum type – It is **eight nucleated** and **seven celled embryo sac**.

Oenothera type – Exceptionally it is four nucleated in which only one nucleus in a central cell and three nucleus in egg apparatus. Antipodal cells are absent. [Micropylar megaspore become functional].

Bisporic Embryo sac – It is formed by two megaspores. It means it develop from two nuclear megaspores. It is of two types –

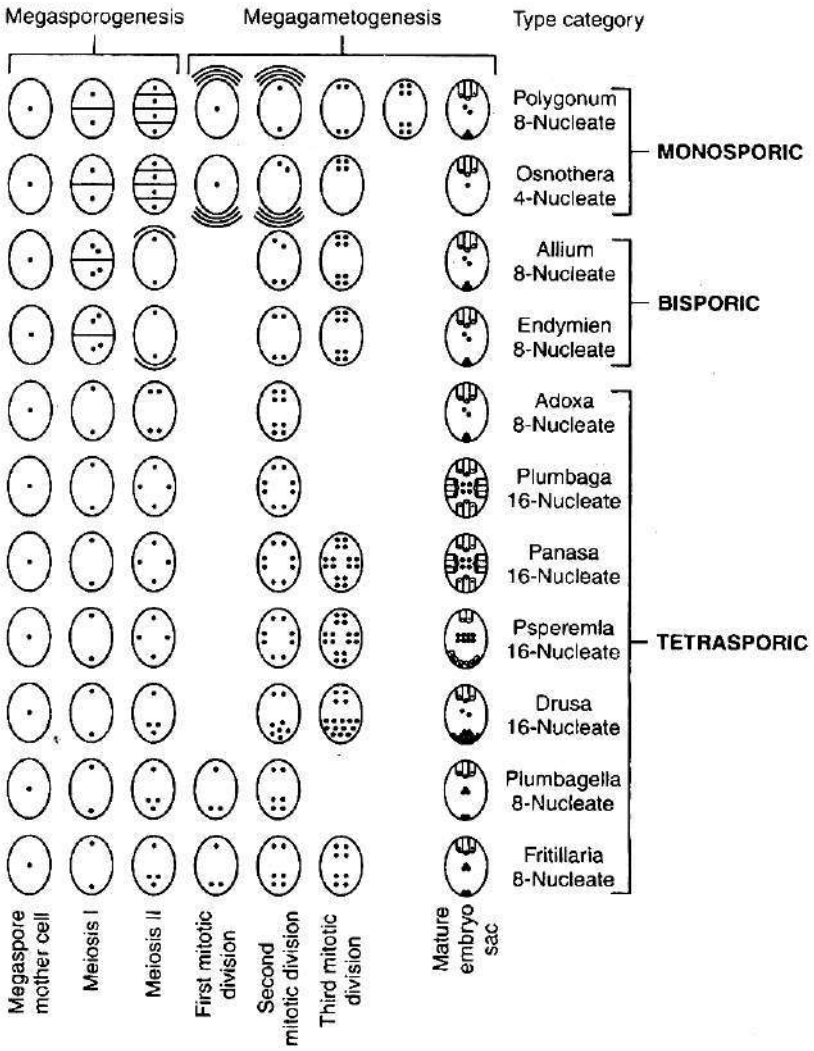
Allium type – Eight nucleated and seven celled [Chalazal megaspores].

Endymion type – Eight nucleated and seven celled [Micropylar megaspores].

Tetrasporic Embryosac – It is formed by all four megaspore nuclei because meiosis is not accompanied by cytokinesis, so that four nuclei of megaspores are formed. All four nuclei are collectively known as "Coenomegaspore".

Generally all the four nuclear megaspores take part in the formation of the seven celled and eight nucleated embryo sac but different types of embryo sacs are also formed. Arrangement of nuclei are not definite in embryo sac of Angiosperms. So that different type of embryo sacs are formed as follows :

Types of Tetrasporic Embryosac	Number of nuclei in Sec. nucleus	Ploidy of endosperm
1. **Adoxa type**	2	3n
2. **Chrysanthemum type**	3	4n
3. **Plumbago type**	4	5n
4. **Plumbagella type**	4	5n
5. **Fritillaria type**	4	5n
6. **Penaea type**	4	5n
7. **Peperomia type**	8	9n



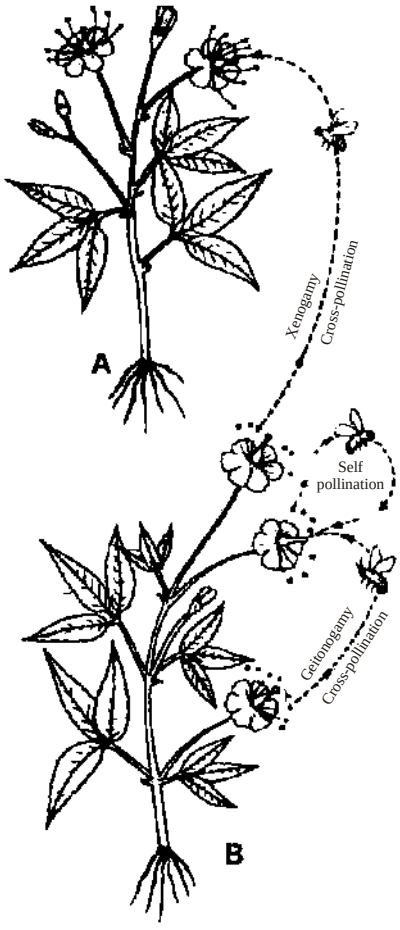
Diagrammatic representation of various types of embryo sac development

POLLINATION

"Pollination is defined as the process of transfer of pollen grains from anther to the stigma of the same flower or of different flower of the same species." The pollination in 60% of angiosperms takes place at two celled structure of pollen grains. Pollination is of two types :

1. **Self pollination or autogamy :**
   If the pollen grain are transferred from an anther to the stigma of the same flower, or other flowers of the same plant is called **self pollination or autogamy**.
2. **Cross pollination or allogamy :**
   When the pollen grains are transferred to the stigma of other flower of the same species is called **Cross pollination** or **Allogamy**. It takes place in between two different flowers.

- **Cross pollination is of two types :**
  Geitonogamy : When, pollination takes place in between the two flowers of the same plant then it is called



Pollination

geitonogamy. From the genetical point of view geitonogamy is self pollination because all flowers of the same plant are genetically identical. But ecologically, it is considerd as cross pollination.

Xenogamy : When the pollination takes place in between the two different flowers of two different plants of the same species then it is called **xenogamy**. This is real or true cross pollination. Genetically, as well as ecologically, it is cross pollination.

Difference between Self and Cross pollination

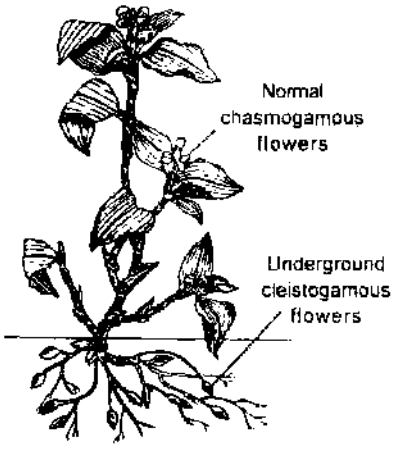
S.No.	Self pollination	Cross pollination
(i)	Pollen grains are transferred to stigma of same or genetically similar flower	Pollen grains are transferred to stigma of genetically different flower
(ii)	Anthers and stigma mature simultaneously	They mature at different time i.e. protandry and protogyny
(iii)	It occurs in open as well as closed flowers	It occurs in only open flower
(iv)	It is very economical for plants in energy point of view	It is not economical in energy point of as the plant has to produce large number of pollen grains, nectar, scent and colouration.
(v)	External agencies are not required	It is essential i.e. depends on agencies.
(vi)	Young ones are homozygous	Young ones are heterozygous.
(vii)	It produces pure lines because of the non occurrence of genetic recombination.	It produces variations due to genetic recombinations.
(viii)	It cannot eliminate harmful traits.	It can eliminate harmful traits.
(ix)	Useful characters are preserved	Not preserved
(x)	No adaptability in the changing environment.	It provides adaptability.
(xi)	It cannot introduce new traits.	It can introduce new traits
(xii)	Disease resistance is low	Disease resistance is optimum
(xiii)	There is decrease in yield.	It increase the yield
(xiv)	It does not help in the development of new species.	Helps in the development of new species.

- **Contrivances or Adaptation for Self Pollination / In breeding devices :**

Monocliny : Bisexuality it means flowers are bisexual.

Homogamy : When both the sex organs of a flower mature at the same time is called **homogamy**. So that chances for self pollination increased. e.g. *Mirabilis, Catharanthus.*

Cleistogamy : In some plants bisexual flower are formed which never opens throughout the life. Such as *Commelina, Viola.* Commelina plant have two types of flowers. One type of flowers are cleistogamous and another are chasmogamous flowers. e.g. *Oxalis, Juncus, Drosera.* A special type of cleistogamy is found in flowers of legume plant. The sex organs are closed in a structure which is formed by joining of some petals. It is called keel. This keep flower never opens. So only self pollination takes place in these plants.



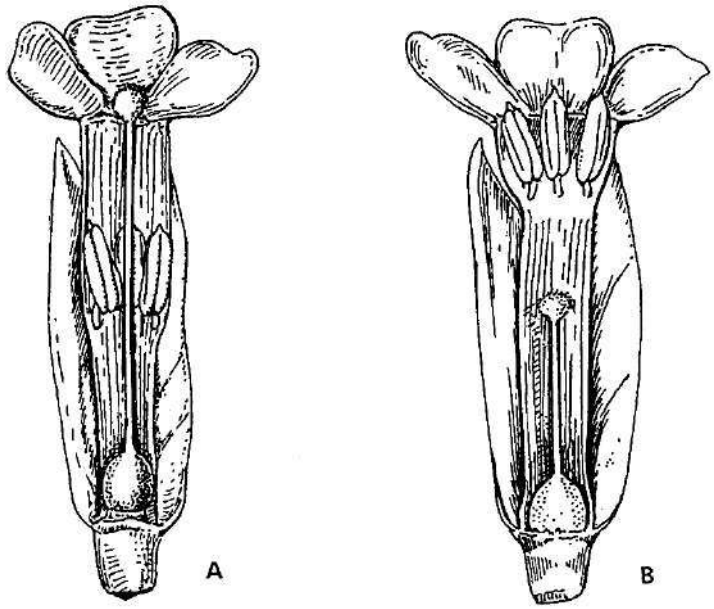
Commelina plant

Contrivances for Cross Pollination / Out Breeding Devices :

- **Dicliny :** Unisexuality of the flower confirms cross-pollination. Self pollination never takes place in these flowers. It means allogamy becomes compulsory. Examples – *Morus*, Palms, Date Palms, *Cucumber* and *Cucrurbita, Carica.*
- **Dichogamy :** In many bisexual flowers of the plants, stamens and carpels of a flower do not mature at the same time. Dichogamy is of two types .
- **Protandry :** The anther of a flower mature earlier than carpels, is called protandry. In most of the plants of Angiosperms, cross pollination only because of protandrus condition. e.g. *Salvia.*
- **Protogyny :** The carpels of the flower mature earlier than stamens. It occurs in very less no. of plants e.g. *Ficus benghalensis, Saraca indica, Ficus religiosa, Aristolochia,* most of plant of *cruciferae* and *Rosaceae* family.
- **Chasmogamy or Anthesis :** Opening [blooming] of the floral bud in the form of a flower is called **anthesis.**
- **Herkogamy :** In some plants, morphological barriers are formed in between the anther and stigma of the same flower, so self pollination can not occurs and pollen grains from the anther are unable to reach the stigma of the same flower. In this condition, only cross pollination is possible. e.g. *Gloriosa, Calotropis and caryophyllaceae* family.

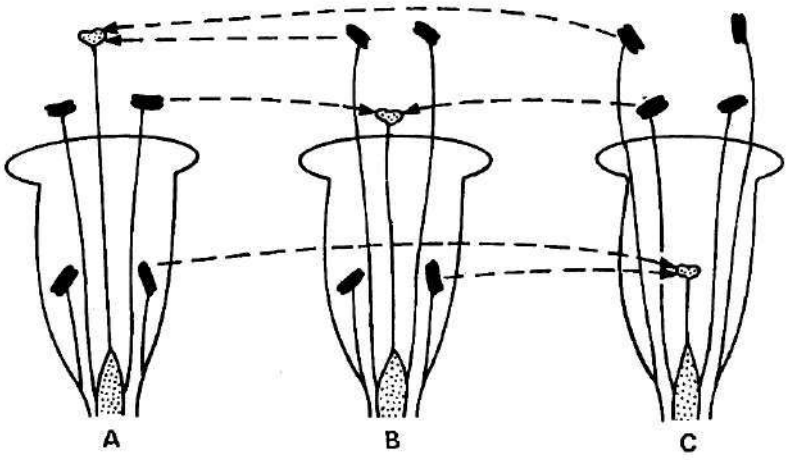
  In the members of caryophyllaceae within the same flower, the stigma projects beyond the stamen so the pollens does not fall on it. In Glorisa the anther dehisce at a distance, so that stigma is out of reach of its own pollen grains. Heterostyly There is difference in between the length of the filaments of stamens and length of style in different flowers of some plants. Some of the plants having long stamen and short style, and in some of the plants bears long style and short filament. Due to this reason, self pollination can not possible in these plants e.g. *Primrose (Primula), Lathyrum, Oxalis.* Primrose (*Primula vulgaries*) is a commonly cited example of this phenomenon. It has two types of flowers (distyly) :

  Pin-eyed or long-styled, with long style, long stigmatic papillae, short stamens and small pollen grains. Thurum-eyed or short-styled, with short style, small stigmatic papillae, long stamens and large pollen grains. The stigma in the thrum-eyed flowers is at the level of anthers in the pin-eyed flowers and vice-versa. As a rule, pollen from thrum-eyed flowers can bring about effective pollination only in pin-eyed flowers and, similarly, pollen from pin-eyed flowers can effect legitimate pollination in thrum-eyed flowers, but not in their own type.



Distyly in *Primula vulgaris.* (A) Pin-eyed flower, (B) Thrum-eyed flower

Some flowers, such as ***Lythrum*** and ***Oxalis***, show **tristyly**. They have **three types of flowers** with respect to the length of the style and stamens. Pollen from flowers of one type can effectively pollinate stigma of only the other two types of flowers and not of its own type.



Tristyly. **A.** Flower with long style, and normal and short stamens. **B.**Flower with mid-style, and long and short stamens. **C.** Flower with short style, and normal and long stamens. As shown by arrows, pollen from any one of these three types of flowers can bring about legitimate pollination in other two but not in its own type.

Self sterility or self incompatibility or intraspecific incompatibility :

In this condition the pollen grains of the flower can not germinates on the stigma of the same flower. This condition is called self sterility. This is a parental [Genetical] characteristic feature which is controlled by genes. Such as in Pitunia, Malva, Thea, Passiflora, Vitis, Apple (Malus). Incompatibility involves many complex mechanisms associated with interactions of pollen and stigmatic tissues. It leads to prevention of pollen germination, retardation of pollen tube growth, deorientation of pollen tube or even failure of nuclear fusion. It is controlled by genes with multiple alleles (s-allele).

Self incompatibility or intraspecific incompatibility :

Plants rejects the self pollens grains i.e. pollens from same flower or different flower of same plant to prevent genetic self pollination. Recognition of "self" pollen in based on genes for self incompatibility called 'S'-gene. In the gene pool of a plant population, there can be dozons of alleles of an S-gene. If a pollen grain has an allele that matches an allele of the stigma on which it land, the pollen tube fails to grow.

Depending on species, self recognition blocks pollen tube growth by one of the two molecular mechanism.

(i) Gametophytic self incompatibility (GSI)

(ii) Sporophytic self incompatibily (SSI)

Gametophytic self incompatibility :

In GSI, the S-allele in the pollen genome regulates the blocking of fertilization. For ex. An S_1 pollen grain from an S_1S_2 parental sporophyte will fail to fertilize egg of an S_1S_2 Flower but will fertilize an S_2S_3 flower. An S_2 pollen grain would not fertilize either flower. Self recognition of this type involves the enzymetic destruction of RNA within a rudimentary pollen tube RNA hydrolyzing enzymes are secreted by style of carpel which destroy pollen tube. Ex. *Liliaceae, Poaceae, Solanaceae, Trifolium.*

Sporophytic self in compatibility (SSI) :

In this system pollens of a plant behave similarly, irrespective of S-allele they carry. For ex. A plant carrying S_1S_2 alleles, the pollen carrying S_1 or S_2 allele, would behave as S_1 if S_1 is dominant or as S_2 if S_2 is dominant and $S_1 + S_2$ if no dominance. So the presence of even one of the alleles of the stylar tissue

in sporophytic tissue of male parent make the all pollen of that plant non-functional with respect to that particular style.

So this S_1S_2 plant produce pollens S_1 or S_2 are completely incompatible to plant carrying S_1S_2, S_1S_4, S_1S_5 or S_2S_3, S_2S_4, S_2S_5 but 100 percent compatible with a plant carrying S_3S_4 or S_3S_5

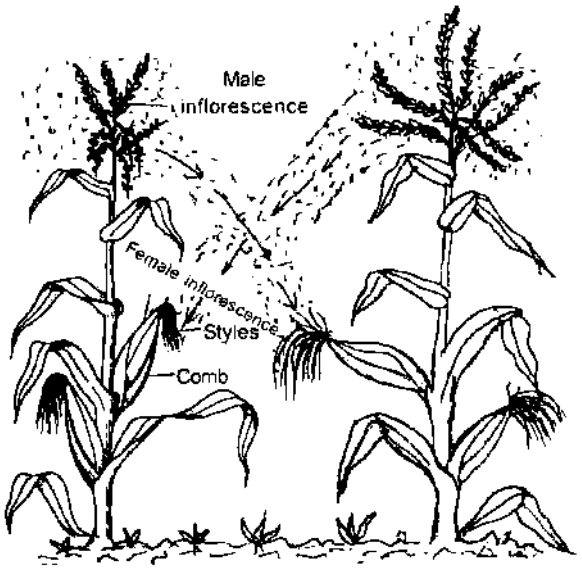
In SSI system rejection occurs on the stigma the pollen tube is destroyed as can not penetrate cuticle of stigma. Ex. *Astaraceae, Brassicaceae.*

Growth of its pollen tube of self pollinated pollen grain is very slow and growth of the pollen tube of cross pollinated pollen grain in very fast so pollen tube of cross pollinated pollen grains reach earlier inside the ovule. This is termed prepotency.

METHODS OF CROSS POLLINATION

Anemophily :

When the pollen grains are transfer from one flower to the another flower through the agency of air is called anemophily and flower is known as anemophilous flowers. Such as Cereal plants :- Maize etc. Anemophily is also found in all Gymnosperms. The anemophilous plants produce enormous amount of pollen grains. The pollen grains are very small, light weight and dry and their stigma is hairy or brushy and mucilaginous (Sticky).



Air pollination in Maize plant

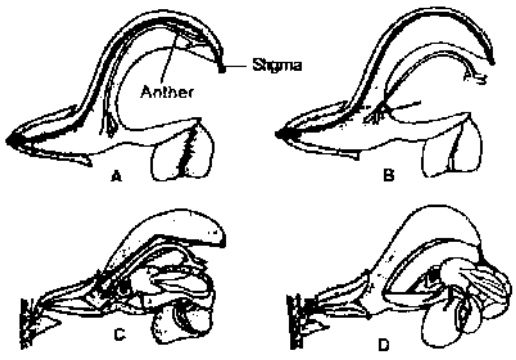
Yellow clouds are formed in the sky during the wind pollination in Pinus. These yellow clouds are formed due to the pollen grains are called **"Sulphur Showers".**

Anemophilous flowers are neither attractive nor with fragrance. They do not have nectar glands, Anemophilous flowers are generally unisexual. E.g. – *Sugar cane, Bamboo, Coconut, Cannabis, Grasses* and *Date palms, Typha, Oak, Hazel.* **Potamogeton** and **Myriophyllum** are aquatic plant but it is anemophilous. Maximum loss of pollen grains takes place in this pollination. It is completely non directional process.

Antomophily :

The pollination takes place by the agency of insects is known as entomophily. Most of insect pollination (80%) only by Honey bees. Entomophilous plant are ornamental plants.

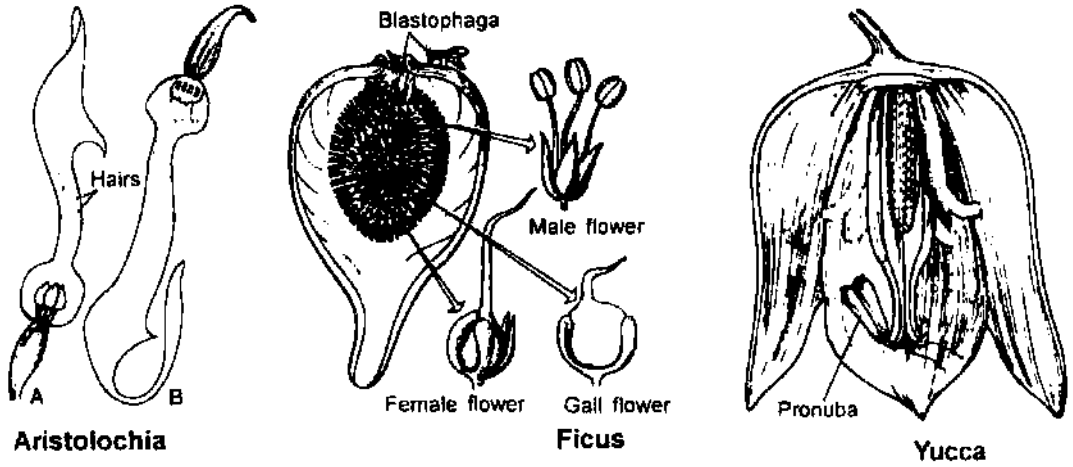
Ornamental plants utilize their maximum energy in this pollination and develops different types of adaptations for attraction of insects. These flowers are attractive in colour. They posses special fragrance. Nectar glands is also present. The pollen grains of insect pollinated flowers becomes sticky due to presence of pollen kitt. The surface of stigma of flowers is rough.



Lever mechanism in Salvia

Some of the plants develop special adaptation for insect pollination. The Lever mechanism or turn pipe mechanism is found in Salvia for pollination. The flower of Salvia have bilabiatecorollate tube. The connective of stamen is long. The anterior anther lobe of connective is fertile while posteriorly lobe is sterile. When the insect lands on the lower lip, the fertile lobe automatically brings down to touch the back of insect and thus depositing the pollen grains on the back of insect.

Some of the flowers have attractive bracts i.e. bright and coloured e.g. *Bouganvillea.* Yucca plant has develops an obligate symbiotic relationship with an insect Pronuba moth. The pollination in Yucca takes only by Pronuba moth. This insect lays eggs in the ovary of flower. Life cycle of both depend on each other.

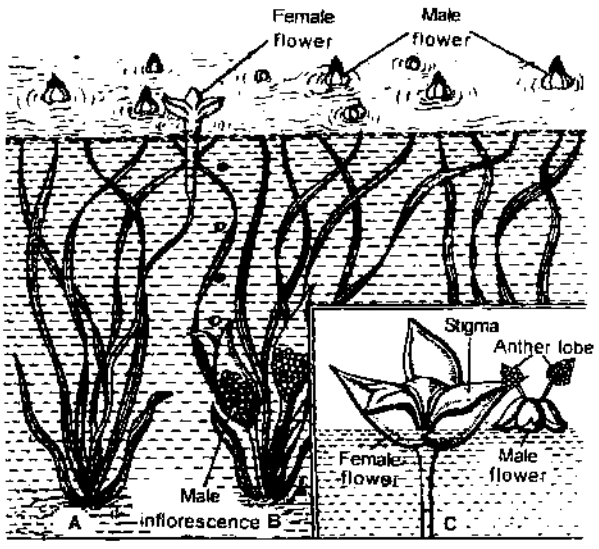


Trap door mechanism is found in species of Ficus for pollination [Blastophaga insect] because Hypanthodium type of inflorescence is present. In Aristolochia, Fly trap mechanism is found for pollination. This flower is known as "Pit fall flower". Ophrys speculum flower pollinated by Wasp [Colpa aurea] by means of pseudo-copulation. The appearance and odour of the flower like female wasp [Mimicry]. In Centaurea plant pollination takes place in piston mechanism. In Rafflesia, the pollination is brought about by Carrion flies. Nymphaea, Nelumbo and Alisma are also entomophilous plants while they are hydrophytes.

Hydrophily :

When the pollination brings by the agency of water is known as hydrophily. It is of two types -

- **Epihydrophily** : When the pollination takes place on the surface of water is called **epihydrophily**. Example – *Vallisneria* and *Ruppia.*
- **Hypohydrophily :** When the pollination takes - place inside the water is called **hypohydrophily**. Example – *Ceratophyllum, Najas, Zostera* and *Hydrilla*. Specific gravity is found in pollen grains so remains suspended in water.



Epihydrophily in Vallisneria

Zoophily :

When the pollination brings by the agency of animals is called **zoophily**. Generally in zoophillous plants, flowers are very large, attractive and maximum number of nectar glands are present (more than entomophilous).

Ornithophily :

When process of pollination is taken place by birds is known as ornithophily. Example – Sun bird or Humming bird in Bignonia plant and by Honey bird in Strelitzia plant, Callistemon (Bottle brush), Bombax [Silk cotton tree,] Butea monosperma.

Chiropterophily :

If the pollination brings through the bats is called Chiropterophily. Example by Pteropus. These flowers are big in size Example *Anthocephalus kadamba, Bauhinia, Kigelia, Adansonia plants.*

Myrmecophily :

This pollination brings about by Termites and Ants. Prosopis – kikar, Acacia (Mimosoideae family) and some members of Rubiaceae family etc.

Malacophily or Malmacophily :

This pollination brings about by Snails. Example Aspidistra lurida and Chrysanthemum plants. Erythrina (Coral tree) plant visited by Crows and squirrels. In Arisaema or Cobra Plant pollination by snake called Ophiophily. Night flowering plants are pollinated by Moths. The are highly scented. Their flower generally white coloured. Orchids are pollinated by Wasps / Snails. Favourable colour of Honey bees is yellow, but they are blind to red colour.

FERTILIZATION

The fusion of male gamete with female gamete is called **fertilization**. First of all fertilization was discovered by Strasburger (1884) in Monotrapa plant. This process is completed in the following steps-

Germination of pollen grains :

After pollination, pollen grains germinate on the stigma. They absorb moisture and sugar contents from stigma and swell up. The intine of pollen grain grows out through the any one germinal pore of exine, in the form of tube like out growth is called pollen tube. One pollen tube develops in Capsella and most of Angiospems is called monosiphonous condition, but more than one pollen tubes develops in Malvaceae and Cucurbitaceae family. It is called polysiphonous. When the pollen tube comes down from the stigma into the style, first of vegetative nucleus enter, into the pollen tube then it is followed by generative cell. The tube nucleus always occupies terminal position in pollen tube.

The vegetative nucleus controls the growth of the pollen tube. Mean while, the generative cell divide mitotically to form two male gametes. Both of the male gametes are non motile. Boron element and calcium ions (mainly Boron) are essential for the growth of pollen tube and best temperature for growth of pollen tube is 20 – 30ºC. Pollen tube shows apical growth and chemotrpic movement.

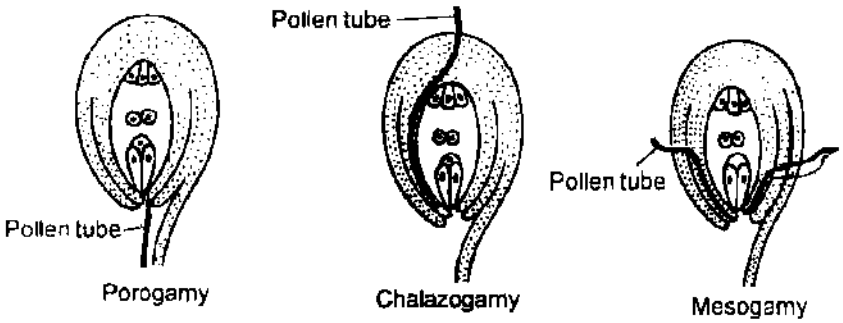
Entry of pollen tube into ovule :

Finally, then pollen tube enters in the ovary at that time, ovule becomes mature. Inside the ovary obturators guides the passage of pollen tube towards the micropyle. A mature ovule in which embryo sac also mature, has three paths for the entry of pollen tube.

Porogamy : In this, pollen tube enters into the ovule through the micropyle. It is known as porogamy. It is found in most of Angiosperms [Capsella].

Chalazogamy : In this method, the pollen tube enter into the ovule through the chalaza. This method discovered in Casuarina by Treub [1891] Example – Betula and Juglans (walnut).

Mesogamy – In this method, pollen tube enter into the ovule either through integuments – Curcurbita or through the funiculus – Pistacia and Populus.



Various methods of entry of pollen tube into the ovule

Entry of pollen tube into embryo sac :

Pollen tube can enter into the ovule thorough the any passage but inside embryo sac, only enter through the egg apparatus. After the entrance inside the ovule, it grows towards the egg apparatus because synergids cells secrete the chemical (hormones) which attracts the growth of pollen tube. It means pollen tube shows chemotropic movement in ovule. Any one synergid starts degenerating when the pollen tube comes near egg apparatus. The pollen tube enter into the embryo sac through the degenerating synergids, helped by filiform apparatus.

When tip of the pollen tube enters into the embryo sac vegetative nucleus degenerates. The tip of the pollen tube swells and burst [endosmosis] after reaching inside the embryo sac. The pollen tube release all contents including both male gametes inside the central cell of embryo sac. Two dark granules appears in the region of degenerating synergids. These are known as X-bodies. They are two in no. and both X-bodies are formed by the degenerating nucleus of tube cell and synergids.

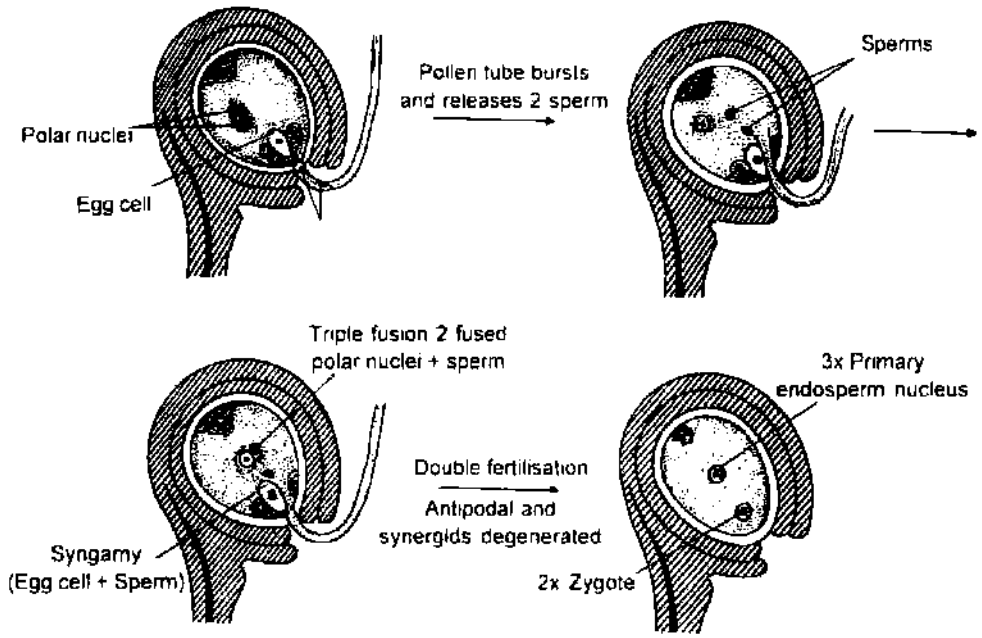
FUSION OF GAMETES :

Before or after the entrance of pollen tube into the embryo sac, both polar nuclei of the central cell fused together to form a diploid nucleus. It is known as secondary nucleus or definitive nucleus. Out of two, one male gamete fertilized with egg cell and to form a diploid zygote. This fusion is known as syngamy. This is true mechanism of fertilization process. The second male gamete fused with diploid secondary nucleus which is formed by the fusion of two polar nuclei. This fusion is known as triple fusion resulting, a triploid (3n) structure is formed. It is called primary endosperm nucleus.

Fertilization takes place twice at a time in Angiosperm is called double fertilization. Double fertilization was discovered by Nawaschin in Lillium and Fritillaria plants. Double fertilization and triple fusion is the specific or universal characteristic of Angiosperm. There are five nuclei (2 polar nuclei, 1 egg nuclei, 2 male gametes) and three gametes (2 male gametes, one egg cell) participate in double fertilization.

A zygote is formed by true fertilization (syngamy) develops into embryo. Triploid primary endosperm nucleus is formed by triple fusion develops into the endosperm which is used as nutrition for growing embryo.

All the remaining cells of embryo sac like antipodal cells, synergids degenerate excluding zygote and primary endosperm nucleus after the fertilization. At this time, zygote obtains food from degenerating synergids and antipodal cells. The fertilization in which non motile gametes are carried to female gamete through pollen tube is known as Siphonogamy. Entry of more than one pollen tube into the ovule leading to occurrence of supernumerary male gametes is called **Polyspermy**.



Release of male gametes and double fertilization

DEVELOPMENT OF ENDOSPERM

First of all endosperm develops from the primary endosperm nucleus after the fertilization which store food materials. It is utilizes by the embryo during the early development and at the time of seed germination. Food is present in the form of starch in endosperm. The endosperm is of three types on the basis of development:-

Nuclear endosperm :

This type of endosperm mostly found in Dicotyledon [Polypetalae]. Nuclear endosperm is also present in *Capsella*.

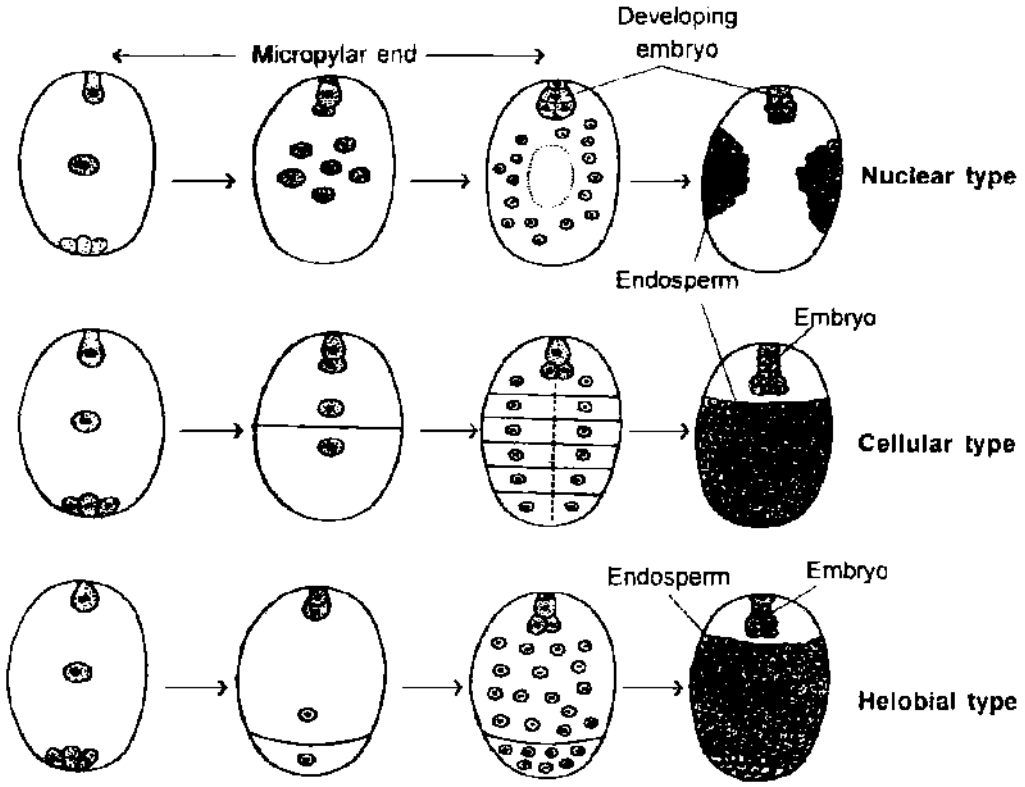
Such type of endosperm develops by free nuclear divisions of nucleus of primary endosperm nucleus, resulting multinucleated endosperm is formed. Later on cytokinesis takes place, so that multicellular endosperm is formed. This type of endosperm is the most common in Angiosperms. The milky fluid is found in green Coconut is example of nuclear endosperm, which is called liquid syncytium. In Melastoma, cytokinesis never take place so that it is always remains nuclear endosperm

Cellular endosperm :

This type of endosperm is found in Gamopetalae group. During the development, each division of primary endosperm nucleus is followed by cytokinesis. So that endosperm remains cellular from the beginning.

Helobial endosperm :

During the development of this type of endosperm, first division of primary endosperm nucleus is followed by unequal cytokinesis so that two unequal sized cells are formed (Cell towards the micropyle is large). Now free nuclear division takes place in each cells, results it becomes multinucleated. Eventually cytokinesis takes place at a time so that is changed into a cellular endosperm. This type of endosperm is found in Monocots. It is intermediate type of endosperm.



Different types of endosperms in Angiosperms

Significance of Endosperm :

Food supply to developing embryo as embryo sac has very little stored food. So zygote developes into embryo after the proper development of endosperm in most of angiosperms. Young endosperm is rich in auxins, Gibberellins and cytokinins. Zeatin is obtained from maize endosperm. Auxin-B is also obtained from maize endosperm. In mature or germinating seeds the reserve food of endosperm is utilized till the development of photosynthetic tissue.

Aleurone layer :

In cereals one or few outer most layers of endosperm become highly specialized morphologically as well as physiologically and form aleuron tissue. It is characterized by thick wall and non vacouled cytoplasm. The cells have aleuron granules or grains which are rich in protein and spherosomes and glyoxysomes. Aleuron grains have protein, phospholipids and some carbohydrates. During seed germination the reserve food in endosperm cells is digested by activity of hydrolytic enzymes like protease, amylase which are secreted by aleuron cells. Gibberellin induce the synthesis or denovo synthesis of these enzymes in aleuron cells.

After the observation of first two division of primary endosperm nucleus, endosperm can be identified whether it would be nuclear, or cellular endosperm. Endosperm is absent in some of Angiosperms e.g. in Orchidaceae, Podostemaceae and Trapaceae. Exceptionally, some of the plants have diploid endosperm instead of triploid such as in Oenothera. Maize and Tomato have mosaic endosperm in which patches of different colours are present. The endosperm in Betel nut is rough surfaced. It is known as ruminate endosperm. The drinking portion is nuclear endosperm and edible portion is cellular endosperm in Coconut.

DEVELOPMENT OF EMBRYO IN DICOT

Development of embryo in *Capsella* is first time discovered by Hanstein. In Angiosperm, Zygote undergoes in resting phase. When the endosperm is formed, development of zygote starts. In the beginning it absorb food from the endosrperm and increase in size then after a layer sectreted by itself. Now it is called Oospore.

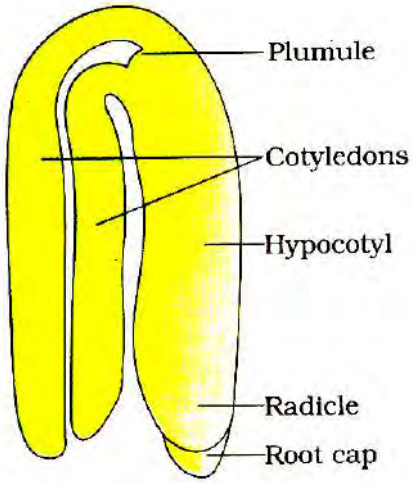


Fig. A typical dicot embryo

The first division of Oospore is transverse, results two cells are formed. The one cell lies towards micropyle is called basal cell or suspensor cell. The other cell is formed towards the Chalaza is called apical cell or terminal cell or embryonal cell. The basal cell and embryonal cell divide simultaneously.

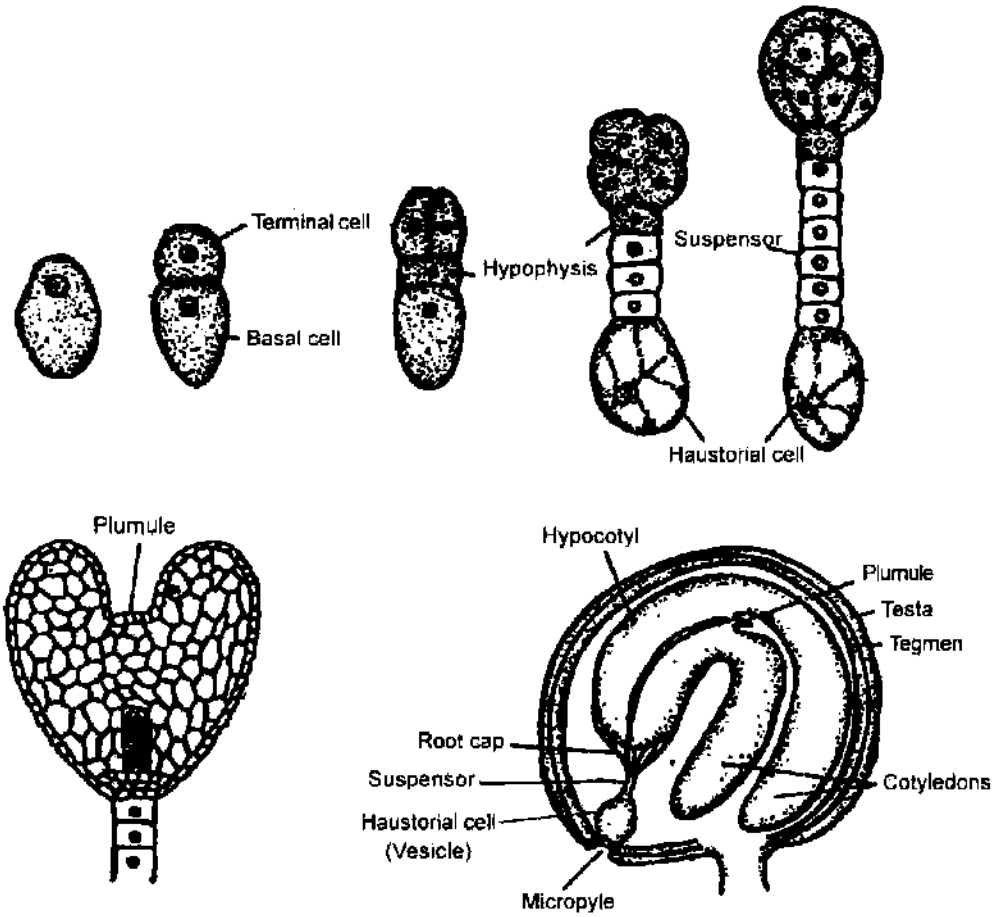
The basal cell divides transversly and apical cell divides vertically resulting, two suspensor cells and two embryonal cell are formed. This stage is made up of four cells which are arranged in 'T' Shape structure. Embryonal cells divided vertically to form four Embryonal cells. This is the quadrant state of embryo. The two suspensor cells divided by the transverse divisions forming a 6-10 celled long filament like structure called suspensor. The main function of suspensor is to push the developing embryo into food laden endosperm to provide nutrition. The micropyler cell of the suspensor swells up. This cell of suspensor is known as haustorial-cell.

The cell of suspensor lies near the embryonal cells is called hypophysis. This cell combined with radicle to form the apex of root [Root cap]. This four cell quadrent embryo further divide transversely to produce eight cells. The eight celled stage of embryo is called octant stage. The eight cells of octant are arranged in two tiers. The four cells of the octant embryo lies near the hypophysis is known as hypobasal cells and four cells present towards the chalaza termed epibasal cells. The hypobasal cells give rise to radicle and hypocotyl and epibasal cells give rise to two cotyledons and plumule of the embryo. All the cells of octant divided by periclinal division so that a 16 cells globular embryo is formed [Proembryo].

Due to fast division of embryonal cells of globular embryo, a heart shaped embryo is formed. All the cells of this embryo are meristematic. Due to the fast growth in two lobes of heart shaped embryo, they develop into two cotyledons. Both the growing cotyledons turn in downwards due to the curved position of body of ovule of Capsella. The tissues are present below the joining place of both the cotyledons are responsible to form plumule and behind it epicotyl is formed. The tissues present opposite to the plumule near the hypophysis give rise to radicle. The apex root [root cap] is formed by hypophysis. This curved position of the embryo is called Torpedo or Chordate stage.

An axis is present between plumule and radicle is called embryonal axis. It is also called Tigellum [main embryonal axis]. Both the cotyledons are present at lateral position of embryonal axis and plumule is formed in terminal position in Dicotyledon embryo. This type of development of embryo is know as Crucifer type or Onagrad type. It is the most common type of development in Dicots. Crucifer type of development is also found in Capsella, so that it is considered as typical Angiosperm for the study of embryonic development of Angiosperms. When embryo is formed, suspensor dries and degenerates so it is known as meroblastic development. Ovule modified into seed in which testa is formed by outer integument and tegmen is formed by inner integument. Only micropyle of ovule remains unchanged and also pesent in seed.

Entire ovary modified into fruit. This fruit is formed by frertilized ovary so that it is called true fruit. In some of the angiosperm fruit is formed by ovary without fertilization know as parthenocarpic fruit. In some fruit parthenocarpy is senseless (If edible part is endosperm or seed).



STAGES IN THE DEVELOPMENT OF EMBRYO IN A DICOT (*Capsella bursa-pastoris*)

DEVELOPMENT OF EMBRYO IN MONOCOTYLEDON

The Lilium type of embryonic development is found in monocotyledons. The first division is transverse division in oospore. Results two cells are formed the upper cell chalazal is called embryonal cell and lower micropylar cell is termed as basal cell. The basal cell does not divide further and later on it increases in size and form single celled vesicular suspensor. Only embryonal cell divides transversly in which terminal cell is called cotyledon cell and lower (middle) cell is known as embryonal axis cell. A transverse division takes place in embryonal axis cell to gives rise two cells.

The one cell out of two, gives rise to plumule initial and another gives rise to radicle initial. The plumule initial divides to form the plumule of the embryo. Radicle initial divide to form the radicle. In this both the initials are responsible to form embryo in lateral position. An apical cotyledon is formed by the continuous division of cotyledon cell. This apical cotyledon is known as Scutellum.

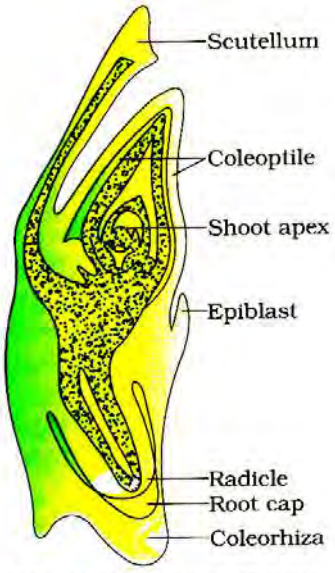


Fig. L.S. of an embryo of grass

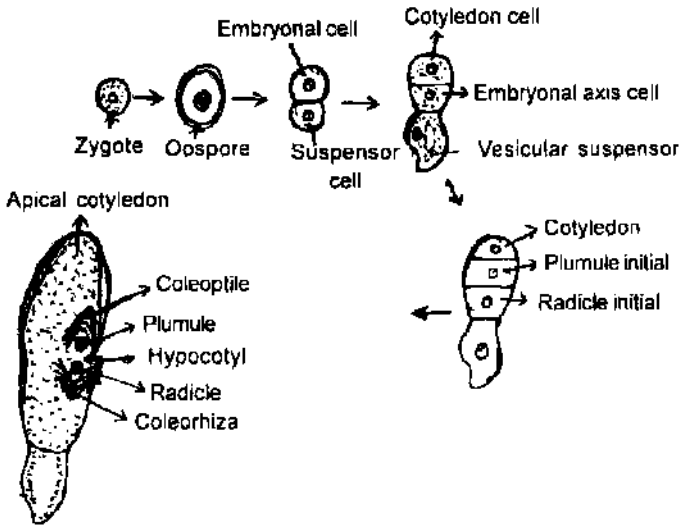
The plumule and radicle is covered by cap like hard protective structures. The covering of plumule is called coleoptile and covering of radicle is known as coleorhiza. These structure broken during the germination. The plumule lies in lateral position and cotyledon in terminal position in monocotyledons. In angiosperm, development of embryo is meroblastic and endoscopic [towards the chalaza].



Development of Embryo in Monocotyledon

Summary of events that take place in an ovary, leading to formation of fruits and seeds.

Ovary	-	**Fruit**
Ovary wall	-	Pericarp
Ovule	-	**Seed**
Funicle	-	Stalk of seed (may be left or broken)
Hilum	-	Hilum
Nucellus	-	Usually degenerates but in some cases persists in the form of a thin layer called **perisperm**.
Outer integument	-	Testa } Seed coat
Inner integument	-	Tegmen } Seed coat
Micropyle	-	Micropyle
Embryo sac		
Synergids	-	Degenerate
Egg cell (After Fertilization)	-	Oospore – Embryo
Antipodals	-	Degenerate
Secondary nucleus	-	Endosperm
(After fusing with male gamete)		Nucleus – Endosperm

POLYEMBRYONY

Many embryos are formed inside the single seed is called polyembryony. First of all, it is observed by Leeuwenhoek in Citrus (Orange) seeds. Polyembryony is commonly found in Gymnosperm but it is also found in some of Angiospermic plants such as Orange, Lemon and Nicotiana etc. If polyembryony develops naturally then it is called spontaneous polyembryony [self], and if develops artificially is called induced polyembryony. When many embryos are formed from separate-separate embryosacs [more than one] inside the ovule is called false or pseudo polyembryony.

When many embryos are formed inside the single embryo sac of the seed is called "true poly embryony". It is either develops from –

Clevage of Zygote or **budding** – e.g. *Cymbidium, Exocarpus, Nymphaea, Nicotiana, Orchids* etc.

By the fertilization of synergids – e.g. *Anemone, Aristolochia, Sagittaria* etc.

Fertilization of antipodal cells – e.g. *Paspalum, Ulmus* etc.

Note : In Lilium all three types of polyembryony are present.

[Adventive embryony is also example of polyembryony in which additional number of embryos are formed from nucellus or integuments].

ANDROGENIC HAPLOID PLANTS

This concept was given by Haberlandt and practically proved by Steward. It is based on totipotency. Anther of the Datura plant grown on culture medium by Guha and Maheshwari. As a result of this culture, haploid and diploid two different type of plants are formed. Diploid plants developed from the wall of the anther and haploid plants developed from the pollen grains. Such type of haploid plants obtained from the tissue culture are known as androgenic plants. Fast vegetative multiplication through the tissue culture from any part [cell or tissue] of the plant in the field of Agroforestry and Horticulture is called micropropagation.

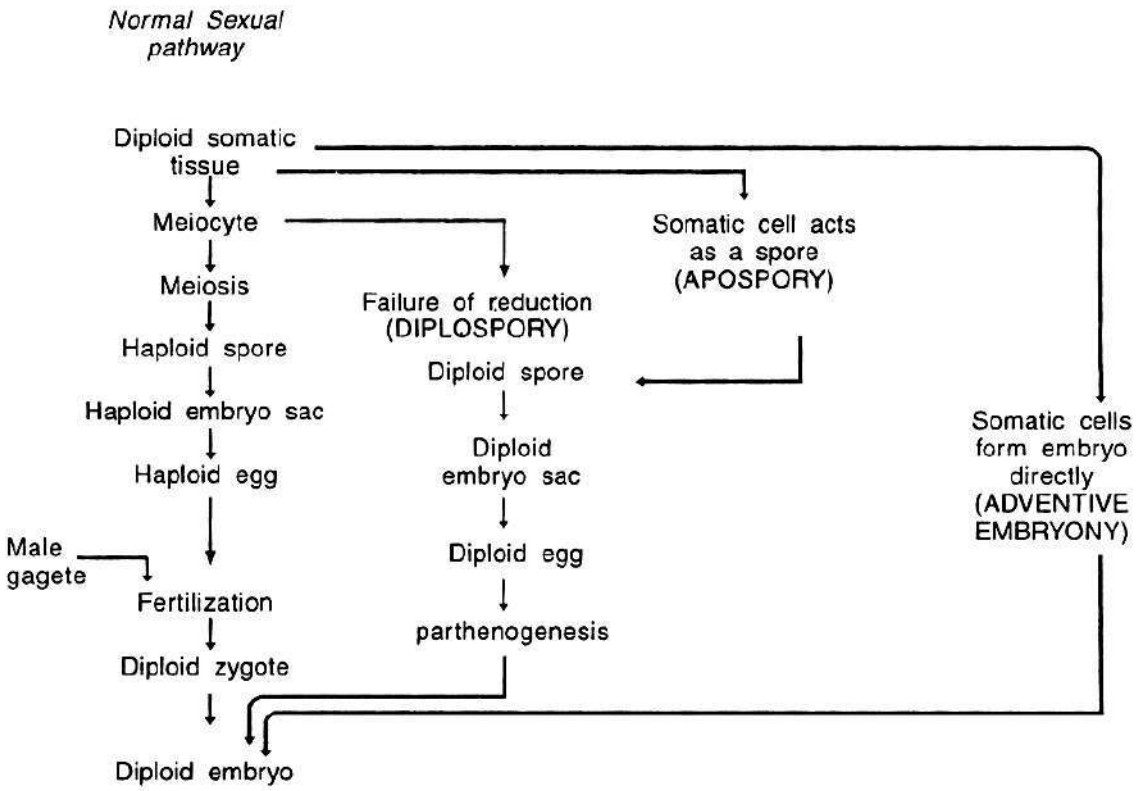
P.Maheshwari established – Research centre of Angiosperm Embryology at Delhi University. Book published by Maheshwari – An Introduction to the Embryology of Angiosperms.

APOMIXIS

In asexual reproduction, the new individual are produced by any means **other than the fusion of sex** gametes. It means a **reproduction in which new individuals are formed without meiotic division and fusion of gametes** is called **asexual reproduction.** In this way asexual reproduction is also known as **apomixis.**

[Greek – Apo = without; mixis = mixing] **Apomixis** term suggested by **Winkler**.

The Apomixis is characterized by quick multiplication and reproduction of genetically similar plants from the single parent. Such a population produced from single individual is called **clone** and each member of the clone is called **remet**.



Agamospermy :

In this type **embryo** is formed without fertilization and meiotic division is called **agamospermy**. It means plants belonging in this category propagated through **seeds** but the embryo formation does **not involve meiosis** and **syngamy**.

There are **three different type of agamospermy** -

Diplospory :

In this method **archesporium** differentiates to form a **megaspore mother cell** but this **megaspore mother cell directly gives rise to an embryo sac without meiosis.** This **embryo sac is diploid** and a diploid embryo is formed without fertilization from diploid **egg** of this embryo sac.

Diplospory is also known as **diploid parthenogenesis**.

Example : Parthenium, Taraxacum

Parthenogenesis : In this process **haploid egg cell of female gameto**phyte is responsible to **form a haploid embryo without fertilization**.

Apogamy : In this process **any haploid cell of female gametophyte except egg cell** is responsible to form a **haploid embryo without fertilization**.

Parthenogenesis and Apogamy both are not included in agamospermy.

Note : If both gametophyte and sporophyte are diploid in Parthenogenesis and apogamy then it is called diploid Parthenogenesis and diploid apogamy.

Apospory :

It is discovered by **Rosenberg** in **Heiarcium** plant. In this method **embryo sac or female gametophyte is directly formed from any diploid cell of the ovule** (nucellus/integument) **except megaspore mother cell** without meiosis is known as **apospory**. In this **gametophyte** always remains **diploid, e.g.** ***Heiracium, Ranunculus*** and ***Rubus*****.**

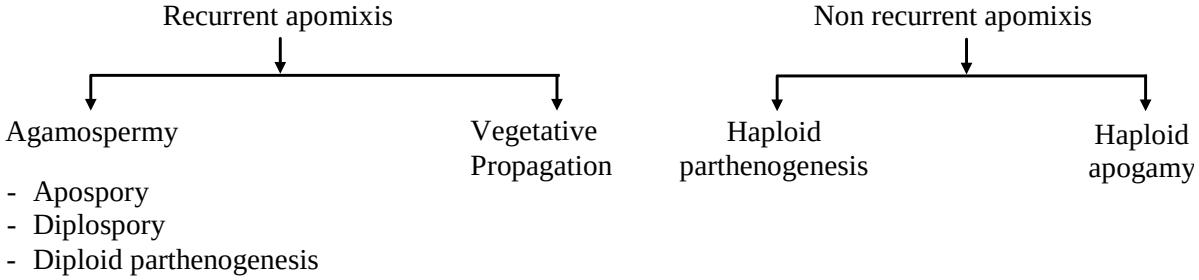
Adventive Embryony :

In this method, an embryo is formed from any **diploid cells (Nucellus or integuments)** of the **sporophyte**. This **diploid cell** behave like a **zygote and develop** (No embryo sac formation) Adventive embry.

from **Nucellus** – **Citrus, Mangifera, Opuntia, Mamillaria**

from **Integuments** – **Spiranthus australis**.

According to P. Maheshwari :



- Apospory
- Diplospory
- Diploid parthenogenesis

Significance of Apomixis over hybrid seeds -

Generally hybrid seeds are utilized in cultivation of most of crops and vegetables. The hybrid seeds have to be produced every year. If the seeds collected from hybrid are sown, the plants in the progeny will segregate and do not maintain hybrid characters. The production of hybrid seeds is costly so cost of hybrid seeds is too expensive to farmers.

So if these hybrid made into apomicts, there is no segregation of characters in the hybrid progeny. Then the farmers can keep on using the hybrid seeds to raise new crop year after year and be does not have to buy hybrid seeds every year. Because of the importance of apomixis in hybrid seed industry, active research is going on in many laboratories around the world to understand the genetics of apomixies and to transfer apomictic genes into hybrid varieties.

PARTHENOCARPY

Parthenocarpy (Gk. *parthenos*-virgin, *karpos*-friut, Noll, 1902) is the formation of fruit without fertilization. The fruit produced due to parthenogenesis does not bear seeds. e.g, pineapple, banana, apple, pear etc. In some cases the stimulus of pollination is required. The phenomenon is called **stimulative parthenocarpy**. In others parthenocarpy. Parthenocarpic fruits are generally seedless. However, technically fruits having seeds (pseudoseeds) with an asexual embryo are also parthenocarpy fruits. Parthenocarpy is of three **types-genetic, environmental** and **chemically induced**.

(1) **Genetic parthenocarpy :** Parthenocorpy is due to genetic alteration caused by mutation or hybridisation. It is also called natural parthenocorpy , e.g., navel orange, banana, pineapple, varieties of apple, grape and pear.

(2) **Environmetal parthenocarpy :** Low temperature, frost and fog have been known found to induce parthenocarpy in a number of plants, e.g., pear, olive, *Capsicum*, tomato.

(3) **Chemically induced parthenocarpy :** Spray or paste of auxins and gibberellins in low concentration of 10^{-6} - 10^{-7} M has been found to induce parthenocarpy in several plants, e.g., tomato, *Vitis*, cucurbits, *Citrus*, strawberry, blackberry, fig, etc.

