Type Study of Botany

Chapter Name	Page No.
	1 – 121
Theory	
Ulothrix	1 – 6
Spirogyra	7 – 11
Riccia	12 – 19
Funaria	20 – 27
Mucor & Rhizopus	28 – 33
Albugo & Cystopus	34 – 40
Selaginella	41 – 48
Pteridium (Monotypic Genus)	49 – 57
Cycas	58 – 67
Pinus	68 – 80
Exercise – 1	81 – 93
Exercise – 2	94 – 107
Exercise – 3	108 – 116
Exercise – 4	117 – 120
Quick Review Table	121

ULOTHRIX

- **Discovered by Knitzing.**

SYSTEMATIC POSITION

Kingdom	:	Plantae
Sub kingdom	:	Thallophyta
Division	:	Chlorophyta
Class	:	Chlorophyceae
Order	:	**Ulotrichales**
Family	:	Ulotrichaceae
Genus	:	**Ulothrix**

HABIT AND HABITAT

- Ulothrix mainly found in **fresh water.**
- The majority of species of Ulothrix occurs in **cold slow moving streams.**
- Marine species, **eg., Ulothrix flacca. (intertidal zone** of sea and **saline marshes)**
- **Lithophyte species. – Ulothrix implexa**
- **Fresh water species. – Ulothrix zonata.**
- **Ulothrix zonata** is the main species of **Ulothrix** which is found in **India.**

STRUCTURE

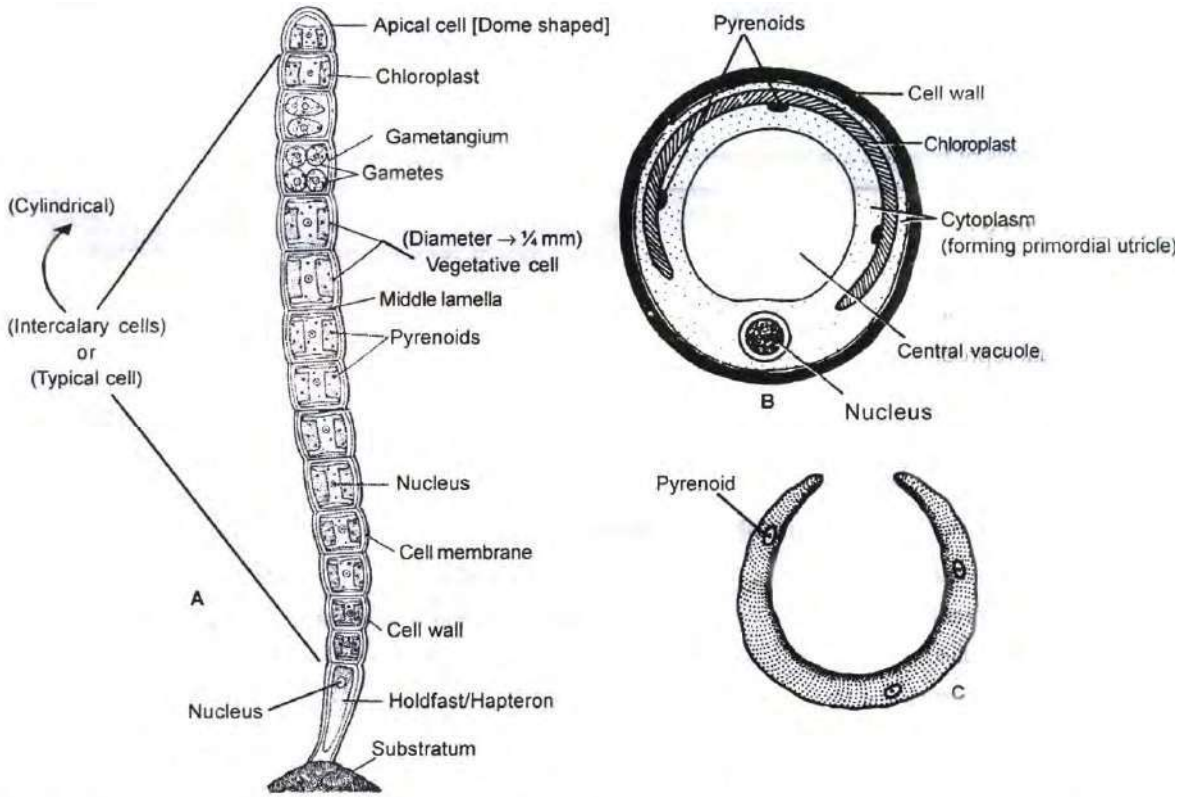

Fig. (A) Ulothrix filament (B) T.S of a cell (C) Structure of Chloro plast

THALLUS STRUCTURE

- The thallus of **Ulothrix** is multicellular, filamentous, unbranched and **bright green** in colour.
- All the cells of the filament are similar but basal cell and apical cell are different. All cells present between basal cell and apical cell are called **intercalary cells.**
- Shape of the cells are **cylindrical** but they looks **rectangular** in **external appearance.**
- The upper most or apical cell is somewhat **dome shaped** and basal cell is elongated and narrow at the base.
- The filament attached to the substratum with its specialized cell which is called **Holdfast** or **Rhizoidal cell** or **Hapteron.**
- At the base of holdfast develops fine **processes or fingers like** structure are called **Haptera.**
- The **holdfast** cell of the thallus is **living** and **non green.** Chloroplast absent in hold fast.
- The cell wall of the filament is double layered.
- The outer layer is **Protopectin.** (Precursor of **pectin** and insoluble in water). The inner layer is **cellulose.**
- A large vacuole is present in the centre of the cell. Surrounding the vacuole, the cytoplasm present as a thin layer and to form a **primordial utricle.**
- Chloroplast contains **two** or **three pyrenoids.** (Protein particles which are surrounded by starch.)
- These pyrenoids are concerned with storage of starch.

Special Points

- **Centriols** are present in **Ulothrix.**
- All the cells of Ulothrix have power of cell division except hold fast.
- **Diffused growth** found in Ulothrix.
- All the cells of filament are joint together through the **middle lamella.**

REPRODUCTION

- Ulothrix reproduce by three methods :
  (1) Vegetative reproduction.
  (2) Asexual reproduction.
  (3) Sexual reproduction.

1. Vegetative Reproduction

- It takes place generally in **favourable conditions.**
- **Fragmentation :**The filaments break up into two or more pecies. They are called fragments.
- Each fragment divides to form a **new Ulothrix filament.**
- Fragmentation occurs due to-
  - Incidental reasons.
  - Death of intervening cells or **middle lamella.**
  - Strong waves of water.
  - Change of pH or temperature

2. Asexual Reproduction :

- It takes place in **favourable** and **unfavourable** conditions.

(I) In favourable conditions : By Zoospores.

- Zoospores formation occurs generally near the apex and progresses towards the base of filament. **(Basipetal order)**
  - Any cell of the filament **except hold fast** can form zoospores.

– A cell which produce zoospores is called **zoosporangium.** A sporangium produces **8-32** zoospores.
– Zoospores are formed through the **mitotic division.**

- Zoospores are of two types –

(1) Micro zoospores

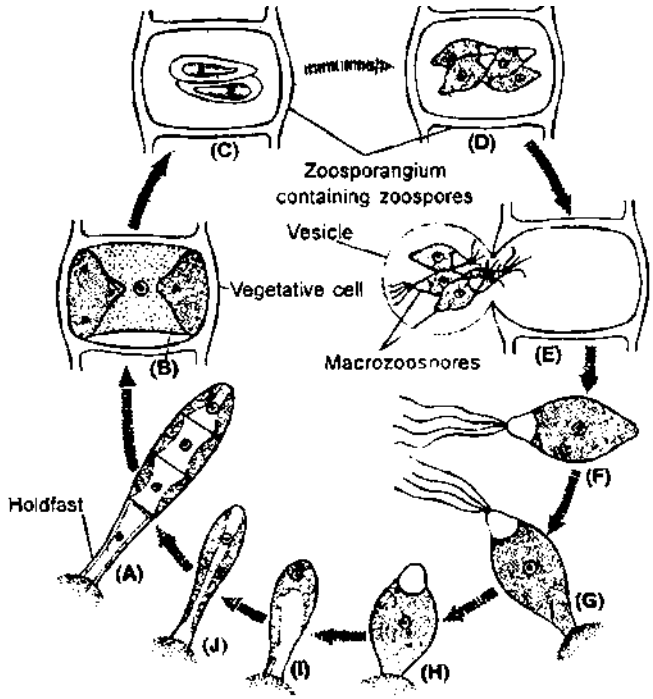
(2) Macro zoospores

(1) Micro zoospores : They are oval shped. They may be **biflagellate** or **quadriflagellate.**

- Eye spot lies at the **anterior lateral position.**
- Their swimming period is **2-6 days.** Their number in mother cell varies from **8** to **32.**
- Their germination begins from the anterior end.

(2) Macro zoospores : They are spindle or pear shaped with a pointed posterior end.

- They are always **quadriflagellate.**
- Eye spot lies at the anterior in middle region. Their swimming period is about **24 hours** (1 day).
- The number of macro zoospores in sporangium from **4-8.**
- Their germination begins from the posterior end.



Asecual reproduction by macro zoospores formation

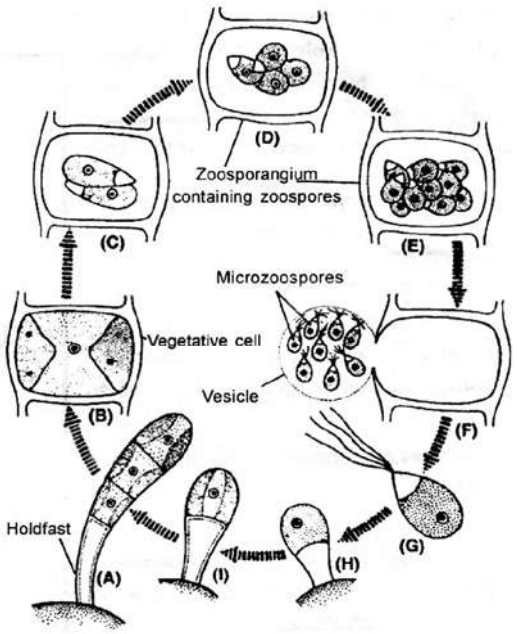
STRUCTURE OF ZOOSPORE

- Zoospores are **naked.** It means cell wall is absent in them. **Cup shaped** chloroplast is present in which one **pyrenoid** is present.
- A **contractile vacuole** is present which is concerned with **osmoregulation.**
- A red colour eyespot is found in zoospores for **reception** of light, which is made up of **carotenoids.** (Hematochrome)

  Note : Contractile vacuole is absent in zoospore of ***Ulothrix flacca.***

GERMINATION OF ZOOSPORE

- Zoospores, after the liberation from zoosporangium swim in water for sometime.
- When they tired then settle down on any solid object.
- Micro zoospore attached with their anterior end and macro zoospore attached with their posterior end.
- The zoospore withdraws its flagella and secretes a wall around it. During this period it elongated and divides.
- First of all **transverse division** takes place, it is **asymmetrical** after that two cells are formed.
- The lower long cell transform into hold fast and upper cell divides continuous transversely to form Ulothrix Filament.



Asexual reproduction by microzoospores formation

(ii) Asexual Reproduction in Unfavourable condition :

(A) By Aplanospore :

- When the unfavourable condition returns **slowly,** then all the cells of thallus except hol fast form **aplanospore.**
- Divided protoplast becomes round inside the cells of **Ulothrix** and form a cell wall around it self.
- Aplanospores are **thin walled** and **Non-flagellated** structure.
- The thallus of **Ulothrix** degenerates in **unfavourable conditions.** Aplonospores pass unfavourable conditions.
- On the approach of favourable condition the aplanospore may germinates by two different ways:

(i) Direct germination :

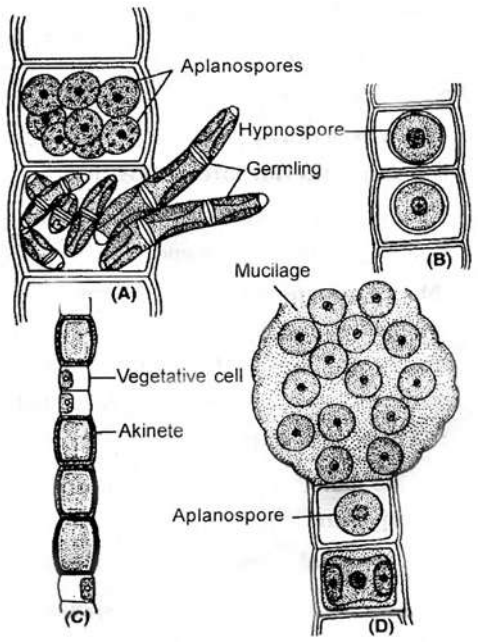
- Aplanospores germinates directly, when the availability of **water is less.**
- Aplanospores absorb water and swells up and their covering breaks and aplanospores become free then transverse division takes place.
- Lower cells transform into hold fast and upper cell produce Ulothrix filament through **continuous** transverse division.

(ii) Indirect germination :

- It take place by formation of zoospores. When water is available in more amount then zoospores are formed in alpanospores.
- Each **alpanospore** act as a **zoosporangium and each** zoospore produce new Ulothrix filament.
- Alpanospore shows **"in situ" germination** also.

(B) By Hypnospores :

- When highly adverse conditions are **coming fast** then the protoplast of the **Ulothrix** cell shrinks and collect in the centre.



Asexual reproduction in unfavourable condition

- Shrinked protoplast secretes a thick wall around itself. These **thick walled non-motile** structures are called **Hypnospores.**
- They are **more resistant** as compared to aplanospores. These are **perennating** bodies.
- On the approach of favourable conditions hypnospores also germinates **directly** or **indirectly.**
  Example – *U. fimbriata.*

(C) Akinetes :

- When adverse conditions come **suddenly** then vegetative cell transform into **thick walled** structure, in which **food** has been accumulated, called **akinete.**
- They shows **perennation.** When favourable conditions come they germinate either directly or indirectly.
  Example : *U. idiospora, U. zonata, U. subtilissima.*

(D) Palmella stage :

- This type of reproduction take place in those Ulothrix species, which lies at the banks of reservoirs.
- The water start drying in the unfavourable conditions, Ulothrix faces deficiency of water **step by step.**
- Certain cells of the thallus divides in uncontrolled manner during such type of changes and to form group of a large number of small daughter cells.
- The cell wall of cells dissolves and to form a **mucilaginous** envelope. Later it dries and form a protective covering.
- On the approach of favourable conditions, mucilage layer dissolves and cells give rise to new thallus through **direct** or **indirect** germination.
  Note : Above stage is identicle to an another **algae-Palmella,** therefore it is known as **Palmella stage.**
  Note : In **Ulothrix,** colony formation occurs during palmella stage.

3. Sexual Reproduction

- Sexual reproduction **isogamous type.** (Such type of sexual reproduction in which fusing gametes are morphologically and physiologically similar called as isogamous.)
- Gametes are type of zoogamete. They are motile and **biflagellated.**
- Each cell can function as **zoogametangium** except the hold fast. The process of gamete formation and liberation is similar to that of zoospores. **8 to 64** zoogametes are formed in a zoogametangium.
- The fusing gametes first unite by their anterior ends in lateral side and later on they get fused completely and a **diploid, quadriflagellated** structure is formed which is called **synkaryon.**
- In the beginning zygote is **quadriflagellate** and later losses its flagella. Zygote secretes a thick wall around it self. It is known as **zygospore.**

GERMINATION OF ZYGOSPORE

One zygospore $\xrightarrow{\text{Germination}}$ 4-16 Ulothrix filament

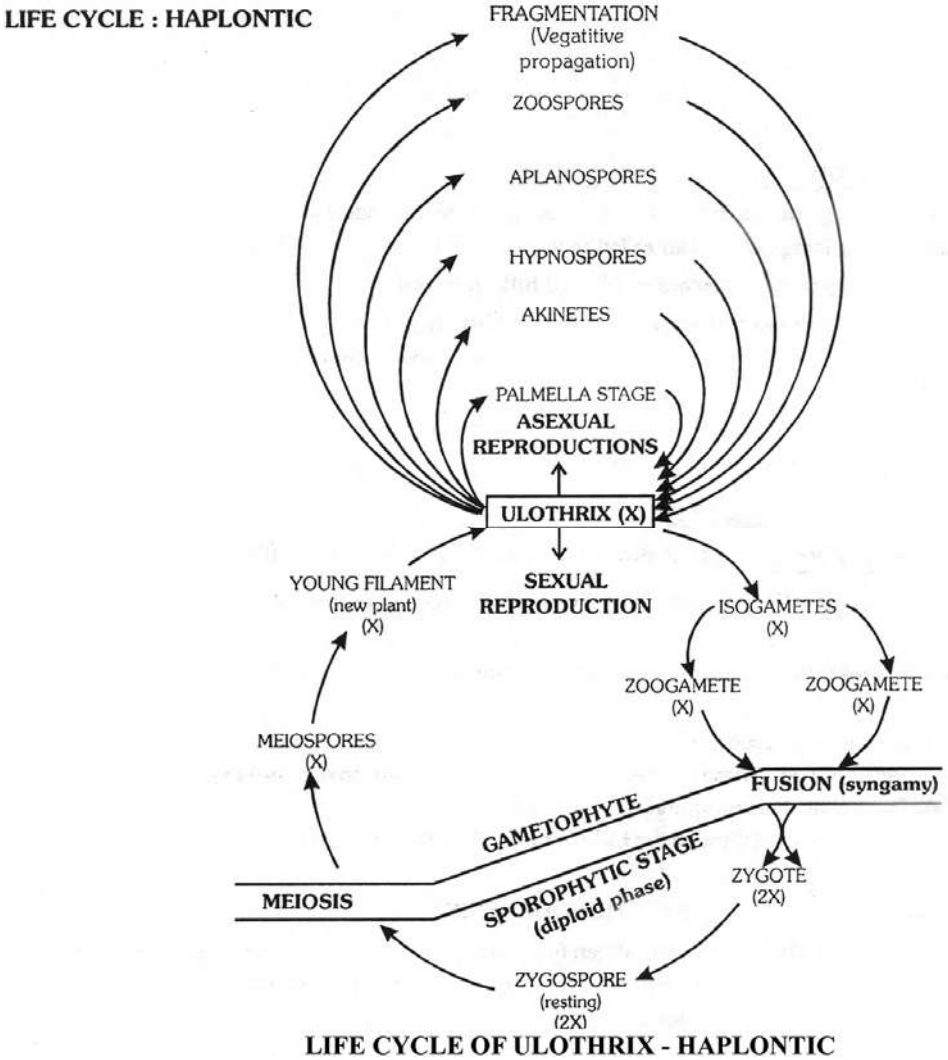
- Germination of zygospore is direct or indirect in favourable conditions and meiotic division takes place during germination.
- A **heterogenetic** thallus is formed throught the **direct germination** in which some of the cells are of opposite strains.
- During indirect germination of zygospores **meiotic divisio**n takes place and **four haploid** spores are formed. They are called **meiospores.**
- These meiospores may be motile **(meiozoospores)** or non motile **(meio aplanospores).**
- The motile meiozoospores are **quadriflagellate.**
- A **homogenetic** thallus is formed through the **indirect germination** of zygospore. It mans all the cells formed in thallus are identicle.

PARTHENOGENESIS

- Fusion of motile gametes is a thought of luck.. When these gametes fail to fuse. They settle down, withdraw their flagella, round off and secretes a thick wall around itself. These are called as **azygospores or parthenospores.**
- Their germination is through the **mitotic** cell division. Homogenetic thallus is formed through the germination of azygospore.

Special point :

- **Ulothrix** is heterothallic. It means fusing isogametes have different strains genetically.
- Sexual reproduction of **Ulothrix** begins after the growth period/ Vegetative season.
- Sporophytic generation is represented only by the zygote. In the life cycle of Ulothrix, Zygote is very short in duration.
- Gametes are formed in **semi drying** condition and released in the **morning.**
- In Ulothrix primary division of labour is found. The work of the holdfast is to make the filament stable on the base. For food it depends on other cell, which does the work of food formation and reproduction.
- In Ulothrix gamete unite first by flagella then by opposite ends then laterally and proceeds towards posterior end.
- In the initial state of zygote of **Ulothrix** have four flagella, two eye spots, two chloroplasts and one diploid nucleus are present.
- **Ulothrix zonata** shows the origin of **Sexual reproduction**.



LIFE CYCLE OF ULOTHRIX - HAPLONTIC

SPIROGYRA

- **"Pond Scum", "Pond Silk" or "Water Silk" or "Mermaid's tresses".**

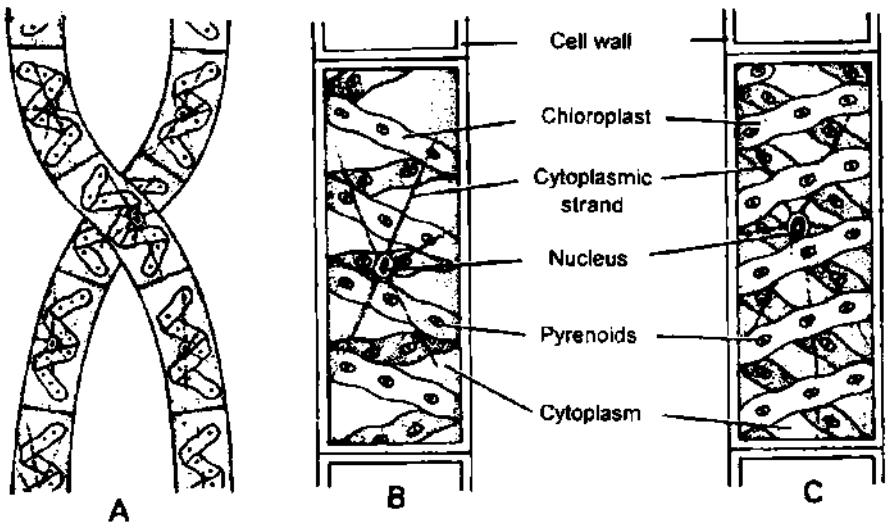
SYSTEMATIC POSITION

Kingdom	:	Plantae
Sub kingdom	:	Thallophyta
Division	:	Chlorophyta
Class	:	Chlorophyceae
Order	:	**Conjugales/Zygnemales**
Family	:	Zygnemaceae/Zygnemataceae
Genus	:	**Spirogyra**

HABIT AND HABITAT

- It occurs in **stagnant fresh water** as **free floating.** It occurs in water of changing temperature.
- ***Spirogyra adnata*** **=** Occurs in stream and river.

STRUCTURE



Spirogyra : A- Two filaments, B - C - Detailed structure of cell.

- **Spirogyra** is a **multicellular, unbranched** and **filamentous algae**. It is **olive-green** in colour.
- All the cells are similar in shape, size and structure. These are arranged in a linear row.
- Hold-fast is normally absent but **S.fluviatalis** contains hold-fast.
- Cell-Wall is **double-layered,** outer layer is made up of **pectose** (which dissolves in water to form a mucilagenous sheath) and inner layer is made up of **cellulose**.

Note: Filament is silky smooth due to presence of pectin in outer layer. Due to this reason epiphytes are not attached with filament.

- Each cell contains a large central vacuole.

- Cytoplasm occurs in the form of a thin layer around the vacuole. Thin layer of cytoplasm is called **"primordial utricle".**
- Cytoplasm contains a large nucleus and it is held by cytoplasmic-fibres.
- Each cell contains **spirally coiled or ribbon-shaped** chloroplasts, with a left **handed twisting (sinistral).**
- Number of chloroplasts varies from one to sixteen in each cell (according to species). (Single chloroplast was recorded in S.Venkataramanii). and 16-chloroplasts in S-rectispora)
- Chloroplast have **many** Pyrenoids.
- Spirogyra grows in length by **intercalary** growth.

  Note: Some species contain **rhizoid like out growths.**

  e.g. ***S.affinis*** ***S.dubia*** ***S.rhizobrachialis***

REPRODUCTION

- **These are of following type -**

1. Vegetative Reproduction

By fragmentation : Fragmentation takes place by -

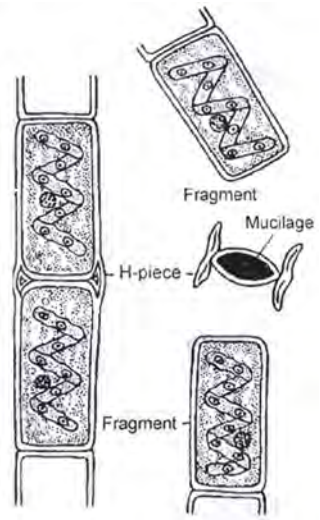
(i) Accidental breakage

(ii) Dissolution of middle-lamella

(iii) By the formation of H-shaped segments -

E.g. Spirogyra colligata

- In some species cell-wall between two cells form **H-shaped** thickening, called **replicate wall/replicate septum.**
- Middle lamella of these cells dissolves and both cells remain connected by replicate wall.
- Replicate wall facilitates fragmentation without dissolution of cells.



2. Asexual Reproduction

- Normally asexual reproduction is **absent** in **Spirogyra.** It takes place only in some species by the following methods-
- **Zoospores** are totally absent in **Spirogyra**. It's reproductive structures are **non flagellated.**

(A) By aplanospore - e.g. ***S.aplanospora***

(B) By akinete

- Under unfavourable conditions, the cells of a filament develop into thick walled structures. Such thick walled structures are called as **akinetes.**
- Thick cell-wall of akinete is made up of **cellulose** and **pectose.** In akinetes, **food** has been accumulated.
- When favourable conditions return, akinete **directly germinates** to form a new thallus.

  e.g., ***S. farlowii.***

(C) By Parthenospores or Azygospores –

- When gametes fail to fuse they form **parthenospore.** Sudden variation in environment leads to the formation of parthenospores.
- **"Kleb"** artificially induced the formation of parthenospores in **S.varians** by placing it in **sugar solution.**

- In ***S.daedalea*** both the gametes form parthenospores **in situ** (at their original place)

Note: In **S.rhizoides** parthenospores are developed from **rhizoids**.

3. Sexual Reproduction

- It takes place towards the **end of growing** season-usually in the late spring.
- It takes place by **conjugation.** Gametes are **non-ciliated** or **non-flagellated** and oval shape.
- Eye-spot is **absent** in gametes.
- Gametes perform **amoeboid movement** during conjugation.
- Gametes of Spirogyra are called **aplanogametes** (due to the absence of cilia or flagella).
- **Physiological anisogamous** type of sexual reproduction is found in ***Spirogyra.***
- Following conditions which favour the process are:

(i) Nitrogen deficiency

(ii) The change in pH of the aquatic medium to alkaline side.

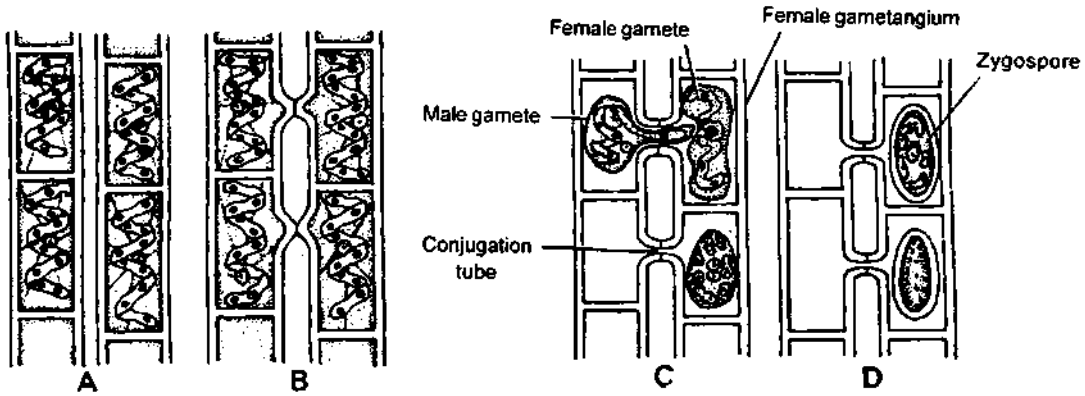
- **Types of Conjugation**

(i) Scalariform or Ladder like conjugation

(ii) Lateral conjugation

Scalariform Conjugation

- It is most common type of conjugation and occurs in **"heterothallic"** species of **Spirogyra.**
- It mainly takes place during **night.**
- Two filaments arranged parallel to each other.
- After some time cells of two filaments opposite to each other form **cylindrical out growths** which fuse to form a **conjugation tube.**
- Cells united by conjugation tube are called **aplanogametangia.**
- Protoplast of gametangium constricts to form gamete.
- In the cells of one filament, male gametes are formed and in the cells of another filament female gametes are formed.
- Male gamete perform **amoeboid movement** and migrate to female gametangium through **conjugation tube,** it fuses with female gamete to form a **diploid zygote.**
- **After this a three layered wall is formed around the zygote, now it is called zygospore.**



Spirogyra - Scalariform Conjugation

- In scalariform conjugation cells of one filament become empty and the other filament contains **zygospore** in its cells.
- Zygote is initially green but soon after chloroplast of male gamete degenerate followed by the degeneration of chloroplast of female gamete. Due to this reason the filaments of **Spirogyra** do not remain green after fusion.

Lateral Conjugation

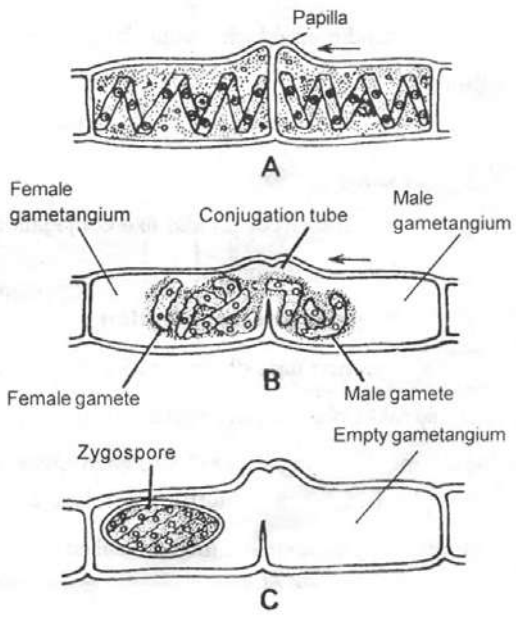
- It takes place between **adjacent cells** of the **same filament.**
- Lateral conjugation occurs in **homothallic species** of **Spirogyra.** Lateral conjugation is of **two types-**

(a) Indirect lateral conjugation

(b) Direct lateral conjugation

(a) Indirect lateral conjugation / chain conjugation-

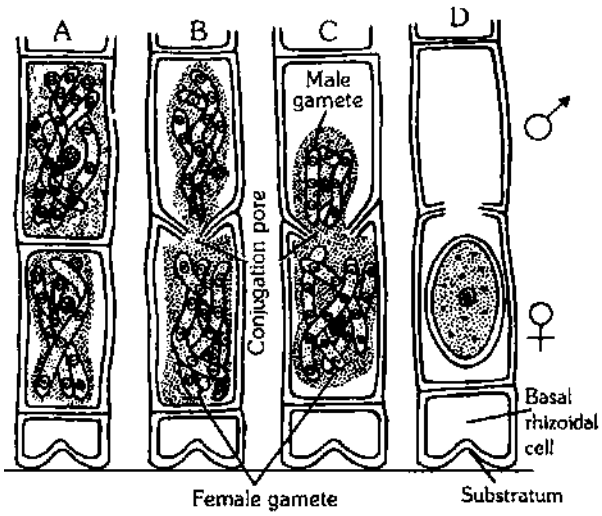
- Protoplast of cells constricts to form gametes.
- Male and female gametes are formed in **adjacent cells** of a filament.
- Each cell form **tubular/papilla-like out growth** in their lateral wall.
- Out growth of two cells fuse to form **conjugation tube.**
- Male gamete migrates through conjugation tube and fuses with female gamete to form zygospore.
- After the completion of conjugation the filament contains empty and zygospore containing cells in alternate manner.
  Ex.: ***S. affinis.***



Spirogyra affinis - Indirect lateral Conjugation/chain conjugaton

(b) Direct lateral conjugation-

- This type of conjugation was studied by **M.O.P. Iyengar** (Father of Indian phycology/Algology) is ***Spirogyra jogensis.***
- Male gamete migrates to adjacent cell through a **conjugation pore** in transverse wall between two cells.
- Male gamete fuses with female gamete to form a **diploid zygote.**



STRUCTURE OF ZYGOSPORE ::

- Wall of zygospore is three layered-

(i) Exosporium – Thin layer of **cellulose** (Mainly) or pectose.

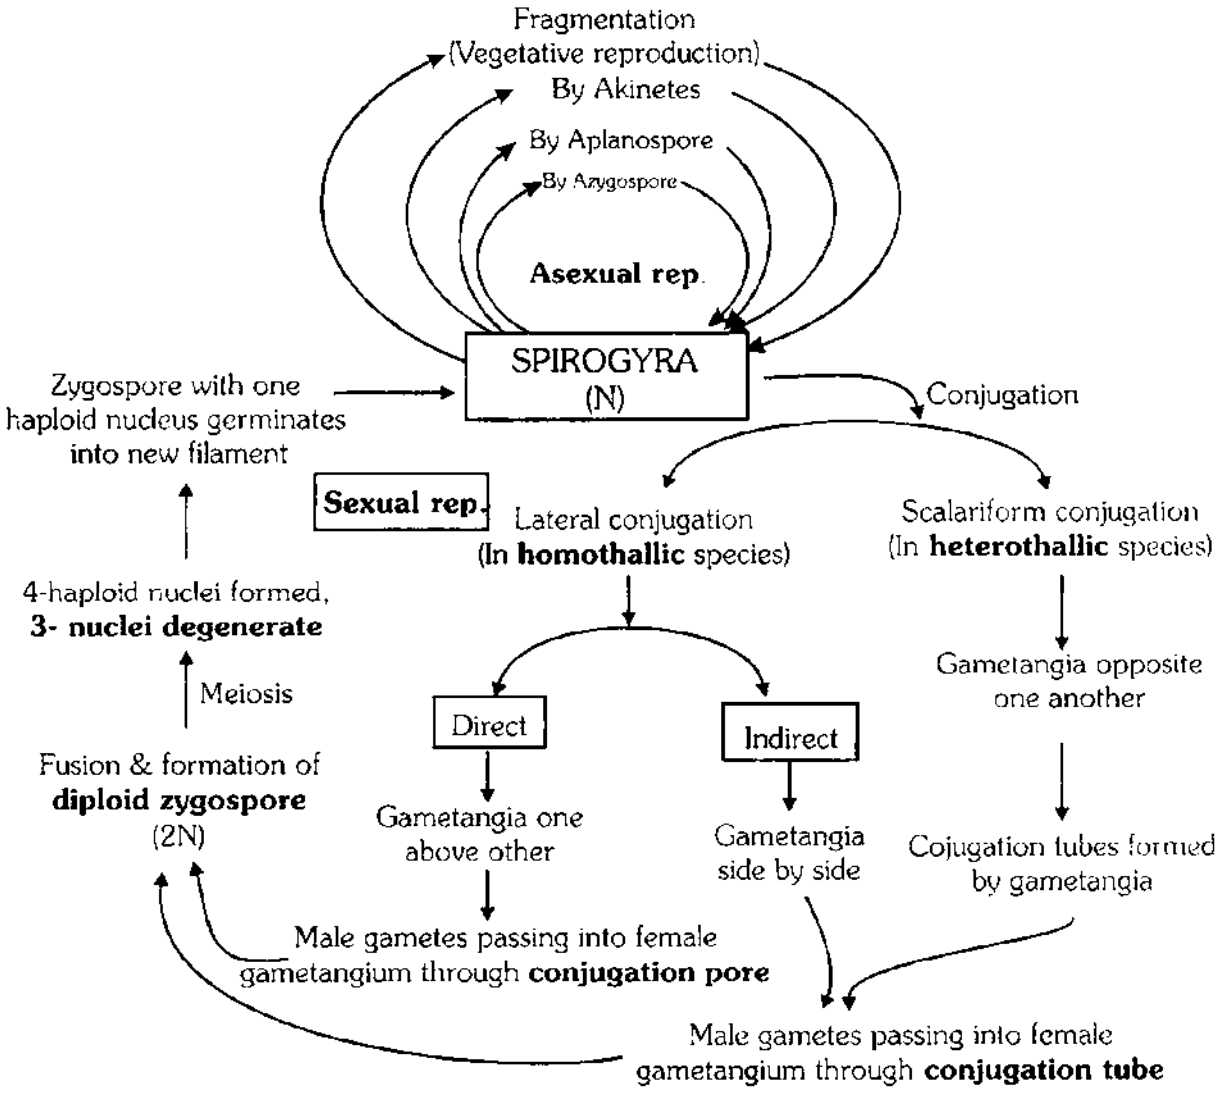
(ii) Mesosporium – Brown, thick ornamented and **chitinised.**

(iii) Endosporium – Thin & made up of cellulose.

- **Germination of Zygospore**
  - Germination takes place in **favourable conditions.**
  - Four haploid nuclei are formed inside the zygospore as a result of **meiosis.**
  - **Three nuclei are degenerate** and only nucleus remains functional.
  - Now functional nucleus of zygospore undergoes repeated mitotic division to form a haploid filament of **Spirogyra.**
  - During germination of zygospore in spirogyra exosporium and mesosporium reptures and endosporium emerges in form of cylindrical tube.

LIFE CYCLE

- Life cycle of **Spirogyra** is **"haplontic type".**



LIFE CYCLE OF SPIROGYRA

RICCIA

SYSTEMATIC POSITION

Kingdom	:	Plantae
Sub kingdom	:	Embryophyta
Division	:	Bryophyta
Class	:	Hepaticopsida
Order	:	Marchantiales
Family	:	Ricciaceae
Genus	:	Riccia

HABIT AND HABITAT

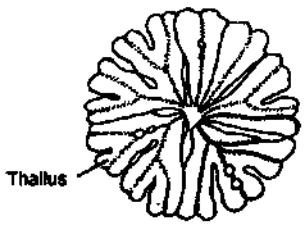
- **Riccia** was discovered by **F.F. Ricci**.
- Species of R iccia are generally found in moist land.
- The common Indian species are as follows :

i. **Riccia discolor/R.himalayensis**
ii. **R. glauca**
iii. **R. pathankotensis**
iv. **R. robusta**
v. **R. crystallina**

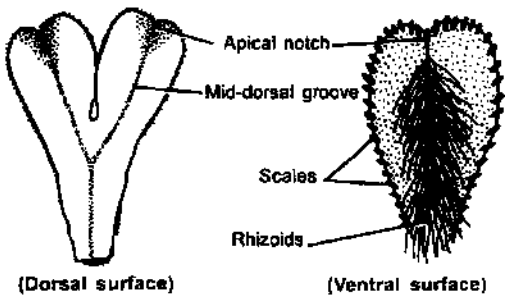
- **Riccia discolor** found in Rajasthan.
- Some species of Riccia are **aquatic**.
- Such as - **Riccia fluitans, R.abuensis, R.riella etc**.

• STRUCTURE

- The main plant of Riccia is **gametophyte** in the form of thallus.
- It is green, flat, dorsiventral and **dichotomously** branched. It grows **prostrate** on the soil.
- At the growing point of thallus a notch is present, at the apical end. It is known as **Apical notch**.
- At the base of apical notch a apical cell is present. It is **pyramidal** shape. The thallus grows by the activity of this apical cell.
- Each lobe of the thallus is thick in the middle and thin at their margins.
- On the **upper (dorsal) surface** of each lobe vein is present in the middle which extends from anterior to posterior. It is known as **longitudinal median vein**.



[Rosette form in terrestrial species] due to the presence of several dichotomies close to each othe



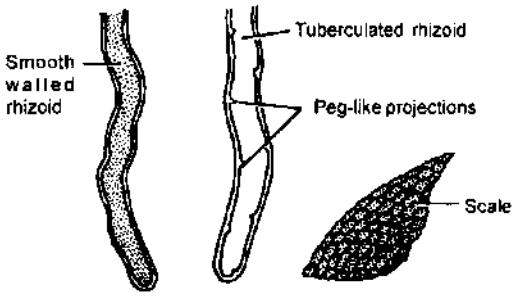
STRUCTURE OF RICCIA THALLUS

- A long groove is present in the rgion of median vein, is called **Median groove.**
- In this groove, sex organs are developed in **acropetal order** (New at apical notch old away from it) on the dorsal surface of thallus.

Note : The dorsal surface of the **Marchantia** thallus (Liver shaped) bears **gemma cups** along the mid rib.

(a) Rhizoid :

- Rhizoids are found in the mid rib region on the **ventral/Adaxial** surface of the Riccia thallus. (In scattered form).
- Rhizoids are **unicellular**, **unbranched**, **colourless** and **tubular**.



Two type of rhizoids are found in Riccia

1. **Smooth walled :**

- Outer and inner walls of rhizoids are smooth & straight.

2. **Tuberculated :**

- Peg like ingrowths are present on the surface of inner wall.
- Tubercalated rhizoids are absent in **Riccia sanguinea**.

Note : Smooth walled & tuberculated rthizoids are also found in **Marchantia** & **Plagiochasma**.

- **Rhizoids are absent** in the aquatic species of Riccia. Such as **R.fluitans**.

  Function : The main function of the rhizoids are is **to fix the plant** with the substratum and it **absorbs** some amount of water and minerals.
- The whole ventral surface also absorbs water and minerals.

(b) Scales :

- Triangular, **multicellular** and **violet colour scales** are present on the margin of **ventral surface** of thallus.
- **Violet (Purple)** colour of the scales is due to presence of **anthocyanin** pigment in their **cell sap**.
- They are **ligulate**. The scales are single celled thick. **Maximum scales are found in apical notch**.
- Scales are absent or less developed in aquatic species of **Riccia.**
- Plant growing moist terrestrial habitats usually have small and ephemeral scales, whereas those of **dry habitats** have **large** and **persistent Scales**.

Note : In **Marchantia** scales are **appendiculate** & **ligulate**.

- In Riccia the half scales are found at margin of the thallus. **Complete scales are found in the apical notch**.

Function :

(1) The main function of the scales is the **protection of growing points**.

(2) Some amount of water also absorbed through the scales.

- Scales are formed by the activity of the apical cell and arranged in a single row, but as the thallus grows and widen, each scale splits into two halves along the median line, so that **two rows of scales** are seen, one row near each margin of the thallus.
- In terrestrial species e.g. **R.sanguinea, Riccia robusta etc. scales are completely absent**.

INTERNAL STRUCTURE

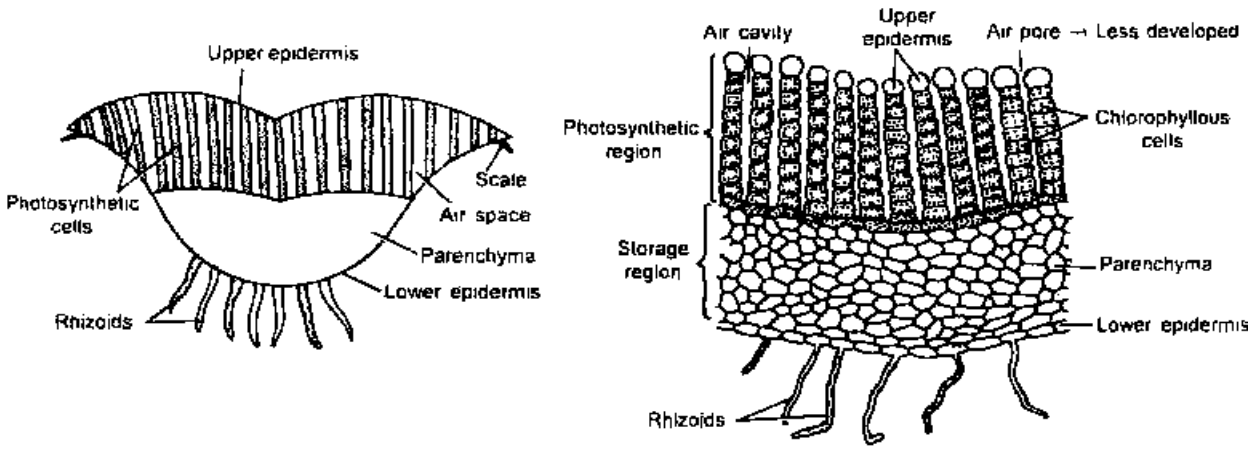
- Interally, the thallus is divided into **two** distinct zones or regions.

(i) Upper or dorsal : **Photosynthetic** or **assimilatory region.**

(ii) Lower or Ventral **: - Storage region**.

(i) Assimilatory Region or Photosynthetic region : -

- The cells of this region are **loosely** arranged and **parenchymatous**.
- Chloroplasts **(Discoid type)** are found in the cells of this region. So this region is able to carry the process of photosynthesis. Therefore it is known as **photosynthetic region**.



V.T.S. OF THALLUS

- The chlorophyllous cells are arranged in **vertical rows**.
- A narrow, deep space is found in between the vertical rows, called **air spac**e or **air canal**.
- Upper cell of each vertical row is **colourless**, larger in size & differentiated to form upper epidermis.
- Air canal opens at upper epidermis through the **pore** called **air pore**.
- Air canals are **schizogenous** in origin. It means it is formed by the **separation of cells.**
- The presence of air canal or air chamber is the ancestral feature. They shows **aquatic ancestral** Character.
- Food material synthesize in this region through the photosynthesis.

(ii) Storage Region : -

- The cells of this region are **colourless, compact, parenchymatous** and without intercellular spaces.
- The **starch** is stored by the cells of this region as food.
- The lower most layer of cells are arranged systematically to form a **lower epidermis.**

REPRODUCTION

- It reproduces by two different ways.

(1) Vegetative Reproduction (2) Sexual Reproduction

1. Vegetative Reproduction

- It is responsible for the **gregarious** (Growing close together but not matted) habit of the plant. It takes place by following methods :

(a) By progressive death and decay of older parts of thallus.

- It is normal method of vegetative reproduction. It takes place in **favourable** growth season (period).
- The older part of the plant body gradually becomes aged, die and ultimately decay.
- When this process of decay reaches up to **dichotomous point,** two branches get separated and each branch form a new thallus through the apical growth.

(b) By Rhizoidal tips.

- It has been reported by ***Fellener*** in ***R.glauca.***
- During this reproduction at the tips of **rhizoids,** a **multicellular mass of cells** is formed by segmentation and repeated division, which becomes green in colour and act as a **bud.** These buds separate from the rhizoids and grow into a new plant.

(c) By Adventitious branches.

- This method of reproduction is found in **aquatic species** of Riccia such as ***R.fluitans.***
- Special adventitious branches arise from the **ventral surface** of the thallus in the **mid rib region**. These branches are detached from the parent thallus and grow into a new plant.

(d) By tuber formation.

- In many species like ***R.discolor, R.perennis*** growing in dry habitat.
- When the **dry season starts,** the apical cell divide to form a **multicellular mass** of cells on the apex of each branch. This mass of cells of the lobes becomes thick due to **storage of food** material and develop a thick protective layer around it after degeneration of marginal cells. This thick structure is known as **tuber.**
- The **tubers** remains **dormant** in **dry season.** On the returns of favourable condition or moist season, each tuber resumes growth and give rise to new thallus. Tubers shows **"perennation".**

(e) By persistent apices/ By death of thallus in drought condition except growing region.

- This method found in region having prolonged dry season as in **Punjab** and **Rajasthan**.
  eg., ***R.discolor.***
- In the beginning of dry season entire body of the thallus becomes dry **except the apices.**
- The apices very often grow down into the soil and becomes thick due to the **storage of food** material.
- On the advent of favourable condition. (ie., rainy season) all the apices grow and form a new plant.

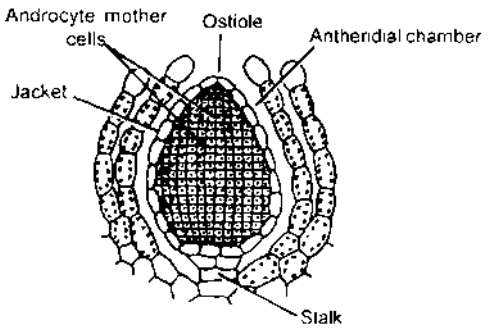
2. Sexual Reproduction

- The main plant of **Riccia** is gametophyte. It reproduces by **gamete formation.**
- It is oogamous type.
- Male sex organ called as **antheridium** and female sex organ called as **archegonium.**
- The sex organs of Riccia are borne on **dorsal surface** of the thallus in the median groove.
- The sex organs are develop singly, usually deeply in the tissues in **acropetal order.** (Youngest sex organ near the apex and oldest sex organ away from the apical notch.)
- For the development of sex organ, **low sun light** and **temperature** is required.
- The species of Riccia are **Monoecious** and **dioecious.** But most of the species of Riccia are **monoecious.**

(a) Monoecious species : Male and female sex organs lies on the same thallus. Such as : ***R.robusta, R.glauca, R.pathankotensis, R.gangetica etc.***

(b) Dioecious species : Male and femal sex organs are present on separate thallus such as : ***R.discolor / R himalayensis***

- Most of the species of Riccia are **homothallic** in nature, ie., fertilization takes place in between genetically identical gametes. But ***R.bischoffii*** and ***R.curtisi*** are **heterothallic.** i.e., Fertilisation takes place in genetically different gametes.



V.S. OF ANTHERIDIUM

[i] Antheridium :

- Each mature antheridium is some what elongated oval or **pear shaped** and **stalked** structure.
- Each antheridium enclosed in a cavity or chamber, known as **antheridial-Chamber.**
- Each antheridium has a short, **few celled stalk** by which it is attached with the base of antheridial chamber.
- The **jacket of the antheridium** is made up of **sterile cells.**
- Jacket is **single celled thick** and **multicellular.**
- Antheridium has large number of small cells, called **Androgonial cells.**

ANTHEROZOIDS

- An **oblique** or diagonal cell division takes place in each androgonial cell. Resulting, two **androcytes** or **antherozoid mother cells** (Sperm mother cells) are formed.
- Each **androcytes** converts into a **male gamete** (elongated nucleus present) or **antherozoids** by metamorphosis.
- These antherozoids are **motile** male gametes.
- The are **comma** like or **curve** shaped and ***biflagellate*.** (In **Marchantia** rod like and biflagellate.)

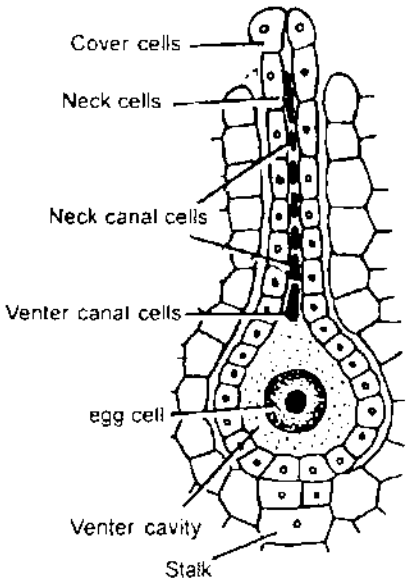
  Note : Most of the species of **Marchantia** are **dioecious** or **heterothallic.**
- At the maturation of antheridium **cell wall of the androcytes** dissolves during metamorphosis and mucilage is formed.
- It is **hygroscopic** in nature.
- The apical cells of **Antheridial Jacket** absorbs water by imbibition from the antheridial chamber Resulting, a pressure increase on the apical region of antheridium and the **Jacket bursts at the apex** then antherozoids come out with mucilage.
- On coming in contact with water, the **antherozoids swim freely** with the help of their flagella.