Importance of parthenocapic fruits

1. They do not contain irritant seeds which have to be removed before eating fruits.

2. Fruits can be developed inside the green houses where pollinators are not available.

3. Quicker food processing.

PARTHENOGENESIS

Process of development of seeds from unfertilized female gametes. Seeds may be haploid or diploid (Gk. parthenos-virgin, genesis-descent). It is the development of a new individual from a single gamete without fusion with another gamete. In lower plants both the type of gametes can female gametes show this facility. Depending upon the haploid of the gamete, there are two types of parthenogenesis, diploid and haploid. In **haploid parthenogenesis**, the embryo sac and its egg are haploid. The egg grows to form haploid embryo. Such embryos do not survive in higher plants but in lower plants, the plant body is haploid embryos has survival value. In diploid parathenogenesis, the embryo sac as well as its egg is diploid. It undergoes parthenogenesis and forms diploid embryo. **Diploid parthenogenesis** is generally accompanied by failure of meiosis during megasporogenesis as well as direct formation of embryo sac from a nucellar cell, e.g., *Rubus*, *Poa*, apple. In apple, self pollination promotes diploid parthenogenesis.

SELF INCOMPATIBILITY : It is recognized in 66 families of angiosperms. Morphologically self in compatibility is of two types :

(A) Heteromorphic self incompatibility (B) Homomorphic self incompatibility

(A) **Heteromorphic self incompatibility** – Occurrence of two (distyly) or three (tristyly) morphologically distinct mating type within a species, which can be easily recognized without a breeding test. The difference in the mating type is generally in the relative length of stamen and style. Ex. *Primula, Lathyrum.*

(B) Homomorphic self incompatibility – In this type all the mating type within a species are morphologically similar and requires proper breeding test, for their recognization. Depending upon the origin of factors determining the mating type on pollen side it is of two types.

(i) Gametophytic self incompatibility (GSI)

(ii) Sporophytic self incompatibility (SSI)

When two pollen tubes enter in an ovule and release their contents, it is possible that the egg may be fertilized by one male gamete from one tube and triple fusion may involves participation of male gamete from another tube. This pnenomenon is called **Heterofertilization** eg. *Zea mays.* When the entry of male gamete is not accompanied by fusion. This phenomenon is called **semigamy**. The percentage of pollen germination and tube growth is better in large populations. This is called as **'population effect'** or **'crowding effect'**

B-Ca-inositol of Sugar complex acts as chemotropic agent for pollen tube growth. Highest amount of fat is found in endosperm of *Coconut.* Embryonic development of Capsella is endoscopic because it is developed towards chalazal region of the zygote. Single celled suspensor is found in *Triticum* [wheat] and *Caryophyllum.* Their seeds are caryopsis fruit. Suspensor is absent in *Sunflower* and *Marigold.* 125 meiotic divisions are essential for development of 100 grains of Wheat.

Heaviest seed (6 k.g.) is found in Lodoshia. Its fruit is 1 meter in lenth and wt. of fruit is 18 kg. Edible part of Betelnut is endosperm. Abscisic acid is the natural germination inhibitor of seed. Light induces germination in Lettuce/(*Lactuca sativa*). Smallest or minute seeds are found in Orchids which are lightest in plant kingdom and are called "Dust seeds" [wt. 20.33 µg].

Xenia (by Focke) – Effect of pollens inside Embryo sac on Endosperm (except Embryo) → Maize.

Metaxenia – Effect of pollen out side the Embryo sac on seed coat or pericarp. Datepalm – maturity time as well as size of fruits can be changed by using different pollens. The longest pollen tube is found in Maize.

The polysiphonous condition is found in families of Malvaceae and cucurbitaceae. Those plants which live immortal through the seeds are known as therophytes.The synergids are absent in the embryo sac of Plumbago.

ANGIOSPERMIC SEED

Difference between Monocotyledonous and Dicotyledonous seed

S.No.	Monocotyledonous Seeds	Dicotyledonous Seeds
(i)	Only single cotyledon is present with embryo	Two cotyledon are present with embryo
(ii)	Generally cotyledon is thin or papery	Cotyledons are thick
(iii)	Generally seeds are endospermic	Generally seeds are non endospermic, some times may be endospermic
(iv)	Cotyledon is also called scutellum	Not called by this name
(v)	In seed plumule is covered by coleoptile and radicle is covered by coleorrhiza.	Coleoptile and coleorhiza are not formed
(vi)	Plumule is in lateral position and cotyledon are is in terminal position	Plumule is in terminal position and cotyledons are present in lateral position
(vii)	Radicle degenerates after sometime and adventitious roots are formed at that place.	Radicle is responsible to form primary root.
(viii)	In some of the seeds, seed coats and cotyledon fused together e.g. Wheat etc.	Such types of seed are not found.

STRUCTURE OF SEED

The miniature plant exists in a seed. Plant is the main base of whole living world. So it can be say that seed is the most important structure. In angiosperm, after the fertilization, fertilized egg cell changed into embryo, ovary changed into fruit and ovule change into seed. Morphologically, fertilized ovule is known as seed. In other words, seed is a mature, integumented megasporangium. Seed is characteristic of Spermatophytes (Gymnosperms and Angiosperms). Typical mature seed have three main parts : (i) Seed coat (ii) Embryo (iii) Cotyledon

(i) Seed coat :

Outer, protective covering of the seed is called seed coat, which develops from integuments of ovule. The seeds which develops from bitegmic ovule, there are two distinct layers in seed coat. The outer layer is thick, hard and leathery (developing from outer integument), called testa, whereas inner layer is thin and papery or membranous (developing from inner integument), called tegmen. In seeds developing from unitegmic ovule there is single layered seed coat. The seed coat performs usual protective function.

The seed is attached to the fruit wall or pericarp by means of a stalk called funicle or funiculus. The point of attachment of funiculus to the body of mature seed is called hilum. A small opening or pore called micropyle is present just near the hilum, which is the way of entry of water into the seed. As most of the ovules in angiosperms are inverted or anatropous, so a ridge called raphe is also present is seed.

(ii) Embryo :

Embryo is the most important part of the seed, which represents mini or tiny future plant. The development of embryo occurs from fertilized egg [zygote]. The embryo having an embryonal axis or main axis called tigellum, to which one or two cotyledons (seed leaves) are attached, depending upon whether the seed is monocot or dicot. The portion of embryonal axis or tigellum below the point of attachement of cotyledons, is called hypocotyl, which bears radicle or future root at its tip. Similarly, portion of embryonal axis or tigellum above the point of attachment of cotyledons, is called epicotyl, which bears plumule (future shoot) at its tip.

Difference between Embryo and Endosperm

S.No.	Embryo	Endosperm
(i)	It is formed by fertilized egg (syngamy)	It is formed by fusion of secondary nucleus (triple fusion)
(ii)	It is always diploid structure	It is generally triploid structure
(iii)	It gives rise to new plant	It provides nutrition to the developing embryo.
(iv)	Cotyledons, plumule and radicle are formed in embryo	Such type of structures are never formed.
(v)	Embryo is present is seed.	It is only found endospermic seeds otherwise. it degenerates with the formation of seed.
(vi)	Embryo dies in the absence of endosperm	Endosperm does not die in absence of embryo.
(vii)	Germination of seed takes place.	There is no germination is found in endosperm.

(iii) Cotyledons (seed leaves) :

In some seeds (e.g. legumes), reserve food is stored in cotyledon, whereas in other (e.g. cereals), there is special nutritive tssue called endosperm. The seeds having endosperm are called endospermic or albuminous seed, e.g. *Cereals, Castor* etc., whereas seeds in which endosperm is fully consumed by embryo and no endosperm is left, are called non-endospermic or ex-albuminous seeds, e.g., *Gram, Pea, Sem, Cucumber, Tamarind*, etc. The reserve food material in seeds may be carbohydrate (e.g. *Wheat, Rice*)

or proteins (legumes) or fats (Castor, peanut, Sunflower), etc. Some time, some part of nucellus remains unused which is present in the form of thin layer around the endosperm is called perisperm e.g. *Betel nut, Black pepper, Castor.*

In Monocot embryo, there is a single cotyledon called scutellum. In some grasses like Wheat, on opposite side of scutellum is a tongue shaped outgrowth which represents the remains of second cotyledon is present called epiblast. In Dicot albuminous seed-castor *(Ricinus communis)*, there is a specific outgrowth called caruncle or strophiole, present over micryopyle. It is formed by proliferation of cells of outer integument at tip. Caruncle is somewhat spongy and helps in absorption of water during germination of seed. On the basis of cotyledon in the seed the angiosperm are called Monocotyledon (monocot) [one cotyledon] and dicotytedons / Dicot [Two cotyledon]. The angiospermic seed are classified into two categories on the presence or absence of endosperm in seeds –

Non Endospermic or Ex-albuminous seed :

Such type of seeds do not have an endosperm at maturity, therefore are called non endospermic or Exalbuminous seeds. The endospermic tissues are absorbed during the development of embryo. The absorbed food materials from the endosperm is stored in cotyledons, thats why they become so large and fleshy e.g. *Capsella* and in most of *dicotyledons*. But Castor seed is endospermic.

Endospermic or Albuminous seed :

This type of seeds, food is stored in endosperm. Such seeds are called endospermic seed or albuminous seed. The endospermic tissue in these seeds utilize during the germination of seed and their cotyledons are thin and membranous e.g. most of *Monocot seeds* e.g. *Wheat, Rice,* and *Maize* etc. Castor [dicot] is also endospermic seed.

Endospermic dicot seeds : e.g., *Castor, Papaya, Cotton.*

Non-endospermic dicot seeds : e.g., *Gram, Bean, Pea, cucumber, Tamarind.*

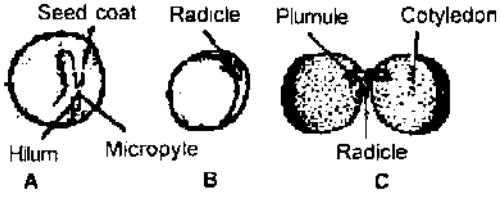
Endospermic monocot seeds : e.g. *Maize, Rice, Wheat and Coconut.*

Non-endospermic monocot seeds : *Pothos (money plant), Vallisneria, Alisma, Amorphophallus.*

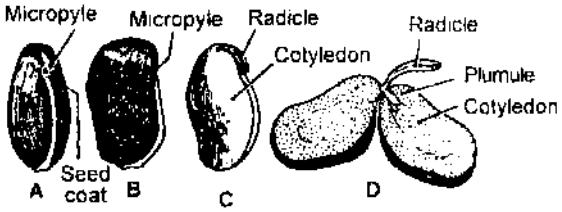
STRUCTURE OF BEAN SEED

Bean seed is kidney shaped having a concave side and a convex side. The concave side is slightly darker and posses a white elongated scar is called hilum, which marks the point of attachment of the seed with the funiculus. A small pore lies adjacent to the hilum, called micropyle, which performs the function of absorbing water during germination. There is a short ridge on the other side of hilum. It is called raphe.

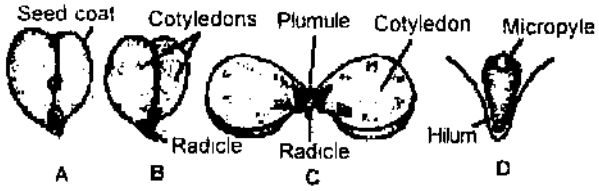
The Bean seed has two seed coats. The outer seed coat is called testa. It is hard, thick, smooth and variously coloured. It develops from outer integument of ovule. The inner coat is white, membranous and thin. It is called tegmen. It is difficult to separate tegmen from testa. The seed coats can easily be removed if the seeds are soaked in water for a few hours.



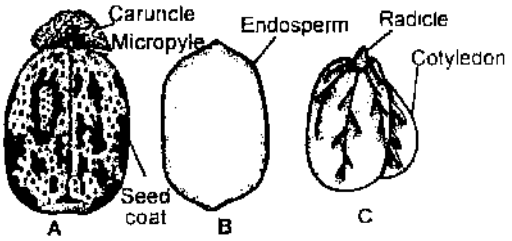
STRUCTURE OF PEA SEED



STRUCTURE OF BEAN SEED



STRUCTURE OF GRAM SEED



STRUCTURE OF CASTOR SEED

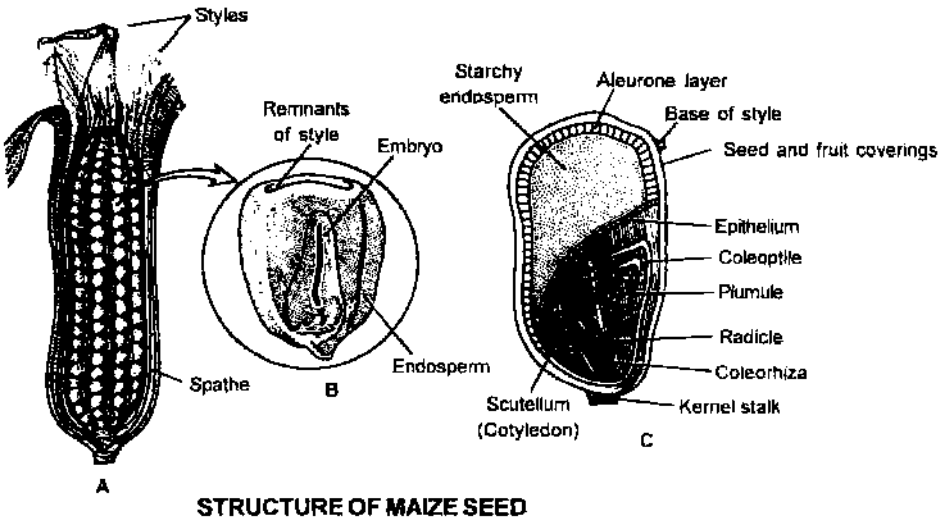
Each seed encloses an embryo which can be examined after removing the seed coats. The bulk of embryo consists of two large, white and kidney-shaped cotyledons (or seed leaves). They store reserve food material in the form of carbohydrates and proteins to provide nourishment to embryo at the time of seed germination and growth of young seedling. The cotyledons are attached laterally to the curved embryonal axis at the cotyledonary node. The micropylar end of embryonal axis is rod-shaped and slightly bulged. It is called radicle (or the embryonic root).

The other side of embryonal axis lies in between the two cotyledons. It is called **plumule** (or the shoot tip). The shoot tip remains protected by two small, folded leaves. The protion of embryo axis between the plumule and cotyledonary node is called **epicotyl.** The portion of axis between the radicle and cotyledonary node is called **hypocotyl.**

STRUCTURE OF MAIZE GRAIN [SEED]

A grain of Maize (*Zea mays*) is infect a dry one-seeded indehiscent fruit of caryopsis type in which pericarp (or fruit wall) is fused with the seed coat. The covering of grain encloses two major parts-endosperm and an embryo. As seen in longitudinal section, the major portion of grain is occupied by a large starchy endosperm. It is surrounded by a special one-celled thick layer, called aleurone layer. The cells of aleurone layer are filled with starch and proteineous grains which play an important role at the time of germination.

The embryo consists of an upper shield-shaped scutellum which is actually a cotyledon. The scutellum is closely pressed against the endosperm and helps in the translocation of nutrients from endosperm to the growing embryo at the time of germination and seed growth. The epidermal tissue of scutellum lying in direct contact with the endosperm which is both secretory and absorptive in function. It secretes certain hormones (Gibberellin) into the endosperm which synthesize enzymes (α-amylase). These enzymes are responsible for the break down of stored nutrients and convert them into soluble state. The soluble nutrients are then absorbed by epithelial layer of scutellum and transferred to the growing embryo.



STRUCTURE OF MAIZE SEED

The scutellum is attached laterally to the embryonal axis. One end of the embryonal axis points towards the pointed end of the grain. It is called **radicle.** The radicle is covered by a protective sheath called **coleorhiza.** The other end of embryonal axis, which faces towards the broader end of the grain, is called **plumule.** The plumule is surrounded by a conical protective sheath, called **coleoptile**. The coleoptile is capable in growth and covers the growing shoot tip till it passes out through the soil during germination.

GERMINATION OF SEED

The embryo of seed grows into a sporophyte plant. The radicle produces primary root. The plumule develops shoot and later on cotyledons degenerates. In some of the plants cotyledon comes above the surface of the soil during the germination of seed. Such type of germination is called epigeal germination e.g. *Capsella*. This is due to higher growth takes place in hypocotyl region of embryo in seed so cotyledon pushed above the soil surface [Capsella, Castor, French bean etc.].

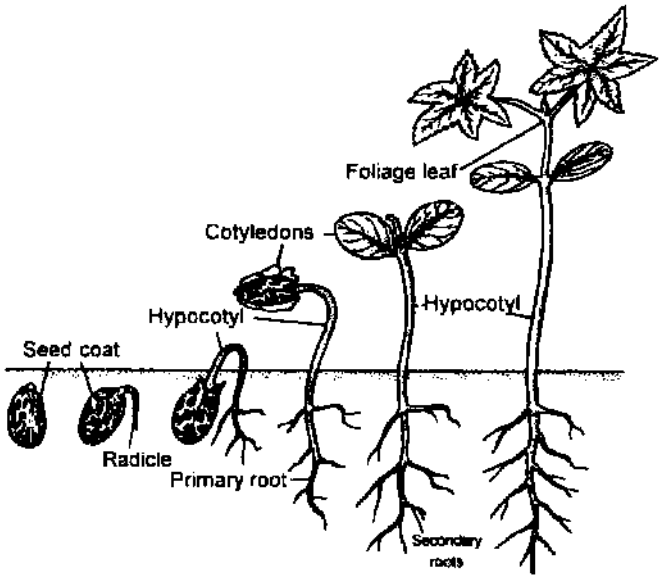
In some of plants the epicotyl region grow faster during the germination results cotyledon remains under the soil. It is known as hypogeal germination, e.g. In most of *Angiosperms* [*Pea, Gram, Rice, Maize* etc]

Types of seed Germination :

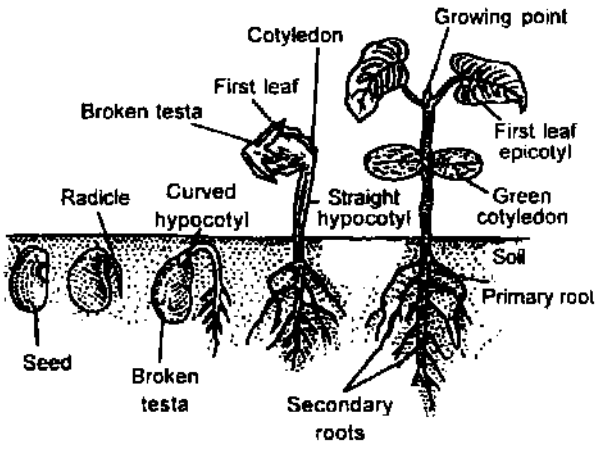
Germination is basically of two types, depending upon behaviour of cotyledons but viviparous germination also found :

Epigel germination :

Here due to faster hypocotyl growth or elongation than epicotyl the cotyledons are pushed out of soil. This is called epigeal germination. This type of germination occurs in *Cotton, Papaya, Castor, Onion, Cucurbits, Tamarind, French bean, mustard,* etc. In some cases, these above ground cotyledons become green leaf like (cotyledonary leaves) and perform photosynthetic function till the seedling assumes independency (e.g., *castor, cotton, onion, papaya*, etc.). In other plants, cotyledons do not assume leaf like shape and fall off (e.g., *French bean* and *Tamarind*).



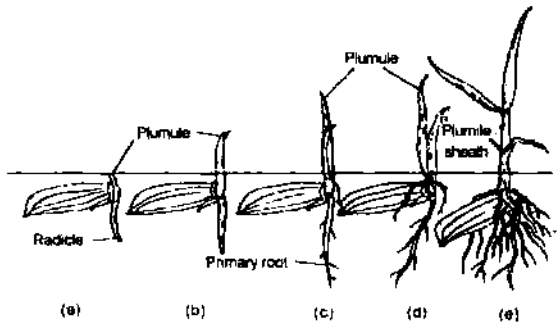
EPIGEAL GERMINATION OF CASTOR SEED



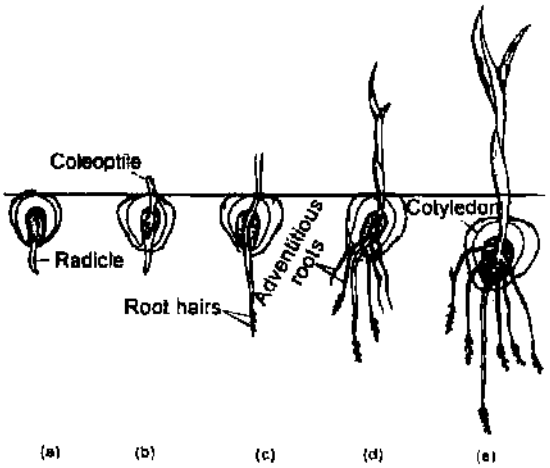
EPIGEAL GERMINATION OF BEAN SEED

Hypogeal germination :

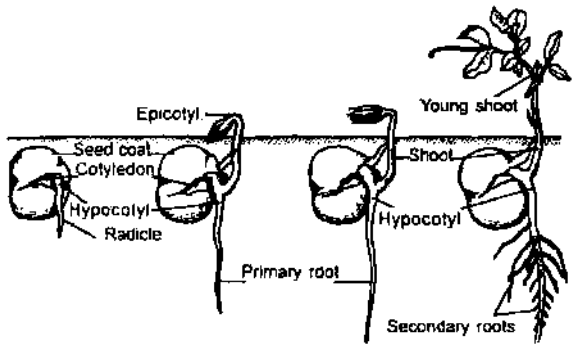
Here due to faster epicotyl elongation, than hypocotyl the plumule comes out of the ground and cotyledons remain underground. This is called **hypogeal germination.** This type of germination occurs in most of the monocotyledons and few dicotyledons, e.g., *Maize, Rice, Wheat, Cocount, Gram, Pea, Peant* and *Mango,* etc.



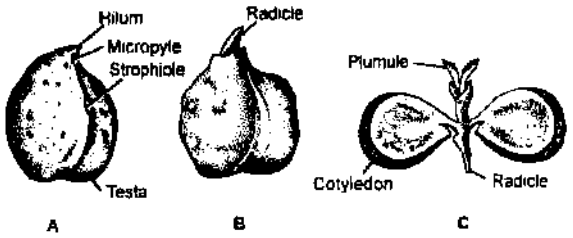
HYPOGEAL GERMINATION OF RICE SEED



HYPOGEAL GERMINATON OF MAIZE SEED



HYPOGEAL GERMINATION OF PEA SEED



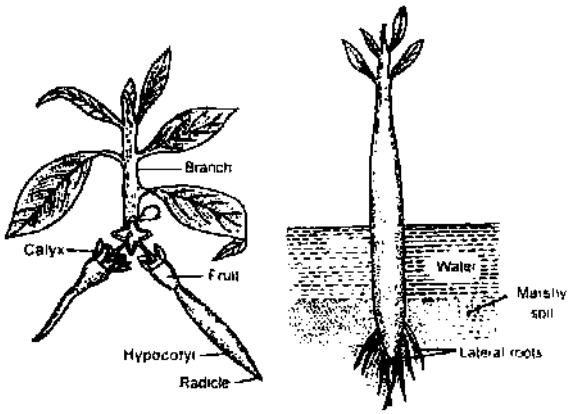
HYPOGEAL GERMINATION OF GRAM SEED

Difference between Epigeal and Hypogeal germination :

S.No.	Epigeal germination	Hypogeal germination
(i)	Cotyledons come above surface of soil during the germination and remains attached till the formation of new leaves.	Cotyledon remains under the soil surface.
(ii)	Due to the growth of hypocotyls, plumule and cotyledon pushed above the ground.	Due to very less growth of hypocotyls, cotyledons do not come above the ground
(iii)	Growth of epicotyl does not take place.	Due to high growth of epicotyl, plumule comes above ground and cotyledon remains inside the ground.
(iv)	Cotyledons become green and perform leaf like function	Cotyledon remains under the soil and do not perform leaf like function
(v)	Cotyledon is responsible to form first leaves, than after dries and fall on the ground	Cotyledon decomposed inside the soil

Vivipary :

A special type of seed germination is characteristic of Mangrove vegetation, found in muddy, saline conditions, seed does not imbibe water as water potential is highly negative and O_2 availability is low e.g., *Rhizophora, Avicennia, Ceriops, Breguira, Sonneratia,* etc. Here there is no resting period of embryo and germination occurs inside the fruit, while it is attached to the parent plant, i.e., "In-situ germination". The seedling is separated in the mud with the help of lateral roots developing from basal end of radicle. This is called viviparous germination or vivipary.



VIVIPARY GERMINATION IN RHIZOPHORA

Significances of seed :

In angiosperms the process of pollination and fertilization are independent of water. Seed formation is very important for plant dispersal. Seeds posses better adaptive strategies for dispersal to new habitat and help in colonisation of these species in new areas. Posses sufficient food so nourish the young seedling till the formation of photosynthetic tissues. Hard seed coat provide protection to young embryo.

Seed is product of sexual reproduction & generate new genetic combination leading to variations. Seeds are basis of agriculture as dehydration and dormancy of mature seed are crusial for storage of seed which can be used throughout the year and also to raise crop in next year or season.

Vaibility of Seeds :

Period of viability of seeds in angiosperms is variable. In some angiosperms seeds are viable only for few months. In many species seeds are viable for years. In some species seeds are viable for hundreds of years. In Lupine (Lupinus arcticus) excavated from Arctic Tundra, the seeds germinated and flowered after an estimated records of 10000 years of dormancy Date palm (phoenix dactylifera) seeds discovered during archeological excavation at king the Herod's palace near Dead Sea are 2000 year old viable seeds. Lotus seeds are viable for 1,000 years.

FACTORS AFFECTING SEED GERMINATION

The process by which the dormant embryo wakes up [becomes active] and begins to grow is known as germination of seed. The seed germination takes place in the presence of favourable condition such as temperature, moisture, and air. This is a very delicated stage in the life of the plant. An minute change in the environment have harmful effect on growing embryo. So favourable environment should be essential for germination. The following factors are essential for germination of seed.

Moisture :

First step of seed germination is imbibition of water by seed surface. The moisture or water is the most important factor for germination of seed. Generally, the cells of embryo contain about 10-15% water in the dormancy period. The vital activities like growth and development is unable to continue in this less amount of water. For active life processes, water must be present about 75-90%. The seed imbibe enter through water and swell up to increase in size before the germination. Water imbibe by seed coat and enter through microypyle. The following effects have been observed in seed due to imbibition of water -

The seed coat becomes soft and imbibed or adsorbed water reaches to the cells of embryo. When the ratio of water increases in the cells, the protoplasmic contents become more active. The size of embryo

increased due to water adsorption results, seed coat breaks up and radicle and plumule easily comes out. Seed coat imbibe water, it becomes soft and increase its permeability. Resulting it increases rate of exchange of oxygen and CO_2. The rate of respiration increases in active cells of embryo. Thus it requires more oxygen. The enzymes are present in the cells of endosperm or cotyledons which are only active in the presence of water. The stored food changed in to dissolved form by the activity of enzyme Gibberellin and it reaches to the active embryo.

Oxygen [O_2] :

The process like cell division, cell elongation etc. of the embryo require energy. This energy is released by the oxidation of organic substances by the process of respiration. Oxygen is essential for oxidation process. The upper surface of soil contains sufficient amount of O_2. The healthy germination does not take place in the absence or scarcity of oxygen in deep soil so crop seed sown in the soil by the farmers upto 5-7 c.m deep.

Temperature :

The suitable temperature is essential for germination of seed. The protoplasm of the cell remains active at certain range of temperature. Most of seed do not germinate in between the range of 0ºC to 5ºC and above the 45ºC. The favourable range of temperature is 20-25ºC for germination of seed in the majority of seeds.

Food or Nutrition :

The growing embryo requires nutrition during germination. The embryo depends upon stored food materials in cotyledons or endosperm in the germination period upto the formation of primary root from the radicle and first leaf from the plumule.

Light :

Light produces different effect in different variety of seeds. The most of the plants do not require light up to the formation of first leaf. Adversely, the rate of germination very fast is the absence of light. But for some plants light is very essential for germination.

They will not germinate in the dark. For example seed of Orchids, Tobacoo, Lettuce etc called photoblastic seeds. After the development of new leaves on shoot light becomes very essential factor. The chlorophyll is not formed in the absence of light and this newly formed plant [Juvenile] will die in the absence of photosynthesis and deficiency of food.

DORMANCY OF SEED

DEFINITION OF DORMANCY OF SEED

The presence of dormancy in a seed is the most important characteristic feature. Because of this character, seeds remain viable for many years. The seeds are dispersed very far places through water, air or insects. Most of the seeds are unable to germinate just after dispersal. They germinate after some time. The time between the maturation and germination of seed is known as "Dormancy period". The sate of inhibited germination as a result of internal factors is usually called 'dormancy' while by external factors in called quiscence. This seed dormancy is of considerable advantage to the plant which helps in adverse environmental conditions. The embryo remains inactive in this period and all the growth processes suspended temporarily. These are three main basic reasons of dormancy of seed.

REASONS OF SEED DORMANCY

Impermeability of seed coat :

The seed coats of many species of Leguminosae and Convolulaceae families are completely impermeable to moisture [water] and oxygen at the time of their maturity. Seed coats, in these are thick and hard. Their cell wall is covered by a layer of lignin which is water proof coating. Such seeds take more time for germination. The dormancy of seeds break by different artificial methods -

By making minute hole/pores with help of pointed sharp apparatus on the seed coat. The seeds are rubbed on hard object so that seed coat become thin. The partial degeneration of seed coat is carried by the action of sulphuric acid. Under natural conditions seed dormancy is gradually over come by the action of microbes [bacteria] in soil, in the alimentary canal of fruit eater birds and due to the presence of high cold or high temperature.

Dormant Embryo :

In many species, although, the embryo completely not matured when the seed is ripe, even than it fails to germinates when ever the environmental conditions are favourable or even seed coat is removed. This is known as "Embryo dormancy". Normally embryo dormancy occurs in many fruit yielding plants of forest. This condition is achieved due to physiological action of seed. Such type of seed must complete their enzymatic and chemical reaction before the germination of seed. In the lack of these reactions, seeds are unable to germinate. Such seed are kept in low temperature and in desirable moisture. Due to this seed dormancy can be broken. The low temperature is the main reason for germination of seeds of Apple, Peaches, pears, Mapple and Pine etc.

Germination Inhibitors :

Germination of some seeds is sometimes checked or prevented by the presence of some chemical compounds are called Germination Inhibitors such as Ferulic acid present in Tomato juice, Caumarin, Abscisic Acid, Dormin and Para ascorbic acid etc. These germination inhibitors washed away with water is known as Leaching.

METHODS OF BREAKING OF SEED DORMANCY

Scarification : The hard seed coat is broken in this method so that water and oxygen enter into the seed coat.

Stratification : The seed kept at low temperature and in the presence of oxygen and water for some time, so that embryo can completes its germination period.

Light Requirement : The plants which seed germination requires light are known as Photoblastic seeds. Such as Lettuce, Capsella, Lepidium and Tobacco etc. Seeds in which germination not affected by light are called nonphotoblastic seeds. The dormancy of photoblastic seeds can be broken by the treatment of red light. The phytochrome red, absorbs red light and convert into phytochrome far red which increase the germination of seed.

Seed + R [red light]	$\rightarrow$	Germination
Seed + R + FR	$\rightarrow$	No germination
Seed + R + FR + R	$\rightarrow$	Germination
Seed + R + FR + R + FR	$\rightarrow$	No germination

Alternative Temperature : Seeds are trated with high and low temperature alternatively at high pressure to increase the germination of seed. e.g. The seed of Malilotus (Sweet clover) and Alfa-alfa are treated at 2000 atmospheric pressure and 18^{o}C temperature.

Viability : This is called existence of life in a seed. The viability of seed can be found out by 2, 3, 5, triphenyl tetrazolium chloride. The embryonal axis of living seed becomes pink in colour in the solution of T.T.C. Seed dormancy also broken by the treatment of Gibberellin.

BUD DORMANCY

REASONS OF BUD DORMANCY

The buds are of two types -

- Vegetative bud
- Floral bud

Before showing their respective growth, the bud of many plants undergoes a dormant phase.

Causes of Bud Dormancy :

According to Hemberg in woody plant, the bud dormancy is caused by Abscisic acid. The level of endogenous ABA increases with the onset of dormant period and decreases when it is broken. In non woody plant like Potato, the bud dormancy is again due to the presence of an inhibitor. Bannet Clark and Kefford (1953) identified this substance as Inhibitor-β. It present in the peel of dormant Potato tuber, which is actually ABA. The inhibitor-β is responsible for checking the sprouting of buds located in the 'eyes' of Potato tuber.

Perception of Dormancy by Buds -

According to Wareing. The bud dormancy, at least in woody plant, is caused by short day length, while it is broken by long day.

BREAKING OF BUD DORMANCY

Chilling : The bud dormancy of some plant can be broken, if they are given cold temperature treatment for specific duration. Alternating temperature treatment : The dormancy of buds of some plants can be broken, if they are subjected to low temperature (0º-10ºC) for a brief duration and then high treatment.

High temperature treatment : If dry Potato tubers are stored at 35ºC or moist at 20ºC, the dormancy of tubers buds is broken.

Chemicals : Some chemicals like 2-chloro ethanol, Gibberellin and Thiourea are capable of breaking of dormancy of buds. Of these 2-chloro ethanol is very effective in breaking the dormancy of Potato tuber's buds. Endogenous Gibberellin plays a very significant role in conrolling the dormancy of Potato tubers.

Gene De-represssion : The genome of the dormant potato bud lacks the ability of DNA dependent RNA synthesis. By treating the bud with Ethyl chlorohydrin or Gibberellin, the ability of RNA synthesis is achieved. Thus causing derepression of a repressed gene.

SPECIAL POINT

FLOWER IS A MODIFIED SHOOT

According by Goethe, Flower is modified shoot which shows favourable adaptation for reproduction through a special method. Flower has a small or long stalk like – structure called pedicel. Free end of the pedicel is flattaned or dome shaped is called thalamus. The thalamus is a type of modified stem, on which nodes and internodes are present. Nodes are present very close to each other and internodes are small highly reduced in the thalamus.

The whorls present in the flower are the modifications of leaves and arranged in four circles on the thalamus. The four nodes are present on the thalamus, in which first modified leaves are attached on the first lower node are called **calyx**. The **corolla** born on the second node. Androecium are present on the

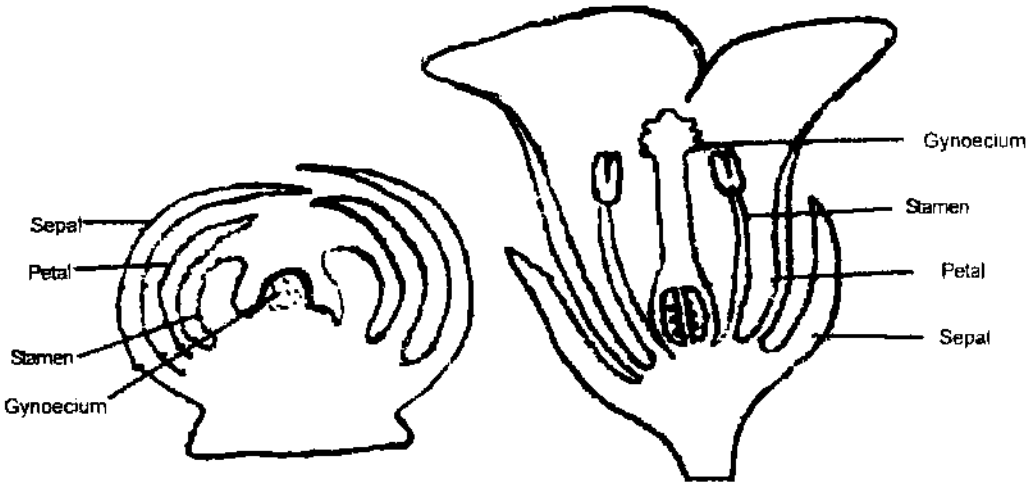
third node and gynoecium on the fourth node in uppermost position. In some of the plants the length of internode increases which is present in between Calyx and Corolla is called **Anthophore** e.g. *silene plant, Dianthus.* The length of internode between the corolla and androecium increases. It is called **androphore** e.g. *Passiflora.*

If the internode between androecium and gynoecium increases then it is called **gynophore** e.g. *androgynophore* e.g. *Gynandropsis pentaphylla* and *Cleome gynandra.* Clayx is also modified vegetative leaves. Such as in Mussaenda flower, one sepals of calyx modified into leaf like bright and attractive yellow colour structure called "**Advertising flag**". It helps in pollination. In some flowers, thalamus grows inside the ovary is called **carpophore** e.g. *Coriandrum* and *Foeniculum.* Nymphaea Petals like stamens are present. On the basis of above examples, we can prove "Flower is modified shoot".

Development of floral organs in *arabidopsis* :

Arabidopsis thaliana is a small weed belonging to family Brassicaceae. It contains approximately 26000 genes and the complete gene sequence has been studied by plant biologists. Like other plants in Arabidiopsis the initiation of flowering is influenced by various environmental factors, of these photoperiodism and temperature are more important. Under the influence of the two factors the apical meristem starts producing flowers instead of vegetative structure. The development of calyx, corolla, androecium and gynoecium is controlled by specific genes. These are called homeotic selector genes, example – *Apetala-2, Apetala-3, Agamous* etc. As a result of effect of these genes, the development of leaves is replaced by the development of flowers.

Similar to leaves, the floral organs developed by periclinal divisions in protodermal or subprotodermal cells. Initially these cells show periclinal divisions followed by periclinal as well as anticlinal divisions resulting in formation of an outgrowth. Cells of the outgrowth divide, develop and differentiate to form different floral organs. In Arabidopsis calyx are the first to develop followed by corolla, androecium and gynoecium. The order of development of floral whorls may vary from plant to plant. For example in members of family Umbelliferae the sequence of development of floral organs is – androecium, corolla, calyx and gynoecium.



Development of floral organs in *Arabidopsis*
(A) intial stage of development (B) fully developed flower

Difference between Male and Female gametophyte of *Arabidopsis thaliane*

S.No.	Male gametophyte	Female gametophyte
(i)	It is developed from microspore or pollen grain.	It is developed from megaspore.
(ii)	It does not remain embedded permanently in microsporangium	It remains embedded permanently in megasporangium
(iii)	Male gametes come out of pollen grain due to the formation of pollen tube	Female gamete always remains inside, covered by membrane of megasporangium
(iv)	There are two phases of growth-prepollination and post pollination	Only single phase of growth
(v)	It is there called structure in mature stage.	It has seven cells in mature stage.
(vi)	It will distintegrate after fertilization	Two new structure are formed after fertilization, that is endosperm and oospore.

Number of Chromosomes in different parts of *Arabidopsis thaliane* plant

S.No.	Sporophyte	
(i)	Zygote	2n
(ii)	Embryo	2n
(iii)	Endosperm	3n
(iv)	Radicle	2n
(v)	Plumule	2n
(vi)	Cotyledon	2n
(vii)	Nucellus	2n
(viii)	Integument	2n
(ix)	Microspore mother cell	2n
(x)	Megaspore mother cell	2n
(xi)	Ovary wall	2n
(xii)	Carpel	2n
(xiii)	Sepal, Petal	2n
(xiv)	Stamen	2n
(xv)	Leaf, Root, Stem	2n

Gametophyte of *Arabidopsis thaliane* :

S.No.	Parts of Plants	Number of Chromosome
(i)	Microspore	n
(ii)	Tube cell	n
(iii)	Male gamete	n
(iv)	Megaspore	n
(v)	Embryo sac	n
(vi)	Synergid	n
(vii)	Antipodals	n
(viii)	Egg cell	n
(ix)	Polar nuclei	n + n

Difference between Pollination and Fertilization in *Arabidopsis thaliane*

S.No.	Pollination	Fertilization
(i)	Transfer of pollen grains from anther to stigma of the flower is called pollination.	Fusion of male gametes and egg cell in embryo sac situated inside the ovule is called fertilization.
(ii)	This process take place before fertilization	This process take after pollination
(iii)	For the completion of this process, insects, water, air like agencies are essential	There is no any external medium is utilized in this process
(iv)	Pollen tube is not formed	Pollen tube is formed which transfer male gametes up to egg cell.
(v)	This process take place on outer parts of flower, so that it is external mechanism	This process take place inside the flower, so that it is internal mechanism

EXERCISE - 1

Q.1 **P**ollen tube exhibits -
(1) Basal growth (2) Apical growth
(3) Both the above (4) Intercalary growth

Q.2 Movement of pollen tube is -
(1) Tactic (2) Tropic
(3) Nastic (4) Autonomous

Q.3 Pollen tube is composed of -
(1) Pactin (2) Cutin
(3) Sporopollenin (4) Pecto-cellulose

Q.4 Polyembryony was first discovered by -
(1) Rosenberg (2) Hofmeister
(3) Leeuwenhoek (4) Guha

Q.5 Longest pollen tube is found in -
(1) Wheat (2) Maize
(3) Barley (4) Rice

Q.6 Tegmen of the seed develops from -
(1) Perisperm (2) Funiculcum
(3) Inner integument (4) Outer inergument

Q.7 Stigma of Anemophilous flower is -
(1) Rough (2) Smooth
(3) Sticky (4) None of above

Q.8 The most simple and most common type of embryosac discovered by -
(1) Nawaschin (2) Straburger
(3) Schleiden (4) Amici

Q.9 Endosperm is not formed in the members of -
(1) Compositae (2) Orchidaceae
(3) Cucurbitaceae (4) Malvaceae

Q.10 In **Casuarina**, pollen tube enters through -
(1) Intergument (2) Chalaza
(3) Micropyle (4) Funiculum

Q.11 'Callase' enzyme which dissolve callose of tetrad of microspores to separate 4 microspores is provided by -
(1) Pollen grains (2) Middle layer
(3) Tapetum (4) Endothecium

Q.12 The common type of embryo sac development is -
(1) Oenothera type (2) Polygonum type
(3) Allium type (4) Adoxa type

Q.13 Example of Epihydrophily is -
(1) **Zostera** (2) **Vallisneria**
(3) **Ceratophyllum** (4) **Nymphea**

Q.14 Pollination in **Yucca** plant takes place by -
(1) Honey bee (2) Butter fly
(3) Pronuba (4) Bird

Q.15 The primary Endosperm nucleus in **Polygonum** type of Embryosac is -
(1) Haploid (2) Diploid
(3) Triploid (4) Tetraploid

Q.16 Protandry is the situation when -
(1) Anther matures later than the stigma of flower
(2) Anther matures earlier than the stigma of flower
(3) Anther and stigma mature at the same time
(4) All of the above

Q.17 The anterior end of pollen tube burst by the process of _____ in embryosac -
(1) Imbibition (2) Exo-osmosis
(3) Enzymatic action (4) Endo-osomosis

Q.18 Which of the following nuclei participate in double fertilization -
(1) The egg
(2) The secondary nucleus
(3) The two male nuclei
(4) All of the above

Q.19 Perisperm is -
(1) Degenerate secondary nucleus
(2) Remnant of nucellus
(3) Peripheral part of endosperm
(4) Degenerate synergids

Q.20 The Parenchyma tussue which forms the bulk of ovule where the sporogenous tissue is produced is -
(1) Megaspore mother cell
(2) Nucellus
(3) Ovule
(4) Embryo sac

Q.21 The main embryo developed from the structure formed as a result of -

(1) Double fertilization

(2) Triple fusion

(3) Syngamy

(4) fusion of two polar nuclei of an embryosac

Q.22 After fertilization the outer integument of ovule change into -

(1) Testa (2) Tegmen

(3) Fruit (4) Seed

Q.23 In **Capsella** the pollen tube enters through the micropyle, therefore fertilization is -

(1) Porogamous (2) Chalazogamous

(3) Mesogamous (4) Basigamous

Q.24 The process of double fertilization was discovered by -

(1) Hofmeister (2) Strasburger

(3) Newaschin (4) Amici

Q.25 The chalazogamy was reported by **"Treub"** in-

(1) **Casuarina** (2) **Capsella**

(3) **Capsicum** (4) Datura

Q.26 After fertilization the seed is developed from -

(1) Ovule (2) Ovary

(3) Embryo (4) Endosperm

Q.27 The pollen tube was discovered by -

(1) Schleiden (2) Amici

(3) Hofmeister (4) Trueb

Q.28 Double fertilization means -

(1) Fusion of male gametes and ovum

(2) Fusion of two polar bodies

(3) A male gamete fused with egg and second male gamete fused secondary nucleus

(4) All the above

Q.29 After fertilization seed coat is formed by -

(1) Chalaza (2) Ovule

(3) Integument (4) Embryo sac

Q.30 Pollen tube enters into embryo sac of Angiosperm through the

(1) Egg cell

(2) Any one of the synergids

(3) Any one of the antipodal cells

(4) None of these

Q.31 Development of embryo from -

(1) Two polar nuclei of embryosac

(2) Secondary nucleus and male gamets

(3) Egg cell and male gamete

(4) Synergids

Q.32 Who discovered fertilization in plant

(1) Newaschin (2) Strasburger

(3) Amici (4) P. Maheshwari

Q.33 Fertilization & double fertilization occurs in -

(1) Ovary (2) Ovule

(3) Embryo sac (4) Nucellus

Q.34 The fusion product of polar nuclei and male gamet is -

(1) Nucellus

(2) Primary endosperm nucleus

(3) Zygote

(4) Secondary nucleus

Q.35 When a diploid $\underset{+}{\bigcirc}$ plant is crossed with a tetraploid $\circlearrowright$ plant, the endosperm will be -

(1) Diploid (2) Triploid

(3) Tetraploid (4) Pentaploid

Q.36 Stigma of the entomophilous flower is -

(1) Sticky (2) Rough

(3) Hairy (4) Smooth

Q.37 Bisporic type of embryo sac is found in -

(1) **Polygonum** (2) **Oenothera**

(3) **Adoxa** (4) **Allium**

Q.38 In which plant self sterility is found -

(1) **Gossypium** (2) **Pitunia**

(3) Marigold (4) Mangifera

Q.39 In pollination "Trap door mechanism" is found in -

(1) **Salvia** (2) **Aristolochia**

(3) **Ficus** (4) Yucca

Q.40 Male gametes of the **Capsella** fused with -
(1) Egg (2) Secondary nucleus
(3) Both of the above (4) None of above

Q.41 Synergids help in -
(1) Pollen entry into embryosac
(2) Endosperm formation
(3) Embryo sac nutrition
(4) Both 1 & 3

Q.42 Embryogeny in **Capsella** was first of all studied by-
(1) Hanstein (2) Famintzin
(3) Souges (4) All of the above

Q.43 The term xenia denotes the effect of pollen on the -
(1) Somatic tissue (2) Root
(3) Flowers (4) Endosperm

Q.44 In **Capsella** the endosperm is formed -
(1) At the time of fertilization
(2) Before fertilization
(3) After fertilization
(4) Before pollination

Q.45 The function of suspensor is -
(1) To provide water
(2) To provide oxygen
(3) To push the embryo towards endoperm to provide more food
(4) To suck food

Q.46 What are x-bodies in ovules -
(1) Two polar nuclei
(2) Disintegrating tube nucleus & synergids nucleus
(3) Filiform apparatus
(4) Two male nuclei

Q.47 Scutellum is a
(1) Endosperm of gymnosperm
(2) Sheild shaped cotyledon of monocot
(3) Protective covering of radicle
(4) Protective covering of plumule

Q.48 Coleoptile is -
(1) Coat of plumule (2) Coat of Radicle
(3) Plumule (4) None of these

Q.49 Water of coconut is -
(1) Endosperm (2) Nucellus
(3) Endocarp (4) Mesocarp

Q. 50 Suspensor is one celled in -
(1) **Capsella** (2) **Triticum**
(3) **Raphanus** (4) **Brassica**

Q.51 Embryonal development in **Capsella** is -
(1) Asteroid type (2) Caryophylloid type
(3) Crucifer type (4) Solanum type

Q.52 The suspensor in **Capsella** develops from
(1) Apical - cell (2) Basal-cell
(3) Micropylar- cell
(4) Apical & basal cell both

Q.53 In monocot plant endosperm is -
(1) Monoploid (2) Diploid
(3) Mixture of monoploid & diploids cells
(4) Triploid

Q.54 Mosaic endosperm is characteristic of -
(1) Wheat (2) **Plumbago**
(3) Maize (4) Coconut

Q.55 Tigellum is known as -
(1) Testa (2) Tegmen
(3) Both of the above
(4) Main axis of the embryo

Q.56 Chasmogamous and cleistogamous type of flower are found in -
(1) Primrose (2) Ficus religiosa
(3) Commelina (4) Calotropis

Q.57 Apex of radicle is formed with help of -
(1) Epibasal cells (2) Hypobasal cells
(3) Cotyledon (4) Hypophysis

Q.58 Embryo is formed in dicotyledon plants -
(1) Lateral (2) At the apex
(3) In middle (4) 2 & 3 both

Q.59 The last cell of suspensor is called -
(1) Hypophysis (2) Suspended cell
(3) Terminal cell (4) Haustorial cell

Q.60 Haploid, diploid and triploid conditions respectively can be traced in -
(1) Egg. Nucellus, Endosperm
(2) Antipodal, Egg, Endosperm
(3) Endosperm, Nucellus, Synergids
(4) Antipodal, Synergids & Integuments

Q.61 Formation of fruit without fertilization known as -

(1) Parthenogenesis (2) Polyembryony

(3) Polygamy (4) Parthenocarpy

Q.62 If the leaf of **Capsella** has 46 number of chromosomes then how many chromosomes number will be there in endosperm -

(1) 46 (2) 23

(3) 69 (4) 138

Q.63 If the nucellus cell of an Angiosperm contains 24 chromosomes the number of chromosomes present in pollen grain, endosperm & embryo will be -

(1) 24, 36, 24 (2) 12, 36, 24

(3) 12, 24, 360 (4) 24, 12, 12

Q.64 How many meiotic division are required to produce 40 seeds in the **Capsella** plant -

(1) 50 (2) 40

(3) 80 (4) 20

Q.65 The number of nuclei taking part in double fertilization are -

(1) two (2) three

(3) four (4) five

Q.66 In Angiosperm, if haploid number of chromosome is 12 then what will be the no of chromosomes in integuments and synergids -

(1) 12, 12 (2) 24, 12

(3) 24, 24 (4) 12, 24

Q.67 How many meiotic divisions are required for the formation of 200 seeds of **Capsella** -

(1) 200 (2) 400

(3) 250 (4) 300

Q.68 In Angiosperm, if number of chromosomes in endosperm is 30, what will be the no. of chromosomes in nucellus -

(1) 15 (2) 30

(3) 20 (4) 40

Q.69 How many meiotic divisions are essential formation of 100 seeds in Cyperaceae family -

(1) 100 (2) 125

(3) 150 (4) 200

Q.70 How many meiotic divisions are necessary for formation of 100 functional megaspores -

(1) 25 (2) 50

(3) 100 (4) 200

Q.71 What type of germination is found in **Capsella**-

(1) Hypogeal (2) Epigeal

(3) Both (4) None

Q.72 In albuminous seed, the food is stored in -

(1) Testa (2) Plumule

(3) Cotyledon (4) Endosperm

Q.73 Seed is not a morphological equivalent of spore because -

(1) Spore is not produced through fertilization

(2) Spore does not posses embryo & endosperm

(3) Spore is a haploid structure

(4) All the above

Q.74 In non endospermic seed or ex-albuminous seed -

(1) The endosperm may be completely used up by developing embryo

(2) No endosperm form

(3) Endosperm is starchy

(4) Endosperm is oily

Q.75 Helobial endosperm is restricted usually to -

(1) Gymnosperm (2) Dicotyledons

(3) Monocotyledons (4) Both 2 & 3

Q.76 "Ruminate endosperm" is commonly found in seed of -

(1) Euphorbiaceae

(2) Cruciferae

(3) Palmae or Arecaceae

(4) Compositae

Q.77 The seeds of which type of plant have no dormancy

(1) Xerophytes

(2) Mesophytes

(3) Halophytes and hydrophyte

(4) Mangrooves

Q.78 What is the cause of long-dormancy in seeds-
(1) Impermiable seed coat
(2) Undeveloped embryo
(3) Presence of ABA/Ferulic acid
(4) All of the above

Q.79 Seeds of Water melon are embeddend in water pulp of the fruit but do not germinate because -
(1) Light is absent
(2) O_2 is absent
(3) ABA is present
(4) Nutrients are absent

Q.80 Low temperature induction of germination is called
(1) Vernalization (2) Stratification
(3) Scarification (4) Chilling

Q.81 What is the cause of dormancy in Tomato seeds -
(1) Hard seed coat
(2) Presence of ferulic acid
(3) Undeveloped embryo
(4) All the above

Q.82 The first requirement for germination of seed is-
(1) Light (2) H_2O
(3) Low temperature (4) Mineral salts

Q.83 Which light is more effective in inducing germination of seeds -
(1) Red (2) Blue
(3) Green (4) Infra red

Q.84 Mechanical cracking of hard seed coat can induce germination of certain seeds this phenomenon is termed as -
(1) Cracking (2) Stratification
(3) Scarification (4) Chilling

Q.85 During seed germination -
(1) Heat is liberated
(2) Starch is synthesized
(3) Light is absorbed
(4) Fat is synthesized

Q.86 What type of pattern of endosperm, development in **Capsella** -
(1) Cellular type (2) Nuclear type
(3) Helobial type (4) None of the above

Q.87 Cotyledons absent in seed of -
(1) **Capsella** (2) **Cuscuta**
(3) **Santalum** (4) 2 and 3 both

Q.88 The dormancy in seeds is naturally induced by-
(1) IAA (2) A.B.A.
(3) ATP (4) N.A.D.P

Q.89 Which hormone can break dormancy of seed -
(1) ABA (2) Auxin
(3) GA (4) Coumarin

Q.90 The seed of black pepper is -
(1) Albuminous (2) Exalbuminous
(3) Perispermic (4) With fleshy testa

Q.91 The seed of **Capsella** is -
(1) Albuminous monocot
(2) Ex albuminous dicot
(3) Albuminous dicot
(4) Ex albuminous monocot

Q.92 The most common natural inhibitor of seed germination is -
(1) Ferulic acid (2) Abscisic acid
(3) Citric acid (4) Phytochrome

Q.93 Which of the following is not essential for the germination of most of seeds -
(1) Light (2) Temperature
(3) O_2 (4) H_2O

Q.94 In which of the following plants cotyledons remains under ground during germination -
(1) **Rhizophora** (2) Gram
(3) Bean (4) Castor

Q.95 In which part of the Embryo maximum growth take place in eqigeal germination -
(1) Redicle (2) Plumule
(3) Epicotyl (4) Hypocotyl

Q.96 The chemical which can break bud dormancy by its spray -
(1) IAA (2) 2,4-D
(3) Zeatin (4) Thiourea

Q.97 Seeds of Gram are -
(1) Exalbuminous and epigeal
(2) Exalbuminous and hypogeal
(3) Albuminous and eqigeal
(4) Albuminous and hypogeal

Q.98 In which part of embryo maximum growth take place in hypogeal germination -

(1) Plumule (2) Radicle

(3) Epicotyl (4) Hypocotyl

Q.99 Which of the following is negative photoblastic seed -

(1) **Lepidium** (2) **Nigella**

(3) Tobacco (4) **Capsella**

Q.100 A which temperature, germination of seed can not possible in most of the plants -

(1) 10° – 15°C (2) 5° – 10°C

(3) 0°– 5°C (4) 20° – 25°C

Q.101 The bud dormancy in Potato is due to -

(1) ABA (2) Ethylene

(3) IAA (4) Phenolics

Q.102 Important "Aeroallergens in India is -

(1) **Serjania** (2) **Amaranthus**

(3) **Borassus** (4) **Holoptelia**

Q.103 Fore most Indian Embryologist is -

(1) S.C. Meheshwari (2) P. Maheshwari

(3) H.Y. Mohan Ram (4) None of above

Q.104 In seeds, characterised by hypogeal germination, cotyledons generally do not becomes green because-

(1) They lack chloroplast

(2) They developed very early

(3) Contains inhibitor

(4) They remains below the soil

Q.105 Which statement is false -

(1) Pollens are received by stigma

(2) Pollen tube discovered by Amici

(3)Pollen kitt is absent on pollen grains of **Capsella**

(4) Tigellum is the main axis of embryo

ANSWER KEY

Exercise – 1

Ques.	**1**	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**	**10**	**11**	**12**	**13**	**14**	**15**	**16**	**17**	**18**	**19**	**20**
Ans.	2	2	4	3	2	3	3	2	2	2	3	2	2	3	3	2	4	4	2	2
Ques.	**21**	**22**	**23**	**24**	**25**	**26**	**27**	**28**	**29**	**30**	**31**	**32**	**33**	**34**	**35**	**36**	**37**	**38**	**39**	**40**
Ans.	3	1	1	3	1	1	2	3	3	2	3	2	3	2	3	2	4	2	3	3
Ques.	**41**	**42**	**43**	**44**	**45**	**46**	**47**	**48**	**49**	**50**	**51**	**52**	**53**	**54**	**55**	**56**	**57**	**58**	**59**	**60**
Ans.	4	1	4	3	3	2	2	1	1	2	3	2	4	3	4	3	4	4	4	1
Ques.	**61**	**62**	**63**	**64**	**65**	**66**	**67**	**68**	**69**	**70**	**71**	**72**	**73**	**74**	**75**	**76**	**77**	**78**	**79**	**80**
Ans.	4	3	2	1	4	2	3	3	4	3	2	4	4	1	3	3	4	4	3	2
Ques.	**81**	**82**	**83**	**84**	**85**	**86**	**87**	**88**	**89**	**90**	**91**	**92**	**93**	**94**	**95**	**96**	**97**	**98**	**99**	**100**
Ans.	2	2	1	3	1	2	4	2	3	3	2	2	1	2	4	4	2	3	2	3
Ques.	**101**	**102**	**103**	**104**	**105**															
Ans.	1	2	2	4	3															

EXERCISE - 2

Q.1 Anthophore structure is formed by :
(1) Internode (2) Node
(3) Sepals (4) Petals

Q.2 When embryo develops from a haploid cell of embryosac, other than egg cell the process is known as -
(1) Apogamy (2) Apospory
(3) Adventive embryony
(4) Diplo spory

Q.3 Which of the following statement is correct -
(1) Flower is a modified root
(2) Flower is a modified shoot
(3) Flower is a modified leaf
(4) Flower is a modified infloresence

Q.4 Androgenic haploid plants are produced from
(1) Pollen grains (2) Connective tissues
(3) Tapetum (4) Wall of the Anther

Q.5 Apomixis was discovered by -
(1) Leeuwenhoek (2) Winkler
(3) Juel & murbeck
(4) Navaschin & guignard

Q.6 In which Era angiosperms originated -
(1) Coenozoic (2) Jurassic
(3) Mesozoic (4) Holozoic

Q.7 Which of the following is monocarpic plant -
(1) Shisham (2) Mango
(3) Pinus (4) Bamboo

Q.8 Anthophore is
(1) Receptacle between two carpels
(2) Internode between Androecium and Gynoecium
(3) Internode between calyx and corolla
(4) None of these

Q.9 Which is the most logical sequence with reference to the life cycle of angiosperm
(1) Germination, endosperm formation, seed dispersal, double fertilization.
(2) Cleavage, fertilization, grafting, fruit formation
(3) Pollination fertilization, seed formation & germination
(4) Maturation, mitosis, differentiation