Dehiscence of antheridium takes place in the presence of high amount of water, is called **Hydrochasy.**

[ii] Archegonium :

- A mature archegonium is **flask shaped** structure and enclosed in **archegonial chamber.**
- It is attached with the base of archegonial chamber with the stalk.
- The basal swollen portion of archegonium is called **Venter.** The upper narrow tube like portion is termed **neck. (sterile cell)**
- The archegonium has a **single layered jacket.**

- The jacket in the neck region is composed of **six vertical rows** of cells. In each vertical row 6 to 9 **(mainly 6) neck cells** are present.
- Venter region contains **two cells.** A large cell which is termed **egg** or **oosphere** and above the oosphere is a small **venter canal cell.**
- The neck region has **4(mainly) – 6 neck canal cells.** (In **Marchantia** 4-8 N.C.C.)
- The **four** terminal cells of jacket of the neck of archegonium function as **cover-cells.**



V.S. OF ARCHEGONIUM

FERTILIZATION

- When archegonium is fully mature, the **neck canal cells** and **venter canal cells** of archegonium **degenerate.**
- Only one cell remains which is called **egg cell.**
- Disintegration of the cells give rise to **mucilaginous substance.**
- Mucilage is **hygroscopic** in nature. It absorbs water, results increase a pressure in archegonium and consequently the **cover cells of archegonium separate from each other** and forming funnel shaped opening and the mucilage oozes out.
- **Inorganic potassium salts** and **soluble protein** are present in mucilage which attracts the **antherozoids**.
- Antherozoid shows **chemotactic** movement.
- Due to this chemotactic response many **antherozoids** enter into the neck of archegonium. But eventually only **one antherozoid** fuses with the **egg cell** and other perish.
- Now fertilized egg cell is called **Zygote** which is **diploid** structure.

DEVELOPMENT OF SPOROPHYTE

- Development of zygote takes place **only inside archegonium.**
- Zygote is the **first cell of sporophytic generation.**
- The first division is **transverse** in zygote and second one is perpendicular to the first one while the third division is vertical which give rise to **8-celled-embryo [octant].**
- Subsequent division occur in all **possible planes** until a mass of 20-40 cells is formed.
- The superficial cells of this mass now undergo **periclinal division,** resulting in an **outer amphithecium** layer and a **central** mass of cells, the **endothecium.**
- The cells **amphithecium** divides again and again **anticlinically** to form the **wall of sporogonium.** It is **single layered.**
- **Endothecium** acts as a **archesporium.**
- The cells of **endothecium** divides in all planes, resulting, a mass of cells **(sporogenous tissue)** is formed. It has two types of cells.

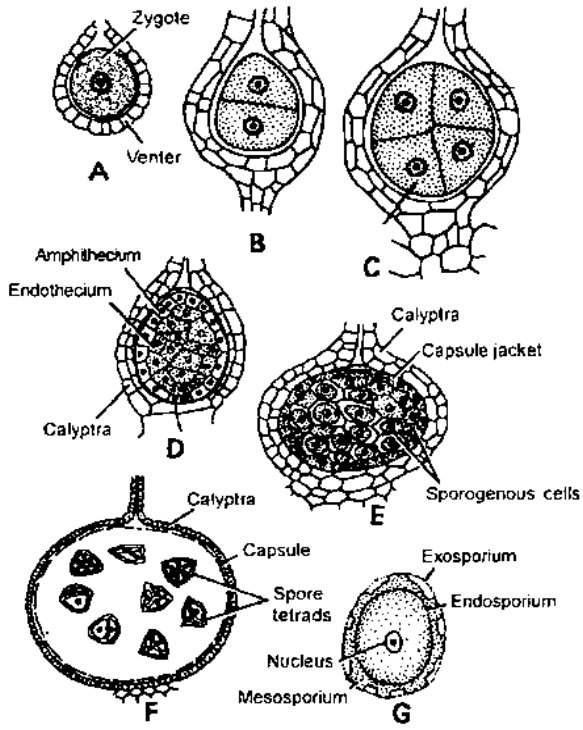
(i) **Sporocytes** or **spore mother** cells and

(ii) **Nutritive cells** or **Nurse cells. (Prestructure of elaters)**

Note : In **Marchantia** nurse cells are transform into **elaters (2N).** Elaters are hygroscopic in nature and help in dispersal of spores.

- The nurse cells provide nutrition to the sporophytes. (In **Riccia**)

- One **periclinal division** takes place in the cells of **venter region** during the development.
- Due to this bilayered covering is formed around the **sporogonium.** It is termed **calyptra.**
- Calyptra is **haploid.** Because, it is formed by venter region of archegonium.
- The cell wall of sporogonium and sporocytes or spore mother cells are diploid.
- Now, **meiotic** cell division takes place in spore mother cells, results, **haploid spores** are formed.
- Now wall of sporogonium disintegrates, to provide nutrition to the spores.
- Later inner most layer (wall) of Calyptra also breaks down to provide additional nourishment.
- In mature sporophyte spore **tetrads** lie in a cavity enclosed by a **single layered calyptra.**
- All the structures in capsule are haploid (n) at the mature stage.



DEVELOPMENT OF SPOROPHYTE

A-E. Successive stages in the development of sporophyte, F. V.S.of mature sporophyte with spore tetrads G. Spore

- The sporophyte of Riccia is simplest in **Bryophyta**. It is made up of **only capsule**.
- The sporophyte is **devoid of foot** and **seta.**
- In ***Marchantia*** sporophyte is differentiated into Foot, Seta and Capsule.

DEHISCENCE OF CAPSULE / DEHISCENCE OF SPORE SAC

- There is no special means of dehiscence of capsule of **Riccia.**
- The liberation of the spores is brought about **by the death and decay of capsule and thallus**.

STRUCTURE OF SPORE

- Spore is the **first cell** of the **gametophytic generation.**
- The spores are arranged in **tetrahedral tetrad.**
- The spores of Riccia are **uninucleate, pyramidal** and **rough.** Their diameter is 0.05 mm to 0.12 mm.
- The spore wall is tri-layered.

(i) Outer layer or Exospore or Exosporium : It is **thick** and **spiny.** It is made up of **callose** and **cutin**.

(ii) Middle layer or Mesospore or Mesosporium : It is thick and solid. It is composed of **Cutin.**

(iii) Innermost layer of Endospore or Endosporium : It is **thin** and **elastic.**
It is composed of **pecto-cellulose.** These layer are developed in centripetal order.

- The spores germinate when there is **enough water** in the soil and **new thallus** is formed.

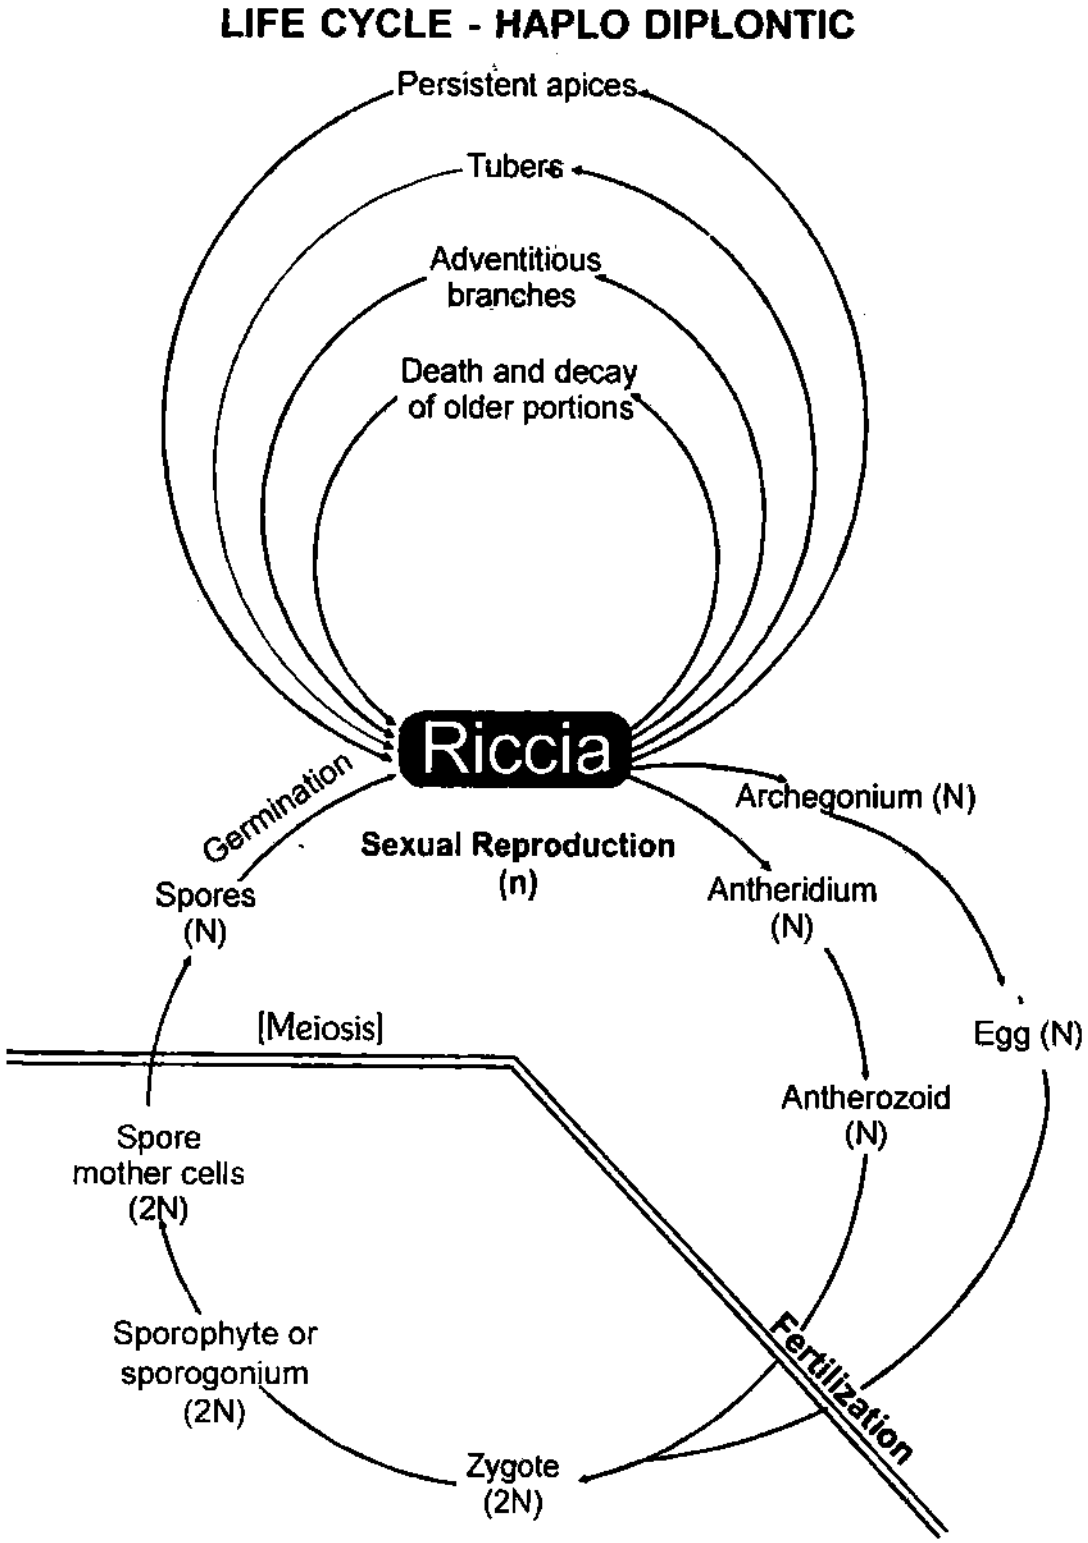
LIFE CYCLE

- **Haplo-diplotic** type alternation of generation is found in **Riccia.**

- **Sporophyte of riccia** completely depend upon **gametophyte for nutrition** and **shelter.**

Note : [In **haplo-diplontic** alternation of generation a **dominant**, **independent**, **photosynthetic**, **thalloid** or erect phase is represented by a **haploid gametophyte** and it alternates with the **short, lived** multicellular **sporophyte** which is totally (eg., Riccia) or partially dependent (eg., Funaria) on the gametophyte for its **anchorage and nutrition.**]

- Haplo-diplontic type of alternation of generation is found Bryophytes.



FUNARIA

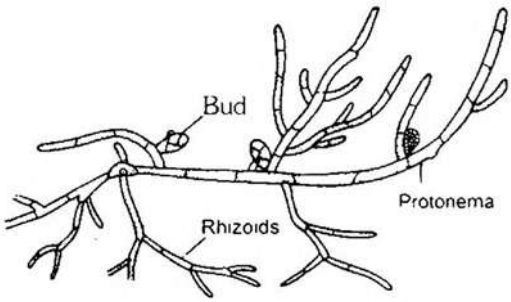
[Green moss or cord moss or rope moss]

SYSTEMATIC POSITION

Division	:	Bryophyta
Class	:	Bryopsida
Order	:	*Funariales*
Family	:	*Funariaceae*
Genus	:	*Funaria*
Species	:	***Funaria hygrometrica***

DISTRIBUTION & HABITAT

- **Funaria hygrometrica** is a cosmopolitan species.
- The plants **(mosses)** are found in **damp** and **shady** localities.
- **Tallest moss** is ***Dawsonia.***
- The adult plant body of moss represents **Gametophytic phase.**



MATURE PROTONEMA

GAMETOPHYTIC PHASE

- It is found in two forms :

(a) Protonema : Prostrate, Creeping filament, Ephemeral, Multicellular and filamentous algae like – [Juvenile stage]

(b) Gametophore : [Erect and Foliose]

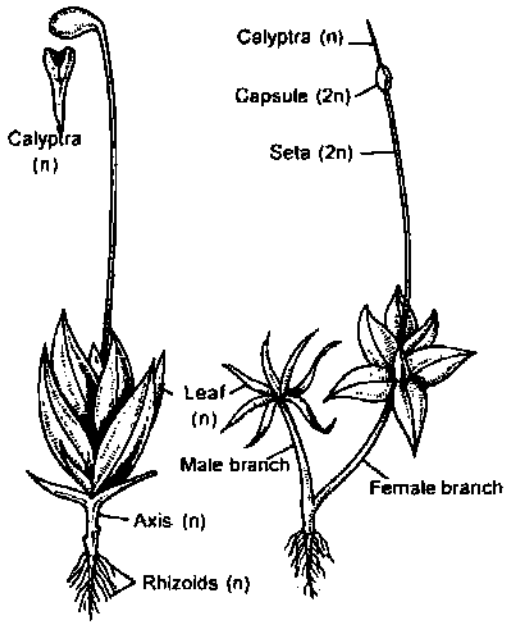
- Gametophore is an actual gametophytic plant which measures 1-3 cms and distinguished into three parts- (i) Rhizoids (ii) Axis (iii) Leaves

(i) Rhizoids :

- Rhizoids are **brownish** in colour.
- **Branched, Cylindrical, Multicellular** and **Oblique septate** structure.

Function :

- They help to **fix** the plant and in **absorption of water** and **minerals.**



FUNARIA HYGROMETRICA

A. A female branch of leafy gametophore with sporophyte B. A leafy gametophore with a male branch and a female branch with young sporophyte.

(ii) Axis :

- It is green in colour, erect, soft and branched.
- Their branches are **extra axillary** in origin. It means branches are developed from below the leaves, not from their axis.
- Stem (axis) and branches bear bright green leaves.

(iii) Leaves :

- Leaves are small, membranous, **sessile** and oval shaped and a **distinct mid-rib is present.**
- They are arranged **(3/8 phyllotaxy)** spirally on the axis. In leaves, **lateral vein are absent.**
- **3/8 phyllotaxy i.e., in three complete spirals there are eight leaves.**

Note : A **pyramidal shape** apical cell is responsible for growth of apex of axis.

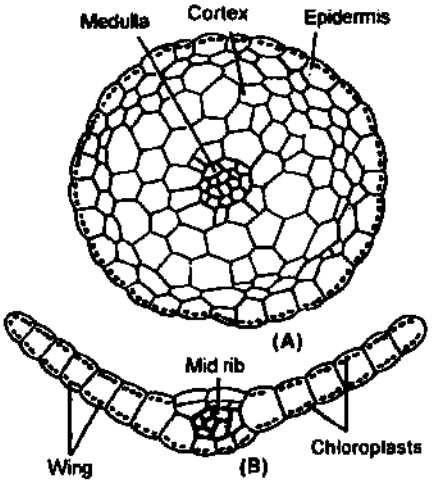
INTERNAL STRUCTURE

1. Axis or stem : A transverse section of the mature axis shows three distinct regions.

(a) Epidermis : It is the outermost layer, composed of tangentially elongated **chlrophyllous cells.** It has **no stomata** and **cuticle.**

(b) Cortex : It is multilayered **parenchymatous** region. The cells of outer layers are thick walled and the cells of inner layers are thin walled.

(c) Central Cylinder : It is composed of long, colourless and thin walled cells. These cells are **dead and lack protoplasm.** They help in the conduction of **water and nutrients.**



A. TRANSVERSE SECTION OF AXIS
B. VERTICAL SECTION OF LEAF

2. Leaf : In the V.S. of leaf lamina one multilayered median vein is found and its both side having single layered **wings.**

- The multilayered median vein is the main part. The central part of median vein formed by narrow parenchymatous cells.
- Wing region of leaf lamina made up of thin layered cells in which **many chloroplasts** are present.
- **Stomata are absent in the leaf.**

REPRODUCTION

- Reproduction in gametophyte of Funaria is of two type-
  (1) Vegetative
  (2) Sexual

1. Vegetative Reproduction

It is responsible for **gregarious habit.**

- Vegetative propagation in *Funaria* takes place by the following method.

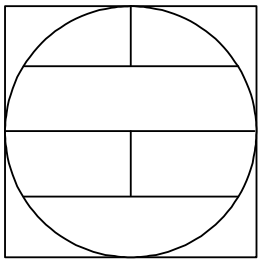
(i) Fragmentation of primary protonema

- On germination the **spore** gives rise to a branched filamentous structure, known as **primary protonema.**
- Sometimes it breaks into small fragments. The fragments **bear buds** and each bud develops into an **erect gametophore.**

(ii) Secondary protonema

- Under favourable conditions. Secondary protonema may be formed by the cells of injured **rhizoids, stems, leaves** or **reproductive** structures.
- Like primary protonema, it bears buds which are capable of growing into erect gametophores.

(iii) Gemmae



- During **unfavourable** period, the **terminal cells** of the protonema form **multicellular green** bodies, called **gammae.**
- Gammae are both, **vertically** and **transversely** septate and has **10-30** cells.
- On return of favourable conditions, it is detached from the parent plant and germinates to form an erect gametophore.
- Under certain condition, gemmae may also develop on the leaf and on the axis of the gametophore.

(iv) Bulbils

- They develop on **rhizoids** and **devoid of chloroplast.** The bulbil grows into a new plant when detached from the parent plant.

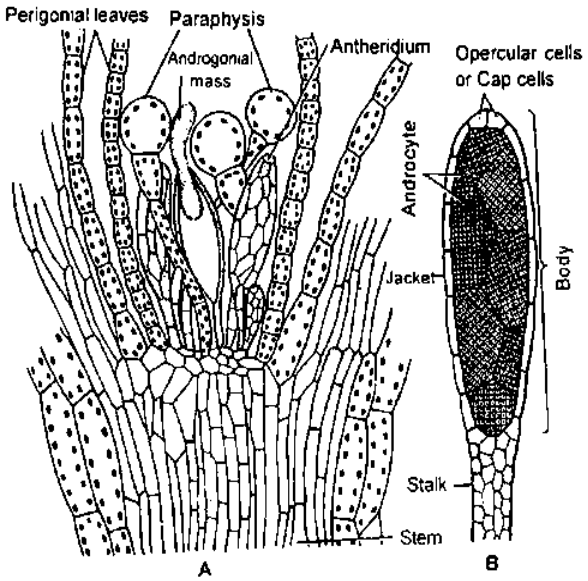
2. Sexual Reproduction

- Sexual reproduction in Funaria is **oogamous** type.
- Funaria is **monoecious** and **autocious plant.**
- Male and female sex organs are called **antheridia** and **archegonia** respectively and are borne in clusters at the tips of different branches.
- **Antheridia** develops at the apex of **main branch** of plant where as **archegonia** develops at the apex of **lateral branch.**
- These are covered by **involucral** leaves.

[Note : Autocious means when two different sex organs are born on different head of the **same plant.]**

ATHERIDIUM

- Antheridium of Funaria is **club shaped** structure.
- It has short multicellular **stalk.**
- It has **single layer jacket.**
- In Antheridium many androcytes are present. Each androcyte forms long, **spirally coiled, biflagellated** antherozoids by **metamorphosis.**
- **Chloroplast** is present in jacket cells of young antheridium due to which they are green but **orange colour of jacket of mature antheridium** is due to presence of **chromoplast.**
- At the apex of jacket **two** colourless cells are present called as **opercular cells** or **cap cells.**
- In between the antheridia, **paraphysis** are present which are **green,** upright and multicellular **capitate hairs.**

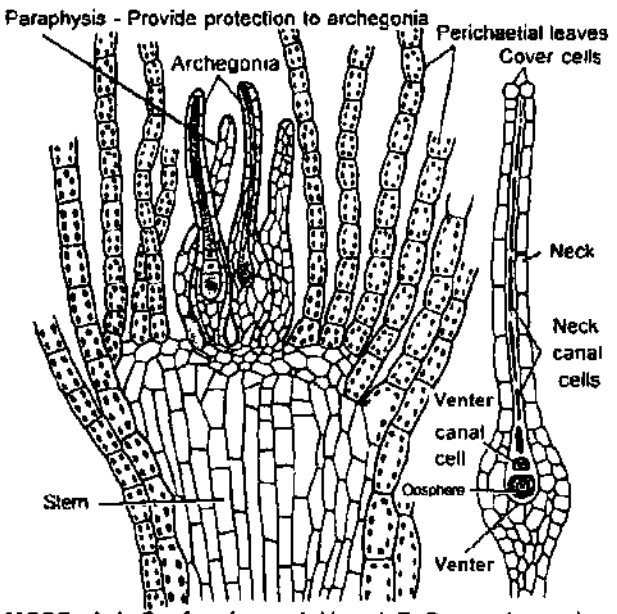


MOSS : A. L. S. of antheridial head, B. L. S. of one antheridium (young stage)

- Antheridia and paraphysis are surrounded by **perigonial leaves.**
- **Function of paraphysis :** Provide protection to antheridia and **water secretion.**

ARCHEGONIUM

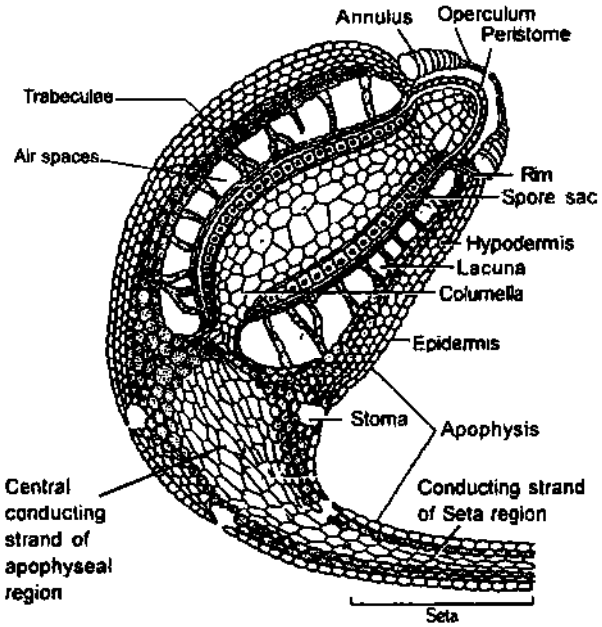
- Archegonium of Funaria develops from an apical cell at the **archegonial branch.**
- A mature archegonium is **flask shaped** structure **paraphysis** are also present between archegonia which are **not capitate.** They are surrounded by **perichaetial leaves.**
- Archegonium is distinguished into **stalk, venter** and **neck.**
- A swollen **double layered** venter contain an **egg** and a **venter canal** cell.
- Neck contain **six** or **more** (6-10) **neck canal cells.** It is capped by **four cover cells.**
- Jacket of neck is single layered and made of **six** vertical rows of **neck cells**.
- In each vertical row **6 to 9 neck cells** are present.



MOSS : A. L. S. of archegonial head, B. One archegonium

FERTILIZATION

- **Water medium** is essential for fertilization and the apical cells of the antheridium Jacket which forms **operculum absorbs water** and bursts.
- The **spirally coiled biflagellate antherozoids** escape from the antheridium.
- The **neck canal cells** and venter canal cells also degenerate to form a **mucilaginous substance** which absorb water to exert a pressure so **cover cells** become separated from each other and to form a passage for antherozoids.
- The antherozoids are attracted towards the neck of the archegonium by some **chemotactic substance,** possibly **sugar,** produced by archegonium.
- An antherozoids fused with egg of archegonium to form a diploid **zygote.**



FUNARIA : L.S. OF MATURE SPOROPHYTE SHOWING SETA AND CAPSULE

SPOROPHYTIC PHASE

- Diploid zygote divides to produce **sporophyte of Funaria.**
- The mature sporophyte distinguished into three parts : **Foot, seta and capsule.**

(i) Foot : Foot is very small and formed by **parenchymatous** cells. It **absorbs water and nutrients from the gametophyte.**

(ii) Seta : Seta is a thick and **thread** like structure. It is **hygroscopic** in nature.

Function :

- Conducts water and nutrients.
- Helps in dispersal of spores.

(iii) Capsule :

- It is pear shaped, the capsule is distinguished into three regions.
- Development of capsule takes place by upper apical cell of embryo.

(i) Upper → **Opercular region** < Annulus, Rim, Peristome

(ii) Middle → **Theca region** < Fertile → Spore sac; Sterile → Collumella

(iii) Lower → **Apophyseal region** ➡ Stoma

(i) Opercular region :

- The opercular region comparises operculum which covers **peristome**.
- The **peristomial teeth** are present in peristome. They are curved and **triangular** in shaped.
- They are arranged in **two whorls-outer** and **inner** whorls.
- Outer whorls bear **16 teeth** which are **thick, large** and **well developed** & **red.**
- **Inner teeth** are also **16** in number but they are **thin** and **delicate & colourless.**
- Total 32 peristomial teeth are present.
- These teeth are help in dispersal of spores.
- The teeth are simply the strips of **cuticle** and they are **acellular.**
- Opercular region is separated by theca region, by two rings.

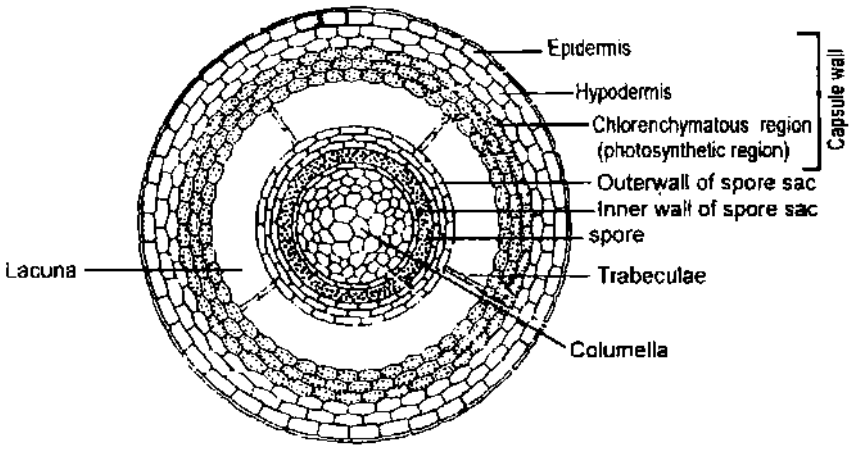
(a) Rim or **Diaphragm** (lower) **(b) Annulus** (upper)

(ii) Theca region :

- The middle theca region is distinguishable into **epidermis, hypodermis, chlorenchymatous** region (2-3 layered), filamentous **trabeculae** with large **air spaces**, two layered **spore sacs** and central **sterile** region is **columella.**
- **Elaters** are absent in **spore sac.**

Function of columella : It provides water and food to developing spores in spore sac.

Function of trabeculae : It connects the inner most layer of capsule wall to outer most layer of outer wall of spore sac.



T.S. OF FUNARIA CAPSULE THROUGH THECA REGION

(iii) Apophyseal region :

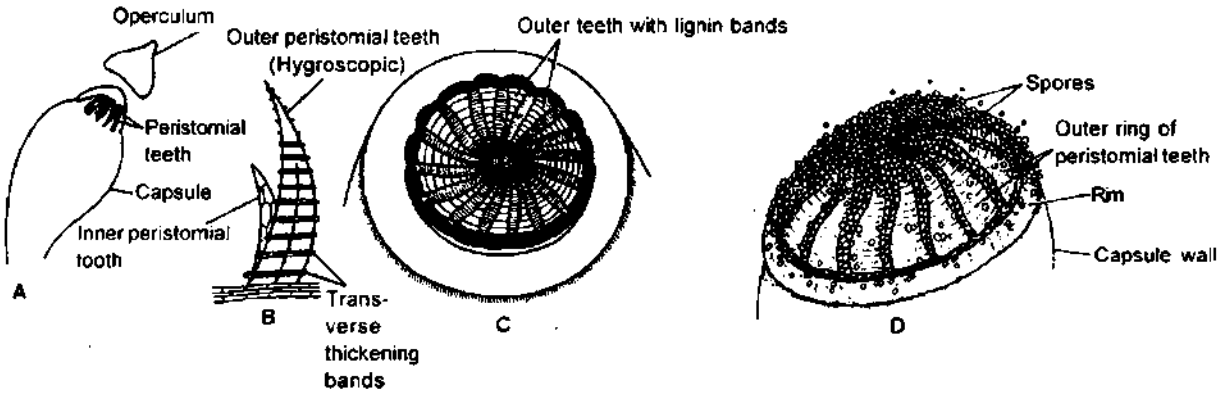
- The apophyseal region is the lower most part of the capsule which has **conducting strand** and attached with seta**.**
- This is surrounded by **chlorenchymatous** cells with prominent **intercellular spaces.**
- The epidermis has **stomatal aperture** which is guarded by two **guard cells.**
- In mature stomata stomatal aperture is guarded by **single ring like guard cell.**

Note :

- The **endothecium** forms the **central parenchymatous** cells in the opercular region.
- **Columella, Inner wall of spore sacs, archesporium** in the fertile region, **central conducting** strand in the **apophyseal region** and central conducting strand in seta region.
- The **rest of the tissues** arises from the **amphithecium.**
- Archesporial cells divide and redivide, to form a mass of **sporogenous tissues.**
- Sporogenous cells behave like **spore mother cells.**
- These cells are divided by **meiosis** and to form **haploid tetrahedral tetrad** of spores.

DEHISCENCE OF CAPSULE AND DISPERSAL OF SPORES

- ***Funaria*** is a **stegocarpous moss**.
- **Stegocarpous** means the dehiscence of capsule always along a predetermined line.
- As the capsule matures, the thin walled cells including **columella** dries up.



(A) CAPSULE WITH PERISTOMIAL TEETH, (B) OUTER & INNER PERISTOMIAL TOOTH, (C) THE STRUCTURE OF CAPSULE AFTER THE SEPERATION OF OPERCULUM (D) DISPERSAL OF SPORES

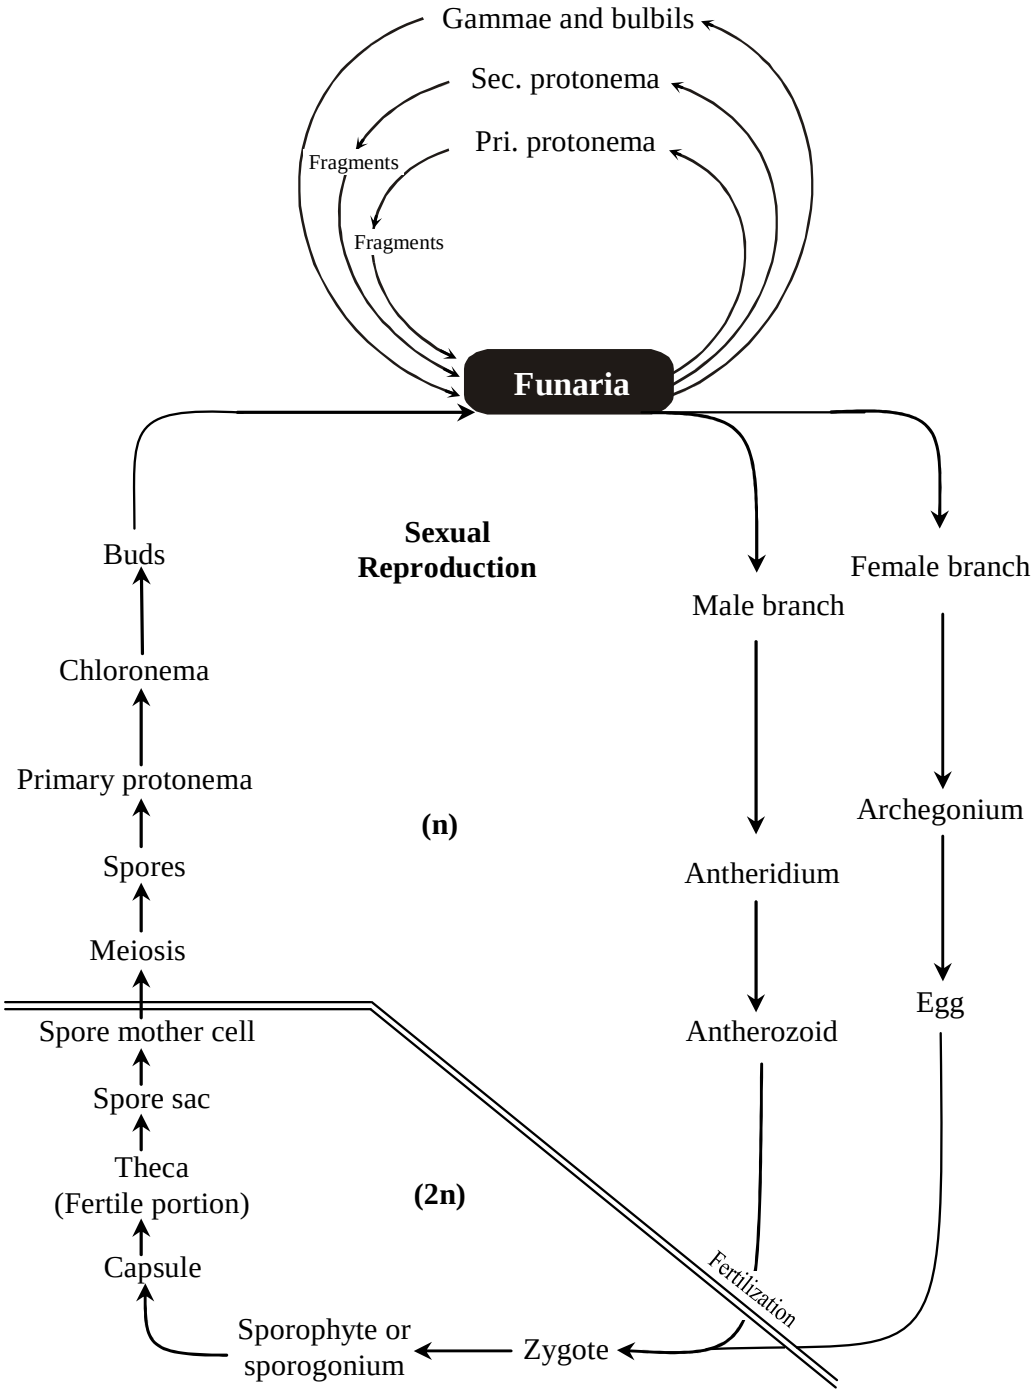
- The thin walled cells of **annulus** break away and thus **operculum separated** along the annulus and **exposing** the **peristome.**
- The **hygroscopic** nature of **outer peristomial teeth** (Open out in only in dry weather) helps in **dispersal of spores.**
- The inner peristomial teeth check sudden dispersal of spores.
- They reach at far places through the medium of **air.**
- In moss capsule, spore dispersal takes place by **censor mechanism.**
- Peristome teeth- They shows **xerochasy.**

STRUCTURE OF SPORES AND GERMINATION OF SPORES

- **Spore** is the **first cell** of gametophytic generation. Spores are spherical in shape and 12-20μm in diameter and **double layered.**

- The outer **wall-exosporium** is much thicker and inner wall **endosporium** is thin.
- Spores have **oil droplets** and **chloroplast.**
- The spore germinates to form the **primary protonema.**
- Protonema grows in **two directions.** The green prostrate branches growing on the surface called as **chloronema** or **chloronemal** branches and **colourless** branches grow into soil are called **rhizoidal branches.**
- The chloronemal branches give rise to many buds and each bud grows into an erect leafy gametophore.

Life cycle : Halpo-diplontic



LIFE CYCLE OF ***FUNARIA***

SPECIAL POINTS

- *Funaria* is a **protoandrous** moss.
- Internal structure of *Sphagnum* stem is differentiated into **central medulla,** cortex and epidermis.
- **Medulla** has **hadrome. Hadrome** is **water conducting tissue** and it is made up of **parenchyma.**
- *Sphagnum* has two types of cell, *hyaline* (water absorbing cells) and ***chlorophyllous*** in leaves.
- In **Anthoceros** and **Notothyllus.** (Specifically cynophycean algae found in thallus as symbiosis.)
- Stem of **Sphagnum** contain special type of water storage cells are called **"retort cells"**(Star shape or bottle neck like cells.).
- Upper region of capsule is covered by membranous structure called **calyptra.** Calyptra is formed by venter of archegonium. So it is **gametophytic tissue** or **paternal tissue (n).**
- The sterile tissue of **capsule** can be divided into four regions.

(i) The sterile cells constituting the **apophysis.**
(ii) The sterile cells forming thick **capsule wall.**
(iii) The sterile cells forming **columella.**
(iv) The sterile cells constituting the **operculum** and **peristome.**

Polytrichum : (Hair cap moss)

(i) **Dioecious**
(ii) Vegetative reproduction – by **bulbils** (Which develop on rhizoids) and fragmentation of underground) rhizome.
(iii) **Neck canal cells – Ten**
(iv) **Annulus absent.**
(v) In **Polytrichum,** peristome teeth (32 or 64) are **not hygroscopic.**
(vi) Common name – **Hair cap moss.**

- **Sphagnum –** Peat moss / Bog moss / Turf moss.

MUCOR & RHIZOPUS

↓ ↓

(Pin mold) **(Common bread mold)**

or

Black mold of bread

SYSTEMATIC POSITION

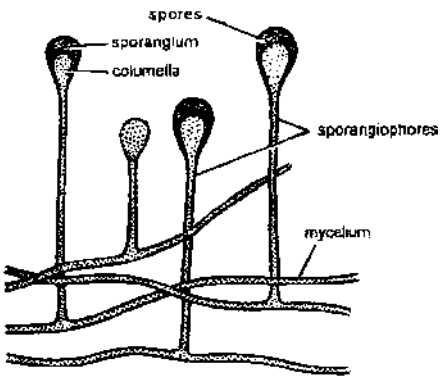
Division	:	Eumycophyta
Class	:	Phycomycetes
Sub. Class	:	zygomycetes
Order	:	mucorales
Family	:	mucoraceae
Genus	:	**Mucor/Rhizopus**

HABIT AND HABITAT

- Rhizopus and Mucor are **saprophytic** fungi and in laboratory can be obtained on moist bread.
- Rhizopus and Mucor are also called as **bread mold**.

STRUCTURE OF MYCELIUM

- It is branched, **coenocytic, aseptate** and vacuolated.
- The hyphal wall is made up of **chitin.**
- Some amount of glucosamine, galactose, protein, lipid, **Mg** and **Ca** are also present in the cell wall.
- In cytoplasm, storage food is present in the form of **oil droplets** and **glycogen bodies**.



STRUCTURE OF MUCOR MYCELIUM WITH SPORANGIOPHORE

REPRODUCTION

(1) Vegetative reproduction
(2) Asexual reproduction
(3) Sexual reproduction

1. Vegetative Reproduction

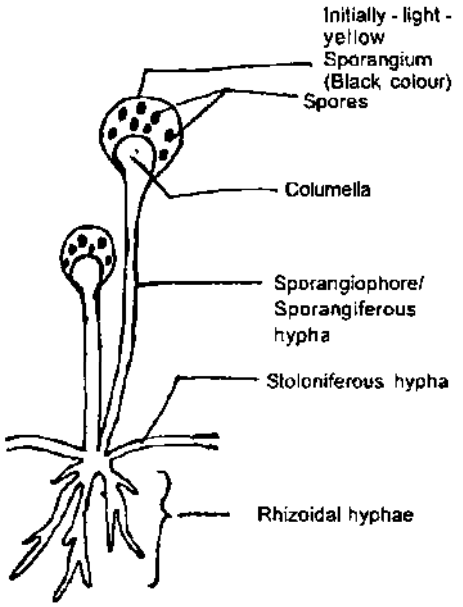
- It takes place by fragmentation.

2. Asexual Reproduction

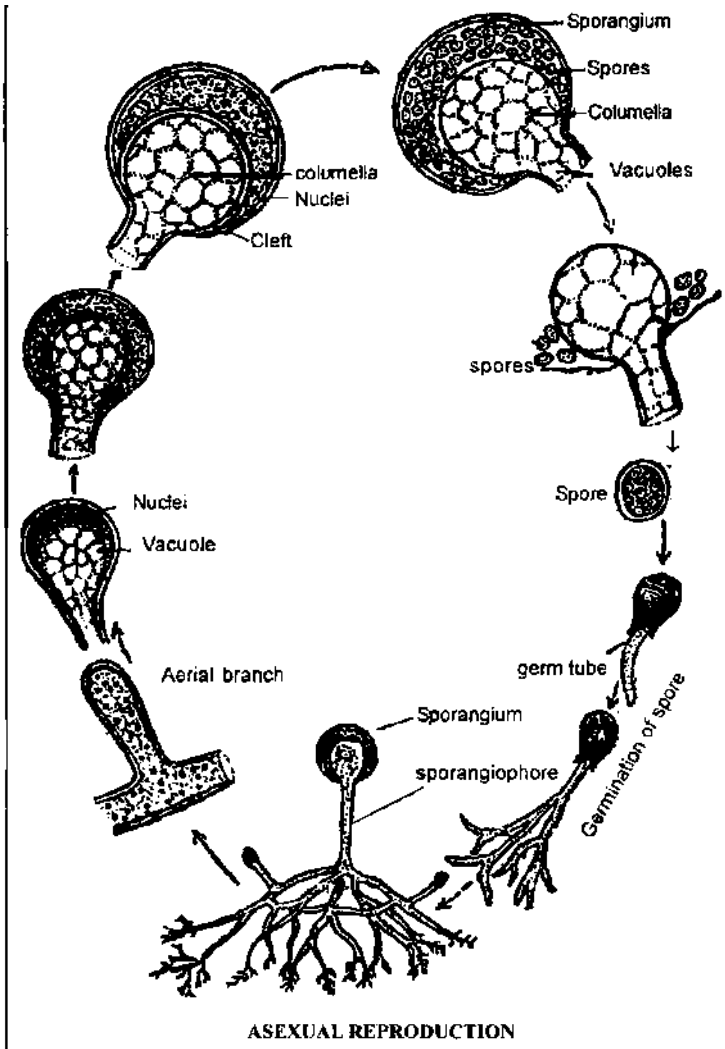
By aplanospore formation –

- Sporangia are **aseptate** and **aerial**.
- Sporangium develops on sporangiophores.

- Sporangiophores are branched **(Mucor mucedo)** or unbranched **(M.jenevensis).**
- Sporangiophores come out from mycelium and their **distal ends** swell up.
- The swollen apices accumulate cytoplasm, nuclei and food. Now it is called **sporangium** (plural-sporangia).
- In this stage protoplast of sporangium is differentiated into a **peripheral dense multinucleated region** and **central** region with **small flattened vacuole**.
- Nucleus are arranged in peripheral region. The peripheral region of sporangium is **fertile**.
- Central vacuolated region is **sterile.** It is hemispherical or club shaped which is called **columella**.
- At the stage of spore formation protoplast of peripheral region of sporangium get divided into many **multinucleated** segments (**2-10 nuclei** in each segment).
- Each segment secretes a wall around itself and form **aplanospores.**
- When they mature outer wall of sporangium ruptures to release the spores in air.
- These spores germinate in **favourable conditions** and form new mycelium.



STRUCTURE OF RHIZOPUS MYCELIUM WITH SPORANGIOPHORE

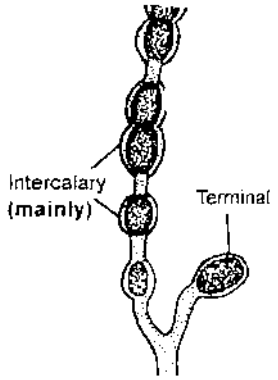


ASEXUAL REPRODUCTION

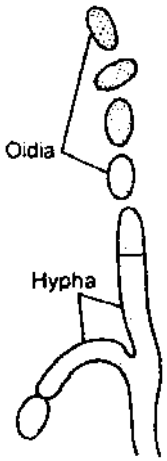
By Chlamydospores –

- Asexual reproduction also takes place by **chlamydospores**.

- When unfavourable condition comes, mycelium becomes **septate**.
- Protoplast of each cell aggregates, to become spherical and secretes a **thick wall** around itself.
- Chlamydospores are may be **intercalary** (mainly) and **terminal** in origin.
- These are **perennating** structure which can survive in **unfavourable conditions**.
- In favourable conditions these spores germinate and form new mycelium.



CHLAMYDOSPORES



OIDIA

Oidia –

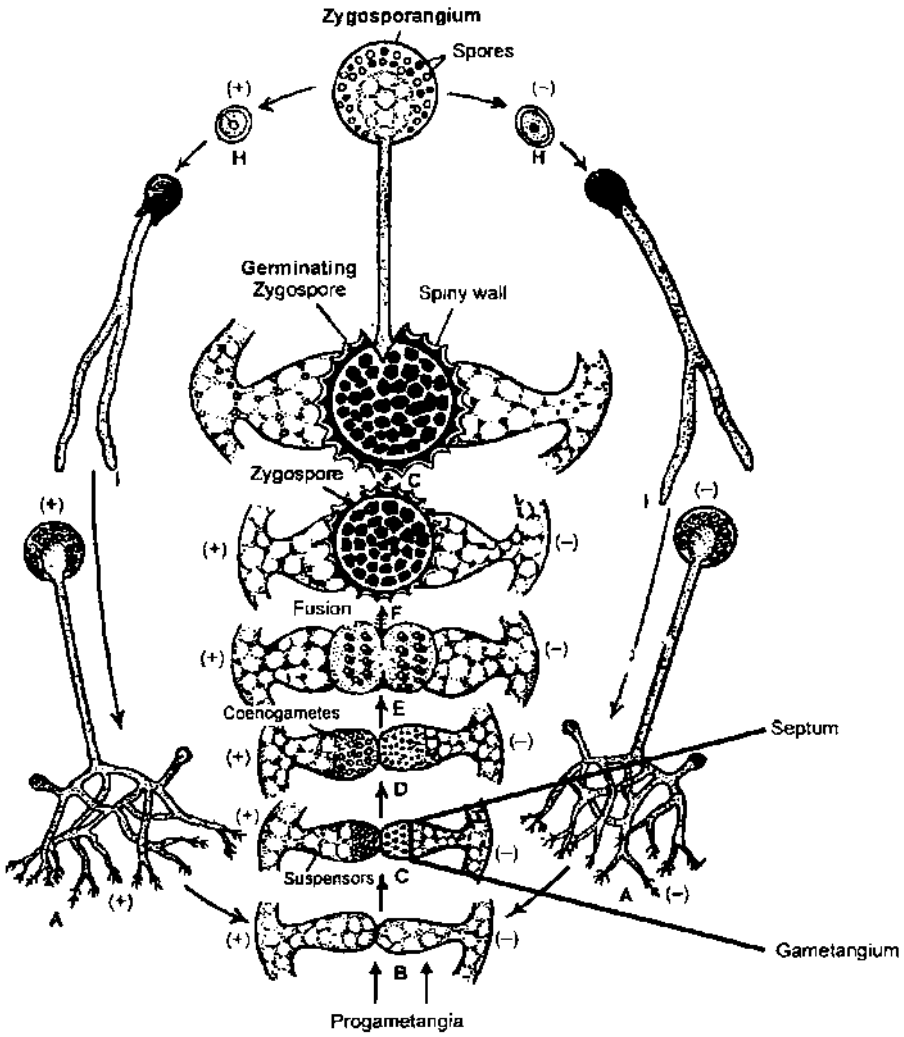
- When mycelium gorws in a **liquid medium** then it becomes septate and **thin-walled**. These cells are called **oidia**.
- Oidia are similar to buds of **yeast**.
- **Fermentation** takes place by oidia in **sugar solution** and **alcohol** is formed.
- Oidia are formed in a chain. This stage is called **torula stage**.

SEXUAL REPRODUCTION → **Isogamous type**

- It takes place during the **absence of nutrient susbstances**.
- In this process **gametangial copulation** takes place between **two gametangia**.
- Both **homothallic** and **heterothallic** species are occur in these fungi. But most of the species are **heterothallic**.
- In **homothallic** species fungal hyphae which participate in sexual reproduction are of same strains i.e. either (+) strains or (-) strains.
- In **heterothallic** species fungal hyhae which participate in sexual reproduction are of different strains.
- In **heterothallic species** sexual reproduction **always takes place between hyphae** of different strains i.e.(+) and (-).

Mucor mucedo (Dung mold)	**–**	**heterothallic**
R.stolonifer	**–**	**heterothallic**
Rhizopus nigricans	**–**	**heterothallic**
R. sexualis	**–**	**homothallic** (species found as obligate parasite in higher plant)

M.hiemalis – homothallic



SEXUAL REPRODUCTION

- When two fungal hyphae which are respectively (+) and (–) strains come close to each other, then these fungal hyphae produce some outgrowths. These outgrowths are called **"progametangia"**.
- Anterior parts of progametangia are filled with **cytoplasm** and **nuclei**. Now these progametangia **(which are different in strains),** come in contact and a **septum** is formed just behind the contact place.
- Now the terminal part is called **gametangium** & long basal part is called **suspensor**, which is **vacuolated**.
- The **multinucleate** undifferentiated protoplast of each gametangium is termed as **coenogamete** or **aplanogamete**.
- In mature gametangium at the place of contact, walls of gametangia are dissolved and fuse together and then **zygospore** is formed.
- In zygospore **diploid nuclei** are formed while haploid nuclei are degenerate.
- A black coloured, thick and ornamented coat is formed around the zygospore [Dormant stage approximately **6 months (In Rhizopus)**]. Which germinate in favourable condition.

GERMINATION OF ZYGOSPORE

- During germination outer wall of zygospore get ruptured.
- A germ tube protrudes out from this ruptured place, it is called **promycelium**/Promycelial Hypha.