Q.10 After culturing the anther of a plants few diploid plant were got along with haploid plant. Which of the following part might have given rise to diploid plant
(1) Vegetative cell of pollen
(2) Exine of pollen wall
(3) Cells of anther wall
(4) Generative cell of pollen

Q.11 **Capsella** is angiosperm because it possess-
(1) Seed (2) Pollen grain
(3) Vascular tissue (4) Fruit

Q.12 Anther of **Arceuthobium** plant is -
(1) Tetra sporangiate (2) Bisporangiate
(3) Monosprangiate (4) (1) and (2) both

Q.13 Which part of the reproductive structure produces both enzymes & hormones -
(1) Archesporium (2) middle layer
(3) Tapetum (4) Endo thecium

Q.14 Ubisch bodies are produced in -
(1) embryosac (2) Endothecium
(3) Pollen grain (4) Tapetum

Q.15 The mature male gametophyte in angiosperm is represented by -
(1) Pollen grain
(2) Germinating pollen grain
(3) Embryo sac
(4) Anther

Q.16 Which structure of pollen grain protect it from ultra violet rays
(1) Sporopollenin (2) Pollen kitt
(3) Ubisch body (4) 1 & 2 both

Q.17 Tapetum is -
(1) Parietal in origin usually the inner most layer of anther wall
(2) Modified endothecium of anther wall
(3) Outer most layer of sporogenous tissue modification
(4) Parietal in origin and is the inner most layer of ovule wall

Q.18 Division taking place in tapetum cell is -
(1) Meiosis (2) Amitosis
(3) Endomitosis (4) Only mitosis

Q.19 in Capsella pollen grains are shed at
(1) One celled stage (2) Three cell stage
(3) Three nuclei stage (4) Two celled stage

Q.20 Example of polyploid tissue present in an angiosperm plant is -
(1) Perisperm (2) Embryo
(3) Tapetum (4) Placenta

Q.21 A microspore is a first cell of -
(1) Female gametophyte
(2) Male gametophyte
(3) Sporophyte (4) Anther

Q.22 Pollen grains of some plants cause -
(1) Pneumonia (2) Typhoid
(3) Allergy (4) None of these

Q.23 Anther is generally composed of
(1) One sporangium (2) Two sporangium
(3) Three sporangium (4) Four sporangium

Q.24 Anther of **Capsella** is equivalent to which structure of fern plant -
(1) Sporangia (2) Sorus
(3) Antheridia (4) Male gametangia

Q.25 Occurrence of more than four spores from Spore mother cells is called -
(1) Polysiphony (2) Polyspermae
(3) Polyspory (4) Polyembryony

Q.26 How many cells or nuclei are present in male gametophyte of **Capsella**
(1) One (2) Two
(3) Three (4) Many

Q.27 How many and what type of male gametes are produced by the male gametophyte of **Capsella**-
(1) One,. multi cilliated
(2) two, biciliated
(3) two, multi ciliated (4) Two, non motile

Q.28 The particular type of fossils of pollen grains present in area may be helpful in the exploration of -
(1) Coal (2) Petroleum
(3) Fossil plants (4) All the above

Q.29 Ubisch bodies are associated with the development of -
(1) Embryo (2) Pollen grains
(3) Endosperm (4) Embryo sac

Q.30 In a pollen grain the small nucleus is -
(1) Generative nucleus (2) Tube nucleus
(3) Vegetative nucleus (4) Pollen nucleus

Q.31 Most reduced size gametophyte is of -
(1) Bryophytes (2) Pteridophyte
(3) Gymnosperm (4) Angiosperm

Q.32 Pollen grain of **Capsella** -
(1) Monocolpate (2) Bicolpate
(3) Tricolpate (4) Polycolpate

Q.33 Essential whorls of a flowers-
(1) Calyx and Corolla
(2) Corolla and Gynoecium
(3) Androecium and Gynoecium
(4) All the above

Q.34 Filiform pollen grains are found in -
(1) **Calotropis** (2) **Myosotis**
(3) **Cyperus** (4) **Zostera**

Q.35 Which statement is false -
(1) Unisexuality of flower induces cross pollination
(2) Androgenic plants are developed by Guha & Meheshwari
(3) Morphological barriers are absent in Gloriosa flower
(4) All

Q.36 Isobilateral tetrad is common in-
(1) Monocots (2) Dicots
(3) Halophia (4) None of these

Q.37 Which type of tetrad is found in **Magnolia** plant -
(1) Isobilateral (2) T-shaped
(3) Linear (4) Decussate

Q.38 Sporopollenin is found in -
(1) Exine (2) Intine
(3) Cytoplasm (4) Nucleus

Q.39 Microsporophyll of Angiosperms is known as -
(1) Androecium (2) Anther
(3) Filament (4) Stamen

Q.40 Main function of endothecium (in anther) is -
(1) Mechanical (2) Nutritive
(3) Dehiscence (4) None of above

Q.41 Which of the following is wrong statement -
(1) Monothecous anthers are found in Malvaceae family
(2) Middle layer is ephemeral
(3) Amoeboid tapetum releases ubisch bodies
(4) Banana is a monocarpic plant

Q.42 Development of male gametophyte is -
(1) Invivo (2) Insitu
(3) Both (4) None of the above

Q.43 Pollen grains preserved for long time because of -
(1) Cellulose (2) Carotenoids
(3) Ubisch bodies (4) Sporopollenin

Q.44 Endothecium, middle layer and tapetum in anther are derived from -
(1) Primary sporogenous layer
(2) Primary parital layer
(3) Both
(4) None of the above

Q.45 Which one is female gametophte -
(1) Embryo (2) Embryosac
(3) Endosperm (4) Pistil

Q.46 What type placentation is found in **Capsella**-
(1) Axile (2) Parietal
(3) Marginal (4) None

Q.47 The ovule of **Capsella** derives it's nutrition from-
(1) Sporogenous (2) Tapetum
(3) Epithecium (4) Placenta

Q.48 A polygonum type of embryosac is -
(1) 7-celled and 8 nucleate
(2) 8-celled and 7-nucleate
(3) 7-celled and 7-nucleate
(4) 8-celled and 8-nucleate

Q.49 What type of ovule found in Capsella
(1) Anatropous (2) Orthotropous
(3) Circinotropus (4) Campylotropous

Q.50 The functional megaspore in **Capsella** is always -
(1) Micropylar (2) Chalazal
(3) All (4) Any

Q.51 Crassinucellate ovule shows -
(1) Absence of nucellus
(2) Well developed nucellus
(3) Partially developed nucellus
(4) Modified nucellus

Q.52 Ovule in angiosperm is technically equivalent to-
(1) A megasporangium
(2) A megasgametangium
(3) A micro spore
(4) A mega spore

Q.53 Proliferation of integumentary cells at the micropylar region of the ovule in castor develops -
(1) Aril (2) Funicle
(3) Caruncle (4) Apophysis

Q.54 Caruncle is formed by -
(1) Peduncle (2) Cotyledons
(3) Integument (4) Perisperm

Q.55 Obturators which help in fertilization are out growth of -
(1) Pollen tube
(2) Stigma
(3) Placenta or funiculus
(4) Pollen grains

Q.56 Just before fertilization the diploid structure in the ovule of **Capsella** is -
(1) Pollen tube
(2) Nucellus/Sec.nucleus
(3) Synergids (4) Antipodals

Q.57 Fillform apparatus are found in -
(1) Antipodal cell (2) Egg cell
(3) Secondary nucleus (4) Synergids

Q.58 Which type of gametes are present in **Capsella**-
(1) Flagellated (2) Motile
(3) Non-motile (4) None of these

Q.59 Perisperm is -
(1) Persistant nucellus in seed
(2) Ovule wall
(3) Ovule coat
(4) Fossil of haustoria

Q.60 Free nuclear division in an angiosperm takes place during -
(1) Gamete formation
(2) Endosperm formation
(3) Embryo formation
(4) Flower formation

Q.61 Archesporial cells in **Capsella** do not form -
(1) Epidermis
(2) Endothecium
(3) Tapetum
(4) Micro spore mother cell

Q.62 Rephe and hilum in seed represent -
(1) Nucellus (2) Funiculus
(3) Integument (4) Micropyle

Q.63 Micropyle in seed helps in the entry of -
(1) Male gamete (2) Pollen tube
(3) Water & air (4) All

Q.64 Anther of the **Moringa** plant is -
(1) Tetrasporangiate
(2) Monosporangiate
(3) Bisporangiate
(4) Above (1) & (2) both

Q.65 The plant in which G.B. Amici discovered pollen tube is -
(1) **Capsella** (2) **Parthenium**
(3) **Portulaca** (4) None of above

Q.66 Megasporophyll is called -
(1) Gynoecium (2) Carpel
(3) Ovary (4) Stigma

Q.67 How many pollen sacs are present in a mature anther
(1) 4 (2) 1
(3) 3 (4) 2

Q.68 The ovule in which single layer nucellar tissue is present is known as -
(1) Crassinucellate (2) Tenuincellate
(3) Amphinucellate (4) Circinotropous

Q.69 The structure which is formed on micropyle by elongation of inner integument known as -
(1) Sarcotesta (2) Operculum
(3) Caruncle (4) Aril

Q.70 In which family, endothelium is formed by integuments -
(1) Malvaceae (2) Compositae
(3) Podostemaceae (4) Crucifereae

Q.71 When outer integument becomes fleshy then known as -
(1) Aril (2) Sarcotesta
(3) Operculum (4) Caruncel

Q.72 By which structure, funiculum is attached with ovule -
(1) Funiculum (2) Raphe
(3) Hilum (4) Placenta

Q.73 Resupinate type of ovule are-
(1) Straight (2) Inverted
(3) Transverse (4) Coiled

Q.74 The barrier which is present towards the micropyle is known as -
(1) Epistase (2) Hypostase
(3) Both of the above (4) None of above

Q.75 Horizontally oriented ovule in Angiosperm is called -
(1) Amphitropous (2) Hemitropous
(3) Campylotropous (4) Circinotropous

Q.76 The structure is formed by integument which helps in germination is called -
(1) Aril (2) Sarcotesta
(3) Caruncle (4) Operculum

Q.77 In anatropous ovule, the micropyle is present -
(1) In straight line with funiculum
(2) At right angles with funiculum
(3) At 45° with funiculum
(4) Side by side with funiculum

Q.78 In ovule a barrier is present towards the chalaza out side the embryo sac is called -
(1) Nuclellar beak (2) Epistase
(3) Hypostase (4) Perisperm

Q.79 Which structure of the ovule remains unchanged in the end -
(1) Embryosac (2) Integuments
(3) Funiculum (4) Micropyle

Q.80 The special features of the endothecium of anther of **Capsella** -
(1) Radially elongated
(2) Thickening of cellulose
(3) Hygroscopic (4) All of the above

Q.81 The type of cells under going meiosis in the flowers are -
(1) Microspore mother cell & megaspore mother cell
(2) Ovule & stamen
(3) Tapetal cells
(4) Placental cell

Q.82 Which of the following types of embryo sac is mostly found in Angiosperm-
(1) Bisporic polygonum type
(2) Tetra sporic type
(3) Monospric –onagrad type
(4) Monosporic-polygonum type

Q.83 In many plants, the sexual reproduction replaced by asexual reproduction it is called -
(1) Semigamy (2) Apospory
(3) Apomixis (4) Amphimixis

Q.84 "Endostome" and "Exostome" are part of -
(1) Nucellus (2) Chalaza
(3) Pollen wall (4) Micropyle

Q.85 Pseudo embryo sac is derived from -
(1) Nucellus (2) Integument
(3) Placenta (4) Funiculus

Q.86 Endothelium is derived from -
(1) Integument (2) Placenta
(3) Nucellus (4) Funiculus

Q.87 Which type embryo sac is found in **Plumbago** plant -
(1) Monosporic (2) Bisporic
(3) Tetrasporic (4) None of above

Q.88 Age of the angiosperms known as -
(1) Mesozoic Era (2) Holozoic Era
(3) Coenozoic Era (4) Archaeozoic Era

Q.89 Female gametophyte like pollens are found in -
(1) **Sorgham** (2) **Hyacinthus**
(3) **Vinca** (4) None of these

Q.90 Which type of growth is found in pollen tube -
(1) Leteral growth (2) Apical growth
(3) Middle growth (4) No growth

Q.91 Monosporic eight nucleated embryo sac reffered as -
(1) Peperomia type (2) Allium type
(3) Polygonum type (4) Oenothera type

Q.92 When funiculum, chalaza, and micropyle lie in one straight line then ovule is called -
(1) Amphitropous (2) Orthotropous
(3) Campylotropous (4) Anatropous

Q.93 Chasmogamy refers to the condition where -
(1) Flower remains closed
(2) Flowers absent
(3) Flowers open
(4) Flowers gamopetalous

Q.94 When pollen grains of flower are transferred to stigma of another flower on a different plant, the process is called -
(1) Geitonogamy (2) Xenogamy
(3) Autogamy (4) Homogamy

Q.95 When anther and stigma mature at the same time is called as -
(1) Dichogamy (2) Allogamy
(3) Xenogamy (4) Homogamy

Q.96 Self-pollination means -
(1) Transfer of pollen from anthers to stigma in the same flowers
(2) Transfer of pollen from one flowers to another flower on the different plant
(3) Occurence of male and female sex organ in the same flowers
(4) Germination of pollen

Q.97 "Lever mechanism" or "turn pipe mechanism" for pollination is characterstic feature of -
(1) Antirrhinum (2) Ocimum
(3) Salvia (4) Ficus

Q.98 Maize is best example of -
(1) Anemophilous (2) Ornithophilous
(3) Entomophilous (4) Hydrophilous

Q.99 Translator apparatus is found in -
(1) Mustard (2) Pea
(3) Calotropis (4) Mango

Q.100 Which type of pollination occurs in **Capsella** -
(1) Stigmatic (2) Micropylar
(3) Nucellar (4) None

Q.101 Insect pollinated flowers usually posssess-
(1) Brightly coloured pollens in large quantity
(2) Dry pollens with smooth suface
(3) Sticky pollen and rough surface stigma
(4) Light coloured scented pollen covered with nectar

Q.102 A close relation between a flower and a pollinating agent is best exemplified by -
(1) Cocos (2) Salvia
(3) Yucca (4) Avena

Q.103 Polysiphonous pollen grains occurs in -
(1) Malvaceae (2) Cucurbitaceae
(3) Both (4) None of these

Q.104 Pollen tube was discovered by -
(1) Strasburger (2) Hofmeister
(3) Amici (4) Winkler

Q.105 Which of the following promote pollen germination and tube growth -
(1) Sucrose (2) Boron
(3) Calcium (4) Potassium

ANSWER KEY

Exercise – 2

Ques.	**1**	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**	**10**	**11**	**12**	**13**	**14**	**15**	**16**	**17**	**18**	**19**	**20**

Ans.	3	3	3	3	2															

EXERCISE-3 PREVIOUS YEAR'S QUESTIONS

Q.1 Orthotropus ovule belongs to – **[Uttarachal PMT 2004]**

(1) Capsella (2) Polygonum

(3) Ranuculus (4) All of these

Q.2 In a flowering plant, megaspore develops into an embryo sac, which contains - **[Uttarachal PMT 2004]**

(1) 4 cell, one of which is an egg cell

(2) 6 cells, one of which is an egg cell

(3) 8 cells, one of which is an egg cell

(4) 7 cells, one of which is an egg cell

Q.3 The adaptation of pollination found in **Calotropis** is- **[Uttarachal PMT 2004]**

(1) Dicliny (2) Pollinia

(3) Heterostyly (4) Dichogamy

Q.4 Apogamy is - **[Uttarachal PMT 2004]**

(1) Reproduction of virus

(2) Failure of fusion of gametes

(3) Development of bacteria

(4) All of the above

Q.5 When vegetative cells of sporophyte form an embryo it is called - **[Uttarachal PMT 2004]**

(1) Apospory

(2) Apogamy

(3) Apomixis

(4) Adventive embryony

Q.6 When seed germinates, while the fruit is attached to parent plant, it is called – **[Uttarachal PMT 2005, C.G. 2006]**

(1) Apomixis (2) Vivipary

(3) Parthenocarpy (4) Parthenogenesis

Q.7 Pollinia are present in family - **[Uttarachal PMT 2005]**

(1) Brassicaceae (2) Cucurbitaceae

(3) Asclepiadaceae (4) Malvaceae

Q.8 Nuclear endosperm is present in - **[Uttarachal PMT 2005]**

(1) Banana (2) Coconut

(3) Phoenix (4) Mango

Q.9 Development of embryo from a cell of embryo sac other than egg is an example of – **[Uttarachal PMT 2006]**

(1) Apospory

(2) Apogamy

(3) Adventive embryony

(4) Parthenogenesis

Q.10 Seed coat is derived from - **[Jharkhand 2003]**

(1) Pericarp

(2) Epicarp

(3) Integuments of ovule

(4) Nucellus

Q.11 What is pollen grain - **[Jharkhand 2003]**

(1) Microspore mother cell

(2) Male gamete

(3) Male gametophyte

(4) Partially developed embryo

Q.12 Entry of pollen tube through micropyle is – **[Jharkhand 2004]**

(1) Porogamy (2) Mesogamy

(3) Psemigamy (4) Chalazogamy

Q.13 Micropyle halps in - **[Jharkhand 2003]**

(1) Germination of pollen grain

(2) Growth of pollen tube

(3) Coming out of pollen tube from pollen grain

(4) Allowing entry of pollen tube

Q.14 Ovule with helium lying close to micropyle is known as - **[Jharkhand 2005]**

(1) Anatropous (2) Circinotropous

(3) Atropous (4) All of the above

Q.15 Syngamy is the process in which – **[Jharkhand 2005]**

(1) Male gamete fuses with female gemete

(2) Pollen tube enters into the ovule through chalaza

(3) Pollen tube enter into the ovule through micropyle

(4) Generative cell and tube cell fuse

Q.16 In embryo sac, n 2n, 3n conditions are found respectively in - **[Jharkhand 2006]**

(1) Egg, antipodal, endosperm

(2) Nucellus, endosperm, egg

(3) Antipodal, zygote endosperm

(4) Endosperm, nucellus, egg

Q.17 In angiosperms, endosperm is formed by – **[UP CPMT 2001]**

(1) Division of fused polar nuceli

(2) Free nuclear division of megaspore

(3) Division of fused synergids and male gamete

(4) Division of fused polar nuclei and male gamete

Q.18 Endosperm of angiospermic plant is – **[UP CPMT 2002]**

(1) Triploid (2) Diploid

(3) Haploid (4) Tetraploid

Q.19 Rarely among angiosperms the pollen grains influences the endosperm. This is called as – **[UP CPMT 2004]**

(1) Metaxenia

(2) Nemec phenomenon

(3) Xenia

(4) Mesogamy

Q.20 Pollination in which pollen grains of one flower are transferred to the stigma of another flower of the same plant is called – **[UP CPMT 2005]**

(1) Xenogamy (2) Autogamy

(3) Geitonogamy (4) Allogamy

Q.21 Aleurone layer is part of - **[UP CPMT 2005]**

(1) Endosperm (2) Embryo

(3) Tegmen (4) Tests

Q.22 Function of embryonal suspensor in angiosperms is to - **[UP CPMT 2005]**

(1) Serve as channel for H_2O

(2) Push embryo deeper into endosperm

(3) Release growth hormones

(4) Transfer nutrients from parent sporophyte to young embryo

Q.23 Microsporophyll contains - **[UP CPMT 2006]**

(1) Pollen tube (2) Pollen grain

(3) Nucellus (4) All of these

Q.24 Mesogamy is - **[UP CPMT 2007]**

(1) Fusion of male and female gametes

(2) Fusion of physiologivally similar and different gametes

(3) Entry of pollen tube through integuments

(4) None of the above

Q.25 Nucellus forms which of the following part of fruit - **[UP CPMT 2007]**

(1) Seed coat (2) Perisperm

(3) Seed (4) Raphe

Q.26 If root of a flowering plant has 24 chromosomes. then its gamete has how many chromosomes – **[UP CPMT 2007]**

(1) 24 (2) 12

(3) 4 (4) 8

Q.27 Raphe is - **[UP CPMT 2007]**

(1) Part of flower

(2) Funicle attached to ovule

(3) Ridge fromed by funiculus

(4) Part of nucellus

Q.28 Caruncle is formed by - **[CG CPMT 2004]**

(1) Peduncle (2) Cotyledons

(3) Integument (4) None of the above

Q.29 Perisperm is - **[CG CPMT 2004]**

(1) Outer part of endosperm

(2) Destroyed synergids

(3) Destroyed secondary nucleus

(4) Remains of nucellus

Q.30 In Pea, the ovule is - **[CG CPMT 2004]**

(1) Hemianatropous (2) Amphitropous

(3) Anatropous (4) Campylotropous

Q.31 A bisexual flower which never opens in life is known as - **[CG CPMT 2005]**

(1) Homogamous (2) Heterogamous

(3) Anatropous (4) Cleistogamous

Q.32 If testa is removed from water soaked gram seed the reaming structure is – **[CG CPMT 2005]**

(1) Full mature embryo with cotyledons

(2) Cotyledons with endosperm and pericarp

(3) Cotyledons filled with starch

(4) None of the above

Q.33 Double fertilization means fusion of - **[CG CPMT 2005]**

(1) One of the polar nuclei fused with the synergids and one male gamete with egg cell

(2) Fusion of one of the male gemetes with polar nuclei and other with antipodal cells

(3) Fusion of one of the male gametes with secondary nucleus and the other male gamete with egg cell

(4) Fusion of one antipodal cell with egg cell and synergid cell with other antipodal cell

Q.34 Doubel fertilization was first discovered by Nawaschin in - **[CG CPMT 2005]**

(1) Lilium and Feritillaria

(2) Mango and Sugarcane

(3) Papaya and Pea

(4) Brassica and candytuft

Q.35 Embryo sac of an Angiospermic plant is – **[Bihar 2001]**

(1) Male gametophyte

(2) Female gametophyte

(3) Male sporophyte

(4) Either female sporophyte

Q.36 Pollination by wind is called - **[Bihar 2004]**

(1) Anemophily (2) Hydrophily

(3) Zoophily (4) Entomophily

Q.37 Development of embryo from egg without fertilization is called - **[Bihar 2004]**

(1) Parthenogenesis (2) Pathenocarpy

(3) Apospory (4) Apomixis

Q.38 Pollen tube enters into ovule through micropyle is called - **[Bihar 2004]**

(1) Porogamy (2) Chalazogamy

(3) Mesogamy (4) None of these

Q.39 Which of the following is not true for double fertilization - **[Bihar 2005]**

(1) Discovered by Newaschin

(2) Male gamete and secondary nucleus fused to form endosperm nucelus

(3) Endosperm nucleus is diploid

(4) Endosperm provides nutrition to embryo

Q.40 In the anther wall- **[Bihar 2006]**

(1) Tapeum lies between endothecium and middle layers

(2) Tapetum lied just inner to endothecium

(3) Middle layer lies between endothecium and tapetum

(4) Endothecium lies just inner to middle layer

Q.41 Aleurone grains are rich in - **[Bihar 2006]**

(1) Fat (2) Protein

(3) Carbohydrates (4) Auxins

Q.42 Meiosis can be observed in - **[Bihar 2006]**

(1) Tapetal cells (2) Megaspores

(3) Micropores (4) Spore mother cells

Q.43 Mark the correct sequence - **[Bihar 2006]**

(1) Anthesis→Meiosis→Pollination→ Syngamy

(2) Pollination→Meiosis→anthesis→Syngamy

(3) Anthesis→Pollination→Meiosis→Syngamy

(4) Meiosis→Anthesis→Pollination→Syngamy

Q.44 Through which route the pollen tube enters the ovule - **[MP PMT 2001]**

(1) Chalaza (2) Micropyle

(3) Funiculus (4) Any of these

Q.45 The point of attachment of ovule to the funicle is known as - **[MP PMT 2001]**

(1) Raphe (2) Chalaza

(3) Micropyle (4) Hilum

Q.46 In Angiosperms the endosperm is – **[MP PMT 2001]**

(1) Diploid (2) Triploid

(3) Haploid (4) Polyploid

Q.47 The endosperm in angiosperms developd from-

(1) Micropylar polar nucleus **[MP PMT 2002]**

(2) Chalazal polar nucleus

(3) Secondary nucleus

(4) Zygote

Q.48 The formation of embryo without fusion of gametes is termed as - **[MP PMT 2003]**

(1) Apospory (2) Isogamy

(3) Apogamy (4) Syngamy

Q.49 In angiosperms embryo sac is developed from -

(1) Megaspore **[MP PMT 2003]**

(2) Secondary nucleus

(3) Endothecium

(4) Microspore mother cell

Q.50 Doubel fertilization was discovered by – **[MP PMT 2003]**

(1) S.G. Nawaschin (2) Strasburger

(3) Robert Brown (4) Purkinje

Q.51 The part of Gynoecium which recives the pollen is called - **[MP PMT 2004]**

(1) Stigma (2) Style

(3) Ovule (4) Ovary

Q.52 Bisexual flowers which never open, demonstrated by - **[MP PMT 2004]**

(1) Autogamy (2) Allogamy

(3) Cleistogamy (4) None of these

Q.53 Double fertilization is characteristic only in – **[MP PMT 2004]**

(1) Bryophytes (2) Angiosperms

(3) Cleistogamy (4) Pteridophytes

Q.54 When pollen tube enters by integument then the process is known as - **[MP PMT 2004]**

(1) Mesogamy (2) Porogamy

(3) Chalazogamy (4) Pseudogamy

Q.55 In which of the following plant group, seeded plants are placed - **[MP PMT 2005]**

(1) Algae (2) Bryophyta

(3) Angiosperms (4) Fungi

Q.56 The main function of tepetum is- **[MP PMT 2005]**

(1) Division (2) Support

(3) Nutrition (4) None

Q.57 The endosperm in angiosperms is - **[MP PMT 2006]**

(1) Triploid (2) Haploid

(3) Diploid (4) Polyploid

Q.58 Polygonum type of embryo sac is - **[MP PMT 2006]**

(1) 7-celled, 8-nucleate

(2) 8-celled, 7-nucleate

(3) 9-nucleate

(4) 16-nucleate

Q.59 The plant which raised from pollen grain is called– **[MP PMT 2006]**

(1) Haploid plant (2) Diploid plant

(3) Polyploid plant (4) Heterosis

Q.60 Male gamete in Angiosperm is produced by- **[MP PMT 2007]**

(1) Generative cell (2) Microspore cell

(3) Vegetative cell (4) Tube cell

Q.61 Plants which flower only once in their life are termed as - **[CGPMT 2009]**

(1) Monochalmydous (2) Monocious

(3) Monocarpic (4) Monosomic

Q.62 The male gametophyte in Angiosperm is reduced to - **[CGPMT 2009]**

(1) One cell (2) Two cell

(3) Three cell (4) Four cell

Q.63 Pollen embryo sacs are - **[CGPMT 2009]**

(1) Pollen like embryo sacs

(2) Pollen developed in embryo sacs

(3) Embryo sacs developed from pollen

(4) Fused pollen and embryo sac

Q.64 The part of Castor seed that yields oil is – **[CGPMT 2009]**

(1) Cotyledon (2) Caruncle

(3) Endosperm (4) Nucellus

Q.65 A hyaline bisexual and self fertilized flower that does - **[CGPMT 2009]**

(1) Chasmogamas (2) Apogamous

(3) Cleistogamous (4) Polygamous

Q.66 Which one of the following is a pseuedocarp – **[CGPMT 2009]**

(1) Apple (2) Guava

(3) Tomato (4) Banana

Q.67 In Gymnosperms the seeds are naked because they lack - **[CGPMT 2009]**

(1) Integument (2) Nucellus

(3) Pericarp (4) Perianth

Q.68 Sprouting of Potato under storage condition is due to - **[CGPMT 2009]**

(1) Auxin (2) Glibberellin

(3) Ethylene (4) Cytokinin

Q.69 For good growth of pollen tube necessary element is - **[CGPMT 2009]**

(1) Ca (2) B

(3) mg (4) Mo

Q.70 Embryo of Sunflower has - **[AIPMT 1998]**
(1) Two cotyledons (2) One cotyledons
(3) Eight cotyledons (4) Cotyledon absent

Q.71 Ornithophily takes place in - **[AIPMT 1999]**
(1) Yellow flower having nectaries
(2) Scented flower
(3) Flower with charming colour
(4) Modified corolla

Q.72 The plant having largest flower is- **[AIPMT 1999]**
(1) Total stem parasite (2) Epiphyte
(3) Total root parasite
(4) Partial stem parasite

Q.73 Eight nucleated embryo sac is -**[AIPMT 2000]**
(1) Only monosporic (2) Only bisporic
(3) Only tetrasporic (4) Any of the above

Q.74 Endosperm is formed during the double fertilization by - **[AIPMT 2000]**
(1) Two polar nuclei & one male gamete
(2) One polar nuclei & One male gamete
(3) Ovum and male gamete
(4) Two polar nuclei & two male gametes

Q.75 By which action a seed coat becomes permeable to water - **[AIPMT 2000]**
(1) Scarification (2) Stratification
(3) Vernalization (4) All of the above

Q.76 Anemophily type of pollination is found in – **[AIPMT 2001]**
(1) **Salvia** (2) Bottle brush
(3) **Vallisneria** (4) Coconut

Q.77 What is the eyes of potato - **[AIPMT 2001]**
(1) Auxillary bud (2) Accessary bud
(3) Adventitious root (4) Apical bud

Q.78 Which one breaks the dormancy of Potato tuber – **[AIPMT 2001]**
(1) Gibberellin (2) IAA
(3) ABA (4) Zeatin

Q.79 In grass what happens in microspore mother cell for the formation of mature pollen grains – **[AIPMT 2001]**
(1) One meiotic and two mitotic divisions
(2) One meiotic and one mitotic division
(3) One meiotic division
(4) One mitotic division

Q.80 Adventive embryony in **Citrus** is due to – **[AIPMT 2001]**
(1) Nucellus (2) Integuments
(3) Zygotic embryo (4) Fertilized egg

Q.81 In Angiosperms pollen tube liberate their male gametes into the - **[AIPMT 2002]**
(1) Central cell (2) Antipodal cells
(3) Egg cell (4) Synergids

Q.82 What is the direction of micropyle in anatropous ovule - **[AIPMT 2002]**
(1) Upward (2) Downward
(3) Right (4) Left

Q.83 Which type of association is found in between entomophilous flower and pollinating agent – **[AIPMT 2002]**
(1) Mutualism (2) Commonsalism
(3) Co-operation (4) Co-evolution

Q.84 In Angioperms all the four microspores of tetrad are covered by layer which is formed by– **[AIPMT 2002]**
(1) Pectocellulose (2) Callose
(3) Cellulose (4) Sporopollenin

Q.85 Seed dormancy is due to the presence of – **[AIPMT 2002]**
(1) Ethylene (2) Abscisic acid
(3) I.A.A (4) Starch

Q.86 In a flowering plant, archesporium gives rise to– **[AIPMT 2003]**
(1) Only the wall of the sporangium
(2) Both wall and the sporogenous cells
(3) Wall and the tapetum
(4) Only tapetum and sporogenous cells

Q.87 The aleurone layer in Maize grain is specially rich in - **[AIPMT 2003]**
(1) Proteins (2) Starch
(3) Lipids (4) Auxins

Q.88 Anthesis is a phenomenon which refer to **[AIPMT 2004]**
(1) Formation of pollen
(2) Development of anther
(3) Opening of flower bud
(4) Reception of pollen by stigma

Q.89 An ovule which becomes curved so the nucellus and embryo sac lie at right angles to the funicle is - **[AIPMT 2004]**
(1) Campylotropous (2) Anatropous
(3) Orthotropous (4) Hemitropous

Q.90 When a diploid female plant is crossed with a tetraploid male, the ploidy of endosperm cells in the resulting seed is - **[AIPMT 2004]**
(1) Pentaploidy (2) Diploidy
(3) Triploidy (4) Tetraploidy

Q.91 Monothecous anther is found in which family – **[RPMT 2000]**
(1) Malvaceae (2) Liliaceae
(3) Brassicaceae (4) Asteraceae

Q.92 Onagrad type of embryo development is found in - **[RPMT 2000]**
(1) **Solanum** (2) **Capsella**
(3) **Lilium** (4) **Hibiscus**

Q.93 In **Capsella** which type of embryosac is found– **[RPMT 2000]**
(1) Bisporic (2) Monosporic
(3) Tetrasporic (4) Trisporic

Q.94 All the cells in Polygonum type of embryo sac are - **[RPMT 2000]**
(1) Haploid
(2) Diploid
(3) Haploid and diploid
(4) Haploid and polyploid

Q.95 In which family pollinia are found - **[RPMT 2000]**
(1) Papilionaceae (2) Asteraceae
(3) Asclepiadaceae (4) Apocyanaceae

Q.96 When the pollens of one flower falls on the stigma of another flower of the same plant then it is known as - **[RPMT 2001]**
(1) Cieistogamy (2) Allogamy
(3) Autogamy (4) Dichogamy

Q.97 What is the liquid part of green Coconut – **[RPMT 2001]**
(1) Endosperm
(2) Female gametophyte
(3) Nucellus (4) Embryo

Q.98 Parthenogensis occurs when - **[RPMT 2001]**
(1) When embryo is formed without the fusion of egg and the sperm
(2) When embryo is formed by the fusion of egg and sperm
(3) When embryo is formed from another cell
(4) When sperm produces the embryo directly

Q.99 Nucellus is found in - **[RPMT 2001]**
(1) Cell (2) Pollen
(3) Ovule (4) Leaf

Q.100 The nutritive layer of microsporangia of **Capsella** - **[RPMT 2002]**
(1) Endothecium (2) Exothecium
(3) Sporogenous tissue (4) Tapetum

Q.101 That haploid cell divides by mitosis to form embryo sac - **[RPMT 2002]**
(1) Megaspore mother cell
(2) Microspore mother cell
(3) Functional megaspore
(4) Non functional megaspore

Q.102 Seed coat is derived from - **[RPMT 2002]**
(1) Pericarp
(2) Epicarp
(3) Integuments of ovule
(4) Nucellus

Q.103 What is pollen grain - **[RPMT 2002]**
(1) Microspore mother cell
(2) Male gamete
(3) Male gametophyte
(4) Partially developed embryo

Q.104 Anther culure yields some haploid and diploid plants. Diploid plants are produced from – **[RPMT 2003]**
(1) Zygote
(2) Seed coat
(3) Anther wall
(4) Wall of pollen grains

Q.105 Endosperm nucleus is formed by the fusion of– **[RPMT 2003]**
(1) 2 nuclei (2) 3 nuclei
(3) 4 nuclei (4) 5 nuclei

Q.106 Embryo sac is represented by - **[RPMT 2003]**
(1) Megagametophyte (2) Megasporophyll
(3) Megagametes (4) Megaspore

Q.107 Double fertilization is essential for formation of– **[RPMT 2004]**
(1) Cotyledons (2) Seed coat
(3) Endosperm (4) Nucellus

Q.108 Entry of pollen tube through micropyle is called- **[RPMT 2004]**
(1) Porogamy (2) Syngamy
(3) Chalazogamy (4) Mesogamy

Q.109 Pollen grains are able to withstand extremes of temperature and dessication because their exine is composed of - **[AIIMS 2003]**
(1) Cutin (2) Suberin
(3) Sporopollenin (4) Callose

Q.110 The pollen tube usually enters the embryo sac– **[AIIMS 2004]**
(1) Through one of the synergids
(2) By directly penetrating the egg
(3) Between one synergid and central cell
(4) By knocking off the antipodal cells

Q.111 In which one pair both the plants can be vegetatively propagated by leaf pieces – **[AIIMS 2005]**
(1) **Bryophyllum** and **Kalanchoe**
(2) **Chrysanthemum** and **Agave**
(3) **Agave** and **Kalanchoe**
(4) **Asparagus** and **Bryophyllum**

Q.112 In a type of apomixis known as adventive embryony, embryos develop directly from the **[AIPMT 2005]**
(1) nucellus or integuments
(2) Synergids or antipodals in an embryo sac
(3) accessory embryo sac in the ovule
(4) zygote

Q.113 Through which cell of the embryo sac, does the pollen tube enter the embryo sac – **[AIPMT 2005]**
(1) Egg cell (2) Central cell
(3) Persistant synergid
(4) Degenerated synergid

Q.114 Which one of the following represents an ovule, where the embryo sac becomes horse-shoe shaped and the funiculus and micropyle are close to each other - **[AIPMT 2005]**
(1) Circinotropous (2) Anatropous
(3) Amphitropous (4) Atropous

Q.115 What would be the number of chromosomes in the cells of the aleurone layer in a plant species with 8 chromosomes in its synergids ? **[AIPMT 2006]**
(1) 16 (2) 24
(3) 32 (4) 8

Q.116 Treatment of seed at low temperature under moist conditions to break its dormancy is called– **[AIPMT 2006]**
(1) Scarification (2) Vernalization
(3) Chelation (4) Stratification

Q.117 The arrangement of the nuclei in a normal embryo sac in the dicot plants is - **[AIPMT 2006]**
(1) 2 + 4 + 2 (2) 3 + 2 + 3
(3) 2 + 3 + 3 (4) 3 + 3 + 2

Q.118 In a Cereal grain the single cotylendon of embryo is represented by - **[AIPMT 2006]**
(1) Coleorrhize (2) Scutellum
(3) Prophyll (4) Coleoptile

Q.119 Long filamentous threads protruding at the end of a young cob of maize are - **[AIPMT 2006]**
(1) Hairs (2) Anthers
(3) Styles (4) Ovaries

Q.120 In which of the following fruit is the edible part the aril ? **[AIPMT 2006]**
(1) Litchi
(2) Custard apple
(3) Pomegranate
(4) Orange

Q.121 Embryo sac represents - **[RPMT 2006]**
(1) Macrogamete
(2) Macrospore
(3) Macrosprophyll
(4) Macrogametophyte

Q.122 Double fertilization involves - **[AIIMS 2005]**

(1) Fertilization of the egg by two male gametes

(2) Fertilization of two eggs in the same embryosac by two sperms brought by one pollen tube

(3) Fertilization of the egg and the central cell by two sperms brought by different pollen tubes

(4) Fertilization of the egg and the central cell by two sperms brought by the same pollen tube

Q.123 A scion is grafted to a stock. The quality of fruits produced will be determined by the genotype of - **[AIIMS 2006]**

(1) Stock

(2) Scion

(3) Both stock and scion

(4) Neither stock not scion

Q.124 Male gametes in angiosperms are formed by the division of - **[AIPMT 2007]**

(1) Microspore mother cell

(2) Microspore

(3) Generative cell

(4) Vegetative cell

Q.125 Which one of the following is surrounded by a callose wall ? **[AIPMT 2007]**

(1) Pollen grain

(2) Microspore mother cell

(3) Male gamete

(4) Egg

Q.126 Unisexuality of flowers prevents – **[AIPMT 2008]**

(1) Geitonogamy, but not xenogamy

(2) Autogamy and geitonogamy

(3) Autogamy, but not getionogamy

(4) Both geitonogamy and xenogamy

Q.127 Endosperm is consumed by developing embryo in the seed of - **[AIPMT 2008]**

(1) Pea (2) Maize

(3) Coconut (4) Castor

Q.128 Which one of the following is resistant to enzyme action ? **[AIPMT 2008]**

(1) Pollen exine (2) Leaf cuticle

(3) Cork (4) Wood fibre

Q.129 What does the filiform apparatus do at the entrance into ovule ? **[AIPMT 2008]**

(1) It brings about opening of the pollen tube

(2) It guides pollen tube from a synergid to egg

(3) It helps in the entry of pollen tube into a synergid

(4) It prevents entry of more than one pollen tube into the embryo sac

Q.130 Which one of the following pairs of plant structures has haploid number of chromosomes? **[AIPMT 2008]**

(1) Nucellus and antipodal cells

(2) Egg nucleus and secondary nucleus

(3) Megaspore mother cell and antipodal cells

(4) Egg cell and antipodal cells

Q.131 An example of a seed with endosperm, perisperm and caruncle is - **[AIPMT 2009]**

(1) Castor (2) Cotton

(3) Coffee (4) Lily

Q.132 What does Angiosperm mean - **[RPMT 2007]**

(1) Naked seed (2) Covered seed

(3) Leaf fall (4) Seed bub

Q.133 How many times flowering takes place in biennial plants - **[RPMT 2007]**

(1) Once (2) Twice

(3) Many (4) None

Q.134 Endosperm of Angiosperm is - **[RPMT 2007]**

(1) 2n (2) 3n

(3) n (4) 2n + 1

Q.135 Apomictic embryos in citrus arise from : **[Pre AIPMT 2010]**

(1) Synergids

(2) Maternal sporophytic tissue in ovule

(3) Antipodal cells

(4) Diploid egg

Q.136 Keel is characteristic of the flowers of:

[Pre AIPMT 2010]

(1) Gulmohur (2) Cassia

(3) Calotropis (4) Bean

Q.137 Transfer of pollen grains from the anther to the stigma of another flower of the same plant is called : **[Pre AIPMT 2010]**

(1) Xenogamy (2) Geitonogamy

(3) Karyogamy (4) Autogamy

Q.138 Even in absence of pollinating agents seed-setting is assured in : **[AIPMT Pre 2012]**

(1) Zostera (2) Salvia

(3) Fig (4) Commellina

Q.139 An organic substance that can withstand environmental extremes and cannot be degraded by any enzyme is :

[AIPMT Pre 2012]

(1) Sporopollenin (2) Lignin

(3) Cellulose (4) Cuticle

Q.140 Which part would be most suitable for raising virus-free plants for micropropagation?

[AIPMT Pre 2012]

(1) Vascular tissue (2) Meristem

(3) Node (4) Bark

Q.141 Both, autogamy and geitonogamy are prevented in : **[AIPMT Pre 2012]**

(1) Cucumber (2) Castor

(3) Maize (4) Papaya

Answer Key

Exercise – 3

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

Ques.	141																			
Ans.	4																			

These questions consist of two statements each, printed as Assertion and Reason. While answering these Questions are required to choose any one of the following four responses.

(1) If both Assertion & Reason are True & the Reason is a correct explanation of the Assertion.

(2) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.

(3) If Assertion is True but the Reason is False.

(4) If both Assertion & Reason are false.

Q.1 **Assertion :-** Some of the Angiospermic plants are propagated only by vegetative propagation.
Reason:- They have lost the capacity of seed formation.

Q.2 **Assertion :-** Clone is formed by amphimixis.
Reason:- In amphimixis, new plants are formed without fertilization and meiosis.

Q.3 **Assertion :-** In apomixis, plants are formed in new genetic sequence.
Reason:- In apomixis two of genetical similar type of organisms fuse together.

Q.4 **Assertion :-** Diplospory is also known as diploid parthenogenesis.
Reason:- In this, embryo is formed from the diploid egg cell without fertilization.

Q.5 **Assertion :-** The plants in which amoeboid type of tapetum is found, middle layer of anther immediately degenerates.
Reason:- Entire food of middle layer is absorbed by tapetum.

Q.6 **Assertion :-** Grafting is possible only in dicot plants.
Reason:- In these plants vascular cambium is absent.

Q.7 **Assertion :-** When formation of embryo takes place inside the ovule nucellus or integuments then it is called ‘‘adventive embryony’’
Reason:- In adventive embryo, formation of embryo occurs at place other than the mother place.

Q.8 **Assertion :-** seedless fruits are formed in parthenocarpy.
Reason:- In this process fruits are formed without fertilization.

Q.9 **Assertion :-** In **Pinus,** symbiosis furnished by mycorrhiza.
Reason:- In mycorrhiza, symbiosis is established between fungus and root of pinus

Q.10 **Assertion :-** The plants in which glandular tapetum is found, formation of exine of pollen grains takes place in these plants.
Reason:- Ubisch bodies formed only in glandular tapetum which participate in the formation of exine.

Q.11 **Assertion :-** Occurence of two male gametes is the constant feature of male gametophyte of angiosperms.
Reason:- Only in-vitro development takes place of male gametophyte of angiosperms.

Q.12 **Assertion :-** Shape of **Pinus** plant is conical.
Reason:- The conical shape of **Pinus** is due to excurrent growth.

Q.13 **Assertion :-** In circinotropous ovule, the entire body of ovule is covered by funiculum
Reason:- Due to growth of funiculum the body of ovule turns on the funiculum at angle of 360°.

Q.14 **Assertion :-** In **Legume** plants, naturally self pollination takes place.
Reason:- Both the types of reproductive organs are present inside the keel and it always remains closed.

Q.15 **Assertion :-** Xenia is the effect of pollen grains on the structure of endosperm.
Reason:- Xenia effect is produced in the seed of Maize due to heterofertilization.

Q.16 **Assertion :-** Night flowering plants are entomophillous.
Reason:- Flowers of these plants are odour less.

Q.17 **Assertion :-** Pollination in **Ophrys** plant take place by pseudo copulation
Reason:- Mimicry is found in flowers of this plant

Q.18 **Assertion :-** Straight position of embryo of **Capsella** is called torpedo stage.
Reason:- Amphitropous type of ovule is found in **Capsella.**

Q.19 **Assertion :-** Symbiosis is found in between **Pronuba** moth and **Yucca** plant.
Reason:- Life cycle of both completely depended on each other.

Q.20 **Assertion :-** Pollen grains are preserved for a long time in fossil form.
Reason:- Sporopollenin is the chief component of exine of pollen grains

Q.21 **Assertion :-** Double fertilization is the universal feature of all plants.
Reason:- In this fusion of only male gamtes and secondary nucleus take place

Q.22 **Assertion :-** Cross-pollination is usually takes place in unisexual plants.
Reason:- Cleistogamy promotes cross-pollination

Q.23 **Assertion :-** Two cotyledons in the seed are the embryonic leaves.
Reason:- Radicle and plumule are present in embryo.

Q.24 **Assertion :-** Synergids of embryo sac also help in fertilization in Angiosperms.
Reason:- Obturators of synergids attract the pollen tube.

Q.25 **Assertion :-** Middle layer of anther known as ephemeral.
Reason:- It secretes all food into the pollen sacs.

Q.26 **Assertion :-** Pollen is known as the first cell of female gametophyte.
Reason:- Pollen grains are formed by microgametogenesis.

Q.27 **Assertion :-** Sexual reproduction takes place with the participation of two different type of gametes.
Reason:- Sexual reproduction is also known as apomixis.

Q.28 **Assertion :-** Periplasmodium is formed by glandular tapetum.
Reason:- Periplasmodium participate in the formation of exine of pollen grains.

Q.29 **Assertion :-** When embryo sac develops from megaspore mother cell without meiosis it is called diplospory.
Reason:- Fruits are formed without seeds in diplospory.

Q.30 **Assertion :-** Ovules of **Santalum** plant are unitegmic.
Reason:- Santalum is a complete root parasitic plant.

Q.31 **Assertion :-** Flower of **Rafflessia** is the largest in the plant kingdom.
Reason:- Rafflessia is total root parasite.

Q.32 **Assertion :-** Nuclear type of endosperm is found in Coconut.
Reason:- Endosperm of Coconut is formed by free nuclear divisions of primary endosperm nucleus.

Q.33 **Assertion :-** In Angiosperm, endosperm is generally triploid
Reason:- In **Oenothera** plant always diploid endosperm is formed.

Q.34 **Assertion :-** After development of embryo, an ovule modifies into seed.
Reason:- Seeds are also formed during the normal sexual reproduction without fertilization.

Q.35 **Assertion :-** Cotyledons come above soil surface during the epigeal germination of seeds.
Reason:- In this type of germination, fast growth occurs in epicotyl region.

Q.36 **Assertion :-** Seeds of monocotyledon plants are called endospermic seeds.
Reason :- Generally in seeds of monocotyledons plants food is stored in cotyledons.

Q.37 **Assertion :-** Seed and fruit formation are the advanced feature of Angiosperms.
Reason:- Triple fusion is considered as universal feature of Angiosperms.

Q.38 **Assertion :-** Viability of seed is checked by TTC.
Reason:- Highest viability of seed is found in Mangroove vegetation.

Q.39 **Assertion :-** Development of mature pollen grain is endoscopic.
Reason:- Pollination in most of the flowering plants take place in three called stage.

Q.40 **Assertion :-** During the germination of pollen grains, pollen tube is formed by Vegetative cell.
Reason:- Male gametes are carried by pollen tube only in Angiosperms.

Q.41 **Assertion :-** Grafting is not possible in Monocotyledon plants.
Reason:- Vascular cambium is not found in Monocots.

Q.42 **Assertion :-** The unit of Androecium is called stamen.
Reason:- The most important part of microsporophyll is anther.

Q.43 **Assertion :-** Development of anther in Angiosperms take place by more than one archesporials.
Reason:- This type of development of anther is called leptosporangiate.

Q.44 **Assertion :-** Gemetophytic phase starts with the formation of pollen grain.
Reason:- Study of structure of pollen grains is called palynology.

Q.45 **Assertion :-** In agamospermy, genetic variations are produced in progeny.
Reason:- In this process, new progeny is formed by gametic fusion.

Q.46 **Assertion :-** Anemophily includes wastage of pollen grains.
Reason:- Anemophillus flowers are neither attractive nor fragrant.

Q.47 **Assertion :-** Life cycle of Pronuba moth depends on Yucca plant.
Reason:- It is the example of commensalisms.

Q.48 **Assertion :-** Pollen tube shows apical growth.
Reason:- Growth of pollen tube is controlled by generative nucleus.

Q.49 **Assertion :-** Polygonum type of embryo sac is the most common in Angiosperms.
Reason:- Polygonum type of embryo sac is monosporic type.

Q.50 **Assertion :-** Generally megaspore mother cell undergoes meiosis to produce four megaspores in Angiosperms.
Reason:- Megaspore is the first cell of male gametophyte.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	**Good / Important questions**
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

REPRODUCTIVE SYSTEM

INTRODUCTION :

To continue its own race, an organism by the process of reproduction, produces off springs like its own. In sexual reproduction the organisms produce male and female gametes which on combining, develop into a new individual. The formation of gametes takes place in the reproductive organs.

PRIMARY SEX ORGAN :

Essential organs which form the gametes. In males, the gamete forming organs are the testes. In females, the corresponding organs are ovaries.

The male gametes is the spermatozoan.

The female gamete is the ovum.

SECONDARY SEX ORGAN :

These form the passage for the gametes to help the union of male & female gametes.

In male this include epididymis, vas deferens, seminal vesicles, prostate, bulbourethral glands & penis.

While in female - Fallopian tube, uterus & vagina. (Breast is an accessory sex organ)

DEVELOPMENT OF SEX ORGAN :

During intra uterine life (IUL) testis & ovary develop from mesoderm. They develop in abdominal cavity in IUL, at the time of birth, testes descend down into scrotal sac but ovaries remain in abdominal cavity.

MALE REPRODUCTIVE SYSTEM

- In man, one pair of testes are the main or primary reproductive organ. Size 4-5 cm × 2-3 cm
- Both testes are located in a small bag like structure situated below & out side the abdominal cavity called as scrotum or scrotal sac. The temperature of scrotum is 2 to 3°C lesser than body temperature.
- Internally scrotum is lined by dartos muscle & spermatic fascia.

  Dartos muscle helps in regulation of the temperature with in the scrotum during cold season,

  It becomes contracted in cold & during warm season, it becomes relaxed.

  Cremaster muscles line inside the wall of scrotal & inguinal canal region and help in elevation of testes.
- Each testis is attached to the walls of the scrotal-sac through flexible, elastic fibres. This group of fibres is called Gubernaculum or Mesorchium.
- Each testis is attached to the dorsal body wall of the abdominal-cavity through a cord termed as the **Spermatic cord.** This cord is made up of elastin fibres & spermatic fascia. The contents of cord are vas deferens, gonadal veins, gonadal arteries, nerves and lymphatics.

  During embryonic stage, testes develop in abdominal cavity & they descend to reach the scrotum at the time of birth. When the testes does not descend to reach the scrotum but remain in abdominal cavity at the time of birth this conditions is called **undescended testes** or **cryptorchidism.** Such testis can not develop and function properly and may develop malignancy.

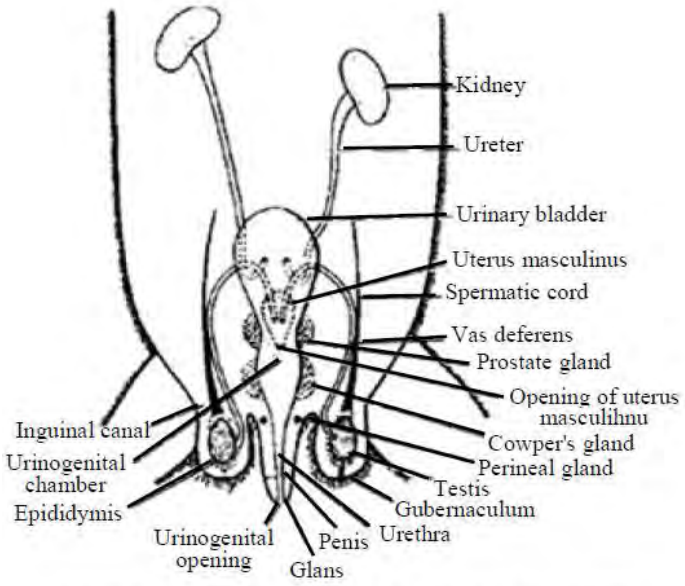
Orchiopexy : When the undescended testes are brought into scrotal sac by surgical process during childhood this process called as orchiopexy.

Castration : Crushing of testes in bulls to convert them to bullocks. (This makes them more obidient due to fall in the level of testosterone)

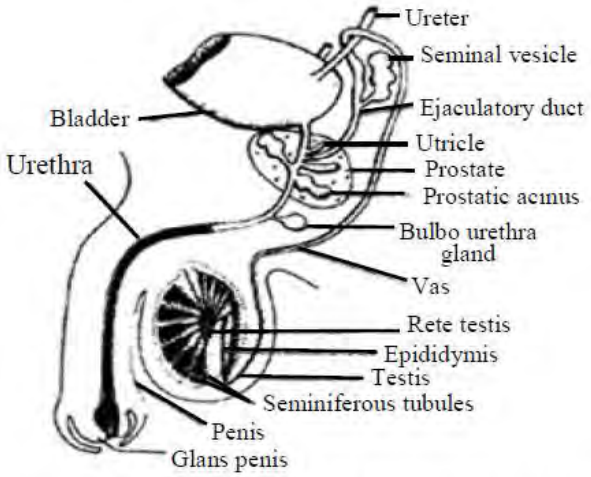
- In some animals the testes descend into the scrotum only in the breeding-season. e.g. Order Chiroptera Order Rodentia
- Testes of some animals are permanently placed in the abdominal-cavity. Their scrotum is vestigial-organ.e.g. Prototherians, animals of the order Edentata (Pangolin, Sloth)
  Order Proboscida (Elephant)
  Order Sirenia and Order Cetacea
- Each scrotum is connected to the abdominal cavity through a passage termed as inguinal-canal. Through this canal the testes descend down into the scrotal-sacs at the time of birth.

  Spermatic cord in males passes through the inguinal canal.

  Sometimes the inguinal canal may tear leading to abnormal protrusion of abdominal contents like loops of intestine into the inguinal canal. This condition is called as **inguinal hernia.**



MALE - REPRODUCTIVE ORGANS (RABBIT)



MALE REPRODUCTIVE SYSTEM (HUMAN)

Internal Structure of Testis :

Testis is covered by three coats. Outer most is tunica vaginalis. Middle coat is tunica albuginea & inner most is tunica vasculosa.

Tunica vaginalis has a parietal & visceral layer. It covers the whole testis except it's posterior border from where the testicular vessels & nerves enter the testis.

The **Tunica albuginea** is a dense, white fibrous coat covering the testis all around . The posterior border tunica albuginea is thickened to form vertical septum called the **Mediastinum testis.**
Tunica vasculosa is the inner most vascular coat of the testis lining testicular lobules.

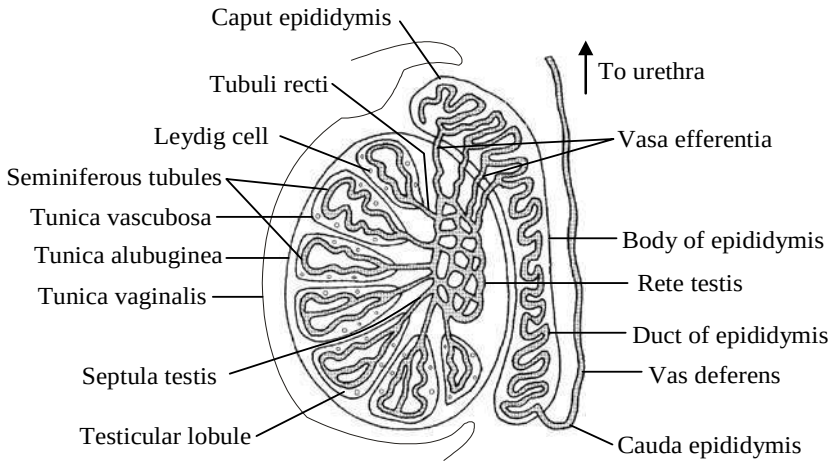


Fig. Median longitudinal section of mammalian testis

- Each lobules has 2 to 3 seminiferous tubules, which join together at the apices of the lobules to form straight tubules or tubulirecti which enter the mediastinum. Here they form a network of tubules called as **rete testis.** Rete testis fuse to form 10 to 20 efferent ductule called as **vasa efferentia or ductuli efferentes.** These ductules come out from upper dorsal surface of testis & open into common tubules, which get highly coiled to form epididymis or ductus epididymis. This epididymis is responsible for functional maturation of sperm.
- Total number of seminiferous tubules in each testis is about 750 to 1000.
- In rabbit, epididymis is 3 m long and in man it is 6 m in length.

  Epididymis has 3 parts :

  (i) Upper, highly coiled part - Caput epididymis or Globus-major

  (ii) Middle part - Corpus epididymis

  (iii) Basal, least coiled part - Cauda epididymis or Globus minor

  Cauda-epididymis, enters inside the abdominal-cavity from the scrotal-sac in the form of Vas deferens or ductus deferens. Terminal dilated part of vas deferens are called **ampulla.** Vas deferens and Epididymis both develop from the **wolfian-duct** of **mesonephros. Epididymis can temporarily stores the sperms for as long as one month and here the functional maturation of sperms takes place.** 18 to 24 hr. after functional maturation of sperm, sperms proceed further to store in vas deferens, specially in its ampulla part. The wall of epididymis is made up of 2 layers-outer circular muscle layer and inner epithelium. Wall of vasdeferens is also made up of 2 layers-outer circular muscle layer and inner epithelium. The sperms reach the abdominal cavity due to the pulsation of the vas-deferens.
- Cutting of the vasa-deferens & tieing it by a thread is termed as **vasectomy.**

  Vas deferens runs upward & enter into abdominal cavity. Both vas deferens coil around the ureter of their respective sides and then dilate to form ampulla. Ampulla of each side receives the seminal vesicle of that side.
- The vas deferens now forms ejaculatory duct and opens into prostatic urethra.

In rabbit 1 seminal vesicle is found on dorsal side of urinary bladder & it opens at the junction of both vas deferens, while in human 1 pair of seminal vesicles are situated on dorsolateral side of urinary bladder which open separately before the terminal ends of vas deferens. So terminal ends of vas deferens meet to form a single ejaculatory duct.

Accessary Reproductive Glands

- The substances secreted by the accessory reproductive glands help in reproduction, these are-

1. Seminal vesicle

It is also called **Uterus-masculinus.** If forms from the Mullerian-duct of the embryo. In females, these ducts form the oviducts. Internally, it is lined by glandular epithelium which secretes seminal fluid, which is lubricating, transparent & jelly like substance, which makes 60-70% part of semen. It is slightly alkaline (pH 7.3.). **Fructose** is found in seminal fluid, it act as fuel to sperm. Fibrinogen, prostaglandin, citrate, inositol and several proteins are also present in semen.

2. Prostate gland

This gland is located below the urinary bladder. It is unpaired & made up of 5 lobes in man. In Rabbit 3 or 4 lobe are found. Each lobe opens into prostatic urethra through many fine apertures. It secretes slightly alkaline prostatic fluid which is milky, thick, sticky or jelly like. It makes about 30% part of semen and helps in sperm activation. In the secretion of prostate-gland citric acid, Calcium and phosphate, clotting enzyme and profibrinolysin are present. The secretion of the prostate gland combines with the secretion of seminal vesicle and so the semen gets coagulated. In the coagulated semen, the mobility of sperms is reduced and so their energy is conserved. After some time of ejaculation due to fibrinolysins, semen again liquefies and in this semen now the sperms can move.

3. Cowper's glands

It is a pair of glands found on lateral side of urethra. It is also called as **bulbourethral gland.** It is situated in membranous part of urethra & opens into penile urethra. It secretes transparent, slimy, jelly like fluid. It is slightly alkaline (pH is 7.2). This destroys the acidity of the urethra and cleans it for the movement of sperms.

4. Perineal or Rectal glands

These are found both in male and female rabbits. Perineal gland is found around external genital organ & perineal region, while rectal glands are found around external genital organs & anus. During the breeding season, these glands secrete odoriferous liquid which has pheromones or **Ectohormones** in it. The pheromone develops sexual attraction between opposite sexes & also develops desire for copulation.

Note : - In man, Perineal or Rectal glands are absent.

Semen - Semen = Sperm + Accessary reproductive gland fluid

Volume = 3 to 4ml.

Normal sperm count 20 to 120 million/ml.

Oligospermia < 20 million/ml.

Azospermia – either absence or near absence of sperms.

Penis

Urethra continues in a muscular & tubular organ called as **penis.** Terminal part of shaft of penis is bulging, it is called as **Glans penis.** This glans penis is covered by a movable skin called as **prepuce or foreskin.**

A special type of sebaceous gland is found on the prepuce called **preputial gland** which secretes **smegma.**

Removal of prepuce by surgery is called as **circumcision.**

Prepuce is attached to the base of glans with the help of an elastic cord like membrane called **Frenulum prepuce.**

In penis of some animals a bone is present called **Baculum** and such a penis is called **Os-penis** e.g. Whale, Bat, Rat etc. The penis of opposum, Bandicoot etc. is double branched (Bifurcated).

Penis is an erectile copulatory intromittent organ. Root of the penis containing muscles is called crura. Penis consists of a long shaft that enlarges to form an expanded tip called the glans penis.

Body of Penis :

It is composed of three longitudinal cylindrical masses of erectile tissue. These masses are, the right & left corpora cavernosa & a median corpus spongiosum.

The two corpora cavernosa do not reach the end of the penis. Each of them terminates under cover of the glans penis.

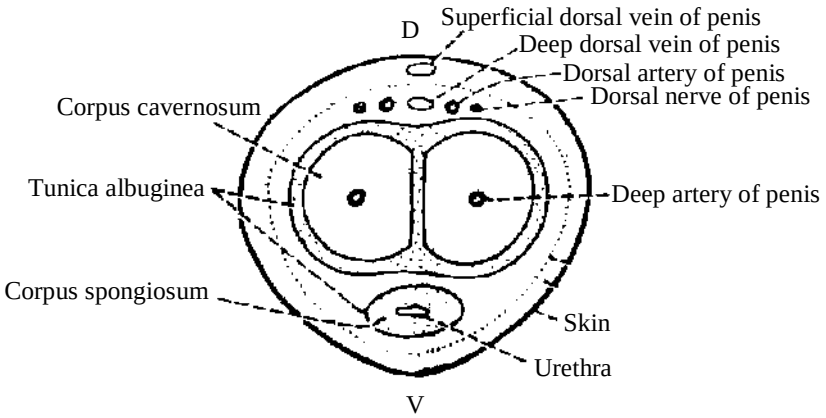
The corpus spongiosum continues further, its terminal part is expanded to form a conical enlargement called the **glans penis**. Through out its whole length it is transversed by the **urethra.**

The base of the glans penis has projecting margin the **corona glandis.**

External opening of penis is called penile meatus.

Erection of Penis :

Erection of penis is purely vascular phenomenon and is controlled by A.N.S It occurs due to increase of blood supply, due to dilation of penile arteries causing enlargement and hardening of penis. During this time the muscles of crura are relaxed.



Transverse section through the body of the penis

Histology of seminiferous Tubules :

Outer surface of seminiferous tubules is composed of white fibrous connective tissues called as **tunica propria.** While inner surface is of cuboidal germinal epithelium. This epithelium is made of spermatogenic cells which forms sperm by spermatogenesis. Some columnar cells are found in the layer of germinal epithelium called as **Sertoli cells.** These provide nutrition to sperm, so they are also called as **subtentacular or sustentacular** or **nurse cells** (these occur in mammals).

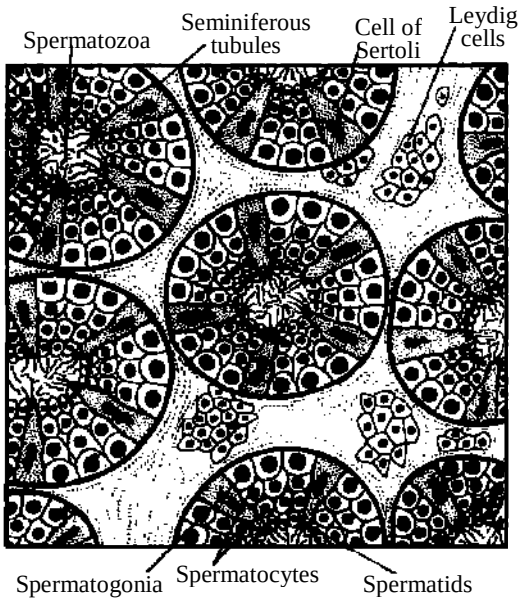
Other function of Sertoli cells -

(1) They phagocyte the injured or dead sperm cells

(2) They are the basis of blood testis barrier

(3) Sertoli cells produce inhibin.

Some endocrine cells are found between seminiferous tubules in intertubular space, these are called as **interstitial or Leydig cells.** These cells secrete **testosterone.** The testosterone from Leydig's cells enter the seminiferous tubules by diffusion under the effect of ABP & promotes spermatogenesis.



HISTOLOGY OF TESTIS

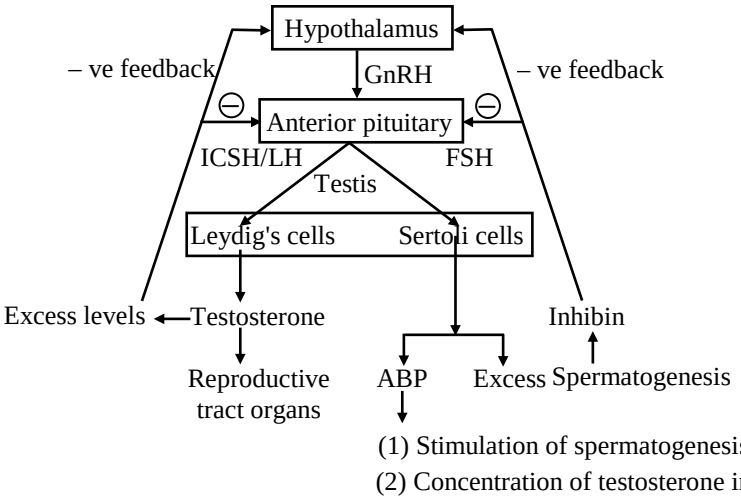
Male Reproductive Hormones

FSH : Binds with FSH receptors attached to the Sertoli cells in seminiferous tubules. This causes these cells to grow and secrete various spermatogenic substances and androgen binding proteins (ABP)

ABP : Concentrates the testosterone inside seminiferous tubules.

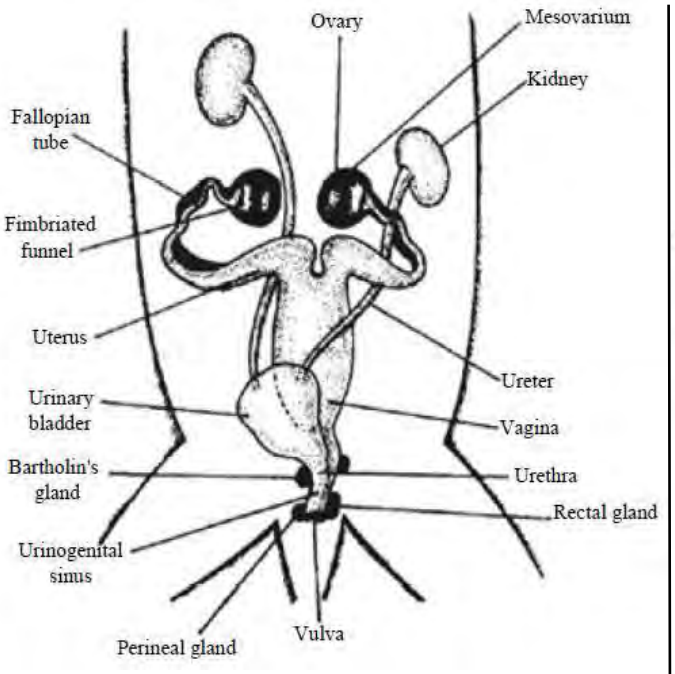
LH/ICSH : - It stimulates the leydig cells to secrete testosterone. Leydig's cells mature at 10 years of age .

Inhibin : : It is secreted by Sertoli cells in response to excess spermatogenesis. The inhibin gives a negative feedback to the hypothalamus and anterior pituitary, this results in suppression of synthesis and release of FSH ($\therefore$ Spermatogenesis decreases).

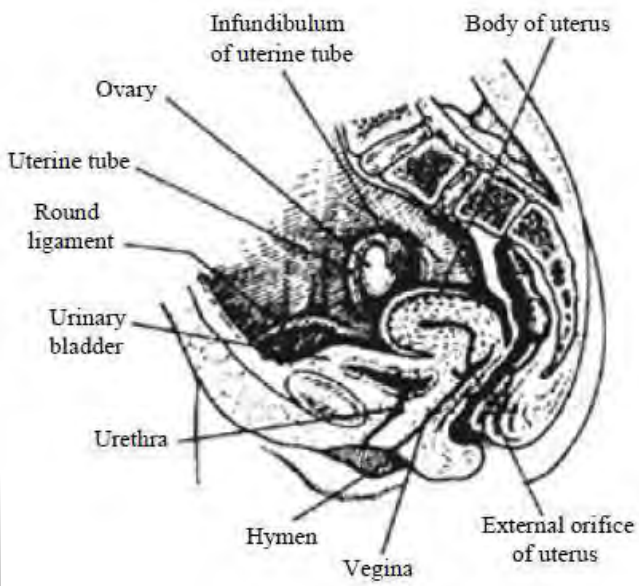


Testosterone : Secreted by Leydig cells. It is essential for (1) Sperm production (2) development of secondary sexual characters (3) ABP secretion (4) it also gives – Ve feedback to hypothalamus and anterior pituitary in its excess concentration to suppress GnRH, FSH & LH release. (5) It is secreted in foetal stage in as low as 30 ng/nl plasma concentration to cause descent of testis in last trimester of intrauterine life.

FEMALE REPRODUCTIVE SYSTEM



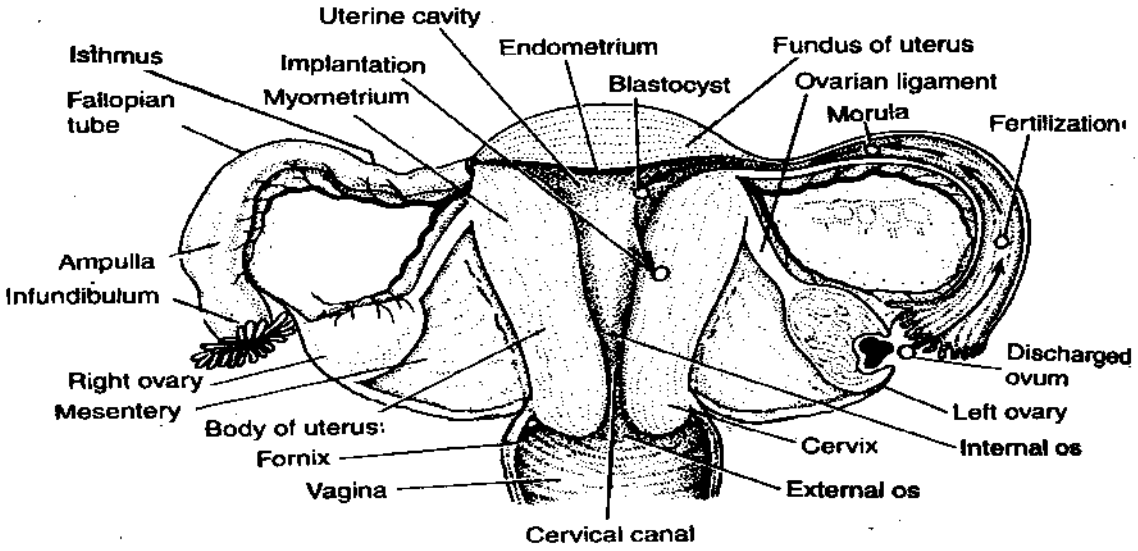
(RABBIT)



(WOMAN)

FEMALE – SEX – ORGANS

A pair of ovaries is the main or primary sex organ of female reproductive system. Both ovaries are located in abdominal cavity in the ovarian fossa. Each ovary is attached to the posterior layer of broad ligament (Peritoneal ligament) with the help of mesovarium. It is short fold of peritoneum & it is the route of vessels & nerves to ovary .



A tubule is situated near the ovary. It is also attached with broad ligament, this tubule is called as **oviduct.** Oviducts develop from the Mullerian-duct of the embryo. In mammals this oviduct is differentiated into two part. It's proximal (towards ovary) narrow & thin part is called as **infundibulum**. Its fimbriated & terminal end bears aperture called as **abdominal ostium** which opens into peritoneal cavity. The part medial to the infundibulum is called **ampulla**, it is a thin walled dilated part of tube. Fertilization takes place in the ampulla. The part medial to ampulla is called **isthmus**. The most medial part of this tube situated in the uterus is called **intramural or interstitial part of tube**. During ovulation, the egg are released in the peritoneal cavity, due to this it is called **coelomic egg.** The distal & dilated part of oviduct forms the **uterus**.

The upper expanded part is called as body or fundus while lower cylindrical part is called as **cervix**;

Upper part of uterus forms the body while lower part forms cervix.

On internal surface of cervix 2 types of constrictions are found which form the **Os-cervix.**

The body of uterus communicates with the cervix through opening called **internal Os.**

The cervix communicates with the vagina through an opening called **external Os.**

The uterus open into a fibromuscular & non glandular tube like organ called **vagina** (Copulatory organ).

Types of Uterus :

I. **Duplex : -** These are the simplest type of uteri. Here both the uteri are completely separated and open independently into the vagina through two separate openings e.g. Rat.

II. **Bipartiate :** In these uteri, the lower part of the two uteri are fused and there is a septa in between them, e.g. Carnivorous mammals.

III. **Bicornuate :-** The lower parts of the 2 uteri are fused with each other but their partition wall is absent e.g. Rabbit.

IV. **Simplex :-** When both the uteri are completely fused with each other to form only one structure. These are the most developed uteri, e.g. Human.
It is the most developed form of the uterus which is made from the complete fusion of both uterus .

It is piriform (inverted pear) in shape,

Vulva

Vulva means external genitalia of female. They include mons veneris, labia majora, labia minora, clitoris, vestibule & related perineum.

Mons veneris (mons pubis) : - It is a pad of sub cutaneous connective tissue, lying in front of pubis & is covered by pubic hairs in adult female.

Labia Majora : - Vulva is bounded on each side by the elevation and folds of skin & subcutaneous tissue. Its inner surface is hairless.

Outer surface is covered by sebaceous gland, Sweat gland & hair follicles. It is homologous with the scrotum in the male.

Labia Minora :- They are two thin folds of skin present just within the labia majora. Lower portion of minora fuses across the midline & form a fold of skin called **fourchette**.

Clitoris :- Small cylindrical & erectile body made by fusion of two labia minora, situated in the most anterior part of vulva. Clitoris is a **homologus** to the penis in the male. It is also made up of two erectile bodies (corpora cavernosa). The skin which covers the glans of clitoris is called **prepuce.**

At the terminal part of vagina the urethra opens separately, so they form a common chamber called **vaginal vestibule or urino genital sinus.** Vagina opens outside through a slit like aperture or triangular space called vestibule. The vulva has following openings :-

(a) Urethral opening – Lies on anterior end

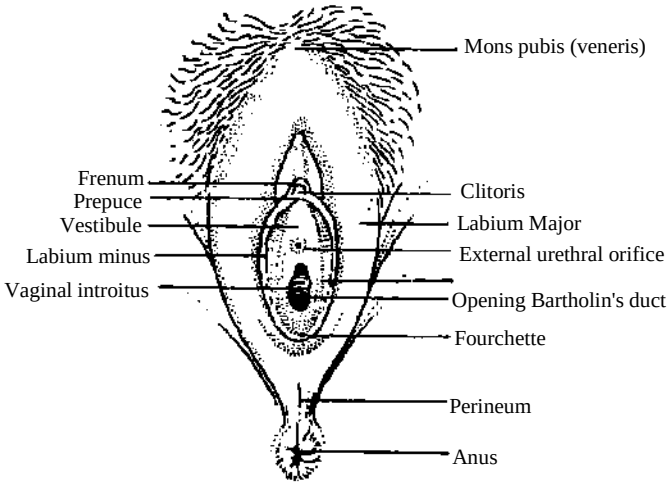
(b) Vaginal orifice – Lies on posterior end.

It is incompletely closed by a septum of mucous membrane called **hymen**, but it may not be a true sign of virginity.

(c) Openings of Bartholin; duct on either side

Bartholin Glands :

- It is homologous to **Cowper gland** of male
- In rabbit 1 pair is found on lateral side of vagina. It also opens into vagina.
- It secretes slimy alkaline, watery fluid which make alkaline media in vaginal passage.
- In human female it is **one pair** on each side. These are also known as **greater and lesser vestibular gland.** These glands are situated on lateral side of vagina and on both sides the Bartholin duct opens into vestibule. It secretes alkaline fluid during sexual excitement.



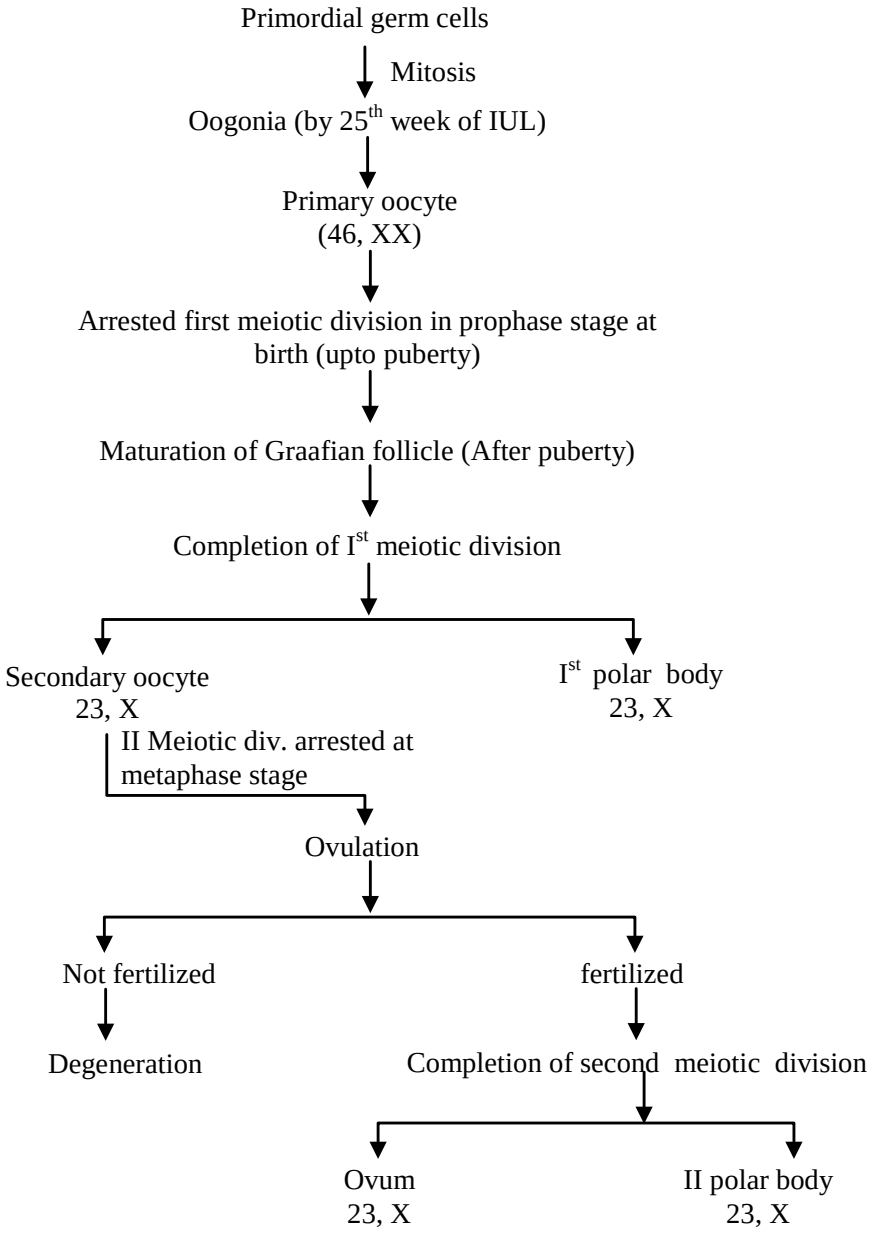
Histology of Oviduct :

I. **Serosa or the adventitia :-** It is the outermost layer of visceral-peritoneum **(Perimetrium)**

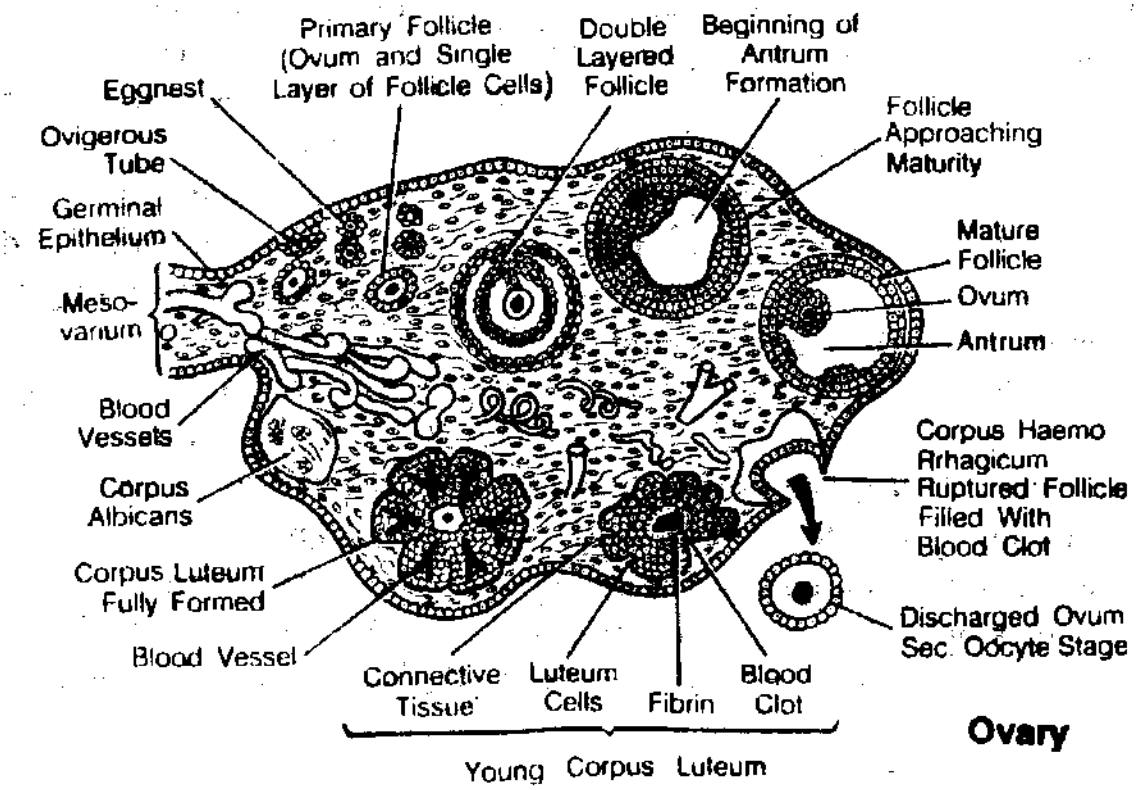
II. **Muscle-layer :-** The middle layer of the oviduct is made up of unstripped-muscle. In uterus, thick smooth muscle bundles are found, these are called as **myometrium.**

III. **Mucous membrane :-** It is the innermost layer. Mucosa consists of simple columnar epithelium. Epithelium contains both ciliated cells & secretory cells. The secretory cells produce viscous liquid film that provides nutrition & protects the ovum. Mucosa of Uterus is called **endometrium**, It contains tubular glands, many fibroblasts & blood vessels. In the uterus, the embryo is attached to endometrium. Longest unstripped muscles of the body are found in the walls of uterus. (During pregnancy)

SCHEME SHOWING GAMETOGENESIS



STRUCTURE OF OVARY :



Outer most layer of ovary is called germinal epithelium while the inner layer called T. albuginea is made up of White fibrous connective tissue.

The inner part of ovary is called as stroma. it is differentiated into 2 parts, outer peripheral part is cortex & inner part is called medulla. Stroma consists of follicular cells, connective tissue, blood vessels & lymphatics.

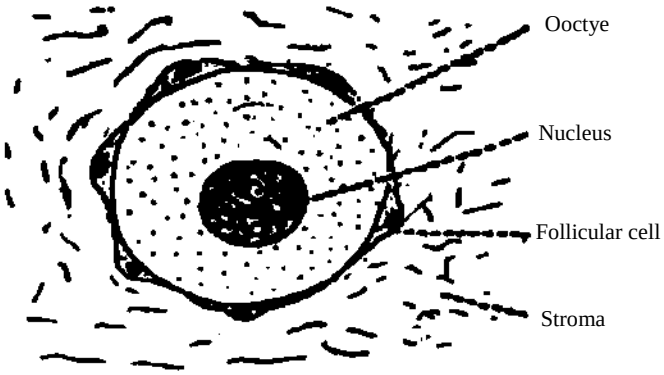
Numerous oogonial are found in cortical region in intrauterine life. In early stage of intrauterine life, they proliferate by mitosis, after which meiosis starts in them and proceeds upto prophase stage & halts there itself up to puberty (when the ovulation starts). Now the halted meiosis process restarts at puberty causing primary oocyte to convert into secondary oocyte Just before ovulation. With this the 1st meiotic division completes & first polar body is formed . The secondary Oocyte immediately begins the second meiotic division but this division stops again at metaphase stage. It proceeds further only when a sperm penetrates the oocyte.

Formation of ovarian or Graafian follicle

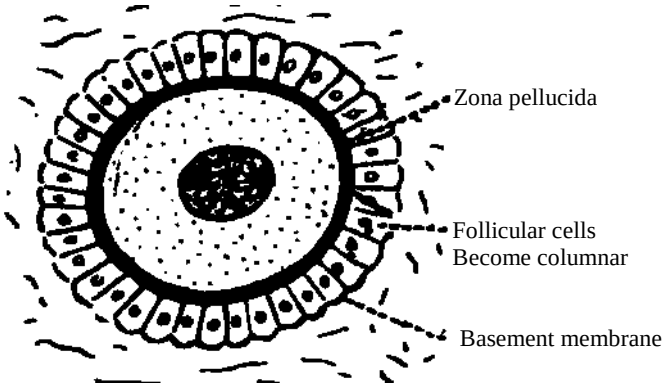
Ova develop from oogonia present in the cortex of the ovary. The oogonia are surrounded by other cells that form a stroma for them. These stromal cells form the ovarian or Graafian follicle that surrounds the ovum and protects it.

The stages of formation of **Graafian** follicle are as follows :

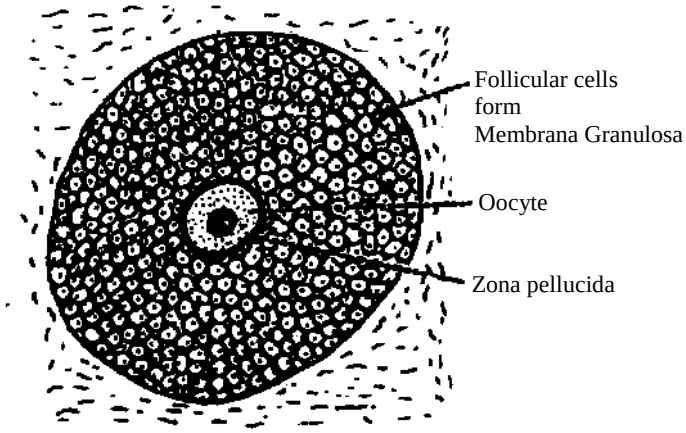
(1) Firstly some cells of the stroma become flattened and surround a primary oocyte (which develops from oogonia). These flattened cells ultimately form the ovarian follicle and are therefore called follicular cells.



(2) The flattened follicular cells now become columnar. Follicles upto this stage of development are called primordial follicle.

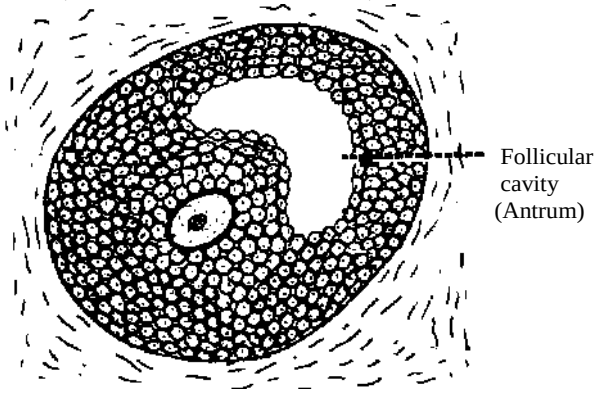


(3) A membrane called the zona pellucida, now appears between the follicular cells and the oocyte.

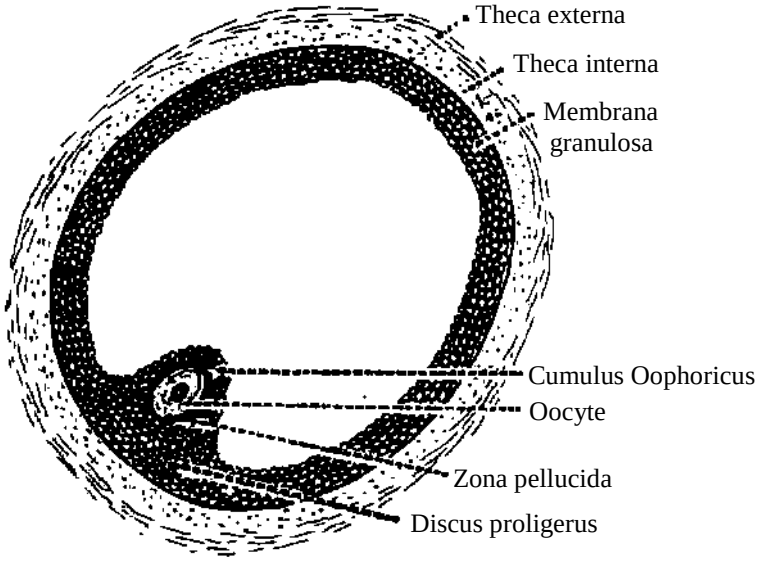


(4) After puberty the follicular cells proliferate now to form several layers of cells to form the membrana granulosa. These cells are now called granulosa cells.

(5) A cavity appears within the membrana granulosa. It is called the **antrum.** With the appearance of this cavity, the follicle is formed (follicle means a small sac).



(6) The cavity of the follicle rapidly increases in size and gets filled with a fluid called liquor folliculi. Due to increases in the size of the cavity the wall of the follicle (formed by granulosa cells) becomes relatively thin. The oocyte now lies eccentrically in the follicle, surrounded by some granulosa cells that are called as cumulus oophoricus. The cells that attached it to the wall of the follicle are called as discus proligerus or Germ hill.



(7) As the follicle expands, the stromal cells surrounding the membrana granulosa become condensed to form a covering called the theca Interna. The cells of theca interna (Thecal cells) afterwards secrete a hormone called oestrogen.

(8) Outside the theca interna some fibrous tissue become condensed to form another covering called the theca externa. The ovarian follicle is now fully formed and is now called the Graafian follicle.

The granulosa cells lying in the close vicinity of the ovum (Secondary oocyte) and zona pellucida, become elongated to form the corona radiata.

After 13 days of menstrual cycle (on 14^{th} day when cycle is ideally for 28 days) Graafian follicle is ruptured & egg is released.

After ovulation the ruptured Graafian follicle is called corpus luteum. Soon after ovulation, the granulosa cells of Graafian follicle proliferate & these cells look yellow due to accumulation of pigment called Lutein. These cells are called lutein cells.

Before ovulation the follicle was avascular but soon after ovulation blood vessels grow & corpus luteum becomes filled with blood. Central part filled with blood is called corpus haemorrhagicum. Lutein cells synthesise the progesterone hormone.

If fertilization occurs in fallopian tube, the corpus luteum then becomes stable for next nine months. If fertilization does not occur then the corpus luteum starts degenerating after about 9 days of it's formation. The degeneration is completed in 14 days to form corpus albicans, which gradually disappears. Progesterone hormone maintains pregnancy and repairs the wall of uterus to make its surface adhesive to help in implantation.

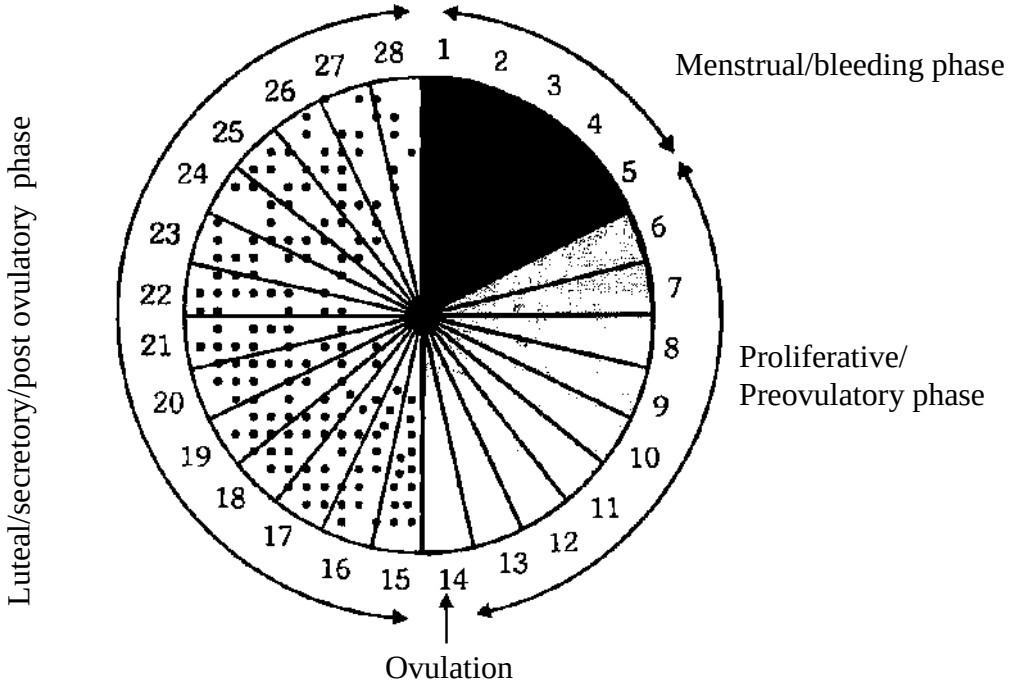
The total number of follicles in the two ovaries of a normal young adult woman is about four lakhs. However most of them undergo regression and disappear due to death and are disposed off by the phagocytes during the reproductive year of the females. This is termed as follicular atresia. This is

responsible for limited number of gamete production in females. Generally, only one ovum is liberated in each menstrual cycle, by alternate ovaries. Only about 450 ova are produced by a human female over the entire span of her reproductive life which lasts till about 40-50 years of age.

Although most of the follicular cells and the oocytes undergo degeneration during follicular atresia, some thecal cells, formed from the stroma and located around the follicle, persists and become active. These are called **interstitial cells.** These cells secrete small amount of androgen.

MENSTRUAL CYCLE

Duration – 28 days Ideally (Range 24 to 32 days)



This is exhibited by primate group of animals. In this cycle the female body prepares itself for a possible pregnancy. If the pregnancy does not occur then the body aborts all preparation done and restarts the prepration for pregnancy again in a monthly cyclic manner.

Menstrual cycle has three main phase.

(i) Bleeding phase or menstruation phase.

(ii) Proliferative/Preovulatory/follicular phase or oestrogenic phase.

(iii) Secretory/Post ovulatory/luteal phase or progesteronic phase.

(i) Bleeding Phase :

The cycle starts with bleeding phase in its first four to five days. During this bleeding the part of the layer of endometrium called decidua gets shed off.

(ii) Preovulatory/Proliferative phase :

After first four or five days this phase begins. During this phase, Due to release of some GnRH, Pituitary secretes some FSH to stimulate the ovarian follicle. The ovarian follicle now begins to develop. Its theca interna now starts secreting an increasing amount of oestrogen.

The rising level of oestrogen causes the endometrium to proliferate and thicken. It also causes increase in the vascularity and glandularity of the endometrium.

Rising level of oestrogen also provides a positive feed back to the hypothalamus. Due to this, the hypothalamus releases more of GnRH . This GnRH induces the pituitary to release more of FSH. The rising FSH levels now cause:

(i) further growth and development ovarian follicle to form Graafian follicle

(ii) even further release of oestrogen from the theca interna of this developing follicle.

As the oestrogen level goes on rising, by the end of 10^{th} day the extreme levels of oestrogen (which have by then caused maturation of Graafian follicle and growth of endometrium) now give a negative feed back to the pituitary causing a fall in FSH secretion but also causing a rise in LH secretion. Now the LH secretion from the pituitary goes on rising. This abrupt rise (on 11^{th} to 13^{th} day) in LH concentration in blood is called as LH surge. This LH now causes the Graafian follicle to rupture after partial completion of II meiotic division in oocyte and thus the secondary oocyte is released. The release of egg (secondary oocyte) which occurs 14 day is called as **ovulation.**

(iii) Post ovulatory/secretory phase :

After ovulation the ruptured Graafian follicle transforms into corpus luteum. The granulosa and theca cells of the ruptured Graafian follicle (which is now called as corpus luteum) is found only in mammals and contain a yellow lutein or carotene pigment.

In case of absence of pregnancy this corpus luteum will get degenerated after 14 days of its formation. The degenerated corpus luteum is called **corpus albicans** (white body).

Function of corpus luteum :- Stimulated by the rising levels of LH, the corpus luteum secretes progesterone hormone. The progesterone facilitates the preparation of endometrium for receiving the embryo and its implantation. Progesterone inhibits the contractions of uterus so that the pregnancy could be maintained. Progesterone also inhibits development of next new ovarian follicle.

If pregnancy occurs then the corpus luteum persists and secretes progesterone. Progesterone is important to maintain the pregnancy and it is thus called as the **pregnancy homone.** By the fourth month of pregnancy, the placenta has developed completely. This placenta now takes over the job of further progesterone secretion. Ovary also secretes some amount of relaxin at the time of parturition.

If pregnancy does not occur after ovulation, then as the progesterone level rise, its rising levels inhibits the release of GnRH from hypothalamus. Due to this FSH, LH secretion by pituitary falls and thereby progesterone secretion by the corpus luteum (which was due to influence of LH) also now falls.

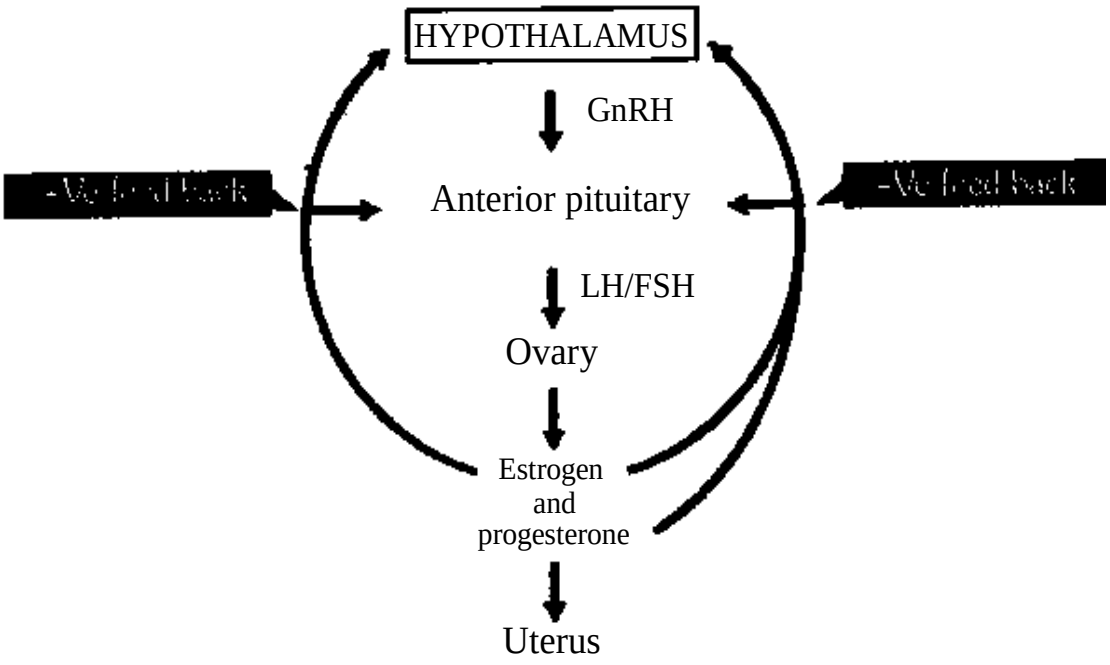
As the progesterone level drops, the corpus luteum begins to degenerate and transform in corpus albicans (which can not secrete progesterone). Due to the lack of progesterone : -

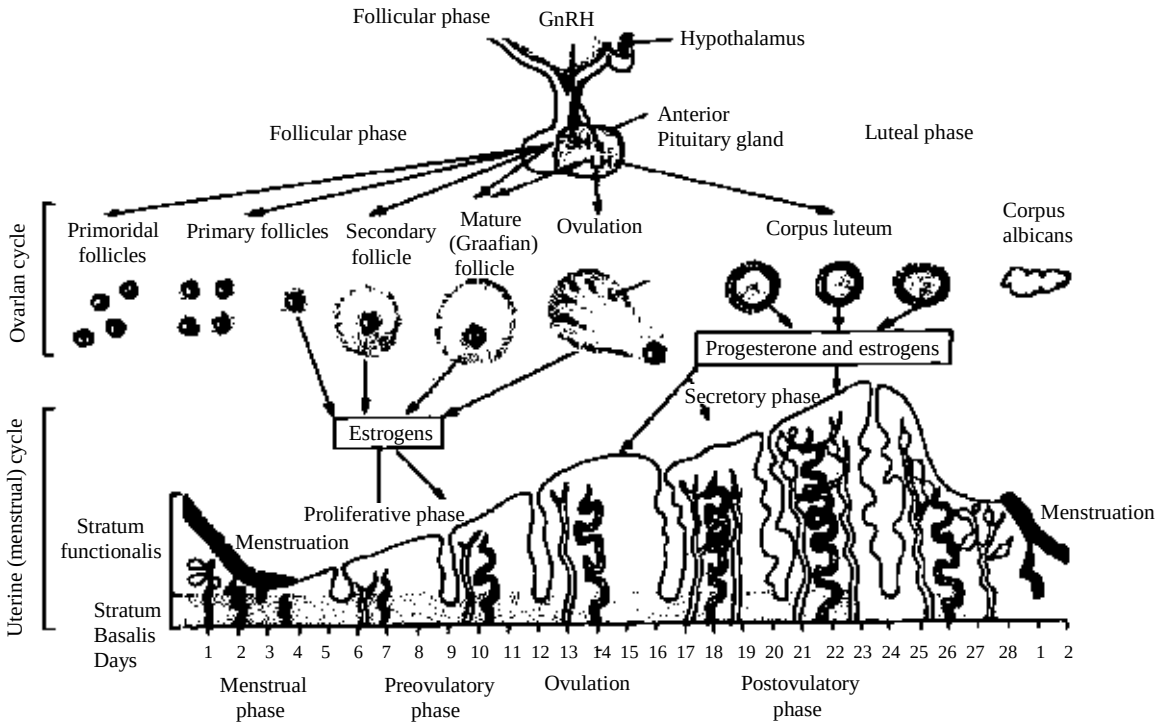
(i) The overgrown endometrium now begin to break and separate from the inner uterine wall causing bleeding.

(ii) The uterine contraction (which was till now inhibited due to presence of progesterone) now start. Thus the separated endometrium along with blood is now being passed out via vaginal route. This is again the beginning of next menstrual or bleeding phase.

Total loss of blood per day is about 20 ml, so an average 40 to 80 ml blood/cycle is lost. This blood can not clot. The period between ovulation and next menstrual bleeding (post ovulatory period) is always constant (i.e. is 14 days). However the ovulation date may vary (causing a change in pre ovulatory period). After ovulation the ovum is viable only for two days, while sperms introduced into the vagina can survive for a maximum of four days.

On basis of the above data, safe period method for family planning is calculated. Normally it is considered to be day 1 to day 8 and then from day 20 to day 28.



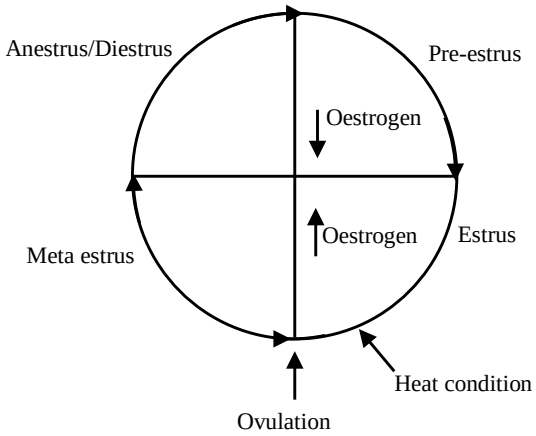


Schematic representation of menstrual cycle

ESTRUS CYCLE

t estrus or menstrual cycle. Except primate mammals, the estrus cycle is found in all mammals. Menstrual cycle is found in primates

On the basis of estrus cycle these mammals are of 2 types :



(1) Mono estrus animals :

Only 1 cycle is found in breeding season.

(2) Poly-estrus animals :

More than 1 estrus cycles are found in the breeding season. Estrus cycle completes in 4-stages :-

(1) Pre-estrus phase
(2) Estrus phase
(3) Meta-estrus phase
(4) Anestrus/Diestrus phase

Pre Estrus :

1st step of estrus cycle. In this stage, **oogenesis** starts in the ovary. In this stage estrogen level is minimum. In low concentration of estrogen some changes occur in uterus.

(i) Blood capillaries become more branched

(ii) Muscles of uterus become more active

(iii) The stratified glandular epithelial layer of uterus known as **stratum Basalis** now divides actively to form new stratified epithelial layer known as **stratum functionale.**

In this phase no copulation occurs between opposite sexes.

Estrus phase :

In this phase secondary follicle develops in the ovary. Concentration of estrogen is increased. Due to high concentration of estrogen following changes occur in the uterus.

(i) The diameter of blood vessels increases
(ii) The circulation also increases
(iii) The muscles of uterus divide to cause further thickening of myometrium.
(iv) Cells of stratum functionale enlarge. New connective tissue & mucous cells are developed.
(v) Mammary glands also get enlarged.

Due to high concentration of estrogen the sex urge develops in the female. This stage is known as **heat condition.** Copulation occurs only in this phase.

Meta-Estrus Phase :

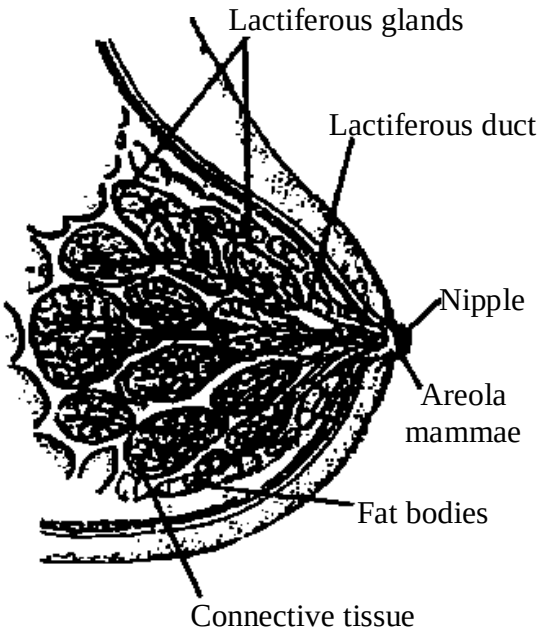
All physiological symptoms which develop in this phase are similar to normal pregnancy even in absence of fertilization, so this phase is known as **Pseudo-pregnancy.** If fertilization occurs in fallopian tube then this phase extends upto parturition. If fertilization does not occur then this phase becomes short. Keratinization occurs in stratum functionale. myometrium is gradually reduced. Blood vessels gradually constrict. Mammary glands are gradually reduced.

Anestrus/Diestrus phase :

Stratum functionale is destroyed by stratum basalis by phagocytosis. Mammary gland, myometrium & blood vessels of uterus become completely normal. So it is the **inter phase stage** of two estrus cycle & is also known as **diestrus phase.** In monoestrus animals the anestrus phase is the diestrus phase also.

BREAST

Breast also serves as an accessoary reproductive organs in women. Human female possesses a pair of breasts containing mammary glands. These are situated in the front of the thorax on pectoral muscles. Each mammary gland has 15-20 tubulo-alveolar lobules contained in its connective tissue. The space between the lobules is filled with fatty tissue. The lobules contain milk glands in the form of bunches of grapes, which secrete milk. Numerous small ductules arise from each lobule, combine to form a lactiferous duct. Such lactiferous ducts open independently in the nipple.



A nipple is pigmented structure which is a elevated knob like structure at the apical part of mammary glands. The area adjacent to the nipples is also deeply pigmented, which is known as areola mammae.

The area surrounding the nipples become much elevated because of the accumulation of fat and by the presence of muscles, Nipple is provided with about 15-20 small pores of 0.5 mm size. In men the nipples are vestigial.

Mammary glands produce a nutritive fluid, milk for the nourishment of young ones. milk protects the young ones from various infections upto some months after birth.

For development of breast four hormones are work :

(1) Oestrogen - For growth of tubules of breast glands.

(2) Progesteron - For growth of follicles of breast glands.

(3) Prolactin- Milk synthesyzing hormone in breast glands.

(4) Oxytocin - Help in milk ejection.

BRIEF REVIEW

Development of secondary sex organ –

Male	Female
Wolffian duct or Mesonephric duct → Epididymis or Vas deferens Regression of Mullarian duct or Paramesonephric duct → Seminal vesicle Urogenital sinus–Prostate Genital tubercle – Penis	Mullarian duct – Fallopian tube, uterus and vagina (Oviduct) Genital tubercle – Clitoris

Puberty –

The age of sexual maturity is called puberty.

Accessory sex character first appear in puberty

Puberty occurs in girls at the age of 11 to 14 year

Puberty occurs in boys at the age of 12-15 year

At puberty, women starts producing ova.

Age of puberty in rabbit – 5-7 months.

	BOYS	***GIRLS***
1. Gonadal	Enlargement of the testes, Spermatogenesis begins	*Ovarian cycle and ovulation begins*
2. Accessary Sexual Organ	Penis, prostate, seminal vesicles and epididymis grow in mass	*Uterus, vagina, fallopian tube, vulva increase in size. Endometrium shows menstrual changes and menstruation occurs*
3. Hairs and voice	Appearance of Beards, moustache, axillary, pubic & chest hair. Low pitch sound	*Typical femine distribution of hairs (axilla + pubis but no hair on chest or abdomen). Breasts grow. Fat deposition leading to feminine contours. High pitch sound.*

4. Somatic	Skeletal system – grows in length Muscular system – Grows in bulk & strength	*Pelvic girdle becomes roomy and bigger than pectoral (opposite to boys, where pectoral girdle is bigger and pelvic much less roomy)*
5. Psychic	Attraction for girls begins.	*Attraction for boys.*
6. Hormonal	*FSH, LH and testosterone secretion – all rise.*	*FSH, LH, estrogen, progesterone secretion – all rise.*

Vagina -

- The vagina is lined by a stratified squamous epithelium without any glands.
- During reproductive life the vagina contains **lactobacillus acidophilus or dorderlein's bacilli** which keeps the vaginal pH between **4 to 5** by producing lactic acid from glycogen.

Gametogenesis –

Formation of gametes for sexual reproduction.

- Germ cells in vertebrate gonads are produced by both mitosis and meiosis.

Clupein protein is present only in Man & fishes sperm

Menstrual Cycle –

Cyclic change in the reproductive tract of primate females.

- In healthy women, menstruation occurs at intervals of about 28 days.
- **Menarche –** Starting of menstruation in girls at about 13 years.

Menopause –

Menopause is the period of life when menstruation naturally stops.

- Menopause occurs in females at the age of 45-50 years.
- Ability of reproduce is lost in the female after menopause.

Estrous Cycle –

- Occurs in non-primate mammals.
- There is no menstruation at the end of estrous cycle.
- The estrous cycle runs only during the breeding season
- Monoestrous animal = Dog, Fox, Dear, Bat
- Polyestrous animal = Mouse, Pig, Squirrel, Cat

Gestation period -

- Duration between fertilization and Parturition.
  (1) Rabbit = 28 – 32 days.
  (2) Man = 270 – 290 days
  (3) Rat = 20 – 22 days

Gynaecomastia – Development of breast in the male

Amenorrhoea – Absence of menstruation cycle

Hysterectomy – Surgical removal of uterus.

Oopherectomy – Removal of ovaries.

World's oldest mother – Roshanna Della corte, an italian woman, gave birth to a baby boy on july 18, 1994 at the age of 62. She is believed to be the world's oldest mother.

Adolescence – Period between puberty and Maturity.

Path of sperms in mammals –

- Seminiferous tubules – Rete testis – vasa efferentia – Epididymis – Vasa deferens – Urinogenital Chamber – Urethra.
- Sterility results if sperms count is $< 20 \times 10^6$/ml or > 40% sperm are immotile.
- Use of antibiotics, smoking marijuana, alcohol, hot bath, high fever can also cause temporary drop in sperm count.

Spontaneous ovulator –

Ovulation occurs without any induction.

Ex. Most animals (Human)

Induced ovulator (Reflex ovulator) = ovulation occurs after copulation

Ex. Rabbit

Rut Cycle or Testicular cycle –

Reproductive cycle of male is known as rut cycle.

Vesectomy –

Cutting and tieing vas deferens

Tubectomy (salpingectomy) –

Cutting and ligating fallopian tube.

- Labia majora of female in homologous to scrotal sacs.
- Clitoris in female is homologus to penis.
- Prostatic utricle is homologous to vagina of female.
- Seminal vesicle is homologous to uterus (oviduct).
- Colostrum is the first milk produced after child birth
- In contraceptive pills oestrogen and progesterone are present in variable **combination.**

Human sperm –

60 μ long, of this 55μ is the length of the tail.

- In menstrual cycle proliferative phase is of 10-12 days and it is under the influence of oestrogen hormone.
- Luteal or secretory phase of menstrual cycle is of 14 days and it is under influence of progesterone hormone & It is always of fixed duration.

Testicle –

Testis + Epididymis

- Epididymis is 3m long in rabbit while 6 to 8 m long in man.
- Maximum no. of leydig's cells are in the testis of pig.
- Function of epididymis = functional maturity and storage of sperms.

Os-penis or Baculum –

In whale, Bat, Rat, Seal, Monkey etc. Ossification occur in septum present between two corpora cavernosa

Semen –

- Milky, viscous, alkaline fluid.
- pH = 7.3
- Quantity is 2.5 – 4 ml at one ejaculation.
  Maximum growth in human embryo occurs in fourth month of pregnancy and minimum in last months.

  Pseudopregnancy = Due to hormonal disturbance, false symptoms of pregnancy may appear.

  Menarche - Begining of menstrual cycle in females.
- Size of human ovary – Length × Width × Thickness
  3 to 3.5 cm 2 to 2.5 cm 1 to 1.8 cm
- Diameter of Graafian follicle – 1 to 1.5 cm
- Fallopian tube length – 10 cm to 12 cm.

Hermaphroditism : Those animals who have both type of sex organs are called Hermaphrodite animals, it is found in tapeworms and earthworms.

Capacitation : Reactivation of sperm called capacitation. It occurs in vagina. After ejaculation of sperm in vagina, cervical mucous secretory fluid dissolves inhibitory substances related to sperm & provide more energy to sperm.

Precautious puberty : Menstruation occurs before the age of 9 years.

Pregnancy is detected with the help of HCG in urine of pregnant lady.

Cryptomenorrhoea: Occurrence of menstrual symptoms without external bleeding.

Dysmenorrhoea : Painful menstruation is called Dysmenorrhoea.

Menorrhagia : A normal menstrual blood loss is 50-80 ml, and does not exceed 100 ml. In menorrhagia the menstrual cycle is unaltered but the duration and quantity of the menstrual blood loss are increased.

Polymenorrhoea : In polymenorrhoea or epimenorrhoea, the menstrual cycle is reduced from the normal of twenty-eight days to a cycle of two to three weeks and remains constant at that increased frequency.

Male hormonal contraceptive : Research is on for development of a male contraceptive by administration of progesterone hormone.

Oral contraceptive pill –

It is commonly used method for contraception. It is in the form of oral tablet. If menstrual cycle is to start on I^{st} day then OCP is taken from 5^{th} day & regulary uto 21st day. Remaining 7 day iron & folic acid tablet is given instead of hormonal preparations.

Mechanism of Action –

(i) It inhibits Ovulation (main action)

(ii) It prevents fertilization due to atrophy or hypertrophy of endometrium.

(iii) Formation of thick cervical mucus plug, so that entry of sperm is resisted.

PARTURITION

Parturition is a **hormonal process** Many hormonal changes take place during it.

1. The progesterone secretion stops, so the placenta dissolves and the foetus is separated from the walls of the uterus.
2. Pituitary gland secretes **Oxytocin** in more amount This hormone induces intense contractions in the uterus. Due to these contractions, the foetus starts moving towards the vagina, The labour pain during child-birth, is due to this hormone. **Oxytocin is the main parturition hormone.** After parturition, Oxytocin stimulates milk-let down by **milk ejection reflex.**
3. **Relaxin** hormone is secreted by the placenta and the ovary. This hormone relaxes the pubic-symphysis i.e. the joint between the pelvic-girdles. So more space is available to the foetus to move out.