- At the apex of promycelium, a sporangium is formed which is called **germsporangium** or **zygosporangium**.
- In **Rhizopus**, at the time of germination **Meiotic division** takes place in zygospore (delayed) whereas in **Mucor, meiotic division** takes place in zygospore **soon after karyogamy**.
- Each nucleus is converted into spore.
- In **Homothallic** species, only one type of (+ or –) spores are formed in the germsporangium whereas in **heterothallic** species both types of spores (+ & –) are formed.
- These spores germinate to form fungal hypha.

HETEROTHALLISM

- **"Blakeslee"** discovered heterothallism first in **Mucor mucedo.**
- In which copulating aplanogametangia are similar externally but are different physiologically i.e., they are of (+) and (–) type.
- According to **Blakeslee** two types of species are found in order mucorales which are called respectively **homothallic** and **heterothallic** species.
- When zygospore is formed by the fusion of two hyphae of same mycelium derived from single type of spore (+ or – strain) then such species are called **homothallic e.g. M.hiemalis**.
- In **heterothallic** species the sexual reproduction takes place between hyphae of **genetically different strains.** i.e. (+) and (–) strains. (In heterothallic species genetically similar strain are **inter-sterile**)
  e.g. **M.mucedo and R.Stolonifer**.
- According to **Blakeslee** in **heterothallic** species, **seperately growing** (+) and (–) strains do not form zygospore, only **sporangia** are formed.
- In heterothallic species (+) and (–) strains grow **together**, they fused and **zygospore** is formed. According to some scientists(+) and (–) strains fungal hyphae are **morphologically similar** but functionally dissimilar.

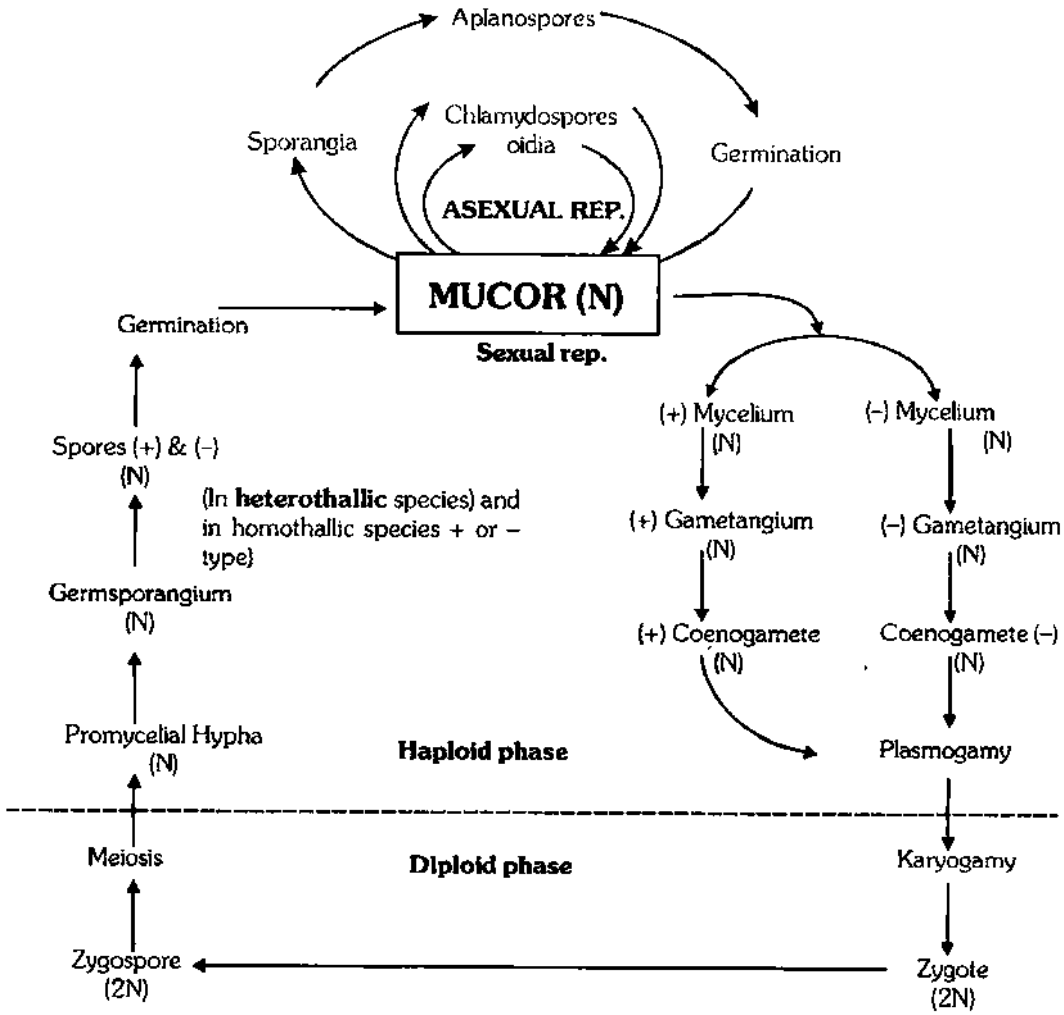
DISEASES

Rhizopus stolonifer – causes soft rot disease of vegetable crops./ **Soft rot** disease of sweat potato.
M.pusilus – infects genitalia of human beings
Rhizopus arrhizus – Causes fruit rot of apple.
R.artocarpi – fruit drop of Jack fruits.

DIFFERENCE BETWEEN RHIZOPUS & MUCOR

Rhizopus	Mucor
1. Mycelium is differentiated into three kind of hyphae-**stolons, rhizoids** and **sporangiophores.**	Mycelium is undifferentiated, i.e. it has only one kind of hyphae**.**
2. **Rhizoids present**.	**Rhizoids absent**.
3. Food material is absorbed mainly by rhizoids.	Food is absorbed by the entire mycelial surface.
4. Sporangiophores occur in tufts from the stolons opposite the rhizoids.	Sporangiophores usually occur singly from any point on the mycelium.
5. Spores easily disseminated by wind.	Spores remain **adhered to columella** and thus spores are not easily disseminated.

LIFE CYCLE – HAPLONTIC



LIFE CYCLE OF *MUCOR*

ALBUGO OR CYSTOPUS

Albugo name proposed by – De berry

SYSTEMATIC POSITION

Division	:	Eumycophyta
Class	:	Phycomycetes
Order	:	Pernosporales
Family	:	Albuginaceae
Genus	:	**Albugo or Cystopus**

Note: Albuginaceae is a **monotypic** family. It includes only single genera **Albugo**.

- It is an **obligate, inter cellular parasite**.
- It can not be grown on culture medium. It causes **"White-rust disease** in the plants of family **cruciferae** or **brassicaceae**. It shows specificity towards the host.

Etiology : - Study of causes of disease in body is called etiology.

Characteristics of White-rust diesase :

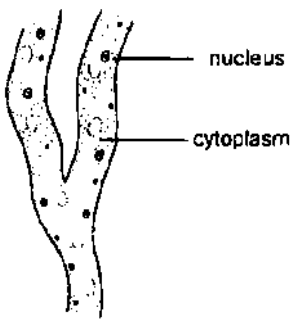
- **White pustules/white blisters** → They are usually present on **lower surface** of leaves which may also spread on the upper surface of the leaves & stems.
- The infected parts of the host become abnormal & the abnormality may be in the form of **hypertrophy**, **fleshyness** or **distortion**.

Note :

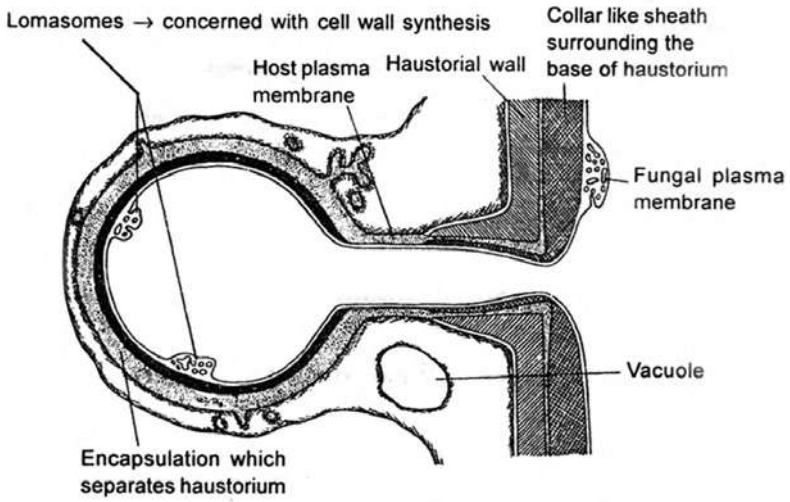
1. The main reason of hypertrophy is the formation of sex organs in the intercellular sapces of host.
2. In the presence of **less** temperature and **high moisture** white rust disease spreads vigorously. The study of sperad of disease is called **Epidemiology**.

STRUCTURE

- Mycelium is **branched, aseptate, coenocytic**. **(Septa** are only formed in mycelium **during reproduction)**.
- The hyphal wall is made up of **cellulose**.
- Reserve food material is present in the form of **glycogen and oil globules**.
- Hyphal network is found in the **inter cellular** spaces of the **host**.
- Round, **button** shaped or **knob** like and stalked **haustoria** are found in Albugo.
- With the help of haustoria it absorbs nutrients from the host cells.
- In the **apical region of haustorium** dense cytoplasm, found but **nuclei** are absent.
- The shape of haustorium have taxonomic importance.
- It's mycelium is stained by **cotton blue** and mounted by **lactophenol**.



STRUCUCTURE OF HYPHA



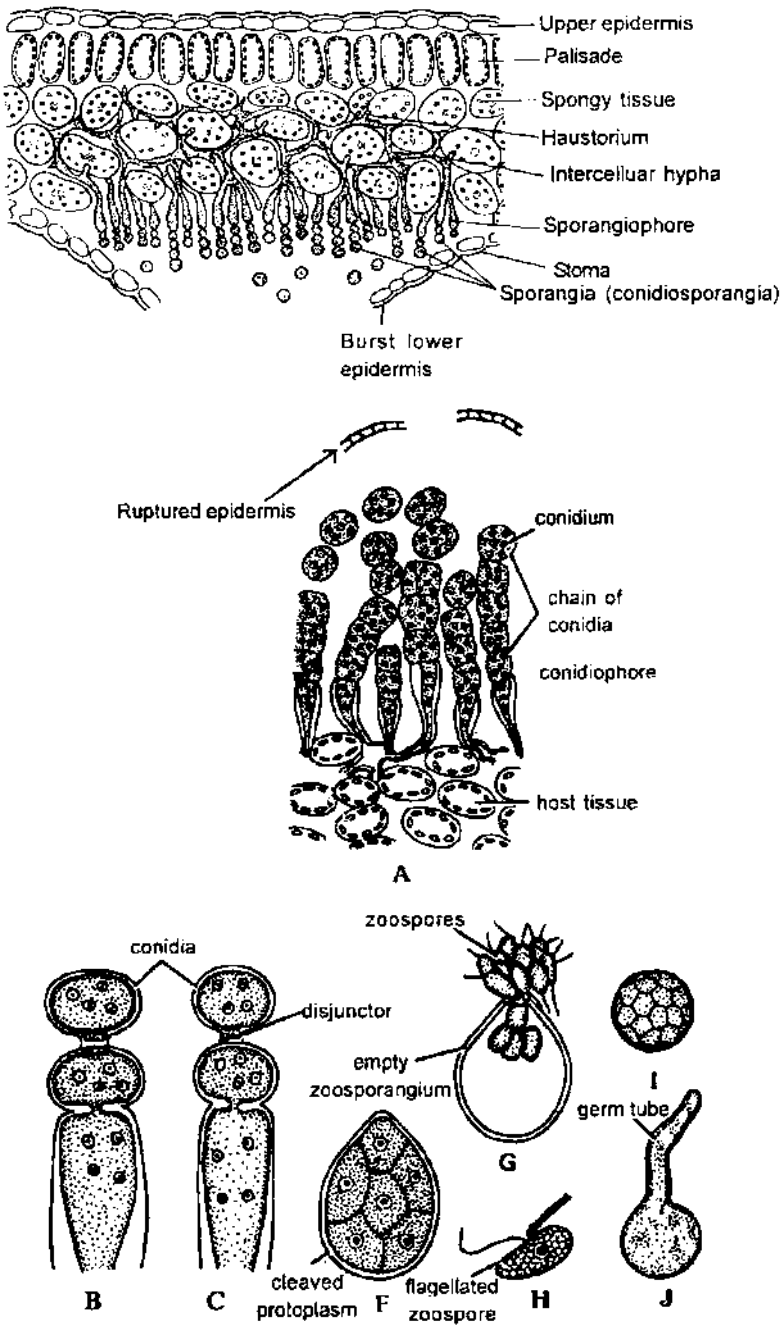
STRUCTURE OF HAUSTORIUM

REPRODUCTION

- **Holocarpic fungus : -** Where whole mycelium is utilized in the formation of reproductive structures. e.g. **Yeast.**
- **Eucarpic fungus : -** Where whole mycelium is not utilized in the formation of reproductive structure. Only few part of mycelium used for the formation of reproductive structures. Example : - **Albugo, Rhizopus, Mucor**
- **Reproduction methods**
  (1) Asexual reproduction
  (2) Sexual reproduction

1. Asexual reproduction

- It takes place by **Conidia** formation**.**
- It is a type of sporangium or zoosporangium.
- Conidium is a smooth colourless, spherical, thin walled and **multinucleated structure,** in which **3-8** nuclei are present.
- The mycelium gives rise to **erect branching**. They are usually formed towards **lower epidermis**. They are called **Conidiophore**.
- Conidiophores are **unbranched** and **club shaped** structure. Thier cell wall of the apical region is thin.
- The thin walled apical region forms the chains of conidia by **constriction technique**.
- Conidia are developed in **basipetal** sequence. It means **newly** formed conidia are present at the **base of chain** and **old** large conidia are present at the **end** of the chain.
- A **gelatinous disc** is present in between the two conidia. It is called **disjunctor.**
- This disc helps, conidia to remain in a chain. The chains of conidia grow and press the lower **epidermis**.
- This causes epidermis to **bulge out** and appears in the form of **blisters**.
- Due to more pressure, the epidermis bursts. And these conidia are spread in the form of **white powder** on the surface of leaf.



ASEXUAL REPRODUCTION

A part of vertical section of infected leaf, B-C conidium, F. A conidium with cleaves protoplasm, G. Liberation of zoospores from sporangium, H. A zoospore, I-J Germination of zoospore.

DISPERSAL & GERMINATION

- Conidia are dispersed by **air**.
- Two different types of germination takes place in favourable conditions.

(i) Direct germination :

- It takes place at **high temperature** and **low humidity** in environment. eg. **Albugo bliti**
- Conidium absorbs some water which is present on the surface of the leaf. A **germ tube** comes out fom the conidium. This tube enters inside host tissues through stomata and form **intercellular mycelium.**

(ii) Indirect Germination :

- In the presence of **less temperature** approximately **10-15ºC** and **high moisture** in atmosphere, condium germinates by (After 2-3 hours of their dispersal) **zoospores** formation.
- Conidium absorbs more water and swell up and forms **3-8 zoospores**. These zoospores are enveloped by **vesicle**.
- These enveloped zoospores are ooze out then the vesicle dissolves and zoospores become free.
- Free zoospores swim in water for few minute and finally they reaches on the surface of host, then after withdraw their flagella and round off and secretes a wall around itself.
- Deflagellated zoospores with wall germinates through the germ tube. This germ tube enter into the host tissue through **stomata** or through the **teared epidermis** and form mycelium.

STRUCTURE OF ZOOSPORES

- Zoospores of Albugo are **uninucleated, reniform** or **bean shaped** and **biflagellated.**
- Flagella are located on the **lateral side** of zoospore which are **unequal** in length.
- Out of them small the hairy flagellum is called **Tinsel or Pantonematic or Flimmergersal**.
- Another long and smooth flagellum is called **whiplash or Acronematic or peitgersal flagellum.**

(i) Monoplanetic Generation : - Only primary zoospores are formed.

(ii) Polyplanetic Generation : - In which many generation of zoospores are formed, like primary, secondary and tertiary zoospores are formed. (during high availability of water)

2. Sexual reproduction

- Sexual reproduction is **oogamous** type.
- Male and female sex organs are known as **antheridium** and **oogonium** respectively.
- In **A. candida** the sex organs are generally formed towards the **end of the growing season** of the host.
- Reproductive organs are **endogenous**. They develop in intercellular spaces, quite deep into the host tissues.
- Their presence is externally indicated by **hypertrophy** and **deformation** of the organ.

(i) Antheridium : -

- The antheridium is an elongated, **club shaped** and **multinucleated** structure.
- A transverse septum is present in its basal region. It develop on male hypha which is placed very close to the oogonium.
- There are many **(6-12)** nuclei present in a young antheridium but mature antheridium has only one **functional nucleus.**

(ii) Oogonium :

- Oogonium is **globular** in shape. The cytoplasm of oogonium differentiated into two distinct regions.

(a) Peripheral cytoplasm or Outer cytoplasm : -

It is vacuolated, spongy and diffused. It is called **periplasm**.

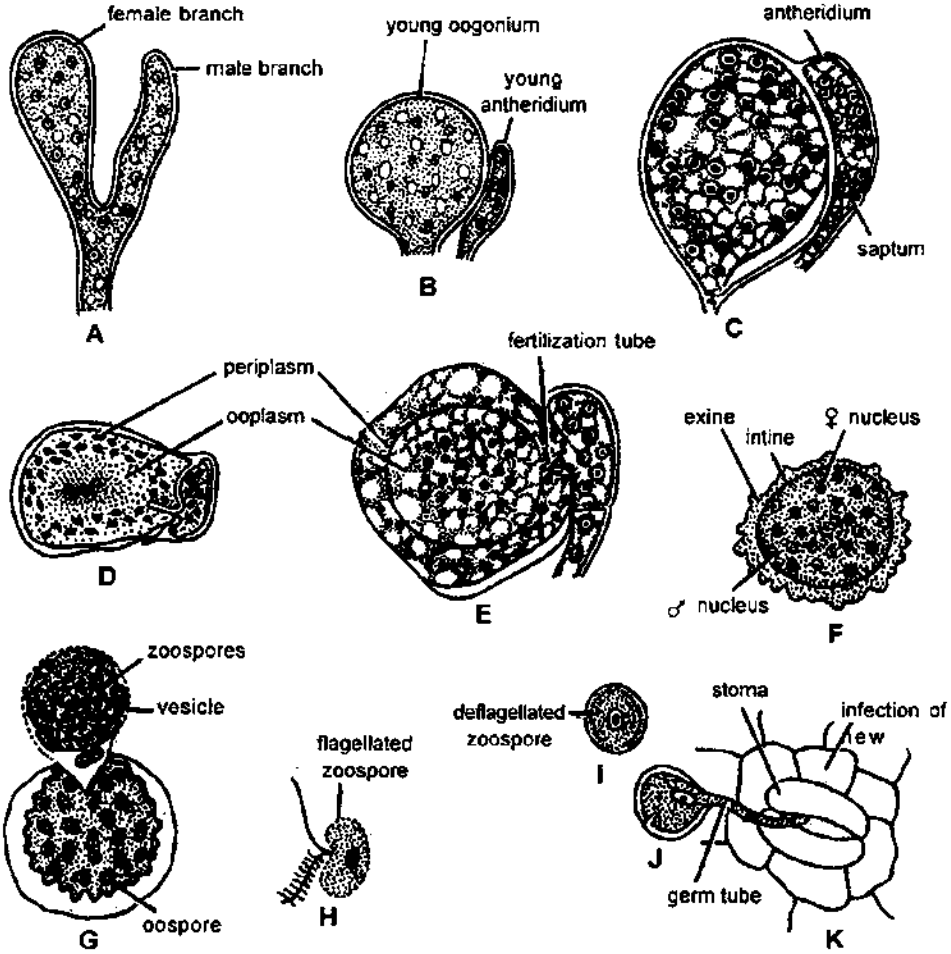
(b) Central cytoplasm : -

- It is dense. It is known as **ooplasm**.
- Both Ooplasm and periplasm are **multinucleated** in the begining but only a **single nucleus** remains in the **ooplasm at maturity** and rest of nuclei are transfered into the periplasm.

- However, some workers believe that all nuclei in the ooplasm except one disintegrate.
- A single nucleus present in the ooplasm is called **female nucleus** or **oosphere.**
- The oogonium of **A.bliti, A.portulacae** contains many female nuclei or oospheres.

Note :

- Antheridium and oogonium develops very close in the mycelium.



SEXUAL REPRODUCTION

A-C. Development of antheridium and oogonium, D-E. Fertilization,
F. Oospore, G. Gemination of oospore, H. Zoospores, I-K. Germination of zoospore.

FERTILIZATION

- A samll **protuberance** develpos from oogonium towards the antheridium. The wall of the antheridium and oogonium become thin at the region of their contact.
- This out growth stimulate the antheridium for fertilization. The inner wall of stimulated antheridium produces **fertilization tube** which enter into the oogonium and grows until reaches the oosphere.
- The terminal end of fertilization tube burst and introduces a **single nucleus** along with some cytoplasm.
- Male nucleus fuses with the female nucleus and results in the formation of **diploid nucleus**. Now it is known as **zygote**.
- Prior to fertilization a mass of protoplast is found in ooplasm. It is called **coenocentrum.** Which is formed by granular cytoplasm.

- After the fertilization, zygote secretes a thick **tri layered** wall around it self and now it is called **oospore** (2N).
- In oospore there occur **free nuclear divisions** and **32-nuclei** are formed in oospore (According to modern mycologists).
- According to **old mycologists,** the diploid nucleus of the oospore divide first by a **meiotic** division, followed by several **mitotic divisions** resulting in the formation of about **32 nuclei** in oospore.
- Oospore with **32 nuclei** is the resting stage of **Albugo**.
- In this stage it lives on dry branches in the absence of host.
- On returns of favourable conditions the 32 nuclei of oospore undergoes repeated divisions to form 100 or more nuclei.
- 100 or more zoospores are formed from these nuclei. The zoospores are released/liberated with vesicle by the rupturing of outer thick wall of oospore (formed by inner wall of oospore).
- These zoospores are coming in contact with a **suitable host** (seedling plants) settle down on the host and infect them.
- The initial stage of the disease during the growth period is called **primary infection** and it takes place through the **soil born oospores**.

POINT TO BE REMEMBERED

- According to **Stevens** all the structures of Albugo are **diploid except gamete.**
- According to **Sansome** and **Sansome** meiosis division takes place at the time of gamete formation i.e. **gametic meiosis** found in Albugo. In Albugo meiosis not takes place in **oospore.**

CONTROL OF WHITE-RUST DISEASE

1. **By crop rotation : -** Primary infection can be checked through the growing of crops one after another crops. This is the best method to control the white – rust.
2. By removal of infected plants from the field. Through this it can be eradicated.
3. **By application of fungicides –** Such as – **Bordeaux** mixture. It is composed of

   $CuSO_4$ + Lime water

   (1 : 1)

- Through the **sulphur dust** etc.
- In the absence of host **Albugo** grows on another plant **(Cleome viscosa)**. This plant grows as weeds.

Some species of Albugo : -

- **Albugo oxidental –** Infects Spinach
- **ipomoeae –** Infects sweet potato
- **bliti –** Infects Amanranthaceae family plants.
- **portulacae –** Infects portulaca plant.
- **tregopogosis –** Infects compositae family plants. eg. **Eclipta alba**

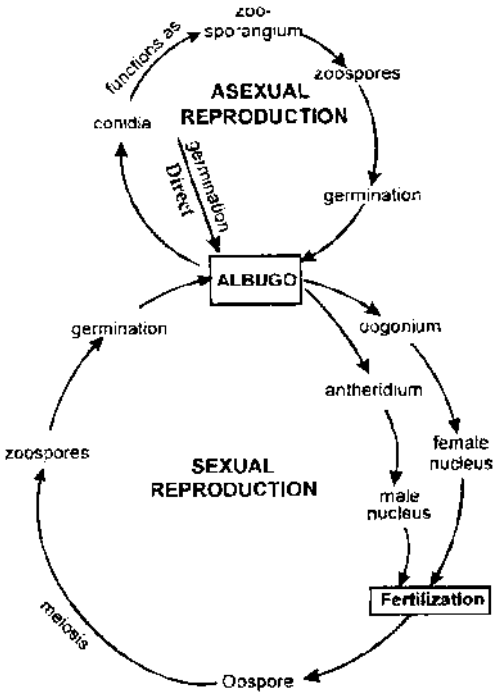
Note :

- Albugo never infects the undergound parts of the plants such as roots.
- It infects only aerial parts of the plants.

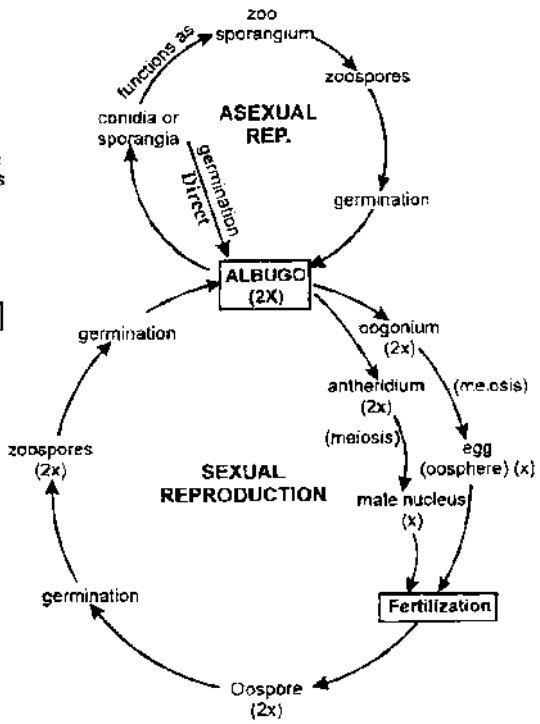
- An excessive enlargement of diseased organ due to an **excessive enlargement of cells,** called **hypertrophy.**
- **Albugo** is **autoecious** fungus. It means its whole life cycle complete in **single host**.
- **Heteroecious fungus :** - Fungus which complete their life cycle in **two different hosts**.
  Example : - **Puccinia, Primary host** – Wheat, **Secondary host** – Berberis

LIFE CYCLE

Diplontic type (according to **modern mycologists**)/ **Haplontic** (According to **old mycologists**)



LIFE CYCLE OF ALBUGO
(ACCORDING TO OLD MYCOLOGISTS)



LIFE CYCLE OF ALBUGO
(ACCORDING TO MODERN MYCOLOGISTS)

SELAGINELLA

SYSTEMATIC POSITION

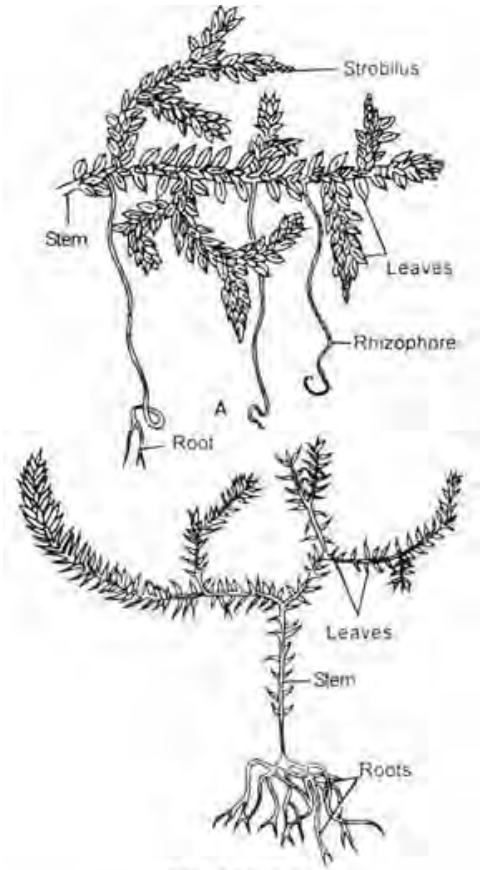
Kingdom	–	Plantae
Subkingdom	–	Embryophyta
Division	–	Tracheophyta
Sub Division	–	Ligulopsida
Class	–	Lycopsida/Lycopodineae
Order	–	Selaginellales
Family	–	Selaginellaceae
Genus	–	Selaginella

Note : Common name – [Little club moss or **spike moss]**

HABITAT & HABIT

- Mostly species are found in tropical rain forest
- The common Indian species are ***Selaginella kraussina, S. pallidissima*** and ***S.oregana*** etc.
- About 70 species are present in India.
- ***S. Oregana*** occurs on the **tree trunk** as **epiphyte**.
- ***S. pilifera, S. rupesteris*** and ***S. lepidophylla*** are the common **xerophytic species** and are called **resurrection plant.**

Note : Xerophytic species of selaginella show cespitose habit. They become ball like during dry season and again become green and fresh when moisture is available. So these are called resurrection plants. ***Selaginella bryopteris*** is known as **"Sanjivani Plant".**



SELAGINELLA
(A) S. Kraussiana, (B) S. Selaginoides

EXTERNAL MORPHOLOGY

- The selaginella is a **evergreen** delicate generally **perennial herb** (annual species **eg. *S. pygmea*** and ***S. gracilima***)
- Main plant body is sporophyte.
- Plant body is distinguished into three parts **Root, Stem and Leaves. Rhizophore** also found in some species.
- **Climber : *S. alligans*** (They possess special **discoid pads** on their **rhizophore for** climbing)

ROOT :

Primary root are **ephemeral** and the adult plant has **adventitious roots. Root hairs are unicellular.**

- These are branched with root hairs.

STEM :

Stem is green and cylindrical. Stem is prostrate and laterally branched (in some species) and **erect** and **dichotomously branched**.

- **Adventitious roots** arise from the **stem** and stem is covered by leaves.

- A structure arise from the dichotomous [bifurcation] point of stem which is colourless without chlorophyll, cylindrical, rootcap less and elongated is called **Rhizophore**

Morphological nature of Rhizophore :

- Rhizophore arises from the **dichotomous point** of stem. It is **Non-chlorophyllous colourless,** long **cylindrical** and **thread like** structure. Rhizophore term given by **Nageli.**
- It grows toward the soil and it is bifurcated. It provides **support** to the plant and help in **absorption** of **water** and **minerals.**
- Morphological nature of the Rhizophore of selaginella is still in question. The following three views about its possible nature are–

(a) Rhizophore is a Root cap less root - According to **Van Tieghem, Harvey Gibson** "rhizophore is a root cap less root" because-

(1) It is **positively geotropic** in nature
(2) It is leafless
(3) Rhizophore is monosteleic like root.

(b) Rhizophore is leafless shoot – **Pfeffer , Treub** and **Cusick, Bruchmann** etc regards rhizophore a leafless shoot because-

(1) Absence of root cap
(2) Absence of root hair
(3) It arises from bifurcation point of stem
(4) It is **exogenous** in origin

(c) Rhizophore is a newly formed organ – According to **Goebel** and **Bowe**r the rhizophore is neither shoot nor a root but organ **sui-generies.**

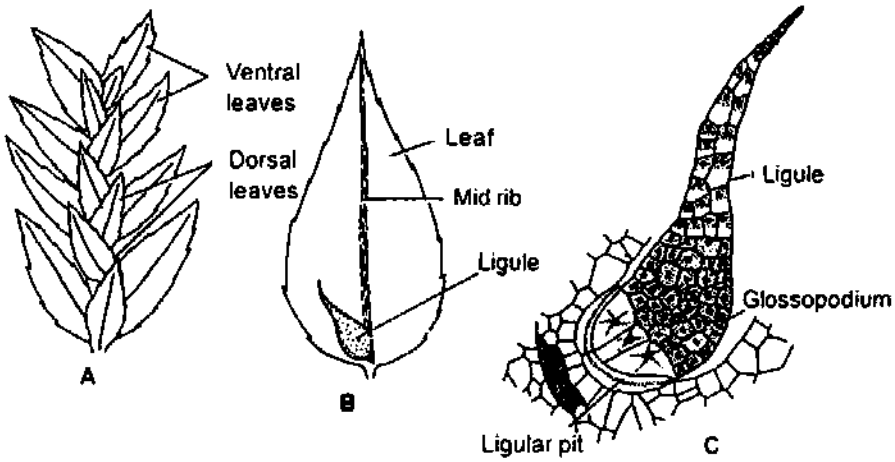
LEAVES :

The leaves of selaginella are **microphyllous**, **sessile** and **simple**. Their shape varies from ovate to lanceolate. The leaves are mostly **Amphistomatic** (Exception ***S. martensii*-Hypostomatic**)

- The vegetative leaf as well as sporophyll has a small, membranous projection on its **adaxial (upper)** surface, close to the base. This projection is known as **ligule**.
- The basal part of the ligule has a distinct **hemispherical** foot-like structure, called **glossopodium**. The ligule is embedded at the base of the leaf in a **pit-like structure** known as **ligular pit**.
- Leaves are **dimorphic** or **Heterophyllum**. The **megaphylls** are develop from **ventral/Abaxial/ lower surface** of the stem and **microphylls** develop from **dorsal/adaxial/upper surface** of the stem.
- *S.spinulosa, S.rupestris, S.pygmea* and *S.oregana* have monomorphic leaves.

Function of ligule :

- According to some scientists ligules are **associated** with water **absorption** and **secretion** and thus prevent **dessication of the shoot**.
- Ligules are concerned with **upward movement of inorganic solutes.**

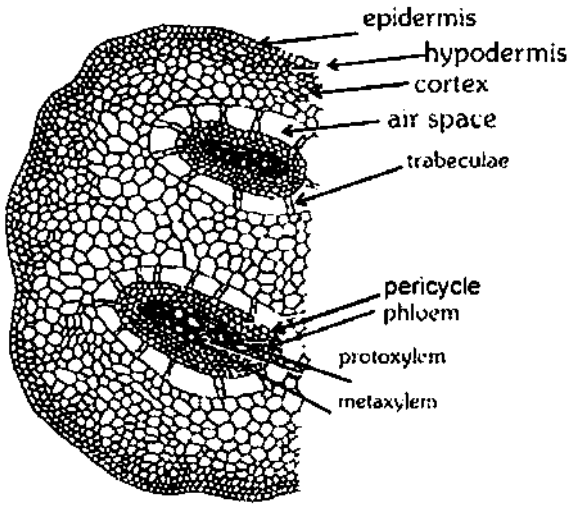


SELAGINELLA

A. Branch B. Leaf with Ligule, C. L.S. of Ligule

Special Point :

1. In ***Selaginella selaginoides*** stem protostele (haplostele) is present & mesarch condition found in vascular bundles
2. In **selaginella** stem, the metaxylem tracheids show **sclariform thickenings** and the protoxylem tracheids have **annular** thickenings.
3. A distinctive feature of selaginella stem is the presence of radially elongated endodermal cells, called trabeculae. Between these cells large intercellular spaces are present.
4. **Trabeculae** are absent in the **stem of xerophytic** species of selaginella.
5. In selaginella stem xylem usually **monarch** (*S. kraussina*) or **diarch** (*S.chrysocaulos, S. oregana*) and **exarch** (mesarch in *S. selaginoides*)



T.S OF SELAGINELLA STEM

REPRODUCTION

- The sporophyte of Selaginella reproduces **vegetatively** and by **spores**.

1. Vegetative Reproduction : It is rare in selaginella. Its occurs by following method.

1. Fragmentation
2. Resting Bud
3. Tuber
4. Apogamy

1. **Fragmentation :** It occur during moist condition.
   In ***S. rupestris***, prostrate branches produce roots during favourable conditions. These root bearing prostrate branches separate from the parent plant and grow in to new sporophytes.
2. **Resting Bud :** Terminal leaves overlapped to each other and become fleshy.
   They form resting bud. They are formed for vegetative reproduction. eg., ***Selaginella chrysocaulos.***
3. **By Tuber :** Subterranean branches of ***S.chrysorhizos*** enters in substratum. Their terminal and swollen end form tuber. During favourable condition they form new plant.

- In S. chrysocaulos aerial branch form tuber.

4. **Apogamy :** Sometime gametophyte directly develops in sporophyte. These sporophyte are haploid.

- In ***S.chrysocaulos*** and ***S.chrysorhizos,*** vegetative reproduction is occur through bulbils also.

2. Reproduction by spores

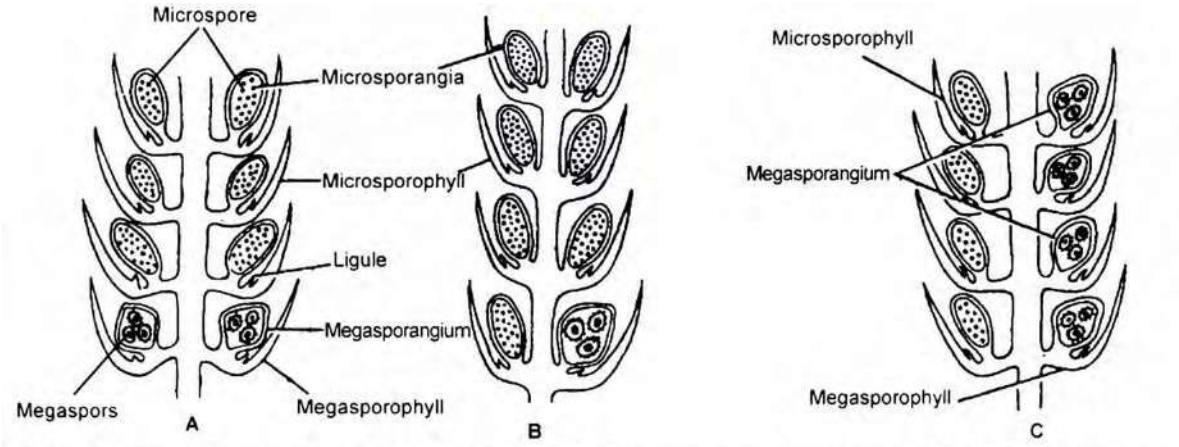
- Selaginella is a **heterosporous** Plant. It produces two types of spores – **megaspores** and **microspores**.

(i) Strobilus or cone –

- In most of the species of Selaginella sporophylls are aggregated at the apex of the main stem or lateral branch and forms compact cones, called **strobili. (Singular - strobilus)**
- The sporophylls are spirally arranged around a central axis.
- The sporangia are borne singly in the axils of **sporophylls.** The sporophyll bearing micro-sporangium is called **microsporophyll.**
- The sporangia are strictly **dimorphic.**
- There are many microspores in a microsporangium but a megasporangium usually has 4 megaspores.
- The **megaspores** form **female gametophytes** on germination and the **microspores** give rise to **male gametophytes.**

(ii) Distribution of micro and megasporangia in strobilus

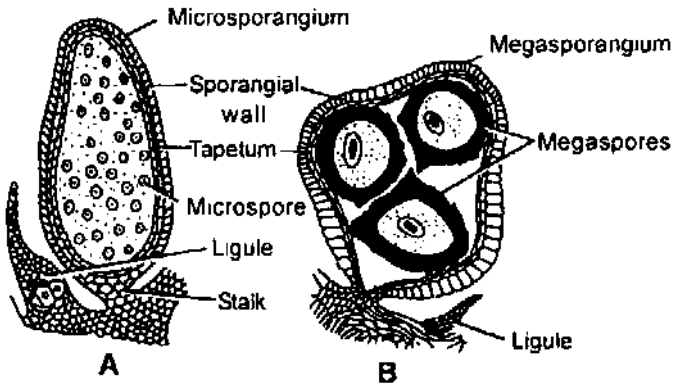
- In most of the species of Selaginella both micro and megasporangia are found within the same strobilus.



A-C. L.S of Selaginella Strobilus : Distribution of Sporophyll in different species of Selaginella
(A) S.rupestris, S. selaginoides and S. helvatica (B) S. kraussiana (C) S. inaequalifolia

- **DEVELOPMENT OF SPORANGIUM** (Eusporangiate type)

(a) Microsporogenesis : Each microspore mother cell divide meiotically to form haploid tetrad sproes in large numbers [**128 or 256**]



A. V.S. Microsporangium,
B. V.S Megasporangium

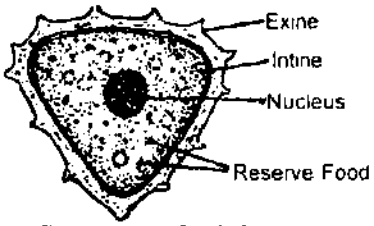
(b) Megasporogenesis:

- All the cells of megasporangium are degenerate except only one **sporocyte**.
- This functional cells is called **megaspore mother cell**. This cell divide meiotically to form **four megaspores**.
- ***S. monospora*** & ***S. rupestris*** bears only **single megaspore** in megasporangium.

• MICROSPORES AND DEVELOPMENT OF MALE GAMETOPHYTE:

1. Microspore :

- The microspores are small spherical structures, ranging **0.015-0.06 mm** in **diameter**. A microspore is surrounded by a thick ornamented exine and a relatively thin **intine**.
- The spore has a single **haploid nucleus** and **granular cytoplasm,** rich in fatty substances (about **35 %**) and **chlorophyll** absent.



Structure of a Microspore

2. Development of male gametophyte :

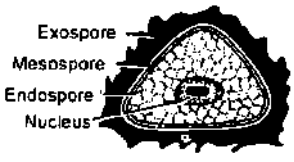
- The microspore germinate **inside the microsporangium** and shed from the microsporangium at **13-celled stage.**
- The first division of the microspore is **asymmetrical** and as a result a small lenticular **prothallial cell** and a large **antheridial initial** is established. The prothallial cell does not divide further.
- The first division of the antheridial initial is nearly at right angles to the prothallial cell. It result in the formation of two **antheridial cells** of almost equal size. Both these cells divide by a vertical wall (at right angles to the first vertical division). Thus, at this stage the gametophyte consists of five cells (**four cells** derived from the antheridial initial and **a prothallial cell**). The two basal cells, derived from the antheridial initial, do not divide further, whereas the upper two daughter cells divide repeatedly and form ten cells. At this stage the gametophytes has **13 cells**. Of these, four central cells function as **primary androgonial cells** and eight peripheral cells function as **jacket cells.**
- The male gametophyte **shed** from the microsporangium at **13-celled** stage. (**1**- prothallial cell, **4**- primary androgonial cells and **8**- jacket cells)
- The **four** central primary androgonial cells of the male gametophyte divide repeatedly forming a mass of **128-256 antherozoid mother cells** or **androcytes.** Each androcyte by **metamorphosis** converts into **a spindle-shaped/comma shaped biflagellate** antherozoid.
- With the formation of antherozoids, the jacket cells decompose and form a **mucilaginous** substance. The antherozoids float in this substance. Until this stage the male gametophyte is completely enclosed within the wall of the microspore. **The gametophyte is not set free and is dependent on the parent sporophyte for nutrition.**

Note :

1. Unlike other pteridophytes, vegetative prothallus are not formed in selaginella.
2. The **antherozoids of Selaginella** are the **smallest among the vascular plant.**
3. Development of gametophyte from spore start before dehiscence of spore, thus it is known as Precocious or In situ germination.

• MEGASPORE AND DEVELOPMENT OF FEMALE GAMETOPHYTE

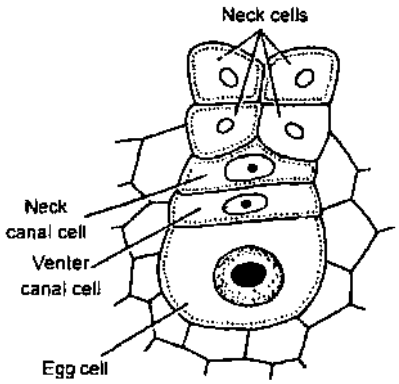
- Their diameter varies from **0.15** to **0.5** mm
- The megaspores are arranged in **tetrahedral tetrads.**
- The wall of the megaspore is differentiated into three distinct layer – the outer **exospore**, the middle **mesospore** and the inner **endospore**.
- The megaspore has a single haploid nucleus, surrounded by granular cytoplasm rich in fatty substances (about 48 %)



Megaspore

- The development of **female gametophyte** starts even when the megaspore remain present in the **megasporangium.**
- By repeated **free nuclear division** followed by cell wall formation female gametophyte is differentiated into upper region called **female prothallus** and lower region called **storage region** which are separated **by diaphragm**.
- A functional cell of the female prothallus acts as **archegonial initial.**

  Note : The mature archegonium of Selaginella has long neck (consisting of eight cells, in two tiers of four cell each), **a neck canal cell, a venter canal cell** and **an egg.**



V.S. of Mature Archegonium

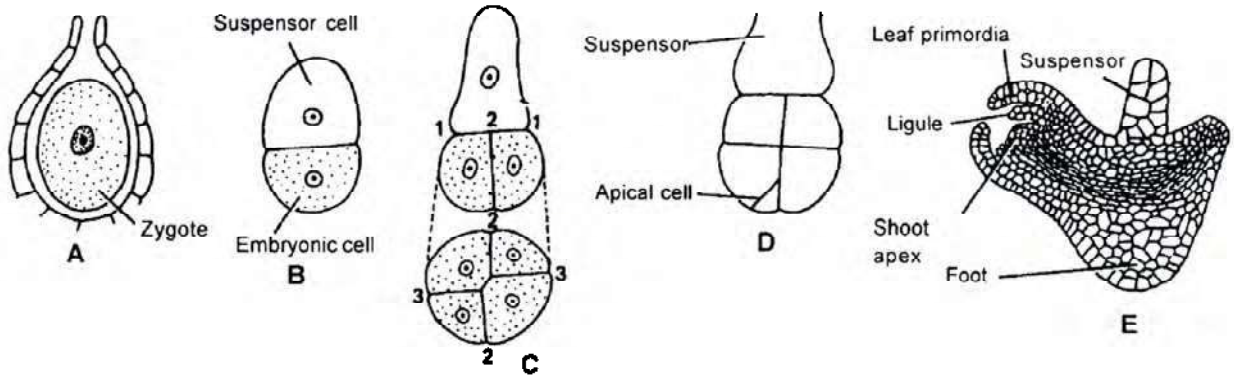
FERTILIZATION

- Fertilization usually takes after the female gametophyte has fallen in the soil but in some species (e.g. ***S. rupestris***) it may occur while the female gametophyte is still with in mega sporangium.
- **Water** is essential for fertilization. Just before the fertilization the neck and ventral canal cell disorganize and to form a **mucilage** which contain some **chemotactic** substances.
- Many **biflagellated antherozoids** enter into the neck of archegonium by chemotactic movement and one antherozoid fuse with the egg, resulting in the formation of **zygote**.

Note : In few species like ***S. rupestris*** archegonia are fertilized when enclosed in the **megasporangium** which is attached with spike hence approach towards the **seed habit** of Angiosperm. **Heterospory** is a **pre-requisite** condition for the **seed habit.**

EMBRYO DEVELOPMENT

- The diploid zygote is the mother cell of the sporophytic generation.
- It divides transversely, establishing an **epibasal** (upper) **suspensor cell** and a **hypobasal** (lower) **embryonic cell.** As development proceeds, the suspensor cell repeatedly divides to form a **suspensor,** which pushes the developing embryo **deep into the female gametophyte.**
- The rest of the embryo develops from the **embryonic** cell. It divides by **two vertical wall** at right angles to each other and thus a **four-celled** embryo is formed. In these, one cell divides by an **oblique vertical** wall and thus an **apical cell** with three **cutting faces** is established. This eventually functions as the **apical** cell of the **embryonic** shoot.

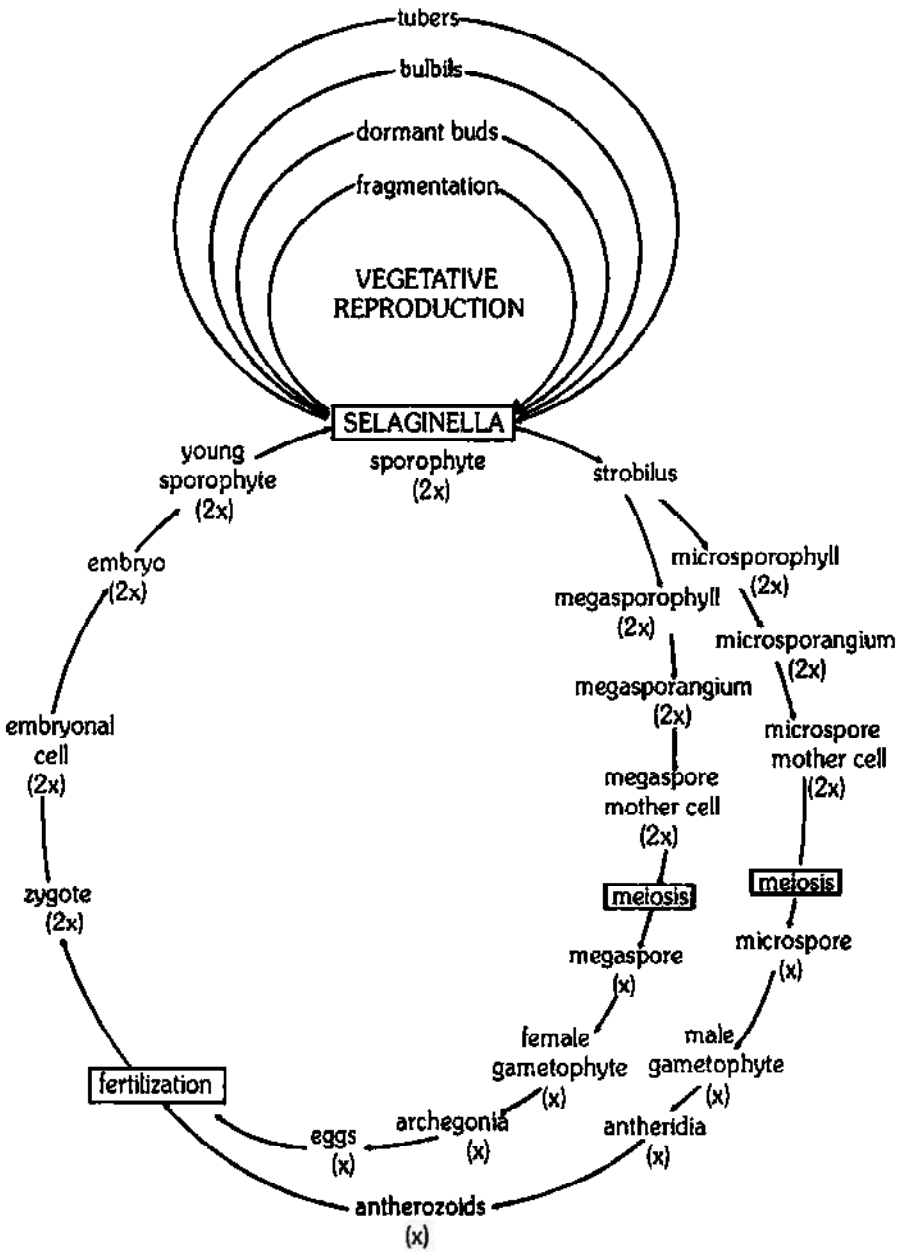


Stages in Embryo Development

- The remaining three cells of the 4-celled embryo and the **sister cell** of **the apical cell** divide **transversely** to form **two tiers** of four cells each.
- The cells of both the tiers divide irregularly, forming a multicellular embryo. Usually the cells of the lower tier divide more rapidly than the upper tier.