GESTATION PERIOD

The time from fertilization to parturition is termed as gestation-period. Rabbit has gestation-period of 28-30 days. In one time 4-6 young- ones are born in rabbit (Maximum = 8). The group of young-ones born the at same time are called Litter. At the time of birth the young ones of rabbit are blind, deaf and uncovered with fur. They become normal in next 4-5 days. The young-ones of Hare are normal at the time of birth. In humans **actual gestation period is 9 months -7 days.**

In human expected date of delivery (EDD) = I^{st} day of last menstrual cycle plus 9 months + 7 days.

In Rabbit copulation occurs in breeding season which extend from Feb to June.

No specific breeding season is found in human being.

During copulation male ejaculates semen in vagina, this process is called as **insemination.**

In rabbit ovulation occurs after 12-24 hour of copulation. That means copulation is necessary for ovulation. Females in which coitus induction is compulsary for ovulation are called as **induced or reflex ovulator.**

In human female ovulation occurs in presence of FSH & LH. Coitus in not necessary for inducing ovulation. Such a female is called as **spontaneous ovulator.**

After copulation oxytocin hormone is secreted from pituitary gland. This hormone promotes the peristalsis in the fallopian tube.

Due to action of estrogens and progesterone, the endometrium of uterus is prepared for implantation. By the 6^{th} to 7^{th} day, embryo is implanted into endometrium (most commonly at the **fundus**).

BIRTH CONTROL MEASURES

Main aim of birth control measures is to check the population growth rate. These include the using of various types of contraceptives. An ideal contraceptive should be :

(i) User friendly.
(ii) Easily available and cheaper.
(iii) Effective but also reversible.
(iv) With no or least side effects.

These have a **significant role** in checking the uncontrolled growth of human population.

Annual Birth, Death and Growth Rates for Human Population in 1973.

Region	Population (Millions)	Average Birth Rate	Average Death Rate	Annual Growth Rate Percent
1. World	3,860	33	13	2.0
2. Developed Countries	1,120	17	9	0.8
3. Developed Countries	2,740	39	14	2.5

1. **Mechanical or Barrier methods**. These prevent coming closer of ovum and sperms and are of following types :

(a) Condoms : These are rubber or latex sheaths which are put on penis before starting coital activity (copulation). These are popularly called **"Niordh".** These check pregnancy by preventing deposition of sperms in the vagina. These are very widely used contraceptive in India because they are easily available, low cost, reliable, effective and with no side effects. These can be self inserted so give privacy to the user. These also prevent the spread of sexually transmitted diseases (STDs) including AIDS, syphilis, etc.

MALE CONDOM

Female condoms : Hindustan Latex of India and Female Health Company of England have agreed to introduce female condoms in India. It is made of **skinfriendly polyurethane** which acts as a clip on the vagina wall blocking the passage to the womb. These were first marketed in Britain in early 90's and are being used in the USA, Brazil, South Africa, Zimbabwe, France, Sri Lanka, Thailand and Nepal.

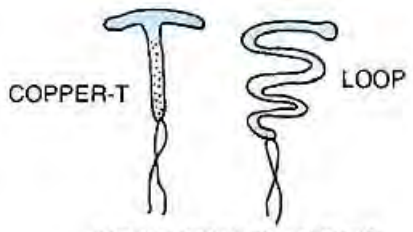
FEMALE CONDOM

(b) Diaphragms and Cervical caps : These are made of rubber and are fitted in vagina of female and check the entry of sperms in uterus. These are reusable.

CERVICAL CAP

(c) Intrauterine Devices (IUD). These include **copper-T** and **loops** which are fitted in the uterus and prevent the fertilization of the egg or implantation of the embryo. Several types of IUDs are available e.g.,

- Non-medicated IUDs e.g., Lippes loop.
- Copper-releasing IUDs e.g., CUT, Cu7 and multiload 375. These release Cu ions which decrease the sperm motility.



INTRA-UTERINE DEVICES

- Hormone-releasing IUDs whose hormones make the uterus unsuitable for implantation.

  But these have certain drawbacks like occasional haemorrhage, chances of infection and spontaneous expulsion.

2. Chemical methods. These are of following types:

(a) Spermicidal tablets, jellies, paste and creams are introduced in the vagina before coital activity. These kill sperms. Common spermicidal chemicals used are lactic acid, citric acid, potassium permanganate, zinc sulphate etc.

(b) Physiological (oral) devices. Birth control pills are taken through mouth. These contain a combination of synthetic progestins (acting like progesterone) and estrogens, so called **"combined pills"**. These progestogen-estrogen combinations inhibit secretion of FSH and LH from anterior lobe of pituitary gland so these inhibit ovulation from the ovary and implantation. These also retard the entry of sperms in the uterus. Commonly used hormonal pills in India are: **Mala-D** (daily) and Saheli (weekly). Saheli contains a non-steroidal preparation called **centchroman**. It has high contraceptive value and with very few side effects.

Drawbacks. These birth control pills generally have side effects like nausea, breast-tenderness, weight gain and breakthrough bleeding (bleeding between menstrual perilous) etc.

(c) Implants : These contain either only progesterone or progesterone-estrogens combinations. These are placed under the skin and act like the oral pills. These have much longer effective period and are found to be very effective even within 72 hours of coitus.

3. Natural or Traditional methods. These methods of birth control depend upon the natural rhythms of a woman. These include following methods

(a) **To abstain.** It involves refraining from coital activity.

(b) **Coitus interruptus.** It involves withdrawing penis by male before ejaculation so that semen is not deposited in the vagina. It is **oldest method** of voluntary fertility control. This method has certain limitations:

– some sperms me, be deposited in the vagina

– even before the sexual climax. may develop psychological and physiological problems to both the partners.

(c) **Rhythm period.** A weak before and a weak after the menstrual phase are supposed to be safe periods for sexual intercourse. It reduces the chances of pregnancy by about 80 per cent. It is so because :

(i) Ovulation generally occurs on 15th day of the menstrual cycle (range is 13-16th day of the cycle).

(ii) Viability period of ovum is of about two to three days.

(iii) Viability period c;f sperm is of only one day.

The period from 10th to 17th day (both days inclusive of the menstrual cycle is called **danger or risk or fertile period** and unprotected sexual intercourse should be avoided during this period. However, rhythm period is not 100 per cent safe period. Effectiveness of rhythm period can be increased by basal body temperature or BBT technology.

(d) Lactational amenorrhoea. It has been noticed that during the period of intense lactation after the parturition, the mother does not undergo menstruation and ovulation so the chances of conception are nearly nil. It also has no side effects but is effective only upto a maximum period of six months after parturition.

4. **Surgical methods.** These methods block the gamete transport and so prevent conception. These methods are highly effective but their reversibility is very low. These include following measures:

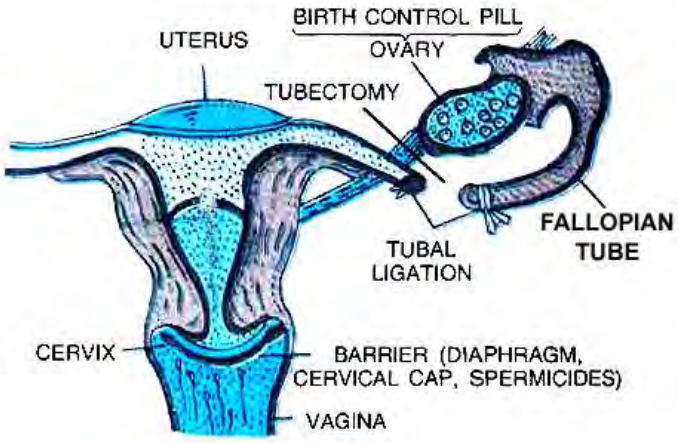
(a) Male sterilization : It is a permanent method of birth control in which either testes are surgically removed, called **castration**, or cutting of the vas deferens, called **vasectomy**.

(b) Female sterilization : Methods of female sterilization include:

(i) **Ovariectomy** involves surgically removal of ovaries.

(ii) **Tubectomy** involves cutting of Fallopian tubes.

(iii) **Tubal ligation** involves blocking of Fallopian tubes by an instrument called **laparoscope**.



SPECIAL POINT

- **Test tube baby -** First test tube baby born in England at 25th July 1978 it was a girl and discovered by Dr. **Steptoet. Edward** the name of baby "*Louis Joy born"*.
- In test tube baby" invitro fertilization" takes place. Invitro early development upto (32 cell stage). Transfer of 32 cells stage zygote into the uterus.
- **Surrogate mother -** When some time uterus of (mother) female used then this female is called. surrogate mother.
- Hysterectomy - Remove of uterus by the surgery.
- Research for a **contraceptive pill for men** that works by deforming the sperms in showing positive results. Its contraceptive effects are reversible.
- '**Injectable contraception** is a reversible and long-acting chemical birth control method. It is most common method of family planning in Indonesia. Injectables contain a synthetic version of progresterone which stops ovulation from the ovaries for about three months.
- Contraceptive pill, **Levonorgestrol**, can prevent pregnancy if taken within five days of unprotected sexual act.
- **Contraceptive corn :** Scientists have produced a genetically-modified com crop which produces antisperm antibodies and suggest that a plant-based jelly may be prepared that will not only prevents pregnancy but also the spraed of STDs. This m ay save the world from over-population.
- Since **September, 2003**, Beijing (China) has started issuing **condom cards** to married womenwho can get condoms free from vending machines.
- ***Family Planning Progmmme*** *was adopted as a* ***National Programme in 1995 A.D.*** *Now it has been renamed as* ***Family Welfare Programme.***

- *Only 12 per cent of males use either vasectomy or condoms indicating about their poor participation in family planning programmes so shifting most of burden on to the fameles .*
- ***Mirena:** A new contraceptive plastic coil coated in copper and is fitted ill the uterus. Copper acts as a spermicide while coil releases small amounts of an artificial hormone, **gastrogen** which further increases the spermicidal effect of copper. It combines both mechanical and hormonal contraceptive methods and has been found to have more than 99% efficary. It is introduced by a Germany company.*
- ***Central Drug Research Institute (Lucknow)** has developed a plant based spermicidal cream **"Consap"** from Reetha **(Sapindus mukrosii).***
- ***Nim-76:** It is a neem based, pre-coital vaginal contraceptive cream having spermicidal properties. It has been developed by Defence Institute of Physiology and Allied Sciences (DIPAS), **New Delhi.** It has been found to be safe, non-hormonal and non-toxic with no side effects. Nim-76 punctures the sperm skin cuasing leakage of cellular contents so preventing the capacitation of sperms. It also has both anti-bacterial and anti-fungal properties.*
- ***India's first test tube baby was "Kanupriya Agarwal".** India's second test tube baby was **"Kumari Harsha".** She was born on August 6, 1986.*
- ***NCP, (National Commission on Population)** in its **April, 2001 report,** has recommended to the Central Government that **"target-free approach",** which believed in the freedom of choice principle being followed after 1996, should be dispensed with. It has recommended that the country should actively preach **"two-children per couple dictum"** as a national goal. It is because that number of sterilisation has drastically declined in the four high-fertility states of U.P. (4.6 TFR), Rajasthan (4.1), Bihar (3.9) and Madhya Pradesh (3.8).*

EXERSICE – 1

Q.1 Which represents mullerian duct in male rabbit-
(1) Vasa differentia
(2) Seminal vesicle
(3) Seminiferous tubule
(4) Urethra

Q.2 Testes permanently retained in abdominal cavity in-
(1) Elephant (2) Whale
(3) Armadillo (4) All the above

Q.3 Temp. of scrotum as compared to abdominal cavity is less by
(1) 1ºC (2) 5ºC (3) 3–4ºC (4) 10ºC

Q.4 Outer coat of seminiferous tubules composed of fibrous connective tissue called
(1) Tunica propria (2) Lamina propria
(3) Plica semilunaris (4) Tunica albuginea

Q.5 Wall of vasa defrense-
(1) Ciliated glandular
(2) Ciliated non glandular
(3) Non-ciliated glandular
(4) Non-ciliated non glandular

Q.6 At the time of sexual excitation, muscles in penis-
(1) Relaxed (2) Contracted
(3) Collapsed (4) None

Q.7 Which acid occur in semen-
(1) Citric acid (2) Mallic acid
(3) Oxalo acetic acid (4) Succinic accid

Q.8 Secretion of which gland have high percentage of fructose
(1) Prostate gland (2) Cowper's gland
(3) Seminal vesicle (4) Tyson

Q.9 If testes of a male rabbit not transferred from abdominal cavity to testes sac then -
(1) Rabbit dies
(2) Absence of male characters
(3) Development of male reproductive system will not occur
(4) Sperms will not form

Q.10 Function of seminal fluid –
(1) Sexual attraction
(2) To provide motility to sperm
(3) To provide a medium for movement of sperms
(4) To provide acidic medium

Q.11 True placenta of mammals is formed by-
(1) Amnion (2) Chorion
(3) Allantois (4) Allanto-chorion

Q.12 Meaning of oligospermia is-
(1) Eggs are fertilized in less number
(2) Less number of sperms in semen
(3) Less munber of sperms formed
(4) Inactive sperm are formed

Q.13 If cowpers gland is removed which of the following will be affected
(1) Sexual attraction (2) Fertilization
(3) Hardness of penis (4) Copulation

Q.14 Atretic follicle is-
(1) Which are not developed completely and degenerate
(2) Other name of which corpus luteum
(3) Which excluded its oocytes
(4) None of the above

Q.15 Non-primate mammals have
(1) Menstrual cycle (2) Oestrous cycly
(3) Breeding seasons
(4) Non–breeding season

Q.16 For ovulation in reflex ovulators-
(1) Coitus is necessary
(2) Coitus is not necessary
(3) Plenty of food is necessary
(4) None

Q.17 Meaning of witches milk is :–
(1) Milk of cow
(2) Milk of women
(3) Sometimes, milk which occurs in infant
(4) None

Q.18 Vasa-efferentia connect the :–
(1) Testes with epididymis
(2) Kidneys with cloaca
(3) Testes with urinogenital duct (4) None

Q.19 Oral-contraceptives prevent the :–
(1) Fertilisation
(2) Ovulation
(3) Implantation
(4) Entrance of sperms in vagina

Q.20 Uterus-masculinus in mammals is derived from:–
(1) Inguinal canal (2) Wolfian's duct
(3) Mullerian duct (4) Ejeculatory duct

Q.21 HCGH is secreted by :–
(1) Trophoblastic cells (2) Interstitial cells
(3) Placenta (4) Mature ovum

Q.22 In mammals, failure of testes to descend into scrotum is known as :–
(1) Paedogenesis (2) Castration
(3) Cryptorchidism (4) Impotency

Q.23 Clupein protein occurs in :–
(1) Human sperms (2) Avian sperms
(3) Human ova (4) All the above

Q.24 A polyoestrous mammalian is :–
(1) Man (2) Cat
(3) Horse (4) All the above

Q.25 In aged person inguinal canal becomes loose, and some parts of intestine is pushed into scrotal sac, the disease is called :–
(1) Myctalopia (2) Hernia
(3) Achondroplasia (4) None

Q.26 Maximum growth in human foetus occurs at which month is :–
(1) Fourth month (2) Sixth month
(3) Second month (4) Eight month

Q.27 Which of the following is ageing pigment :–
(1) Lipofuschin (2) Viletemin
(3) 1 & 2 both (4) Bilirubin

Q.28 Vagina of the female reproductive system is–
(1) Primary sex organs
(2) Accessory sex organs
(3) Secondary sex organs
(4) None

Q.29 External/acessory sexual characters first appear in–
(1) Childhood (2) Puberty
(3) Foetus (4) None of these

Q.30 Puberty occurs in females at the age of :–
(1) 8 - 10 years (2) 11 - 14 years
(3) 15 - 17 years (4) 18 - 20 years

Q.31 Voice is high pitched in :–
(1) Aged persons (2) Adult males
(3) Boys (4) Females

Q.32 First menstrual cycle is :–
(1) Parturition (2) Menopause
(3) Menarche (4) Implantation

Q.33 Non-primate mammals have :–
(1) Menstrual cycle (2) Oestrous cycle
(3) Breeding seasons (4) None

Q.34 Partitions of testis develop from :–
(1) Tunica albuginea (2) Tunica vasculosa
(3) Tunica vaginalis (4) Rete testis

Q.35 Vasa-efferentia posses :–
(1) Peristalsis
(2) secretory cells
(3) Ciliated cells
(4) Opening for seminal vasicle

Q.36 Vas-defrens arises from :–
(1) Cauda-epididymis (2) Caput epididymis
(3) Corpus-epididymis (4) Rete testis

Q.37 Common duct formed by union of vas-defrens and duct from seminal vesicle is :–
(1) Urethra (2) Tunica-vasculosa
(3) Ejaculatory duct (4) Spermatic cord

Q.38 Menstrual cycle is generally of :–
(1) 21 days (2) 28 days
(3) 30 days (4) 3-5 days

Q.39 In menstrual cycle ovum is released during –
(1) Beginning (2) Midway
(3) End (4) Any time

Q.40 Menstrual cycle is controlled by :–
(1) Estrogen and progesterone of ovary
(2) FSH and LH of pituitary
(3) Both 1 & 2
(4) FSH of pituitary

Q.41 Stages in menstrual cycle are :–
(1) Recovery and proliferative phase
(2) Proliferative and secretory phase
(3) Proliferative, secretory and menstrual phase
(4) Recovery phase, secretory phase and phase of menstrual flow

Q.42 Luteal phase is the other name of :–
(1) Follicular phase
(2) Proliferative phase
(3) Menstrual flow phase
(4) Secretory phase

Q.43 Follicular phase of menstrual cycle is the other name of :–
(1) Proliferative phase (2) Secretory phase
(3) Luteal phase (4) Menstruation

Q.44 Mesorchium is peritoneal covering of :–
(1) Ovary (2) Testis
(3) Kidney (4) Liver

Q.45 Phase of menstrual cycle in human that last for 7-8 days is-
(1) Follicular phase (2) Ovulatory phase
(3) Luteal phase (4) Menstruation phase

Q.46 Uterus of female reproductive system is–
(1) Primary sex organs
(2) Secondary sex organs
(3) Accessory sex organs
(4) External sex character

Q.47 Scrotum communicates with abdominal cavity through :–
(1) Urethra (2) Inguinal canal
(3) Vas-deferens (4) Epididymis

Q.48 Ostium is the aperture present in :–
(1) Oviduct (2) Fallopian funnel
(3) Ovisac (4) Cloaca

Q.49 Progesterone is :–
(1) Carbohydrate (2) Steroid
(3) Protein (4) Sterol

Q.50 Tunica albuginea is the covering around :–
(1) Ovary (2) Testis
(3) Kidney (4) Heart

Q.51 Eggs from ovary are released in :–
(1) Oviduct (2) Uterus
(3) Ovary (4) Coelom

Q.52 Development of foetus takes place in :–
(1) Vagina (2) Uterus
(3) Ovary (4) Oviduct

Q.53 Lower narrow end of uterus is called :–
(1) Urethra (2) Cervix
(3) Clitoris (4) Vulva

Q.54 The functional unit of testis of man is :–
(1) Uriniferous tubules
(2) Malpighian tubules
(3) Seminiferous tubules
(4) Acini or lobules

Q.55 Chorionic gonadotropin is secreted by :–
(1) Pituitary (2) Ovary
(3) Placenta (4) Uterus

Q.56 Vitelline membrane is a :–
(1) Primary egg membrane
(2) Secondary egg membrane
(3) Tertiary egg membrane
(4) None of these

Q.57 An egg of bird was coated with varnish and then incubated. The egg did not hatch because the developing embryo :–
(1) could not excrete and died
(2) Could not utilize yolk in the presence of excess amount of nitrogenous wastes
(3) Died because of depleted O_2 supply
(4) Died because of toxic effect of varnish

Q.58 Vaginal cavity of tunica vaginalis is found in –
(1) Ovaries of female (2) Testis of male
(3) Vagina of female (4) None

Q.59 Testesterone is secreted by :–
(1) Leydigs cells (2) Sertoli cells
(3) Pituitary (4) Testis

Q.60 Penile urethra traverses through :–
(1) Corpora cavernosa (2) Corpus spongiosum
(3) Corpus callosum (4) Corpus striatum

Q.61 Seminiferous tubules are composed of :–
(1) Spermatogonia (2) Glandular epithelium
(3) Sensory epithelium (4) Germinal epithelium

Q.62 In mammals, the testes are located in :–
(1) Abdominal cavity
(2) Thoracic cavity
(3) Extra-abdominal cavity
(4) Pericardial cavity

Q.63 Oviduct of frog is actually :–
(1) Bidder's canal (2) Vagina
(3) Mullerian duct (4) None

Q.64 Sperms and ova are :–
(1) Ectodermal in origin (2) Mesodermal in origin
(3) Endodermal in origin (4) All of the above

Q.65 Eggs of female from are stored temporarily before spawning in :–
(1) Oviduct (2) Ovisac
(3) Ureter (4) All

Q.66 Proximal part of oviduct is fimbriated funnel and distal part is :–

(1) Corpus luteum (2) Bartholin's gland
(3) Uterus (4) None

Q.67 Germinal epithelial cells are cuboidal and these are found in :–

(1) Testes (2) Ovary
(3) Both (4) None

Q.68 Subtentacular cells are found in :–

(1) Testis of mammal (2) Ovary of mammal
(3) Testis of Ascaris (4) Pancrease of frog

Q.69 In rabbit, the uterus is :–

(1) Bicornute (2) Multicornute
(3) Unicornute (4) Acornute

Q.70 Abnormal conditining when the mammary glands of man become female like is called–

(1) Feminization (2) Gonochorism
(3) Gynacomastism (4) Gynoecism

Q.71 Bundles of muscles in penis are

(1) Corpus cavernosa (2) Corpus spongiasum
(3) Both (4) None

Q.72 Corpus ablicans is found in ovary it is also found in–

(1) Liver (2) Pituitary
(3) Kidney (4) None

Q.73 Vivipary is found in–

(1) Frog (2) Lizard
(3) Snake (4) Rabbit

Q.74 Which of following animals do not show parental care over their youngs

(1) Mammals (2) Lizards
(3) Fowl (4) Bat

Q.75 Sexual reproduction in larval condition is known as–

(1) Paedogamy (2) Autogamy
(3) Isogamy (4) Anisogamy

Q.76 Degenerative process of follicles or eggs in ovary is called :–

(1) Metagenesis (2) Atresia
(3) Regression (4) None

Q.77 Progesterons is active during–

(1) Menstrual phase (2) Proliferative phase
(3) Follicular phase (4) Secretory phase

Q.78 Glans penis is covered by :–

(1) Areomembrana (2) Prepuce
(3) Metrium (4) None

Q.79 Lutein cells are found in :–

(1) Primary follicle (2) Corpus albicans
(3) Corpus luteum (4) All

Q.80 Pseudopregnancy is due to :–

(1) Polyembryony
(2) Absence of fertilisation after ovulation
(3) Harmonal disturbance
(4) All the above

Q.81 After fertilisation corpus luteum remains for

(1) 8 days (2) 28 days
(3) 80 days (4) 280 days

Q.82 If both male and female systems are present in one individual, the animal is called as :–

(1) Dioecious (2) Protandrous
(3) Unisexual (4) Monoecious

Q.83 Greater maturation of sperms in rabbit takes place in :–

(1) Testes (2) Vasa-efferentia
(3) Epididymis (4) Spermatic cord

Q.84 The bidder canal help to pass out :–

(1) Ova (2) sperms
(3) Both (4) None

Q.85 Which of the following is immortal–

(1) Germ cells (2) Pituitary cells
(3) Brain cells (4) All of these

Q.86 Gestation period is minimum in :–

(1) Rabbit (2) Man
(3) Elephant (4) Mouse

Q.87 The testis are abdominal in :–

(1) Elephant (2) shrew
(3) both (4) None

Q.88 Number of prostate glands in rabbit :–

(1) One (2) Two
(3) Many (4) None

Q.89 The expulsion of completely developed foetus from the uterus is known as :–

(1) Ovulation (2) oviposition
(3) Gestation (4) Parturition

Q.90 Inner layer of graffian follicle is :–
(1) Theca externa (2)Membrana granulosa
(3) Theca interna (4) Discus proligerous

Q.91 Kangaroo is :–
(1) Oviparous (2) Viviparous
(3) Ovo-viviparous (4) None

Q.92 In prototherians mammary glands are :–
(1) Absent
(2) Present in male only
(3) Present in female only
(4) Present in male and female both

Q.93 Central stroma of ovary is made up of :–
(1) White fibrous tissue
(2) Reticular connective tissue
(3) Adipose connective tissue
(4) None

Q.94 Mammalian follicle was first described by :–
(1) Leeuvenhock (2) R.D. Graaf
(3) Spallangi (4) Von Baer

Q.95 Frog is :–
(1) Reflex ovulator (2) Spontaneous ovulator
(3) Induced ovulator (4) None

Q.96 Amnion foetal membrane is absent in :–
(1) Fish (2) Frog (3) Both (4) None

Q.97 Germ-hill is found in :–
(1) sperm (2) Ovum
(3) Graffian follicle (4) All

Q.98 Antrum is filled with fluid and is found in :–
(1) Bone-marrow of bone
(2) Cavity of brain
(3) Graffian follicle of ovary
(4) Pericardium of heart

Q.99 One of the following is fibrous layer of follicle–
(1) Theca exterma (2) Theca interna
(3) Membrana granulosa (4) Vitelline membrane

Q.100 Fertilization in man and rabbit takes place in fallopian tube of oviduct in :–
(1) Proximal part (2) Distal part
(3) Basal part (4) None

Q.101 Scrotal sacs of man and rabbit are connected with the abdominal cavity by :–
(1) Ingunal canal (2) Haversian canal
(3) Vagina cavity (4) Spermatic canal

Q.102 Clitoris in female mammals is :–
(1) Homologous to penis
(2) Analogous to penis
(3) Functional penis in females
(4) None functional

Q.103 Eggs librated from ovary in :–
(1) Secondary oocyte stage
(2) Primary oocyte stage
(3) Oogonial stage
(4) Mature ovum stage

Q.104 Cryptorchidism is a condition of testes :–
(1) Unable to descend in scrotal sacs
(2) Unable to produce sperms
(3) Having been surgically removed
(4) Having remained undeveloped

Q.105 In mammals, the testes occur in scrotal sacs, outside the viscrea becasue of the :–
(1) Less space in abdominal cavity
(2) Presence of rectum
(3) Long vas-deferens
(4) Requirement of low temperature for spermatogenesis

Q.106 Number of polar bodies formed in rabbit in ovary is–
(1) 1 (2) 2 (3) 3 (4) 4

Q.107 Sertoli cells are found in :–
(1) Testis of cockroach (2) Liver of mammals
(3) Testis of mammals (4) Testis of frog

Q.108 Graffian follicle are found in :–
(1) Testis of mammal (2) Ovary of frog
(3) Ovary of cockroach (4) Ovary of mammals

Q.109 Sertoli cells are found in :–
(1) Seminiferous tubules
(2) Germinal epithelium
(3) Cauda epididymis
(4) Caput epididymis

Q.110 Cells of Leydig occur in :–
(1) Liver (2) Ovary
(3) Testis (4) Spleen

Q.111 Location and secretion of leydig cells are :–
(1) Liver – choleseterole
(2) Ovary – oestrogen
(3) Testis – Testosterone
(4) Pancrease – Glucagon

Q.112 A female gland corresponding to prostate of males is–
(1) Perineal gland (2) Bartholin's gland
(3) Bulbourethral gland (4) None

Q.113 Site of fertilisation in mammal is :–
(1) Ovary (2) Uterus
(3) Vagina (4) Fallopian tube

Q.114 Endomatrium is lining of :–
(1) Testis (2) Urinary bladder
(3) Uterus (4) Ureter

Q.115 A secondary character is :–
(1) Breast (2) Ovary
(3) Testis (4) Thyroid

Q.116 Percentage of syndromes increases in the offspring of a lady over 40 years. It is because :–
(1) Oocytes grow older (2) Ovaries are weak
(3) Placenta is weak (4) Lady becomes weak

Q.117 Seminal vesicle is present at the junction of–
(1) Prostate and urethra
(2) Prostate and vas-deferens
(3) Prostate and cowper's gland
(4) vas-deferns and testis

Q.118 Expanded proximal part of oviduct in female is :–
(1) Uterus (2) Fallopian tube
(3) Fimbriated funnel (4) Vestibule

Q.119 The excretory structure formed after ovulation (release of ovum from graphian follicle) is :–
(1) Corpus albicans (2) Corpus callosum
(3) Corpus leuteum (4) Corpus striatum

Q.120 Seminiferous tubules occur in :–
(1) Liver (2) Kidney
(3) Ovary (4) Testis

Q.121 Spermatogenesis and sperm differentiation are under the control of :–
(1) FSH (2) LH
(3) Testesterone (4)Parathyroid Harmone

Q.122 Development of sperm from spermatids take place in–
(1) Leyding's cells (2) Kuffer's cells
(3) Spermatogonia (4) Sertoli cell

Q.123 Seminal fluid has sperms and secretions of–
(1) Prostate, cowper's & Bertholin glands
(2) Seminal vesicle, Prostate & cowper's glands
(3) Seminal vescile, ureter & Prostate gland
(4) Follicles, ureters and prostate gland

Q.124 Cowper's gland are found in :–
(1) Male mammals (2) Female mammals
(3) Male amphibians (4) Female amphibians

Q.125 Corpus luteum is :–
(1) Excretory (2) Endocrine
(3) Digestive (4) Reproductive

Q.126 Enzyme hyaluronidase is synthesised in :–
(1) Head of sperm
(2) Golgibody of acrosome
(3) Lysosome of acrosome
(4) Tail of sperm

Q.127 Tail less sperm occurs in :–
(1) Frog (2) Ascaris
(3) Amphioxus (4) Rabbit

Q.128 Sertoli cells occurs in :–
(1) Human testis (2) Frog testis
(3) Human ovary (4) Frog ovary

Q.129 Loss of reproductive capacity in women after age of 45 years is :–
(1) Menstruation (2) Ageing
(3) Menopause (4) Menarche

Q.130 On fertilization, the urine of would be ..... other contains :–
(1) LH (2) Progesterone
(3) FSH (4) HCG

Q.131 Which one is primary sex organ :–
(1) Scrotum (2) Penis
(3) Testis (4) Prostrate

Q.132 Estrous cycle is indication of :–
(1) Breeding period (2) Estrogen secretion
(3) Pregnancy (4) Menopause

Q.133 A female gland correspounding to prostate of males is :–
(1) Bartholin's gland (2) Bulbourethral gland
(3) Clitoris (4) None

Q.134 Ovulation occurs under the influence of :–
(1) LH (2) FSH
(3) Estrogen (4) Progesterone

Q.135 Somatic chromosomes number is 40. What shall be chromosomal number in the cell of seminiferous tubules :–
(1) 40 (2) 20 (3) 10 (4) 40 and 20

Q.136 In 28 day human ovarian cycle, ovulation occurs on :–
(1) Day 1 (2) Day 5 (3) Day 14 (4) Day 28

Q.137 Progesterone is secreted by :–
(1) Corpus Luteum (2) Thyroid
(3) Thymus (4) Testis

Q.138 Release of oocytes from ovary is :–
(1) Gestation (2) Ovulation
(3) Parturition (4) Implantation

Q.139 Growth and maturation of graphian follicle is controlled by :–
(1) FSH-LH (2) FSH-LTH
(3) ACTH-LH (4) GH-ADH

Q.140 Monoestrous cycle animals have :–
(1) One ovulation each month
(2) One egg
(3) One breeding season in a year
(4) One menses each month

Q.141 Testis of rabbit occur :–
(1) One either side of dorsal aorta
(2) Inside body
(3) On side of kidneys
(4) In scrotal sacs

Q.142 Estrous cycle is characteristic of :–
(1) Human females
(2) Mammalian females
(3) Mammalian females other than primates
(4) Mammals

Q.143 Sugar fructose is present in the secretion of–
(1) Prostate gland (2) Perineal gland
(3) Cowper's gland (4) Seminalvesicle

Q.144 Spermatozoa are nourished during their development :–
(1) Sertoli cells (2) Interstitial cells
(3) Connective tissue cells
(4) None

Q.145 Sertoli cells are found in the–
(1) Frog's testis (2) Rabbit's testis
(3) Cockroach's testis (4) Liver of frog

Q.146 Acrosome is made up of–
(1) Mitochondria (2) Centrioles
(3) Golgi bodies (4) Ribosomes

Q.147 Achrosome aids the sperm to–
(1) Penetrate vittelline membrane of ovum
(2) Find ovum
(3) Swim
(4) Higher activity

Q.148 Secondary sex organ is :–
(1) Testis (2) Breast
(3) Beard (4) Vasa deferens

Q.149 Cessation of menstrual cycle is called :–
(1) Ovulation (2) Menopause
(3) Puberty (4) Implantation

Q.150 What would happen if vasa deferantia of man are cut:–
(1) Sperms are non nucleate
(2) Spermatogenesis does not occur
(3) Seman is with out sperms
(4) Sperm are non motile

EXERSICE – 2

Q.1 Which one is primary sex organ ?
(1) Scrotum (2) Penis
(3) Testis (4) Protate

Q.2 Which is correct ?
(1) Menstrual cycle is present in all mammals
(2) Menstrual cycle occurs in human, apes and old monkey
(3) Estrous cycle occurs in all mammals
(4) Most mammals are ovoviviparous

Q.3 Yellow corpus luteum occurs in a mammal in
(1) Heart to initiate heart beat
(2) Skin to function as pain receptor
(3) Brain and connects cerebral hemispheres
(4) Ovary for secretion of progesterone

Q.4 A female gland corresponding to prostate of males is-
(1) Bartholin's gland
(2) Bulbourethral gland
(3) Clitoris
(4) None of the above

Q.5 What would happen if vasa deferentia of man are cut ?
(1) Sperms become non-nucleated
(2) Spermatogenesis does not occur
(3) Semen is without sperms
(4) Sperms are nonmotile

Q.6 When a sperm enters an egg of frog
(1) first polar body is formed
(2) first meiotic division occurs
(3) fertilization process is completed
(4) second meiotic division occurs

Q.7 Largest egg in Animal Kingdom is that of
(1) Whale (2) Elephant
(3) Albatrosses (4) Ostrich

Q.8 Human ovarian cycle is of 28 days, ovulation occurs on
(1) Day 1^{st} (2) Day 5^{th}
(3) Day 14^{th} (4) Day 28^{th}

Q.9 Germinal epithelium of ovary has
(1) Cuboidal cells (2) Columnar cells
(3) Squamous cells (4) Stratified cells.

Q.10 Growth and maturation of Graafian follicle is controlled by
(1) FSH – LH (2) FSH – LTH
(3) ACTH – LH (4) GH – ADH

Q.11 Oestrous cycle is characteristic of:
(1) Human females
(2) Mammalian females
(3) Mammalian females other than primates
(4) Mammals

Q.12 Sugar fructose is present in the secretion of :
(1) Prostate gland (2) Perineal glands
(3) Cowper's glands (4) Seminal vesicles

Q.13 Ovulation occurs under the influence of
(1) LH (2) FSH
(3) Estrogen (4) Progesterone

Q.14 During copulation a slimy alkaline fluid to lubricate vagina is secreted by
(1) perineal gland (2) Cowper's gland
(3) Prostate gland (4) None of these

Q.15 Which one is hermaphrodite ?
(1) Earthworm, Hydra and Leech
(2) Cockroach, Earthworm and Hydra
(3) Earthworm, Ascaris and Leech
(4) Ascaris, cockroach and Hydra

Q.16 Testis of Whale are
(1) Extra-abdominal (2) Half external, half internal
(3) Internal (4) None of these

Q.17 Prostate gland is present :
(1) On ureter (2) On kidney
(3) On testis (4) Around urethra

Q.18 Prostate gland produces a secretion for-
(1) Attracting sperms
(2) Stimulating sperm activity
(3) Inhibiting sperm activity
(4) None of the above

Q.19 Corpus luteum develops from
(1) Oocyte (2) Nephrostome
(3) Graafian follicle (4) None of the above

Q.20 If egg is not fertilized, the corpus luteum
(1) Reduces secretion of progesterone
(2) Changes in corpus albicans
(3) Enhances secretion of progesterone
(4) None of these

Q.21 Failure of testes to descend into scrotum is-
(1) Vasectomy (2) Cryptorchidism
(3) Impotency (4) Tubectomy

Q.22 Sertoli cells are involved in
(1) Excretion (2) Respiration
(3) Nutrition of sperms (4) All of the above

Q.23 In male mammals primary germ cell is-
(1) cortex of testis (2) medulla of testis
(3) germinal epithelium (4) apical part of embryo

Q.24 Secretion of progesterone by corpus luteum is initiated by :
(1) MSH (2) LH
(3) Testosterone (4) Thyroxine

Q.25 Graafian follicle of ovary secretes-
(1) Estrogen (2) Relaxin
(3) Progesterone (4) Cortisone

Q.26 Seminal vesicles are located in-
(1) Caput epidydimis (2) Uterus
(3) Below Cowper's glands (4) Glans penis

Q.27 Number of eggs released in the life time of a woman is approximately :
(1) 40 (2) 400
(3) 4000 (4) 20000

Q.28 Correct sequence of hormone secretion from beginning of menstruation is :
(1) FSH, progesterone, estrogen
(2) Estrogen, FSH, progesterone
(3) FSH, estrogen, progesterone
(4) Estrogen, progesterone, FSH

Q.29 From acrosome which secrets :
(1) hyaluronic acid (2) hyaluronidase
(3) TSH (4) fertilizin

Q.30 When embryonic development is completed in mother but the embryo not accept nutritent from mother. Which is known as :
(1) ovoviparous (2) viviparous
(3) oviparous (4) all of these

Q.31 Sertoli cells are associated with :
(1) Kidney of Rabbit (2) ovary of Frog
(3) Testis of Rabbit (4) Ovary of Rabbit

Q.32 Gametes formation in animlals is found in-
(1) ovary (2) gonads
(3) gall bladder (4) testis

Q.33 All mechanism of living organism divided in two parts:
(1) reproduction and evolution
(2) nutrition and metabolism
(3) synthesis and metabolism
(4) reproduction and internal autonomy

Q.34 Corpus leuteum secrets :
(1) LH (2) progesterone
(3) estrogen (4) FSH

Q.35 Glands secreting male sex hormone are :
(1) Leydig cells (2) Seminiferous tubules
(3) Vasa deferentia (4) Testes

Q.36 Cervix occurs in :
(1) Kideny
(2) Fallopian tube
(3) Between uterus and vagina
(4) Epididymis

Q.37 Graafian follicle contains
(1) Many oocyte
(2) Many sperm
(3) A single oocyte
(4) Site for egg fertilization

Q.38 Mullerian duct is
(1) Ureter (2) Urethra
(3) Sperm duct (4) Oviduct

Q.39 Progesterone level falls during :
(1) Gestation (2) Menopause
(3) Lactation (4) Mensturation

Q.40 Head of epididymis present at head of testis is called:
(1) Caput epididymis (2) Cauda epididymis
(3) Vas deferens (4) Gubernaculum

Q.41 Human female reaches menopause at the age of about-
(1) 25 years (2) 35 years
(3) 50 years (4) 70 years

Q.42 Orchidectomy is the surgical removal of :
(1) Liver (2) Kidney
(3) Ovary (4) Testis

Q.43 This is a method of birth control :
(1) IUDs (2) GIFT
(3) HTF (4) IVE-ET

Q.44 Sertoli cells occur in :
(1) Ovary (2) Kidney
(3) Testis (4) Thyroid

Q.45 Fertilization in Rabbit occurs in :
(1) Uterus (2) Fallopian tube
(3) Ovary (4) Water

Q.46 Process of fusion of haploid cells is-
(1) Cell cycle (2) Meiosis
(3) Mitosis (4) Syngamy

Q.47 Antrum is cavity of -
(1) Ovary (2) Graafian follicle
(3) Blastula (4) Gastrula

Q.48 Estrogen is secreted by :
(1) Corpus luteum
(2) Membranous granulosa of Graafian follicle
(3) Germinal epithelium of ovary
(4) Pituitary gland

Q.49 A normal human being will have :
(1) 22 pairs of chromosome
(2) 23 pairs of chromosome
(3) 44 pairs of chromosome
(4) 46 pairs of chromosome

Q.50 The human sprem cell contains :
(1) 46 chromosomes
(2) 44 chromosomes and 1X and 1Y chromosome
(3) 23 chromosomes only
(4) 23 chromosomes and 1X and 1Y chromosome

Q.51 The mobility of a mature sperm is controlled by the mitochondria located in the
(1) head (2) middle piece
(3) tail (4) in all of them

Q.52 In mammals corpus Inuteum is found in which organ?
(1) Brain (2) Ovary
(3) Liver (4) Eyes

Q.53 In Rabbit at the time of fertilization zygote is formed in :
(1) coelom (2) fallopian tube
(3) uterus (4) vagina

Q.54 Bartholin's glands are situated-
(1) On either side of vas deferens in human
(2) On the sides of the head of some amphibian
(3) At the reduced tail end of birds
(4) On either sides of vagina in human

Q.55 The site of fertilization in mammals is-
(1) Ovary (2) Abdominal
(3) Uterus (4) Fallopian tube

Q.56 Natural parthenogenesis is found in-
(1) Housefly (2) Honey bee
(3) Drosophila (4) All of these

Q.57 Spermatogenesis is induced by -
(1) FSH (2) ACTH
(3) ICSH (4) ATH

Q.58 Vivipary is found in-
(1) Coelenterata (2) Protozoa
(3) Rabbit (4) Pisces

Q.59 Testis fail to descent in scrotal sacs, this condition is called as-
(1) Cryptorhcidism (2) Hernia
(3) Castrection (4) None of these

Q.60 Sertoli cells are present in-
(1) Testis (2) Ovary
(3) Blood (4) Lymph

Q.61 In the urinogenital organs of rabbit which one of the following part is present in male but not in female?
(1) Vagina (2) Urethra
(3) Fallopian tube (4) Vasa deferens

Q.62 Which one of the following events is correctly matched with the time period in a normal menstrual cycle ?
(1) Release of egg : 5th day
(2) Endometrium regeneration : 5-10 days
(3) Endometrium secretes nutrients for implantation : 11-18 days
(4) Rise in progesterone level : 1 - 15 days

Q.63 Withdrawal of which of the following hormones is the immediate cause of menstruation?
(1) Progesterone (2) Estrogen
(3) FSH (4) FSH-RH

Q.64 Which part of ovary in mammals acts as an endocrine gland after ovulation?
(1) Stroma (2) Germinal epithelium
(3) Vitelline membrane (4) Graffian follicle

Q.65 In the human female, menstruation can be deferred by the administration of-
(1) Combination of FSH and LH
(2) Combination of estrogen and progesterone
(3) FSH only (4) LH only

Q.66 Compared to a bull a bullock is docile because of-
(1) Higher levels of cortisone
(2) Lower levels of blood testosterone
(3) Lower level of adrenaline/noradrenalin in its blood
(4) Higher level of thyroxin

Q.67 Outer coat of seminiferous tubules is composed of fibrous connective tissue called -
(1) Tunica propria (2) Lamina propria
(3) Plica semilunaris (4) Tunica albuginea

Q.68 At the time of sexual excitation, muscles in penis-
(1) Relaxed (2) Contracted
(3) Collapsed (4) None

Q.69 Pseudopregnancy is due to
(1) Polyembryony
(2) Absence of fertilisation after ovulation
(3) Hormonal disturbance
(4) All the above

Q.70 Secretion of which gland has high percentage of fructose -
(1) Prostate gland (2) Cowper's gland
(3) Seminal vesicle (4) Tyson

Q.71 If testes of a male rabbit are not transferred from abdominal cavity to testes sac then -
(1) Rabbit dies
(2) Absence of male characters
(3) Development of male reproductive system will not occur
(4) Sperms will not form

Q.72 Uterus-masculinus in mammals is derived from-
(1) Inguinal canal (2) Wolfian's duct
(3) Mullerian duct (4) Ejeculatory duct

Q.73 In mammals, failure of testes to descend into scrotum is known as -
(1) Paedogenesis (2) Castration
(3) Cryptorchidism (4) Impotency

Q.74 Clupein protein occurs in -
(1) Human sperms (2) Avian sperms
(3) Human ova (4) All the above

Q.75 Partitions of testis develop from -
(1) Tunica albuginea (2) Tunica vasculosa
(3) Tunica vaginalis (4) Rete testis

Q.76 Vas-deferens arises from -
(1) Cauda-epididymis
(2) Caput epididymis
(3) Corpus epididymis
(4) Rete testis

Q.77 Common duct formed by union of vas-deferens and duct from seminal vesicle is -
(1) Urethra (2) Tunica-vasculosa
(3) Ejaculatory duct (4) Spermatic duct

Q.78 Mesorchium is peritoneal covering of
(1) Ovary (2) Testis
(3) Kidney (4) Liver

Q.79 Scrotum communicates with abdominal cavity through -
(1) Urethra (2) Inguinal canal
(3) Vas-deferens (4) Epididymis

Q.80 Tunica albuginea is the covering around -
(1) Oviduct (2) Testis
(3) Kidney (4) Heart

Q.81 Testosterone is secreted by -
(1) Leydigs cells (2) Sertoli cells
(3) Pituitary (4) Testis

Q.82 Penile urethra traverses through -
(1) Corpora cavernosa
(2) Corpus spongiosum
(3) Corpus callosum
(4) Corpus striatum

Q.83 Seminiferous tubules are composed of -
(1) Spermatogonia (2) Glandular epithelium
(3) Sensory epithelium (4) Germinal epithelium

Q.84 Sustentacular cells are found in -
(1) Testis of mammal (2) Ovary of mammal
(3) Testis of Ascaris (4) Pancrease of frog

Q.85 Bundles of muscles in penis are -
(1) Corpus cavernosa (2) Corpus spongiosum
(3) Both (4) None

Q.86 Glans penis is covered by -
(1) Areomembrana (2) Prepuce
(3) Metrium (4) None

Q.87 Lutein cells are found in -
(1) Primary follicle (2) Corpus albicans
(3) Corpus luteum (4) All

Q.88 The testis are abdominal in -
(1) Elephant (2) shrew
(3) Both (1) & (2) (4) None

Q.89 Number of prostate glands in rabbit -
(1) One (2) Two
(3) Many (4) None

Q.90 Scrotal sacs of man and rabbit are connected with the abdominal cavity by -
(1) Inguinal canal (2) Haversian canal
(3) Vagina cavity (4) Spermatic canal

Q.91 Cryptorchidism is a condition of testes
(1) Unable to descend in scrotal sacs
(2) Unable to produce sperms
(3) Having been surgically removed
(4) Having remained undeveloped

Q.92 In mammals, the testes occur in scrotal sacs, out side the viscera because of the -
(1) Presence of urinary bladder
(2) Presence of rectum
(3) Long vas-deferens
(4) Requirement of low temperature for spermatogenesis

Q.93 In between spermatogonia are found -
(1) Germinal cells (2) Sertoli cells
(3) Epithelial cells (4) Lymph space

Q.94 Sertoli cells are found in -
(1) Testis of cockroach (2) Liver of mammals
(3) Testis of mammals (4) Testis of frog

Q.95 Which acessory genital gland occurs only in male mammal
(1) Bartholin's gland (2) Perineal gland
(3) Prostate gland (4) All

Q.96 Seminal vesicle is present at the junction of -
(1) Prostate and urethra
(2) Prostate and vas-deferens
(3) Prostate and cowper's gland
(4) vas-deferns and testis

Q.97 During differentiation the spermatids remain associated with -
(1) Leyding's cells (2) Kuffer's cells
(3) Spermatogonia (4) Sertoli cell

Q.98 Seminal fluid has sperms and secretions of -
(1) Prostate, cowper's & Bartholin glands
(2) Seminal vesicle, Prostate & cowper's glands
(3) Seminal vesicle, ureter & Prostate gland
(4) Follicles, ureters and prostate gland

Q.99 Sugar fructose is present in the secretion of -
(1) Seminal vesicle (2) Perineal gland
(3) Cowper's gland (4) Bartholin's gland

Q.100 Spermatozoa are nourished during their development by -
(1) Sertoli cells (2) Interstitial cells
(3) Connective tissue cells
(4) None

Q.101 Sertoli cells are found in the
(1) Frog's testis (2) Rabbit's testis
(3) Cockroach's testis (4) Liver of frog

Q.102 What whould happen if vasa deferantia of man are cut
(1) Sperms are non nucleate
(2) Spermatogenesis does not occur
(3) Semen is with out sperms
(4) Sperm are non motile

Q.103 If the epididymis is not presented then what will happen
(1) sperm life cycle is short
(2) Early cross the pathway
(3 Functional maturation is early
(4) Sperm will be incapable for fertilization

Q.104 In majority of pre mature babies testis is situated in
(1) Scrotal sac
(2) Abdominal cavity
(3) Descending pathway
(4) Come into scrotal sac but not attached properly

Q.105 After vasectomy what happens
(1) Absence of semen
(2) Sperm are dead or inactive
(3) Sperm immediately disapear in semen
(4) Sperm gradually disapear in semen

Q.106 Sertoli cells occur in -
(1) Human testis (2) Frog testis
(3) Human ovary (4) Frog ovary

Q.107 Which one is primary sex organ
(1) Scrotum (2) Penis
(3) Testis (4) Prostrate

Q.108 If somatic chromosomes number is 40. What shall be chromosomal number in the cell of seminiferous tubules -
(1) 40 (2) 20
(3) 10 (4) 40 and 20

Q.109 Testis of rabbit occur
(1) One either side of dorsal aorta
(2) Inside body
(3) On side of kidneys
(4) In scrotal sacs

Q.110 Meaning of oligospermia is
(1) Eggs are fertilized in less number
(2) Less number of sperms in semen
(3) More number of sperms formed
(4) Inactive sperm are formed

Q.111 In aged person inguinal canal becomes loose, and some part of intestine is pushed into scrotal sac, the disease is called
(1) Myctalopia (2) Hernia
(3) Achondroplasia (4) None

Q.112 Vagina of the female reproductive system is -
(1) Primary sex organs
(2) Essential sex organs
(3) Secondary sex organs
(4) None

Q.113 External/acessory sexual characters first appear in-
(1) Childhood (2) Puberty
(3) Foetus (4) Adulthood

Q.114 Puberty occurs in females at the age of -
(1) 8-10 years (2) 11-14 years
(3) 15-17 years (4) 18-20 years

Q.115 Mesovarium is peritoneal covering of -
(1) Ovary (2) Testis
(3) Kidney (4) Liver

Q.116 At puberty woman start producing
(1) Sperms (2) Urine
(3) Young ones (4) Ova

Q.117 Ostium is the aperture present in
(1) oviduct (2) Fallopian funnel
(3) Ovisac (4) Cloaca

Q.118 Progesterone is
(1) Carbohydrate (2) Steroid
(3) Protein (4) Sterol

Q.119 Eggs from ovary are released in -
(1) Oviduct (2) Kidney
(3) Ureter (4) Coelom

Q.120 Lower narrow end of uterus is called -
(1) Urethra (2) Cervix
(3) Clitoris (4) Vulva

Q.121 Vaginal cavity of tunica vaginalis is found in -
(1) Ovaries of female
(2) Testis of male
(3) Vagina of female
(4) None

Q.122 Oviduct of frog is actually -
(1) Bidder's canal (2) Vagina
(3) Mullerian duct (4) None

Q.123 Sperms and ova are -
(1) Ectodermal in origin
(2) Mesodermal in origin
(3) Endodermal in origin
(4) All of the above

Q.124 Proximal part of oviduct is fimbriated funnel and distal part forms the -
(1) Corpus luteum (2) Bartholin's gland
(3) Uterus (4) None

Q.125 Germinal epithelial cells are cuboidal and these are found in -
(1) Testes (2) Ovary
(3) Both (4) None

Q.126 In rabbit the uterus is -
(1) Bicornute (2) Multicornute
(3) Unicornute (4) Acornute

Q.127 Corpus albicans is found in ovary it is also found in-
(1) Liver (2) Brain
(3) Kidney (4) None

Q.128 Degenerative process of follicles or eggs in ovary is called -
(1) Metagenesis (2) Atresia
(3) Regression (4) None

Q.129 Process by which Graffian follicles are formed in the ovary is known as -
(1) Oogenesis (2) Luteirisation
(2) Folliculogenesis (4) All

Q.130 Central stroma of ovary is made up of -
(1) Fibrous connective tissue
(2) Reticular tissue
(3) Adipose connective tissue
(4) None

Q.131 Mammalian follicle was first described by
(1) Leeuvenhock (2) R.D. Graaf
(3) Spallangi (4) Von Baer

Q.132 Antrum is filled with fluid and is found in -
(1) Bone-marrow of bone
(2) Cavity of brain
(3) Graffian follicle of ovary
(4) Pericardium of heart

Q.133 One of the following is fibrous layer of follicle
(1) Theca externa (2) Zona pellucida
(3) Membrana granulosa
(4) Vitelline membrane

Q.134 Fertilization in man and rabbit takes place in fallopian tube of oviduct in -
(1) Proximal part (2) Distal part
(3) Basal part (4) None

Q.135 Eggs librated from ovary in human in
(1) Secondary oocyte stage
(2) Primary oocyte stage
(3) Oogonial stage
(4) Mature ovum stage

Q.136 Graffian follicle are found in
(1) Testis of mammal (2) Ovary of frog
(3) Ovary of cockroach
(4) Ovary of mammals

Q.137 Site of fertilization in mammal is -
(1) Ovary (2) Uterus
(3) Vagina (4) Fallopian tube

Q.138 Endometrium is lining of
(1) Testis (2) Urinary bladder
(3) Uterus (4) Ureter

Q.139 A secondary sexual character is
(1) Breast (2) Ovary
(3) Testis (4) Thyroid

Q.140 Expanded proximal part of oviduct in female is -
(1) Uterus (2) Fallopian tube
(3) Fimbriated funnel (4) Vestibule

Q.141 The Endocrinal structure formed after ovulation (release of ovum from graafian follicle is -
(1) Corpus albicans (2) Corpus callosum
(3) Corpus luteum (4) Corpus striatum

Q.142 Human beings are
(1) Ovoviviparous (2) Oviparous
(3) parthenogenetic (4) Viviparous

Q.143 At the time of birth, ovum is the form of
(1) Oogonia (2) Primary oocyte
(3) Sec. oocytes (4) Egg

Q.144 Cowper's glands are found in
(1) Male mammals
(2) Female birds
(3) Male amphibians
(4) Female amphibians

Q.145 Corpus luteum is
(1) Excretory (2) Endocrine
(3) Digestive (4) Reproductive

Q.146 A female gland corresponding to prostrate of males is
(1) Bartholin's gland (2) Bulbourethral gland
(3) Clitoris (4) None

Q.147 Progesterone is secreted by
(1) Corpus Luteum (2) Thyroid
(3) Thymus (4) Testis

Q.148 Growth and maturation of graafian follicle is controlled by -
(1) FSH-LH (2) FSH-LTH
(3) ACTH-LH (4) GH-ADH

Q.149 If cowpers gland is removed which of the following will be affected -
(1) Sexual attraction (2) Fertilization
(3) Hardness of penis (4) Copulation

Q.150 Atretic follicle is -
(1) Which are not developed completely and degenerate
(2) Other name of which corpus luteum
(3) Which excluded its oocytes
(4) None of the above

Q.151 For ovulation in reflex ovulation -
(1) Coitus in necessary
(2) Coitus is not necessary
(3) Plenty of food is necessary
(4) None

Q.152 Oral-contraceptives prevent the
(1) Fertilisation (2) Ovulation
(3) Implantation
(4) Entrance of sperms in vagina

Q.153 A polyoestrous mammalian example is -
(1) Man (2) Cat
(3) New age monkey (4) All the above

Q.154 Voice is high pitched in -
(1) Aged persons (2) Adult males
(3) Boys (4) Females

Q.155 First menstrual cycle starts at
(1) Parturition (2) Menopause
(3) Menarche (4) Implantation

Q.156 Gestation period of Rabbit is -
(1) 18 - 20 days (2) 28 - 32 days
(3) 48 - 50 days (4) 60 - 70 dyas

Q.157 Menstrual cycle is generally of -
(1) 21 days (2) 28 days
(3) 38 days (4) 40 days

Q.158 In menstrual Cycle ovum is released during -

(1) Beginning (2) Midway

(3) End (4) Any time

Q.159 Menstrual cycle is controlled by -

(1) Estrogen and progesterone of ovary

(2) FSH and LH of pituitary

(3) Both (1) and (2)

(4) FSH of pituitary

Q.160 Stages in menstrual cycle are -

(1) Recovery and proliferative phase

(2) Proliferative and secretory phase

(3) Proliferative, secretory and menstrual phase

(4) Recovery phase, secretory phase and phase of menstrual flow

Q.161 Luteal phase is the other name of -

(1) Follicular phase

(2) Proliferative phase

(3) Menstrual flow phase

(4) Secretory phase

Q.162 Follicular phase of menstrual cycle is the other name of -

(1) Proliferative phase (2) Secretory phase

(3) Luteal phase (4) Menstruation

Q.163 Cryptorchidism is a condition of testes

(1) Unable to descend in scrotal sacs

(2) Unable to produce sperms

(3) Having been surgically removed

(4) Having remained undeveloped

Q.164 Abnormal conditioning when the mammary glands of man become female like is called

(1) Feminization

(2) Gonochorism

(3) Gynacomastism

(4) Gynoecism

Q.165 Vivipary is found in -

(1) Frog (2) Lizard

(3) Snake (4) Rabbit

EXERCISE-3 PREVIOUS YEAR'S QUESTIONS

Q.1 The lytic enzyme present in semen is – **[Uttaranchal PMT 2004]**
(1) Ligase (2) estrogenase
(3) androgenase (4) hyaluronidase

Q.2 Progesterone hormone is secreted by – **[Jharkahnd 2004]**
(1) Corpus albicans (2) corpus collosum
(3) Corpus luteum in ovaries
(4) Corpus uteri

Q.3 Sertoli cells are involved in - **[Jharkhand-04]**
(1) Respiration (2) Nutrition of sperms
(3) Excretion
(4) Development of sex organs

Q.4 In mammals corpus luteum is found in which organ - **[Jharkahand-04]**
(1) Brain (2) Ovary
(3) Liver (4) Eyes

Q.5 Testosterone is secreted by - **[Bihar – 2004]**
(1) Leydig cells (2) Sertoli cells
(3) Seminiferous tubule
(4) None of these

Q.6 Most important component of oral contraceptive is - **[Bihar – 2004]**
(1) LH (2) GH
(3) Thyroxine (4) Progesterone

Q.7 Purpose of tubectomy is to prevent – **[Bihar 2004]**
(1) Fertilization (2) coitus
(3) Egg formation
(4) Embryonic development

Q.8 Progesterone is secreted by **[UP CPMT – 01]**
(1) Corpus aorta (2) Corpus albicans
(3) Corpus luteum (4) Corpus callosum

Q.9 In the urinogenital organs of rabbit which one of following part is present in male but not in female - **[UP CPMT – 05]**
(1) Urethra (2) Fallopian tube
(3) Vagina (4) Vasa deferens

Q.10 Bidder's canal is present in **[UP CPMT 06]**
(1) Female frog (2) Male frog
(3) Female rabbit (4) Male rabbit

Q.11 Which of the following causes abortion in ladies- **[MP PMT-07]**
(1) Virus (2) Bacteria
(3) Mycoplasma (4) None of these

Q.12 Accessory sexual character in female is promoted by - **[MP PMT 07]**
(1) Androgen (2) Progesterone
(3) Estrogen (4) Testosterone