- The derivatives of the lower tier form the foot. The foot acts as a **haustorial organ;** its main function is to **absorb nutrition** for the **developing sporophyte** from the **female gametophyte**.
- Two cells of upper tier acts as apical cell of cotyledon and forms two ligulated cotyledon.
- The part of the embryo posterior to cotyledons develops into **hypocotyledonary part** of the stem. The stem grows with the help of the apical cell of the embryo.
- After the formation of **cotyledons** and **stem,** the apical cell of the root differentiates on the lateral surface of the foot. The derivatives of this cell develop into a root-like structure, called **rhizophore.** Roots, infact, develop at the apex of the rhizophore.
- In **early stages of development** the **young sporophyte** is attached to the **megaspore** and derives its food from the female gametophyte with the help of its foot. But after the establishment of root and stem, the sporophyte becomes **independent.**

LIFE CYCLE : DIPLO-HAPLONTIC



Life Cycle (Schematic Representation)

Note :

1. Selaginella is the only living genus in selaginellaceae family.
2. In ***S.intermedia***, microspore is not formed, embryo develops **parthenogenetically.**
3. Stele of Rhizophore and root is **monarch** and **exarch**
4. **Distele** is found in stem of ***S.christina***
5. **Meroblastic development** takes place in embryo of selaginella
6. Lycopodium is called **"Botanical snakes"** or **snakes of plant kingdom.**
7. **Cyathea, Dicksonia** & **Alsophila** are peculiar fern having tree habit.
8. **Rhynia** is a **fossil pteridophyte**
9. **Telome theory** for origin of plant body in pteridophyte was proposed by **Zimmerman**
10. Ovule absent in all Pteridophyte.
11. **Adiantum** is called **"Walking fern"** or **"Maiden hair fern"** and **chelanthum** is called **"Silver fern"**
12. Development of sporangium of selaginella is **"eusporangiate"**
13. Xerophytic species of **Selaginella** (e.g. **S. rupestris**) called as "Bird's nest moss".
14. When two different sex organs are born in different group but on the same head this condition is called **paroicous**.
15. In ***S. selaginoides*** the **parenchymatous** cells of the **cortex** show **mycorrhizal association.**
16. In **Rhizophore** of ***S.Kraussiana*** the xylem is **centrifugal.**
17. In leaves of selaginella stomata are distributed mostly in the **midrib region**. A **mesophyll cell** has **1-8 cup shaped chloroplast,** which have many **spindle shaped pyrenoid** like bodies.
18. Selaginella, Marsillia, Isoetes, Salvinia, Azolla etc. are heterosporous plant.

PTERIDIUM (MONOTYPIC GENUS)

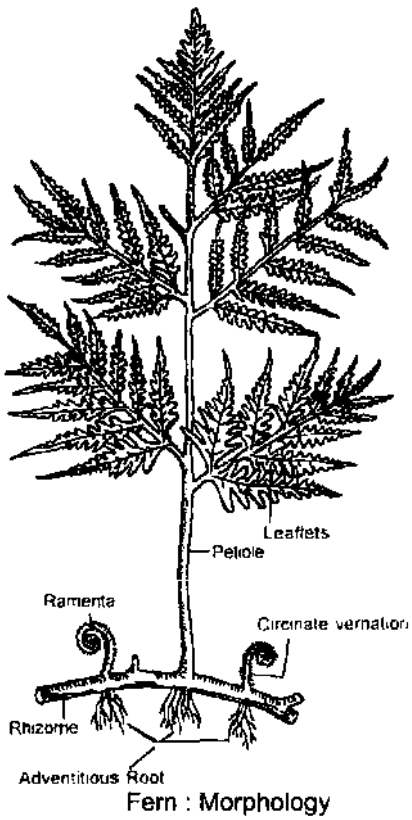
SYSTEMATIC POSITION

Kingdom	–	Plantae
Sub Kingdom	–	Embryophyta
Division	–	Tracheophyta
Class	–	Pteropsida
Sub Class	–	Filicineae
Order	–	Filicales
Family	–	Polypodiaceae
Genus	–	Pteridium
Species	–	Aquilinum

Common name – " Sun Fern" or "Bracken Fern"

HABIT AND HABITAT

- Ferns are commonly grow in **moist** and **shady** places. This is present throughout world except South America and Antarctica.
- They shows '**gregarious**' habit. This habit is due to **vegetative reproduction.**
- It can be grown in the presence of **less moisture** and **high light,** so it is called **"Sun fern**". It is xerophytic plant. It is pioneer plant after forest fire.



Fern : Morphology

EXTERNAL MORPHOLOGY

- The plant body of Pteridium is **sporophytic** and it is differentiated in **root, stem** and **leaves**. Root and stem are underground and leaves are aerial. Plants are **perennial.**

I. ROOT :

- The primary root is short lived. It is soon replaced by **adventitious** roots which develop from the **rhizome** in **Acropetal** manner.
- The adventitious root are thin, small, soft and less branched.
- They are endogenous in origin

II. STEM (Rhizome)

- The stem of fern is **underground rhizome**.
- Rhizome grows **horizontally** in the soil. The main stem is **dichotomously** branched.
- The young rhizome particularly covered by multicellular brown hairs called as **ramenta.**

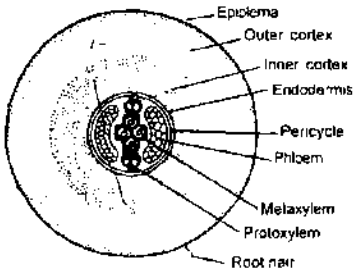
III. LEAVES :

- Pteridium is a **megaphyllous** plant. It's large leaf is known as '**frond**'. leaves are borne only on small branches

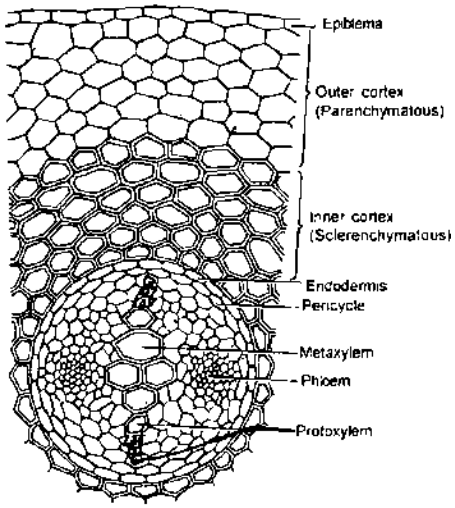
- The leaves may be 2-12 feet long (height) and in each leaf, the petiole and lamina are almost equal in length. They are developed on rhizome in **alternate** manner.
- Leaf lamina is divided into number of **leaflets.** The leaves are **compound, bipinnate and imparipinnate.**
- The young leaf shows typically **open furcate venation.** (The bifurcation of veinlets without attachment, at the anterior end is called open furcate venation).
- In these leves, the young leaves of Pteridium are curled. **Circinate ptyxis"** is found. Each young leaf open from the base to apex. Ramenta are also present on young leaves.

INTERNAL STRUCTURE OF ROOT

- In the transverse section the root appears approximately like a dicotyledons root.
- The outermost layer is called **epiblema.** It possesses unicellular root hairs.
- Below the epiblema there is broad cortex is present which is differentiated into two zones.
- **Outer cortex** which is made up of **parenchymatous** cells.
- **Inner cortex** which is composed of **Sclerenchymatous** cells.
- In the centre a stele is present which is surrounded by single layered **endodermis**. Below the endodermis **pericycle** is present which is **one** or **two** layered and medeup of thin walled **parenchymatous** cells.
- The **stele** is **diarch** with two xylem bundles alternating with two pholem bundles.
  The xylem is **exarch** in position. The xylem is without vessels and phloem lacks **companion cells.**
  Secondary growth is absent in fern roots.



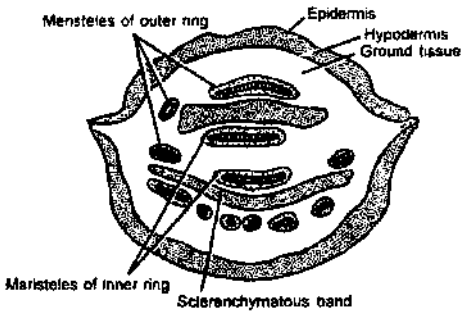
(Pteridium : T.S. of Root Internal Structure)



(Pteridium : T.S. of Root-Out line diagram)

INTERNAL STRUCTURE OF RHIZOME :

- In a transverse section the rhizome of **Pteridium** appears somewhat **oblong** being flattened dorsiventrally
- The outer layer is termed as **epidermis**. Inside the epidermis, three-four layers of **sclerenchymatous hypodermis** is present. which is **broken** at **two** ends (Points). At these points, the parenchymatous cells of ground tissues reaches directly up to the epidermis.
- Hypodermis is followed by parenchymatous **ground tissues** in which two rings of **meristeles** are present. The stele is **polycylic dictyostele** or **polystele** or Dictyostele type.
- Both the rings of meristele are separated by **two plates** of **sclerenchyma** in dorsiventral position.



T.S. of Rhizome

- The meristeles of outer ring are smaller in size and more in number, while there are two or three large meristeles are present in inner ring .

MERISTELE :

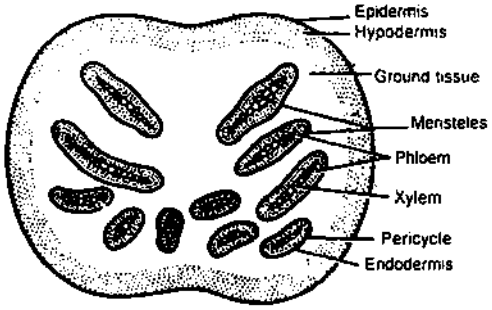
- Each meristele is surrounded by a single layered endodermis.
- Below the endodermis one or two layered parenchymatous pericycle is present.
- Xylem forms the central core of the meristele, which is **Mesarch** in position i.e. protoxylem is surrounded by metaxylem.
- Vessels in xylem and companion cells in phloem are absent.
- In meristeles vascular bundles are **concentric** and **amphicribral** or **hadrocentric type.**
- Pseudo vessels are formed due to disintegration of septum from meta xylem tracheids.
- Meristele is a complete stele because it has its own pericycle, endodermis, Xylem and phloem.
- **Secondary growth is absent in rhizome due to absence of vascular cambium.**

INTERNAL STRUCTURE OF LEAF :

It is differentiated into rachis and leaflet (pinnules).

(1) Rachis : In a transverse section the young rachis is hemispherical in shape.

- The outermost layer is **epidermis.**
- Below the epidermis a few layers of thick walled cells forms the **sclerenchymatous** hypodermis.
- Many meristele are arranged in the mature rachis of **Pteridium** in **horse-shoe shaped**.

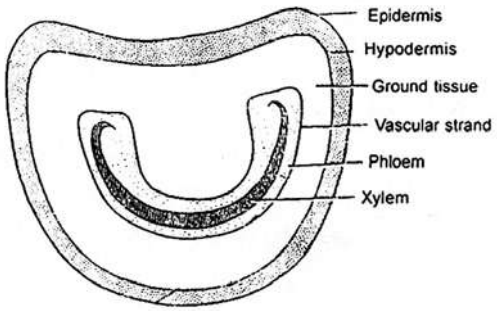


Internal Structure of Mature Rachis

- In each meristeles vascular bundles are **concentric, amphicribral** and **mesarch.**

(2) Leaflet pinnules :

- Mesophyll is present between two epidermal layers and mesophyll differentiated into palisade and spongy tissue.
- The stomata are present on lower epidermis.
- The epidermal cells of leaflet also bears **chloroplast. Concentric** vascular bundles are present in **Pteridium** leaflets.



T.S. OF YOUNG RACHIS

Note :

1. In **Dryopteris leaf,** mesophyll is not differentiated into palisade and spongy tissue.
2. In **Dryopteris** leaf **bicollateral** vascular bundle are found in **large veins** where as in **small veins collateral** vascular bundle are present.

REPRODUCTION

- Three different type of reproduction – **Vegetative, by spore formation and sexual,** are found in Pteridium.
- The main plant body represents sporophytic phase and reproduces by **vegetative** and **by spore formation.**
- **Sexual reproduction** only takes place in **gametophytic phase** i.e. in the **prothallus.**

1. VEGETATIVE REPRODUCTION :

(1) By death and decay method :

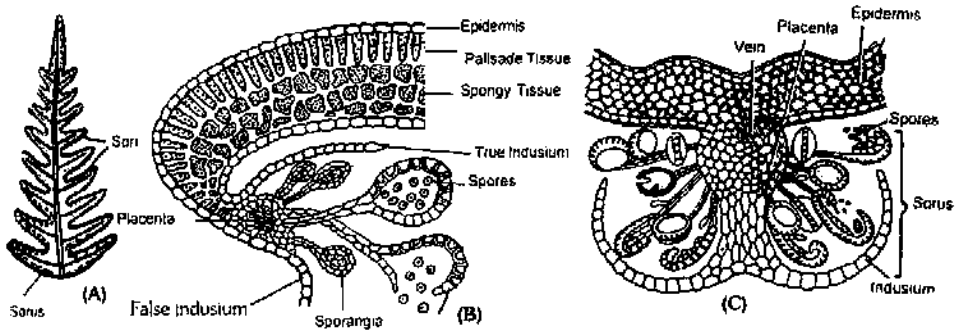
- Vegetative reproduction takes place through **rhizome in Pteridium and Dryopteris.**
- The rhizome is **dichotomously** branched and grows indefinitely. When the death and decay of rhizome reaches upto the point of dichotomy, both the branches are separate and each grows into a new plant.
- This method is responsible for the **gregarious habit** of plant.

(2) By adventitious buds : Sometimes a **bud** is formed in the axis of **persistent leaf base.** These buds separate and grow into a new plants

(3) By spore formation :

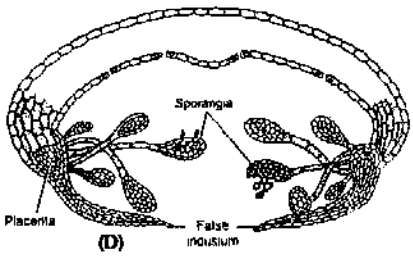
- The main plant body of **Pteridium** is **sporophytic** and **reproduces** by the **formation of spores.**
- The spores of pteridium are of one type and this condition is termed as **homospory**.
- **Leaflet / fronds** at maturity bears small, rounded, reniform, brown or black coloured spots called **sori**. Sori bearing fronds are called as **sporophyll.** The sporophylls of **Pteridium** are **photosynthetic** in nature.
- **Each Sorus** is protected by a covering sheath called **indusium** (bilipped) which may be true or false on the basis of origin.
- A **true indusium** (Inner and small) arise from the **placenta** whereas **false indusium** (outer and large) does not arise from the placenta but it is formed by **curved margin** of the **sporophyll.**
- The main function of **indusium** → Provide protection to sori (Singular – sorus).
- Each sorus bears large number of sporangia and each sporangium produce many spores.

Position and Form of Sori :



(B) V.S. of *Pteridium* Sporophyll Through sorus region

(C) V.S. of *Dryopteris* Sporophyll Through sorus region



(D) V.S. of *Pteris* Sporophyll Through sorus region

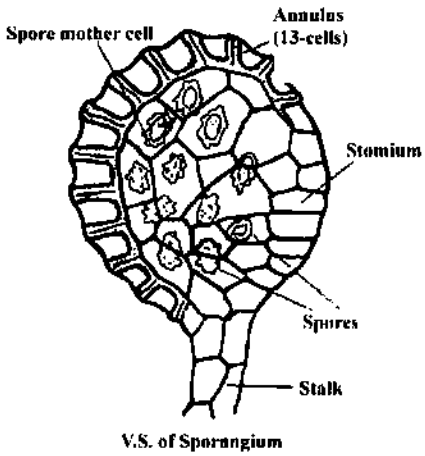
- Each sporangium develop on the **abaxial (Lower)** surface of the leaves
- These sporangia arises in the groups i.e. in the form of **sori.**
- These **sorus** develops continuous, linearly arranged along under the margin of leaves is termed as **continous linear sorus** or **coenosorus**
- Those sorus lies on the margin of sporophylls termed as **"marginal sorus"**

- Inner indusium is small and true and it is arises from the placenta.

Note :

1. First of all **Bower** studied the development of **sorus.**
2. Pteridum is a **laptosporangiate** type fern. It means each sporangium develops from a single initial cell.
3. In **Adiantum, Pteridium & Pteris** sori are marginal but in **Dryopteris** and **Nephrolepis,** sori are arranged in two rows, one of either side of mid rib/vein
4. In **Adiantum** and **Pteris** false indusium is found whereas in **Dryopteris** and **Nephrolepis**, true indusium is found

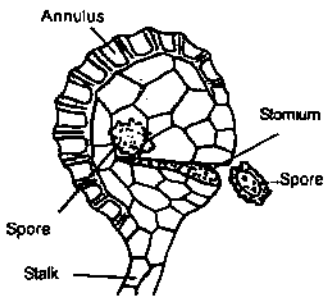
STRUCTURE OF SPORANGIUM



V.S. of Sporangium

- A sporangium has a long narrow, slender, multicellular **stalk** usually composed of **three vertical rows** of cells and a sporangial body or **capsule.**
- The capsule is **oval** or **biconvex (generally)**.
- The radial and inner walls of the cells of specialised row of jacket becomes heavily thickened while their outer tangential wall remains thin.
- These cells constitute the **"annulus"**. It starts from the base of the capsule on one side, run upwards curve on the other side and ceases almost near the middle.
- Annulus covers **3/4 part of the sporangium.** Below this, the cells of marginal row are thin walled and parenchymatous, consititute the **stomium**.
- The annulus and stomium together help in dispersal of spores and dehiscence of sporangium. Sporangium break at the place of stomium during dehiscence of sporangium.
- The cavity of capsule contain **8 or 16 spore mother cells** or **sporocyte** which is **diploid**.
- Spore mother cells divide meiotically to produce **32** or **64** haploid spores.

Dehiscence of sporangium :



Dehiscence of Sporangium

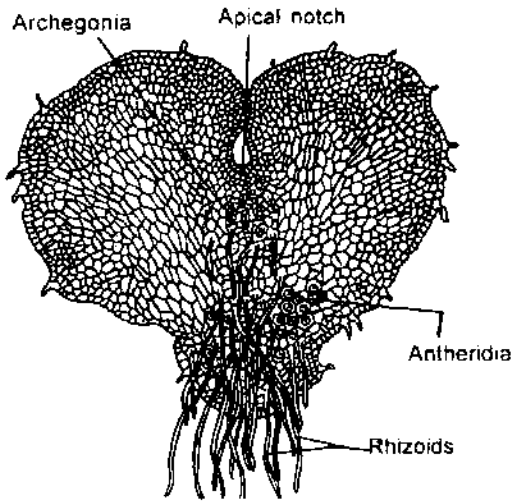
- Dehiscence of sporangium takes place in **dry season**. When the sporangium mature, the indusium dries and shrivels exposing the sporangia to dry air.
- In dry weather, the annulus Cells of the sporangial wall loose moisture, dries up and **shrink.** The radial and tangential walls of annulus are thick so they do not shrink or bend easily. But **outer wall** of **annulus** is mainly **thin** which curve **inwards** and becomes **concave**. This inwards curving of the thin walls exerts pulling force on **annulus** cells.
- Due to this **pulling force** (tension) thin cells of stomium tear up. So that a **fissure** once started from region of stomium and ultimately reaches up to the base of annulus on the opposite side of stomium.
- Due to the pulling force the **entire annulus** turns into the back side. Along the annulus most of the spores are attached. The space which is created by loss of water is filled **by air** and saturate. Because of this **pulling force** suddenly released from the annulus and annulus immediately comes in original position with a great force. The spores are attached on annulus, during this time, are thrown away. Dispersal of spores in **Pteridium** by **"Catapult mechanism"** (By annulus).

SPORES

- The gametophytic phage begins with the formation of spores which are **tetrahedral.**
- The spore wall or coat is usually two layered. **The outer layer** which is brown in colour called **exosporium** or **exine.** It is thick and ornamented. The inner layer is thin and delicate. It is termed as **endosporium** or **intine**.

Prothallus :

- Under the favourable conditions of moisture and temperature the spores germinates.
- A gametophyte plant prothallus is produced by germination of spore. Prothallus is a **heart shaped** structure
- The prothallus is thin, delicate flat short lived and **dorsiventral** structure. Initialy prothallus is uniseriate thick but later on maturity it become multiseriate.
- It is **independent** and **autotrophic**. It is free from the sporophytic generation. It is **unbranched**. Diameter of adult prothallus is **3-8 mm**.
- It grows prostrate on the soil. The middle region of the prothallus is thick and, thin towards the marginal side. An apical notch is present at the anterior end.



Ventral Surface of Pteridium Prothallus

- A apical cell is present in the apical notch, by which growth takes place in the prothallus. It is **nonvascular.** Unicellular and unbranched **rhizoids** are located on the ventral surface of the **prothallus.**
- They fix the prothallus with the substratum (soil). Sex-organs are developed on the ventral surface of the prothallus. Prothallus is **monoecious** which bears both sex organs –**Antheridia** and **Archegonia**
- Archegonia borne on prothallus near the apical notch, while the antheridia are developed in the posterior region in between the rhizoids.

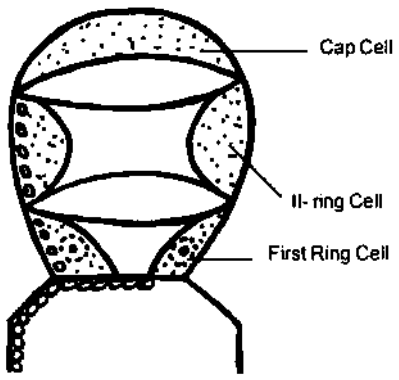
Main point

(i) Antheridia matures before the archegonia ie, prothallus is **protandrous.**

(ii) Always, cross fertilization takes place in **Pteridium (Heterothallism).**

ANTHERIDIUM :

- Antheridium of **Pteridium** is simpler than **Riccia**. The presence of antheridium is the primitive character.
- Antheridium of **Pteridium** is a small **sessile** spherical structure.
- The jacket of the antheridium is composed of three cells. The two cells of the jacket lying one above and the other forming the base.
- The lowest and middle cells are called **I-ring cell** and **II-ring cell,** respectively. The upper or apical cell is called **cap cell** or **operculum** forming the top portion of the jacket.



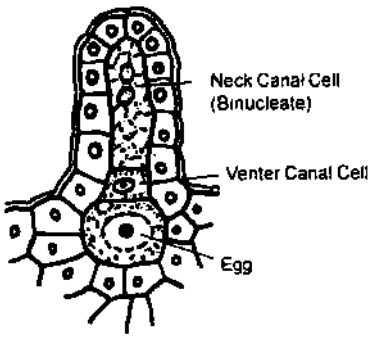
V.S. of Antheridium

- Inside the antheridium there are **20-50 androcytes** or **antherozoid mother cells** are present which are responsible to form **spirally coiled multiflagellate antherozoids.**

- Dehiscence of antheridium takes place in the presence of **water.**
- When the antheridium fully mature and water is available, its mucilage which is present in the cavity of antheridium, absorb moisture and swells up, resulting, the opening of the lid like cell at the top.
- The antherozoids liberated and after coming in contact with water, they swim freely.

Archegonium :

- Archegonium is a **flask-shaped sessile** structure. Its swollen venter embedded in the tissue of prothallus and short curved neck projecting above the prothallus. Jacket is only found in neck region. Jacket of neck region is made up of **four vertical rows** of neck cells.
- The venter has a large **ovum** or **egg** and a small **venter canal cell.**
- In the cavity of the neck there is a **single long neck canal cell** which is usually **binucleated**. **Cover cells are absent** at the apex of neck.



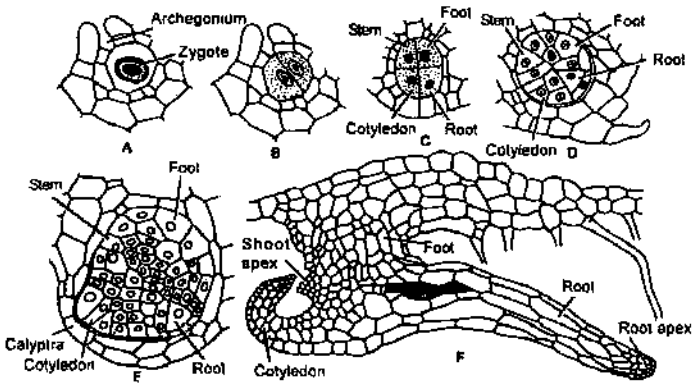
V.S. of Archegonium of Pteridium

FERTILIZATION

- Fertilization takes place in the **presence of water.**
- Just before the fertilization the **venter canal cell** and **neck canal cell** of the archegonium disintegrate forming a mucilagenous substance which absorbs moisture, resulting the opening of mouth of the neck.
- Some of the mucilage oozes out at the tip of the archegonium and attracts the antherozoids on account of certain organic substance like **malic acid** present in it.
- As a result of **chemotactic** response and lashing movement of cilia, some of the antherozoids enter the archegonium and ultimately one of them fuse with the egg. This fertilized egg is termed **oospore** or **zygote**.

Embryo and its development :

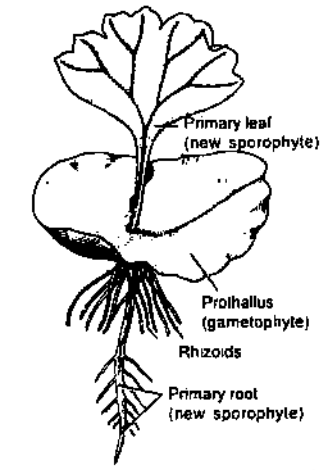
- Zygote (oospore) is the first cell of the sporophytic generation.
- The oospore **first divide** by a **vertical** division nearly parallel to the long axis of the archegonium, which divide the oospore into two half an **Anterior** or **epibasal** cell (lying the notch of prothallus) and posterior cell or hypobasal cell (lying towards the posterior end). Second division is also vertical but right angle to first one so that four-celled embryo is formed.



A. ZYGOTE, B-F STAGES IN THE DEVELOPMENT OF EMBRYO

- There are **two epibasal** or **anterior cells** and **two hypobasal** or **posterior** cells. This stage known as **quadrate stage.**
- Third division is **transverse** and therefore eight cells are formed. This is known as **octant stage.** Therefore, two **inferior hypobasal cells**, two **inferior epibasal** cells, two **superior epibasal cells** and two **superior hypobasal cells** are formed.

- The superior epibasal cells gives rise to **apical bud** of the stem.
- Both **inferior epibasal cells** give rise to **cotyledon.**
- Both the **superior hypobasal cells** giving rise to the **foot**. Foot is embedded in the prothallus and help in providing nourishment to the embryo. The young sporophyte depends upon **gametophyte**.
- Both the **inferior hypobasal** cells gives rise to radicle. The radicle grows first and pierce into the soil and form the **primary root.** Firstly, the primary root comes out from the prothallus but it is short lived. It soon dies and is replaced by **adventitious root** developed from the stem.
- The cotyledons and apical bud of stem comes out in air from the lower surface of the gametophyte. Plumule grows immediately to form an underground **rhizome.** Foot and prothallus dies later on.

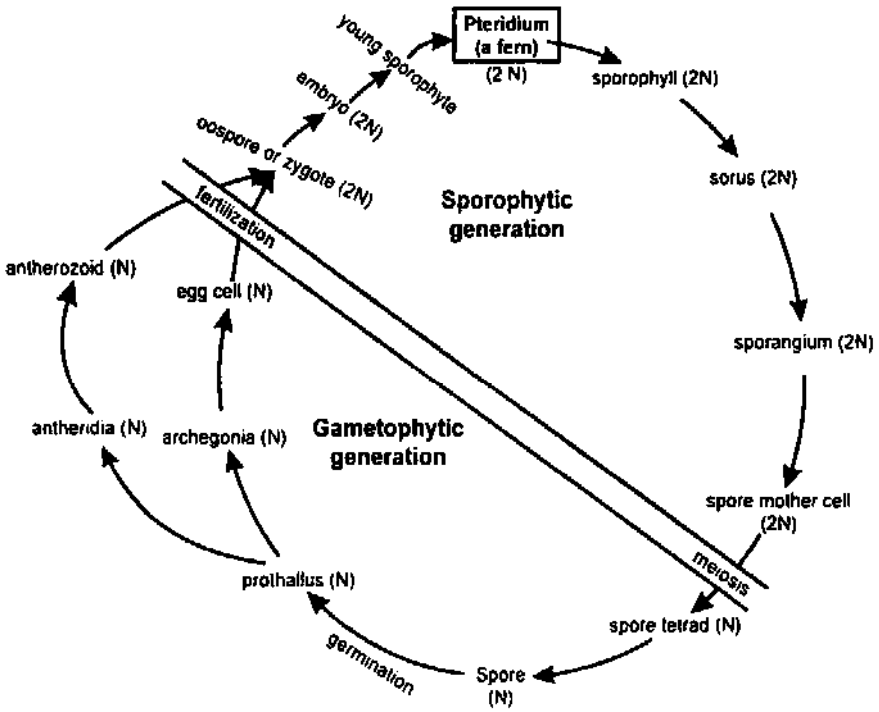


YOUNG SPOROPHYTE DEPENDS UPON GAMETOPHYTE

Note :

- **Lateral polarity** is exhibited by the embryo of **Pteridium.**
- The venter of the archegonium forms a protective covering, called calyptra, around the developing embryo. Its is haploid and part of gametophyte.
- **Primary leaves** are simple and lives for one year and later it dies off. Later on special leaves arises from the rhizome. New leaves are developed each year, new leaves are compound and pinnate.
- Old leaves left the **leaf base.** If **10** leaf base are present in **Dryopteris** then the age will be **11 years.** Because in first year plant bears simple leaves.

ALTERNATION OF GENERATION



LIFE CYCLE OF PTERIDIUM

- Independent alternation of generation is found in **Pteridium.**
- In its life cycle two independent phases are present. Out of them one is main plant which is sporophyte. This reproduce through spore formation.
- A haploid gametophyte plant body **prothallus** develops from the germination of spore.
- Gametophytic generation begins from the spores till the formation of the gametes.
- Sporophytic generation begins with **zygote or oospore** formation. Spore mother cells are last cell of sporophytic generation. Spore is the first cell of gametophytic generation.
- The life cycle of **Pteridium** is known as **Diplo-haplontic type.**

IMPORTANT POINTS

- **Dryopteris filix – mas :** Male shield fern / Beech fern / Hay scented fern.
- Sympodial branching found in **Pteridium** rhizome
  Branches are three types in pteridium.
  Long shoots, Short shoots, Intermediate shoot. Short shoots bear fronds.
- In **pteridium**, at the base of each leaf let a **nectary** is present
- Main feature of ferns :

1. Presentce of ramenta on young leaf and rhizome
2. Circinate ptyxis of young leaf.

- In Zygote / oospore of Pteridium and Dryopteris : Ist and IInd division are vertical but IIIrd is transverse.
- In **Dryopteris** & **Pteridium** roots are **Diarch**.
- In **Dryopteris** rhizome meristeles are arranged in **one ring** whereas in **Pteridium** rhizome meristeles are arranged in **two rings**.
- **Pteridium, Dryopteris, Psilotum, Equisetum** and **Nephrolepis** are **homosporous** plant.
- **Heteromorphic alternation of generation** is found in **Pteridium, Funaria** and **Dryopteris** etc.
- **Pteridium, Adiantum, Nephrolepis** (Sword fern) & **Dryopteris** etc are **leptosporangiate** fern.
- 
- **Megaphyllous pteridophytes** – With large pinnatified leaves having a complex series of vein. They form prominent leaf gaps in the stem stele.
  eg. **Pteris, Pteridium and Dryopteris.**
- Tapetum cells are present in sporangium of pteridium which provide nutrition to sporogenous mother cell. It is Diploid.

CYCAS

SYSTEMATIC POSITION

Kingdom	→	Plantae
Sub kingdom	→	Embryophyta
Division	→	Tracheophyta
Class	→	Gymnospermae
Subclass	→	Cycadophyta
Order	→	Cycadales
Family	→	Cycadaceae
Genus	→	**Cycas**

Common name : **Sago palm** or **palm fern.**

- Cycas is the most widely distributed genus of the order Cycadales. There are about 20 species which occur in wild state in China, Japan, Australia, Africa, Nepal, Bangladesh, Burma and India. Four species of Cycas – ***C. circinalis, C. pectinata, C. rumphii and C. beddomei*** – occur in natural state in India, chiefly in Assam, Orissa, Meghalaya, Andaman and Nicobar Islands, Karnataka and Tamil Nadu. ***C. revoluta*** and ***C. siamensis*** are widely grown in gardens.
- ***C. rumphii* –** This species occurs in Andaman and Nicobar Islands.

ECONOMIC IMPORTANCE

- The juice of young leaves of ***C. circinalis*** is used as remedy for disorders of stomach, flatulence, blood vomiting and skin diseases.
- Decoction of young seeds of ***C. circinalis*** is purgative and emetic.
- Pollen grains of some species of Cycas are strongly narcotic, and microsporophylls of ***C. rumphii*** and ***C. circinalis*** are used as painkiller.
- A tincture prepared from the seeds of ***C. revoluta*** is used to relieve headache, giddiness and sore throat.
- A hair wash prepared from the pounded and crushed stems of ***C. pectinata*** is used in Assam for the treatment of diseased hair roots
- Leaves of ***C. revoluta*** are rich in nitrogen and they are used as green manure for rice, sweet potato and sugarcane.
- The starch of stem cortex & pith (usually) of ***C. revoluta*** is utilized for the production of **sago.**

SPOROPHYTE

[I] External morphology :

Cycas is an evergreen slow-growing **palm-like** small tree with an average height of 1.5-3m. It is commonly found in **xerophytic habitats**. It also grows well under cultivation in gardens. The sporophytic plant body is differentiated into roots, stem and leaves.

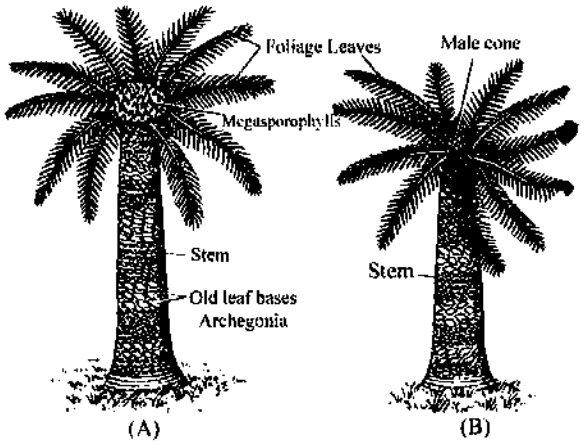
1. **Root :** There are two types of roots in Cycas :
   (a) Normal tap roots (b) Coralloid roots.

(a) Normal tap roots : These roots are **positively geotropic** and their main function is anchorage and absorption of water and mineral nutrients.

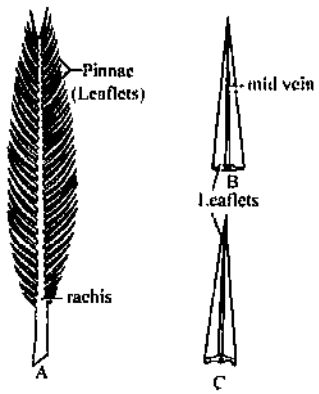
(b) Coralloid roots : These are speciallised **apogeotropic** roots which grow on the surface of the soil. They are repeatedly dichotomously branched and appear as coralline masses. They are more frequent on young plants. The coralloid roots possess **lenticels**, which help in **respiration**.

2. Stem : In mature plants, the stem becomes thick, columnar and woody. It is covered with **persistent and woody leaf bases**.

- The stem is **usually unbranched**, but sometimes due to injury shoot apical meristem is divided into two parts and the stem appears as **dichotomously branched**.



Cycas :- (A) Female Plant, (B) Male plant



(A) A foliage leaf, (B) A part of leaflet of *C. rumphii*, (C) A part of leaflet of *C. revoluta*

3. Leaves : Cycas has **dimorphic** leaves : (i) Foliage or Assimilatory leaves and (ii) Scale leaves.

(i) Foliage or Assimilatory leaves : Large, **pinnately compound** foliage leaves form a crown at the top of stem. Each leaf has 80-100 pairs of leaflets which are arranged on both sides of the rachis in opposite or alternate manner. The leaflets are sessile, elongated and ovate or lanceolate with flat (***C, rumphii***) or revolute (***C. revoluta***), margins. The apex is acute or spiny. The leaflet has a **single mid vein**, lateral veins are absent. Young leaves covered with **ramenta**.

- **Circinate vernation** is found in young leaf let.

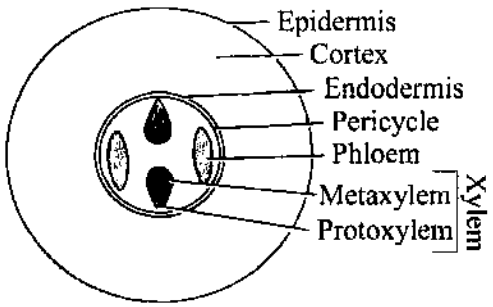
(ii) Scale leaves : The scale are small, rough, dry and **triangular**. They are thickly covered with ramenta. They are incapable of carbon assimilation and their **main function** is to protect **apical meristem** and other **aerial parts**.

- The foliage and scale are arranged in close alternate whorls at the stem. Usually a single crown of leaves is formed in a year.

[II] Internal Anatomy :

(a) Internal Structure of Normal Tap Root :

- Some cells of epiblema give rise to root hairs and root hairs are ephemeral.
- Cortex are filled with **starch**. Some **tannin cells** and **mucilage cells** are also present in this region.
- Vascular tissue forms a central **diarch** stele. The xylem is **exarch** and tracheids of the protoxylem have **spiral thickenings** and metaxylem tracheids have **sclariform thickenings**.
- The mature normal root shows secondary growth.



T.S. of young root. (Out line diagram)

(b) Internal structure of Coralloid root : Coralloid roots'cortex is differentiated in to three distinct regions.

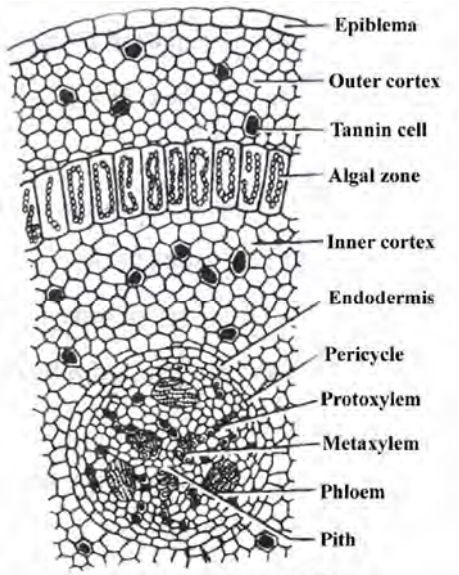
(i) Outer cortex ⟶ Composed of compact polygonal cells

(ii) Inner cortex ⟶ Thin walled parenchymatous cells.

(iii) Middle cortex ⟶ It has algal zone.

The algal zone consists of a single layer of lossely connected thin

walled and **radially elongated cells**. In the algal zone blue-green algae, such as ***Anabaena cycadae, Nostoc punctiforme*** and ***Oscillatoria spp.*** occur which live symbiotically. These help in nitrogen fixation. Pericycle is present inside inner cortex.

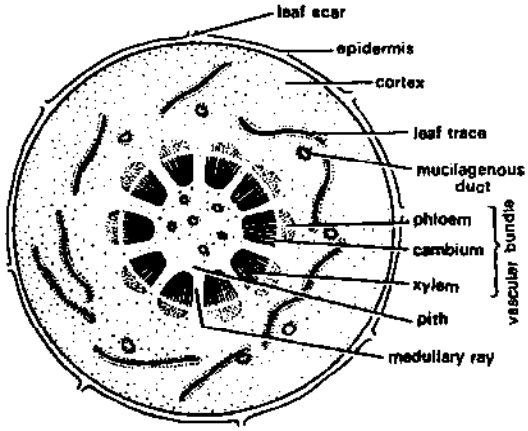


Internal structure of coralloid roots

- **Vascular Bundle :** coralloid roots are **triarch** and **exarch**. Root hair and root cap absent in coralloid roots

(c) Internal structure of Stem : Its internal structure is similar to that of a dicotyledonous stem.

- Epidermis is usually discontinous due to the presence of persistent leaf bases.
- Cortex composed of parenchymatous cells, rich in starch grains. The cortex is also traversed by several **mucilagenous** canals and many **leaf traces**.
- Endodermis and pericycle both are indistinct.
- There are several vascular bundles arranged in a ring forming an **ectophloic siphonostele**.
- The vascular bundles are conjoint, collateral, endarch and open.



Diagrammatic representation of transverse section of young stem

- The individual bundles are separated by parenchymatous medullary rays.
- The xylem is composed of tracheids and xylem parenchyma only, **vessels are absent**.
- The phloem is composed of **seive tubes** and phloem parenchyma, **companion cells are absent**.
- In a transverse section of stem, numerous leaf traces can be seen in the cortical region. They are vascular strands which supply the leaves.
- Each leaf receives four leaf traces. (**Two direct** & **Two girdle traces**)
- There is a parenchymatous pith in the centre of stem. The pith cells are rich in starch and several pith cells also contain tannin and mucilagenous substances.
- The stem of **Cycas** shows normal secondary growth in early stages, similar to that of dicotyledonous stem.

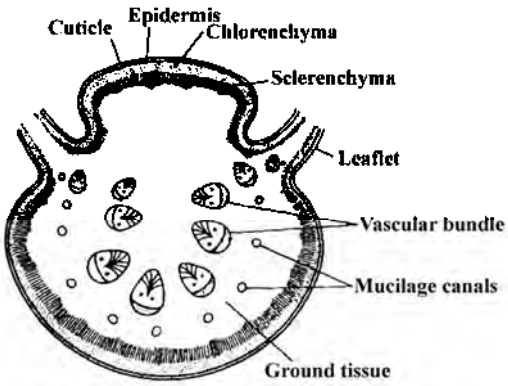
Note : Young stem of **Cycas** which is **monoxylic** earlier becomes **polyxylic** later on.

(d) Internal structure of leaf : -

(i) Rachis : - In a transverse section rachis is **circular** in outline. It has two rows of leaflets inserted on the adaxial side.

- Epidermis is outer most and parenchymatous. Scleranchymatous hypodermis is present below it.
- Ground tissue containing mucus canals present below hypodermis.

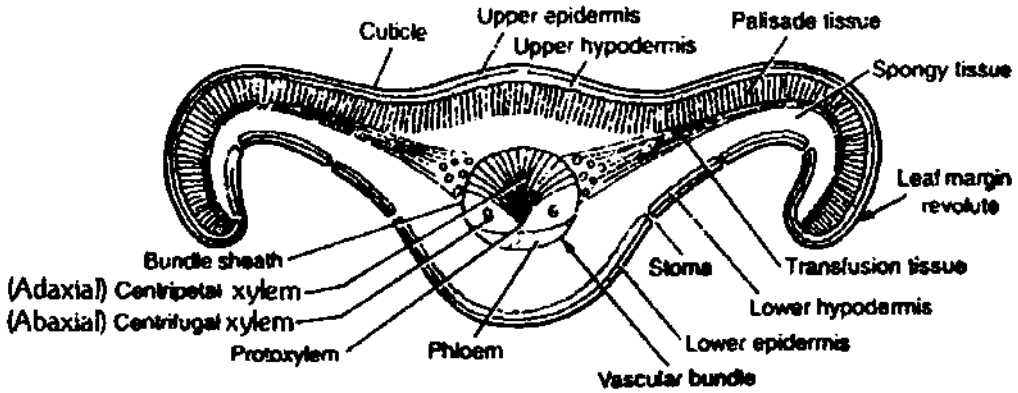
- There are several vascular bundles in the ground tissue and they are arranged in a typical inverted **omega-like** arc.
- The vascular bundles are conjoint, collateral and open, and each is surrounded by a single layered bundle sheath.
- Xylem is diploxylic in V.B. i.e. centrifugal & centripetal xylem present. Centrifugal xylem is more at basal part of rachis while centripetal xlyem is more towards tip.



T.S. of Cycas Rachis

(ii) Leaflet : - There is a single midrib in the leaflet, lateral veins are absent. The leaflet is swollen in the mid rib region.

- Upper and lower epidermis is present. stomata are present only at lower epidermis .
- The margins of the wings are revolute in ***C.revoluta*** and ***C.beddomei*** and straight in ***C.circinalis***, ***C.pectinata*** and ***C.rumphii***.
- Leaf mesophyll is modified in pallisade and spongy tissue.
- There are groups of tracheid-like cells on the lateral sides of the vascular xylem in the mid-rib region. These cells have reticulate thickenings and **bordered pits** on their walls. They represent **transfusion tissue**.



V.S. of Cycas Leaf Let

- In the wing region long colourless and transversely elongated parenchyma cells are present in between palisade and spongy parenchyma. They represent **secondary** or **accessory transfusion tissue**.
- Accessory transfusion tissue helps in lateral conduction of water and nutrients because lateral veins are lacking in cycas.
- A **single vascular bundle** is present in the **midrib region**. The vascular bundle is conjoint collateral, open and xlyem is **diploxylic**.
- It has a large and **triangular centripetal** xylem (Adaxial in position) and two small groups of **centrifugal xylem** (**Abaxial in position**).
- A thin layer of cambium is present between the xylem and phloem.

REPRODUCTION

- Cycas reproduces by vegetative and sexual means.

I. Vegetative reproduction :

- Vegetative propagation takes place by resting **adventitious buds or bulbils**. They develop in the basal part of the stem from parenchymatous cells of the cortex, in the crevices between persistent leaf bases.
- It is a common method of propagation in ***C.revoluta***, as **male plants** of this species usually do not occur in **Northern India** and in their absence sexual reproduction is not possible. Bulbils formed on male plants give rise to male plant and those developed on female plants form female plants.
- In ***C.circinalis***, vegetative propagation takes place by **suckers** which develop from the roots. They grow horizontally at the ground for some distance and then form new plants.

II. Sexual reproduction : -

- Species of **Cycas** are strictly **dioecious**.

1. **Male strobilus :** The strobilus (cone) develops at the apex of the stem in between the crown of foliage leaves. In its development apical meristem of the stem is utilised and as a result the future stem becomes **sympodial**.

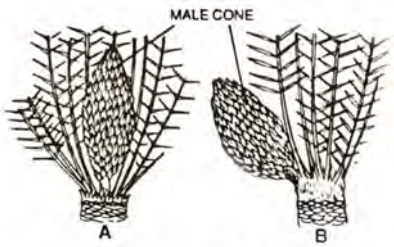


Fig.: Cycas Male Strobilus

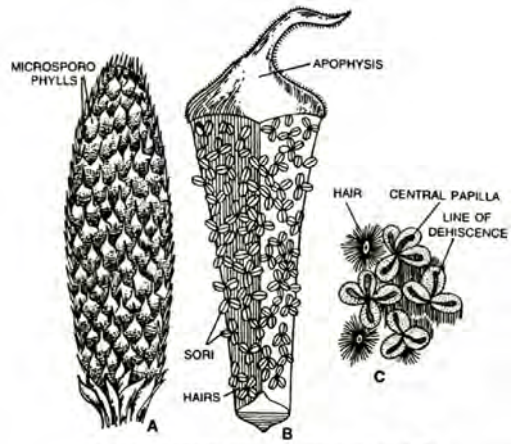
- The male cone is shortly stalked, compact, oval or conical woody structure.It is **40-80** cm in length, the **largest among the plant kingdom**.
- The male cone consists of several microsporophylls which are arranged spirally around a central cone axis.
- The microsporophyll is a woody, more or less horizontally flattened and nearly triangular structure. It is differentiated into a proximal **wedge-shaped fertile** part which expands distally from a narrow point of attachement and a distal sterile part, tapering into an upcurved **apophysis**. The upper (adaxial) surface of the fertile part of the microsporophyll is sterile, while on the lower (abaxial) surface there are **700-1000** microsporangia, arranged in definite groups, known as **sori**. (Singular - Sorus). Each microsporangium is globular and sac like structure. The wall of microsporangium is trilayered.



Cycas : (A) Male cone, (B) Microsporophyll
(C) Microsporangium

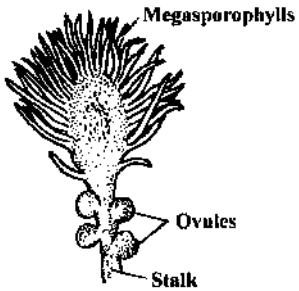
Exothecium
Endothecium
Tapetum

- Tapetum is inner most and it covered sporogenous tissue
- Types of development of microsporangium → Eusporangiate type.

Microsporogenesis : Microsporogenus cell $\xrightarrow{\text{mitosis}}$ **microsporemother cell** $\xrightarrow{\text{meiosis}}$ **microspore**

FEMALE REPRODUCTIVE STRUCTURE

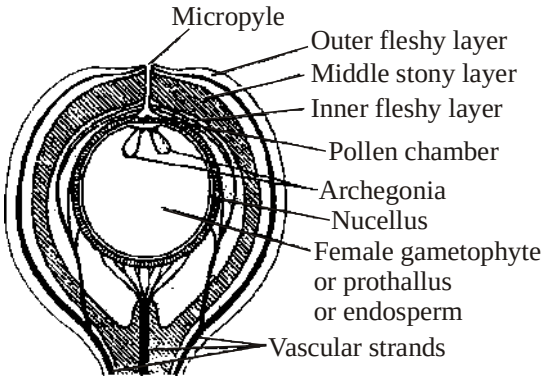
- The **megasporophylls** of Cycas are not organised into cones and instead they occur in close spirals in **acropetal** succession around the stem apex of the female plant. New megasporophylls are produced every year like the foliage leaves. The growth of the apical meristem of the female plants is **monopodial**, the axis countinues to grow as it produced foliage leaves and megasporophylls.
- The megasporophylls are considered to be **modified leaves**. They are flat and dorsiventral structures, measuring **15-30 cm** in length. A megasporophyll is differentiated into a basal stalk and an upper **pinnate** lamina. **Ovules are formed on the lateral sides of the stalk**.
- Largest ovule in plant kingdom is present in **Cycas thaursai**.



Cycas : Megasporophylls

Structure of Ovule :

- The ovule of Cycas is **orthotropous** and **unitegmic**. It is sessile or shortly, stalked and largest in the plant kingdom, about **6 cm** in length and **4 cm in diameter**. The ovule consists of a large nucellus surrounded by a single integument. The integument remains fused with the body of the ovule except at the apex of the nucellus, where it forms a **nucellar beak** and micropyle.
- The integument is very thick and is differentiated into **three distinct layers** – the outer and inner layers are fleshy, whereas the middle layer is hard and stony. The inner fleshy layer remains fused with the nucellus and it is **short-lived**. Mucilage canals and tannin cells are frequently present in the integument. Some cells of the nucellar beak dissolve to form a pollen chamber that lies in the central region of the beak. The young ovule is green and is covered by minute multicellular hairs. At maturity it becomes red or orange in colour and hairs disappear.
- The ovule is supplied by **three vascular strands** from megasporophyll.



L.S. of Cycas ovule

GAMETOPHYTE

- Cycas is **heterosporous**, it produces two types of spores – **microspores** and **megaspores**. The microspore develops into male gemetophyte and the megaspore in female gametophyte.

A. Male gametophyte :

The male gametophyte develops partially inside the micro sporangium before pollination and partially within the pollen chamber of the ovule after pollination.

1. Development of male gametophyte before polination : - The development of the male gametophyte before pollination takes place inside the **microsporangium**. The microspore divides by a transverse wall in to **two unequal** cells, a small prothallial cell and a large antherdial cell. The prothallial cell does not divide further. The antheridial cell divides to form a small generative cell (adjacent to the prothallial cell) and a

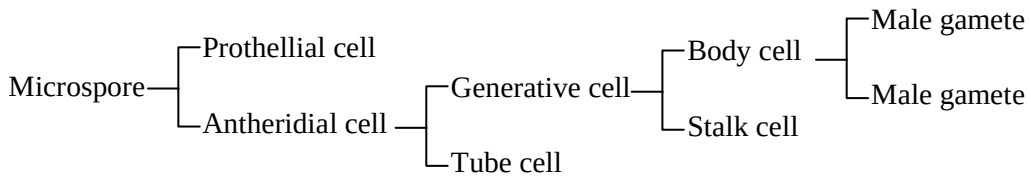
large tube cell. Thus the microspore becomes 3-celled. The **dispersal of microspores takes place** at the **3-celled stage**. Further development occurs in the pollen chamber of the ovule after pollination.

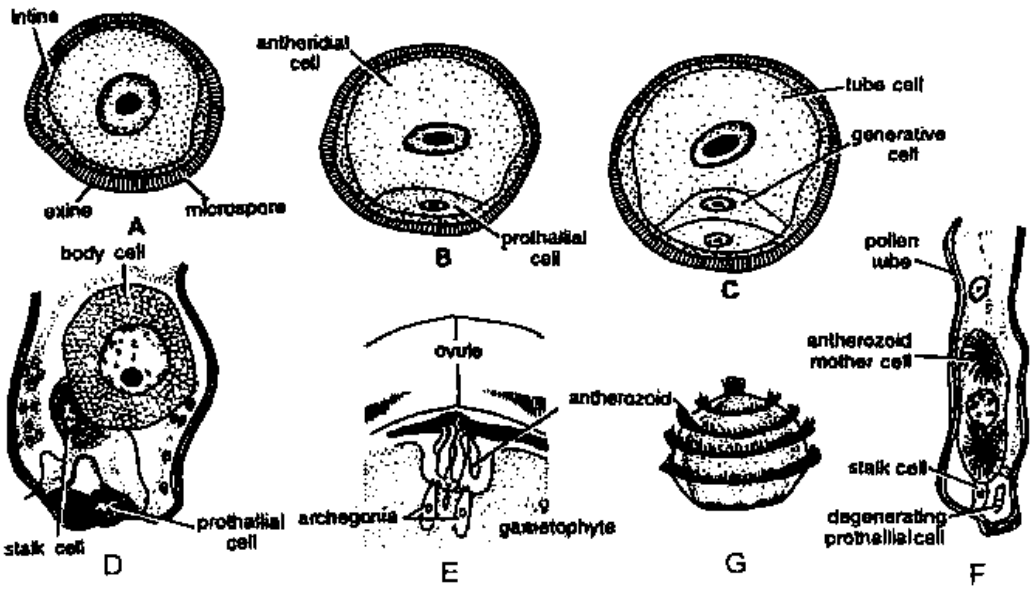
2. **Pollination :** The 3-celled microspores are shed in the air after the dehiscence of the sporangium. They are **very light in weight** and are carried by **air currents**.

- In **synchronization** with the time of dispersal of the microspores, some cells of the nucellar beak disorganise to form a **viscous fluid**. This fluid oozes out from the micropyle in the form of a pollen drop. Some of the microspores, carrieds by air current, are entangled in the pollen drop. As the pollen drop dries up, the microspores are sucked into the pollen chamber through the micropylar canal. As the result of drying of the viscous fluid, the micropylar canal of the pollinated ovules is plugged.

3. **Development of male gametophyte after pollination :** Further development of the 3-celled male gametophyte takes place within a week of pollination in the pollen chamber of the ovule. The generative cell divides to form a **stalk** cell and a **body** cell, about the same time, the exine ruptures and the intine protrudes out in the form of a pollen tube. The pollen tube penetrates the nucellar tissue and grows towards the female gametophyte. In **Cycas**, the **pollen tube is haustorial in nature**.

- The stalk cell does not divide, whereas the body cell divides to form two male gametes (antherozoids) just before fertilization. **(Mature male gametophyte of Cycas is 5-celled)** The antherozoids swim freely in the cytoplasm of the pollen tube. There is an interval of about four months between the pollination and fertilization.
- The male gametes are **naked, top-shaped** structures, measuring **180-210 µm** and **multi ciliated/ multiflagellated**.

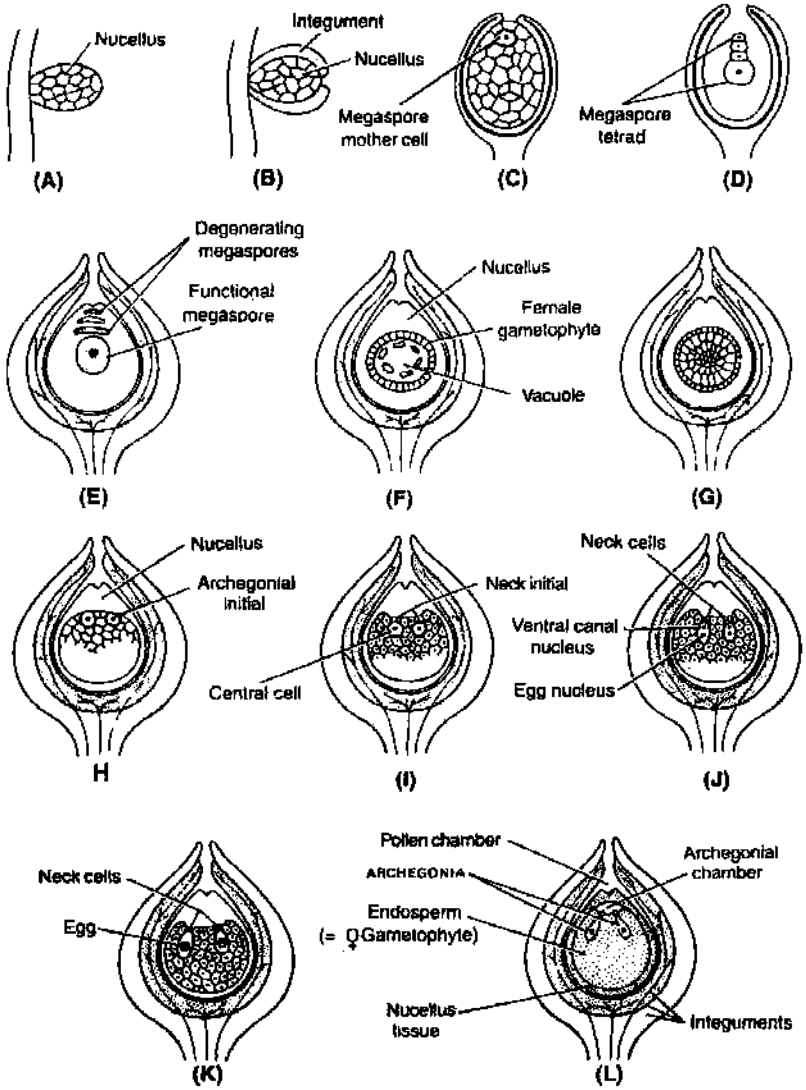




A-G Cycas : Development of male gametophyte;
A-C Stages before pollination, D-F. Stage after pollination, G. An antherozoid.

B. Development of Female Gametophyte :

- Four megaspore are formed by meiotic division in megaspore mother cell. Megaspore mother cell is originated from nucellus. Out of these four megaspore, three megaspore towards micropyle end degenerate and only one remain functional. Free nuclear division occur in functional megaspore. Cell wall formation occur and multicellular female gametophyte or endosperm is formed.
- Archegonia are formed from archegonial initial cell which is present toward micropyle.
- The mature archegonia consists of 2(generally)-4 neck cells and an egg. The venter is surrounded by a nutritive jacket of cells formed by the gametophyte cells. This jacket is called **archegonial jacket**. Neck canal cells are absent.
- **Note :** - The number of archegonia in an ovule varies in different species of cycas, for example, 3-6 in ***C. rumphii***, 3-8in ***C.circinalis*** and 2-8 in ***C.revoluta***.



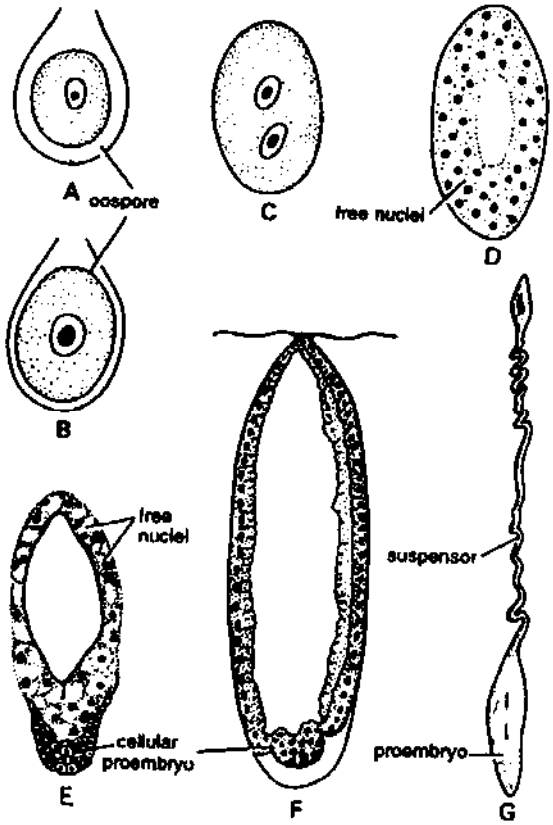
Different stages of the development of female gametophyte

[III] Fertilization – Zoodiosiphogamous type

Embryo development : Meroblastic and endoscopic

- The Cycas proembryo differentiated into three regions : (i) the uppermost **haustorial region** at the micropylar end, (ii) the middle **suspensor region**, and (ii) the basal **embryonal** region.
- The cells of the **haustorial region** absorb nutrients from the micropylar end and provide them to the developing embryo.

- The cells of the **suspensor** region are elongated and much coiled. They push the embryo deep into the female gametophyte (endosperm).
- The embryonal region forms the main part of the embryo. The embryo takes **about one year for its complete development**.
- Two cotyledon are present in embryo of cycas.



A-G Cycas : Stages in the development of embryo

SEED :

- The ovule is **transformed into seed after fertilization**. The inner fleshy layer of the ovule wall and the major part of the nucellus are consumed in providing nourishment to the developing embryo. Thus both these parts persist in the seed in the form of a thin layer.
- The mature seed is red, orange or dark brown in colour. It is surrounded by a fleshy seed coat formed by the three layers of the integument of the ovule. The outer fleshy layer of the integument forms **sacrotesta** and the middle stony layer **sclerotesta**, while the inner layer remains thin and papery. The seed coat has a sweet taste and pleasant odour. These provide attraction to birds and animals which help in dispersal of seeds. There is a straight embryo with **two unequal cotyledons** inside the seed coat.
- The seed of **Cycas** represents **three generation**. The seed coat, formed by the integument of the ovule, represents the first sporophytic stage, the endosperm is the gametophyte stage and the embryo is the next (new) sporophytic stage.

Germination of seed :

- The seed germinates without undergoing any rest period. It remains viable only for few months. The germination is **hypogeal**.

Species of Cycas	**No. of ovules in a megasporophyll**
Cycas circinalis	12

Cycas revoluta	2 – 4
Cycas pectinata	4 – 6
Cycas rumphii	6 – 10
Cycas siamensis	two

- **Age of Cycads** ⟶ Triassic period of mesozoic era
- Height of ***Cycas media*** ⟶ 20 meters
- In Cycas, the radicle is enclosed in a pod-like hard covering known as **Coleorrhiza**.
- Multiseriate bordered pits are present in **Cycas tracheids.**
- Two embryo are present in seed of ***cycas circinalis*** which are formed through two fertilized archegonia

Alternation of generation :

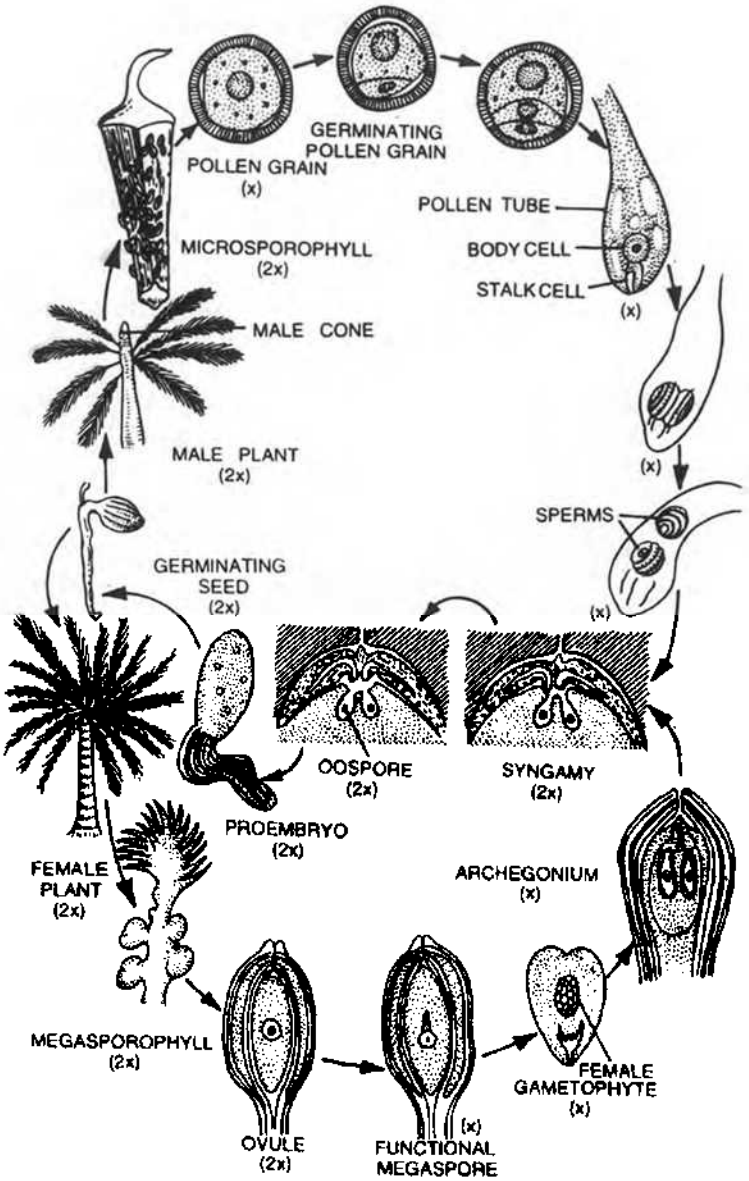


Fig.: Cycas : Alternation of Generation

PINUS

SYSTEMATIC POSITION

Kingdom		Plantae
Sub kingdom	→	Embryophyta
Division	→	Tracheophyta
Class	→	Gymnospermae
Subclass	→	Coniferophyta
Order	→	Coniferales
Family	→	Pinaceae/Abitaceae
Genus	→	Pinus

SPECIES OF PINUS

- There are six species of Pinus commonly found in India

(i) ***Pinus gerardiana*** **– (Chilgoza Pine)**

(ii) ***Pinus wallichiana Syn. Pinus excelsa*** **– (Blue Pine/Kail)**

(iii) ***Pinus roxburghii Syn. Pinus longifolia*** **– (Chir Pine)**

(iv) ***Pinus merkusii*** **(Teenasserim Pine) : Height-3 mt**

(v) ***Pinus insularis*** **Syn.** ***Pinus khasya*** **– (Khashi Pine)**

(vi) ***Pinus armandi*** **(Armandi's Pine)**

- Pinus is a **evergreen and perennial** tree with xerophytic adaptation which is growing on the slopes of hills in **temperate** climate. It is **conical** in **shape** due to **excurrent growth** of the plant i.e. both main axis and lateral branches grow continously to acquired **cone like** shape.

Note : The excurrent/conical habit of **Pinus** tree is caused by auxin effect on the growth of stem tip & axillary branches.

EXTERNAL MORPHOLOGY OF PINUS

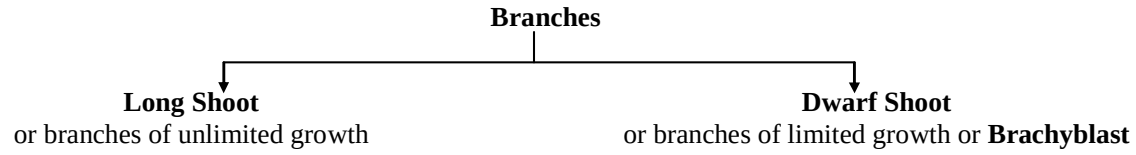
- Main plant body of **Pinus** is sporophytic and which is differentiated into root, stem and leaves.

1. Root : Well developed tap root system is found in **Pinus**. Root hairs are poorly developed. Ectomycorrhiza are present.

- Basidiomycetes fungus like ***Clavatia, Scleroderma, Amanita*** and ***Boletus*** etc. are present in mycorrhiza in the form of symbiont in root of pinus. They help in absorption of water and minerals.

2. Stem :

- Stem of the **Pinus** is erect/straight, cylindrical, long, woody and branched.
- Branches are **monopodial** and developed from the axis of scaly leaves which are present on the stem. Branching gives **conical** appearance to plant.
- Branches are Dimorphic.



(i) Long Shoot :

- These are developed in the axis of scaly leaves on stem after the growth of every year. In long shoot, apical bud is found. These are responsible for unlimited growth.
- These branches bear only **scaly leaves**.

(ii) Dwarf Shoot/Branches of limited growth or Brachyblast :

- They develop in the axis of scaly leaves on the long shoot and bear both **scaly** and **foliage** leaves.
- They possess foliage leaves at their apex.
- These branches do **not have apical bud** and hence show only limited growth.
- **A dwarf shoot with a group of needle like foliage leaves, called as foliar spur.**

3. Leaves :

- The leaves are **Dimorphic.**
  (i) Scaly leaves
  (ii) Foliage leaves/Photosynthetic leaves.

(i) Scaly leaves :

- The scaly leaves are dark brown, membranous, thin and small, and present on both long and dwarf shoots.
- They do not help in photosynthesis

Main function : protection of the young buds.

- They fall off as the branches are mature.
- The scaly leaves on the dwarf shoots have a distinct midrib and they are called **Cataphylls**.

(ii) Foliage leaves : (or photosynthetic leaves)

- They **develop** only on the **dwarf shoot** and present on their apex.
- The foliage leaves are green & needle like.

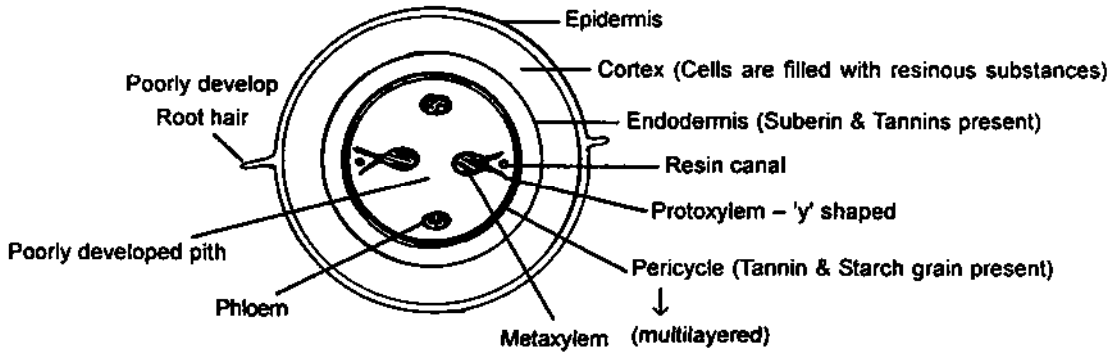
Species of Pinus	Number of needles	Types of spur
1. ***Pinus monophylla***	1	**Monofoliar**
2. ***P. merkushii*** and ***P. sylvestris***	2	**Bifoliar**
3. ***Pinus gerardiana***		
Pinus insularis	3	**Trifoliar**
P. roxburghii syn. P. longifolia		
4. ***Pinus quadrifolia***	4	**Quadrifoliar**
5. ***P. armandi***		
Pinus wallichiana syn. P. excelsa	5	**Pentafoliar**

Note : The foliage leaves are Photosynthetic and remain persistent for several years. The needle like nature of the foliage leaves indicates xerophytic adaptation.

INTERNAL STRUCTURE OF PINUS

(A) INTERNAL STRUCTURE OF ROOT :

- Internal structure of primary root of Pinus is similar to dicot root, but vessels in xylem and companion cell in phloem are absent.



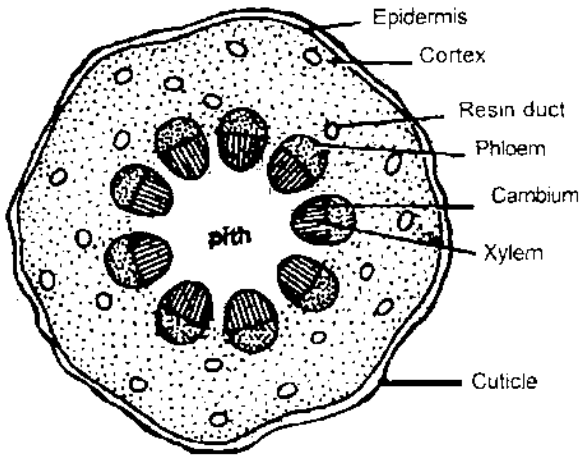
T.S. of pinus young root.

(B) INTERNAL STRUCTURE OF PINUS STEM.

- The internal structure of **Pinus** stem is similar to that of a dicotyledon stem.

1. **Epidermis :** It is the outer most layer and composed from compactly arranged and heavily **cutinised** cells.
2. **Cortex :**

- **Hypodermis :** The outer sclerenchymatous zone of the cortex forms hypodermis.
- **General cortex :** It is formed by several layers of parenchymatous cells. Some cells of this zone are filled with **tannin**. Several resin canals are also distributed irregularly in the cortex.
- **Endodermis :** The inner most layer of the cortex represents endodermis. It is indistinguishable from the cortical cells.



Outline diagram of T.S. of pinus young stem

3. **Pericycle :** 2-3 layered pericycle is present which is indistinct and undifferentiated.
4. **Vascular Bundles :** 5-9 Primary Vascular Bundles are presents. They are arranged in a ring. The vascular bundles are **conjoint, collateral, Open & endarch**. The protoxylem tracheids possess **spiral** thickening where as metaxylem tracheids have **reticulate** thickening.
5. **Pith :** A parenchymatous pith is present in the centre of the stem. Some pith cells are filled with **resinous substances**.

Note : In transverse section of the stem (long shoot) appears wavy or irregular in outline due to the presence of close appressing scaly leaves and dwarf shoots.

INTERNAL STRUCTURE OF PINUS NEEDLE

- Leaf of the pinus is **xeromorphic.** Outline of the T.S. section of **Pinus** leaf (Needle) depends upon number of foliage leaves on foliar Spur :

Species	Number of foliar leaves	Out line
P. monophylla	1	Circular
P. sylvestris	2	Half circular/semi circular
P. longifolia	3	Triangular

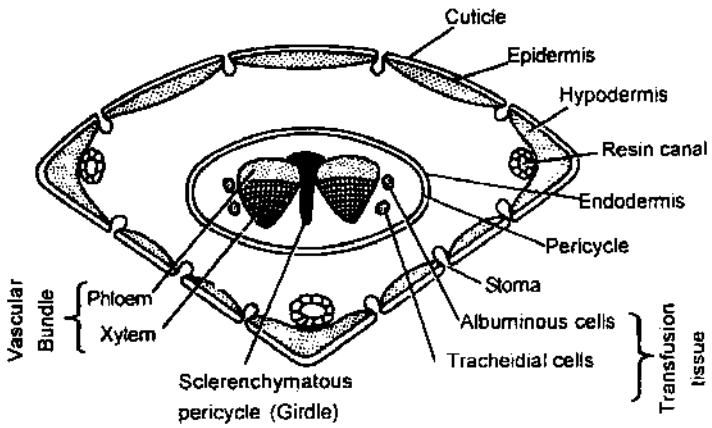
1. **Epidermis :** The single layered epidermis consists of heavily cutinized thick walled cells. It has many **sunken stomata**. Each stomata consists of **two** guard cells and **6-9 subsidiary** cells. Stomata are present on both surface.
2. **Hypodermis :** It is more than one layered and composed of **sclerenchymatous** cells. Due to the presence of substomatal cavities. Hypodermis is discontinuous.

- **In *P.longifolia*, the hypodermis is more developed at the corners.**

3. **Mesophyll :** Mesophyll (3 – 5 layered) is made up of parenchymatous cells. Large number of long peg like process are formed by **infolding** of **internal cell well** of mesophyll. So it is known as **"armed mesophyll"**. It increases the photosynthetic area of leaf. Leaf mesophyll is not differentiated in it.
4. **Endodermis :** It is made up of **barrel shaped** cells. **Casparian thickening** are present on their radial wall.
5. **Pericycle :** A multilayered pericycle is present next to endodermis. It consists of the following types of cells.

(i) Parenchymatous cell : Most of the pericycle is composed of parenchymatous cells which are densely filled with **starch grains**.

(ii) Albuminous cell : These cells occur in close contact with the **phloem cells**. They are also parenchymatous cells which are packed with **proteins** and **starch grains**. They **do not possess pits** and probably helps in translocation of nutrients from mesophyll to phloem cells.



***Pinus roxburghii* : Outline diagram of the T.S. of *Pinus* needle**

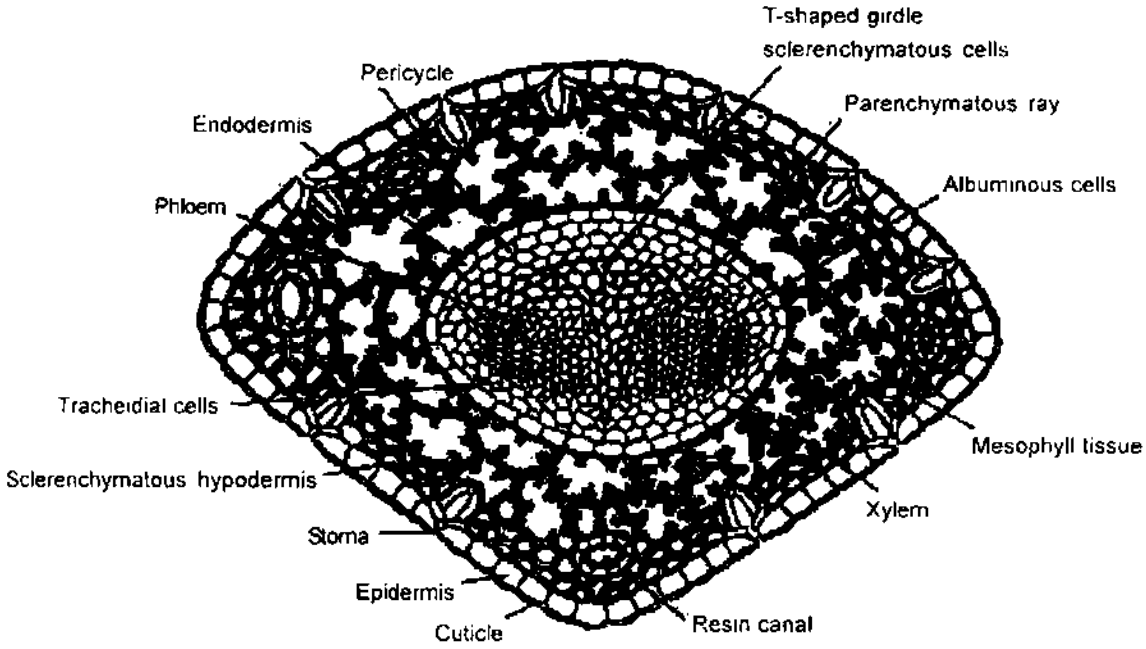
(iii) Tracheidial cells : These are tracheids like cells which occur close to **xylem cells**. These cells **possess pits** & helps in conduction of water & minerals from xylem to mesophyll cells.

Albuminous cell + Tracheidial cell ➡ Transfusion tissue

(vi) "T" Shaped sclerenchymatous girdle

6. Vascular Bundle :

- In the middle of the leaf two vascular bundles are Surrounded by bundle sheath. Vascular bundles are conjoint, collateral, Open & endarch. **"T' shaped girdle is found between the both vascular bundls. 'T' shaped girdle is composed of sclerenchymatous cells.**



Detailed cellular structure of the T.s. of Pinus needle

- **Pinus needle ➡ Amphistomatic**
- **Stomata – Haplochelic type. i.e.** subsidiary and guard cells are arises from separate cells.
- The needle possesses basal meristem which helps in their elongation

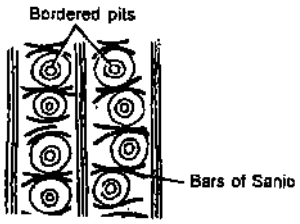
Secondary Growth in Pinus root is similar to that of a dicot root
Secondary Growth in Pinus stem is similar to that of a dicot stem

Linear **uniseriate bordered pits** are present in **tracheids.**

- Clear annual ring are found in **Pinus.**
- **Resin canals** are also found in **secondary xylem.**

IMPORTANT POINT :

- An important characteristics features of **Pinus** wood is the presence of **bars of Sanio**. They occur in the form of **crescentic bars** in between the bordered pits. These bars are formed by the deposition of **cellulose & pectin** on **Tracheidial walls**.



Bars of Sanio in between bordered pits in trachieds

REPRODUCTION IN PINUS

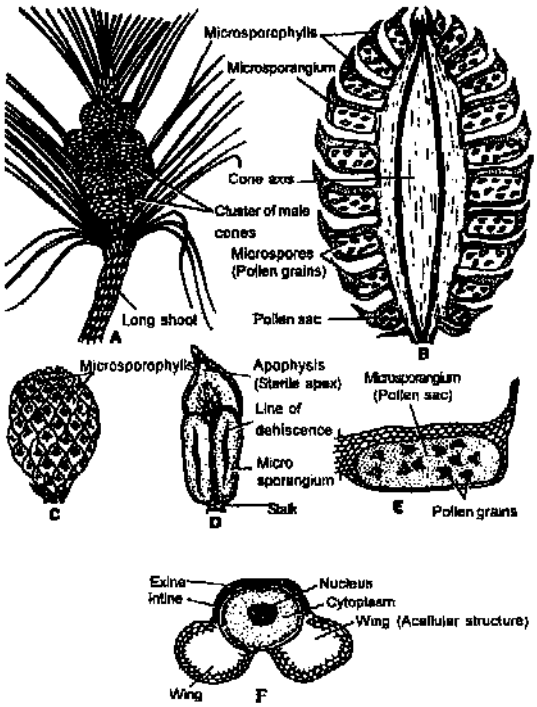
- Pinus is a **Sporophytic & heterosporous** plant. The plant body forms two types of spores i.e. **microspores** and **megaspores**. The spores are haploid which indicate the first cell of **gametophytic phase.**
- The plants are **monoecious** and male & female cones are formed on different branches of the same plant. It means it is a **autoicous** plant.
- Male & female cones are monosporangiate.
- **Exception :** In ***Pinus roxburghii***, ***P. montana*** and ***P. maritima*** the cones are **bisporangiate**. i.e. cone possess two types of sporangia.

MALE CONE :

- Male cone are developed in the axis of scaly leaves on the branches of unlimited growth in **place of dwarf shoot**. The male cones are considered as modified dwarf shoot. They are develops in groups, just behind the apical bud on the branches of unlimited growth. Thus main shoot continues to grow further. The number of cones in a cluster varies from **15 (*Pinus wallichiana*)** to **140 (*Pinus roxburghii*).**

STRUCTURE OF MALE CONE :

- Each male cone is small & oval shaped structure about **2-4 cm** long, **5-6 mm** in diameter and 60-150 micro sporophylls are arranged spirally on the central axis of each male cone. Each micro sprophyll is a membranous, stalked & **roughly triangular** structure. **(microsporophyll Compared with stamen of angiosperm)**
- The apical sterile part of the micro sporophyll is known as **apophysis**. It bears **two microsporangia** at the base of its **abaxial side**. Each micro sporangium has numerous microspores.
- Microsporophylls are arranged at right angle to the cone axis in such a manner that the apophysis of the upper micro sporophyll is overlapped by the apophysis of the lower microsporophyll.
- **Development of microsporangium :** - **Eusporangiate** type.



Pinus : A. Bunch of Male cone B. L.S of male cone C. Microsporophyll in male cone D. Microsporophyll E. Internal structure of microsprophyll F. Pollen grains

STRUCTURE OF MICROSPORE :

(i) Exine : This layer is highly cutinized and it is found only at one side.

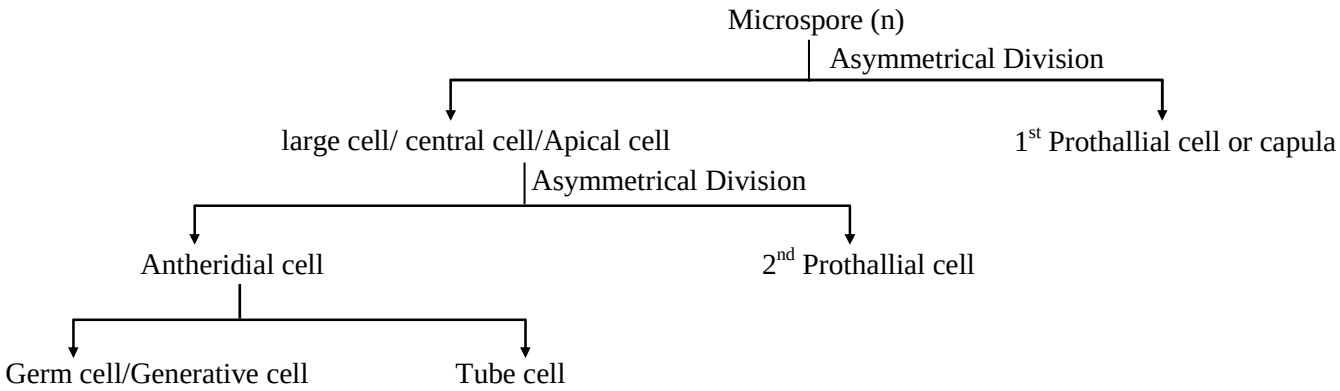
(ii) Exointine : Two wings are developed on lateral side of this layer of microspore. It is a part of exine.

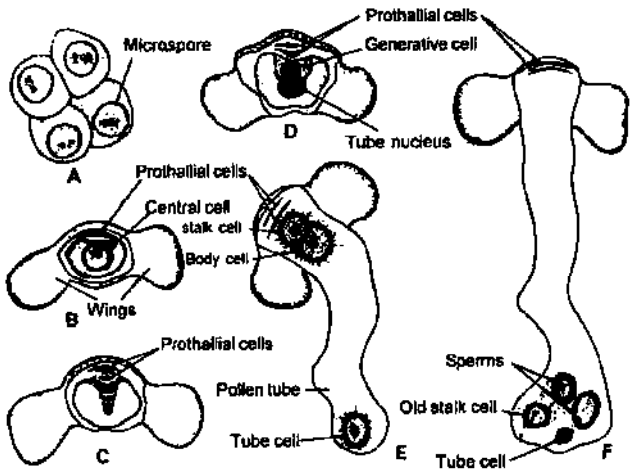
(iii) Intine : It is inner most layer of microspore.

DEVELOPMENT OF MALE GAMETOPHYTE :

- The microspore is the first cell of the male Gametophyte. The Germination of microspore starts **in situ** i.e., they germinate while still inside the microsporangium.
- The microspore are released from the microsporangium after partial development of male gametophyte. The rest of the development of male gametophyte takes place in the **pollen chamber of the ovule** after pollination.

(A) Development of male gametophyte with in the microsporangium before pollination :





Pinus : A. Tetrad of microspores, Development of male gametophyte B-D. Stages before pollination, E-F. Stages after pollination

Pollination : Pollination takes place through the air at 4-celled stage. In India, dehiscence of microsporangium takes place in **warm & dry** environmental conditions.

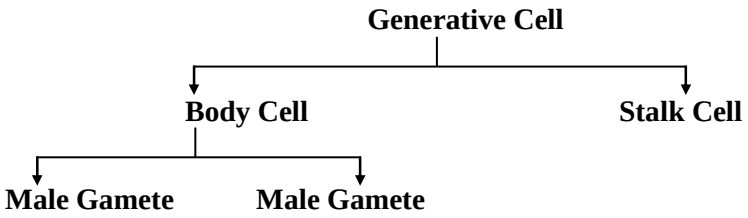
- The microspores are released in such a large quantity that pine forest appears yellow at the time of dehiscence of microsporangium. This is called **"shower of sulphur"**.

(B) Development of Male Gametophyte after pollination :

- After pollination the **4-celled** male gametophyte reaches to the pollen chamber and there it remains **inactive** for about **11 months**. **(The ovuliferous scale during this period have thickened and closed the**

cone completely. The ovule is not yet ready for fertilization.) Further development of the male gametophyte starts in the next spring.

- Exointine breaks off from the middle of the wing and the tube cell comes out in the form of pollen tube. Pollen tube reaches to archegonia through nucellus.
- Pollen tube is rich with starch grains & it may be **branched** or **unbranched**. It acts as a sperm carrier. Tube nucleus moves into the pollen tube while generative cell remains inside the pollen grain.
- The generative cells of the **4-celled gametophyte** divide to form a **body cell** and a **stalk cell**. The nucleus of the body cell divides to form **two nuclei** just before fertilization. The male nuclei function as **sperm** which is **microscopic, non flagellate** & **ephemeral** structure.



- Thus mature male gametophyte of **Pinus is 6-celled.**

FEMALE CONE :

- Female cones are developed on long shoot in place of dwarf shoot. Female cones are also called as **modified dwarf shoot**.
- The female cone are formed in groups (1-4 in each group), in the axis of the scaly leaves towards the tips of long shoots of the current year. The female cone with seed takes about three year to mature.
- The female cones are much larger than the male cones. They are usually 15-20 cm long.

[*Pinus coultre* = 25-35cm & *Pinus lambertiana* = 60 cm]

STRUCUTRE :

- The female cone is complicated structure. It has a central axis around which many (80-90) megasporophylls are arranged spirally.
- Some basal megasporophylls are small & sterile & the rest are fertile. The megasporophyll is a compound structure, consisting of two types of scales : -

(A) Bract scale (B) Ovuliferous scale

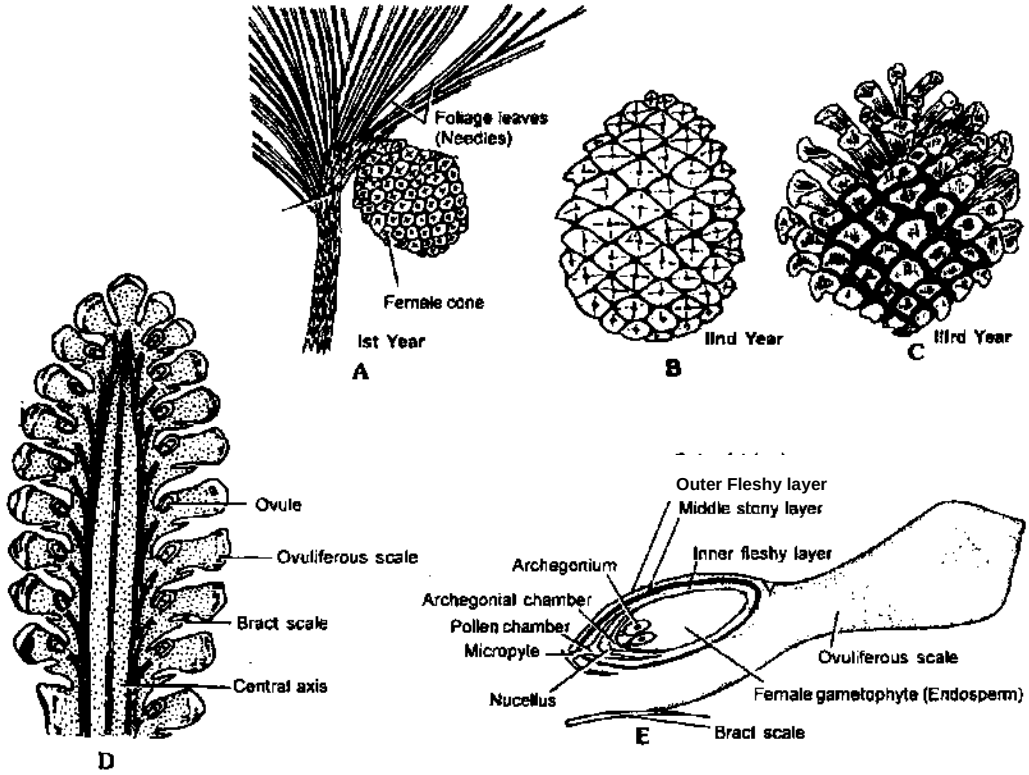
(A) Bract scale :

- It is small membranous structure which is directly attached to the cone axis just below the ovuliferous scale. At the maturity of cone, the bract scale curve inwards so that seeds are dispersed easily.
- Each bract scale has a **single vascular bundle** with its xylem pointing upwards.

(B) Ovuliferous scale :

- It is thick, large woody and brownish structure, attached to the **dorsal** surfaces of the bract scale.
- It is roughly triangular in shape and its upper broad and thick part is known as **apophysis**. Two ovules are present at the base of the ovuliferous scale on its **dorsal surface**.

- The micropyle of each ovule is directed towards the cone axis.



Pinus : A-C. Female cone First, Second and Third year **D.** L. S. of Female cone
E. Structure of Megasporophyll and female gametophyte.

- **Development of megasporangium/Ovule : Eusporangiate type** i.e. the megasporangium develops from more than one superficial initial cells.

STRUCUTRE OF OVULE :

- Ovule of pinus is **anatropous, unitegmic & sessile**. The following part can be seen in longitudinal section of the ovule.

(i) Nucellus : It is the massive **parenchymatous** region of the ovule.

(ii) Integument : It is the thick protective covering around the nucellus. It has a very narrow aperature at the apex of the nucellus. It is known as **micropyle**.

The integument is differenciated in to three layers.

(i) Outer fleshy layer
(ii) Middle stony layer
(iii) Inner fleshy layer.

(iii) Pollen chamber : A small furrow is present opposite to the micropyle in the **nucellus region** which is known as **pollen chamber**. Material secreted by nucellus is found in this chamber during pollination which is known as **"Pollen drop"**.

- **Endosperm & Archegonia are present in the centre of nucellus region.**

MEGASPOROGENESIS :

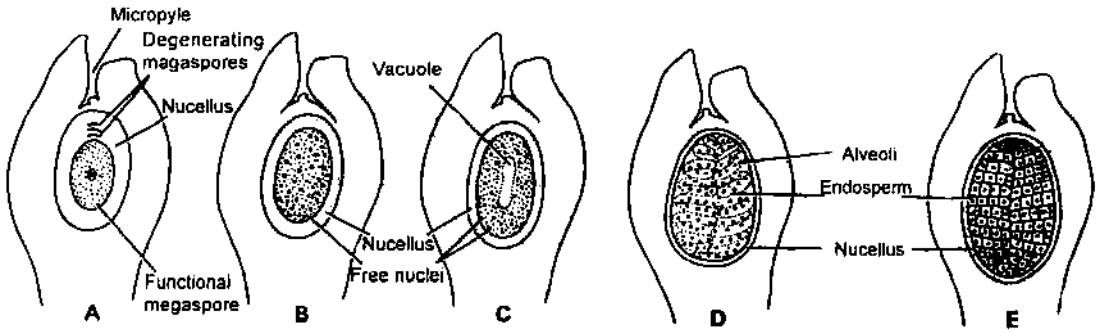
- At the apex of nucellus (**towards micropyle**), hypodermal cells is differentiated from other cells by its larger size, called as **archesporial cell**. Archesporial cell divides by periclinal division to form an outer primary parietal cell & inner sporogenous cell. Sporogenous cell function as a **megaspore mother** cell.

Megaspore mother cell divide **meiotically** to form a linear tetrad of megaspore. Out of four, three megaspore degenerat which **lies** towards the micropyle. Only one megaspore remains functional which is present towards the **chalazal end**.

DEVELOPMENT OF FEMALE GAMETOPHYTE

A. DEVELOPMENT OF ENDOSPERM :

- Functional megaspore first of all increases in size then after **free nuclear divsion** take place in nucleus of functional megaspore resulting 2000-2500 nucleus are formed. All the nucleus move towards the periphery due to vacuole formation in centre.
- There is one characteristic feature of Pinus, in which long **multinucleated** tube like cells are developed radially in early stage. These are known as **alveoli**. Later on **uninucleated** cells are formed due to formation of walls. The structure is known as **endosperm**.
- **Endosperm is haploid structure because it is derived from the megaspore before fertilization.**
- The nucellus cells surrounding the **endosperm** form a 2-3 layered nutritive layer. This layer is known as **spongy layer or endosperm jacket & it is equivalent to the tapetal layer**.



DEVELOPMENT OF ENDOSPERM

B. ARCHEGONIA :

- 2-5 archegonia (normally two) are formed towards the micropylar end in female gametophyte.
- Each archegonium at maturity consists of **eight neck jacket cells** arranged in two tiers of four each and a venter having a small venter canal cell and large egg cell. **Neck canal cells are absent**. The venter canal cell disorganizes before fertilization.
- A nutritive layer is differentiated around the central cell & this layer is known as **archegonial jacket**. The jacket helps in **conduction of nutrients** from the endosperm to the archegonium.

  Note : - *P.roxburghii* and *P.wallichiana* 4-4 neck cells & in **Cycas** archegonium 2-4 neck cells are found in neck region.

FERTILIZATION

- Fertilization in Pinus first of all described by ***Gauroschenchin***.
- Fertilization is ***siphonogamous***. The process of fertilization takes place after the **12-14 month** of pollination.
- Many archegonia fertilized in a female gametophyte but only one zygote is able to form an embryo successfully.

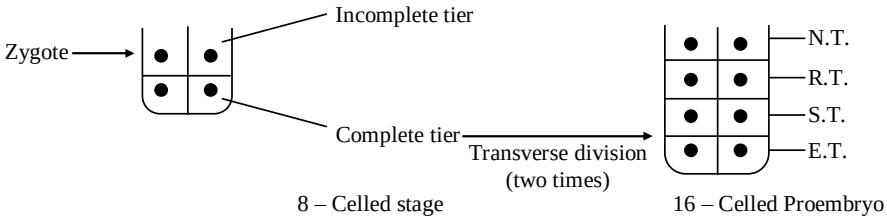
DEVELOPMENT OF EMBRYO :

- **Meroblastic** (embryo is formed by only a part of oospore) and **endoscopic** (development of embryo takes place inside the megasporangium directed away from micropyle)
- Development of embryo can be studied in the following two steps.

(A) Development of proembryo (16-celled) from zygote

(B) Development of embryo from proembryo

(A) Development of proembryo from zygote :



- Pinus proembryo consists of **16 cells** arranged in four tiers.

(i) Nutritive tier : The upper most tier consisting of incomplete cells is known as nutritive tier and it provides nutrition.

(ii) Rosette tier : Function conduction of nurtient between **embryo & suspensor**.

(iii) Suspensor tier : The cells of the suspensor tier elongate to form suspensor. Its cells are long which pushed the embryo into the endosperm.

(iv) Embryonal tier : The lower most tier is known as the embryonal tier; its cells divide to form **embryo**.

(B) Development of embryo from proembryo :

- All the four cells of the suspensor tier elongate considerably and as a result the embryonal cells present at their base are embedded in the endosperm.
- Due to the limitation of space in the endosperm, the primary suspensor cells become coiled to each other.
- At this stage, the cells of the embryonal tier divide by **transverse division** and form another tier of cells, known as **embryonal tubes** or **secondary suspensor**.
- The cells of the embryonal tier separate from each other and form **four independent embryos**. The phenomenon of the formation of more then one embryo from zygote is known as **polyembryony**.
- In pinus, as the polyembryony occurs by the splitting of a zygote. It is known as **cleavage polyembryony**.
- Another type of polyembryony found in pinus is **simple polyembryony** (when more than one embryo is developed as a result of fertilization of different archegonia.)

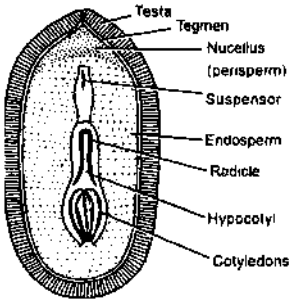
STRUCTURE OF EMBRYO :

(i) **Cotyledons :** Usually more than two **(3 to 18)**

(ii) **Plumule** or **Shoot apex** : Present between the cotyledons in the opposite direction of the micropyle.

(iii) **Radicle :** Directed towards the micropyle

(iv) **Hypocotyl :** Present in between the plumule & radicle.



Pinus : L.S. of Seed

Parts of Ovule		Parts of Seed
(1) Integument –		
(i) Outer fleshy layer	–	Disappear
(ii) Inner fleshy layer	–	**Tegmen** is formed in the form of thin layer
(iii) Middle stony layer	–	It forms the outer most covering of the seed called **testa**.
(2) Nucellus	–	Present in the form of thin layer which is known as **"perisperm"**.
(3) Micropyle	–	On the apex of seed in the form of a pore.
(4) Thin layer of Adaxial surface of ovuliferous Scale	–	Forms **wing** of seed.

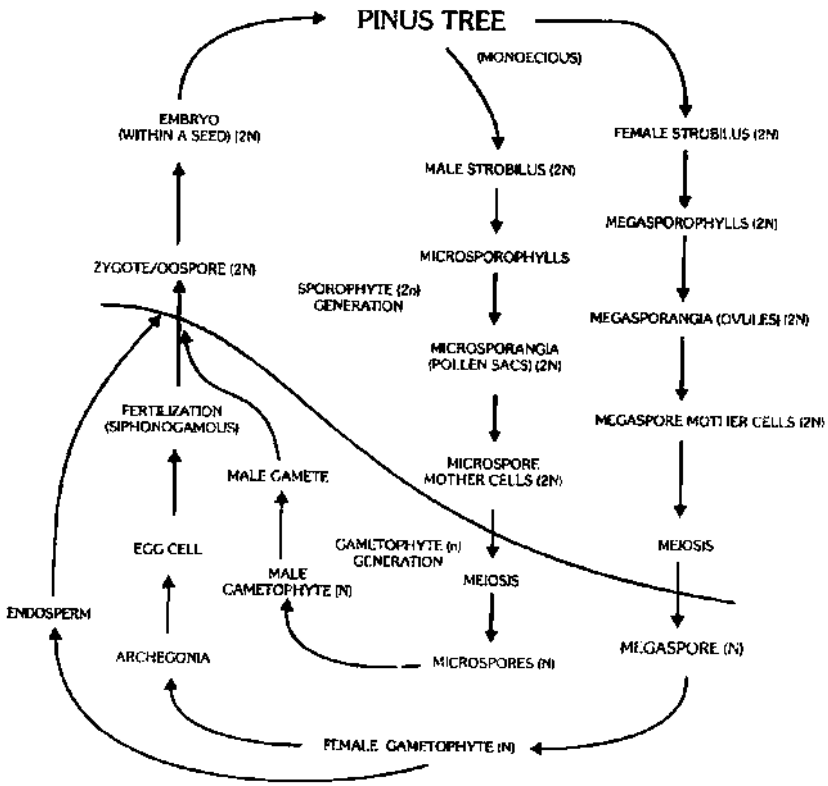
- The **mature seed** represents three generations –

(1) Old sporophyte – Testa, tegmen and nucellus
(2) Gametophyte – **Endosperm** (female gametophyte)
(3) New sporophyte – Embryo

GERMINATION OF SEED :

"Epigeal" type of germination is found in seed of **Pinus** i.e. cotyledon come outside on the soil surface by elongation of the **hypocotyl**.