Q.13 Sertoli cells are found in testis. These cells are– **[MP PMT 07]**
(1) Nurse cell (2) Reproductive cell
(3) receptor cell (4) None of these

Q.14 Cryptorchidism is a condition in which – **[MP PMT – 07]**
(1) Testis does not descend into scrotal sac
(2) Sperm in not found
(3) Male hormones are not reactive
(4) Ovaries are removed

Q.15 The cellular layer that disintegrates and regenerates again and again in humans is – **[MP PMT 04]**
(1) Endometrium of uterus
(2) Cornea of eye
(3) Dermis of skin
(4) Endothelium of blood vessels

Q.16 The functional maturation of sperms takes place in - **[MP PMT 05]**
(1) Oviduct (2) Epididymis
(3) Vagina (4) All of these

Q.17 Surgical removal or cutting and ligation of the ends of oviduct is known as - **[MPPMT 06]**
(1) tubectomy (2) Oviductomy
(3) Castration (4) Vasectomy

Q.18 The follicle that ruptures at the time of Ovulation promptly fills with blood, forming **[MP PMT 01]**
(1) Corpus haemorrhagicum
(2) Corpus luteum
(3) Corpus albicans (4) Corpus callosum

Q.19 In mammals the estrogens are secreted by the Graafian follicle from its **[MP PMT-01]**

(1) External theca (2) Internal theca

(3) Zona pellucida (4) Corona radiata

Q.20 Orchidectomy is the surgical removal of- **[MPPMT-2001]**

(1) Liver (2) Kidney

(3) Ovary (4) Testes

Q.21 Supporting cells found in the germinal epithelium of testis are called- **[MPPMT-2002]**

(1) Interstitial cells of leydig

(2) Sertoli cells

(3) Granular cells

(4) Phagocytes

Q.22 Atretic follicles are found in the- **[MPPMT-2002]**

(1) Fallopian tube (2) Uterus

(3) Labia majora (4) Ovary

Q.23 In mammals the female secondary sexual characters are developed mainly by the hormone- **[MPPMT-2002]**

(1) Relaxin (2) Estrogens

(3) Progesterone (4) Gonadotropins

Q.24 Cryptorchidism is a condition of testes **[AIIMS-83]**

(1) Unable to descend in scrotal sacs

(2) Unable to produce sperms

(3) Having been surgically removed

(4) Having remained undeveloped

Q.25 In between spermatogonia are found - **[CPMT 87]**

(1) Germinal cells (2) Sertoli cells

(3) Epithelial cells (4) Lymph space

Q.26 Which acessory genital gland occurs only in male mammal **[CPMT 91]**

(1) Bartholin's gland (2) Perineal gland

(3) Prostate gland (4) All

Q.27 During differentiation the spermatids remain associated with - **[MP PMT 88]**

(1) Leyding's cells (2) Kuffer's cells

(3) Spermatogonia (4) Sertoli cell

Q.28 Sugar fructose is present in the secretion of – **[Orrisa JEE 95]**

(1) Seminal vesicle (2) Perineal gland

(3) Cowper's gland (4) Bartholin's gland

Q.29 Spermatozoa are nourished during their development by - **[Orrisa JEE 95]**

(1) Sertoli cells (2) Interstitial cells

(3) Connective tissue cells

(4) None

Q.30 Sertoli cells are found in the **[CPMT – 83]**

(1) Frog's testis

(2) Rabbit's testis

(3) Cockroach's testis

(4) Liver of frog

Q.31 What whould happen if vasa deferantia of man are cut **[MP PMT 93]**

(1) Sperms are non nucleate

(2) Spermatogenesis does not occur

(3) Semen is with out sperms

(4) Sperm are non motile

Q.32 Sertoli cells occur in - **[Bihar PMT 91]**

(1) Human testis (2) Frog testis

(3) Human ovary (4) Frog ovary

Q.33 Which one is primary sex organ **[Rohtak PMT 93]**

(1) Scrotum (2) Penis

(3) Testis (4) Prostrate

Q.34 If somatic chromosomes number is 40. What shall be chromosomal number in the cell of seminiferous tubules - **[AFMC 94]**

(1) 40 (2) 20

(3) 10 (4) 40 and 20

Q.35 Testis of rabbit occur **[MP PMT 95]**

(1) One either side of dorsal aorta

(2) Inside body

(3) On side of kidneys

(4) In scrotal sacs

Q.36 Eggs librated from ovary in human in **[CBSE 89]**

(1) Secondary oocyte stage

(2) Primary oocyte stage

(3) Oogonial stage

(4) Mature ovum stage

Q.37 Graffian follicle are found in **[DPMT 82, BHU 85]**

(1) Testis of mammal
(2) Ovary of frog
(3) Ovary of cockroach
(4) Ovary of mammals

Q.38 Site of fertilization in mammal is – **[MP PMT 88, 95, BHU 89]**

(1) Ovary (2) Uterus
(3) Vagina (4) Fallopian tube

Q.39 Endometrium is lining of **[CPMT – 88]**

(1) Testis (2) Urinary bladder
(3) Uterus (4) Ureter

Q.40 A secondary sexual character is **[DPMT -82]**

(1) Breast (2) Ovary
(3) Testis (4) Thyroid

Q.41 Expanded proximal part of oviduct in female is– **[DPMT -85]**

(1) Uterus
(2) Fallopian tube
(3) Fimbriated funnel
(4) Vestibule

Q.42 The Endocrinal structure formed after ovulation (release of ovum from graafian follicle is – **[CPMT – 83]**

(1) Corpus albicans (2) Corpus callosum
(3) Corpus luteum (4) Corpus striatum

Q.43 Human beings are **[MP PMT 1993, 96]**

(1) Ovoviviparous (2) Oviparous
(3) parthenogenetic (4) Viviparous

Q.44 Cowper's glands are found in **[MP 94, 95]**

(1) Male mammals (2) Female birds
(3) Male amphibians
(4) Female amphibians

Q.45 Corpus luteum is **[CPMT – 91]**

(1) Excretory (2) Endocrine
(3) Digestive (4) Reproductive

Q.46 A female gland corresponding to prostrate of males is **[MP PMT 93]**

(1) Bartholin's gland
(2) Bulbourethral gland
(3) Clitoris
(4) None

Q.47 Progesterone is secreted by **[MP PMT 94]**

(1) Corpus Luteum (2) Thyroid
(3) Thymus (4) Testis

Q.48 Growth and maturation of graafian follicle is controlled by - **[MP 95]**

(1) FSH-LH (2) FSH-LTH
(3) ACTH-LH (4) GH-ADH

Q.49 Cryptorchidism is a condition of testes **[AIIMS 1983, WARDHA 2000, 02]**

(1) Unable to descend in scrotal sacs
(2) Unable to produce sperms
(3) Having been surgically removed
(4) Having remained undeveloped

Q.50 Spermatogenesis and sperm differentiation are under the control of **[CPMT -87]**

(1) FSH
(2) LH
(3) Progesterone
(4) Parathyroid Hormone

Q.51 Loss of reproductive capacity in women after age of 45 years is - **[JK CEE 92]**

(1) Menstruation (2) Ageing
(3) Menopause (4) Menarche

Q.52 During pregnancy, the urine of would contain **[CPMT – 93]**

(1) LH (2) Progesterone
(3) FSH (4) HCG

Q.53 Ovulation occurs under the influence of - **[CBSE – 94]**

(1) LH (2) FSH
(3) Estrogen (4) Progesterone

Q.54 In 28 day human ovarian cycle, ovulation occurs on - **[CBSE – 94]**

(1) Day 1 (2) Day 5
(3) Day 14 (4) Day 28

Q.55 Monoestrous cycle animals may have **[MP PMT-95]**

(1) One ovulation each month
(2) one egg
(3) one breeding season in a year
(4) one menses each month

Q.56 Estrous cycle is characteristic of **[CBSE-95]**
(1) Human females
(2) Mammalian females
(3) Mammalian females other than primates
(4) Mammals

Q.57 In the absence of preganancy, corpus luteum- **[MPPMT-1989]**
(1) Becomes active, secretes FSH and LH
(2) Produces lot of oxytocin and relaxin
(3) Degenerates after some time
(4) Is maintained by progesterone

Q.58 In the female Rabbit which structure is homologous to penis of male- **[RPMT-2001]**
(1) Cervix (2) Vagina
(3) Uterus (4) Clitoris

Q.59 10 oogonia yield 10 primary oocytes, then how many ova are produced on completion of oogenesis- **[RPMT-2001]**
(1) 5 (2) 10
(3) 20 (4) 40

Q.60 In Rabbit, ex-abdominal reproductive organs are- **[RPMT-2001]**
(1) Testes, Penis, Epididymis
(2) Testes, Vas deferens, Testes sac
(3) Testes, Vas deferens, Ejaculatinduct
(4) Testes sac, Seminal Vesicle, Epididymis

Q.61 Parturition duct in female is called- **[RPMT-2001**
(1) Uterus (2) Oviduct
(3) Vagina (4) Cervix

Q.62 In mammales, corpus luteum is found in which organ- **[RPMT-2002]**
(1) Brain (2) Ovary
(3) Liver (4) Eyes

Q.63 In rabbit at the time of fertilization zygote is formed in- **[RPMT-2002]**
(1) Coelom (2) Fallopian tube
(3) Uterus (4) Vagina

Q.64 Which temporary endocrine gland forms in ovary after ovulation- **[RPMT-2003]**
(1) Corpus callosum (2) Corpus albicans
(3) Corpus luteum (4) Corpus striata

Q.65 Oral contraceptives contain- **[CBSE-1998]**
(1) Progesterone (2) LH
(3) Oxytocin (4) Steroles

Q.66 Which substance can be used as male contraceptive in future- **[CBSE-1999]**
(1) FSH (2) LH
(3) Testosterone (4) progesterone

Q.67 Which induces the development of corpus luteum- **[CBSE-1999]**
(1) LH (2) Oestrogen
(3) FSH (4) LTH

Q.68 After ovulation follicles converted into- **[CBSE-1999]**
(1) Corpus luteum
(2) Corpus albicans
(3) Corpus cavernosa
(4) Corpus calosum

Q.69 What is the work of copper T – **[CBSE-2000]**
(1) To inhibit ovulation
(2) To inhibit fertilization
(3) To inhibit implantation of blastocyst
(4) To inhibit gametogenesis

Q.70 What is the work of progesterone which is present in oral contraceptive pills- **[CBSE-2000]**
(1) To inhibit ovulation
(2) To check oogenesis
(3) To check entry of sperms in to cervix and to make them inactive
(4) to check sexual behaviour

Q.71 Which gland secrets odourous secretion in mammals- **[CBSE-2000]**
(1) Bartholins (2) Prostate
(3) Anal gland (4) Liver-bile

Q.72 Mainly which type of hormones control the menstrual cycle in human beings- **[CBSE-2002]**
(1) FSH
(2) LH
(3) FSH, LH, Estrogen
(4) Progesterone only

Q.73 When both ovary are removed from rat then which hormone is decreased in blood- **[CBSE-2002]**

(1) Oxytocin
(2) Prolactin
(3) Estrogen
(4) Gonadotrophic releasing factor

Q.74 Bartholin's glands are situated- **[CBSE-2003]**

(1) On the sides of the head of some amphibians
(2) At the reduced tail end of birds
(3) On either side of vagina in humans
(4) On either side of vas deferens in humans

Q.75 Ovulation in the human female normally takes place during the menstrual cycle-**[CBSE-2004]**

(1) At the end of the proliferative phase
(2) At the end of the proliferative phase
(3) Just before the end of the secretory phase
(4) At the beginning of the proliferative phase

Q.76 In mammals, maturation of sperms take place at a temperature- **[MPPMT-1991]**

(1) Equal to that of body
(2) Higher than that of body
(3) Lower than that of body
(4) At any piece of mammalian sperm

Q.77 Onset of pregnancy- **[MPPMT-1991]**

(1) Stimulates testosterone secretion
(2) Inhibits further ovulation
(3) Leads to degeneration of ovary
(4) Inhibits fusion of egg and sperm nuclei

Q.78 Graffian follicles contain **[MPPMT-1992]**

(1) Corpus luteum
(2) Corpus albicans
(3) Theca externa and theca interna
(4) Oogonial cells

Q.79 Bartholin's glands occurs in- **[MPPMT-1992]**

(1) Females and help in vestibular lubrication
(2) Females and produce oestrogen for regulating secondary sexual characters
(3) Males and form liquid part of spermatic field
(4) Males and produce alkaline fluid for neutralising urethral acidity

Q.80 Loss of reproductive capacity in women after age of 45 years is- **[JK CEE 1992]**

(1) Mensturation (2) Ageing
(3) Menopause (4) Menarche

Q.81 Estrous cycle is indication of ? **[MPPMT-1993]**

(1) Breeding period (2) Estrogen secretion
(3) Pregnancy (4) Menopause

Q.82 Which is correct ? **[MPPMT-1993]**

(1) Menstrual cycle is present in all mammals
(2) Menstrual cycle is present in all primates
(3) Estrous cycle occurs in all mammals
(4) Most mammals are ovoviviparous

Q.83 Yellow corpus luteum occurs in a mammals in- **[MPPMT-1993,98; CBSE-95]**

(1) Heart to initiate heart beat
(2) Skin to function as pain receptor
(3) Brain and connects cerebral hemisphere
(4) Ovary for secretion of progesterone

Q.84 A female gland corresponding to prostate of males is ? **[MPPMT-1993]**

(1) Bartholin's gland
(2) Bulbourethral gland
(3) Clitoris
(4) None of the above

Q.85 What would happen if vasa deferentia of man are cut ? **[MPPMT-1993]**

(1) Sperms are non-nucleate
(2) Spermatogenesis does not occur
(3) Semen is without sperms
(4) Sperms are nonmotile

Q.86 Human sperm was discovered by- **[DPMT-1996]**

(1) Leeuwenhoek (2) Aristotle
(3) Graaf (4) Pander

Q.87 Prostate gland produces a secretion for- **[BHU-1996]**

(1) Attracting sperms
(2) Stimulating sperm activity
(3) Attractive egg
(4) None of the above

Q.88 Corpus luteum secretes- **[Pb.PMT-1997, AMU-2001]**

(1) LH (2) Estrogen
(3) Progesterone (4) FSH

Q.89 In case of nonfertilization, corpus luteum- **[CPMT-1997]**

(1) Stops secreting progesterone
(2) Changes to corpus albicans
(3) Starts producing progesterone
(4) None of the above

Q.90 After ovulation, Graafian follicle forms- **[CBSE-1999]**

(1) Corpus luteum (2) Corpus albicans
(3) Corpus artesia (4) Corpus callosum

Q.91 Seminal vesicles are located in- **[Manipal-1999]**

(1) Caput epidydimis
(2) Uterus
(3) Above Cowper's glands
(4) Glans penis

Q.92 Number of eggs released in the life time of a woman is approximately- **[Karnataka-1999]**

(1) 40 (2) 400
(3) 4000 (4) 20000

Q.93 Correct sequence of hormone secretion from beginning of menstruation is- **[AIIMS-1999,Orissa-04]**

(1) FSH, progesterone, estrogen
(2) Estrogen, FSH, progesterone
(3) FSH, estrogen, progesterone
(4) Esterogen, progesterone, FSH

Q.94 Graafian follicle contains- **[MPPMT-2000]**

(1) Many oocytes
(2) Many sperms
(3) A single oocyte
(4) Site for egg fertilisation

Q.95 Mullerian duct is- **[MPPMT-2000]**

(1) Ureter (2) Urethra
(3) Sperm duct (4) Oviduct

Q.96 Progesterone level falls leading to- **[MPPMT-2000]**

(1) Gestation (2) Menopasue
(3) Lactation (4) Mensturation

Q.97 Head of epididymis present at head of testis is- **[CPMT-2000]**

(1) Caput epididymis (2) Cauda epidiymis
(3) Vas deferens (4) Gubernaculum

Q.98 Human female reaches menopause at the age of about- **[AFMC-2000]**

(1) 25 years (2) 35 years
(3) 50 years (4) 70 years

Q.99 Glands secreting male sex hromone are- **[Pub. PMT-2000]**

(1) Leydig cells
(2) Seminiferous tubules
(3) Vasa deferentia
(4) Testes

Q.100 Estrogen is secreted by- **[Hr. PMT-2000]**

(1) Corpus luteum
(2) Graafian follicle
(3) Germinal epithelium of ovary
(4) Pitiutary

Q.101 Phase of menstrual cyle when ovulation occurs in- **[Wardha-2001]**

(1) Luteal (2) Menstrual
(3) Proliferative (4) Secretory

Q.102 Antrum is cavity for- **[Karnataka-2001]**

(1) Ovary (2) Graafian follicle
(3) Blastula (4) Gastrula

Q.103 Testes descent into scrotum in mammals for- **[AFMC-2001]**

(1) Spermatogenesis
(2) Fertilization
(3) Development of sex organs
(4) Development of visceral organs

Q.104 Which grouping has gestation period in decreasing order- **[Hr. PMT-2002]**

(1) Cow, Horse, Goat, Monkey and Swine/Pig
(2) Horse, Cow, Goat, Monkey and Swine
(3) Monkey, Cow, Horse, Goat and Swine
(4) Monkey, Horse, Goat, Cow and Swine

Q.105 Hormone controlling human menstrual cycle- **[CBSE-2002]**

(1) Estrogen (2) FSH
(3) LH (4) All the above

Q.106 Phase of menstrual cycle in human that lasts for 7-8 days is- **[AIIMS-2003]**

(1) Follicular phase (2) Ovulatory phase
(3) Luteal phase (4) Menstruation

Q.107 Menstruation is caused by- **[D.PMT-2003]**

(1) Increase in FSH level
(2) Fall in oxytocin level
(3) Fall in progesterone level
(4) Increase in oestrogen level

Q.108 The hormone that prevents ovulation and formation of corpus luteum is- **[B.V. 2003]**

(1) Progesterone (2) Estrogen
(3) LH (4) FSH

Q.109 Nutritive cells of seminiferous tubules are- **[Keral-2003]**

(1) Leydig cells
(2) Sertoli cells
(3) Atretic follicular cells
(4) Spermatogonial cells

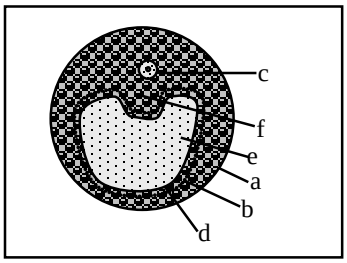
Q.110 The animal in which testes descent into scrotum only during breeding season- **[AFMC-2004]**

(1) Frog (2) Kangaroo
(3) Shrew (4) Bat

Q.111 In uterus endometrium, proliferates in response to- **[Kerala-2004]**

(1) Relaxin (2) Oxytocin
(3) Progesterone (4) Oestrogen
(5) LH

Q.112 In the diagram of section of Graafian follicle, different parts are indicated by alphabets. Choose the correct combination- **[Karnataka-2004]**



(1) a-membrana granulosa, b-thea interna, c-ovum, d-cumulus oophorus, e-antrum, f-theca, externa
(2) a-theca externa, b-theca interna, c-ovum, d-membrana granulosa, e-antrum, f-cumulus oophorus
(3) a-theca externa, b-theca interna, c-ovum, d-cumulus oophorus, e-antrum, f-membrana granulosa
(4) a - membrana granulosa, b-theca externa c-ovum, d-cumulus oophorus, e-antrum, f-theca interna

Q.113 Oral contraceptives are used by females to check **[DPMT 2010, CET Chd. 2010]**

(1) Implantation (2) Fertilization
(3) Ovulation
(4) Entry of sperms in vagina

Q.114 Role of Leyding cells is **[Manipal 2004, CET Chd. 2010]**

(1) Nourishment of sperms
(2) Provide motility to sperms
(3) Bring about maturation of sperms
(4) Synthesis of testosterone hormone

Q.115 Amniocentesis is employed for determining **[CPMT 2009]**

(1) Hereditary abnormality is embryo
(2) Cardiac ailments of embryo
(3) Errors in amino acid metabolism in embryo
(4) All the above

Q.116 Stage of sperm before entry into ovum/a pre-fertilisation process is **[JIPMER 2004, MHTCET 2008]**

(1) Maturation (2) Insemination
(3) Capacitation (4) Fertilization

Q.117 Testosterone is secreted by **[Bih. PMT 2004, JKCMEE/CET Chd. 2007]**

(1) Sertoli cells
(2) Leydig/interstitial cells
(3) Seminiferous cells
(4) All the above

Q.118 Pattern of cleavage in egg of Frog is **[CPMT 2005, Manipur 2009]**

(1) Meroblastic
(2) Holoblastic unequal
(3) Holoblastic equal (4) All the above

Q.119 In the urinogenital system one of the following part is present in males and not in females **[CPMT 2005]**

(1) Urethra (2) Fallopian tube
(3) Vagina (4) Vas deferens

Q.120 Number of sperms formed from four spermatocytes is **[CPMT 2005]**

(1) 4 (2) 1 (3) 16 (4) 32

Q.121 Fertilization was discovered by **[Wardha 2005]**

(1) Strasburger (2) Robert Brown
(3) Lamarck (4) Darwin

Q.122 Macrolecihal eggs are characterised by **[Manipal 2005]**

(1) Little yolk (2) Abundant yolk
(3) Entry of sperm (4) Pattern of cleavage

Q.123 In human females, ova are produced in **[MPPMT 2005]**

(1) Ovarian follicles (2) Oviduct
(3) Uterus (4) Vagina

Q.124 Hormone that prepares and maintains the uterus during pregnancy is produced by **[EAMCET 2005, WB 2005, MHTCET 2008]**

(1) Corpus albicans (2) Corpus luteum
(3) Graafian follicles (4) Corpora cardiaca

Q.125 At menopause there is rise in urinary **[Orissa 2005]**

(1) FSH (2) STH
(3) MSH (4) LH

Q.126 Delivery of developed foetus is **[Orissa 2005, Kerala 2010]**

(1) Ovulation (2) Oviposition
(3) Parturition (4) Abortion

Q.127 Abnormal condition when mammae of man become female like **[Orissa 2005]**

(1) Feminisation (2) Gynochorium
(3) Gynoesism (4) Gynaecomastia

Q.128 Which is not formed by Wolffian duct? **[DPMT 2005]**

(1) Epididymis (2) Vas deferens
(3) Ejaculatory duct (4) Oviduct

Q.129 Which are derivatives of endoderm? **[KCET 2005]**

(1) Muscles and blood
(2) Alimentary canal and respiratory organs
(3) Excretory and reproductive organs
(4) Skin and never cord

Q.130 Which are haploid? **[KCET 2005]**

(1) Spermatogonial cells
(2) Germinal epithelial cells
(3) Secondary spermatocytes
(4) Primary spermatocytes

Q.131 Sertoli cells secrete a hormone **[KCET 2005]**

(1) Gonadortropin (2) Testosterone
(3) Relaxin (4) Inhibin

Q.132 Germ cells in female gonad and male gonad begin undergoing meiosis simultaneously. What will be ratio of ova and sperms **[KCET 2005, Orissa 2008]**

(1) 1 : 1 (2) 1 : 2
(3) 1 : 4 (4) 2 : 1

Q.133 Grey crescent is the area **[CBSE 2005]**

(1) At the point of entry of sperm into ovum
(2) At the animal pole
(3) Just opposite the site of entry of sperm into ovum
(4) At the vegetal pole

Q.134 Which is correctly matched in a normal menstrual cycle? **[AIIMS 2005]**

(1) Endometrium regenerates – 5 to 10 days
(2) Release of egg – 5th day
(3) Endometrium secretes nutrients for implantation – 11 to 18 days
(4) Rise in progesterone level – 1 to 15 days

Q.135 Which of the following is immortal? **[BHU 2005]**

(1) Somatic cell (2) Germ cell
(3) Glomerular cell (4) Cells of pituitary

Q.136 Extra structure that provides nutritaion to embryo is **[BHU 2005]**

(1) Umbilicus (2) Amnion
(3) Choriom (4) placenta

Q.137 Spermatogonia develop through division **[Har. PMT 2006]**

(1) Ovary (2) Ovum
(3) Sperm (4) Zygote

Q.138 Spermatogonia develop through division **[Har. PMT 2005]**

(1) Amitosis (2) Mitosis
(3) Meiosis I (4) Meiosis II

Q.139 Graafian follicles occur in **[Har. PMT 2005]**

(1) Ovary (2) Testis
(3) Egg (4) Sperm

Q.140 Twin develops from **[Har. PMT 2005]**
(1) Defferent zygotes (2) Defferent ova
(3) Different sperms (4) Same zygote

Q.141 Ovulation occurs in and on **[Har. PMT 2005]**
(1) Ovary (2) About 14th day
(3) Both A and B (4) None of these

Q.142 Low level of progesterone and estrogen stimulates production of **[AMU 2005]**
(1) FSH-LH (2) LH
(3) GH (4) All the above

Q.143 Due to presence of large amount of yolk, zygote divides into two incomplete halves. This type of cleavage does not occur in **[Manipur 2005]**
(1) Peacok, Duck-billed Platypus and Crocodile
(2) Jungle Fowl, Dove and Duck
(3) Amphioxus, Salmander and Rana
(4) Hemidactylus, Calotes and Varanus

Q.144 Which is incorrect about the process of gestrulation **[Manipur 2005]**
(1) Movement and rearrangement of cells
(2) Rapid division of cells by mitotic cell division
(3) Formation of three germinal layers
(4) Formation of archenteron

Q.145 Withdrawal of which hormone is the immediate cause of menstruation **[CBSE 2006]**
(1) Estrogen (2) FSH
(3) FSH-RH (4) Progesterone

Q.146 Blastopore occurs in **[Bih. PMT 2006]**
(1) Gastrula (2) Blastula
(3) Blastocoel (4) Morula

Q.147 Mesoderm is formed through invagination of **[Guj. PMT 2006]**
(1) Ectoderm (2) Endoderm
(3) Inner mass of cells (4) Primitive streak

Q.148 Secretion of which structure prepares the inner wall of uterus for implantation **[Guj. PMT 2006]**
(1) Ovary (2) Corpus luteum
(3) Pituitary gland (4) Ovarian follicle

Q.149 Which of the following can reproduce without using mitosis **[KCET 2006]**
(1) *Amoeba* (2) *Hydra*
(3) *Sycon* (4) *Tapeworm*

Q.150 Which secretions are produced by spermatozoa at the time of fertilization **[KCTE 2006]**
(1) Fertilizin and spermlysin
(2) Only spermlysin
(3) Fertilizin and antifertilizin
(4) Antifertilizin and spermlysin

Q.151 Which reperesents a condition of highly reduced motility **[KCET 2006]**
(1) Azospermia (2) Polyspermy
(3) Oligospermia (4) Asthenospermia

Q.152 Oxytocin is helpful in **[COMED-K'S 2006]**
(1) Semen formation (2) Parturition
(3) Diuresis
(4) Molecular development

Q.153 Ectoderm forms **[COMED-K'S 2006]**
(1) Bones and muscles
(2) Lining of gut and respiratory organs
(3) Enamel of teeth and cornea of eye
(4) Gonads and blood vessels

Q.154 Cleidoic eggs occur in **[COMED-K'S 2006]**
(1) Fishes and reptiles
(2) Fishes and amphibians
(3) Amphibians and reptiles
(4) Birds and some mammals

Q.155 In organisms, shape of foetus is determined by **[RPMT 2006]**
(1) Organogenesis (2) Blastula
(3) Morphogenesis (4) Reproduction

Q.156 Energy centre of sperm is **[RPMT 2006]**
(1) Head (2) Middle piece
(3) Entire sperm (4) Tail

Q.157 Fusion of sperm and ovum is **[RPMT 2006]**
(1) Amphimixis (2) Regeneration
(3) Fertilization (4) None of the above

Q.158 Hormaphrodite animal is **[Manipur 2006]**
(1) Spider (2) Honey Bee
(3) *Ascaris* (4) Leech

Q.159 Embryonic connective tissue is formed from **[CET Chd. 2006]**
(1) Ectoderm (2) Endoderm
(3) Mesenchyma (4) Mesogloea

Q.160 Embryo at 16-called stage is called **[BHU 2006, CPMT 2008]**

(1) Morula (2) Blastula
(3) Blastomere (4) Gastrula

Q.161 Which one is the safest method of birth control **[KCET 2006]**

(1) Termination of nonwanted pregnancy
(2) Sterilisation techniques
(3) The rhythm method
(4) Use of physical barriers

Q.162 Under favourable conditions encysted Amoeba divids by multiple fission form many pseudopodiospores. The phenomenon is **[HPPMT 2007]**

(1) Sporulation (2) Fragmentation
(3) Regeneration (4) Budding

Q.163 Which one shows longitudnal binary fission **[Kerala 2007]**

(1) Euglena (2) Plasmodium
(3) Planaria (4) Paramecium
(5) Hydra

Q.164 Which one is wrong **[Kerala 2007]**

(1) Amnion is the outer layer containing amniotic fliud that acts as a shick absorber for soft embryo
(2) Amnion and chorion develop as upward projecting folds of somatopleure called amniotic folds
(3) In mammals, allantosis is not excretory in function
(4) Yolk sac is a foetal membrane that help in nourishment of embryo in general
(5) Chorio-allantoic membrane develops villi and contributes much to the development of placenta.

Q.165 Disintegration of corona radiata **[Guj. PMT 2007]**

(1) LTH (2) FSH
(3) Progesterone (4) LH

Q.166 Which one holds corona radiata **[MHTCET 2007]**

(1) Mucopolysaccharide
(2) Oligosaccharide
(3) Lipopolysaccharide
(4) Lipoprotein

Q.167 Greek word "sexus" means **[MHTCET 2007]**

(1) Disjunction (2) Disintegration
(3) Union (4) Both A and B

Q.168 A protective layer around testes is **[MHTCET 2007]**

(1) Tunica adventitia (2) Tunica vasculosa
(3) Tunica media (4) Tunica albuginea

Q.169 Sperm capacitation involves **[MHTCET 2007]**

(1) Change in shape
(2) Release of mitochondria
(3) Removal of membrane fatty acids
(4) Hyaluronic acid

Q.170 Accessory genital gland found only in males is **[KCET 2007]**

(1) Cowper's gland (2) Bartholin gland
(3) Perineal gland (4) Prostate gland

Q.171 Release of second polar body from human egg occurs **[COMED-K's 2007]**

(1) After entry of sperm
(2) After fertilization
(3) Before sperm entry
(4) With no relation to sperm entry

Q.172 Cell division that occurs in zygote is called **[JKCMEE 2007]**

(1) Meiosis (2) Mitosis
(3) Cleavage (4) Differentiation

Q.173 Layers of ovum from outside to inside are **[CPMT 2007]**

(1) Corona radiata, zona pellucida, vitelline membrane
(2) Zona pellucida, corona radiata, vitelline membrane
(3) Vitelline membrane, zona pellucida, corona radiata
(4) Zona pellucida, vitelline membrane, corona radiata

Q.174 Which layer of embryo is formed first **[CPMT 2007, 2009, MHTCET 2009]**

(1) Ectoderm (2) Mesoderm
(3) Endoderm (4) Both B and C

Q.175 LH phase occurs during phase of menstrual cycle **[Orissa 2007]**

(1) Menstrual phase
(2) Begining of proliferative phase
(3) Just before end of proliferation phase
(4) At the middle of the cycle

Q.176 Transverse bainary fission occurs in **[DPMT 2007]**

(1) Euglena (2) Amoeba
(3) Hydra (4) Paramecium

Q.177 In which phase of cell division are oogonia arrested **[DPMT 2007]**
(1) Anaphase II (2) Anaphase I
(3) Interphase (4) Both A and B

Q.178 Capacitation of sperms occurs in **[DPMT 2007]**
(1) Female genital tract
(2) Vagina
(3) Vas efferens (4) Vas deferns

Q.179 Fertilization of ovum occurs in **[DPMT 2007]**
(1) Fimbriae of oviduct
(2) Isthmus of oviduct
(3) Amupulla of oviduct
(4) None of the above

Q.180 Function of Sertoli cells is controlled by **[DPMT 2007, AFMC 2008]**
(1) Estrogen (2) FSH
(3) Testosterone (4) ACTH

Q.181 Which one functions as endocrine gland after ovulation **[CBSE 2007]**
(1) Stroma
(2) Vitelline membrane
(3) Germinal epithelium
(4) Graafian follicle

Q.182 In human females, memstruation can be defrred by administration of **[CBSE 2007]**
(1) FSH and LH
(2) Estrogen and progesterone
(3) FSH only
(4) LH only

Q.183 Corpus spongiosum occurs in **[Har. PMT 2007]**
(1) Ovary (2) Penis
(3) Testis (4) Uterine wall

Q.184 Cytoplasm of ovum does not possess **[Har. PMT 2007]**
(1) Golgi complex (2) Mitochondria
(3) Centrosome (4) Ribosomes

Q.185 Which one takes part in formation of placenta? **[Guj. CET 2008]**
(1) Only trophoblast
(2) Only allantois
(3) Trophoblast and mesoderm
(4) Trophoblast, mesoderm and allantois

Q.186 Notochord, skeletal system and dermis of skin are derive from **[KCET 2008]**
(1) Mesoderm (2) Endoderm
(3) Ectoderm (4) All the above

Q.187 During embryogenesis archenteron is preceded by **[COMED-K's 2008]**
(1) Blastulation (2) Meuralation
(3) Gastrulation (4) Implantation

Q.188 Eggs produced in a year by an ovary of nonpregnant woman is **[COMED-K's 2008]**
(1) 12 (2) 6
(3) 24 (4) 48

Q.189 Sperms are produced in **[Orissa 2008]**
(1) Epididymis
(2) Interstitial cells
(3) Prostate gland
(4) Seminiferous tubules

Q.190 Which extraembryonic membrane in human prevents desiccation of embryo inside uterus? **[CBSE 2008]**
(1) Yolk sac (2) Amnion
(3) Chorion (4) Allantois

Q.191 Luteinising hormone is **[MHTCET 2008]**
(1) Lactotropic (2) Mammotropic
(3) Non-mammotropic (4) Both A and B

Q.192 Proximal centriole of sperm is found in **[MHTCET 2008]**
(1) Head (2) Neck
(3) Middle piece (4) Tail

Q.193 Which provides nutrition to maturing sperms? **[DPMT 2008, CPMT 2009]**
(1) Leydig cell (2) Scrotum
(3) Epididymis (4) Sertoli cells

Q.194 Extra structure which provides nutrition to embryo is **[BHU 2008]**
(1) Umbilicus (2) Chorion
(3) Placenta (4) Amnion

Q.195 Pick up the correct information about menstrual cycle control **[BHU 2008]**
A. Estrogen and progesterone of ovary
B. FSH of pituitary
C. FSH and LH of pituitary
D. Oxytocin
(1) 1, 2, 3 correct (2) 1, 2 correct
(3) 2, 4 correct (4) 1, 3 correct

Q.196 Pick up correct statement about organs with dual origin from embryonic layers **[BHU 2008]**

A. Hypophysis B. Adrenal glands

C. Sense organs D. Pancreas

(1) 1, 2, 3 correct (2) 1, 2 correct

(3) 2, 4 correct (4) 1, 3 correct

Q.197 LH and FSH are collectively called **[CPMT 2008]**

(1) Oxytocin (2) Somatotropins

(3) Gonadotropins (4) Luteotropins

Q.198 Which hormone level reaches peak during luteal phase of menstrual cycle? **[JKCMEE 2008]**

(1) Luteininsing hormone

(2) Progesterone

(3) Follicle stimulating hormone

(4) Estrogen

Q.199 Arrange the events in human female reproductive cycle **[KCET 2009]**

a-Secretion of FSH, b-Growth of corpus luteum, c-Growth of follicle and oogenesis, d-Ovulation, e-Sudden increase in level of LH

(1) $a \rightarrow c \rightarrow e \rightarrow d \rightarrow b$

(2) $c \rightarrow a \rightarrow d \rightarrow b \rightarrow e$

(3) $a \rightarrow d \rightarrow c \rightarrow e \rightarrow b$

(4) $b \rightarrow a \rightarrow c \rightarrow d \rightarrow e$

Q.200 Which one is initiated by secretion of trophoblast? **[COMED-K's 2009]**

(1) Blastulation (2) Implantation

(3) Cleavage (4) Gastrulation

Q.201 "Saheli", an oral contraceptive for females, was developed by **[CET Chd. 2009, HPPMT 2010]**

(1) AIIMS, Dehli (2) IICB, Kolkata

(3) SG PGI Lucknow (4) CDRI, Lucknow

Q.202 Foetal ejection reflex in human female is induced by **[CBSE 2009, 2010]**

(1) Release of oxytocin from pituitary

(2) Pressure exerted by amniotic fluid

(3) Differentiation of mammary glands

(4) Fully developed foetus and placenta

Q.203 Which is correctly matched? **[CBSE 2009]**

(1) Menstruation. Breakdown of myometrium and ovum not fertilised

(2) Ovulation. LH and FSH attain peak level, sharp fall in secretion of progesterone

(3) Development of Corpus luteum. Secretory phase and increased secretion of progesterone

(4) Proliferative Phase. Rapid regeneration of myometrium and maturation of Graafian follicle

Q.204 Seminal plasma of humans is rich in **[CBSE 2009, 2010]**

(1) Fructose and certain enzymes, poor in Ca^{2+}

(2) Fructose, Ca^{2+} and certain enzymes

(3) Fructose, Ca^{2+} and certain enzymes

(4) Glucose certain enzymes but no Ca^{2+}

Q.205 32-celled stage of human embryo is **[AMU 2009]**

(1) Smaller than fertilized egg

(2) Same size as fertilized egg

(3) Two times the size of fertilized egg

(4) Four times the fertilised egg

Q.206 Besides activating egg, another role of sperm is to carry **[Orissa 2009]**

(1) RNA (2) Ribosomes

(3) Mitochondria (4) DNA

Q.207 In females, hormone inhibin is secreted by **[AMU 2009]**

(1) Granulosa cells and corpus luteum

(2) Granulosa and theca cells

(3) Granulosa and cumulus oophorus cells

(4) Granulosa cells and zona pellucida

Q.208 Match the column and find the correct combination **[Kerala 2009]**

I	II
A. Hypothalamus	1. Sperm lysins
B. Acrosome	2. Estrogen
C. Graafian follicle	3. Relaxin
D. Leydig cells	4. Gn RH
E. Parturition	5. Testosterone

(1) A – 2, B – 1, C – 4, D – 3, E – 5

(2) A – 4, B – 1, C – 2, D – 5, E – 3

(3) A – 2, B – 1, C – 5, D – 4, E – 3

(4) A – 5, B – 1, C – 2, D – 3, E – 5

Q.209 Type of asexual reproduction found in *Hydra* is **[Kerala 2009]**

(1) Gemmule formation
(2) Sporulation
(3) Binary fission (4) Budding

Q.210 Accessory glands associated with genital organs of female are **[Kerala 2009]**

(a) Vestibular or Bartholin's
(b) Cowper's
(c) Amupullary (d) Vesicular
(1) a, b (2) a only
(3) b,c (4) d only
(5) c only

Q.211 Connective tissue around seminiferous tubles posses endocrine cells called **[MHTCET 2009]**

(1) Leydig cells
(2) Sertoli cells
(3) Pimary germ cells (4) Both A and B

Q.212 Multicellular, multinucleate, irregular mass of embryo which pass into uterine wall is **[MHTCET 2009]**

(1) Ectoderm
(2) Endoderm
(3) Syncytiotrophoblast
(4) Amnion

Q.213 Which gland is absent in reproductive system of Rabbit **[CPMT 2010]**

(1) Cowper's gland (2) Perineal gland
(3) Collateral gland (4) Prostate gland

Q.214 Various parts of male urethra are **[MHTCET 2010]**

(1) Prostatic, bulbourethral and ejaculatory
(2) Prostatic, membranous and penile
(3) Corpora cavernosa and corpus spongiosum
(4) Prostatic, bulbourethral and glans

Q.215 What is false? **[MHTCET 2010]**

(1) Menarche is beginning of menstruation
(2) Menstruation is shedding of endometrial lining
(3) Menopause occurs in the beginning of puberty
(4) Ovulation occurs under high titre of LH

Q.216 The cavity contained in Graafian follicle is **[MHTCET 2010]**

(1) Antrum (2) Centrocoel
(3) Blastocoel (4) Archenteron

Q.217 Morphogrnrtic movements take place during **[MHTCET 2010]**

(1) Formation of morula
(2) Blastulation
(3) Gastrulation
(4) Organogenesis

Q.218 Gastrula has a pore known as **[KCET 2010]**

(1) Zoospore (2) Oospore
(3) Gonospore (4) Blastopore

Q.219 In the absence of acrosome the sperm **[KCET 2010]**

(1) Cannot penetrate the egg
(2) Cannot get food
(3) Cannot get energy
(4) Cannot swim

Q.220 Hormone, human chorionic gonadotropin, is **[COMED-K's 2010]**

(1) Placenta
(2) Ovary
(3) Antherior pituitary gland
(4) Posterior pituitary gland

Q.221 Isogamy is found in **[CET Chd. 2010]**

(1) *Hydra* (2) *Monocystis*
(3) *Plasmodium* (4) *Planaria*

Q.222 Metadiscoidal placenta is found in **[CET Chd. 2010]**

(1) Humans (2) Cow
(3) Pig (4) Rabbit

Q.223 In humans the oocyte is maintained in a state of meiotic arrest by the secretion of **[AMU 2010]**

(1) Granulosa cells
(2) Zona pellucida
(3) Cumulus oophorus
(4) Theca

Q.224 Identical twins are also known as **[Orissa 2010]**

(1) Monozygotic twins
(2) Dizygotic twins
(3) Fraternal twins
(4) Both B and C

Q.225 In human the unpaired male reproductive structure is **[Kerala 2010]**

(1) Testis (2) Seminal vesicle
(3) Spermatic cord (4) None

Q.226 Mammalian blastula is known as **[MPPMT 2010]**

(1) Trophoderm (2) Blastocyst
(3) Foetal blastula (4) Oedema

Q.227 Acrosome of sperm contains **[MPPMT 2010]**
(1) Hydrolytic enzymes
(2) DNA
(3) Fructose
(4) Mitochondria

Q.228 Radial cleavage is found in **[MPPMT 2010]**
(1) Tunicates (2) Protozoans
(3) Coelenterates (4) Annelids

Q.229 In mesolecithal egg the cleavage is **[MPPMT 2010]**
(1) Meroblastic (2) Unequal holoblastic
(3) Equal holoblastic (4) None of the above

Q.230 Cavity formed during gastrulation is **[MPPMT 2010]**
(1) Primitive gut (2) Gastrocoel
(3) Archenteron (4) All the above

Q.231 Menstual phase is followed by **[HPPMT 2010]**
(1) Luteal phase (2) Follicular phase
(3) Fertilization (4) Implantation

Q.232 Which of the following cannot be considered as assisted reproductive technology **[HPPMT 2010]**
(1) Diaphragm (2) Lippe's loop
(3) Cervical cap (4) Vault

Q.233 Which of the following cannot be considered as assisted reproductive technology **[HPPMT 2010]**
(1) *In vitro* fertilization (IVF)
(2) Medical termination of pregnancy (MTP)
(3) Gamete intrafallopian transfer (GIFT)
(4) Intracytoplasmic sperm injection (ICSI)

Q.234 Internal cavity formed by cell division prior to gastrulation is **[DPMT 2010]**
(1) Enteron (2) Blastopore
(3) Blastocoel (4) Coelom

Q.235 Foetal movements and appearance of hair on head occur in ..... month of pregnancy **[CBSE 2010]**
(1) Fifth (2) Sixth
(3) Third (4) Fourth

Q.236 Part of fallopian tube closest to ovary is **[CBSE 2010]**
(1) Infundibulum (2) Cervix
(3) Ampulla (4) Isthmus

Q.237 In which of the following asexual reproduction, a maternal cell produces innumerable unicellular uninucleate offspring **[Guj. PMT 2010]**
(1) Sporulation (2) Fragmentation
(3) Parthenogenesis (4) Multiple fission

Q.238 Which one is not characterof heamochorial placenta **[Guj. CET 2010]**
(1) CO_2 and excretory products pass from foetus to mother's body
(2) O_2 and nutrients from mother's body enter the foetus
(3) Chorion villi are covered by blood sinuses of mother
(4) It protects foetus from mechanical shocks

Q.239 The figure given below shows a small part of human lung where exchange of gases takes place. Select the option which represents labelled part (A, B, C or D) correctly identiffed along with its function. **[CPMT 2011]**
(1) C : arterial capillary - passes oxygen to tissues
(2) A : alveolar wall - main site of exchange of respiratory gases
(3) D : capillary wall - exhange of O_2 and CO_2 takes
(4) B : red blood cells - transport of CO_2 mainly.

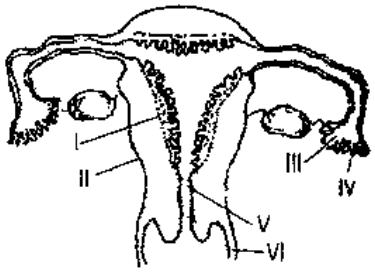
Q.240 A large proportion of oxygen remains unused in the human blood even after its uptake by the body tissue. this O_2**.** **[CPMT 2011]**
(1) Acts as a reserve during muscular exercise
(2) Raises the pCO_2 of blood to 75 mm of Hg.
(3) Is enough to keep oxyhaemoglobin saturation at 96%
(4) Helps in releaising more O_2 to the epithelial tissues.

Q.241 If for some reason, the vasa efferentia in the human reproductive system get blocked, the gametes will not be tranported from **[CPMT 2011]**
(1) Testes to epididymis
(2) Epididymis to vas deferens
(3) Ovary to uterus (4) Vagina to uterus

Q.242 The testes in humans are situated outside the abdominal cavity inside a pouch called scrotum. The purpose served is for **[CPMT 2011]**
(1) Maintaining the scrotal temperature lower than the internal body temperature
(2) Escaping any possible compression by the visceral organs
(3) Providing more space for the growth of epididymis
(4) providing a secondary sexual feature for exhibiting the male sex.

Q.243 The figure given below depicts a diagrammatic sectional view of the human female reproductive system. Which set of three parts out of I-VI have been correctly identified?

[CPMT 2011]



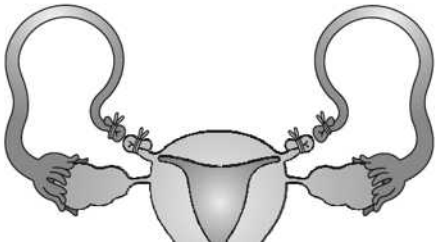
(1) (II) endometrium, (III) infundibulum, (IV) fimbriae

(2) (III) infundibulum, (IV) fimbriae, (v) cervix

(3) (IV) oviducal funnel, (V) uterus, (VI) cervix

(4) (I) perimetrium, (II) myometrium, (III) Fallopian tube

Q.244 What is the figure given below showing in particular ? **[AIPMT PRE 2012]**



(1) Uterine cancer (2) Tubectomy

(3) Vasectomy (4) Ovarian cancer

Q.245 Singnals for parturition originate from :

[AIPMT PRE 2012]

(1) Oxytocin released from maternal pituitary

(2) Placenta only

(3) Fully developed foetus only

(4) Both placenta as well as fully developed foetus

These questions consist of two statements each, printed as Assertion and Reason. While answering to choose any one of the following four responses.

(1) If both Assertion & Reason are True & the reason is correct explanation of the Assertion.

(2) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.

(3) If Assertion is True but the Reason is False.

(4) If both Assertion & Reason are false.

Q.1 **A :** In post natal life, oocyte development occurs in mature follicle.
R : After ovulation, graafian follicle transforms in corpus luteum.

Q.2 **A :** Placenta is combined structure of foetal tissue & maternal tissue.
R : Placenta formation is completed before 6 week

Q.3 **A :** Seminal vesicle is called as accessory sex organ of male.
R : Seminal vesicle conserve sperm energy & provide fuel to sperm.

Q.4 **A :** Testes are retroperitoneal organ in man.
R : Peritoneal layer covers the testes on dorsal side.

Q.5 **A :** Cervix contain most weak sphincter muscle in the body.
R : Cervix open into fallopian by os-external.

Q.6 **A :** In ovarian cycle corpus luteum is exocrine gland.
R : It secretes the pheromones.

Q.7 **A :** Failure of testes to descend into the scrotum causes sterility in man.
R : Higher temperature of the abdomen than in the scrotum is suitable for sperm development

Q.8 **A :** Primary mammalian follicle are called graffian follicle.
R : These were discovered & described by graaf.

Q.9 **A :** Corpus albicans is inactive structure which found in the ovary.
R : Corpus albicans secretes the progesteron hormone after ovulation.

Q.10 **A :** Placenta functions as a temporary endocrine gland during development of embryo
R : Placenta produces pheromones.

Q.11 **A :** Menarche starts at the age of puberty.
R : After birth oocyte is matured and developed in Graffian follicle.

Q.12 **A :** Corpus leuteum present in proliferative phase of menstrual cycle.
R : High concentration of present in proliferative phase.

Q.13 **A :** Testes are situated in the extra abdominal cavity.
R : Spermatogenesis process required less temperature as compared to body temperature.

ANSWER KEY

EXERCISE - 4

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13
Ans.	2	3	1	4	4	4	3	4	3	3	2	4	1

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

EMBRYOLOGY

INTRODUCTION :

Embryology term was coined by **Aristotle**. Study of embryogenesis is known as **Embryology**.

Development Biology : This branch deals with study of complete development of organism. Development continues till death.

Prenatal Development - Development before the birth. **Post-natal Development -** Development after the birth.

The pre-natal development of animals is known as **Ontogeny**. This is of two types-

(1) Zygotic : Animals develop by sexual reproduction.

The animals which are produced through zygote is known as *oozoids*.

Oozoids have more survival as compared to blastozoids. Oozoids have genetic variations.

The development of animals through zygote is known as embryogenesis.

(2) Blastematic : Animals develops by any asexual structure known as blastema. Eg. Buds in Hydra.

Animals which are produced through blastema are known as blastozoids.

Development of animals through blastema is known as blastogenesis.

HISTORY OF EMBRYOLOGY :

(1) Aristotle is known as "Father of Embryology" he first studied the development in chick and other embryos. He gave its description in his book "Historia Animalia".

(2) Leeuvenhock (1671) - He observed and described human sperm for the first time.

- According to Hartsoeker and Leeuvenhock there is a small model of developing animals present in the head of the sperm of that animal. This small model is called homunculus. Both these scientists are called spermists, and this theory is called **'' Theory of spermist ''.**

(3) Swammer Dame, Haller, Bonette & Malpighi : - According to these scientists, small model of animal is always present in the egg. These scientists are called Ovists, and their theory is known as 'Ovists theory'

(4) Schleiden & Schwann : - Both the scientists established the cellular structure of egg and sperm.

(5) Pander : - He described the presence of three germinal layers in chick embryo.

(6) Fredrich Wolff : - He first presented the **''theory of epigenesis''.**

(7) Muller : - He gave the recapitulation theory.

(8) Haeckel : - He gave the details of Recapitulation theory and named it as the **bio-genetic law.**

- Bio-genetic Law : - According to this each organism during its embryonal development, passes through all stages, through which its species has evolved or embryo repeats its ancestry. i.e. Ontogeny recapitulates its Phylogeny.

(9) ''Carl Ernest Von Baer'' : - He is known as the "father of modern embryology." He gave the Baer's Law which in turn proves the recapitulation theory.

According to this law, during embryonal development, the development of general structures takes place earlier and specific structures develop at last or later on.

(10) A. Weismann : - He gave the **theory of germplasm** or the **theory of continuity of germplasm.** According to him, there are 2 types of protoplasm in the body of animals : -

(i) Somatoplasm (ii) Germplasm

Somatoplasm dies but the germplasm is never destroyed, rather it is transferred to the progenies.

(11) Wilhelim : - He studied embryonal development in frog and gave the mosaic theory.

- He said that there are some presumptive areas in the eggs of frog. These areas form specific structures during embryonal development. This is termed as "Promorphology ." and these type of eggs are termed as the mosaic eggs.

(12) Hand Driesch : - He studied embryonal development is sea-urchin and gave the regulative theory.

- In the eggs of Sea-Urchin presumptive areas are not found i.e. promorphology is not found. So, each part of the egg is capable of forming the complete embryo. These type of eggs are termed as regulative eggs.

(13) Hans Driesch : - He studied embryonal development in sea-urchin and gave the regulative theory.

- In the eggs of Sea-Urchin presumptive areas are not found i.e. promorphology is not found. So, each part of the egg is capable of forming the complete embryo. These type of eggs are termed as regulative eggs.

(14) Boveri & Child : -

They gave the gradient theory to explain the mosaic development in eggs.

According to them, a metabolic gradient is present inside the eggs.

Different parts of the egg have different metabolic rates.

The rate of metabolism is faster at the animal-pole of the egg and is slower at the vegital pole of the egg.

(15) Spemann :- He gave the **''Theory of organizers''.**

- According to it embryo has some special type of tissues, which induce development of some specific structures.

These are termed as the **organizers.**

- These organizers secrete some special chemicals called **evocators** which induce the formation of specific structures.

- Spemann got the Nobel prize for his theory of organizers.

(16) R.V. Graff : -

- He studied a follicle in human ovary and termed it as **''Graafian follicle''**

FORMATION OF GAMETES / GAMETOGENESIS :

Follicle stimulating hormone stimulates gametogenesis. Besides this hormone vitamin E is also essential for gametogenesis. Deficiency of vitamin E leads to sterility. Vitamin A is also required for the formation of healthy gametes.

Gemetogenesis is divided in three stages :

(i) Multiplication phase (ii) Growth phase (iii) Maturation phase.

As there are two types of gametes, the spermatozoa and ova, gametogenesis can be studied under two broad headings : spermatogenesis and oogenesis. **Spermatogenesis** is the formation of spermatozoa, whereas **oogenesis** is the formation of ova. Both spermatozoa and ova originate from **primordial germ cells** or **PGCs**, which are extra-gonadal in origin. In humans, the PGCs originate during early embryonic development from the extra-embryonic mesoderm. Eventually, they migrate to the yolk sac endoderm, and ultimately, to the gonads of the developing embryo, where they undergo further development. You can recall that spermatogenesis occurs in the seminiferous tubules of the testes of oogenesis occurs in the follicles of ovary. Formation of gametes starts at puberty.

SPERMATOGENESIS :

Spermoatogenesis : i.e. formation of sperms. In most of the animals spermatogenesis takes place in testes, (exception-earthworm). Mammalian testes contain seminiferous tubules and wall of seminiferous tubule is composed of germinal epithelium. It contains some special types of cells called primordial germ cells and these cells start spermatogenesis. On the basis of origin, primordial germ cells are extra embryonic mesodermal. Besides these cells, germinal epithelium contains some large sized cell called sertoli cells. Occurrence of sertoli cells is the unique feature of mammalian testis. Sertoli cells provide nutrition of developing sperm i.e. developing sperms are embedded in cytoplasm of sertoli cells and absorb nutrition. After maturation sperms comes out from sertoli cells and librate in seminiferous tubules.

Liberation of sperms from Sertoli cells is called **spermiation.**

Liberation of sperms from testes is called **semination.**

Liberation of sperms from body of male is called **ejaculation.**

Mammalian sperms are transferred to vagina of female by the process called **insemination.**

Sertoli cells form 'blood testes barrier' and protect the sperm from immune system of the body. because antibody may attach on haploid cells and destroy them. (Sperms are haploid and other cells of body are diploid).

Sertoli cells function as an endocrine gland i.e. secrete three type of hormones :

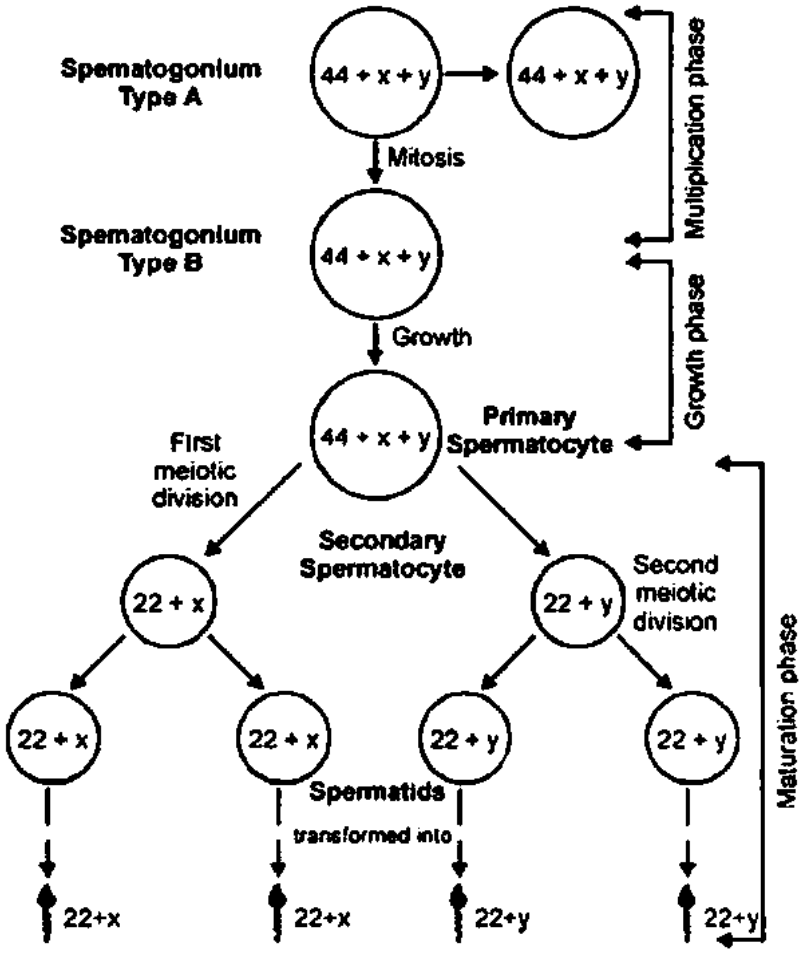
(i) Antimullerian hormone : function of this hormone is degradation of female gonads in male embryo. (In male seminal vesicle is the ruminant part of oviduct of female).

(ii) Inhibin hormone : Function of this hormone is to control excess secretion of pituitary gland to prevent the over-production of sperms.

(iii) Androgen binding protein : Function of this hormone is to concentrate testosterone in seminiferous tubules because testosterone is must for spermatogenesis in seminiferous tubules.

STEPS OF SPERMATOGENESIS :

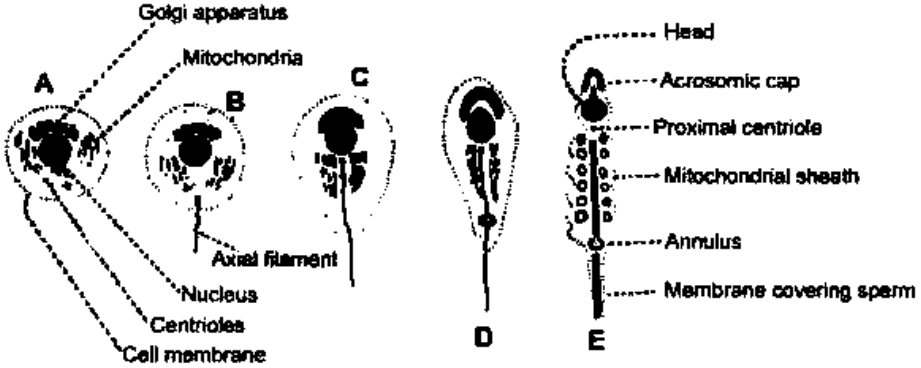
Spermatozoa are formed in the wall of the seminiferous tubules of the testes. The various cell-stages in spermatogenesis are as follows (the number of chromosomes at each stage is given in brackets)



An adult male produces over 10^{12} to 10^{13} sperm cells each day. These gradually move into the epididymis and the first portion of the vas deferens, where they undergo further maturation and are stored.

A. The *spermatogonia (type A)* or *germ cells* (44 X + Y) divide mitotically, to give rise to more spermatogonia of type A (spermatogenic lineage) and also spermatogonia of type B.
B. The *spermatogonia (type B)* (44 + X + Y) enlarge, to from primary spermatocytes (spermato cytogeneis)
C. The *primary spermatocytes* (44 + X + Y) now divide so that each of them forms two secondary spermatocytes. This is the first meiotic division. it reduces the number of chromosomes to half.
D. Each *secondary spermatocyte* has 22 + X or 22 + Y chromosomes. It divides to form two spermatids. This is the second meiotic division and this time there is no reduction in chromosome number.
E. Each *spermatid* (22 + X or 22 + Y) gradually changes its shape to become a spermatozoon. This process of transformation of a circular spermatid to a spermatozoon is called **spermiogenesis**/**spermateleosis**

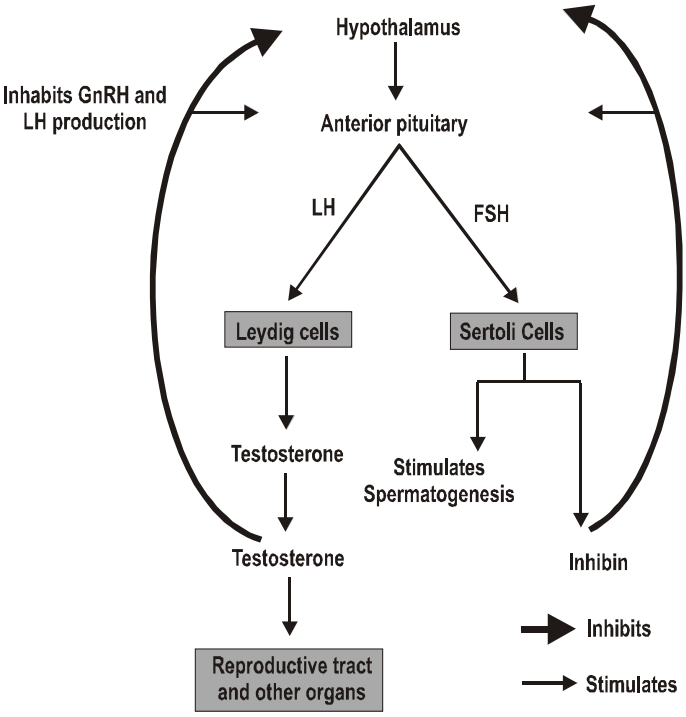
Spermiogenesis



In spermiogenesis first, of all nucleus of spermatid shift at one side. Except chromatin material, all the structures come out from nucleus as a result nucleus become small and light in weight. Then several golgi vesicles gathered just above the nucleus. Some of the Golgi vesicles develop granules called proacrosomal granules, such granule containing vesicle is called **proacroblast.** Rest of the golgi vesicles are called golgirest, the golgirest dissolve in cytoplasm. All the proacroblast fuse and form large vesicle called acroblast and it's granule is called acrosomal granule. Acroblast arranged just above the nucleus. Then cytoplasm of spermatid starts moving towards posterior side. As a result, plasma membrane shrinks and gets attached to acroblast and nucleus. Due to this head of sperm is formed. Now centriole starts forming axonema, then all the mitochondria of spermatid are arranged in spiral order around axonema. In this way middle piece of sperm is formed. Now axonema elongates towards posterior side and forms tail. Cytoplasm of spermatid continuously flows towards posterior side.

Harmone control of spermatogonesis

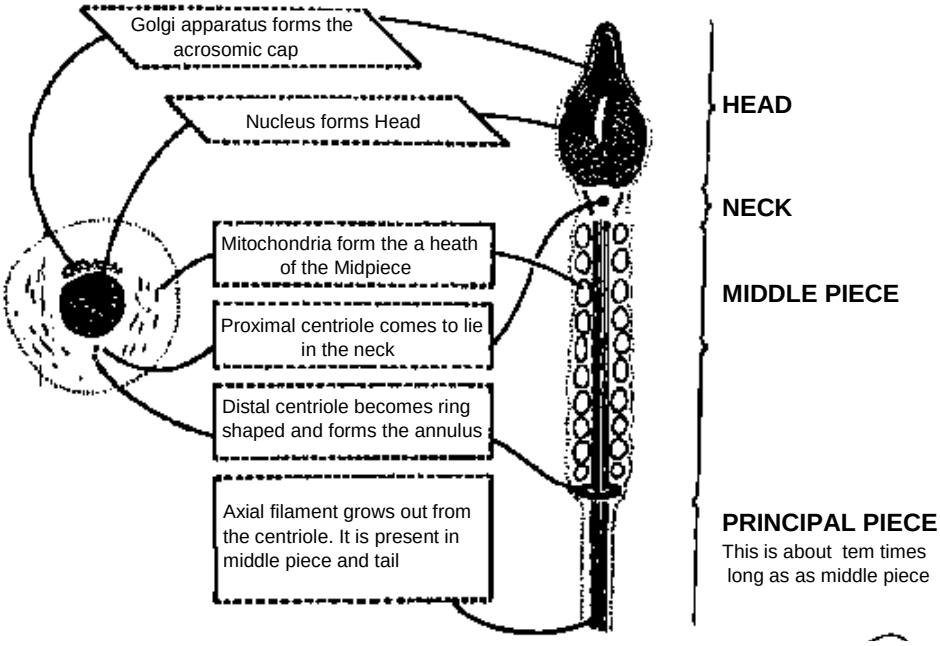
(a) Interstial cells of leydig produces testosterone that promotes sperms foramtion.
(b) These interstitial cells of leydig are triggered by ICSH = Interstitial cells timulating harmone produced by anterior lobe of pituitary. It is same as LH.
(c) Under the control of FSH and testosterone sertoli cells secrete androgen binding protein (ABP). It helps in concentrating testosterone in seminiferous tubules.
(d) Sertoli cells also produces inhibin that supress FSH.
(e) FSH acts on spermatogonia to stimulate sperm formation.
(f) FSH and LH production by pitutary is regulated by hypothalamus which produces GnRF - gonadotropin releasing harmone/factor.
(g) High level of testosterone negatively feed back the GnRF from hypothalamus.



Hormonal control of male reproductive system

Structure of sperm :

The spermatozoon has a head, a *middle piece* and a *tail.* The **head** is covered by cap the *acrosomic* cap, anterior nuclear cap, or *galea capitis*. Acrosome is a bag like structure filled with lytic enzymes called spermlysins. In the anterior part of middle piece neck is present. The **neck** is narrow : it contains a proximal & distal *centriole* (or Basal body). An axial filament begins just behind this centriole, it passes through the middle piece and extends into the tail. At the point where the middle piece joins the tail, this axial filament passes through a ring-like structure called the annulus (or ring centriole or zensons ring). That part of the axial filament which lies in the middle piece, is surrounding by a spiral *sheath* made up of mitochondria. (Nebenkern sheath)

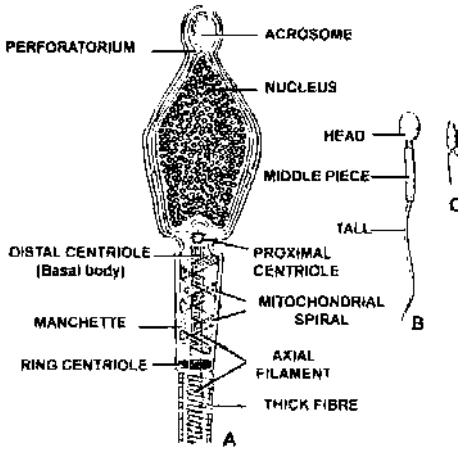


Nuclear part of head of spermatozoa consist of chromatin (mostly DNA) that is extremely condensed. It contains a basic nature protein called protamin.

The basal body is made up of nine segmented rod like structures each of which is continuous distally with one coarse fibril of the axial filament.

The axial filament, that passes through the middle piece and most of the tail, is actually composed of several fibrils arranged. There is a pair of central fibrils, surrounded by nine pairs (doublets) arranged in a circle around the central pair (9+ 2). This arrangement of one central pair of fibrils surrounded by nine doublets is covered by nine solid protein (making the arrangement as 9 + 9+ 2).

STRUCTURE OF A MATURE SPERMATOZOA



Structure of sperm

In the proximal tail part it is covered by only two solid protein fibres (therefore arrangement is 2 + 9 + 2), while end part of tail has no protein covering (therefore arrangement is 9 +2). Immediately outside the fibrils there is a fibrous health.

Middle piece (also called as the energy chamber) is surrounded by spirally arranged mitochondria (Nebenkern sheath). Finally, the entire sperm is enclosed in a plasma membrane.

In humans sperm formation is completed in 74 days.
In one ejaculation 4 ml semen have 400 million sperms.
If sperm count is less = Oligospermia.
If there are dead sperms = Necrospermia.
If there are no sperm = Azoospermia.

OOGENESIS :

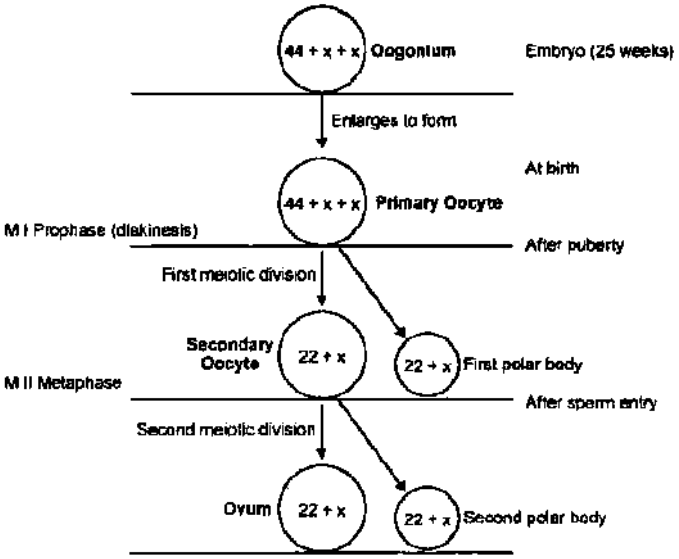


Fig. 2

Like spermatogenesis oogenesis process also can be divided into three stages :

(A) Multiplication **(B) Growth phase** **(C) Maturation phase**

(A) Multiplication phase : In this stage primordial germ cells or ovum mother cells repeatedly divide by mitosis to form large number of diploid oogonia.

This process completes in embryo stage of female in most higher animals.

(B) Growth phase : Like spermatogenesis, in this process oogonia grow in size and form primary oocytes. The growth phase is the longest phase oogenesis (except humans). During growth phase size of egg increases many times.

During growth phase several changes occur in egg and all these changes are classified in 2 sub-stages

- **Previtellogenesis**
- **Vitellogenesis**

Previtellogenesis :

During previtellogenesis, changes occur in nucleus and cytoplasm of egg.

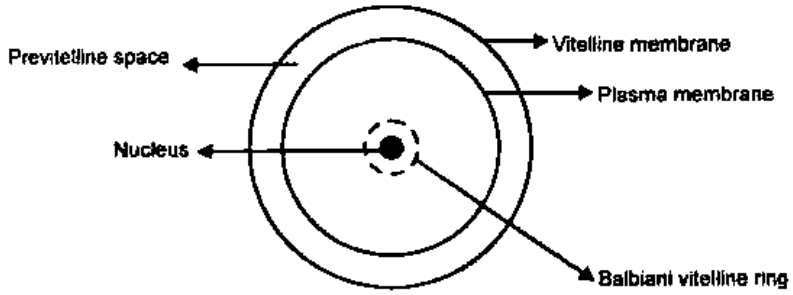
Changes in nucleus :

- Amount of nucleoplasm increases in nucleus.
- Number of nucleolus increase in nucleus.
- Formation of lamp brush chromosome starts.
- Activity of DNA increases in nucleus, as a result DNA become highly active and rapidly synthesizes different types of RNA. Increased activity of DNA is called as Gene redundancy/Gene amplification. Due to all these changes, size of nucleus increases and nucleus becomes vesicular. This vasicular nucleus is called germinal vesicle .

Changes in cytoplasm :

In cytoplasm, rate of protein synthesis increases. Cytoplasm rapidly synthesises different type of protein and enzyme. Due to more availability of protein and enzymes, synthesis of new protoplasm takes place and size of egg increases.

Number of cell organelles increase in cytoplasm, specially endoplasmic reticulum, golgi-body and mitochondria Mitochondria become very large in number so mitochondrial clouds are found in cytoplasm of egg.



Later on all these 3 cell organelle (golgi body, endoplasmic reticulum, mitochondria) are arranged in the form of ring around the nucleus, it is called as Balbiani vitelline ring. In the stage golgi body of egg secretes a membrane around the egg which is it called as vitelline membrane. A space appears in between plasma membrane of egg and vitelline membrane called as perivitelline space, It is filled with a fluid called perivitelline fluid.

At the end of previtellongenesis endoplasmic reticulum disappear. Golgi bodies gets converted into corticle granule. Corticle granules are filled with mucopolysacharide. Large number of change occur in mitochondria also.

☐ **Vitellogenesis :** During vitellogenesis egg stores food in the form of yolk.
Some part of yolk is synthesized in egg only, but major part of yolk is received from liver. Yolk received from liver is less viscous and is therefore soluble but this type of food cannot be stored for long periods (because it easily gets converted into simple form)

So mitochondria of egg with the help of kinase enzyme make the yolk more viscous and insoluble. 2 types of yolk is found :
Granular yolk occurs in the form of fine granules.
eg. Protostomia animals.
Yolk platelets occur in the form of plate disc like granule.
eg. Deuterostomia animals (higher animals)

Chemical composition of yolk :

1. Most abundant compound in yolk is phospholipid
   Most common phospholipids is lecithin.
2. Yolk contains different type of protein :
   – Simple protein : Albumin, Globin, Globulin
   – Phosphoprotein : Phosvitene, Ovovitelline
   – Lipoprotein : Lipovitelline
3. In yolk, least amount of substance found is carbohydrate.

(C) Maturation phase : Oogenesis (Fig.2) takes place in the ovaries. In contrast to males the initial steps in egg production occur prior to birth. By the time the foetus is 25 weeks old, all the oogonia that she will ever produce, are already formed by mitosis. Hundreds of these diploid cells develop into **primary oocytes**, begin the first steps of the first meiotic division, proceed up to diakinesis, and them stop any further development. The oocytes grows much larger and completes the meiosis I, forming a large **secondary oocyte** and a small **polar body** that receives very little amount of cytoplasm but one full set of chromosomes.

In humans (and most vertebrates), the first polar body does not undergo meiosis II, whereas the secondary oocyte proceeds as far as the **metaphase** stage of meiosis II. However, it then stops advancing any further, it awaits the arrival of the spermatozoa for completion of second meiotic division. Entry of the sperm restarts the cell cycle breaking down **MPF** (M-phase promoting factor and turning on the **APC** (Anaphase promoting complex). Completion of meiosis II converts the secondary oocyte into a fertilized egg or zygote (and also a second polar body)

Ova are derived from oogonia present in the cortex of ovary. Some important differences between oogenesis and spermatogenesis are

(i) Whereas one primary spermatocyte gives rise to four spermatozoa, one *primary oocyte* forms only one ovum.

(ii) When the primary spermatocyte divides, its cytoplasm is equally distributed between the two secondary spermatocytes formed. However, when the primary occyte divides, almost all its cytoplasm goes to the daughter cell which forms the *secondary oocyte*. The other daughter cell *(first polar body)*, receives half the chromosomes of the primary oocyte, but almost no cytoplasm.

• The first polar body is, therefore, formed merely to get rid of unwanted chromosomes.

TYPES OF EGGS :

(A) On the basis of amount of yolk

(i) Alecithal or Microlecithal or Oligolecithal eggs –

- The amount of yolk is very small or absent in these types of eggs. (oligolecithal, or microlecithal or alecithal).
- The term 'alecithal' (absence of yolk eg. Man) was given by Kent. And term microlecithal' (eg. Urchin) was given by Tori.

  Examples :- Egg of Amphioxus, Eutheria, Metatheria and sea – urchin.

(ii) Mesolecthal Eggs : - In this type of egg, the amount of yolk is moderate i.e medium ,neither more nor less.

Example : - Eggs of Amphibia, Petromyzon and lung-fishes.

(iii) Polylecithal or Macrolecithal or Megalecithal eggs : -

Eggs are with large amount of yolk. e.g. Bird's egg , Insect's egg.

(B) On the basis of distribution of yolk :

(i) Isolecithal or homolecithal eggs : The yolk is evenly or homogenously distributed in these eggs.

eg. : micro, oligo or alecithal eggs.

(ii) Telolecithal eggs : The yolk is concentrated in one part of the egg.

eg. Mesolecithal eggs of amphibia. (Moderately telolecithal)

Discoidal eggs : A type of telolecithal and megalecithal eggs. Where the yolk is in enormous quantity and concentrated in one part of the egg. Thus only a disc of cytoplasm called germinal disc remains in the egg which is located at the other pole of egg. (Heavily telolecithal)

eg. : Eggs of reptiles, birds and prototherian mammals.

(iii) Centrolecithal eggs : Megalecithal eggs where the enormous amount of yolk is located in the centre an cytoplasm is in the form of superficial layer around the yolk.

eg. : Insects egg.

(C) Classification of Eggs on the basis of Shell : -

On the basis of shell, eggs are of 2 types : -

(i) Cleidoic eggs : -

Eggs surrounded by a hard shell are known as cleidoic eggs. These eggs are found in those animal which have a terrestrial mode of life or which lay eggs on land.

These eggs have more amount of yolk. These are adaptations to terrestrial mode of life. Shell prevents the egg from dessication.

e.g. : - eggs of "Reptiles", "Birds", "Insects" and "Prototherians".

(ii) Non-Cleidoic eggs : -

Eggs which are not surrounded by a hard shell are called non-cleidoic eggs.

eg. : - all viviparous animals (Mammals) and all oviparous animals which lay eggs in water (Amphibians). Reptilia eggs are called leathery eggs.

STRUCTURE OF AN OOCYTE :

- The nucleus of egg is also called germinal vesicle.
- Oocyte is surrounded by membranes termed as the egg-membranes.
- Oocyte/Ovum along with the egg-membrane are termed as the egg.
- Egg = Ovum/Oocyte + Egg membrane.

Majority eggs are oval but the eggs of insects are long and cylindrical. Smallest eggs are of 50 in polychaeta and the largest eggs are of an Ostrich.

Classification of egg - membranes :

On the basis of origin, egg-membranes are of 3 types : -

(1) Primary egg membrane :

This membrane is secreted by the oocyte itself.

eg. Vitelline membrane, Zona Pellucida (mammals)

(2) Secondary egg membrane :

This is found outside the primary egg membrane and is secreted by the ovary.

(3) Tertiary egg membrane :

The is present outside the primary egg membrane. It is either secreted by the uterus or the oviduct.

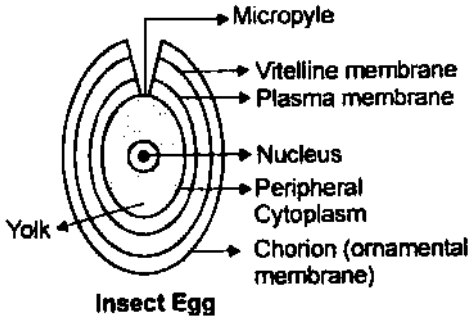
Functions of Egg-membranes

(i) To provide protection (ii) To check polyspermy (iii) To provide buoyancy to the amphibian eggs

Different types of eggs

(I) INSECT EGG

- Eggs of insects are megalecithal or polylecithal in them yolk is present in the centre, so the eggs are also centrolecithal.



Insect Egg

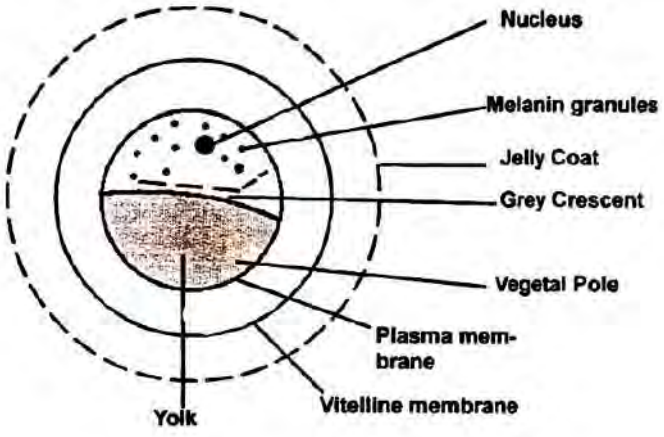
- Two egg membranes are present here, inner vitelline membrane (primary) and outer chorian (secondary).
- The sperm enters the egg through micropyle because on the head of insect sperm acrosome is absent.
- The Cytoplasm here is found in two parts :

(a) Central cytoplasm : - It is present in a very small amount in the centre of the egg. Egg nucleus is located in it.

(b) Peripheral Cytoplasm : - It is present in a very small amount along the periphery of the egg.

(II) FROG'S EGG

- Eggs of frog are moderately Telolecithal & Mesolecithal



Frog's Egg

Two types of egg membranes are found in frogs egg :

(i) Vitelline membrane : This is primary egg membrane which is secreted by the ovum around itself.

(ii) Jelly coat : This is tertiary egg membrane, secreted by oviduct. Jelly coat has air bubbles trapped in it due to which it floats on water. This group of frogs egg is called spawn, Jelly coat is bitter in taste so enemies do not eat it.

Secondary egg membrane is absent in frog's egg.

Internal part of the egg is divided in two parts :

(i) Animal pole : This part has cytoplasm, egg nucleus in also located in this part. In the cytoplasm melanin granules are found which prevent the egg from harmfull radiations. They also help in protection of egg by camouflage.

A sperm always enters into the ovum at some point in animal hemisphere. This point is normally other than the animal pole itself.

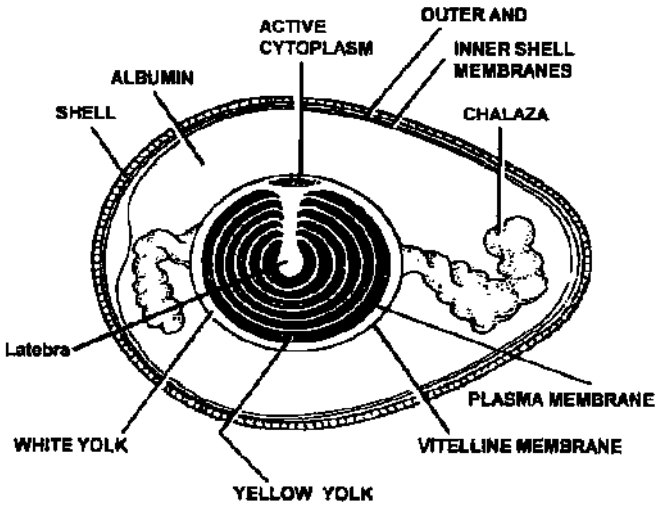
As the sperm enters into the ovum, taking some pigment granules with it, a grey, crescent shaped region appears in the equatorial zone geometrically opposite the sperm entrance point. This region is called **grey crescent.** It is formed due to movement of some pigment granules away from it towards sperm entrance point.

(It marks the dorsal side of future embryo). This area of sperm entrance point marks the anterior side of future embryo. The side diagonally opposite to it in the vegetal hemisphere marks the future posterior side. Thus the sperm entrance establishes the anteroposterior and dorsoventral axis as well as bilateral symmetry of future embryo.

(ii) Vegetal pole : yolk is concentrated in this part of egg.

(III) CHICK EGG

- These eggs are megalecithal or polylecithal and discoidal eggs.
- In these eggs, yolk is present in the centre of the egg in the form of a dense mass. The cytoplasm of the egg is in the form of a disc above the yolk, which is termed as the germinal-disc.
- Yolk is of 2 types i.e. yellow yolk and white yolk.
- Yellow – yolk has more amount of phospholipids and is secreted during the night. White yolk has less amount of phospholipids and is secreted during the day time. Central white part of yolk is called latebra.
- Both the types of yolk are arranged in alternate and concentric layers.
- Pander was the scientist, who discovered the 3 germinal layers i.e. Ectoderm Mesoderm and Endoderm in chick - egg.



Chick Egg

- Around the egg, porous shell of $CaCO_3$ is present which is secreted by the cells of the oviduct.
- In between the vitelline membrane and the shell membrane albumin is filled which is also called the white of egg. It contains 13% proteins.
- Thick albumin-fibres termed as "Chalaza" are present in the albumin part of egg.

(IV) EGG OF MAMMALS

- Mammalian eggs have very less amount of yolk, so the eggs are oligolecithal and isolecithal or microlecithal and homolecithal.
- The egg has 2 egg-membranes : -

(1) Zona Pellucida : - This is a transparent membrane like covering and is a primary membrane secreted by the ovum/oocyte itself.

(2) Corona radiata : - This is a layer of follicular cells" and these cells are attached to the surface of egg through "hyaluronic acid" This is a secondary membrane, which is secreted by the ovary. These eggs don't have tertiary membrane.

Mammalian eggs are approx 0.1 mm in size.

FERTILIZATION :

The process in which union of male and female gametes (formed by gametogenesis) and fusion of pronuclei of sperm and ovum takes place thus diploid zygote is formed, is called fertilization.

- **Fertilization has following processes : -** The union of male and female gametes is called **Syngamy**. Where as intermixing of their cytoplasm is called **plasmogamy**. The fusion of pronuclei of sperm and ovum is called **karyogamy.** The intermingling of their chromosomes is called **amphimixis.**

Due to fertilization , a diploid zygote is formed, by the union of two different types of gametes.

SITE OF FERTILIZATION :

(A) INTERNAL FERTILIZATION - Fertilization in the body (i.e., genital organs of animal) is called internal fertilization. In this type of fertilization, sperms are discharged by male directly into the genital tract of female after coitus.

- Whole process of fertilization takes place within the body of female. This is the most common adaptation in terrestrial animals.

Examples : - Aschelminthes, reptiles, birds and mammals.

(B)EXTERNAL FERTILIZATION - External fertilization takes place outside the body of females i.e., in water.

Example : - In most of the invertebrates, some protochordates, amphibian and most of the fishes.

TYPES OF FERTILIZATION :

(a) Self fertilization - This process takes place in the body of single animal i.e., fusion of male and female gametes produced by male and female organs of the same animal. This is called self-fertilization. This is possible only in bisexual or hermaphrodite animals.

Examples : - Animals of phylum porifera and most of the species *Hydra.*

(b) Cross-Fertilization – Fertilization takes place between two (male & female) different animals of same species.

This is called cross fertilization.

- This process is found in all unisexual animals. These animals are also called dioecious animals
- Cross-fertilization is also found in most of the bisexual or hermaphrodite animals because in these animals male genital organs develop first. This condition is called protandrous condition. In some of the species female organs develop first, this condition is called protogynous condition e.g. sponges.

MECHANISM - We can understand the process of fertilization in following steps.

1. Movement of sperms towards ovum.
2. Entrance of sperms in the ovum.
3. Activation of ovum.

Approach of sperm towards the egg – it is a chance factor, so sperms perform random (directionalless) movement. To increase the chances of approach of sperm towards egg there are mainly two adaption

(a) Number of sperms is very high : - e.g. In man 20 to 120 million sperms are present per cubic mm of semen.

(b) Egg is 1000 times larger than sperm

- Some special proteins are found on the surface of egg and sperm to help in fertilization.

According of **Lillie,** chemicals named as "fertilizins" are found on the surface of egg. Fertilins are glycoproteins or acid mucopolysaccharides. According to **Ballinsky,** an acidic protein named as Antifertilizin is present on the surface of sperms. "Fertilin" proteins are also present on sperm surface.

- Both the proteins are specific for a particular species. Antifertilizin present on sperm of a particular species will react with fertilizin of present on egg of the same species of animals.
- If we place some eggs of sea-urchin in sea-water, this sea water becomes viscous, this is called egg-water. When some sperms come in contact with this egg water, sperms adhere with each other. It is called agglutination.

Here the reaction of fertilizin (dissolved in water from egg) and antifertilizin of sperm is observed clearly.

- Fertilizins behave like lock and antifertilizins behave like keys.
- Fertilization is always intraspecific.
- According to Washerman and Sailing (1989) a specific pair of protein molecules is found on the surface of mammalian sperm, which can recognize specific carbohydrates and proteins in ZP_3 region of zona pellucida. The **bindin** protein of sperm reacts with these molecules to initiate the changes in acrosome. A specific sugar galactose remains attached with ZP_3 glycoprotein. The sperm fails to recognize the ovum of its own species, if this sugar is removed from zona pellucida.
- In addition to these glycoproteins, there are some hormones also, which help in fertilization.

The hormones present at the surface of sperm are called androgamones. These are of two types. Androgamone first & androgamone second.

- **Androgamones I** help in the energy conservation of sperms.

- **Androgamones II** dissolve the gelatinous coverting present all over the egg.
- Hormones present at the surface of egg are called gyanogamones these are of 2 types.

(a) Gyanogamones I - this hormone neutralizes Androgamone I and activates sperm to move

(b) Gyanogamones II - It makes sperm head sticky.

Enzyme of acrosome (Hyaluronidase and sperm lysins) dissolve the egg membrane. This is called **acrosomal reaction.** As a result sperm head make the contact with the plasma membrane of egg, now inner membrane of acrosome evaginates outside and form rigid tube is called **acrosomal filament.** Acrosomal filament provide stimulus to plasma membrane of egg and due to stimulus of sperm, egg is induce for fertilization. Mammalian sperms do not form this type of filament because mammalian sperms are highly active and provide stimulus to plasma-membrane of egg without any filament. Mammalian sperms acquire activity at two places. First-epididymis and second-vagina. Vaginal secretion make the sperm highly active and sperm acquire capacity of fertilization is called **capacitation.**

Activation of egg : Due to stimulus of sperm an enzyme is induced in plasma-membrane of egg it is called adenyl cyclase enzyme and function of this enzyme is to catalyze C-AMP in egg cytoplasm. C-AMP is the second messenger. Cyclic AMP receive stimulus from plasma membrane of egg and transfers it in egg cytoplasm and induces all the response of egg for sperm.

All the response of egg for sperm are collectively called **gyanogenesis.**

Due to stimulus of sperm, permeability of plasma membrane of egg increases specially for k^+ and Ca^{2+} ions. Function of Ca^{2+} ions is to inactivate the cytostatic factors in egg. As a result egg is now ready for cleavage (In egg cytoplasm special type of protein called cytostatic factor are present these factor prevent the cleavage in unfertilized egg)

Due to stimulus of sperm, $H^+ – Na^+$ pump activates and induces the plasma-membrane of egg. Function of this pump is to continuously influx H^+ ions and outflux Na^+ ions. As a result concentration of H^+ ion increases in egg cytoplasm and develops an acidic medium. In acidic medium, proteolytic enzyme become active and liberate the m-RNA from informosome. These m-RNA become active and rapidly synthesize different types of protein and enzymes. Due to more availability of protein and enzymes metabolic activity of egg increases.

Response of egg : (1) Due to stimulus of sperm, meiosis-II is induced in human egg by excluding second polar body becoming mature ovum.

(2) At the point of contact with sperm and plasma-membrane of egg a cone-like structure is formed called **reception cone.** After some time reception cone sinks in egg cytoplasm along with sperm (entry of sperm is a type of phagocytosis). With the entry of sperm all the cortical granules burst and secrete a membrane around the egg is called fertilization membrane **(cortical reaction).** It is secreted on inner surface of primary egg membrane and perivitelline space become more wide and amount of perivitelline fluid is also increase. Function of perivitelline fluid and fertilization membrane is to prevent the entry of sperm in egg. so normally only one sperm enter inside the egg (monospermy). Sometimes more than one sperm enter inside the egg **(polypermy).** Two types of polyspermy are found in nature.

(1) **Pathological polyspermy :** In it the nuclei of all the sperms fuse with egg nucleus. In such type of condition embryo development does not occur. (Due to polyploidy condition)

(2) **Physiological polyspermy :** In physiological polysermy nucleus of only one sperm fuses with egg nucleus and rest of the sperm die in egg cytoplasm. Dead sperm are called merocytes. In physiological polyspermy normal embryo development occurs.

Polyspermy is absent in human beings. Polyspermy mostly occurs in megalecithal eggs.

Fate of sperm in egg - In majority of animals, only head and middle piece enter inside the egg and tail is left outside.

- In mammals, whole sperm enters in the egg.
- In some animals, only head of sperm enters in the egg tail and middle piece remain outside e.g. *Hydra, Neries* etc. After entering inside the egg, sperm rotates by 180°. All the structure of sperm dissolve in egg cytoplasm except sperm nucleus and proximal centriole.
- The centriole of egg itself degenerates at the time of second maturation division. So proximal centriole of sperm starts division, it divides into 2 daughter centrioles, which migrate towards opposite pole and start forming spindles.

Fat of sperm nucleus : -

- The nucleus of sperm absorbs water from egg cytoplasm and becomes enlarged. Now it is called **male pronucleus.**

After meiosis – II egg nucleus occur in the form of scattered vesicles then it is called as karyomeres and after some time ll the karyomeres assembled to form complete nucleus is called female pronucleus.

- Male pronucleus and female pronucleus migrate through definite routes and come close to each other. These routes are called fertilization path. (It has following parts)

(1) Sperm penetration path - Male pronucleus for some distance, moves at the equator of egg. This is called sperm penetration path.

(2) Sperm copulation path - Male pronucleus starts migrating towards female pronucleus.

(3) Egg copulation path - Female pronucleus migrates towards male pronucleus. Both the pronuclei come close to each other.

(4) Cleavage path - Both the pronuclei move together to their final position which is somewhere in animal pole. At this final position nuclear membrane of both the pronuclei degenerate and chromosomes of male and female pronuclei form pairs. The mixture of male and female chromosomes is called amphimixis.

- Amphimixis was discovered by **O.Hertwig** in the eggs of sea – urchin.
- **Newport** was of all first observed the entry of sperm into the egg.

Significance of Fertilization

1. Oocyte completes its second maturation division on coming in contact with the sperm.
2. Amphimixis process leads to the formation of diploid zygote to restore the normal diploid number of the chromosomes.

3. The centriole of sperm after entering into egg induces the egg to undergo cleavage.
4. The paternal and maternal characters are transmitted to the off springs through the process of fertilization.
5. The peripheral changes occurring in the egg prevent the further entry of sperm into the ovum, thus checking polyspermy.

PARTHENOGENESIS OR VIRGINAL DEVELOPMENT

- The development of embryo without fertilization is called parthenogenesis. The animals which are formed by unfertilized eggs are called parthenotes.
- The discovery of parthenogenesis was done by **Charles Bonet** in the eggs of sea-urchins.
- Parthenogenesis is of two types –

  (a) Natural (b) Artificial

(a) Natural parthenogenesis -

Some animals show parthenogenesis by nature e.g. Honey bees, wasps, ants, grass-hoppers, ticks, mites and sea-urchins. Natural parthenogenesis is of 2 types : -

(i) Haploid parthenogenesis or Arrhenotoky : - In this case eggs are formed by meiosis. Eggs are haploid, they have the power of fertilization sometimes male animals are developed by unfertilized eggs. In Honeybees, unfertilized eggs develop into males (drones), and fertilized eggs develop into queen and soldiers. Thus male honey bees are always haploid and queen with soldiers are always diploid.

(ii) Diploid parthenogenesis or Thelytoky : - In this case, eggs are formed without meiosis division. Eggs are diploid they do not have the power of fertilization.
Diploid eggs give rise to female generation only. Male members are absent in these species.

Examples : - *Lacerta sexicola armenica* (lizard), Caresius aratus gibelio (Fish).

Diploid parthenogenesis may also be divided into two types –

(A) Ameiotic Thelytoky - In this type of parthenogenesis, during oogenesis first meiotic division does not take place but second meiotic division occurs as usual. In this situation the ovum still remains diploid. These ova, when reproduce parthenogenetically give rise to diploid off springs. For example, *Trichoniscus, Daphnia, Daphnia pulex* etc.

(B) Meiotic thelytoky - If the eggs are formed by normal oogenesis process, but by one or other reasons the eggs retain their diploid chromosomal number, then the parthenogenesis is called meiotic thelytoky. It may happen because of autofertilization. Some species of order – Lepidoptera exhibit this type of parthenogenesis.

- In some animals parthenogenesis alternates with normal sexual reproductive cycle. This is called cyclic parthenogenesis e.g., Honey bee.
- In some animals, development of animals is always by parthenogenesis and sexual reproduction is absent in these species. This is called complete parthenogenesis. Males are absent.

Example - Lacerta sexicola armenica (lizard)

(b) Artificial parthenogenesis : -

This type of parthenogenesis is done by artificial methods. Artificial parthenogenesis is done by putting eggs in different atmospheres or by giving special stimulus to the eggs. Different artificial methods used for this purpose are as follows -

(1) If we place eggs in brine or salt solution, KCl solution. Then eggs show parthenogenesis e.g. eggs of sea-urchins.

(2) By short exposure of radiations on eggs or exposure of silk insect egg to sunlight.

(3) If eggs are given shocks of temperature.

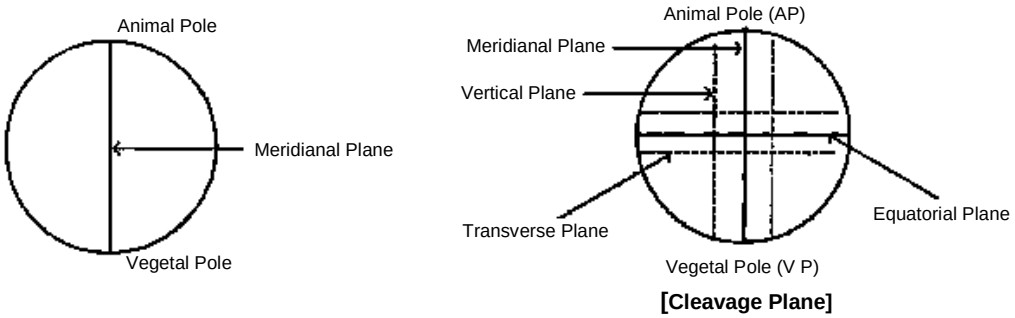
(4) If eggs are pierced by needle dipped in the blood of some animal. The eggs of frog show parthenogenesis by this method.

CLEAVAGE

- The term 'Cleavage' was given by **''Von Baer''.**
- In fertilized egg or activated egg, the egg undergoes repeated cell divisions which occur rapidly producing a multicellular structure without changing its size. All these mitotic cells divisions collectively called cleavage or segmentation. Due to the process of cleavage, a single celled zygote, through a successive mitotic cell divisions changes into a complex multicellular structure. Cells produced as a result of cleavage are termed as blastomeres. The total size of the embryo remains the same. Though the number of blastomeres as a result of mitotic cell divisions increases, the size of blastomeres gradually decreases are compared to parent cell. Interphase stage is very short in cleavage. In interphase only DNA duplication and histone protein synthesis takes place up to some extent. In the interphase of cleavage only 'S' phase is present, G_1 & G_2 phases are absent. Protein synthesis and RNA synthesis do not occur during this interphase. Nucleolus is absent in the nucleus of blastomeres. Size of blastomeres decreases during cleavage. When size of blastomere becomes equal to that of size of somatic ells, the divisions of cleavage are stopped. Only normal cell division take place. Cleavage can be observed till onset of gastrula stage. After gastrulation, cleavage is completely checked. Nucleous appears first in gastrula stage. The consumption of oxygen is increased during cleavage.

CLEAVAGE PLANE :

- The traveling path of cleavage furrow in fertilized egg is called cleavage plane. Different animal eggs show different cleavage planes : -



[Cleavage Plane]

PATTERNS OF CLEAVAGE :

(a) Radial Cleavage - In this pattern, cleavage furrows are straight and form right angle with each other. In this case I, II cleavages are meridianal, which are at right angle to each other. III cleavage is equatorial In this way 8-celled octate is formed. In radial cleavage, 4 blastomeres of upper tier and 4 blastomers of lower tier are on sampe plane i.e, Blastomeres are arrangement in radial symmetry in the beginning.

(b) Biradial Cleavage - In this pattern, first two cleavages are meridianal and at right angle to each other all III cleavage is vertical. In 8-celled stage 4 blastomeres of central zone are bigger and 4 blastomeres of peripheral region are smaller.

Examples : - In the eggs of Ctenophora.

(c) Bitareal Cleavage - In this patterhn, first two cleavages are meridianal in same plane and III Cleavage is transverse. i.e., embryo shows bilateral symmetry in 8-celled stage. The blastomeres of one side are smaller and blastomeres of other side are larger.

Examples : - In the eggs tunicata, cephalochordata, amphibian and amphioxus.

(d) Spiral Cleavage - The cleavage furrow passes obliquely. In this pattern 4 blastomeres of lower tier rotate clockwise or anticlock wise. If this rotation is clockwise, then it is called dextral spiral cleavage e.g. In Mollusca. If this rotation of lower tier blastomeres is anti-clockwise, then pattern is called sinistral spiral cleavage, e.g. In helminthes and annelida.

CLASSIFICATION OF CLEAVAGE :

On the basis of fate of blastomeres : -

A. Determinate Cleavage - In this pattern of cleavage, the fate of blastomeres is fixed, determined i.e. each blastomere forms a particular portion of embryo. If (by certain reason) any blastomere is damaged or destroyed, then the part of embryo (which would have development from that blastomere) will be absent e.g., Nematoda, Annelida, Mollusca and Some chordates like amphibian & ascidians.

B. Indeterminate Cleavage - In this type of cleavage, the fate of blastomeres is not definite. All the blastomeres form all the parts of embryo. If some blastomeres are lost, no loss is observed in this embryo. If in the early stages of cleavage, the embryo is cut into small pieces, then each piece of embryo will develop into a complex embryo, and all the embryos are identical. So identical twins are monozygous. This is the basis of embryo cloning.

CLASSIFICATION OF CLEAVAGE :

On the basis of amount of Yolk : -

☐ A scientist named **Balfour** gave a law. According to him, rate of cleavage is inversely proportional to amount of yolk present in the egg. The yolk present in egg, disturbs the rate of cleavage. The rate of cleavage is slow in that part of egg, in which amount of yolk is more, and the rate of cleavage is faster in the portion of egg in which yolk is in lesser amount. Mostly cleavage is of 2 types : -

A. Complete or holoblastic : - When cleavage furrow passes through the egg completely. As a result of this the whole egg divides. Holoblastic cleavage is found in all the eggs except megalecithal eggs. The whole egg divides into blastomeres. No part of egg remains undivided. It is of 2 types : -

(a) Equal holoblastic cleavage - In those eggs, in which amount of yolk is less and it is distributed evenly in the egg, cleavage occurs in whole egg, blastomeres (So formed) are of same size. All the parts of egg show same rate of cleavage.

Example : - It is found in microlecithal and isolecithal eggs.

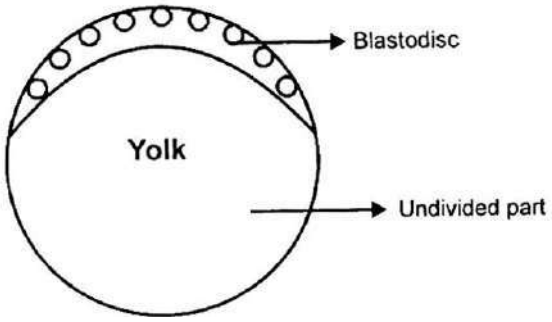
(b) Unequal holoblastic cleavage - In those eggs in which amount of yolk is medium and it is distributed unevenly in the egg. The blastomeres are bigger and less in number where the concentration of yolk is higherin the egg. The part of egg which contains small amount of yolk, blastomeres here formed are smaller and more in number. The bigger blastomeres are called megamere and smaller blastomere are called micromeres.

Examples : - Unequal holoblastic cleavage is present in mesolecithal and telolecithal eggs and human eggs.

B. Meroblastic cleavage - This cleavage is found in megalecithal eggs, in which amount of yolk is large. Cleavage does not occur in that part of egg, where yolk is present cleavage occurs only Cytoplasmic part, yolk remains undivided. Meroblastic cleavage is of 2 types on the basis of distribution of yolk in egg.

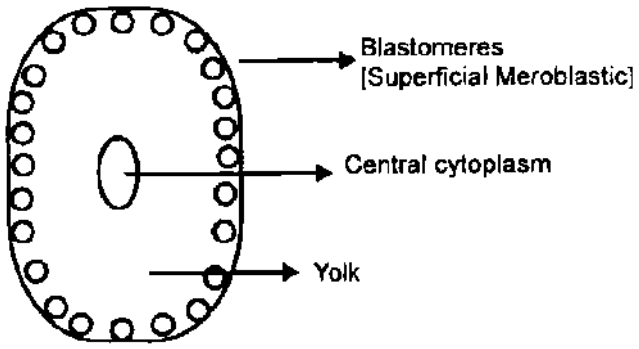
(a) Discoidal meroblastic cleavage - Cleavage occurs only in blastodisc of egg. This is mainly found in megalecithal or polylecithal eggs, because in these eggs, cytoplasm is found in the form of a disc.

Examples : - Reptilian eggs and birds eggs.



(b) Superficial meroblastic cleavage – In insect egg, central cytoplasm shows free central division, due to which so many nuclei are formed. All these nuclei migrates towards peripheral cytoplasm. Cleavage occurs only in peripheral region. As a result of this, a superficial layer of blastomeres is formed around the yolk. This type of cleavage is also called superficial meroblastic cleavage.

Example - In centrolecithal eggs.



Significance of Cleavage -

1. There is no change in shape and size developing embryo till blastula stage comes. Till then it remains just like undivided egg in shape.
2. As a result of cleavage, unicellular zygote changes into multicelluar structure.

HUMAN EMBRYOLOGY :

Fertilization -

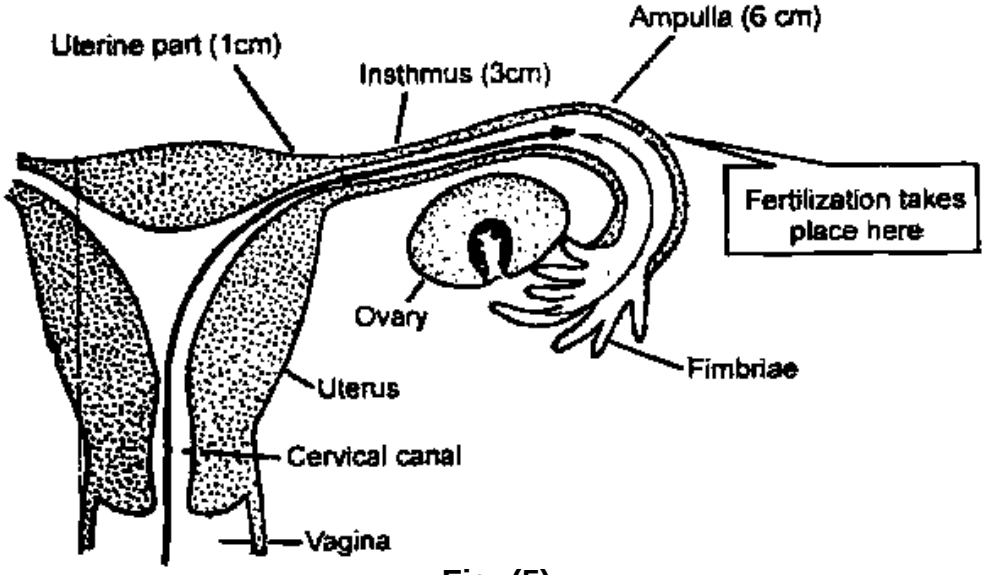


Fig. (5)

Fertilization is the union of two opposite types of gametes, spermatozoa and ova. The semen is a mixture of spermatozoa and accessory fluids. Once deposited with in the vagina, the spermatozoa proceed on their journey into and through the uterus and on up into the oviducts. Although spermatozoa can swim several millimeters each second, their trip through the uterus and to the oviducts requires on increase in their motility.

On the first hand, ejaculation of semen in the vagina triggers motility of spermatozoa. This is aided further by muscular contraction of the walls of the uterus and the oviducts. An additional increase in sperm motility occurs due to activation of the sperm by the viscous liquid secreted from the secreted cells of the epithelial lining of oviduct mucosa. This phenomenon of sperm activation in mammals is known **capacitation**. It takes about 5-6 hours for capacitation.

Before fusion of a spermatozoan with the egg, the spermatozoa are to penetrate a few barriers, the **egg membranes,** which cover the egg. The activated spermatozoa undergo **acrosomal reaction** and release varies chemicals, like **hyaluronidase** that acts on the **ground substances** of follicle cells, **corona penetrating enzyme** that dissolves **corona radiata,** and **zona lysine which perforates the zona pellucida**. All these chemicals are contained in the acrosome, located at the tip of the sperm head, and are collectively termed **sperm lysins.** An average human ejaculate of 3-4 ml of semen contains 80-100 million spermatozoa. Out of these, only one will succeed in entering the egg and fertilizing it. Fertilisation of egg with only one spermatozoan is known as **monospermy.**

While the ovarian follicle is growing, the oogonium within it undergoes maturation. The oogonium enlarges to form a primary oocyte. The primary oocyte undergoes the first meiotic division to shed off the first polar body and becomes a secondary oocyte (fig. 5.2A). At the time of ovulation, the second meiotic division is in progress and a spindle has formed for separation of the second polar body (fig. 5.2B)

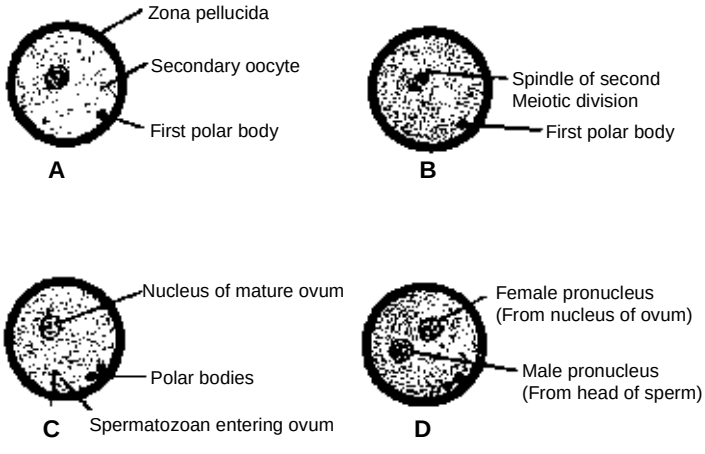

Fig 5.2

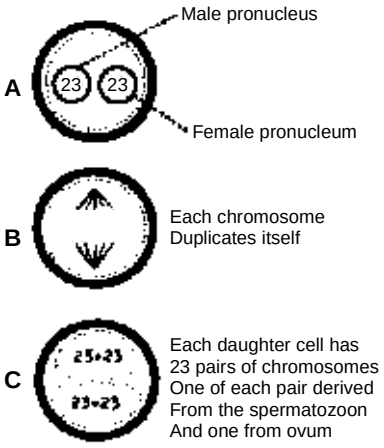

Fig 5.3

At this stage the 'ovum' enters the infundibulum of the uterine tube and passes into the ampulla (fig. 5)
Fertilization of the ovum occurs in the ampulla of the uterine tube. One spermatozoon pierces the zona pellucida and enters the ovum. In response to egg sperm binding two things happen (1) **depolarization** of egg membrane (2) **cortical reaction** i.e. formation of fertilization membrane to prevent **polyspermy.** (After one spermatozoon has entered the ovum other spermatozoa cannot enter it). After the entry of the spermatozoon, the second polar body is extruded. The chromosomes of the ovum now assume the shape of a nucleus called the *female pronucleus.* At the same time the head of the spermatozoon (which it will be remembered is formed from the nucleus) separates from the middle piece and tail, and transforms it self into the *male pronucleus* (Fig. 5.2 D).
The male and female pronculei meet, but they do not fuse to form one nucleus. Their nuclear membranes disappear and their chromosomes become distinct. It will be recalled that each pronucleus has 23 chromosomes so that the fertilized ovum now has 46 chromosomes in all (fig 5.3 A).

- Each of these 46 chromosomes splits into two (fig. 5.3B). Meanwhile, a spindle has formed, and one chromosome of each pair moves to each end of the spindle (as in mitosis). Leading to the formation of two daughter cells fig. (5.3C). This is called the two-cell stage of the embryo. Note that stricktly speaking there is no one-cell stage of the embryo (fig. 6A)
- Important points note at this stage are that :
  (i) the two daughter cells are still surrounded by the zona pellucida :
  (ii) each daughter cell is much smaller than the ovum. As subsequent divisions occur the cells become smaller an smaller until they acquire the size of most cells of the body.

CLEAVAGE :

The two cells formed as described above undergo a series of divisions. One cell divides first so that we have a '3-cell' stage of the embryo (fig.6B) followed by a '4-cell' stage (fig. 6C), a 5-cell, stage etc. This process of subdivision of the ovum into smaller cells is called cleavage. These cells are called blastomeres.

- As cleavage proceeds the ovum comes to have 16 cells. It now looks like a mulberry and it called the
  morula (fig. 6D). It is still surrounded by the zona pellucida. If we cut a section across the morula

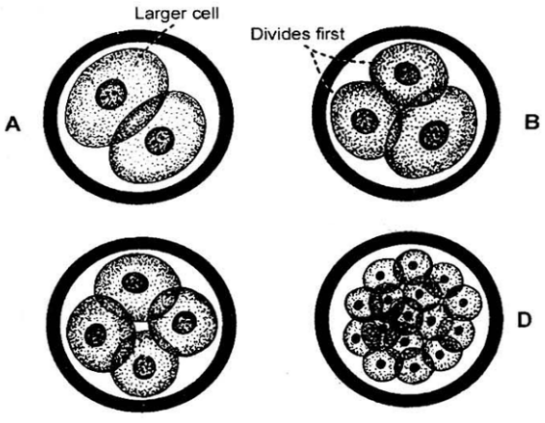

Fig 6

we see that it consists of an *inner cell* mass that is iscompletely surrounded by an outer layer of cells, *(Compaction).* The cells of the outer layer will later give rise to a structure called the *trophoblast* (fig. 7A). The inner cell mass gives rise to the embryo proper, where as the cells of the trophoblast help to provide nutrition to the embryo.

- Some fluid now passes into morula from the uterine cavity, and partially separates the cells of the inner cell mass from those of the trophoblast (fig. 7B). As the quantity of fluid increases, the morula acquires the shape of a cyst. The cells of the trophoblast become flattened and the inner cell mass comes to be attached to the inner side of the trophoblast on one side only (fig. 7C). The morula has now become a blastocyst. That side of the blastocyst to which the inner cell mass is attached is called the *embryonic* or animal pole. While the opposite side is the vegetable or *abembryonic pole.*

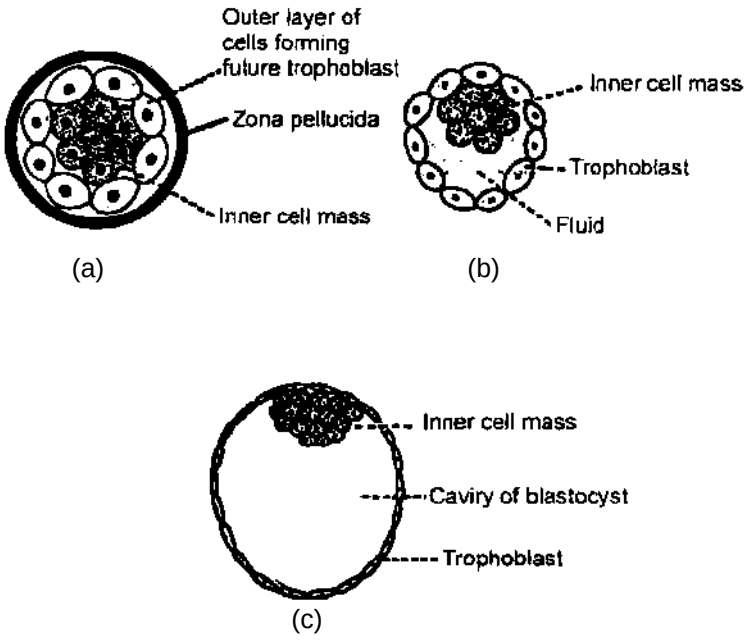

Fig. 7

Function of the zona pellucida -

- The trophoblast has the property of being able to stick to the uterine (or other) epithelium and its cells have the capacity to eat up other cells. As the embryo travels down the uterine tube, and the upper most part of the uterine cavity ; it is prevented from 'Sticking' to the epithelium by the zona pellucida.

FORMATION OF GERM LAYERS (GASTRULATION) :

As the blastocyst develops further, it gives rise not only to the tissues and organs of the embryo, but also to a number of structures that support the embryo and help it to acquire nutrition. At a very early stage in development, the embryo proper acquires the form of a three-layered disc. This is called embryonic disc (also called embryonic area, embryonic shield, or germ disc) The three layes that constitute this embryonic disc are.

(i) Endoderm (endo = inside)

(ii) Extoderm (ecto = outside)

(iii) Mesoderm (meso = in the middle)

- These are the *three germ layers.* All the tissues of the body are derived from one or more of these layers. We have seen that the blastocyst is a spherical cyst lined by flattened trophoblastic cells, and that inside it there is a mass of cells, the inner cell mass, attached eccentrically to the trophoblast Further changes are as follows

(a) Some cells of the inner cell mass differentiate (i.e. they become different from others) into flattened cells, that come to line its free surface (fig. 8A). These are called hypoblast and constitute the *endoderm*, which is thus the *first germ* layer to be formed.

(b) The remaining cell of the inner cell mass become columnar (fig. 8D). These are called are called epiblast and form the second germ layer, the *ectoderm.* The embryo is now in the form of a disc having two layers.

(c) A space appears between the ectoderm (below) and the trophoblast (above). This is the amniotic cavity (fig. 8C), filled by *amniotic fluid,* or liquor animal. The roof of his cavity is formed by *amniogenic cells* (cells of Rauber) derived from the trophoblast, while its floor is formed by the ectoderm.

(d) Flattened cells arising from the endoderm, spread and line the inside of the blastocystic cavity. In this way, a cavity, lined on all sides by cells of endodermal origin, is formed. This cavity is called the *primary yolk* sac (fig. 8D)

(e) The cells of the trophoblast give origin to a mass of cells called the *extra-embryonic mesoderm* (or primary mesoderm). These cells come to lie between the trophoblast and the flattened endodermal cells lining the yolk sac, thus separating them from each other. These cells also separate the wall of the amniotic cavity from the trophoblast (fig. 9A).

This mesoderm is called extra-embryonic because it lies out side the embryonic disc. It does not give rise to any tissues of the embryo itself.