Life Cycle – Diplontic :



ECONOMIC IMPORTANCE OF PINUS :

- The wood of ***P.roxburghii*** (Chir) and ***P.wallichiana*** (Kail) is an important timber. It is suitable for making railway sleeper, packing cases, furniture, etc Besides, it is also used for making match sticks.
- ***Pinus roxburghii***, ***P. wallichiana***, ***P.insularies*** and ***P.merkusii*** are the chief sources of **turpentine** in India. Rosins, obtained as a residue after the distillation of pine resin, are used in paper sizing, varnish making enamels and in the preparation of plasters and ointments.
- The roasted seeds of ***P.gerardiana*** (Chilgoza pine), ***P.edulis*** and ***P.monophylla*** are **edible**.
- The oleo-resin obtained from ***P.roxburghii*** is diuretic.
- The **fossilized resin**, obtained from a fossil species of Pinus (e.g., ***P.succinifera***), is known as **amber**. It is widely used in **ornaments** and **decoration work**.
- The wood and female cones of Pinus are used as fuel.

IMPORTANT POITNS:

1. **Endosperm** is formed by functional megaspore before fertilization in **gymnosperm**. so, it is **haploid**.
2. **Winged pollen grains** are found in **Pinus**, wings are formed from exine of pollens. These are **acellular**.
3. In Gymnosperms, gametes of **Cycas** and **Ginkgo** are motile and ciliated/Flagellated.
4. **Ephedra** is found in **Rajasthan** and in **Ephedra** pollination takes place at **5-celled** stage.
5. The **edible part** of **chilgoza seed** is **female gametophyte**.
6. In all seed bearing plants diplontic life cycle is found. In this type of life cycle pattern the diploid sporophyte is dominant. Photosynthetic independent phase of the plant. The gametophyte phase is represented by the single to few-celled haploid gametophyte.
7. ***Pinus longifolia*** known as Red wood of china

EXERCISE – 1

ULOTHRIX

Q.1 A motile flagellate asexual cell is known as -
(1) Zoospore (2) Zygospore
(3) Tetraspore (4) Zygote

Q.2 ***Ulothrix*** is a green algae because-
(1) It has a cell-wall
(2) Each cell has a single nucleus
(3) Each cell has a single chloroplast
(4) It has chl.'a', chl.'b', β-carotene and xanthophyll

Q.3 ***Ulothrix*** produces
(1) Quadri flagellate macrozoopores
(2) Biflagellate micro zoospores
(3) Quadriflagellate micro zoospores
(4) All the three types of zoospores stated above.

Q.4 The organ by which ***Ulothrix*** is attached to its substratrum is called a-
(1) Rhizoid (2) Holdfast
(3) Trichome (4) Root

Q.5 The number of flagella in the gametes of ***Ulothrix*** is -
(1) six (2) four
(3) one (4) none of the above

Q.6 The non-motile, highly thickened asexual spores are called-
(1) hypnospores (2) macro-spores
(3) aplanospores (4) micro zoospores

Q.7 The basal cell of Ulothrix is devoid of-
(1) Nucleus (2) Cytoplasm
(3) Chloroplast (4) All of these

Q.8 In Ulothrix reduction division occurs-
(1) In the gamete (2) In the zygospores
(3) In the zoospores (4) In the somatic cell

Q.9 The species of Ulothrix preferring Salty water is-
(1) ***U. flacca*** (2) ***U. tenarima***
(3) ***U. zonata*** (4) ***U. variabilis***

Q.10 The akinete formed during unfavourable conditions in the Ulothrix life cycle is-
(1) Protoplasm + thin cell
(2) Protoplasm + cell wall
(3) Cell + thick wall
(4) Naked protoplasm

Q.11 Which cell of ***Ulothrix*** does not divide-
(1) Rhizoidal cell (2) Apical cell
(3) Both the above (4) None of these

Q.12 In *Ulothrix,* colony formation occurs during-
(1) Formation of aplano spores
(2) Formation of zoospores
(3) Palmella stage (4) All of the above

Q.13 In ***Ulothrix***, eye spot does not occurs in-
(1) Zoospores (2) Gametes
(3) Microzoospores (4) None of the above

Q.14 In ***Ulothrix***, gametes are released in-
(1) Morning (2) After noon
(3) Evening (4) Night

Q.15 Which type of spores fix to substratum by anterior end at the time of germination-
(1) Macro zoospore (2) Micro zoospores
(3) Aplanospores (4) Hypno spores

Q.16 If ***Ulothrix*** is removed from water and placed in dry soil then it will produce-
(1) Aplanospores (2) Hypnospores
(3) Akinetes (4) Palmella stage

Q.17 When single thick walled aplanospore is produced in a cell of ***Ulothrix*** it is called-
(1) Akinete (2) Hypnospore
(3) Oidium (4) Torula

Q.18 Which type of gametes are produced in ***Ulothrix***-
(1) Biflagellate zoogametes
(2) Biflagellate antherozoids
(3) Quadriflagellate (4) Non motile gametes

Q.19 ***Ulothrix*** is-
(1) Homothallic (2) Heterothallic
(3) Protoandrous (4) 2 & 3 both

Q.20 ***Ulothrix*** inhabits-
(1) Slow flowing warm water
(2) Stagnant cool water
(3) Slow flowing cool water
(4) Any of the above

Q.21 Cells of ***Ulothrix*** are-
(1) Rectangular (2) Spherical
(3) Cylindrical (4) Ellipticle

Q.22 Pyrenoids are composed of-
(1) Starch (2) Protein
(3) Starch and lipid (4) Starch and protein

Q.23 Why Ulothrix is not considered a linear colony of cells-
(1) Because all cells are in a common cell wall
(2) Because cell exhibit a division of labour
(3) Because cells have plasmodesmatal connections
(4) All the above

Hint : In a colony cells mechanically held together generally in a gelatinous envelope. The cells in the colony have little or no dependence upon one another.

Q.24 Apical cell of thallus in Ulothrix is-
(1) Dome shaped (2) Cylindrical
(3) Rectangular (4) Club shaped

Q.25 Chloroplast of *Ulothrix* is-
(1) Girdle shaped with grana & intergrana
(2) Girdle shaped without or less developed grana & intergrana
(3) Disoidal with well developed grana
(4) Discoidal with poorly developed grana

SPIROGYRA

Q.26 Replicate septum occurs in -
(1) ***Ulothrix*** (2) ***Spirogyra***
(3) ***Chlamydomonas*** (4) All the above

Q.27 On germination each zygosopre of ***Spirogyra*** gives rise to-
(1) Four plants (2) Three plants
(3) Two plants (4) One plant

Q.28 Filament of ***Spirogyra*** is-
(1) Branched and filamentous
(2) Unbranched and filamentous
(3) Highly branched
(4) All the above

Q.29 ***Spirogyra*** also known as-
(1) Thread of wool (2) Water silk
(3) Pond silk (4) 2 and 3 both

Q.30 Gametes of ***Spirogyra*** are-
(1) Biflagellated (2) Multiflagellated
(3) Quadriflagellated (4) Non flagellated

Q.31 ***Spirogyra*** found in-
(1) Stagnant fresh water
(2) Running salt water
(3) Stagnant salt water
(4) Running fresh water

Q.32 Food is stored in ***Spirogyra*** in-
(1) Chloroplast (2) Pyrenoid
(3) Vacuole (4) Cytoplasm

Q.33 Scalariform conjugation occurs in-
(1) ***Ulothrix*** (2) ***Oedogonium***
(3) ***Spirogyra*** (4) ***Chlamydomonas***

Q.34 Which of the following produce non motile gametes-
(1) ***Ulothrix*** (2) ***Spirogyra***
(3) ***Anabaena*** (4) ***Cladophora***

Q.35 The sexual reproduction in ***Spirogyra*** is-
(1) Oogamous
(2) Physiological Anisogamous
(3) Cleistogamous
(4) None

Q.36 The zygospore of ***Spirogyra*** produces-
(1) 2-zoospores (2) 4-zoospores
(3) 2-4 zoospores (4) None of these

Q.37 The product of conjugation ***Spirogyra*** is called-
(1) Zoospores (2) Akinete
(3) Chlamydospore (4) Zygospore

Q.38 Flagellated stage are absent in-
(1) ***Ulothrix*** (2) ***Albugo***
(3) ***Spirogyra*** (4) ***Chlamydomonas***

Q.39 Which is the commn and advanced type of conjugation in ***Spirogyra***-
(1) Direct lateral conjugation
(2) Indirect lateral conjugation
(3) Scalariform conjugation
(4) None of these

Q.40 No growth of ***Spirogyra*** can occur in-
(1) River (2) Ponds
(3) Streams (4) Sea

RICCIA

Q.41 ***Riccia*** is a liverwort due to its-
(1) Use in liver disease (2) Liver like colour
(3) Shape
(4) Cause of liver disease

Q.42 How does the dehiscence of sporogonium and dispersal of spores occur in ***Riccia.***
(1) By internal pressure of elaters
(2) By death and decay of thallus and sporogonium and external pressure on calyptra
(3) By peristome teeth and seta
(4) By shrinking of annulus and dehiscence of capsule

Q.43 Scales on margins of ***Riccia*** are arranged in -
(1) Basipetal order (2) Acropetal order
(3) Scattered (4) None of the above

Q.44 Which of the following type of scales are found in ***Riccia***-
(1) Multicelled and ligulate
(2) Multicelled and appendiculate
(3) Unicelled and appendiculate
(4) Unicelled and ligulate

Q.45 In which of the following, sporogonium is having nurse cells-
(1) *Porella* (2) *Anthoceros*
(3) *Riccia* (4) *Marchantia*

Q.46 Rhizoids of **Riccia** are-
(1) One type and scattered
(2) One type and arranged in rows
(3) Two types and scattered
(4) Two type and arranged in rows

Q.47 Vegetative propagation is most common in -
(1) Fern sporophyte (2) Fern gametopyte
(3) *Riccia* gametophyte (4) *Riccia* sporophyte

Q.48 Where do air chambers occur in *Riccia*-
(1) Storage region
(2) Assimilatory zone
(3) Both (1) and (2)
(4) Below the lower epidermis

Q.49 Rosette habit of *Riccia* is due to-
(1) Dichotomous brancing
(2) Sympodial branching
(3) Monopodial branching
(4) Assymetrical branching

Q.50 How many antherozoids are produced from an Androgonial cell in *Riccia*-
(1) One (2) Two
(3) Three (4) Four

Q.51 What type of sexual reproduction occurs in *Riccia*-
(1) Isogamous (2) Anisogamous
(3) Oogamous (4) Conjugation

Q.52 The gametophytic phase of *Riccia* ends with-
(1) Gamete (2) Spore mother cells
(3) Spore (4) Oospore

Q.53 Aquatic *Riccia* are-
(1) Free floating (2) Submerged
(3) Amphibians (4) Suspended

Q.54 Spores release from sporogonium in *Riccia* take place in-
(1) Dry-season (2) Wet-season
(3) High temperature (4) Low temperature

Q.55 Cells of calyptra and wall of sporogonium in *Riccia* are respectively-
(1) Diploid, Diploid (2) Haploid, Haploid
(3) Triploid, Triploid (4) Haploid, Diploid

Q.56 Sex organ in *Riccia* develop on-
(1) Dorsal surface in acropetal order
(2) Dorsal surface in basipetal order
(3) Ventral surface in acropetal order
(4) Ventral surface in basipetal order

Q.57 Which statement/s is/are true-

(1) In *Riccia*, sporophyte is made up of only capsule

(2) In *Riccia* thallus rhizoids are present on ventral (adaxial) surface

(3) Six to eight cells are present in the axis of archegonium of *Riccia*

(4) All of these

Q.58 In dry weather, *Riccia* survives in form of-

(1) Tubers (2) Peristent apices

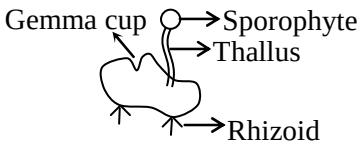
(3) Spores (4) All the above

Q.59 At the time of fertilization, how many cell/cells is/are present in the axis of archegonium of *Riccia*-

(1) One (2) Two

(3) Three (4) Four

Q.60 Given diagram related to which plant group :



(1) Thallophyta (2) Pteridophyta

(3) Bryophyta (4) Gymnosperm

Q.61 During formation of calyptra jacked cells divided by-

(1) Periclinal division (2) Anticlinal division

(3) Both (1) and (2) (4) Diagonal division

Q.62 In which of the following groups would you place a plant which produces spores and embryos but lacks seeds and vascular tissues-

(1) Bryophytes (2) Pteridophytes

(3) Gymnosperms (4) Fungi

Q.63 In aquatic *Riccia*-

(1) Rhizoids absent

(2) Scales poorly developed or absent

(3) Air canals more developed

(4) All the above

Q.64 Which characteristic assign *Riccia* to bryophyte-

(1) Depended sporophyte

(2) Plant body thallus

(3) Free gametophyte

(4) Non vascular

Q.65 In the life cycle of *Riccia* from 20 Androgonial cells, how many antherozoids will be formed-

(1) 10 (2) 20

(3) 40 (4) 80

Q.66 Which structure protects apical meristem in *Riccia* -

(1) Apical notch (2) Scales

(3) Primordial leaves

(4) Position of sex organ

Q.67 Which species of *Riccia* reproduces by Persistent apices-

(1) *R.glauca* (2) *R.curtisi*

(3) *R.bischoffii* (4) *R.discolor*

Q.68 The cell walls of mature spores in Riccia have

(1) One layer (2) Two layer

(3) Three layer (4) None of these

Q.69 If '6' chromosomes are present in each cell of the spore tetrad of *Riccia*. How many chromosomes should be present in the cells of apical cell and calyptra? Respectively-

(1) 6 & 12 (2) 6 & 6

(3) 12 & 6 (4) 3 & 6

Q.70 Bryophytes grow in moist and shady environments because-

(1) They cannot grow on land

(2) They requires water for fertilization

(3) They lack vascular tissue

(4) They lack roots and stomata

FUNERIA

Q.71 The two layers of teeth in the peristome of moss are-

(1) Decorative part functioning like sepals and petals in a flower

(2) Parts which help in the discharge of spores only when the capsule matures. After the operculum falls. They dry up and open out

(3) Parts which help in the gradual dispersal of spores. The upper teeth are hygroscopic and open out only in dry weather. The lower ones check sudden dispersal

(4) Part which help in the dispersal of spores. They are not hygroscopic and allow the discharge of spores by disintegration of capsule wall

Q.72 A bryophytes differs from Pteridophytes in-
(1) Presence of archegonia
(2) Lack of vascular tissues
(3) Presence of swimming antherozid
(4) Independent gametophyte

Q.73 Funaria is included in Bryophytes because-
(1) Heteromorphic alternation of generation
(2) It lacks roots
(3) Sporophyte is attached to gametophyte
(4) It lacks xylem

Q.74 Rhizoids of Funaria are-
(1) Multicellular
(2) Unicellular
(3) Multicellular, branched with oblique septum
(4) Tuberculated

Q.75 Conducting tissues in moss is made up of-
(1) Xylem (2) Parenchyma
(3) Collenchyma (4) Xylem and Phloem

Q.76 In Moss, medulla has -
(1) Piliferous layer (2) Endodermis
(3) Hadrome (4) Hypodermis

Q.77 Which of the following type of sex organs are found in ***Funaria***-
(1) Projecting and sessile
(2) Projecting and stalked
(3) Embedded and sessile
(4) Embedded and stalked

Q.78 In ***Funaria*** -
(1) Male and female reproductive organ are present on same branch
(2) Male and female reproductive organ are present on the different branches of same plant.
(3) Male and female reproductive organs on different plant
(4) None of these

Q.79 Which one of the following is not a part of moss gametophyte-
(1) Calyptra (2) Spore
(3) Protonema (4) Columella

Q.80 Why Mosses are found in moist regions -
(1) Because water is needed for fertilization
(2) Because rate of transpiration is very high
(3) Because it is free floating hydrophyte
(4) None of these

Q.81 Cells in leaves of *Funaria* are-
(1) Polyploid (2) Diploid
(3) Haploid (4) Haploid & Diploid

Q.82 The number of cells in neck canal of archegonium of Moss is -
(1) 1 (2) 2
(3) 4 (4) 6-10

Q.83 The sporophytic phase in *Funaria* is composed of -
(1) Foot and capsule
(2) Foot, seta and capsule
(3) Capsule only
(4) Spore sac

Q.84 Moss capsule represents -
(1) Gametophyte
(2) Sporophyte
(3) A part of protonema
(4) A part of sorus

Q.85 Stomata are present in *Funaria* plant on the-
(1) Upper part of capsule
(2) Lower part of capsule
(3) Leaf
(4) Stem

Q.86 Annulus of Moss capsule separates-
(1) Theca and columela
(2) Columela from apophysis
(3) Operculum and columela
(4) Operculum from theca

MUCOR & RHIZOPUS

Q.87 Reproduction in Mucor takes place by
(1) Anisogametes (2) Isogametangia
(3) Agametes (4) None

Q.88 The zygospore of Mucor thick walled and its colour is
(1) Blue (2) White
(3) Green (4) Black

Q.89 Zygospore of Mucor germinates to form
(1) Mycelium (2) Promycelium
(3) Germ tube (4) Hyphae

Q.90 In Mucor, heterothallism was discovered by -
(1) Lederberg and Tatum
(2) Debary
(3) Pontecorvo
(4) Blakeslee

Q.91 Yeast like budding of oidia in Mucor is termed as
(1) Gongrosira stage (2) Torula stage
(3) Palmella stage (4) None

Q.92 Thick walled spore like structure formed in the mycelium of Mucor are named as -
(1) Hypnospore (2) Akinetes
(3) Oidia (4) Chlamydospores

Q.93 How many zones are present in the sporangia of Mucor which develops from a vegetative mycelium -
(1) Two (2) Three
(3) Four (4) Five

Q.94 Zygospores are formed in -
(1) Puccinia (2) Penicillium
(3) Alternaria (4) Mucor

Q.95 Coenogametes are formed in -
(1) Mucor (2) Puccinia
(3) Pencillium (4) Ustilago

Q.96 Torula condition occurs in
(1) Mucor (2) Rhizopus
(3) Both (1) and (2) (4) Puccinia

ALBUGO & CYSTOPUS

Q.97 The disease produced by Albugo on the crucifers is
(1) Rust (2) White-rust
(3) Red rust (4) Black-rust

Q.98 The mycelium of the albugo is
(1) Inter cellular, septate
(2) Intracellular, aseptate
(3) Intra cellular, septate
(4) Intercellular, aspetate

Q.99 From one crop to next another; the infection of Albugo reaches in the form of
(1) Conidia (2) Mycelium
(3) Oospore (4) Zoospore

Q.100 The male gamete in albugo reaches to the female gamete by
(1) Flagella (2) Fertilization tube
(3) Swimming (4) Chemotaxis

Q.101 Which of the following sets of conditions favour rapid spread of white rust disease
(1) High temperature + High humidity
(2) Low temperature + High Humidity
(3) High temperature + Low humidity
(4) Low temperature + Low humidity

Q.102 *Albugo bliti* attacks on
(1) *Sonchus* (2) *Portulaca*
(3) *Amaranthus* (4) Sweet potato

Q.103 Haustoria of albugo are
(1) Sessile (2) Stalked
(3) Appendiculate (4) Biramous

Q.104 Sexual reproduction in albugo produced which type of symptoms on host plant
(1) Hypertrophy & deformation
(2) Raised white spots
(3) Phylloidy (4) All the above

Q.105 After fertilization ***coenocentrum*** in albugo
(1) Persists (2) Grows in size
(3) Grows in number (4) Disappears

Q.106 Haustoria of Albugo is
(1) Club shaped (2) Button shaped
(3) Palmate (4) Pinnate

Q.107 Viruses are similar to albugo in
(1) Being obligate parasite
(2) Having DNA as genetic material
(3) Being Coenocytic
(4) All the above

Q.108 Resting oospore of *A.candida* contains
(1) 100-nuclei (2) 64-nuclei
(3) 32-nuclei (4) One nucleus

Q.109 Which of the following is the source of primary infection by Albugo candida
(1) Soil born oospores
(2) Conidia born on ***Cleome visocsa***
(3) Conidia born on crop host
(4) 1 and 2 both

Q.110 Albugo is
(1) Intercellular, obligate parasite
(2) Intracellular, obligate parasite
(3) Intercellular, facultative parasite
(4) Intercellular, facultative saprophyte

Q.111 Which stain and mount are generally used for fungi
(1) Cotton blue and glycerine
(2) Saffranine and glycerine
(3) Cotton blue and Lactophenol
(4) Eosine & Lactophenol

Q.112 Conidia of ***Albugo-candida*** collected from mustard are not infective to raddish leaves because
(1) Thick cuticle on raddish leaves
(2) Raddish leaves secrete antibiotics
(3) Biological specialization in Albugo-candida
(4) Biological specialization is radish

Q.113 Study of secondary infection is called
(1) Etiology (2) Ecology
(3) Epidemiology (4) Pathology

Q.114 Bordeaux mixture is first fugicide, is discovered by
(1) Millardet (2) De-berry
(3) Mitchelli (4) Alexopolus

Q.115 How many nuclei is/are found in conidia of Albugo
(1) 1 (2) 2-3
(3) 3-8 (4) Many

Q.116 At what stage septa are formed in Albugo
(1) At the time of vegetative growth
(2) At the time of haustorial formation
(3) At the time of sexual & asexual reproduction
(4) Never Formed

Q.117 Albugo is found
(1) In dung
(2) In streams
(3) In decaying organic matter
(4) On the leaves of a living plant

Q.118 Which part of the plant is not infected by Albugo
(1) Stem (2) Root
(3) Leaf (4) Flowers

Q.119 Most common method of asexual reproduction in Albugo, by
(1) Zoosporangia (2) Aplanospores
(3) Conidiosporangia (4) Zygospore

SELAGINELLA

Q.120 Main plant body of the selaginella is :
(1) A gametophyte (2) A sporophyte
(3) Half gametophyte (4) Haploid phase

Q.121 The number of megaspores in ***Selaginella rupestris*** is:
(1) One (2) Two
(3) Three (4) Four

Q.122 Which is the epiphytic species of selaginella
(1) S. Lepidophylla (2) S. Oregana
(3) S. kraussiana (4) S. rupestris

Q.123 The 13-celled male gametophyte of Selaginella has
(1) 10 cells of the antheridium + 1 prothallial cells
(2) 12 cells of the antheridium + 1 prothallial cells
(3) 9 cells of the antheridium + 4 prothallial cells
(4) 8 cells of the antheridium +5 prothallial cells

Q.124 Which organ of the selaginella is "Organ sui-generis"-
(1) Root (2) Stem
(3) Ligule (4) Rhizophore

Q.125 Which type of stele is found in rhizophore of selaginella
(1) Monarch (2) Diarch
(3) Triarch (4) Polyarch

Q.126 Rhizophore is not a true root because it is
(1) Endogenous (2) Exogenous
(3) Intermediate (4) None of above

Q.127 Glossopodium is found in selaginella-
(1) In root (2) In rhizophore
(3) In stem (4) In leaves

Q.128 How many cotyledons are present in embryo of selaginella
(1) Two cotyledons (2) One cotyledons
(3) Many cotyledons (4) Cotyledon absent

Q.129 By which type of leaf is found in selaginella
(1) Aligulate and microphyllous
(2) Ligulate and megaphyllous
(3) Ligulate and microphyllous
(4) Aligulate and megaphyllous

Q.130 In which of the following trabeculated endoderm is found
(1) Funaria (2) Selaginella
(3) Monocots (4) Dicots

Q.131 By in which character selaginella is alike as Gymnosperm
(1) In heterospory (2) In vascular tissues
(3) Cone (4) All of the above

Q.132 Which structure is developed from microspore of the selaginella
(1) Male gametophyte
(2) Female gametophyte
(3) Male sporophyte
(4) Female sporophyte

Q.133 In which plant, male and female sporangia are developed in same plant
(1) Dryopteris (2) Cycas
(3) Selaginella (4) Nephrolepis

PTERIDIUM

Q.134 Which of the following venation is characteristic of fern -
(1) Parallel
(2) Reticulate
(3) Open and furcate
(4) Closed and dichotomous

Q.135 The most important characteristic of a fern plant is -
(1) Circinate pinnules
(2) Photosynthetic sporophyll
(3) Compound leaves
(4) Spores in sporangia

Q.136 The stele of **Pteridium** root is -
(1) Diarch, exarch
(2) Diarch, endarch
(3) Polyarch, exarch
(4) Polyarch, endarch

Q.137 Meristele of **pteridium** is -
(1) Collateral
(2) Concentric and leptocentric
(3) Bicollateral and leptocentric
(4) Amphicribral and mesarch

Q.138 Sori of **Pteris** and **Pteridium** are -
(1) Continous and linear
(2) Discontinous and circular
(3) Discontinous and reniform
(4) Discontinous and vermiform

Q.139 Protective structure of fern sorus is -
(1) Ramenta (2) Indusium
(3) Tapetum (4) Stomium

Q.140 The shape of fern sporangium is -
(1) Bi-concave (2) Bi-convex
(3) Plano-convex (4) Plano-concave

Q.141 Which combination of characteristics is correct for a fern sporangium -
(1) Sessile, Unicellular, non-jacketed
(2) Stalked, unicellular, non jacketed
(3) Sessile, multicellular, non jacketed
(4) Stalked, multicellular, jacketed

Q.142 Which of the following statements is not correct for **Pteridium** -
(1) Young sporophyte is parasite on gametophyte
(2) Free alternation of generation
(3) Exhibits a step in evolution of seed habit
(4) Gametophyte is parasite on sporophyte

Q.143 In **Pteridium** cross fertilization take place due to -
(1) Protandry (2) Protogyny
(3) Dicliny (4) Monocliny

Q.144 In **Pteridium,** antheridium and archegonium are respectively -
(1) Stalkless and stalked
(2) Stalked and stalkless
(3) Both stalked
(4) Both stalkless

Q.145 Embryonal leaves of **Pteridium** are -
(1) Simple
(2) Bipinnate-Paripinnate
(3) Bipinnate-Imparipinnate
(4) Unipinnate

Q.146 True and false indusia can be differentiated on the basis of -
(1) Origin (2) Function
(3) Structure (4) All the above

Q.147 Stem of **Pteridium** is -
(1) Vertical in soil (2) Horizontal in soil
(3) Tuber like (4) Sub-aerial

Q.148 Dehiscence of sporangium in pteridium take place -
(1) In dry season by water loss
(2) In wet season by water absorption
(3) By mucilage formation
(4) Any of above

Q.149 In Fern stem xylem is -
(1) Exarch (2) Mesarch
(3) Endarch (4) Polyarch

Q.150 Neck of the archegonium of fern is -
(1) Long & Straight (2) Short and straight
(3) Long and curved (4) Short and curved

Q.151 Leaf-gap in the vascular cylinder in fern is -
(1) Air space
(2) Parenchymatous zone
(3) Collenchymatous zone
(4) Area exclusively of phloem

Q.152 The ferns are usually found in -
(1) Near marshy places
(2) Marshy places
(3) Moist and shady places
(4) Dry climate

Q.153 The sori bearing leaves of pteridium are known as -
(1) Apophylls (2) Sporophylls
(3) Tropophylls (4) Sclerophylls

Q.154 The Chief characteristic of ferm leaf is that they-
(1) Have ramenta
(2) Are microphyllous
(3) Have ramenta and circinate vernation when young
(4) Are simple

Q.155 In **Pteridium** the root are -
(1) tap root (2) Adventitious roots
(3) Rhizoids (4) Coralloid

Q.156 In **Pteridium,** main plant body represent -
(1) Sporophytic generation
(2) Gametophytic generation
(3) None of the above
(4) May be sporophyte

Q.157 The **Prothallus** of pteridium is -
(1) Kidney shaped (2) Club-shaped
(3) Heart shaped (4) Flask shaped

Q.158 The stem and petiole are covered with numerous brownish scale like structure which are called -
(1) Root hair (2) Hairs
(3) Ramenta (4) Scales

Q.159 The **pteridium** plant is -
(1) Homosporous
(2) Heterosporous
(3) None of the above
(4) May be heterosporous or Homosporous

Q.160 The prothallus of **Pteridium** represents -
(1) Sporophytic generation
(2) Gametophytic generation
(3) Both of the above
(4) Asexual stage

Q.161 The sex organs that develop towards the rhizoids of fern prothallus are called as -
(1) Archegonia (2) Antheridia
(3) None of above (4) Sporangia

Q.162 In **Pteridium the archegonia** are present -
(1) Near rhizoids on lower surface
(2) Near anterior notch on lower surface
(3) Distributed on whole surface
(4) On posterior end of prothallus

Q.163 The stele of **pteridium** is a -
(1) Dictyostele (2) Eustele
(3) Siphonostele (4) Protostele

Q.164 The sori of pteridium are covered by a thick multicellular covering known as -
(1) Indusium (2) Ramenta
(3) Stele (4) Sclerenchyma

Q.165 The sori in pteridium are found on -
(1) Lateral surface of sporophyll
(2) Abaxial surface of sporophyll
(3) Adaxial surface of sporophyll
(4) On the margins of leaves

Q.166 The capsule of sprogonium of fern contains-
(1) 32 or 64 spores (2) 8 spores
(3) 128 spores (4) 16 spores

Q.167 The capsule of fern sporangium brust at a place called -
(1) Annulus (2) Stomium
(3) Placenta (4) Ramenta

Q.168 Which of the following is not involved in the fertilization of ferns -
(1) Pollen tube (2) Water
(3) Archegonium
(4) Flagellated antherozoids

Q.169 Pteridium prothallus normally is -
(1) Haploid (2) Diploid
(3) Tetraploid (4) Triploid

Q.170 The major role in the dehiscence of a fern sporangium is played by its -
(1) Indusium (2) Annulus
(3) Stomium (4) None of these

Q.171 Spores of **Pteridium are -**
(1) Haploid (2) Diploid
(3) Tetraploid (4) Hexaploid

Q.172 In the archegonium of **Pteridium** the number of neck-canal cells is / are -
(1) 4 (2) 2
(3) 3 (4) 1

Q.173 Prothallus of pteridium bears -
(1) Sporangia (2) Sex organ
(3) Both sporangia and sex organ
(4) None of the above

CYCAS

Q.174 Female cone is absent in which gymnosperm :
(1) Cycas (2) Pinus
(3) Ephedra (4) None of these

Q.175 How many species of Cycas are found in India:
(1) 20 (2) 4
(3) 2 (4) 1

Q.176 How many kinds of leaves are found in Cycas :
(1) 3 (2) 2
(3) 1 (4) 0

Q.177 Cycas trunk is covered with :
(1) Leaves (2) Leaf bases
(3) Scale leaves (4) Both (1) and (2)

Q.178 Inverted 'Omega' (Ω) shaped arrangement of vascular bundles are found in :
(1) Cycas leaf (2) Cycas rachis
(3) Cycas stem (4) Cycas root

Q.179 Transfusion tissue is found in :
(1) Cycas leaf (2) Cycas leaflet
(3) Cycas petiole (4) Cycas root

Q.180 Cycas is :
(1) Monoecious (2) Dioecious
(3) Sterile (4) None of these

Q.181 Pollen grains are shed at ..... celled stage in Cycas :
(1) 4 (2) 3
(3) 2 (4) 1

Q.182 The number of prothallial cells in male gametophyte of Cycas is :
(1) 1 (2) 2
(3) 3 (4) 0

Q.183 Cycas ovule is :
(1) Orthotropous and unitegmic
(2) Orthotropous and bitegmic
(3) Anatropous and unitegmic
(4) None of the above

Q.184 How many archegonia develop on one gametophyte of Cycas :
(1) 1 (2) 2
(3) 1 - 5 (4) 3 - 6

Q.185 Male gametes are largest and visible to naked eyes in :
(1) Cycas (2) Pinus
(3) Gnetum (4) Ginkgo

Q.186 The number of neck canal cells in the archegonium of Cycas is/are :
(1) 2 (2) 4
(3) 6 (4) 0

Q.187 The number of cotyledons in seed of Cycas is/are :
(1) 1 (2) 2
(3) Many (4) All of these

Q.188 Cycas plant is like ..... in appearance :
(1) Mango (2) Wheat
(3) Palm (4) Ficus

Q.189 Leaves in Cycas show :
(1) Hydrophytic characters
(2) Xerophytic characters
(3) Mesophytic characters
(4) Lithophytic characters

Q.190 Stem of Cycas contains :
(1) Pycnoxylic wood (2) Manoxylic wood
(3) Heart wood (4) Porous wood

Q.191 Number of ovules present on megasporophyll of Cycas is :
(1) Only one (2) One pair
(3) 1-6 pairs (4) Absent

Q.192 Cycas is a gymnosperm because
(1) It form seeds
(2) It bear pollen grains
(3) It lacks ovary but has exposed ovules
(4) Its xylem consists of tracheids

PINUS

Q.193 Which of the following is commonly known as "Blue pine" : -
(1) ***Pinus roxburghii***
(2) ***P.Strobus***
(3) ***P. Wallichiana***
(4) ***P. Sylvestris***

Q.194 Which is commonly known as "Khasi Palm"
(1) ***Pinus strobus*** (2) ***P. wallichiana***
(3) ***P. sylvestris*** (4) ***P. insularis***

Q.195 Why **Pinus** seedling do not grow on places after fire. This is because the soil becomes
(1) Hard
(2) Devoid of bacteria
(3) Dry (4) Devoid of fungi

Q.196 Foliage leaves of Pinus are borne on :
(1) Branches of unlimited growth
(2) Branches of limited growth
(3) Both of above
(4) None of above

Q.197 Which type of resin canal are found in cortex and secondary xylem of the stem of Pinus : -
(1) Schizogenous cavities
(2) Lysigenous cavities
(3) Schizolysigenous cavities
(4) None of these

Q.198 Dimorphic branches and leaves are found in -
(1) Pea (2) Cycas
(3) Pinus (4) Fern

Q.199 Sclerenchymatous hypodermis in Pinus needle helps in
(1) Mechanical support
(2) Checking transpiration
(3) Photosynthesis
(4) Increasing the absorptive surface of the cell

Q.200 The mesophyll tissue of Pinus needle is -
(1) Collenchyma
(2) Spongy parenchyma
(3) Armed parenchyma
(4) Transfusion tissue

Q.201 In *Pinus roxburghii*, microsporophyll are having :
(1) 2 Microsporangia on abaxial side
(2) 4 Microsporangia on adaxial side
(3) 2 Microsporangia on adaxial side
(4) 4 Microsporangia on abaxial side

Q.202 Vascular bundles in leaves of Pinus needle are:
(1) Collateral & closed
(2) Collateral & open
(3) Radial (4) None of above

Q.203 Foliar spur of **Pinus sylvestris** is called : -
(1) Unifoliar (2) Bifoliar
(3) Trifoliar (4) Pentafoliar

Q.204 Vascular bundle in stem of Pinus is : -
(1) Conjoint, Collateral and Endarch
(2) Conjoint, Collateral and Exarch
(3) Radial and diarch
(4) Conjoint, Bicollateral and Endarch

Q.205 **Pinus armandi** is known as : -
(1) Unifoliar (2) Bifoliar
(3) Trifoliar (4) Penta foliar

Q.206 **Pinus** is a cold xerophyte, its adaptation is/are-
(1) Thick cuticle & sunken stomata
(2) Sclerenchymatous hypodermis in leaves
(3) Compact mesophyll of armed parenchyma
(4) All the above

Q.207 Male cone of **Pinus** is a modification of
(1) Long shoot (2) Dwarf shoot
(3) Megasporophylls (4) Vegetative leaves

Q.208 What causes sulphur clouds in spring season of temperate climate :
(1) Male gametophytes of Pine
(2) Male gamets of Pine
(3) Volatile resin & turpentine
(4) Sulphur bacteria

Q.209 The male gametophyte of gymnosperms differ from angiosperms in having -
(1) One or more prothallial cells
(2) No prothallial cells
(3) One male gamete
(4) One tube nucleus

Q.210 Wings of **Pinus** pollen grains are -
(1) Multicellular (2) Unicellular
(3) Acellular (4) Coenocytic

Q.211 If the chromosome number of cells of nucellus of megasporangium of Pinus 16 (sixteen) what would be the chromosome number of endosperm cells :
(1) 32 (2) 16
(3) 48 (4) 08

Q.212 Female cone of **Pinus** is considered a modified
(1) Flower (2) Dwarf shoot
(3) Long shoot (4) Sporophyll

Q.213 The ovuliferous scale of **Pinus** is part of -
(1) Microsporophyll (2) Ovule
(3) Dwarf shoot (4) Megasporophyll

Q.214 In Pinus the megaspore after germination develops into -
(1) Endosperm with naked egg
(2) Endosperm with embryo sac
(3) Endosperm with archegonia
(4) Pollen tube with two motile male gametes

Q.215 In **Pinus** oospore develops into
(1) Compound suspensor with a single embryonal mass
(2) No suspensor but single embryo mass
(3) Compound coiled suspensor with four embryo masses formed by cleavage polyembryony
(4) Simple suspensor with single embryo

Q.216 What is the intermediate stage in the development of the embryo of Pinus
(1) Protonema (2) Polyembryony
(3) Proembryo (4) Protocorm

Q.217 The development of embryo in **Pinus** is
(1) Discoblastic (2) Meroblastic
(3) Periblastic (4) Mesoblastic

EXERCISE – 2

ULOTHRIX

Q.1 Hold-fast of *Ulothrix* is-
(1) Living and without chloroplast
(2) Living and without nucleus
(3) Non-living and without chloroplast
(4) Non-living and with nucleus

Q.2 Red eye spot of zoospores of *Ulothrix* is made up of-
(1) Lycopene (2) Haematochrome
(3) Carotene (4) Leutine

Q.3 The name "Palmella Stage" is after the name of a-
(1) Lady (2) Slime molds
(3) Scientist (4) Algae

Q.4 How many mating types occur in *Ulothrix*-
(1) One (2) Two
(3) Three (4) Many

Q.5 Vegetative reproduction in Ulothrix takes place by-
(1) Parthenogenesis (2) Fragmentation
(3) Harmogonium (4) Aplanospore

Q.6 Lithophytic species of Ulothrix is-
(1) ***U. implexa*** (2) ***U. flacca***
(3) ***U. zonata*** (4) ***U. flaccida***

Q.7 In Ulothrix food is stored in the form of-
(1) Protein (2) Starch
(3) Pyrenoid (4) Lipid

Q.8 Which type of sexual reproduction occurs in Ulothrix-
(1) Isogamous (2) Anisogamous
(3) Oogamous (4) Conjugation

Q.9 In Ulothrix, Zygote is initially-
(1) Uniflagellate (2) Biflagellate
(3) Quadriflagellate (4) Aflagellate

Q.10 One celled sporophyte are found in-
(1) Ulothrix (2) Riccia
(3) Moss (4) Fern

Q.11 The zoospores of Ulothrix exhibit a closer resemblance to the thallus of -
(1) Ulothrix (2) Chlamydomonas
(3) Palmella (4) Chlorella

Q.12 Micro zoospores in Ulothrix are-
(1) Biflagellate (2) Quadri flagellate
(3) Both (1) & (2) (4) Multiflagellate

Q.13 How many zoospores are produced in a single cell of Ulothrix-
(1) 1-8 (2) 8-16
(3) 8-32 (4) 8-64

Q.14 The type of zoospores not formed in Ulothrix are-
(1) Qudriflagellated macro zoospores
(2) Qudriflagellated micro zoospores
(3) Biflagellated macro zoospores
(4) Biflagellated micro zoospores

Q.15 How many chloroplast occur in Ulothrix cell-
(1) One, Girdle shaped (2) Two, star shaped
(3) Three, Girdle shaped
(4) Biflagellated zoospores

Q.16 The zoo gametangia and zoo sporangia of Ulothrix are-
(1) Jacketed and unicellular
(2) Non-jacketed and unicellular
(3) Jacketed and multi cellular
(4) Non jacketed and multi cellular

Q.17 Parthenogenesis in Ulothrix forms a resting structure called-
(1) Zygospore (2) Azygospore
(3) Hypnospore (4) Zoospores

Q.18 The cause of polarity in Ulothrix is due to-
(1) Apical cell (2) Basal cell
(3) Intercalary cell
(4) Both apical and Basal cell together

Q.19 Which of the following reproductive structure is equivalent to a complete cells-
(1) Aplanospore (2) Zoospore
(3) Akinete (4) Hypnospore

Q.20 Ulothrix is-
(1) A colonial algae
(2) An anchored & branched algae
(3) An attached filamentous algae
(4) A free floating algae

Q.21 Filaments of Ulothrix are-
(1) Brick shaped (2) Branched
(3) Girdle shaped (4) Unbranched

Q.22 How many thalli (filaments) are produced from the germination of a zygospore of Ulothrix-
(1) 1-4 (2) 4-16
(3) 16-32 (4) 4-64

Q.23 What type of nuclear division occurs at the time of the germination of zoospores and zygospore respectively?
(1) Both mitotic (2) Mitotic and meiotic
(3) Meiotic and mitotic (4) Both meiotic

Q.24 If total 52 cells are present in a Ulothrix filament, how many of them can divided to produce zoospore or aplanospores-
(1) All the 52 (2) 51 only
(3) 40 only (4) 1 only

Q.25 Ulothrix cell have a double layered cell-
(1) The outer of cellulose and inner of protopectin
(2) Inner of cellulose and outer of protopectin
(3) Both of cellulose
(4) Both of pectin

Q.26 In Ulothrix the common mode of Asexual reproduction take place by-
(1) Aplanospores (2) Macro-zoospores
(3) Micro-zoospores
(4) Macro & micro zoospores

SPIROGYRA

Q.27 In ***Spirogyra***, Meiosis occurs-
(1) During conjugation
(2) During vegetative reproduction
(3) During formation of gametes
(4) As the zygospores germinates

Q.28 ***Spirogyra*** belongs to-
(1) volvocales (2) conjugales
(3) ulotrichales (4) siphonales

Q.29 Which is not true for ***Spirogyra***-
(1) Spiral chloroplast
(2) Presence of pyrenoids
(3) Flagellated zoospores
(4) Presence of chlorophyll 'a' and 'b'

Q.30 Ribbon shaped chloroplast is found in-
(1) ***Spirogyra*** (2) ***Ulothrix***
(3) ***Chlamydomonas*** (4) ***Nostoc***

Q.31 How many chloroplast occur in a single cell of ***Spirogyra***-
(1) One to four (2) One to eight
(3) Four to eight (4) One to sixteen

Q.32 The outer cell-wall of ***Spirogyra*** is made up of-
(1) Cellulose (2) Pectin/Pectose
(3) Hemicellulose (4)Protein

Q.33 Cell wall of ***Spirogyra*** is-
(1) One layered (2) Two layered
(3) Three layered (4) Four layered

Q.34 ***Spirogyra*** is more advanced than ***Ulothrix*** because it has-
(1) Internal fertilization
(2) Multicellular thallus
(3) Absence of hold fast
(4) Heterothallic thallus

Q.35 ***Spirogyra*** appear ladder like during-
(1) Lateral conjugation
(2) Direct lateral conjugation
(3) Scalariform conjugation
(4) Semidrying condition

Q.36 In which of the following plant archegonium is absent -
(1) ***Spirogyra*** (2) ***Funaria***
(3) ***Pteris*** (4) ***Cycas***

Q.37 At the time of germination of zygospore in ***Spirogyra***-
(1) All haploid nuclei are functional
(2) Only one haploid nucleus is functional
(3) Diploid nucleus does not divide
(4) Diploid nucleus divides mitotically

Q.38 Pyrenoid is found in one of the following organs of ***Spirogyra***-
(1) Nucleus (2) Chloroplast
(3) Cytoplasm (4) Cell wall

Q.39 Sexual reproduction in ***Spirogyra*** is an advanced feature because it shows-
(1) Different sizes of motile sex organs
(2) Same size of motile sex organs
(3) Morphologically different sex organs
(4) Physiologically differentiated sex organs

Q.40 The sexual reproduction in which cells of two different spirogyra filaments conjugate is known as-
(1) Lateral conjugation
(2) Scalariform conjugation
(3) Parthenospory
(4) Azygospory

Q.41 ***Spirogyra*** has a-
(1) Haplontic life cycle
(2) Haplodiplontic life cycle
(3) Diplontic life cycle
(4) Diplohaplontic life cycle

RICCIA

Q.42 What is the function of the Ventral scales of *Riccia*-
(1) Fixation
(2) Absorption and protection
(3) Protection
(4) Perennation and protection

Q.43 In *Riccia*, stomata are found on-
(1) Dorsal assimilatory region
(2) Sporangium
(3) Ventral scales
(4) No where on ***Riccia***

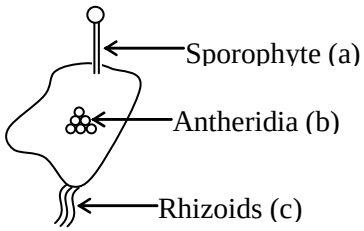
Q.44 **Violet colour** of scales of **Riccia** is due to-
(1) Presence of anthocyanin pigment in cytoplasm
(2) Presence of anthocyanin pigment in cell sap
(3) Presence of anthocyanin pigment in chloroplast
(4) None of the above

Q.45 In *Riccia*, whats is the first and last stage of gametophytic generation-
(1) Gamete and spore
(2) Spore and gamete
(3) Spore mother cell and zygote
(4) Sporocyte and gamete

Q.46 The gametangia of ***Riccia*** are present in -
(1) Dorsal side (2) Ventral side
(3) Dorsal surface in medium groove
(4) Any where in the thallus

Q.47 In the life cycle of ***Riccia***, the stage in which meiosis occurs is-
(1) Sporogonium (2) Oospore
(3) Spore mother cell (4) Gamete formation

Q.48 Given a picture of Bryophyte. The correct ploidy levels of the indicated structure are-



(1) (a) ; 2N (b) ; N (c) ; N
(2) (a) ; N (b) ; N (c) ; N
(3) (a) ; N (b) ; 2N (c) ; 2N
(4) (a) ; 2N (b) ; N (c) ; 2N

Q.49 Conducting tissue in *Riccia* is made up of-
(1) Parenchyma (2) Collenchyma
(3) Xylem and Phloem (4) Thick walled cells

Q.50 The nature of movement of antherozoids in *Riccia* is-
(1) Phototactic (2) Chemotactic
(3) Chemotrophic (4) Chemonastic

Q.51 The simplest sporophyte among bryophyte is of-
(1) *Riccia* (2) *Marchantia*
(3) *Anthoceros* (4) Moss

Q.52 In *Riccia*, the shape of antheridium is-
(1) Pear-shaped (2) Spherical
(3) Conical shaped (4) Flask-shaped

Q.53 *Riccia* and other bryophytes differ from algae in-
(1) Discoidal chloroplast and absence of pyrenoids
(2) Jacketed gametangia and sporangia
(3) Mitotic development of Oospores into embryo
(4) All of these

Q.54 In *Riccia*, what is first cell of a gametophytic and first cell of a sporophytic generation respectively-
(1) Gamete and spore (2) Spore and Oospore
(3) Oospore and Spore (4) Spore and gamete

Q.55 In *Riccia*, reduction division take place in-
(1) Archegonium (2) Antheridium
(3) Capsule (4) Rhizoids

Q.56 *Riccia* is a bryophyte because-
(1) It occurs mostly on land and have motile sperm
(2) It has heteromorphic alternation of generation
(3) It has multicelled sex organ with a jacket of sterile cells
(4) Sporophyte depends upon gametophyte

Q.57 The positive evidence of aquatic ancestry of Bryophyte is-
(1) Their green colour
(2) Thread like protonema
(3) Flagellated antherozoids
(4) Some bryophytes are still aquatic

Q.58 What is the most common method of vegetative reproduction of *Riccia*-
(1) Fragmentation
(2) Formation of adventitious buds
(3) Progressive death and decay of older parts of the cells
(4) Tuber formation

Q.59 The assimilatory tissue of *Riccia* thallus is made up of-
(1) Assimilatory filaments
(2) Spongy mesophyll
(3) Palisade tissue (4) Both (2) and (3)

Q.60 Exchange of gases into assimilatory region occurs via-
(1) Stomata (2) Air pores
(3) Lenticels (4) All of these

Q.61 Which structures causes apical growth in *Riccia*?
(1) Promeristem (2) Procambium
(3) Transverse row of apical cell
(4) All of these

Q.62 The neck canal of *Riccia* archegonium is filled up with-
(1) 2-cells (2) 4-6 cells
(3) 6-12 cells (4) 24 cells

Q.63 Sporophyte of *Riccia* possess-
(1) Foot and Seta
(2) Foot and capsule
(3) Foot, Seta and Capsule
(4) Capsule only

Q.64 The sporophyte is completely dependent on gametophyte in-
(1) *Riccia* (2) *Pteris*
(3) *Cycas* (4) *Pinus*

Q.65 Calyptra is a structure-
(1) Formed of the venter of archegonium
(2) Formed at the base of antheridium
(3) Formed in the center of the capsule
(4) Formed at the base of leaves

Q.66 The rhizoids of *Riccia* are-
(1) Unicellular and coloured
(2) Unicellular and colourless
(3) Multicellular and Green
(4) Multicellular and Brown

Q.67 The shape of apical cell in *Riccia* is-
(1) Pyramidal (2) Tetrahedral
(3) Sclerenchyma (4) All of these

Q.68 Storage region in *Riccia* is made up of-
(1) Collenchyma (2) Parenchyma
(3) Sclerenchyma (4) All of these

Q.69 The spores from *Riccia* capsule are released-
(1) Through stomium and annulus
(2) Through transverse slit
(3) Through vertical slit
(4) On decay of thallus

Q.70 The jacket of antheridium in *Riccia* is made up of-
(1) One layer of three cells
(2) One layer of many cells
(3) Two layer of many cells
(4) Many layer of many cells

Q.71 Shape of chloroplast in assimilatory zone of *Riccia* is-
(1) Girdle shaped (2) Spiral
(3) Discoidal (4) Cake like

Q.72 A student came from U.P. to Rajasthan to study on ***Riccia discolor*** a species of ***Riccia*** found in dry habitat. When dry season becomes start he observed, a mass of multicellular structure is formed, due to fast division of apical cell of the apex of every branch, in which food materials stored and develop a thick protective layer around it after degeneration of marginal cell. This perennating body called as-

(1) Rhizoids (2) Tuber

(3) Rhizome (4) Persistent apices

Q.73 An order of development of structures successively towards the apex, the oldest at the base and youngest nearest the apex called as-

(1) Acropetal (2) Basipetal

(3) Both (1) and (2) (4) None of these

Q.74 An order of development of organs in which the youngest structures are at the base and the oldest at the apex, called as-

(1) Acropetal (2) Basipetal

(3) Both (1) and (2) (4) None of these

FUNERIA

Q.75 When moss spores germinate, they form-

(1) Leafy gametophyte directly

(2) First protonema, then form a bud and then a leafy gametophyte

(3) Capsule directly

(4) Protonema which bears archegonia and antheridia

Q.76 The middle part of funaria capsule is sterile is known as -

(1) Columella (2) Operculum

(3) Apophysis (4) Spore sac

Q.77 The peristome in Funaria is consist of -

(1) 8 teeth (2) 16 teeth

(3) 32 teeth (4) 64 teeth

Q.78 In Funaria, the antherozoids swim in water to reach upto archegonium for the process of fertilization, this type of movement is known as-

(1) Chemotropic (2) Chemotactic

(3) Thermotactic (4) Phototactic

Q.79 The air in the capsule of moss are partitioned with delicate strands of cells, these are called-

(1) Partitions (2) Compartments

(3) Trabeculae (4) Septa

Q.80 The dehiscence of moss capsule take place by the rupture of the following-

(1) Operculum (2) Annulus

(3) Calyptra (4) None of above

Q.81 In which part reduction division take place in Moss plant-

(1) Antheridium (2) Archegonium

(3) Seta (4) Capsule

Q.82 Dispersal of spores of *Funaria*-

(1) By bursting of the capsule

(2) Through peristome

(3) Death & decay of operculum

(4) By bursting of operculum

Q.83 If the number of chromosomes of a spore mother cell of *Funaria* is 18, then what will be the chromosome numbers of the following structures-

	Perichaetial leaf	Protonema	Operculum	Columella
(1)	9	9	18	18
(2)	18	9	9	18
(3)	9	18	9	18
(4)	18	18	9	18

Q.84 The development of a sporophyte from moss gametophyte without gametes formation is called-

(1) Apospory (2) Parthenogenesis

(3) Apogamy (4) None of these

Q.85 Which of the following is not common in *Funaria* and *Selaginella*-

(1) Roots (2) Archegonium

(3) Embryo (4) Motile antherozoids

Q.86 If the number of chromosomes in the cells of spore sac of *Funaria* is 20. What will be the number of chromosomes in the cells of its calyptra-

(1) 20 (2) 10

(3) 40 (4) 30

Q.87 Chloroplasts are present in the spores of-
(1) *Rhizopus* (2) *Funaria*
(3) *Dryopteris* (4) *Penicillium*

Q.88 The peristome in *Funaria* consists of a-
(1) One series of curved narrow triangular teeth, 16 in number
(2) One series of curved narrow triangular teeth, 32 in number
(3) Two series of curved narrow triangular teeth, 8 teeth in each series
(4) Two series of curved narrow triangular teeth, 16 teeth in each series

Q.89 When antherozoids of *Pteridium* and *Funaria* are put together near the archegonia of *Pteridium* only the antherozoids of *Pteridium* readily enter the archegonia and reach the egg. The reason being that-
(1) Archegonia of *Pteridium* secrete a substance which repels antherozoids of *Funaria*
(2) Archegonia of *Pteridium* secrete a chemical substance which attracts antherozoids of *Pteridium*
(3) Antherozoids of *Funaria* are less motile
(4) Antherozoids of *Funaria* are killed when mixed with antherozoids of *Pteridium*

MUCOR & RHIZOPUS

Q.90 Mucor mucedo is a -
(1) Homothallic fungus
(2) Heterothallic fungus
(3) Heteroecious fungus
(4) None

Q.91 Mucor belongs to order -
(1) Mucoraceae (2) Mucorales
(3) Zygomycetes (4) Oomycetes

Q.92 Dung-mold is -
(1) Rhizopus stolonifer
(2) Mucor mucedo
(3) Aspergillus flavus
(4) Clostridium tetani

Q.93 Which one of the following life cycles is associated with mucor
(1) Heteromorphic (2) Haplontic
(3) Diplontic (4) Isomorphic

Q.94 Mucor is -
(1) Heterothallic and heterotrophic
(2) Heterotrophic and heteroecious
(3) Heteroecious and heterosporous
(4) heterosporous and heterothallic

Q.95 Bread mold is the common name of -
(1) Batrachospermum (2) Rhizopus
(3) Agaricus (4) Bacillus

Q.96 In Mucor species, usually isogamy takes place between -
(1) Same strains (2) (+) and (–) strain
(3) Zygospores (4) Microspores

Q.97 In mucor, stored food is –
(1) Glycogen and oil (2) Starch
(3) Leucosine and oil (4) Foridean starch

Q.98 Mucor is -
(1) With chlorophyll
(2) Without chlorophyll
(3) With carotenes (4) None

ALBUGO & CYSTOPUS

Q.99 Albugo produces conidiosporangia
(1) In chain (2) In Clusters
(3) Singly (4) In Clumps

Q.100 The order of development of conidia in Albugo is
(1) Acropetal (2) Basipetal
(3) Irregular (4) Radial

Q.101 The flagella on the zoospores of Albugo are
(1) Equal & Lateral
(2) Equal and terminal
(3) Unequal and terminal
(4) Unequal and Lateral

Q.102 Albugo draws nutrition from its host by
(1) Extra cellular phagocytosis
(2) Club shaped conidiophores
(3) Tuberculate rhizoids
(4) Globular or Button shaped haustoria

Q.103 In what form of the food is stored in the mycelium of Albugo
(1) Sugar, oil and mannitol
(2) Strach and protein
(3) Protein and cellulose
(4) Glycogen and oils

Q.104 Which structure of Albugo exhibits symptoms of white rust disease
(1) Mycelium (2) Conidia
(3) Gametangia (4) Oospore

Q.105 Albugo mycelium can reproduce (a) Sexually (b) Asexually (c) Vagetatively.
(1) 'a' and 'b' (2) 'a' and 'c'
(3) 'b' and 'c' (4) 'a', 'b' & 'c'

Q.106 The conidiophores of Albugo are
(1) Club shaped and branched
(2) Club shaped and unbranched
(3) Peltate and branched
(4) Peltate and unbranched

Q.107 Secondary infection of white rust could be controlled by
(1) Crop rotation
(2) Use of bordeaux mixture
(3) Soil fumigation
(4) Use D.D.T.

Q.108 Female Gametangium of Albugo is called :
(1) Trichogyne (2) Archegonium
(3) Ascogonium (4) Oogonium

Q.109 The gametes of Albugo are
(1) Non-flagellated
(2) Flagellated and Motile
(3) Male flagellated & Female non flagellated
(4) Female flagellated & Male non flagellated

Q.110 Sexual reproduction (or fertilization) can occur without water in
(1) Ulothrix (2) Albugo
(3) Funaria (4) Fern

Q.111 Which stage in the life cycle of Albugo candida is not coenocytic
(1) Vegetative mycelium
(2) Conidiosporangia
(3) Zoospores (4) All of these

Q.112 The flagella on the zoospore of Albugo are
(1) Whiplash type (2) Tinsel type
(3) One whiplash and one tinsel type
(4) Mixed type

Q.113 Hypertrophy of floral parts in a cruciferous plant is caused by
(1) Conidia of Cystopus
(2) Conidiophores of Cystopus
(3) Accumulation of hyphae of Cystopus for sexual reproduction
(4) All the above

Q.114 To cause infection, the germ tube enters through
(1) Epidermal cell (2) Guard cell
(3) Stomata (4) Lenticels

Q.115 An excessive enlargement of a diseased organ due to an increase in the number of its cells is called
(1) Hyperplasia (2) Damping off
(3) Necrosis (4) Hypertrophy

Q.116 Which of the following is the symptom of white rust disease of crucifers
(1) Hypertrophy of floral axis
(2) White blisters on the stem
(3) White blisters on the leaf
(4) All the above

Q.117 Which of the following produced non-motile gamete -
(1) Ulothrix (2) Albugo
(3) Riccia (4) Pteridium

Q.118 Sexual reproduction in Albugo is
(1) Isogamous (2) Anisogamous
(3) Oogamous (4) None of these

Q.119 What holds the conidia together into a chain in *Cystopus/Albugo* -
(1) Middle lamella (2) Cell-wall
(3) Intercalary mucilagenous septum
(4) Plasmodesmata

Q.120 Albugo belongs to
(1) Phycomycetes and zygomycetes
(2) Archaemycetes and Oomycetes
(3) Phycomycetes and Oomycetes
(4) Zygomycetes and archaemycetes

Q.121 A combined solution of copper sulphate and calcium hydroxide which used as a fungicide is
(1) Collins mixture (2) Bordeaux mixture
(3) Carminative mixture
(4) Fehling's solution

SELAGINELLA

Q.122 Selaginella is a type of plant
(1) Oogamous and homosporous
(2) Oogamous and heterosporous
(3) Isogamous & heterosporous
(4) Isogamous & Homosporous

Q.123 In which stage of the male gametophyte of selaginella pollination take place
(1) 3 celled stage (2) 6 celled stage
(3) 13 celled stage (4) 2 celled stage

Q.124 By which plant seed habit originated-
(1) Moss (2) Little Club moss
(3) Pinus (4) Angiosperm

Q.125 How many cells of prothelial and antheridial are found in male gametophyte of selaginella
(1) P_4A_9 (2) P_2A_{11}
(3) P_1A_{12} (4) P_8A_5

Q.126 Selaginella is associated with class-
(1) Psilopsida (2) Coniferopsida
(3) Lycopsida (4) Pteropsida

Q.127 When does meiotic division take place in selaginella
(1) During gametes formation
(2) During spores formation
(3) During zygote formation
(4) During germination

Q.128 Selaginella differs from Pteris in which of the following character
(1) Heterosporous condition
(2) Absence of seed
(3) Absence of vessels in xylem
(4) Need of water for fertilization

Q.129 In which species of the selaginella vivipary is found
(1) S. rupestris (2) S. kraussiana
(3) S. Lepidophylla (4) S. oregana

Q.130 What is the function of foot of selaginella
(1) Fusion (2) Water absorption
(3) Food absorption (4) None of above

Q.131 Which species of the selaginella are known as "Resurrection plants"
(1) Epiphytic species (2) Aquatic species
(3) Mesophytic species (4) Xerophytic species

Q.132 Selaginella differ from moss in having-
(1) Well developed vascular system
(2) Swimming antherozoid
(3) Free gametophyte
(4) Archegonium

Q.133 Number of Prothallial cell in selaginella-
(1) 1 (2) 2
(3) 3 (4) 4

Q.134 In some pteridophytes and most gymnosperm a temporary organ of cell filament is form which pushes growing embryo in tissue of female gematophyte, it is known as-
(1) Strobilus (2) Tapetum
(3) Suspensor (4) Trabeculae

Q.135 Which of the following is essential for seed habit-
(1) Free gametophyte
(2) Dependent sporophyte
(3) Heterospory (4) Haploid life cycle

Q.136 Megasporophyll of selaginella is equivelant to which structure of angiosperm-
(1) Carpel (2) Stamen
(3) Ovule (4) Leaf

PTERIDIUM

Q.137 Formation of a sporophyte from a vegetative portion of prothallus is called -
(1) Apocarpy (2) Apogamy
(3) Apomixis (4) Apospory

Q.138 Sex organ in prothallus develop on -
(1) Dorsal surface
(2) Lateral surface
(3) Ventral surface
(4) Dorsilateral surface

Q.139 The ferns in which the entire sporangium develops from a single superficial cell of the sporophyll are knows as -
(1) Lepto sporangiate
(2) Eusporangiate
(3) Unisporangiate
(4) Mesosporangiate

Q.140 Distinct alternation of generation is found in -
(1) **Mucor** (2) **Riccia**
(3) **Pteridium** (4) **Ulothrix**

Q.141 In **Pteridium** meiosis occurs when -
(1) Spores are formed
(2) Gametes are formed
(3) Prothallus is formed
(4) Sex organ are formed

Q.142 Structures that produce gametes in prothallus are -
(1) Anther and archegonia
(2) Ascogonium and anther
(3) Antheridia and archegonia
(4) None of these

Q.143 Young sporophyte of pteridium draws nourishment from prothallus through -
(1) haustorium (2) foot
(3) root (4) rhizoids

Q.144 Pteridium pholem lacks -
(1) Sieve cell
(2) Companion cell
(3) Phloem parenchyma
(4) All of the above

Q.145 The heart shaped prothallus of **Pteridium** always -
(1) Monoecious
(2) Dioecious
(3) Both monoecious and dioecious
(4) Not certain

Q.146 The xylem of stele of **Pteridium** is made up of-
(1) Vessels
(2) Tracheids
(3) Tracheids and xylem parenchyma
(4) None of these

Q.147 Fern plant are -
(1) Ornamental (2) Of medical value
(3) Of food value
(4) Of no particular value

Q.148 Indusium of **Pteridium** is -
(1) Outer false & inner true
(2) Outer true & inner false
(3) Only true type (4) Only false

Q.149 An indusium is said to be true if it originates from -
(1) Sorus region (2) Extra sorus region
(3) Stelar region (4) Rhizome

Q.150 In **Pteridium** the annulus is -
(1) Transverse (2) Oblique
(3) Vertical (4) Horizontal

Q.151 Fern prothallus is -
(1) Heterothallic (2) Heteromorphic
(3) Heterotrophic (4) Homothallic

Q.152 The sex organs of **Pteridium** which develops on ventral surface of prothalli & intermingled with rhizoids are -
(1) Antheridia (2) Archegonia
(3) Sorus (4) Sporangia

Q.153 Sexuality in fern is -
(1) Isogamy (2) Anisogamy
(3) Oogamy (4) Siphonogamy

Q.154 In **Pteridium**, the flagella of antherozoids are attached to -
(1) Body surface (2) Nucleus
(3) Blephroplast (4) Ovum

Q.155 Antherozoids attractant in an archegonial ooze in **Pteridium** (Fern) is -
(1) Sugar (2) Amino acid
(3) Malic acid (4) Mucliage

Q.156 How many cells form the jacket of fern antheridium -
(1) One (2) Two
(3) Three (4) Four

Q.157 Development of Oospore in fern produces -
(1) X-Gametophyte
(2) 2X-embryo & sporophyte
(3) Prothallus
(4) Zoospores & Antherozoids

Q.158 The dominant phase in fern plant is -
(1) Spore (2) Sporophyte
(3) Gametophyte (4) Prothallus

Q.159 What is the criterion used in the classification of ferns -
(1) Sori
(2) Nature of indusium
(3) Nature of sporophyll & sporangia
(4) Nature of annulus

Q.160 A feature is common to gametophytes and sporophytes of Moss and **Pteridium** -
(1) Independent existance
(2) Unbranched habit
(3) Dichotomous branching
(4) Autotrophy

Q.161 How does the spores of a fern plant behaves-
(1) Joins with another spore to form a seedling
(2) Germinates in to a prothallus
(3) Germinates into a fern plant
(4) Act as a resting structure

Q.162 The male gametes in **Pteridium** are -
(1) Non motile
(2) Motile, biflagellated
(3) Motile, multiflagellated
(4) Non-Motile, multi nucleate

Q.163 What type of polarity is exhibited by the embryo of **Pteridium** -
(1) Apical (2) Basal
(3) Lateral (4) Central

Q.164 The place of point where sporangium of a fern bursts is -
(1) Annulus (2) Stomium
(3) Ostiole (4) Operculum

Q.165 The annulus of sporangium of the fern assists in the dispersal of spores by -
(1) Collapsing in the strong wind
(2) Loosing the air of its cells
(3) Loosing water from its cells
(4) Taking up water from air

Q.166 What may be the possible advantage accrueing out of the presence of antheridia and archegonia on the underside of a fern prothallus -
(1) They are protected from direct rays of sun
(2) Capillary water accumulates on the underside of the prothallus between its lower surface and the soil surface. Sex organs projecting in this water can be readily fertilized by the Flagellated antherozoids which are chemotactically attracted by the archegonia
(3) The sex organs are protected from the wind
(4) Nutrients manufactured by the green prothallus can readily seep downwards to the sex organs due to the action of gravity

Q.167 Which statement is generally true for pteridium-
(1) Gametophyte depends upon Sporophyte
(2) Mature sporophyte depends upon gametophyte
(3) Young sporophyte depends upon gametophyte
(4) None of these

Q.168 What is the nature of tapetum of Pteridium?
(1) 1 N (2) 2 N
(3) 3 N (4) Polyploid

Q.169 Tapetum is a nutritive tissue of –
(1) Male and female gametes
(2) Spore mother cells
(3) Both of above
(4) None of the above

Q.170 Which type of alternation of generation is found in Pteridium ?
(1) Well defined heteromorphic, diplobiontic
(2) Haplobiontic, haploid phase dominant
(3) Haplobiontic, diploid phase dominant
(4) Triplobiontic, heteromorphic

Q.171 How many sporophytes develop on a prothallus of Pteridium ?
(1) One (2) Many
(3) Many initially but finally one sporophyte
(4) The same number of embryos and sporophytes as the number of archegonia

Q.172 The primary root of young sporophyte of the sporangium is –
(1) Tap root (2) Short lived
(3) Both of above (4) None of these

Q.173 Which is found in Pteridium ?
(1) Protandry (2) Heterothallism
(3) Both of above (4) None of these

Q.174 Which type of branching is found in Pteridium stem ?
(1) Alternate (2) Monopodial
(3) Dichotomous (4) Cyclic

Q.175 What is the situation of cortex in root of Pteridium ?
(1) Completely parenchymatous
(2) Outer part parenchymatous, inner part sclerenchymatous
(3) Outer sclerenchymatous, inner one parenchymatous
(4) Outer and inner part parenchymatous, middle part sclerenchymatous

Q.176 What is essential for fertilization in Pteridium ?
(1) Air (2) Water
(3) Chemical (4) Insect

CYCAS

Q.177 Which of the following is not the characteristic feature of Cycas :
(1) Naked ovules (2) Circinate vernation
(3) Vessels in xylem (4) Girdling leaf traces

Q.178 In the plants of Cycas, the male cone lacks :
(1) Microspore (2) Microsporophyll
(3) Microsporangium (4) Nucellus

Q.179 The girdle leaf traces in Cycas go to leaves :
(1) After making a semi-circle
(2) After making a complete circle
(3) After making two circle
(4) None of the above

Q.180 Polyembryony seen in Cycas is :
(1) Potential true polyembryony
(2) Potential true polyembryony and cleavage polyembryony
(3) Adventive polyembryony
(4) All of the above

Q.181 Each leaf of Cycas is supplied by :
(1) Two direct traces and two girdle traces
(2) A number of direct traces and two girdle traces
(3) A number of direct traces and a number of girdle traces
(4) Two direct traces and a number of girdle traces

Q.182 In which of the following, sexual reproduction is possible without water :
(1) Ulothrix (2) Funaria
(3) Dryopteris (4) Cycas

Q.183 The tracheids of Cycas have :
(1) Uniseriate bordered pits
(2) Biseriate bordered pits
(3) Multiseriate bordered pits
(4) No bordered pits

Q.184 The leaves of Cycas are :
(1) Unipinnately compound with parallel venation
(2) Unipinnately compounds with unicostate reticulate venation
(3) Unipinnately compounds with multicostate reticulate venation
(4) Unipinnately compounds with no venation

Q.185 Which is absent in coralloid roots of Cycas :
(1) Root hair and casparian band in endodermis
(2) Root cap and casparian band in endodermis
(3) Both root hair and root cap
(4) None of the above

Q.186 Which species of Cycas is having largest male cones :
(1) ***Cycas revoluta*** (2) ***C. rumphii***
(3) ***C. circinalis*** (4) ***C. beddomei***

Q.187 Male and female Cycas plants show which type of growth :
(1) Monopodial in both
(2) Sympodial in both
(3) Monopodial in male and sympodial in female plant
(4) Sympodial in male and monopodial in female plant

Q.188 A single microsporophyll in Cycas revoluta is having about ..... sporangia :
(1) 1000 (2) 2000
(3) 100-300 (4) 400-500

Q.189 Seeds of Cycas are dispersed by :
(1) Wind (2) Birds
(3) Water (4) Insects

Q.190 Radicle (embryonic root) is covered by a hard podlike covering 'coleorrhiza' in :
(1) Cycas (2) Pinus
(3) Both (1) and (2) (4) None of these

Q.191 In Andaman and Nicobar islands, common species of Cycas is :
(1) ***C. circinalis*** (2) ***C. revoluta***
(3) ***C. beddomei*** (4) ***C. rumphii***

Q.192 During pollination, pollen grains in Cycas are trapped by :
(1) Malic acid drop
(2) Pseudostigma
(3) Stigma
(4) Viscous Fluid in pollen chamber

Q.193 Sago is obtained from :
(1) Cycas (2) Cedrus
(3) Pinus (4) Taxus

Q.194 If haploid number of chromosomes in a gymnosperm is 12, the number of chromosomes in its endosperm will be
(1) 12 (2) 24
(3) 36 (4) 64

Q.195 The number of neck canal cells in Cycas
(1) 2 (2) 4
(3) Nil (4) One with two nuclei

Q.196 Cycas is
(1) Monoecious and seed bearing
(2) Dioecious and seed bearing
(3) Monoecious and seedless
(4) Dioecious and seedless

PINUS

Q.197 Gymnosperm produce seed in -
(1) Pericarp (2) Cones
(3) Flowers (4) Ovary

Q.198 Seed of Pinus contain several embryos with a compound suspensor. They are developed through
(1) Adventive polyembryony
(2) Normal polyembryony
(3) Cleavage polyembryony
(4) both 2 & 3

Q.199 Which of the following is not applicable to Pinus ?
(1) Sessile ovules
(2) Motile sperm
(3) Embryo with many cotyledons
(4) Resin ducts

Q.200 Which is true for Pinus -
(1) Haploid endosperm
(2) Biflagellate sperms
(3) Occurence of double fertilization
(4) Presence of antheridia

Q.201 Ovule in gymnosperm is generally : -
(1) Anatropous and bitegmic
(2) Orthotropous and bitegmic
(3) Anatropous and unitegmic
(4) Orthotropous and unitegmic

Q.202 In gymnosperm "pollen drop" is -
(1) Pollen dropped by wind
(2) Water drop
(3) Secretion of nucellus
(4) Pollinium

Q.203 **Resin** and **turpentine** are obtained from : -
(1) Cycas (2) Pinus
(3) Cedrus (4) Gnetum

Q.204 The germination of seed in Pinus is : -
(1) Hypogeal (2) Epigeal
(3) Both (4) None

Q.205 If the haploid no. of chromosomes in gymnosperm is 12, what will be the no. of chromosomes in its root and endosperm : -
(1) 12, 12 (2) 12, 24
(3) 24, 12 (4) 24, 36

Q.206 'Naked seed' of gymnosperm mean : -
(1) Seed without seed coats
(2) Seed without tegmen
(3) Seeds not enclosed in ovary wall
(4) All of the above

Q.207 In which plant "chilgoza" is the name of seed of : -
(1) ***P. longifolia*** (2) ***P.gerardiana***
(3) ***Cycas circinalis*** (4) ***P.insularis***

Q.208 The characteristic of ovule of Pinus is presence of : -
(1) Integument (2) Vascular supply
(3) Pollen chamber (4) Nucellus

Q.209 Endosperm in Pinus is : -
(1) Post fertilization tissue
(2) Pre and post fertilization tissue
(3) Pre fertilization tissue
(4) None of the above

Q.210 Pollination in Pinus is exclusively by : -
(1) Wind (2) Insect
(3) Water (4) Birds

Q.211 **Compact** and **hard wood** of Pinus is known as:
(1) Porous (2) Pycnoxylic
(3) Manoxylic (4) Soft and loose

Q.212 Pinus differs from mango in having : -
(1) Presence of wood
(2) Ovules not enclosed in ovary
(3) Tree habit (4) Green leaves

Q.213 Pinus has : -
(1) Motile male gametes
(2) Ciliated male gametes
(3) Non motile male gametes
(4) All of the above

Q.214 The interval between pollination and fertilization in Pinus is : -
(1) One day (2) One week
(3) One month (4) One year

Q.215 Number of the cotyledons in embryo of Pinus is : -
(1) One (2) Two
(3) 3 - 18 (4) 3 – 10

Q.216 Wings in Pinus seeds develop from : -
(1) Bract scale (2) Ovuliferous scale
(3) Cone axis (4) Seed coat

Q.217 In Pinus male and female reproductive structures occur : -
(1) On same branch of plant
(2) On different plant
(3) On different branches of same plant
(4) None of above

Q.218 Pinus is a Gymnosperm because : -
(1) It is large tree
(2) It is pollinated by wind
(3) It has exposed naked ovules
(4) It produces seeds and it has narrow leaves

Q.219 In which of the following fertilization / reproduction is possible without water : -
(1) **Ulothrix** (2) **Funaria**
(3) **Dryopteris** (4) **Pinus**

Q.220 Turpentine is obtained from : -
(1) Angiosperm wood
(2) Angiospermic flowers
(3) Gymnosperm wood
(4) Fern

Q.221 In microsporophylls of **Pinus** micro-sporangium are present on :
(1) Abaxial side (2) Adaxial side
(3) Along the margins (4) In the axils

Answer Key

Exercise – 2

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Ans.	1	2	4	2	2	1	2	1	3	1	2	3	3	3	1	2	2	4	3	3

LEFT BLANK

EXERCISE – 3 PREVIOUS YEAR'S QUESTIONS

ULOTHRIX

Q.1 In Ulothrix, Zygote is- **[RPMT 2000]**
(1) Quadriflagellate (2) Biflagellate
(3) Unifilagellate (4) Aflagelate

Q.2 Life cycle of "*Ulothrix*" is - **[RPMT 2001]**
(1) Haplontic (2) Diplontic
(3) Haplodiplontic (4) None of them

Q.3 Morphologically similar but physiologically different gametes are called- **[RPMT 2001]**
(1) Isogamete (2) Oogamete
(3) Physiological anisogamete
(4) Syngamous

Q.4 Pigments present in chloroplast of Ulothrix- **[RPMT 2002]**
(1) Chlorophyll α, Ch-β, fucoxanthin β-carotene
(2) Ch-α, Ch-β, Ch-c, C-phycocyanin, C-phycoerythrin
(3) Ch-α, Ch-β, β-carotene and xanthophylls
(4) Ch-α, Ch-β, r-phycocyanine, r-phycoerythrin

Q.5 In *Ulothrix,* zoospores are libereated by- **[RPMT 2003]**
(1) Degeneration of lateral walls
(2) Formation of pore in lateral wall
(3) Gelatinisation of lateral walls
(4) Gelatinisation of all cell walls

Q.6 Which one of the following shows *haplontic* life cycle- **[MP PMT 2002]**
(1) Ulothrix (2) Funaria
(3) Selaginella (4) Pinus

Q.7 Meiosis in Ulothrix take place during- **[MP PMT 2002]**
(1) zoospore formation (2) gamete formation
(3) zygospore germination
(4) zoospore germination

RICCIA

Q.8 Photosynthetic filaments occur in- **[RPMT 2000]**
(1) *Nostoc* (2) *Chlamydomonas*
(3) *Phytopthora* (4) *Riccia*

Q.9 Which type of rhizoids are presents in *Riccia* **[RPMT 2002]**
(1) Unicellular and smooth
(2) Multicellular and smooth
(3) Unicellular, smooth and tuberculated
(4) Multicellular smooth and tuberculated

Q.10 *Antherozoids* of *Riccia* are - **[RPMT 2003]**
(1) Long, curved and multifilagellate
(2) Small and non-filagellate
(3) Small, curved (comma shaped) and biflagellate
(4) Rod shaped and biflagellate

Q.11 Sporophyte of *Riccia* is- **[RPMT 2005]**
(1) Saprophyte (2) Partial parasite
(3) Complete parasite (4) None of these

FUNERIA

Q.12 Antherozoids of ***Funaria*** are – **[CPMT-1991]**
(1) Biflagellated and spirally coiled
(2) Biflagellated with no coiling
(3) Multi flagellated (4) Aflagellated

Q.13 Spore of *Funaria* represents- **[Dehli PMT 1986]**
(1) Gametes
(2) Beginning of gametophyte
(3) Beginning of sporophyte
(4) None

Q.14 In the capsule of moss peristome teeth show- **[RPMT - 2000]**
(1) Hydrochasy (2) Chemotropism
(3) Hydrotropism (4) Xerochasy

Q.15 What is formed by the germination of spores of moss- **[RPMT - 2000]**
(1) Leafy gametophyte (2) Stem
(3) Protonema (4) Rhizoids

Q.16 Spore of which plant produces protonema- **[RPMT - 2001]**
(1) *Riccia* (2) *Funaria*
(3) *Anthoceros* (4) *Pellia*

Q.17 In *Funaria* spore germinates to produce- **[MP PMT - 1999]**

(1) Protonema (2) Prothallus

(3) Proembryo (4) Embryo

Q.18 In *Funaria*, plant stomata are present in- **[MP PMT - 2002]**

(1) Foot (2) Seta

(3) Capsule (4) Leaf

Q.19 Which of the following is absent in moss sporophytes- **[MP PMT - 2002]**

(1) Seta (2) Foot

(3) Elater (4) Columella

Q.20 The sporophyte of *Funaria* develop within- **[MP PMT - 2002]**

(1) Antheridium (2) Archegonium

(3) Capsule (4) Protonema

Q.21 Peat moss is used as a packing material for sending flowers and live plants to distant places because- **[AIPMT - 2006]**

(1) It reduces transpiration

(2) It serves as a disinfectant

(3) It is easily available

(4) It is hygroscopic

Q.22 In a moss the sporophyte- **[AIPMT 2006]**

(1) arises from a spore produced from the gametophyte

(2) manufactures food for it self, as well as for the gametophyte

(3) is partially parasitic on the gametophyte

(4) produces gametes that give rise to the gametophyte

MUCOR & RHIZOPUS

Q.23 Mycelium of mucor is **[MP PMT 2000]**

(1) Septate and unicellular

(2) Septate and multicelluar

(3) Asptate and Uninucleate

(4) Coenocytic

Q.24 Sporangiospores of mucor is -**[MP PMT 2002]**

(1) Haploid (2) Diploid

(3) Triploid (4) Polyploid

Q.25 Mucor shows **[MP PMT 2002]**

(1) Isogamy (2) Anisogamy

(3) Oogamy (4) None of the above

Q.26 Which of the following environmental conditions are essential for optimum growth of Mucor on a piece of bread ? **[CBSE 2006]**

A. Temperature of a about 25ºC

B. Temperature of a bout 5ºC

C. Relative humidity of about 5%

D. Relative humidity of about 95%

E. A shady place

F. A brightly illuminated place

(1) B, D and E only (2) B, C and F only

(3) A, C and E only (4) A, D and E only

ALBUGO & CYSTOPUS

Q.27 Which is correct statement : - **[RPMT 2001]**

(1) Perithecium is fruiting body of ***Aspergillus***

(2) Sexual reproduction in ***Albugo*** is oogamous

(3) Ascomycetes is known as club fungi

(4) Male gametes of Albugo are flagellated

Q.28 Botanical name of speicies which cause white rust of cruciferae - **[RPMT 2002]**

(1) *Pernospora Parasitica*

(2) *Puccinia graminis*

(3) *Phythium debarganum*

(4) *Albugo candidia*

Q.29 Branched aseptate, coenocytic mycelium present in : - **[RPMT 2002]**

(1) *Aspergillus* (2) *Albugo*

(3) *Penicillium* (4) *Erysiphe*

Q.30 *Albugo candida* which causes white rust of cruciferae is : -

(1) Saprophyte

(2) Facultative parasite

(3) Obligate parasite

(4) Obligate saprophyte

Q.31 White rust diesease of crucifers is caused by : - **[RPMT 2005]**

(1) *Puccinia* (2) *Ustilago*

(3) *Albugo candida* (4) *Aspergillus*

SELAGINELLA

Q.32 An evolutionary characteristic is found in selaginella: **[MP PMT 1997]**
(1) Presence of ligule (2) Heterophilly habits
(3) Sporangia present in cone
(4) Heterospory

Q.33 In selaginella, male gametes are **[MP PMT 2000]**
(1) Multi flagellate (2) Aflagellate
(3) Biflagellate (4) Mono flagellate

Q.34 In selaginella, trabeculae, represent **[MP PMT 2000]**
(1) Endodermis (2) Cortex
(3) Xylem (4) Epidermis

Q.35 Which one of the following is not fond in selaginella **[MP PMT 2002]**
(1) Heterophylly (2) Heterospory
(3) Homospory (4) Ligulate leaf

Q.36 Club mass is common name of **[RPMT 2001]**
(1) Lycopodium (2) Selaginella
(3) Funaria (4) Potamogeton

PTERIDIUM

Q.37 If the aerial parts of a typical pteridophyte are destroyed by the fire then which plant part helps to regenerate -
(1) Root (2) Rhizome
(3) Leaf - tip (4) Pinnule

Q.38 **Pteridium** shows - **[RPMT – 2000]**
(1) Only true indusium (2) Only false indusium
(3) Both (1) and (2) (4) None of the above

Q.39 In which stage meiosis takes place in **Pteridium**- **[RPMT – 2001]**
(1) During the spore germination
(2) During the spore formation
(3) During the gamete formation
(4) During the organ formation in prothallus

Q.40 In Fern, gametophyte is - **[RPMT – 2001]**
(1) Main plant body
(2) Prothallus attached to the sporophyte
(3) Prothallus free from sporophyte
(4) A structure attached to the rhizome

Q.41 In rhizome of **Pteridium,** stele which is composed of two or more than two concentric rings of vascular bundles is called - **[RPMT – 2002]**
(1) Polycyclic
(2) Siphonostele
(3) Ectophloic siphonostele
(4) Cladosiphonostele

Q.42 Archegonium of fern has - **[RPMT – 2003]**
(1) Four neck canal cells
(2) Binucleated, one neck canal cell
(3) Uni nucleated two neck canal cells
(4) Three neck canal cell

Q.43 Fern Prothallus produces - **[RPMT – 2005]**
(1) Gametes (2) Spores
(3) Both (1) & (2) (4) None

Q.44 Which of the following is not common in **Funaria** & **Pteridium** - **[RPMT – 2006]**
(1) Root (2) Archegonia
(3) Embryo (4) Motile sperms

Q.45 In the prothallus of a vascular cryptogam, the antherozoids and eggs mature at different time. As a result- **[AIPMT – 2007]**
(1) there is no change in success rate of fertilization
(2) there is high degree of sterility
(3) one can conclude that the plant is apomictic
(4) self fertilization is prevented

CYCAS

Q.46 Ciliated male gametes are found in : **[Pb PMT 1997]**
(1) Cycas (2) Ginkgo
(3) Pinus (4) Both (1) and (2)

Q.47 'Sago palm' is : **[CPMT 2002]**
(1) Cycas revoluta (2) C. circinalis
(3) C. rumphii (4) Pinus

Q.48 Germination of Cycas seed is : **[CPMT 2002]**
(1) Epigeal (2) Hypogeal
(3) Both (1) and (2) (4) None of these

Q.49 The coralloid roots of Cycas have an algal zone and the alga present in this zone is **[CPMT 1991]**

(1) Ulothrix (2) Anabaena
(3) Nostoc (4) 2 and 3 both

Q.50 The neck canal cells are absent in the archegonia of : **[Re. Ex. CPMT 1991]**

(1) Cycas (2) Bryophytes
(3) Funaria (4) Pteridophytes

Q.51 Cycas has an embryo with two cotyledons yet it is not classified as dicotyledonous plant because : **[CBSE 2001]**

(1) It has compound leaves
(2) It bears megasporophylls
(3) It looks like a palm tree
(4) Its ovules are naked

Q.52 Multiciliate male gametes (spermatozoids) are found in : **[CPMT 1999, BHU 1999]**

(1) Angiosperms (2) Cycas
(3) Ulothrix (4) Funaria

Q.53 The secondary growth in stem of Cycas is brought about by : **[CPMT 1990]**

(1) Persistent cambium
(2) Short lived cambium
(3) Number of cambia produced in succession
(4) Isolated strips of cambium

Q.54 The neck cells in the archegonium of Cycas are: **[CPMT 1990]**

(1) One (2) Two
(3) Eight (4) Six

Q.55 From the pith of stem of Cycas revoluta "sago" is obtained which is used as food article for a patient with stomach disorders because : **[AIIMS 1997]**

(1) It is much tastier
(2) Its nutritive value is very high
(3) It is having less amount of starch and easily digestable
(4) It is a cheap food article

Q.56 The main character of gymnospermic plant is : **[CPMT 1991]**

(1) Presence of xylem
(2) Presence of circinate vernation
(3) Presence of traces of leaves
(4) Presence of naked exposed ovules

Q.57 Largest ovule is found in : **[CPMT 1998; AFMC 2002]**

(1) Cycas (2) Pinus
(3) Taxus (4) Watermelon

Q.58 Largest sperms in the plant world are found in : **[CBSE 1998]**

(1) Thuja (2) Pinus
(3) Banyan (4) Cycas

Q.59 Which of the following statements about Cycas is incorrect ? **[CPMT 2000]**

(1) Its coralloid roots contain some blue-green algae
(2) It does not have a well organized female flower
(3) It has circinate vernation
(4) Its Xylem is mainly composed of xylem vessels

Q.60 Male cone of Cycas consists of : **[CPMT 2000]**

(1) Megasporophylls (2) Microsporophylls
(3) Archegonia (4) None of these

Q.61 In which portion of Cycas, diploxylic vascular bundle are found : **[AIIMS 2000, EAMCET 2002, APMEE 2002]**

(1) Root (2) Stem
(3) Leaflet (4) Rachis and leaflet

Q.62 Which of the following is correct regarding Cycas : **[AIIMS 2001]**

(1) The same sporophyll bears microsporangia and ovules
(2) A single cone consists of both mega and microsporophylls
(3) Male strobilus and megasporophylls occur on the same plant
(4) Male strobilus and megasporophylls on separate plants

Q.63 In Cycas, male gamets are produced in the pollen tube by the division of which of the following cells : **[BHU 2001]**

(1) Body cell (2) Stalk cell
(3) Tube cell (4) Prothallial cell

Q.64 Male gametes of cycas are : **[CPMT 1992]**

(1) Rounded and nonciliate
(2) Sickle – shaped biflagellate
(3) Boat – shaped nonciliate
(4) Large, top-like, spirally twisted with cilia

Q.65 Vascular bundles of Cycas stem are :
[CPMT 1996, MP PMT 2001]
(1) Conjoint, collateral and closed
(2) Conjoint, collateral and open
(3) Conjoint, bicollateral and open
(4) Conjoint, bicollateral and closed

Q.66 Naked seeds occur in :
[CPMT 1986, JIPMER 1998]
(1) Pteris/Pteridophytes
(2) Cycas/Gymnosperms
(3) Funaria/Bryophytes
(4) Maize/Angiosperms

Q.67 Cycas resembles angiosperms in having :
[MP PMT 1996]
(1) Circinate venation in leaves
(2) Vessels
(3) Motile sperms
(4) Ovules

Q.68 Vegetative reproduction in Cycas occurs by :
[RPMT 1997]
(1) Scale leaves (2) Bulbils
(3) Sporophylls (4) Fragmentation

Q.69 Cycas occurs commonly in : **[AMU 1999]**
(1) South America (2) North America
(3) South East Asia (4) Europe

Q.70 Algal zone is characteristic of :
[Pb PMT 2000, BHU 1999]
(1) Coralloid root of Cycas
(2) Normal root of Cycas
(3) Normal root of Pinus
(4) Mycorrhizal root of Pinus

Q.71 Microsporangia of Cycas occur over microsporophyll : **[RPMT 2000]**
(1) Adaxially (2) Abaxially
(3) Laterally (4) Marginally

Q.72 Megasporophyll of Cycas is homologous to :
[AIIMS 2002]
(1) Carpel (2) Stamen
(3) Coralloid root (4) Sepal

Q.73 What is the true about leaves of cycas-
[AMU 2002]
(1) Palmate and Pinnate foliage leaves
(2) Brown scales and Pinnate green foliage leaves
(3) Oblong and long leaves
(4) Green and scaly leaves

Q.74 Which one is living fossil : **[CBSE 2003]**
(1) Pinus (2) Cycas
(3) Selaginella (4) Sphagnum

PINUS

Q.75 What is the habit of **Pinus** plant –
[BHU – 84, Delhi PMT 85]
(1) Decurrent (2) Excurrent
(3) Recurrent (4) Dichotomous

Q.76 The excurrent/conical habit of Pinus tree is caused by -
[AIIMS-85, CPMT-85, EMCET-86]
(1) Auxin effect on the growth of stem tip & axillary branches
(2) Competition of neighbouring pine trees for sunlight
(3) Mutual competition of branches
(4) Efficiency of water movement in plants

Q.77 The mycorrhizal relationship between fungi & roots of **Pinus** plant is – **[CPMT 73, BHU 82]**
(1) Parasitic relationship
(2) Saprophytic relationship
(3) Symbiotic relationship
(4) Epiphytic relationship

Q.78 Pine wood comprises of **[CPMT 85]**
(1) Vessels only
(2) Tracheids only
(3) Both equally
(4) More vessels & less tracheids

Q.79 Male gametophyte of **Pinus** is – **[AIPMT 90]**
(1) Male cone (2) Microsporophyll
(3) Pollen grain (4) Megasporophyll

Q.80 In **Pinus** the third distal tier of its proembryo from below is – **[BHU 82]**
(1) Embryonal tier (2) Suspensor tier
(3) Rosette tier (4) Upper tier

Q.81 Example of a plant which bears seeds but does not bear fruit is - **[Delhi PMT 82]**
(1) **Pinus** (2) **Selaginella**
(3) Maize (4) Groundnut

Q.82 Winged seeds are found in – **[BHU 1985]**
(1) **Fern** (2) **Pinus**
(3) China rose (4) **Cycas**

Q.83 If the number of chromosomes in the pollen grains of Pinus is 12 i.e., n = 12, the number of chromosomes in its endosperm cells should be **[Delhi PMT 81, MPPMT 2000]**

(1) 36 (2) 24
(3) 12 (4) 6

Q.84 If the number of chromosome in the nucellus of **Cycas** or **Pinus** is 24 its number in their endosperm should be – **[CPMT 1989]**

(1) 12 (2) 24
(3) 36 (4) 48

Q.85 The edible part of Pinus chilgoza seed is – **[CPMT 1989]**

(1) Pericarp
(2) Female gametophyte
(3) Diploid perisperm
(4) Triploid endosperm

Q.86 Which of the following plants produces seeds but not flowers – **[AIPMT 2002]**

(1) Maize (2) Mint
(3) Peepal (4) Pinus

Q.87 Pinus is – **[MP PMT 1999]**

(1) Deciduous (2) Dioecious
(3) Monoecious (4) None of these

Q.88 The wood of pinus is – **[MP PMT 2000]**

(1) Pycnoxylic & Homoxylous
(2) Pycnoxylic & Heteroxylous
(3) Manoxylic & Homoxylous
(4) Manoxylic & Heteroxylous

Q.89 Winged pollen grains are formed in **[MP PMT 2002]**

(1) **Pinus** (2) **Cycas**
(3) **Triticum** (4) **Solanum**

Q.90 **Endosperm** in pinus is – **[MP PMT 2002]**

(1) Haploid (2) Diploid
(3) Triploid (4) Polyploid

Q.91 Conifers differ from grasses in the **[AIPMT - 2006]**

(1) absence of pollen tubes
(2) formation of endosperm before fertilization
(3) production of seeds from ovules
(4) lack of xylem tracheids

Q.92 If number of chromosomes in pollen grain of any species of Pinus is 8, then after fertilization what will be the number of chromosomes in Endosperm : - **[RPMT - 2006]**

(1) 24 (2) 16
(3) 08 (4) 32

Q.93 Flagellated male gametes are present in all the three of which one of the following sets ? **[RPMT - 2006]**

(1) **Anthoceros, Funaria** and **Spirogyra**
(2) **Zygnema, Saprolegnia** and **Hydrilla**
(3) **Fucus, Marsilea** and **Calotropis**
(4) **Riccia, Dryopteris** and **Cycas**

Q.94 In gymnosperms, the pollen chamber represents **[AIPMT 2007]**

(1) a cell in the pollen grain in which the sperms are formed
(2) a cavity in the ovule in which pollen grains are stored after pollination
(3) an opening in the megagametophyte through which the pollen tube approaches the egg.
(4) the microsprorangium in which pollen grains develop

Q.95 Select one of the following pairs of important features distinguishing ***Gnetum*** from ***Cycas*** and ***Pinus*** and showing affinities with angiosperm : - **[AIPMT 2008]**

(1) Presence of vessel and absence of archegonia
(2) Perianth and two integuments
(3) Embryo development and apical meristem
(4) Absence of resin duct and leaf venation

Q.96 In which one of the following, male and female gametophytes do not have free living independent existence ? **[AIPMT 2008]**

(1) *Funaria* (2) *Polytrichum*
(3) *Cedrus* (4) *Pteris*

Q.97 Which one of the following plant is monoecious ? **[AIPMT 2009]**

(1) Papaya (2) Marchantia
(3) Pinus (4) Cycas

Q.98 In **Pinus** the megaspore on germination develops **[CPMT 99]**

(1) Pollen tube with two sperms

(2) Endosperm with archegonia

(3) Endosperm with naked egg

(4) Endosperm with embryo sac

Q.99 Female cone of **Pinus** is a

(1) Modified dwarf shoot

(2) Modified long shoot

(3) Modified needles

(4) None of the above

Q.100 Which of the following part of **Funaria**, sporophyte is involved in the dispersal of spores ? **[UTTARANCHAL PMT-2004]**

(1) Calyptra (2) Operculum

(3) Peristome (4) Annulus

Q.101 In **Selaginella**, the adaxial outgrowth, develops from the base of leaf, is called :

[UTTARANCHAL PMT-2004]

(1) ligule (2) velum

(3) rhizophore (4) glassopodium

Q.102 In pinus, the third tier of embryonal cells from below is known as :

[UTTARANCHAL PMT-2004]

(1) rosette tier (2) suspensor tier

(3) embryonal tier (4) free-nuclear tier

Q.103 If a sporangium is derived from a single cell, it is called :

[UTTARANCHAL PMT-2004]

(1) leptosporangiate (2) eusporangiate

(3) heterosporangiate (4) monosporangiate

Q.104 Which is haploid in case of Cycas ?

[UTTARANCHAL PMT-2005]

(1) Stem (2) Root

(3) Endosperm (4) All the above

Q.105 In which of the following pairs of genera sporocarps are presents ?

[UTTARANCHAL PMT-2006]

(1) Marsilea and Salvinia

(2) Marsilea and Isoetes

(3) Isoetes and Salvinia

(4) Marsilea and Lycopodium

Q.106 In Equisetum stem, the cavity formed by dissolution of protoxylem is known as :

[UTTARANCHAL PMT-2006]

(1) vallicular canal (2) vasuclar canal

(3) carinal canal (4) resin canal

Q.107 Sperms of both Funaria and Dryopteris were placed near the archegonia of Dryopteris. Only sperms of Dryopteris entered the archegonia and reached the egg because of :

[WEST BENGAL JEE 2007]

(1) less motility of Funaria sperms

(2) Dryopteris archegonia secrete chemicals which attract dryopteris sperms only

(3) Dryopteris archegonia secrete chemical to repel Funaria sperms

(4) Funaria sperms are killed when mixed with Dryopteris sperms

Q.108 The moss plant develops from :

[CG PMT-2004]

(1) Diploid spores (2) Protonema

(3) Oospores (4) Anthrozoids

Q.109 Fern plant is a : **[CG PMT-2004]**

(1) Haploid gametophyte

(2) Diploid gametophyte

(3) Diploid sporophyte

(4) Haploid sporophyte

Q.110 How much time is generally required/taken by the pine plant from pollination to fertilizaton?

[CG PMT-2004]

(1) Four months (2) Twelve months

(3) Two years (4) Four years

Q.111 In Pinus male and female reproductive structures occur? **[CG PMT-2005]**

(1) On different branches of the same plant

(2) On different plants

(3) On same branch

(4) None of these

Q.112 Stomata in Funaria are found in :

[CG PMT-2005]

(1) Capsule (2) Foot

(3) Seta (4) No where

Q.113 Embryo is found in : **[CG PMT-2006]**

(1) Ulothrix (2) Spirogyra

(3) Funaria (4) Chlorella

Q.114 In which of the following protonema stage is found : **[CG PMT-2006]**
(1) Riccia (2) Funaria
(3) Selaginella (4) Pinus

Q.115 Haploid structure of Funaria is : **[JHARKHAND-2006]**
(1) protonema (2) capsule
(3) apophysis (4) operculum

Q.116 Sperm of Cycas is : **[JHARKHAND-2006]**
(1) multiflagellated and very large
(2) small and biflagellated
(3) multiflagellated and small
(4) large and biflagellated

Q.117 Fern gametophyte bears : **[JHARKHAND-2005]**
(1) archegonia (2) antheridia
(3) sporangia (4) both (1) and (2)

Q.118 Spore of Funaria on germination give rise to : **[JHARKHAND-2005]**
(1) protonema (2) embryo
(3) antheridia (4) archegonia

Q.119 The number of prothallial cell in male gametophyte of Selaginella is : **[JHARKHAND-2002]**
(1) one (2) two
(3) twelve (4) numerous

Q.120 In Funaria, the number of peristomial teeth is : **[JHARKHAND-2002]**
(1) 8 (2) 16
(3) 32 (4) 64

Q.121 Number of peristomial teeth in moss is **[BIHAR-2005]**
(1) 16 + 16 (2) 16 + 32
(3) 8 + 16 (4) 32 + 32

Q.122 Turpentine oil is obtained from : **[BIHAR-2006]**
(1) Pinus longifolia (2) Azadirachta
(3) Eucalyptus (4) All of these

Q.123 The sclerenchyma of the hypodermis in Pinus needle helps in : **[BIHAR-2006]**
(1) increasing the absorptive surface of the cell
(2) checking transpiration
(3) mechanical support
(4) photosynthesis

Q.124 In Cycas, the vascular bundles are arranged in the shape of inverted omega in : **[UP-CPMT 2001]**
(1) Stem (2) rachis
(3) leaflet (4) both stem & leaf

Q.125 Cleavage polyembryony is found in : **[UP-CPMT 2001]**
(1) Cycas (2) Pinus
(3) Funaria (4) Ephedra

Q.126 The rhizoids in **Funaria** are : **[UP-CPMT 2001]**
(1) tuberculated
(2) unicellular and simple
(3) distinct, branched and coenocytic
(4) multicellular and oblique septate

Q.127 In Funaria, stomata are present on the : **[UP-CPMT 2001]**
(1) stem (2) leaves
(3) capsule (4) archegonia

Q.128 Which of the following statement is true regarding the archegonium of fern : **[UP CPMT 2001]**
(1) there are four neck canal cells
(2) there are three neck canal cells
(3) there is one neck canal cell with one nucleus
(4) there is one neck canal cell with two nuclei

Q.129 Cycas revoluta is popularly known as : **[UP CPMT 2002]**
(1) date palm (2) sago palm
(3) sea palm (4) royal palm

Q.130 Protonema stage is found in : **[UP-CPMT 2005]**
(1) fern (2) mosses
(3) liverworts (4) fungi

Q.131 Funaria is attached to substratum by : **[UP-CPMT 2005]**
(1) roots (2) rhizoids
(3) haustoria (4) stem

Q.132 Which of the following are formed due to germination of spores in ferns **[UP-CPMT 2006]**
(1) protonema (2) prothallus
(3) thallus (4) gametophore

Q.133 Funaria is not : **[UP-CPMT 2006]**
(1) acrocarpous (2) cleistogamous
(3) monoecious (4) autoicous

Q.134 In which of the following feature, Cycas resembles angiosperm **[UP-CPMT 2007]**

(1) presence of tracheids

(2) circinate vernation

(3) dichotomously branched leaves

(4) pollen tube is the carrier of male gametes

Q.135 The number of prothallial cells in male gametophyte in pinus **[UP-CPMT 2007]**

(1) 2 (2) 1

(3) 3 (4) 0

Q.136 The plant of Funaria is : **[MP-PMT 2001]**

(1) Monoecious (2) Dioecious

(3) Heteroicous (4) none of these

Q.137 The sporophyte of Funaria always begins development within the : **[MP-PMT 2002]**

(1) Antheridium (2) Archegonium

(3) Capsule (4) Protonema

Q.138 Trabaculae is the transformation of : **[MP-PMT 2003]**

(1) pericycle (2) endodermis

(3) xylem (4) phloem

Q.139 Meiosis in pteridophytes takes place at the time of : **[MP-PMT 2003]**

(1) spore formation

(2) sexual organ formation

(3) germination of spores

(4) gamete formation

Q.140 Pinus seed is originated in :**[MPPMT 2002,03]**

(1) Capsule (2) microsporophyll

(3) microsporangia (4) megasporophyll

Q.141 The endosperm of Pinus is : **[MP-PMT 2003]**

(1) haploid (2) diploid

(3) triploid (4) polypoid

Q.142 Fern prothallus is developed from : **[MP-PMT 2003]**

(1) elaters (2) spore mother cells

(3) spore (4) zygote

Q.143 The development of Funaria gametophyte always initiated from : **[MP-PMT 2003]**

(1) antheredium (2) protonema

(3) archegonium (4) capsule

Q.144 Gametophyte in Funaria is : **[MP-PMT 2004]**

(1) Heterothallic (2) Dioecious

(3) Monoecious

(4) Monoecious and dioecious

Q.145 Winged pollen grains are found in which of the following : **[MP-PMT 2002, 04]**

(1) Pinus (2) Selaginella

(3) Pteris (4) Cycas

Q.146 Calyptra of Funaria arises from : **[MP-PMT 2007]**

(1) capsule (2) antheridium

(3) columella (4) archegonium

Ans.	1	3	2	3	1	4														

These questions consist of two statements each, printed as Assertion and Reason. While answering to choose any one of the following four responses.