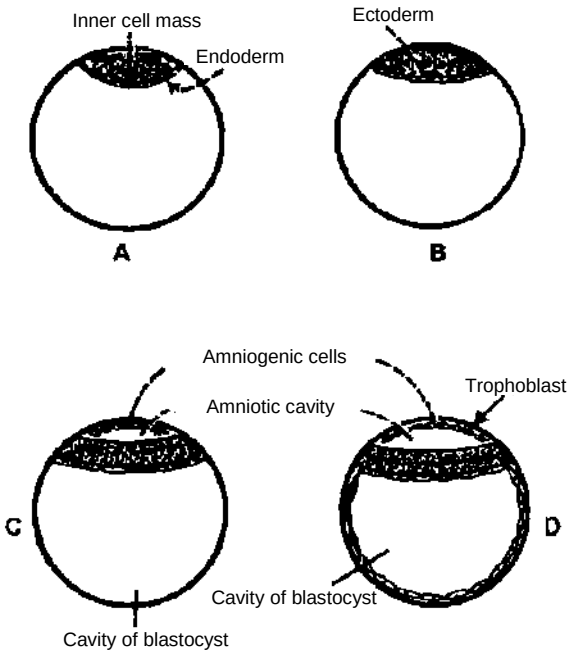

Fig. 8

(f) Small cavities appear in the extra-embryonic mesoderm. Gradually these join together to from larger spaces and, ultimately, on large space is formed. This cavity is called the *extra-embryonic coelom* (fig. 9B), it will be seen that the extra-embryonic coelom does not extend into that part of the extra-embryonic mesoderm which attaches the wall of the amniotic cavity to the trophoblast. The development embryo, along with the amniotic cavity and the yolk sac, is now suspended in the extra-embryonic coelom, and is attached to the wall of the

blastocyst (i.e. trophoblast) only by this unsplitted part of the extra-embryonic mesoderm. This mesoderm forms a structure called the *connecting stalk.*

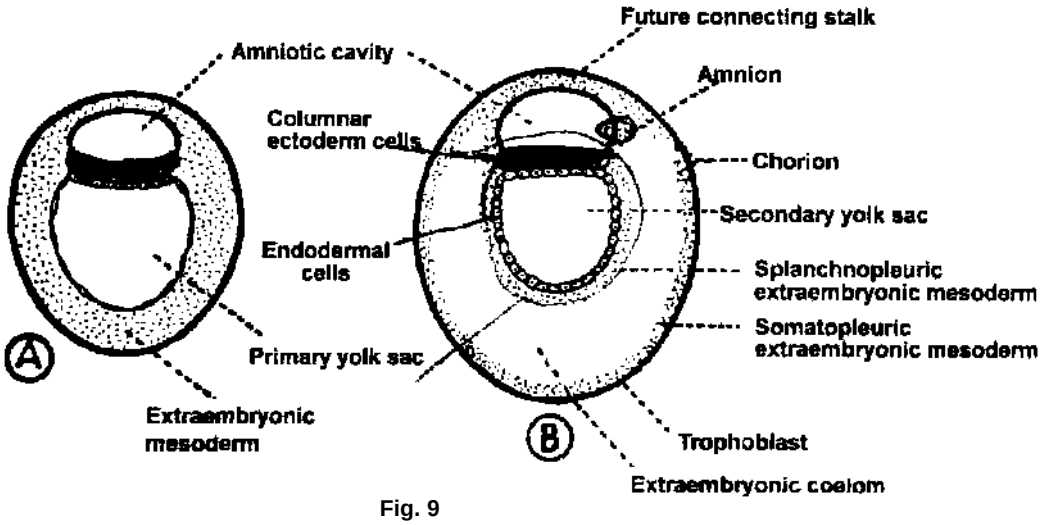

Fig. 9

(g) **Formation of chorion and amnion :** At this stage, two very important membranes are formed. One is formed by the parietal extra-embryonic mesoderm (on the inside) and the overlaying trophoblast (on the outside) this is called the chorian (fig. 9B). The other is the amnion which is constituted by the amniogenic cells forming the wall of the amniotic cavity (excluding the extodermal floor). These cells are derived from the trophoblast. We have already seen that the amnion is covered by the unsplit extra-embryonic mesoderm, and that the connecting stalk is attached to it.

(h) With the appearance of the extra-embryonic mesoderm, and later of the extra-embryonic coelom, the yolk sac becomes much smaller than before and is now called the *secondary yolk sac.* This alteration in size is accompanied by a change in the nature of the lining cells. They are no longer flattended but become cubical (fig. 9B).

(i) At this stage, the embryo proper is a circular disc composed of two layers of cells : the upper layer (towards amniotic cavity) is the ectoderm, the cells of which are columnar, while the lower layer (towards yolk sac) is the endoderm, made up of cubical cells (fig. 10)

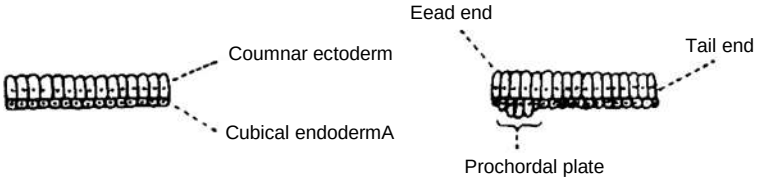

Fig.10

(j) At one circular area a near the margin of the disc, the cubical cells of the endoderm become columnar. This area is called the prochordal plate. The appearance of the *prochordal plate* determines the central axis of the embryo (i.e. enables us to divide it into right and left halves), and also enables us to distinguish its head and tail ends (fig. 10)

(k) Soon after the formation of the prochordal plate some of the ectodermal cells lying along the central axis, near the tail end of the disc, begin to proliferate, and form an elevation that bulges into the amniotic cavity. This elevation is called the *primitive streak* (fig. 11). The primitive streak is at first a rounded or oval swelling primitive streak later forms the Henson's node.

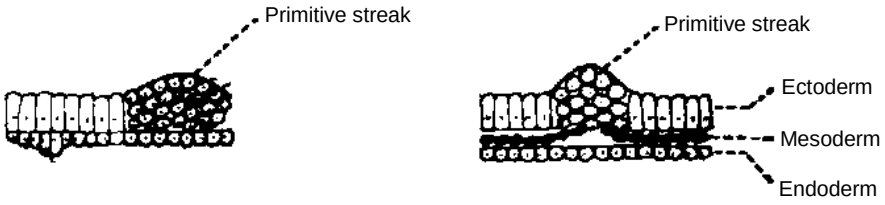

Fig. 11

(i) The cells that proliferate in the region of the primitive streak pass sideways, pushing themselves between the ectoderm and endoderm (fig. 11). These cells from the *intra-embryonic mesoderm* (or secondary mesoderm) which is the third germ layer.

Notochord

The notochord is a midline structure, that develops from mesoderm in dorsal region.

Importance of the notochord

The notochord is present in all animals that belong to the phylum Chordata. In some of them e.g. **Amphioxus,** it persists into adult life and forms the central axis of the body. In others, including man, it appears in the embryo but only small remainants of it remain in the adult. Notochord elongates considerably, and lies in the midine, in the position to be position to be later occupied by the vertebral column. However, the notochord does not give rise to the vertebral column.

Neurulation : i.e formation of neural tube. After neurulation there occur three type of ectoderm.

(i) Somatic ectoderm (ii) Neural tube ectoderm (iii) Neural crest ectoderm.

Anterior part of neural tube differentiate brain and rest of the neural tube differentiate in spinal cord so central nervous system is formed by neural tube.

TERATOGENY :

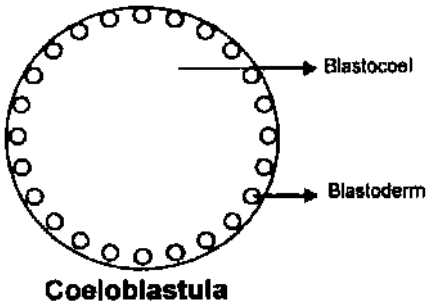
☛ During the first 3 months of pregnancy the basic structure of baby is formed. This involves cell division, cell migration, and differentiation of cells into the many types found in the body. During this period, the developing baby called foetus is very sensitive to anything that interferes with developmental steps. Eg.

Virus infection of mother by rubella (German measles) virus or pexposure to certain chemicals may cause malformation in the developing embryo. Such agents are called teratogens (Monster Forming agents).

GENRAL STAGES OF EMBRYONIC DEVELOPMENT

1. **Morula -** As a result of segmentation or cleavage activities, unicellular zygote changes into a solid ball like multicellular structure. In the later stage of cleavage, clusters of sticky, cohering, protruding (otuside) blastomeres are produced, which look like mulberry. This stage is termed as morula stage.
2. **Blastulation -** Cleavage continues in solid ball like morula and new formed blastomeres start rearranging themselves. Cell-aggregation starts in blastomeres, due to the movement of these blastomeres a cavity appears in the embryo, it is called as blastocoel. This cavity is schizogenous cavity in origin i.e. it is formed by the separation of cells. Cell aggregation is also known as cohesion. Blastomeres arrange

themselves in the form of a layer around the blastocoel, this layer is termed as blastoderm. The embryonic stage is now called blastula, and its formative activites is called blastulation.



Coeloblastula

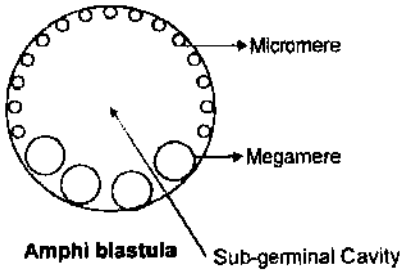
Types of blastula

The shape of blastula depends on so many factors e.g. size of eggs, amount of yolk, distribution of yolk in the eggs, frequency of cleavage and number of cleavage divisions. According to these factors, we can classify blastula of different animals in different categories.

(a) Coeloblastula (b) Stereoblastula (c) discoblastula

(d) Blastocyst (e) Superficial blastula or Periblastula

(a) Coeloblastula - Blastocoel is wide and clear in this blastulation, it is completely surrounded by blastomeres on all the sides i.e, blastocoel cavity is situated totally inside the embryo. Blastomeres are very small in size as compared to blastocoel.

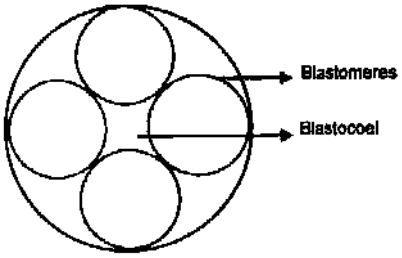


Amphi blastula

Example : - Eggs of **Amphioxus,** coelenterate, amphibia, sponges etc.

Coeloblastula of amphibians is called amphiblastula because in it blastocoel cavity is accentric in position and is more towards the animal pole (amount of yolk is more towards the vegetal pole). Amphiblastula of sponges is a free swimming larva, its blastomeres are flagellated. This larva swims freely with the help of these flagella. It is a unique feature in sponges.

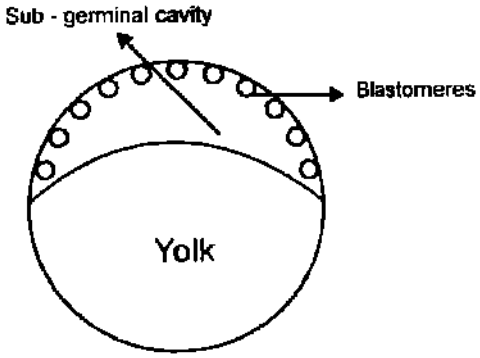
(b) Stereoblastula - In this blastula, blastocoel is very narrow or obliterated. Blastomeres are large as compared to blastocoel. It is almost solid.



[Stereoblastula]

Example - eggs of Neries, and members of phylum Mollusca.

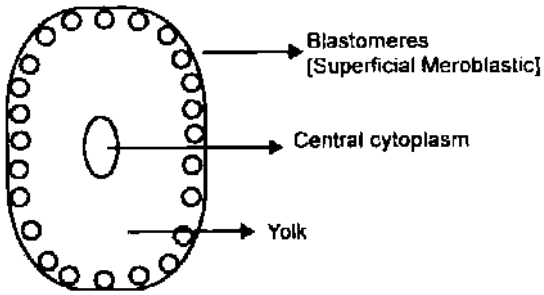
(c) Discoblastula - It is found in those animals which have discoidal eggs. There is a cavity present in between blastomeres and yolk, it is called subgerminal cavity. It is a type of cavity, which is surrounded by yolk on one side and by blastomeres on the other side.



[Discoblastula]

Examples - eggs of reptiles, birds and prototheria.

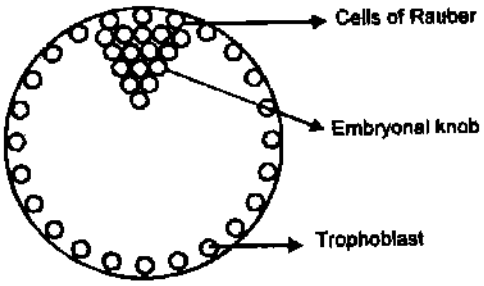
(d) Superficial blastula or periblastula - In centrolecithal eggs, cleavage occurs only in peripheral region. The layer of blastomeres surrounds the centrally situated yolk. Blastocoel is absent in this type of blastula. In place of blastocoel, subgerminal cavity is found.



[Periblastula]

Example - Eggs of insects.

(e) Blastocyst - blastula or Eutherian & Metahterian mammals is called blastocyst, because blastula is in the form of a cyst.



[Blastocyst]

Blastula - of mammals is called blastocyst. In blastocyst all the embryonal cells occur in the form of solid mass called embryonal knob. Embryonal knob (inner cell mass) is covered by protective layer called trophoblast and it's cell just above the embryonal knob are trophoblast called cells of Rauber (amniogenic cells). There occurs a cavity in between embryonal knob and trophoblast called albumin cavity. It is filled with nutritive fluid absorbed from the wall of uterus. So albumin cavity is also nutritive-cavity.

SPECIAL POINT :

1. The growth phase is the longest phase during male gametogenesis. But in human oogenesis, maturation phase is longest.
2. The acrosome of sperm are produced by golgibodies.
3. The smallest sperm is of crocodile and its size of 0.02 mm & largest sperm is of Discoglossus (2 mm)
4. 74 days are required to complete the cycle of spermatogenesis in human being.
5. In 1 ml of semen, 20 to 120 millions of sperms are present in human being.
6. Deficiency in the number of sperms result in sterility which is known as oligospermia.
7. Absence of sperms in semen is known as azoospermia .
8. Formation of yolk in oogenesis takes place in the growth phase.
9. Largest egg is of Ostrich (16 cm long with its shell).
10. Although normal number of sperm are present in semen but if these are completely non motile. The condition is known as necrospermia.
11. Smallest egg in birds is of humming bird.
12. Due to high mortality rate in lower animals, the production of egg is more.
13. Sequence of egg production is as follows.
    Mammals < Aves < Reptiles < Amphibian < Pisces.
14. Cat and rabbit both are induced ovulator.
15. The life span of eggs in female reproductive organs in human being is 48 hrs.
16. The nucleus of egg is known as germinal vesicle.
17. At the age of 45-50 yrs. In female the ovulation process will stop which is known as menopause.
18. The spermiation (release of sperms from sertoli cells) in all sertoli cells occurs simultaneously.
19. Cortical granules are absent in rat.
20. Mosaic type of cleavage is found in the parasite *Echinococcus* granulosus.

Special features of some animals :

(a) Sperms of some animals are not having flagella :

eg. (1) Ascaris - sperm is amoeboid

(2) Cray fish - star shaped, tail less sperm

(3) In crab and lobuster the sperm are tail less and have three sharp process.

(b) Biflagellated sperm :

eg. In toad fish *(Opsansus)* head of many sperms unite together and form sperm boats

In Gastropods, the sperms are hexaflagellated.

Smallest sperm – Crocodile (0.02 mm)

Largest sperm – *Discoglossus* (2 mm) in chordates and Drosophila in entire animal kingdom.

Shape of head part of sperms :

(i) Spherical – eg Teleostei

(ii) Lance shaped – eg Amphibia and Reptiles
(iii) Spiral end – eg. Birds
(iv) Spoon shaped – eg. Mammals (in man)
(v) Hook like – eg. Rat.

Germinal layers and their derivatives

The following description gives an account of the respective organs formed by the three germ layers. Most of the organs are the product of combination of more than one germ layers.

Organs derived from ectoderm

1. Skin (epidermis) and their pigment cells.
2. Mucosal membrane of lips, cheek gums, basal portion of mouth, some part of palate, nasal apertures.
3. Lower part of anal canal.
4. Glans penis.
5. Labia majora and outer part of labia minora.
6. Anterior epithelium of cornea, epithelium of conjunctiva, ciliary body and iris of eyes.
7. Outer face of tympanic membrane, epithelium of labyrinth.
8. Glands :
   (i) Exocrine –
   (A) Sweat glands (B) sebaceous glands (C) parotid glands
   (D) mammary glands (E) lacrimal glands ;
   (ii) Endocrine –
   (A) Hypophysis cerebri (B) adrenal medulla
9. Hairs, nails, enamel of teeth
10. Lens of eyes.
11. Nervous system.

Derivatives of mesoderm

1. Connective tissues, superficial and deep fascia, ligaments, tendons, dermis of skin. (from dermatome)
2. Specialized connective tissues like adipose tissue, reticular tissues, bones, cartilages.
3. Teeth.
4. All muscles.
5. Heart, all blood vessels and blood cells.
6. Kidneys, ureters, urinary bladder, posterior urethra of female, upper glandular part of prostate.
7. Ovaries, uterine tubes.
8. Testes, epididymis, vas defeens and seminal vesicle, ejaculatory duct.
9. Pleural cavities, peritoneal cavity and pericardial cavity.
10. Joints.
11. Cornea, sclera, choroid ciliary body and iris related material.
12. Microglia, duramater etc.

Derivatives of endoderm

1. Epithelial part of mouth, some part of palate, tongue, tonsils, pharynx, oesophagus, stomach, small and large intestine, upper part of anal canal.
2. Pharyngo-tympanic tube, middle ear, inner face of tympanic membrane.
3. Respiratotry tract.
4. Gall bladder, pancreatic duct.
5. Major protion of urinary bladder, complete urethra of female except posterior part, complete urethra of male except anterior and posterior part.
6. Whole inner part of vagina including inner face of labia minora.

7. Glands :

(i) Exocrine –

(A) Liver (B) Pancreas

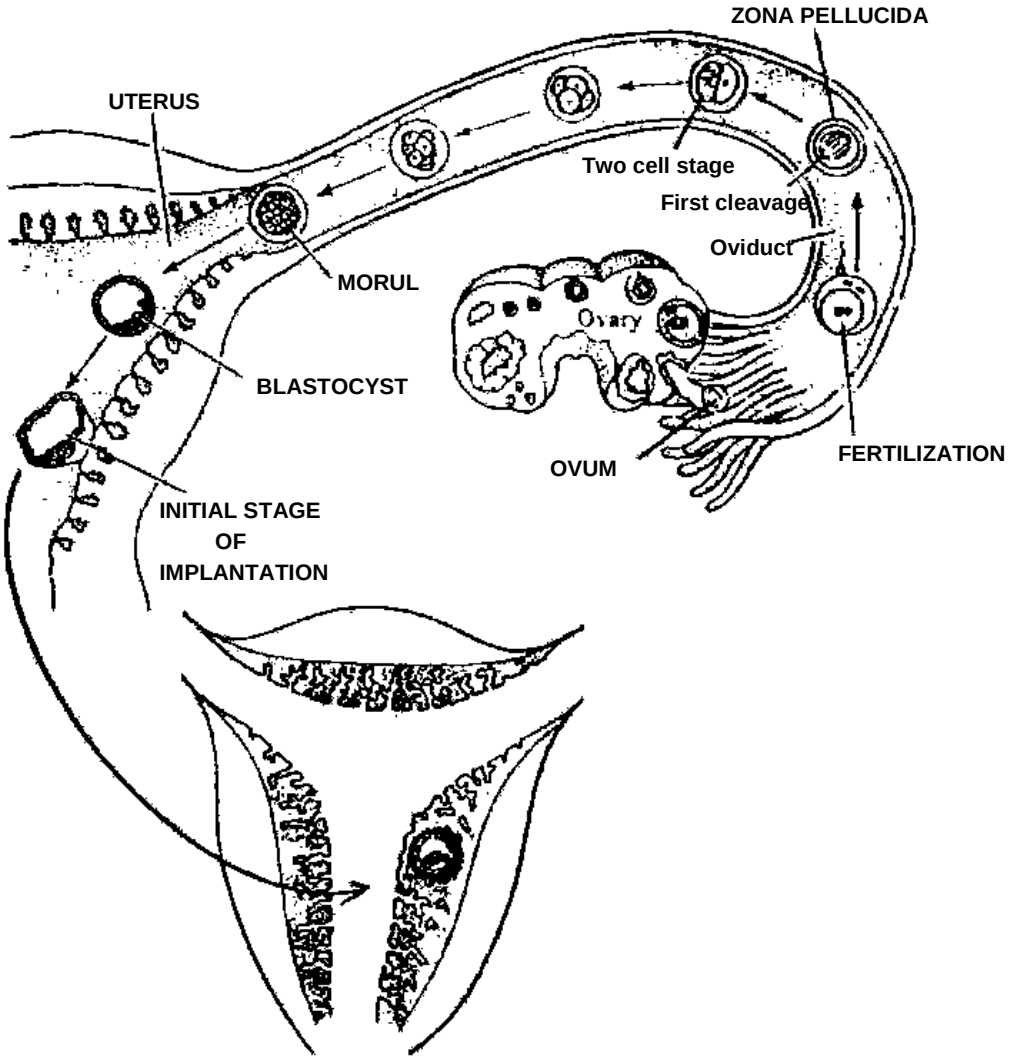
(ii) Endocrine –

(A) Thyroid (B) parathyroid (C) thymus (D) islets of Langerhans

In addition to the above, the glands of gastrointestinal tract, major part of prostate etc. are also formed by endoderm.

Implantation

The attachment of developing embryo to the appropriate body layer or surface to obtain nutrition is called implantation. This phenomenon is a common event in most mammals (except prototheria) in which embryo (blastocyst stage) after reaching in uterus attaches itself with the wall of the uterus. In other animals like fishes, reptiles, birds, prototherian mammals etc., this nutritive connection is established with the yolk present in egg. In higher mammals including men, the blastocyst on its contact with endometrium of uterus gets completely buried in the wall of the uterus.



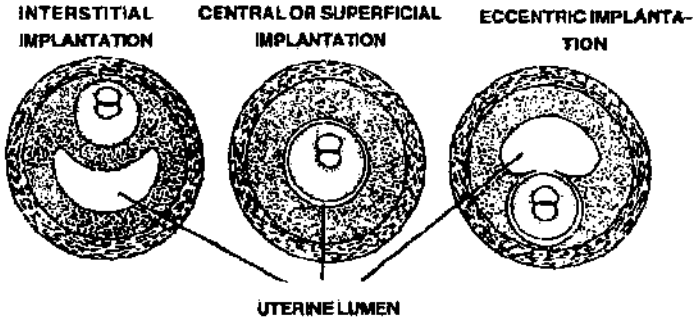
Initially the oocyte after its release from ovary, comes into fallopian tube where the process of fertilization is completed, Just after fertilization, embryonic development starts and a blastocyst is formed after cleavage and morulation. In human being, the blastocyst gets attached with the uterine endomdetrium in

about four days after entering in uterus. At the same time, the cells of endometrium of implantation area separate out and adhere with embryonic cells with the help of certain enzymes secreted by the cells of trophoblast. In human, the site of implantation is generally mid-dorsal or mid-ventral part of uterus. Implantation of blastocyst takes about 7-8 days after fertilization in human and by 12^{th} day it is completely buried in the wall of the uterus. The place of entry through which the embryo enters into the wall, is completely closed by a fibrous and cellular plug, known as **closing coagulum.**

Types of Implantation

On the basis of the position of attachment in the uterus, implantation is of three types -

1. **Central or Superficial implantation -** In this type the blastocyst attaches superficially with the wall of uterus, and remains suspended in the lumen of the uterus. This type of implantation occurs in lower chordates, e.g. cow, pig, dog etc.



2. **Interstitial implantation –** The blastocyst is buries deeply inside the wall of uterus and covered by endometrial tissues lying under epithelium. This type of implantation occurs in human being.

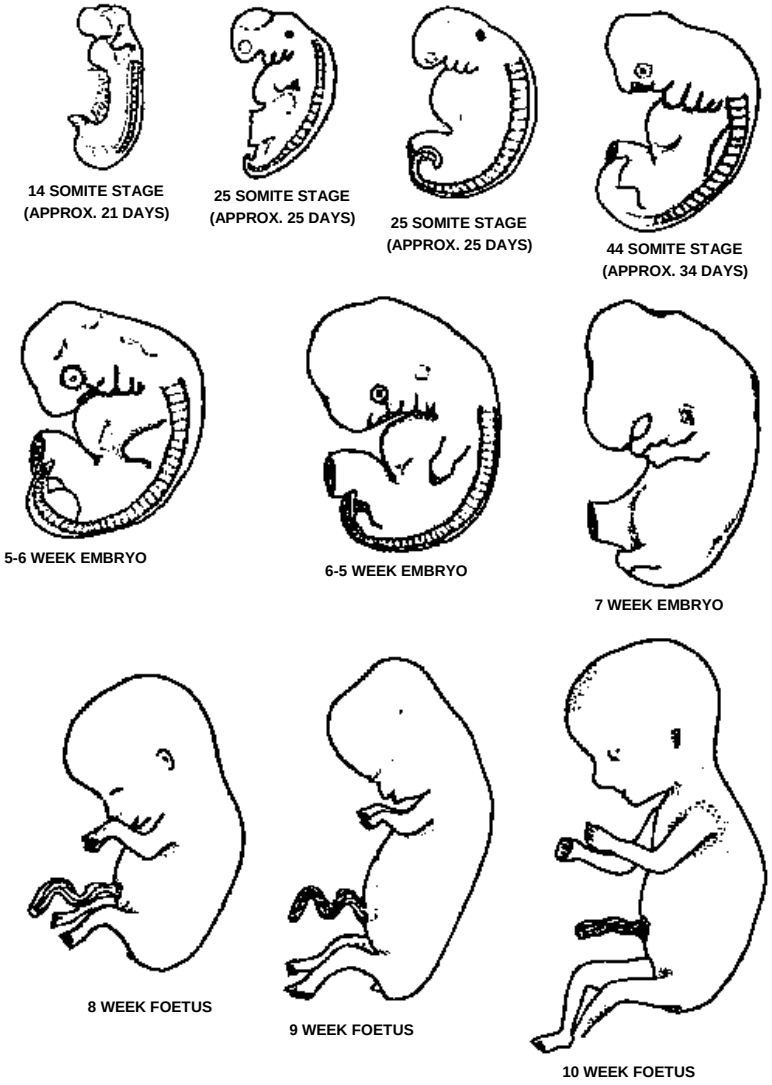
3. **Eccentric implantation –** It occur in rat, squirrel etc. In this type of implantation , the blastocyst settles in the flods of epithelium of uterus. After some time it is completely surrounded by these folds.

Summary of developmental stages in human

Day 1	–	Fertilization; the diameter of fertilization egg is about 0.15 mm.
Day 2	–	Two cells stage
Day 3	–	16 cell stage, morula
Day 4	–	Entry of blastocyst in the lemen of uterus, disappearance of zona pellecida, diameter of blastocyst is about 0.3 mm.
7-8 days	–	Partial entry of blastocyst inside the endometrium of uterus; implantation
Day 12	–	Complete entry of blastocyst into endoderm, extra-embryonic mesoderm, amnion and yolk sac.
Day 14	–	primitive streak formation.
Day 18	–	Formation of 3-5 pairs of somites.
Day 19	–	Neural groove, neural plate, notochordal plate, and 6-8 pairs of somites formed.
Day 24	**–**	Indication of the formation of head and tail region; 21-23 pairs of somites formed, formation of heart continues at ventral side.
Day 28	**–**	Heart starts beating, neural tube formed, 3 pairs of visceral arch and 30-31 pairs of somites formed. Blood islands appear
Day 32	**–**	30-39 pairs of somites formed.
7 Weeks	**–**	Jaws, fingers and external ears begin to appear. The CR length (crown-rump length; the length from head to the bottom of hips) is 19-20 mm.

8 Weeks – The embryo is completely surrounded by amnion, fingers and toes clearly visible, almost all organs formed with continuing development, at the end of 8th week the embryo appears like a little human, now called as foetus; C-R length is 28 to 30 mm.

5 months – Blood formation starts in bone marrow Decidua capsularis and parietalis connect together, hairs appear.



Embryonic development in human

9 months – placenta attains maximum size, nails on fingers appear. In the next 10 days the foetus is ready to born as a little bady.

The above mentioned timing are approximate time periods. Some times, due to some reasons, certain babies are born before stipulated time. The babies born in 7th month may also survive as normal babies.

EXTRA EMBRYONIC MEMBRANES AND PLACENTA

Extra embryonic membranes

In chordates like reptiles, birds and prototherian mammals, shaped blastula is a disc structure called as blastodis. The cellular layer formed of blastomeres remains as blastoderm. The central part of blastoderm gives rise to embryo proper, while the peripheral portion does not take past in the formation of embryo. This peripheral part is known as extra embryonic region. This region takes part in the formation of certain

membranes called extra embryonic membranes. These extra embryonic membranes provide facilities for nutrition, respiration and excretion to the embryo. Extra embryonic membranes are of four types –

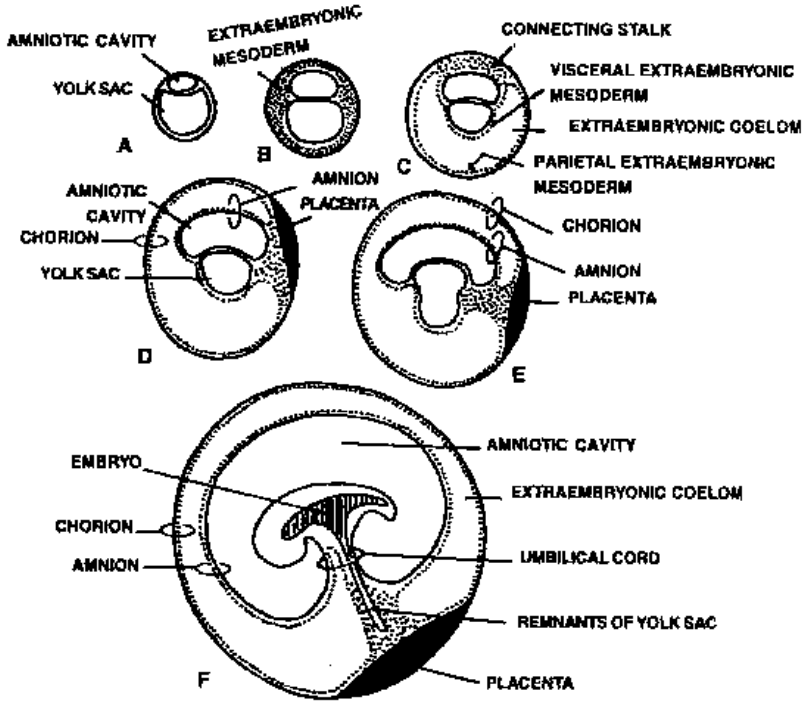
1. Amnion 2. Chorian 3. Yolk sac 4. Allantois

On the basis of presence of absence of amnion, two groups of vertebrates are categorised.

1. **Amniota -** This group is characterized with the presence of amnion in the embryos of its members. For example members of class Reptilia, Aves and Mammalia.
2. **Anamniota -** Animals of this group are devoid of amnion in their embryos. For example class cyclostomata, pisces and amphibia.

Extra embryonic membranes in human

The process of gastrulation in embryo results into the formation of endoderm or hypoblast, ectoderm or epiblast, amniotic cavity, yolk sac, extra embryonic parietal and visceral mesoderm, connecting stalk etc. Extra embryonic membranes are also formed during this process. Each extra embryonic membrane is derived from two layers.



Formation of extraembryonic membranes in human

1. **Amnion -** It is formed by the layer of amniogenic cells present around the amniotic cavity and the extra embryonic mesoderm. Extra embryonic mesoderm layer surrounds the amnion. The connecting stalk is also attached with it. With a gradual increase in size the amnion covers the embryo from all sides. After about eight weeks of fertilization, amnion is completely incorporated into connecting stalk, which finally forms the umbilical cord. Embryo, in this stage, is called as foetus remains hanging in amniotic fluid.
2. **Chorion -** It is formed by the extra embryonic parietal layer of mesoderm and the cell of trophoblast. After implantation of blastocyst, the trophoblast gives out several figner like processes, the chorionic villi which get embedded into uterine endometrium Mesoderm also contributes in the formation of these villi. After a period of four these villi disappear from all parts except the connecting stalk where they grow rapidly and participate in the formation of placenta.

3. **Yolk sac -** Yolk sac is formed by the cells of extra embryonic visceral mesoderm and endoderm. Initially the sie of yolk sac is larger as compared to that of the embryo. About eight weeks after fertilization, the yolk is reduced in size and changes into a tubular structure. Ultimately a placenta is developed with the incorporation of yolk sac and mesodermal connecting stalk with the amnion and chorion.
4. **Allantois -** It is a solid and cylindrical mass formed by embryonic mesoderm. A small cavity lined by endodermal cells develops in it. The mesoderm of allantois forms many small blood vessels in this region. These vessels connect the embryo with placenta and ensure nutritional and respiratory supply to embryo. In human, allantois does not function to store the excretory wastes as it does in reptiles and birds.

PLACENTA

The eggs of viviparous animals are unable to develop into their embryos outside the uterus independently. This is because of the very little or negligible amount of yolk present in these eggs, which can not fulfill the nutritional and other physiological demands of a developing embryo. Here the embryo depends upon maternal tissues for shelter, nutrition, respiration etc. These animals therefore, have developed adaptation, respiratory and other physiological requirements from mother's body.

Placenta is found in all viviparous (exept sub-class-prototheria; oviparous) animals.

Structure of Placenta

Placenta is not a simple membrane. It is made up of the tissues from two different sources –

Maternal tissue - These include uterine epithelium, connective tissues and blood capillaries.

Embryonic tissue - These include extra embryonic membranes (mainly chorion). Yolk sac and allantois may also take part in placenta formation. Embryonic connective tissues and blood capillaries are also constituents of it.

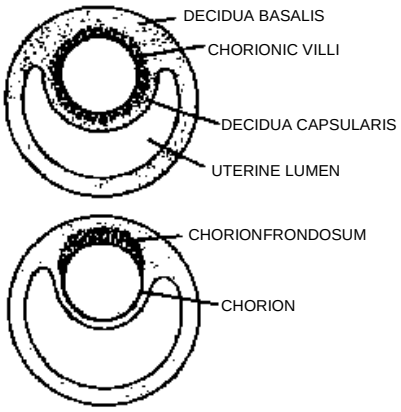
On the basis of extra embryonic membranes, the placenta is of three types.

1. **Yolk sac placenta -** It is formed by yolk sac and uterine epithelium. For example, Elasmobrancs (Sharks), **Mustelus** etc.
2. **Choria-vitelline placenta -** It is formed by chorion and yolk sac combinely. Hence it is called as choriovitelline placenta. For example, **Didelphis, Macropus** and other metatherian mammals.
3. **Chorio-allantoic placenta -** This type of placenta is formed by embryonic chorion and allantoic membranes. It is also referred to as a true placenta. It is found in eutherian mammals.

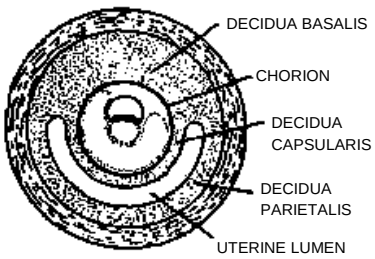
Chorio- allantoic placenta in mammals.

1. In this type of placenta, allantoic mesodern and the mesoderm of umbilical cord jointly form the blood vessels of umbilical cord. The endodermal part of the allantois remains as a very small cavity.
2. To obtain nutrition from maternal blood several finger like processes or villi are formed by chorion which penetrate deeply into the crypts of uterus. Initially the villi are scattered over the whole surface of chorion but later they become restricted in the deciduas besalis region. The chorionic villi on the remaining surface

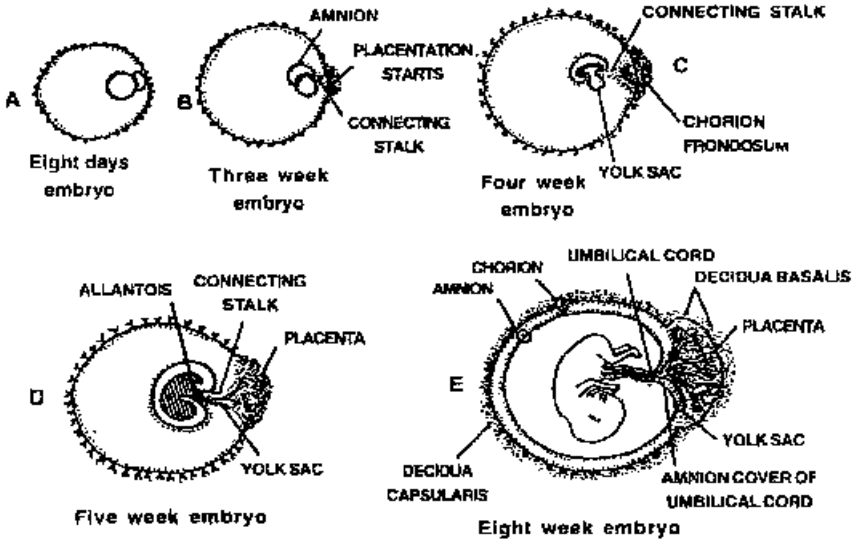
disappear shortly. The part of chorion, which helps in placenta formation is known as **chorionic frondosum.**



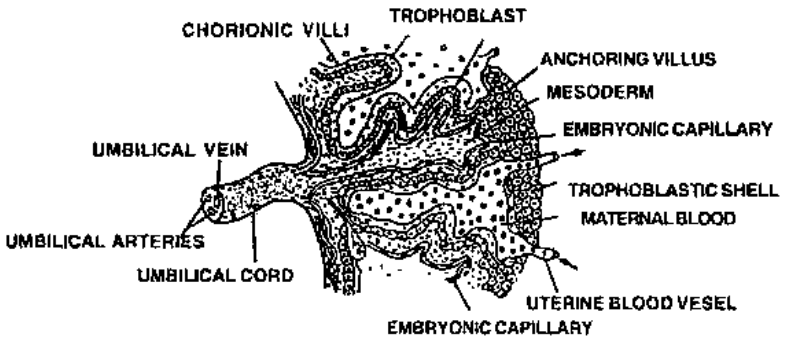
Formation of chorionic villi



Subdivisions of decidua



Placentation and formation of umbilical cord in human



A part of placenta in human

Classification of Placenta

On the basis of different characters, the placenta are classified in following manner –

1. On the basis intimacy

After implantation, the wall of uterus is called as deciduas, instead of endometrium. The part of deciduas, where placenta is formed is called **deciduas basalis** whereas, the part separating the embryo

from lumen of uterus is called **deciduas capsularis.** The remaining part of lumen of uterus is called **deciduas parietalis.** Decidua also comes out from uterus at the time of parturition. On the basis of intimacy between embryo and uterine wall the placenta is classified into three classes –

(i) Non-deciduate or Semi placenta - In this type of placenta, there is no close and rigid association between embryo and the wall of uterus. Hence, at the time of parturition, there is no bleeding as the chorionic villi are easily pulled out from the crypts of uterus. For example, cow, buffalo, horse, pig.

(ii) Contra-deciduate placenta - There is a close association between embryonic and maternal tissues. However at parturition, the damaged maternal and embryonic tissues along with the part of placenta remain inside the uterus which are absorbed is situ by leucocytes. For example – Parameles, Talpa etc.

(iii) Deciduate placenta - This type of placenta is found in human, dog, hare etc. It is characterized with a very close association between chorionic villi and uterine wall. At the time of birth, the mucosal covering of the uterus is also damaged and discarded outside. This results in an extensive bleeding at child birth. This placenta is known as a true placenta.

2. On the basis of implantation

Three types of placenta are found on the basis of implantation.

(i) Superficial - When the placenta is situated in the lumen of uterus. For example, Parameles, pig, cow, cat etc.

(ii) Eccentric - The placenta is situated in the fold or pocket of the cavity of uterus. For example - rat, squirrel etc.

(iii) Interstitial – This type of placenta is found in man, guinea pig, apes etc. The chorionic sac (placenta) penetrates deep inside the wall of uterus. Hence, the association between embryo and maternal part becomes very close.

3. On the basis of distribution of villi

On this basis, the placenta are of four types.

(i) Diffused placenta – The villi are scattered on the whole surface of placenta. For example pig, horse, lemur etc.

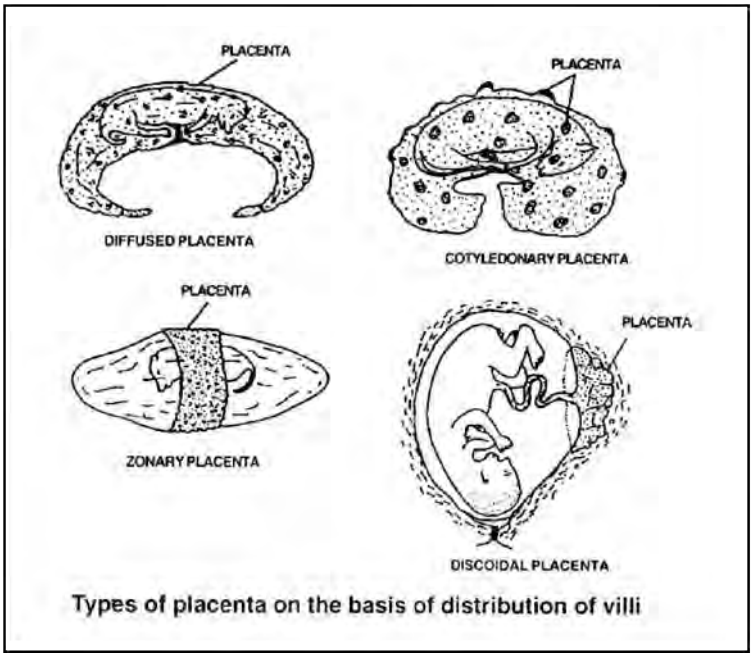
(ii) Cotyledonary placenta – The villi are distributed in small isolated groups on the chorionic surface. These groups of villi are called as cotyledons. For example, cow, buffalo, sheep, deer etc.

(iii) Zonary placenta - This type of placenta have the villi distributed in a belt shaped zone which is large sized and circular.

Zonary placenta is of two types –

(a) Complete zonary placenta - The belt of villi is complete and ring shaped in it. For example - dog, cat, lion etc.

(b) Incomplete Zonary placenta - The belt of villi is incomplete in it. For example - raccoon.



Types of placenta on the basis of distribution of villi

(iv) Discoidal placenta - In this type of placenta, whole of the chorionic surface is covered by villi in initial stage, but the villi disappear later from later from most area except the region of implantation, that is only a disc like region is left with villi. Discoidal placenta is also of two types –

(a) Mono discoidal placenta - The villi are present only on dorsal surface in single circular disc like area. For example – human, hare etc.

(b) Bi discoidal placenta - If the villi are distributed in two disc like areas, the placenta is called as bidiscoidal, eg. Monkeys.

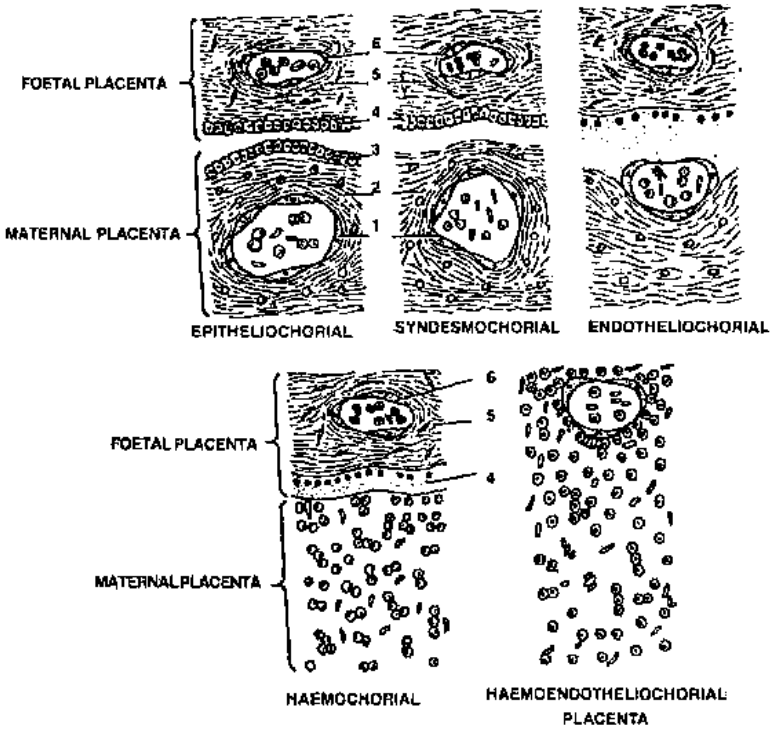
4. On the basis of histology

The blood of maternal and embryonic do not mix together through placenta. The blood circulations of the two sides are kept separated by one or more layers described below –

1. Maternal endothelium
2. Uterine connective tissue } Maternal layes
3. Uterine epithelium

4. Trophoblast/Chorion
5. Chorionic connective tissue } Foetal layes
6. Endothelium of embryonic blood vessels

The transportation of various materials takes place by diffusion through these six layers the intimacy between maternal and embryonic tissues in different mammals is determined by the presence or absence of these layers in placenta. Therefore, on the basis of presence or absence of the above layers, the placenta is of five types.



Types of placenta on the basis of histology

1. **Epitheliochorial -** It is the most primitive type of placenta in which all the six layers. mentioned earlier, remain intact. For example pig, horse etc.
2. **Syndesmochorial -** In this type of placenta the uterine epithelium is eroded by chorionic villi, so only two maternal layers remain functional. Therefore, along with three foetal layers, total five layers are preent in this placenta. For example - sheep, goat, cow etc.
3. **Endotheliochorial -** Here uterine connective tissue layer is also damaged along with uterine epithelium layer. Therefore only four layers (3 foetal and one maternal) are found in this placenta eg. dog, cat, etc.
4. **Haemochorial –** All the three maternal layers are penetrated in this placenta. The chorionic epithelium comes in direct contact with uterine blood sinusoids. For example – man, monkey, bat etc.
5. **Haemoendotheliochorial/Haemoendothelial :** It is the most typical placental in which the trophoblastic epithelium of embryo is also eroded along with all three maternal layers. The foetal capillaries are in direct contact with maternal blood. For example rat, guinea pig, rabbit etc.

   The placenta of human mainly secretes two steroid hormones like **estradiol** and **progesterone,** and two protein hormones like **human chorional gonadotropin** HCG and **human placental somatomammotropin HCS** large amount of –HCG, hormone is secreted, during early pregnancy, from the placenta. Because of this reason its quantity increases in the urine of pregnant lady. On the basis of this fact, pregnancy test is performed. The above hormones are also held responsible for keeping the corpus luteum active, protection of embryo, prevention of abortion and growth of mammary glands.

Functions of placenta

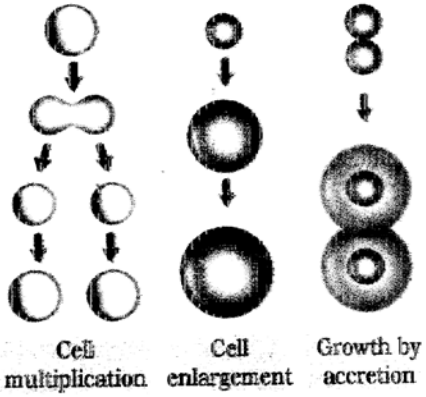
1. Exchange of important materials between foetal and maternal blood.
2. The essential materials are exchanged by diffusion, pinocytosis or active transport.
3. The small molecules like O_2, CO_2, H_2O etc. and other inorganic substances like chlorides, phosphates, sodium, potassium, magnesium etc. are also diffused through placenta.
4. Large molecules like lipids, polysaccharides, carbohydrates proteins etc. are obtained by pinocytosis process.
5. The nutritional substances are supplied to embryo from the mother through placenta.
6. Placenta also serves as a respiratory medium for exchange of O_2 and CO_2 between embryo and mother.
7. The nitrogenous and metabolic wastes from foetus are released into the blood of mother by diffusion through placenta.
8. The antibodies for measles, chickenpox, polio etc. present in the blood of mother reach the embryo through placenta.
9. Pathogenic viruses may also enter in embryo through placenta.
10. If a female takes some harmful chemicals, liquor, drugs etc. during pregnancy, these may cross the placenta and on reaching into foetus may cause deformity during organogenesis. (eg. Thallidomide)
11. Placenta itself secretes some hormones like progesterone, estrogen, lactogen, HCG, HCS etc.
12. Progesterone, maintains and supports the foetus during the whole pregnancy period. At the time of parturition, relaxin is secreted by placenta which lubricates and widens the birth canal to facilitate child birth.

GROWTH

(1) The multicellular animals life starts with a single cell zygote. It regularly undergo cleavage - mitotic divisions and produces the multicellular body.

(2) Growth is an irreversible change in shape, size, mass volume etc in organism. General aspects of growth are cell proliferation, development and morphogenesis.

(3) From embryonic life till death there is a regular growth. Skin shed stratum corneum parts and replace them, RBC and alimentary canal mucosa is also replaced. Many larva shows metamorphosis i.e. changes to adults, various animals can regenerate lost parts.



Strategies of growth

(4) During growth **protoplasmic** and **apoplasmic** substances increases. Anabolism is more than catabolism.

(5) Growth occurs by three ways –

(a) Cell proliferation or enlargement but no division eg. Neurons, Muscles.

(b) Cell division occurs but no overall growth eg. Blastula, gasturla.

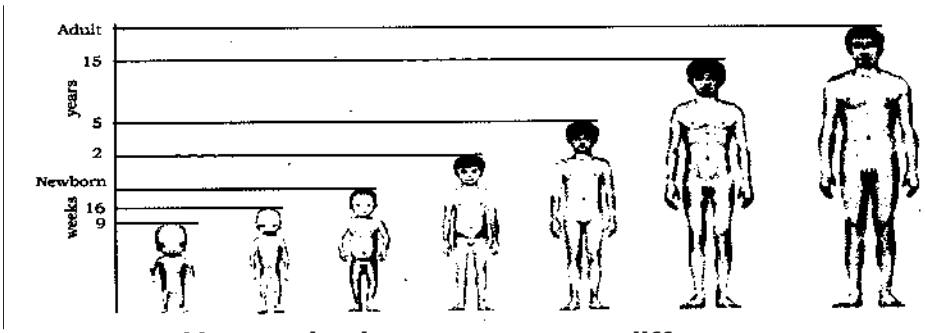
(c) Both cell proliferation and division. It is most common.

(6) **Degrwoth :** In this constituent proteins of protoplasm is used or oxidised.

(7) **Embryonic growth :** During early stages of development clevage divisions produces blastula and later form gastrula. Primitive organ rudiments are still in **prefunctional state**. After there complete development there starts **functional state**.

(8) **Post embryonic growth :** Animals shows different rate of grwoth. In humans embryo size is

– At the time of implantation – 150 µm
– First nine months – 50 µm
– One year after birth – 50 cm
– Upto 7 years - growth rate is slow.
– From 9-18 years growth rate is again rapid.
– 22 - 23 years stops.
– At 9 weeks the head size is 1/3 of lengths



Human body parts grow at different rates

(9) Cellular growth occurs in cell cycle.

$G_1 \longrightarrow$ Growth phase-I - Most of the general growth.

S $\longrightarrow$ Synthesis phase - DNA replication occurs

$G_2 \longrightarrow$ Growth phase-II - Growth and proparation for division.

(10) **Types of growth :**

(a) Auxetic growth : Only volume increases, no divisions occurs eg. Rotifers, Nematoda, tunicata.

(b) Multiplicative growth : Number increases but no overall growth eg. early embryos.

(c) Accretionary growth : Both volume and number increases. ECM and ECF production is also included in it.

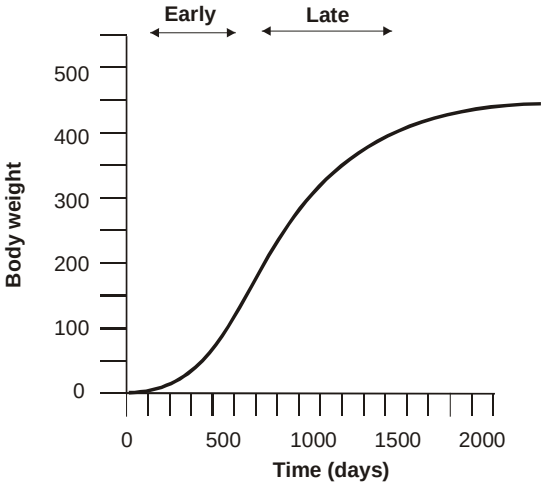
(11) **Reserve cells :** These are undifferentiated cells which divides and replace differentiated cells. eg. regular RBC formation by reserve cells of bone marrow.

(12) **Growth curve :** In case of animals weight is taken as a criteria of growth. When weight is plotted against time we get grwoth curves it have three phases-

(a) Lag phase - slow but progressive growth.

(b) Log or exponential phase - rapid growth.

(c) Stationary phase - almost no growth.



Growth curve of a 500-kg animal

(13) **Hormonal control of growth :**

Many growth factors are known to be important–

(a) FGF - Fibrolbast growth factors – limb development in chick.

(b) IGF - Insulin like growth factor - In mammal growth.

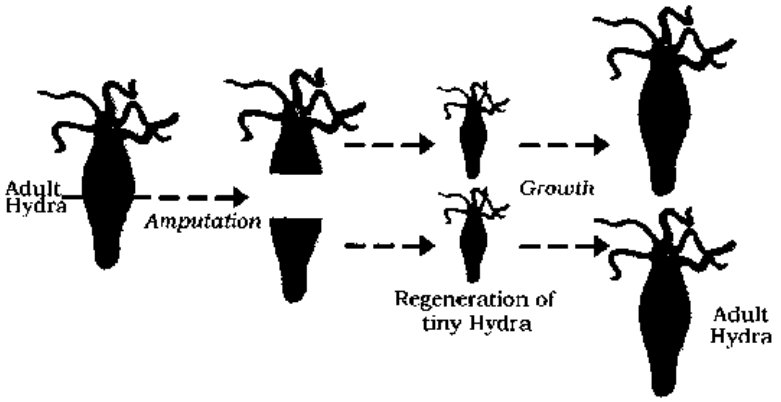
(c) GH - Growth hormone and its inhibitor somatostatin.

(d) Sex hormones.

(14) Cells must receives signals through growth factors or other proteins for division and survival. In absenceof these signals internal death programme is activated and cells commit sucide by **Apoptosis.**

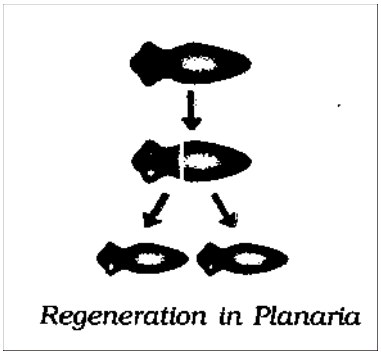
REGENERATION

1. There occurs regular replacement of cells in multicellular organisms. Skin and inner lining of intestine is also regulatory replaced.
2. At the place of wound healing new cells are added. This repair also occurs regularly in animals if injury occurs.
3. This ability of fuly developed organism is replace lost parts by growth or remodelling os somatic tissue is called as regeneration.
4. Regeneration is also a developmental process that involves growth, morphogenesis and differentiation in post embryonic life.



Regeneration in Hydra

5. Hydra, Planaria, sponges there is a greater power of regeneration.
6. Nematodes have very slow and low regeneration ability few Annelida can renew all of the anterior and posterior body segments after an amputation.
7. Many arthropods such as spiders, crustacea, and insect larvae can regenerate lost appendages, eye stalks, eyes. Parts of head and foot in gastropods.
8. Echinoderms can regnerate arms, sea cucumber can regenerate respiraton free and alimentary canal.
9. In Ascedians blood cells can give rise to a fully functional organism.
10. Fish can regenerate scales, fins.
11. Amphibians can regenerate tail, limb, external gills, nwet can regenerate eye lens from pigmented epithelium of Iris.
12. Autotomy is removal of body parts in order to protect from predators. eg. tail regeneration of Lizard.
13. Mammals can regenerate a part of liver of Kidney. They can restore fractured bone.



Regeneration in Planaria

Types of Regeneration : It is of two types –

(1) **Morpholaxis :** When whole new organism is developed from the small fragment. eg. in Hydra, Porifera.

(2) **Epimorphosis :** When a lost part is regenerated such as tail or limb regeneration. These occurs dedifferentiation of undifferentiated mass of cell.

Mechanism of forelimb regeneration in Newt :

(1) Due to injury if limb is cut or amputed in laborotatomy it regenerates by epimorphosis.

(2) A group of dedifferentiated cells along the epidermal covering develops. It is called as regeneration blastema or regeneration bud.

(3) These cells redifferentiated and forms rudiment of limb, further organogenesis completely develops the new limb.

Compensatory regeneration : If liver or kidney cells divide but do not dedifferentiate. They divide and produce similar type of cells i.e.

Factors controlling amphibian limb regeneration :

Many growth factors helps and triggers regeneration.

(a) Glial growth factor - GGFs

(b) Fibroblast growth factor FGFs

(c) Insulin like factor IGFs (Important for cartilage growth)

(d) Tranferrin : It is an iron transport protein required for mitosis in all dividing cells.

AGEING : SENESCENCE

(1) It is observed after certain stage cells and organism as whole shows decline in vigor, rate of physiological functions. Entropy overcomes then biological control.

(2) Ageing is time-related deterioration of physiological functions necessary for

(3) Science of ageing is **Gerontology**.

(4) **Maximum life span :** Maximum age reached by the member of any species. In human it is about 121 yrs. (shirechlyo lzumi of Japan)

(5) **Average lifwe span :** The average number of years survived by most of the members of a species.

(6) **Life expectancy :** The number of years an individual can expect to live. (56 yrs. in India) It increases with the improvement in sanitation, discovery of antibiotics and medical care.

Affects of Ageing on Different body parts :

(a) **Heart :** Size slightly merease O_2 consumption reduces to 10% in man.

(b) **Lungs :** Vital capactiy may decline by 40% between the ages of 20 - 70.

(c) **Brain :** Few neurons are lost and few damages Dendrites and

(d) **Kidney :** Waste filter capacity decreases. Bladder capacity declines.

(e) **Body fat :** Its accumulation increases. It is more distributed in deeper parts. In females at hips and thigh. In males in abdominal area.

(f) **Muscles :** Muscle mass reduces upto 22 percent in woman and 23 percent in men.

(g) **Sight :** Accomodation and resotution of eye decreses.

(h) **Hearing :** Gradually declines

Theories of Ageing

Ageing is a deteriation of body physiology also gradually loose efficiency this is called as senescene in animals.

These are two main gruop of theories

(A) Programmed theories it includes :

(a) Endocrine theory

(b) Programmed senescence theory

(c) Immunological theory

(B) Damage or error theories :

(a) Living theory (b) Free radicals theory

(c) Cross linking theory (d) Wear and tear theroy

(e) Error catastroph theory (f) Somatic mutation theory

(A) Programmed theory : It includes all those distrubing mechanism which are result of a biological time table.

(a) **Endocrine theory :** According to it biological clock acts through hormones. GH, sex harmones, melatonia, thymosin reduces with age. **Dehydroepiandros terone** (DHEA) a weak male harmone from adrenal gland also reduces.