(1) If both Assertion & Reason are True & the reason is correct explanation of the Assertion.

(2) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.

(3) If Assertion is True but the Reason is False.

(4) If both Assertion & Reason are false.

Q.1 **A :** Water is necessary to complete their life-cycle.
R : All bryophytes are land dwellers.

Q.2 **A :** The bryophytes exist in two phases gametophyte and sporophyte.
R : The sporophyte is nutritionally independent.

Q.3 **A :** Fragmentation is means of vegetative reproudction in bryophytes.
R : Bryophytes lack non-motile mitospores.

Q.4 **A :** Unlike thallophytes, bryophytes show formation of embryo.
R : The embryo gives rise to gametophyte plant of bryophytes .

Q.5 **A :** Bryophytes possess archegonium as a female sex organ.
R : Algae also possess the archegonium.

Q.6 **A :** Meiospores are produced by gametophytic plant of bryophtes.
R : They are of two types.

Q.7 **A :** Liverworts possess rhizoids.
R : It helps in the attachment to the substratum only.

Q.8 **A :** Bryophytes need water for fertilization.
R : Bryophytes can withstand desiccation very well.

Q.9 **A :** The thallus of liverworts is small in size.
R : They are not completely adapted to land condition.

Q.10 **A :** Some liverworts form tubers.
R : Tubers form plants even in unfavourable season.

Q.11 **A :** Many species of liverworts form the gammae.
R : They are fomed on the ventral surface.

Q.12 **A :** Liverworts fail to spread to a new locality through fragmentation.
R : Gemmae are helpful in propagating liverworts in different locality.

Q.13 **A :** Each part of liverworts is capable of regeneration.
R : Isolated scales and rhizoids of liverworts fail to form new individuals.

Q.14 **A :** Marchantia consists of unicellular rhizoids.
R : Rhizoids are of tuberculate type only.

Q.15 **A :** Riccia is many cells thick.
R : Riccia has both assimilatory region and storage region.

Q.16 **A :** Horn worts resemble algae.
R : Their chloroplasts contain pyrenoid.

Q.17 **A :** The sporogonium of riccia is the simplest among the liverworts.
R : Sporophyte consists of capsule only.

Q.18 **A :** The sporogonium of riccia is parasitic on the gametophytes.
R : The sporogonium never dehisces.

Q.19 **A :** Mature marchantia bears gametophores.
R : The antheridiophores and archegoniophores are borne on different thalli.

Q.20 **A :** In marchantia, elaters are directly formed from the sporogenous cells.
R : Elaters are haploid.

Q.21 **A :** The sporogonium of marchantia has three regions foot, seta and capsule.
R : Meiosis takes place in all cells of capsule.

Q.22 **A :** Morphologicall the spores of marchantia are identical.
R : The spores show physiological heterospory.

Q.23 **A :** Sporogonium of riccia is totally dependent on the gametophyte.
R : Sporogonium of marchantia is partly dependent on the gametophyte.

Q.24 **A :** In marchantia, dispersal of spores is done by wind.
R : Elaters facilitate dispersal of spores.

Q.25 **A :** Upper surface of marchantia thallus shows formation of gemma cups.
R : One gemma cup contains one gemma.

Q.26 **A :** Hornworts are more close to algae.
R : Chloroplasts of hornworts contain pyrenoid.

Q.27 **A :** The tuberculate rhizoids are absent.
R : Hornwort-thallus shows regular dichotomous branching.

Q.28 **A :** Nostoc lives in anthoceros thallus.
R : Nostoc obtains organic nutrition from anthoceros.

Q.29 **A :** Pseudoelater is present in the capsule of anthocerous.
R : Pseudoelater is single celled structure.

Q.30 **A :** The sporophyte of anthoceros is long-lived.
R : Sporophyte of anthoceros is semi independent.

Q.31 **A :** The mosses occur in almost all habitats.
R : They do not occur in sea.

Q.32 **A :** Early moss gametophyte is protonema stage.
R : Late moss gametophyte is leafy stage.

Q.33 **A :** Leafy moss contains tubers.
R : Tuber directly gives rise to new leafy gametophore.

Q.34 **A :** The primary protonema of moss by death and decay of cells may break into fragments.
R : Each fragment gives rise to leafy gametophyte.

Q.35 **A :** Any undamaged cell of the moss sporophyte can grow into a protonema.
R : It is a case of apospory.

Q.36 **A :** Autoicous mosses bear sex organs on different branches.
R : Paroicous mosses have both sex organs intermingled together.

Q.37 **A :** In paroicous moss, the antheridial and archegonial groups are demarcated by perichaetial bracts.
R : In synoicous moss, the leaves below the sex organs form a distinct sheath or a rosette-like structure.

Q.38 **A :** Archegonial venter forms calyptra.
R : Calyptra is present a the top of the sporophyte as a hood.

Q.39 **A :** The capsule of moss is highly differentiated.
R : Each region performs a distinctive function.

Q.40 **A :** The peristome is a fringe of teeth-like projections found at the mouth of the capsule.
R : It may be of two types nematodontous and orthodontous.

Q.41 **A :** True mosses bearing peristome teeth are called cleistocarpous.
R : Stegocarpous mosses do not show differentiation of peristome teeth.

Q.42 **A :** Spore of liverworts produces a single sporeling.
R : A number of leafy gametophytes of moss forms from a single spore.

Q.43 **A :** Sphagnum is called peat moss.
R : It is the major component of peat.

Q.44 **A :** Juvenile erect leafy gametophyte of sphagnum is called gametophore.
R : Gametophores bear rhizoids like the mature gametophyte.

Q.45 **A :** It can survive without water.
R : Mature sphagnum cannot absorb water due to lack of rhizoids.

Q.46 **A :** Sphagnum is used for dressing wounds.
R : Sphagnum cannot absrob water.

Q.47 **A :** Sphagnum has great ecological importance.
R : It brings succession in pond ecosystem.

Q.48 **A :** The growth of funaria stem occurs by a single cell.
R : Its position is apical.

Q.49 **A :** Funaria multiplied vegetatively by means of bulbils.
R : Bulbils and tubers are two different structures.

Q.50 **A :** Sporophytes of pteridophyta are dominant individual.
R : They do not show the formation of true root.

Q.51 **A :** Filicales are usually homosporous.
R : They are monoecious.

Q.52 **A :** The sporophytes of polypodiaceae are of various types.
R : Polypodiaceae contains common ferns.

Q.53 **A :** Adiantum caudatum is called walking fern.
R : It can reproduce by its leaf tips.

Q.54 **A :** Coenosorus lacks true indusium.
R : Indusium covers sori.

Q.55 **A :** Ramenta are scales which cover young

rhizome and leaves of Dryopteris.

R : Pteridium lacks ramenta.

Q.56 **A :** Indusium dries in mature sorus and releases sporangia.

R : Mature sporangium releases spors by the structures annulus and stomium.

Q.57 **A :** Both bryophytes and pteridophytes contain well-developed antherida.

R : Biflagellate sperms are formed by their antheridia.

Q.58 **A :** In leptosporangiate development, sporangia are formed from a group of initials.

R : Eusporangiate development of sporangia starts from single initial.

Q.59 **A :** Gymnosperms seeds are naked.

R : They lack ovary wall.

Q.60 **A :** All gymnosperms trees.

R : They lack vegetative reproduction.

Q.61 **A :** Manoxylic wood is soft.

R : The amount of secondary xylem is very small.

Q.62 **A :** The nucellus is present in the ovule.

R : It forms pollen chamber.

Q.63 **A :** In gymnosperms pollination occurs through wind.

R : The ovule secretes a pollination drop.

Q.64 **A :** Cycas has two types of root-tap root system and coralloid roots.

R : Coralloid root contains anabaena.

Q.65 **A :** Xylem of gymnosperms consists of tracheids and no vessels.

R : Phloem of gymnosperms consists of phloem parenchyma, companion cells and sieve tubes.

Q.66 **A :** All living species of cycas are dioecious.

R : Cycas contains male and female cones on the same plant.

Q.67 **A :** *Pinus* has mycorrhizal roots.

R : *Pinus* has no root hairs.

Q.68 **A :** Pinus leaf shows xerophytic adaptations.

R : Cycas too, has xerophytic adaptation,

Q.69 **A :** In India, Cycas revoluta is grown by means of bulbils.

R : Cycas revoluta never forms seed.

Q.70 **A :** In cycas, male cones are found in cluster.

R : The stem of male plant is monopodial.

Q.71 **A :** The male cone of cycas is woody.

R : The microsporophyll at the base cone is sterile.

Q.72 **A :** The male of cycas change in size when the microspores became mature.

R : The microspores are dispersed by wind.

Q.73 **A :** The female cone of cycas is not true cone.

R : Its formation checks the growth of the stem.

Q.74 **A :** The megasporophyll of cycas bears ovules.

R : The ovules are arranged terminally.

Q.75 **A :** Nucellus of cycas forms nucellar beak.

R : Nucellus of cycas forms pollen chamber.

Q.76 **A :** The interval between pollination and fertilization is about 4 months in cycas.

R : Cycas show retention of swimming sperm.

Q.77 **A :** Cycas embryo has many cotyledons.

R : Compound suspensor is formed due to fusion of suspensors of proembryos.

Q.78 **A :** Cycas revoluta is of high economic importance.

R : It yields sago grains.

Q.79 **A :** Pinus has a pyramidal appearance.

R : The older parts of long shoot have scars of fallen dwarf shoots.

Q.80 **A :** Pinus tree is evergreen.

R : Its needles are persistent.

Q.81 **A :** Resin protects Pinus tree from microbial attack.

R : Resin is formed in resin canals.

Q.82 **A :** The pollen grains of pinus are wind pollinated.

R : They are winged.

Q.83 **A :** Companion cells are absent in gymnosperm.

R : In gymnosperms, plants show well-developed vessels and fibres.

Q.84 **A :** "Uper carboniferous" period is also called "Age of Ferns".

R : Ferns dominated during the period.

Q.85 **A :** Pinus is heterosporous.

R : Microspore and megaspore are present in them.

Q.86 **A :** Pinus tree is evergreen.

R : Leaves of pinus are xerophytic in nature.

Q.87 **A :** Conifers shed their leaves during winter

season.

R : In temperate areas, conifers are deciduous in nature.

Q.88 **A :** Long shoots bears male cones.

R : Long shoots of pinus grow vigorously for some time, then growth stops.

Q.89 **A :** The scale leaves on the long shoots are called cataphylls.

R : Cataphylls lack mid rib.

Q.90 **A :** It shows presence of albuminous cells.

R : Pinus lacks sieve plates.

Q.91 **A :** Bract scale is a membranous structure.

R : Bract scales helps in the disporsal of seeds.

Q.92 **A :** Pinus shows formation of annual rings.

R : Pinus grows in area of environmental fluctuation.

Q.93 **A :** The mesophyll of pinus shows no distinction as mesophyll and palisade.

R : Parenchymatous cells are present in mesophyll of pinus.

Q.94 **A :** Pinus is monoecious.

R : Each sporophyll bears only one microsporangia.

Q.95 **A :** Male cone bears pollen grains.

R : Male cone of Pinus is equivalent to stamens of angiosperms.

Q.96 **A :** The female cones are same in number as male cones.

R : Male and female cones appears alternately on the same branch of the Pinus.

Q.97 **A :** The female cones take much time to mature.

R : The seeds are shed when the cone is 22 months old.

Q.98 **A :** Pinus shows polyembryony.

R : Pinus embryo has two cotyledons.

Q.99 **A :** Pinus displays the alternation of generations.

R : The gametophyte is dependent upon the sporophyte phase.

Q.100 **A :** Cedrus deodara yields highly valued timber.

R : Cedrus deodara is resistant to pathogen attack.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

Contents

Module - 2
Type Study of Animal

Chapter Name	Page No.
	1 – 117
Theory	
Amoeba	1 – 12

AMOEBA

CLASSIFICATION

Phylum - **Protozoa** - Acellular animals. (According to DOBELL), Body organisation- **Protoplasmic**

Subphylum - **Plasmodroma** - Locomotory organs are flagella or pseudopodia or Absent.

Class - **Rhizopoda (or Sarcodina**) - Locomotary organs are pseudopodia. Body-Naked

Order - **Lobosa (or Amoebina)**- Pseudopodia are with rounded ends called lobopodia.

Genus - **Amoeba** - Pseudopodia distinct, C.V. present, uninucleate.

Species - ***A. proteus*** - Body shape irregular, keep changing its form.

DISCOVERY & HISTORY

R.V. Rossenhoff :

– Discovered Amoeba. Termed it as "Little Proteus" on the name of an Yunanian God able to change his shape.

Saint Vincent :

– Named "Amoeba" which was further changed to "Amoeba".

Heirsch Field :

– Detailed study of *Amoeba proteus*.

HABIT AND HABITAT

– Most of the species of Amoeba are found in fresh water and feeds on algae and bacteria.
– It is present in dirty water with mud. Culture of Amoeba = By **Hay infusion process**.
– Two species of Amoeba are also found in sea water or marine water.- ***Amoeba verucosa, Amoeba striata***

***Amoeba radiosa* :**

– Found in tropical areas.
– This is the most common species found in India.

***Amoeba proteus* :**

– Present in temperate areas.
– Its structure is like a simple cell and the size is also sufficient therefore is most studied.

***Amoeba pelomyxa* :**

– (Chaos - Chaos) = Giant Amoeba.
– This is the biggest Amoeba (2.5 to 6 mm), its structure is uncommon because it is exceptionally multinucleated.

MORPHOLOGY

Shape and Size :

– Amoeba is micro organism.
– Size varies from 0.2 mm to 0.6 mm.
– It is colourless and transparent.

– Shape is variable because pellicale is absent and pseudopodia are continuously forming and disappearing.

Exception :

– Due to presence of pellicle in *Amoeba verucosa and A. striata***,** pseudopodia are not formed and their shape is fixed.

Pseudopodia - (= false feet) :

– These are finger like and blunt extensions of the cell body.
– These are formed due to liquefication and forward flow of the cytoplasm.
– They are formed by both ecto and endoplasm.
– *Amoeba proteus* is a polypodial species. In this, pseudopodia are large and tubular with rounded tips, called "lobopodia".
– Body of amoeba is differentiated into protoplasmic membrane, cytoplasm and nucleus.

Protoplasmic membrane (Plasma lemma) :

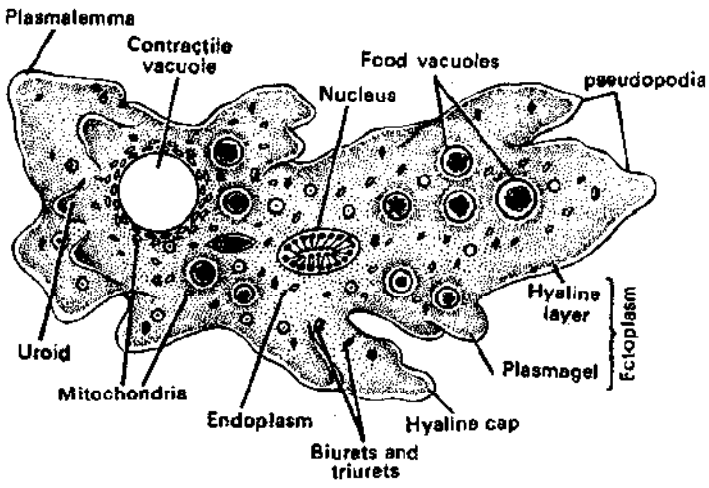
– This is the outermost covering.
– It is thin (0.2μ to 2μ in thickness) soft, selectively permeable unit membrane which is capable of regeneration.
– Electron microscope shows that hair like extensions are present on whole of the membrane, hence are called microvilli .
– They are mucoproteinaceous in nature.
– These microvilli helps amoeba in adhesion with the surface.
– Plasma lemma covers the body thus it is protective in nature.
– It is excretory, NH_3 diffuses out through it.
– It is also respiratory, diffusion of O_2 and CO_2 takes place through it.

CYTOPLASM

It is divided into two parts-Outer = Ectoplasm or Ectosarc. Inner = Endoplasm or Endosarc

1. Ectoplasm :

– It is transparent and present in the form of a thin layer.
– It is devoid of granules and structures.
– Electron microscope shows that it is differentiated into two area.
– Outer part is made of a watery fluid which is called "Hyaline layer".
– This layer is thick in pseudopodia and called as "Hyaline cap". It gives strength to pseudopodia.
– Internal part is made of plasmagel.



– The ectoplasm of *Amoeba proteus* contains various perpendicular projections.
– These are called as "longitudinal ridges".
– These ridges causes friction and helps amoeba to adhere with the ground.

2. Endoplasm :

- It is semi transparent, and granular.
- All the structures of Amoeba are present in endoplasm.
- According to "Mast" Endoplast is divided into two parts.
- Internal - Plama sol. Peripheral - Plasma gel. But electron microscope does not show this type of division.
- So whole of the endoplasm is considered as sol in the modern theory Endoplasm shows cyclosis around the nucleus.

NUCLEUS

- Normally Amoeba is uninucleated but exceptionally ***Amoeba diploidia*** has two nucleus.
- While *Amoeba pelomyxa* is multi nucleated.
- The nucleus of young or baby Amoeba is Biconcave but biconvex in adult Amoeba.
- Nucleus is granular and refractive to light.
- It is bounded by a thin nuclear membrane which is double and intercepted by pores.
- A network of protein fibers is present just inside the nuclear membrane.
- It is Honey comb in shape so called as "Honey comb lattice".
- It maintains the shape of nucleus.
- Nucleus of Amoeba is massive in nature. It means that chromatin material is more and nucleoplasm is less in quantity.
- Chromatin material is present in spherical granules known as **"Chromidia"** .
- These are 500-600 in number.
- Every chromidia is made up of one or two genes.
- Study of Amoeba shows development of chromosomes. Initially there were separate chromosomes which combine and remain in sets during development.
- So more genes are found on a single chromosome.
- Nucleolus - Many in number, but minimum three are present.

CELL ORGANELLES

Contractile Vacuole (C.V) :

- Only one in number.
- It is formed by union of many small vacuoles.
- C.V. is present in endoplasm. Its position is not fixed, but usually it is present between nucleus and rear part of Amoeba (Uroid).

Function :

- Water balance.
- The liquid medium around amoeba is Hypotonic so water is coming inside from outside continuously.
- This extra incoming water is thrown out by C.V. Functionally C.V. is equivalent to kidney or nephron or uriniferous tubules of higher animals.

– Numerous long tubules are related to C.V. These are called as **Feeding canals or Radiating canals**.
– These canals collect water from cytoplasm and drain into C.V.

Diastole :

– Increase in size of C.V. due to filling of water.

Systole :

– When C.V. becomes sufficiently large, it bursts near plasmalemma and water is thrown out. This process is called systole.
– Then many small vacuoles combines to form a C.V. Maximum energy is used in this process so many mitrochondria surrounds the C.V.
– The functional ability of C.V. increases when Amoeba is put in distilled water. When Amoeba is transferred from fresh water to marine water C.V. disappears. When marine amoeba is transferred to distilled water, a new C.V. is formed.

Food Vacuole :

– Many food vacuoles are present in endoplasm.
– Every time when food is ingested, a new food vacuole is formed and full digestion occurs in this vacuole.
– Fuctionally it is closely related to alimentary canal of higher animals. In hungry amoeba food vacuole is absent.

Water Vacuoles :

– These are small, non contractile vacuoles filled with water and are present in endoplasm.
– Formation by pinocytosis. for getting minerals.

Other organelles :

– The ribosomes occurs on some of, the endoplasmic reticulum as well as scattered in the endoplasm.
– Golgi bodies present as several group of sac like tubes.
– Mitochondria are more or less and have tubular cristae.

Biurets and Triurets :

– Many bipyramidal and tripyramidal crystals are present in endoplasm of amoeba.
– These crystals are made up of excretory product:- **carbonyl diurea**. (Specific property).
– Probably these crystals are excreted during reproduction.
– Stored food of Amoeba - Glycogen and Oil drops.
– Every cell organelle is present in cytoplasm of Amoeba except centriole.
– Endoplasmic reticulum in Amoeba does not contain cisternae.

LOCOMOTION IN AMOEBA

Amoeba is a **polypodial** animal but the **locomotion is monopodial**, means Amoeba uses a single pseudopodia in locomotion. Speed = .02 - .03 mm/min.

Locomotion in Amoeba is completed in three stages :

1. **Adhesion with base :**

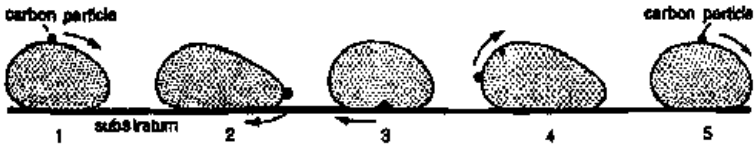
– In this process, microvilli, longitudinal ridges, and ions present in water like Ca^{++}, Mg^{++}, K^{+}, etc. are helpful.

– This is essential for pseudopodia formation.

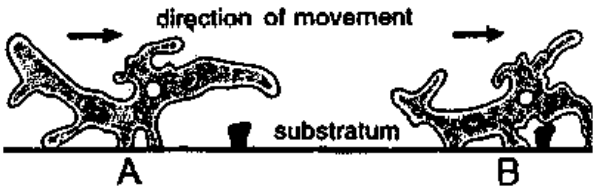
3. **Contraction in body :**
   – Amoeba moves forward by this contraction.

THEORIES RELATED TO LOCOMOTION

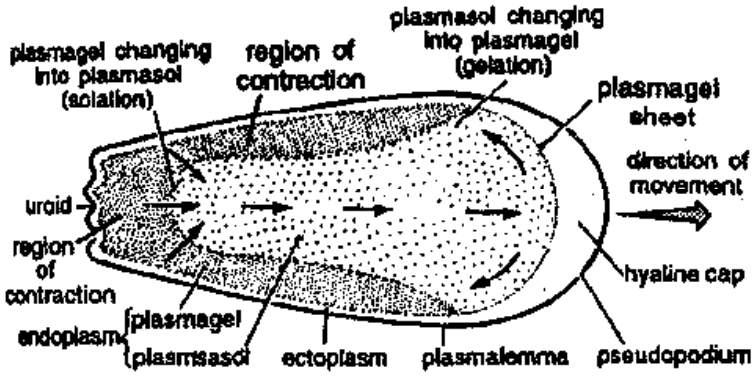
1. **Rolling movement theory :**
   – This theory was proposed by "**Jennings**".
   – This type of rolling movement was observed on *Amoeba verucosa*.
   – This theory is correct for only two species. *Amoeba verucosa, Amoeba striata*. (because on his surface pellicle is present).
   – He explained that the amoeboid movement takes place due to rolling movement of the body surface comparable to the rolling movement of the fluid filled sac on substratum.
2. **Contraction theory :**
   – This theory is given by **Heitzman & Schultze.**
   – According to this theory a pseudopodia is formed due to contraction.
   – Contraction occurs in posterior portion of Amoeba while pseudopodia forms in front part or in the direction of locomotion.
   – Pseudopodia formed is considered as Hernia.
   – This theory is not valid.
   – Only contraction is not responsible for pseudopodia formation.



3. **Walking movement theory :**
   – This theory was given by **Dellinger**.
   – This theory says, that pseudopodia forms in the front part.
   – These pseudopodia serves as feet for amoeba which causes locomotion.
   – Pseudopodia disappears in the back part and are observed as wrinkles.
   – These wrinkles are called **Uroids**.
   – This theory is not right.
   – At the time of locomotion Amoeba is in contact with surface.



4. **Surface tension theory :**
   – Proposed by **Berthold. Butschli and Rhumbler** supported this theory.
   – According to this theory pseudopodia are formed due to difference in surface tension of body of Amoeba and ground.
5. **Sol-Gel Theory :**
   – (Change in viscosity theory) = Proposed by = Hyman
   – Detailed study by = **Pantin and Mast**
   – This theory suggest that pseudopodia are formed due to interconversion of sol. and gel.
   – According to Mast endoplasm is divided into two parts.



- Central part - Sol. Peripheral - Gel
- In locomotion sol flows in the direction of locomotion and breaks the gel barrier.
- This sol strikes with the ectoplasm.
- After striking it moves on either side and converts into gel.
- In locomotion the gelation process occurs in front while solation (gel to sol) occur in rear outward.
- This process helps in pseudopodia formation.
- Pseudopodia is a tube like structure of ectoplasm in which endoplasm is filled.
- The wall of pseudopodia is made up of gel while sol is inside.

Drawbacks :

- This theory do not explain the sol-gel interconversion.
- It does not mention about the force by which sol moves forward.

SOME THEORIES IN FAVOUR OF SOL-GEL THEORY

1. **Molecular folding unfolding theory :**
   - **Proposed by Goldacre and Lorch**. It explains the sol-gel interconversion.
   - This is a biochemical and biophysical process.

   - The sol form of protoplasm is due to tertiary structure (folded state) of protein.
   - While the gel form is due to secondary structure which is formed by unfolding of tertiary protein.
2. **Contraction Hydraulic theory :**
   - **Given by Rinaldi**. It explains how do sol moves in the direction of locomotion.
   - According to this, actin and myosin type of proteins are present in rear portion of Amoeba.
   - These proteins produce hydraulic pressure by contraction.

- This pressure is maximum in front, minimum in middle and moderate in rear.
- According to "Huxley", the proteins participating in solution and gelation are similar to actin and myosin of muscles fibres.

3. **Fountain zone theory :**
   - **Proposed by Allen.** According to this, sol is present in periphery while gel inside.
   - This central gel moves like a fountain in the direction of locomotion.
   - This fountain applies pressure over ectoplasm and thus pseudopodia is formed.
   - But this theory is absolutely wrong because in amoeba sol is always inside while gel is always outside.

PHYSIOLOGY

Nutrition :

- Nutrition in amoeba is holozoic or zootropic.
- It means that initially ingestion of food and then digestion occurs in body.
- Amoeba is omnivorous. It takes bacteria, algae, ciliated and flagellated protozoa.
- There is no pore for ingestion and excretion of digested food.
- Any part of plasmalemma can ingest food and excrete digested food.
- Some protozoans like paramecium contain pore.
- These are called **cytostome (mouth) and cytoproct (anus)**. (or cytopyge).

Methods of food ingestion - Studied by Rhumbler :

1. **Import :**
   - Amoeba do not take effort in this method.
   - Any moving food when strikes with amoeba, it is embedded into the cytoplasm.
2. **Invagination :**
   - By this process small and non-motile food is ingested.
   - This type of food when comes in contact with plasmalemma, it invaginates and food is ingested due to invagination of plasmalemma in the form of a food vacuole.
3. **Circumfluence :**
   - This process is used to ingest large and nonmotile food e.g. Filaments of algae.
   - In this process amoeba moves and covers the food by sitting on it.
   - Now it spreads over the food, plasmalemma invaginates and forms a food cup which further converts to a bit food vacuole.
4. **Circumvallation :**
   - By this process amoeba ingests active, motile food.
   - Amoeba surrounds its food by pseudopodia.
   - Later these pseudopodia unite and form a food cup.
   - These pseudopodia along with the food are absorbed in the endoplasm.

Digestion :

- Digestion occurs completely in food vacuole.
- The total duration is approximately 30 hrs. when digestion is completed.
- Digested food is thrown out by exocytosis.

- The mechanism of digestion is same as in higher animals.
- Initially the medium is acidic, in this medium food is dissolved.
- Later on the medium becomes basic so that digestive enzymes digest the food.
- All digestive enzymes are present in amoeba but the presence of carbohydrate digestive enzymes is suspicious. After digestion, digestive food is diffused from food vacuole to endoplasm.
- During digestion food vacuole shows changes.
- Initially food present in food vacuole is complex and insoluble.
- So medium in food vacuole is hypotonic with respect to external media.
- So that food vacuole looses some water and hence it becomes a little small.
- When food is digested, it becomes soluble.
- Now medium of food vacuole is hypertonic and hence water is re absorbed which increases the size of food vacuole.
- Later on, digestive food is diffused to cytoplasm and this causes the medium to become hypotonic which in turn causes food vacuole to a smaller size.
- This decreased size food vacuole is thrown by exocytosis.

Respiration and excretion :

- Both these functions are completed by plasmalemma through diffusion.
- Amoeba is an obligate aerobe.
- It depends only on aerobic respiration.
- So when amoeba is put under O_2 less water, it dies.
- In view of excretion amoeba is ammonotelic.

Reproduction :

There are many processes -

1. **Binary fission :**
   - Simplest type of reproduction.
   - It occurs in desirable condition.
   - In this process division is primitive type of mitosis called as cryptomitosis.
   - Phases of this division are as under.
2. **Sporulation - Occurs in two stages :**
   - i. Sometimes amoeba reproduces by sporulation in unfavourable conditions.
   - ii. When excessive energy is spent in continous binary fission, ability of survival decreases.
   - To reproduce, it does sporulation.
   - Spore is the **resting stage of amoeba** hence it saves energy.
   - In sporulation amoeba retracts its pseudopodia and becomes a sphere.
   - Nuclear membrane disappears and chromidia disperse in sets of 2 or 3 chromidia.
   - Every set of chromidia is surrounded by a newly formed nuclear membrane.
   - After that cytoplasm divides and breaks in 200 pieces.
   - Every piece contains a nucleus.

- Every piece now secretes a hard and thick coat around itself.
- This structure is called spore.
- So 200 spores are formed by this process.
- Coat of spore is made up of chitin.
- Now plasma lemma in a parent amoeba dissolves and spores are spread out.
- When favourable conditions arrive, spore germinates.
- They absorb water and swallow.
- Thick coat splits and a young amoeba comes out.
- In this young stage endomitosis occurs in nucleus, so that chromidia increases in number up to 500-600 nuclei formed by endo mitosis is called **restitution or polyenergid nucleus**.
- Spore also helps in dispersion of amoeba.

3. Encystment and multiple fission :

- This process is used under unfavourable conditions, like lack of O_2, lack of food and high temp.
- In this case amoeba secretes a three layered thick coat around itself.
- Now amoeba is called cyst.
- Coat of cyst is also made up of chitin like of spore.
- It is impermeable for water and permeable for O_2 and CO_2.
- Inside cyst, amitosis occurs several times so that 500 small amoeba are formed.
- These are called pseudopodiospores or swarm spores.
- On returning of favourable conditions, cyst splits and amoeba are free in water.
- According to modern scientists multiple fission is very rare.
- It is not a process of reproduction. It is a process of perennation.
- Amoeba is least active inside cyst.
- This is called **"Suspended Animation"**.
- This is also a process of dispersion but its efficiency is more than spore.

4. Rejuvenation :

- This is also called non-functional conjugation.
- In this process, two old amoebae come close to each other and adhere themselves.
- After a while they get separated.
- Now both of these amoebae are more active than before.
- Exchange do not occurs in this process.

5. Regeneration :

- Studied by bruno & Hoger – There is maximum power of regeneration in amoeba.
- Any part of amoeba which contain at least one chromidia may regenerate.

IMMORTALITY IN AMOEBA - STUDIED BY HERTMAN

- Amoeba is immortal because its natural death do not occur, as a parent amoeba is converted completely into two daughter amoeba by binary fission.
- Immortality can also be explained on the basis of "Germplasm theory of Weismann".

- According to this theory, amoeba is not differentiated into somatoplasm and germplasm.
- This type of differentiation is present in multicellular animals.

Irritability :

- Amoeba has protoplasmic grade of irritability.
- Maximum taxis movement of amoeba are negative, these are called phobotaxis.
- Some positive taxis are also present these are called philotaxis.

Examples of irritability

1. **Thigmotaxis :** Normally phobotaxis, but in response to food it is always philotaxis.
2. **Phototaxis :** Amoeba likes dim light. So phobotaxis is seen in response to bright light & darkness.
3. **Thermotaxis :** Optimum temp = 20-25ºC. When amoeba is kept suddenly under high temperature, it dies but when rise in temp is gradual it forms cyst.
4. **Chemotaxis :** Amoeba shows phobotaxis when kept under water in which those chemicals are present that are not present normally in water.
5. **Galvanotaxis :** When low current is passed, amoeba moves toward cathode but in high current it dies.
6. **Rheotaxis :** Amoeba moves with the flow of water.
7. **Geotaxis :** Philotaxis because amoeba like to live in bottom. These animals are called benthos or benthic. For locomotion ground is available to amoeba. Sufficient food is also present.

Entamoeba histolytica

Discovered by = Lamble.

- Pathology of Ent. histolytica given by = LOSCH (Life cycle monogenetic). Ent. Histolytica is a parasitic amoeba and it causes "amoebic dysentery".
- A patient with this disease has acidic stools.
- Stool also contain mucous and blood and cyst of entamoeba.
- So this disease is diagnosed by stool test. Ent. Histolytica is a parasite of large intestine of man.
- Here, it secretes histolytic enzymes which causes harm to wall of intestine. Ent. destroys the mucosa and submucosa of colon and enters in its wall.
- Finally, it approaches in other organs of body like liver, lungs, kidney, brain etc. through blood circulation.
- In this stage, it may be dangerous.

Two forms of Entamoeba

[i] Trophozoites or Magna form.

[ii] Precyst or minuta form.

[i] Trophozoites or Magna form :

- Trophozoite form is larger than Minuta form.
- Trophozoite is the adult stage of entamoeba.
- This stage of entamoeba is motile, actively feeding and pathogenic.
- Basically structure of entamoeba is similar to Amoeba, but C.V. is absent in entamoeba because of isotonic medium.
- It's food vacuole contains R.B.C., W.B.C. and bacteria.
- Nucleus of entamoeba is vesicular chromatin material less and nucleoplasm is more.
- Chromidia are arranged on periphery of nucleus.
- At the centre of nucleus, a false nucleus or karyosome or Endosome occurs.

- Endosome surrounded by a small clear shiny and transparent area which is called "Halo".
- Nucleoplasmic striations connect Halo to chromidia.
- *Ent. Histolytica* :- monopodial animal.
- In its rear portion plasmalemma is gelatinous and sticky.
- So that it helps in sticking of food particles.
- Food is ingested by the process of invagination.
- This is the only process of food ingestion.

(ii) Minuta or Precyst form :

- This is non-motile form, non-pathogenic, non-feeding form called as **minuta**.
- Cytoplasm of these minuta contain only one or two granules of glycogen, but contains a dense body called as "Chromatid body". (in only unmature cyst) Possibly it is made up of Ribo nucleoproteins which further disappear.

Life Cycle :

- Division is by binary fission the daughter are formed which receive their nutrition and become adult called Trophozoite.
- But some daughter Ent. do not take nutrition and hence no growth occurs, so they remain small in size called minuta.
- Minuta secretes a thin but strong coat around itself.
- This is called cyst. Nucleus of cyst undergo two mitosis and a tetra nucleated cyst is formed it is carried out from the body by stools of the patient.
- This tetra nucleated cyst is the infective stage of Ent. for human.
- Cyst enters in human by impure water and food.
- Houseflies carry these cyst to food.
- When these cyst reaches to colon their hard coat is damaged this process is called hatching or excystment now mono nucleated stage comes out this is called metacyst.
- Metacyst undergo binary fission and eight Ent. are formed.
- So cytoplasmic division is only one times while nuclear division is three times to make eight Ent.
- All these Ent. enters the wall of colon and after growth converted into Trophozoite.
- Some medicines used in prevention of diseases caused by ent. histolytica. Emetine (Inj.), Diodoquin, Dependal, Carborsone metrogyl, magma, Amicline.

Entamoeba gingivalis

- It is present in Tarter which is deposited in between teeth and take W.B.C. and Bacteria.
- Approximately 70% humans are infected by this.
- Some times it also infect gums.
- *Ent. gingivalis* is a human parasite but it **is not pathogenic** actually it helps some pathogenic protozoa. In infection e.g. **Trichomonas tenax** and **Trichomonas buccalis** both of these causes pyorrhoea.
- In this disease there is leakage of blood & pus from gums.
- *Ent. gingivalis* do not form cyst.
- It spreads through mouth to mouth kiss (*E. gingivalis* KTP = Kiss Transmitted parasite).
  Prevention may be done by using sensoform mouth wash.

Entamoeba coli.

- This species is found in human colon.
- It shows commanselism means host is neither in gain nor in loss.
- It feeds on non digestive food & bacteria. E. Coli = Escherichia Coli - It is a bacteria it also shows commanselism found in alimentary canal of human.

SPECIAL POINTS

- Amoeba is omnivorous.
- Pelomyxa is the largest amoeba.
- *Amoeba proteus* is a free living and solitary animal.
- Amoeba is polypodial where as Entamoeba is Monopodial.
- Amoeba shows polarity as uroids are present on rear.
- Chromatin material of Amoeba is granular and called chromidia.
- Gaseous exchange in Amoeba is done through body surface.
- Excretion of Ammonia is also done through body surface.
- The universal theory for locomotion in Amoeba is sol-gel theory.
- Mechanism of binary fission in Amoeba is cryptomitosis.
- General method of reproduction in Amoeba is binary fission.
- Digestion is intracellular.
- Food vacuole of Amoeba is analogous to the alimentary canal of an animal or gastrovascular cavity of Hydra.
- Quadrinucleate cyst of Ent. amoeba is infective stage.
- Most effective medicine for amoebiasis is metrogyl or flagyl.
- Amoeba has no skeleton.
- Difference between Amoeba and Entamoeba is contractile vacuole.

PLASMODIUM (Malaria Parasite)

CLASSIFICATION

Phylum - **Protozoa**
Sub Phylum - **Plasmodroma** – Locomaotive organs are pseudopodia or flagella or absent
Class - **Sporozoa** - All members are endoparasites. So locomotive organs are absent
Subclass - **Telosporidea** thin and long sporozoites and sporulation found
Order - **Haemosporidia** = Digenetic life cycle and parasite on blood and tissue
Genus - **Plasmodium** – Blood parasite of mammals, birds or reptiles. Vector is usually mosquito.
Species - There are 60 species of Plasmodium are known. Only four species causes malaria.

P. vivax
P. ovale
P. malariae
P. falciparum

LIFE CYCLE OF PLASMODIUM

- Plasmodium is a member of order Haemosporidia therefore it completes its life cycle in two hosts.
- **Primary host -** Primary host for **plasmodium** is **human being**. Plasmodium completes only **asexual life cycle** in this host.
- **Secondary host -** Intermediate host = Carrier host - **female anopheles** serves as secondary host for plasmodium. Both sexual cycle and sporogony (asexual) are completed in this host.
- **Reservoir host -** Monkey is reservoir host for plasmodium.
- All the stages of plasmodium life cycle that occurs in human are also found in monkey, but monkey do not suffer or die of malaria.
- Eradication of **plasmodium** is not easy due to its several hosts. Another reason is that vaccine can not be formed because **plasmodium** do not induce human body to form antibodies and hence no immunity against **plasmodium** can develop.
- **NMEP** - National Malaria Eradication Programme

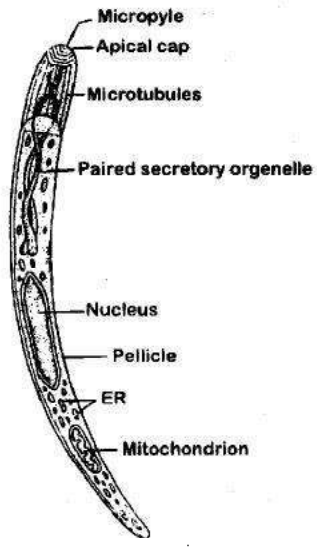
LIFE CYCLE OF PLASMODIUM IN HUMAN

Infection :

- A healthy person acquires infection when a female Anopheles mosquito contains infective stages (sprozoites) of the parasite in its salivary gland, bites him for sucking blood.
- Sporozoite are present around a number of 2,00,000 in salivary glands of female **anopheles**.

Sprozoites :

- Sporozoites are spindle or sickle shaped.
- Body is covered by pellicle which is made up of **11-15** microtubules. Pelicle is contractile due to pelicle sporozoite show wriggling movment.
- No. of microtubles in pelicle of P. vivax – 11, P.ovale – 13 and P. falciparum – 15.
- Sporozoite contains an aperture at the apex. This is called "Micropyle".



Sprozoite

- A structure which covers micropyle is known as apical cap. It is made up of 3 concentric microtubules.
- A pair of secretory organelles are related to micropyle. It contains **lytic enzymes** which helps sporozoite to penetrate human liver cells.
- A big oval shaped nucleus is present in middle of sporozoite. Just beneath it, there is a mitochondria.

- An anticoagulant **(Anophellin)** is secreted when female anopheles bites, it do not allow blood to clot so that anopheles can suck blood easily. With the saliva, a number of sporozoites enters in human blood.
- Within 30 minutes all of these sporozoites approaches the liver. Now no sporozoite is visible in the blood.

Exo erythrocytic Cycle :

- There are two sites for activity of plasmodium in human (i) Liver (ii) RBC.
- All the activities that oocurs in liver are known as **"Exo erythrocytic Cycle"**.
- Whereas activities in RBC are termed as "**Erythrocytic cycle**".
- Exo erythrocytic Cycle consist of (a). pre erythrocytic cycle and (b). post exo erythrocytic cycle.

(a) Pre Erythrocytic Cycle :

- The first cycle of plasmodium in liver is called as pre erythrocytic cycle.
- Sporozoite enters into the liver cell and become spherical by phagocyting the cytoplasm.
- Now these are termed as "**Cryptozoites**". Cryptozoites undergo multiple division.
- This is called "**Schizogony**". This results in the formation of 1000-1500 small structure called as **cryptomerozoites**.
- At this stage cryptozoite is called "Schizont" (According to old scientists) schizont name is used for cryptozoite which undergoes schizogony.
- Old scientist use the name cryptozoite for products of schizogony.
- Finally cell membrane of liver cell & schizont bursts and cryptomerozoites are now free in blood sinusoids of liver.
- A few of these cryptomerozoites infect RBC and start the erythrocytic cycle.
- Rest of the cryptomerozoites go back in liver cells and starts the post exoerythrocytic cycle.
- All these cycles in liver, **except the first one** are called **post erythrocytic cycles**.
- Time taken to complete pre erythrocytic cycle is called **pre patent period**.
- In this period plasmodium is not visible in blood.
- After pre-patent period report of blood test is positive and plasmodium can seen in blood.
- Plasmodium starts its life cycle from liver because
  (i) To prevent itself from the phagocytic action of WBC
  (ii) Plasmodium use glycogen as food and liver is rich in glycogen.
  (iii) To multiply in number

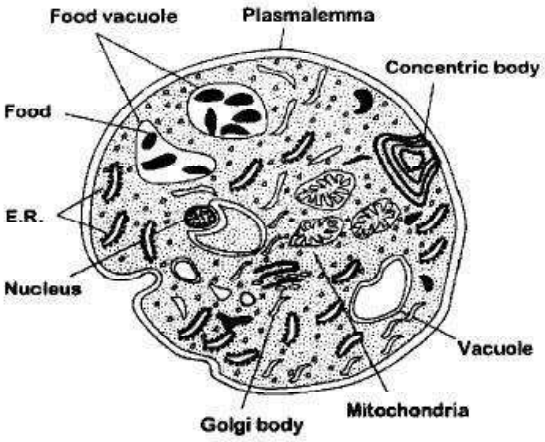
(b) Post Exoerythrocytic cycle :

- In this cycle, cryptomerozoites infect the liver cells.
- They phagocytise the cytoplasm and become big and spherical.
- Now these are known as **Metacryptozoite or phanerozoites.**
- Two types of metacryptozoites are formed.
  (i) Micro Metacryptozoites - (Mi mcz) (ii) MacroMetacryptozoites - (Ma mcz).
- **Mi mcz** are further divided into 100-1000 merozoites by the process of schizogony.
- The product is called Micro meta crypto merozoite (Mi mcmz).
- **Ma mcz** also undergo the process of schizogony.
  It results in the formation of 64 merozoites these are called (Ma mcmz) *Macrometacryptomerozoite.*

- Mi mcmz infect only & only RBC, whereas Ma mcmz infect liver cells.
- This cycle goes on repeating again and again which causes destruction of liver cells.
- In case of an excessive Malaria, liver may damage and jaundice like symptoms may appear.

Erythrocytic cycle or Golgi cycle :

- This cycle starts at first by cryptomerozoites and further carried on by micrometacryptomerozoite.
- Cryptomerozoite infects R.B.C. They phagocytosis hemoglobin of R.B.C. & become big & spherical.
- Then they are called **trophozoites**. Later on, a big central vacuole is formed in the cytoplasm of trophozoite and nucleous come in lateral side.
- This makes it appear like a "Ring". So this stage is called **signet ring stage.** Double signet ring found in falciparum.
- After a while vacuole is lost and trophozoite become irregular in shape.
- At this stage plasmodium looks like Amoeba, so this is called as amoeboid stage.



Trophozoite

- Amoeboid stage is active and feeding stage of plasmodium, it phagocytise hemoglobin quickly, grows up and occupies whole of the RBC approximately.
- Particularly, at this stage, reddish brown coloured granules are seen in the cytoplasm of plasmodium, these are called haemozoin granules.
- It is the non digested heme part of hemoglobin.
- At the same time bright yellow coloured granules appear in the cytoplasm of RBC.
- These are called **Schuffner's dots** which are probably waste product of plasmodium.
- These dots are used in diagnosis of malaria because they are most clear structures, that appear in blood.
- A stain known as **Romanovaski stain** is used to observe Schuffner's dots.
- There are two species of plasmodium that do not form Schuffner's dots.
- These are -In *P.ovale* Schuffner's dots known by **James dots**.

1. **Plasmodium Malariae :** They form Red coloured granules known as **Zeiman's** dots.
2. **Plasmodium falciparum :** They form green coloured **Maurer's dots.**
   - Both of these are also helpful in diagnosis of malaria.
   - Now schizogony occurs in trophozoite and 12-24 merozoites are formed.
   - They are arranged as petals of flower.
   - So plasmodium looks like a flower and hence this stage is known as **Rosette stage**.
   - Some cytoplasm in this stage remains undivisible.
   - Haemozoin granules are present in this cytoplasm.
   - Finally membrane of RBC and schizont bursts and all the material is free in blood plasma.
   - Merozoites infect new RBC and repeats the erythrocytic cycle again and again.
   - Burst RBC is called ghost RBC. These ghost RBC are uptaken by spleen from the blood and destroy it.
   - A special type of phagocyting cells called as macrophages are present in spleen.
   - These cells secrete an enzyme-lysolecithin which destroy ghost RBC.

Incubation period :

- The time lapse between infection of plasmodium and first attack of malaria is called incubation period.

- Plasmodium shows biological clock system, because erythrocytic cycle is completed exact with in 48-72 hours.
- In case of excessive malaria infection, spleen becomes large and swollen.
- This disease is called Megaly of spleen or spleen index.
- It is due to increase in number of macrophages, and lysolecithin causes swelling.
- Excessive malaria infection may also lead to anaemia, becaue more lysolecithin secretion occurs which reaches to blood and destructs the healthy RBC's.
- So decrease in number of healthy RBC causes Anaemia.
- This anaemia is called hemolytic anaemia. plasmodium also secrete haemolysin enzyme which destroy healthy R.B.C.

Post erythrocytic cycle :

- Sometimes merozoites formed by erythrocytic cycle escapes from blood and enters the liver cells.
- These merozoites remain inactive here. After a long time they become active and multiply in number.
- This causes malaria again. So after a long time malaria is repeated again. This is called Relapse of Malaria.
- Post erythrocytic cycle is not found in **Plasmodium falciparum.** So relapse of malaria do not occur.
- Longest relapse of malaria, found in palsmodium malariae may last upto 3 years.

GAMETOCYTE STAGE

- When many erythrocytic cycle have been completed, then merozoites enter the RBC and form a new stage called as gametocyte or Gamonts or Resistant Trophozoite schizont.
- Gametocyte is the last stage in human. Further development occurs in female Anopheles because high temp in human is unfavourable for gametocyte formation.
- There is biological clock system in plasmodium.
- It means that it form gametes when there is more probability of attack of female anopheles.
- So gametes are formed in night, (from late evening up to midnight.)
- Gametocytes which reach in female anopheles will develop and rest which are left in blood are destroyed by morning.
- Two type of gametocytes are formed.

(1) Micro gametocyte
(2) Macro gametocyte

	(1) Micro gametocyte		**(2) Macro gametocyte**
(a) **ratio**	1	**:**	2
(b) **Position and size of nucleus -**	big and central		Small and eccentric
(c) **Store food quantity -** -	less stored food		More stored food
(d) **Haemozoin granules -** -	less and diffused		more and central in position

LIFE CYCLE OF PLASMODIUM IN FEMALE ANOPHELES

Infection :

- Gametocyte is the infective stage of plasmodium for female anopheles.
- When it sucks blood, many stages reach in its crop, but only gametocyte stage remains rest of all become digested.

There are two type of cycles :

(1) Gametogony (Sexual cycle)
(2) Sporogony (Asexual cycle)

I. Gametogony : It is sexual cycle which has 3 stages.

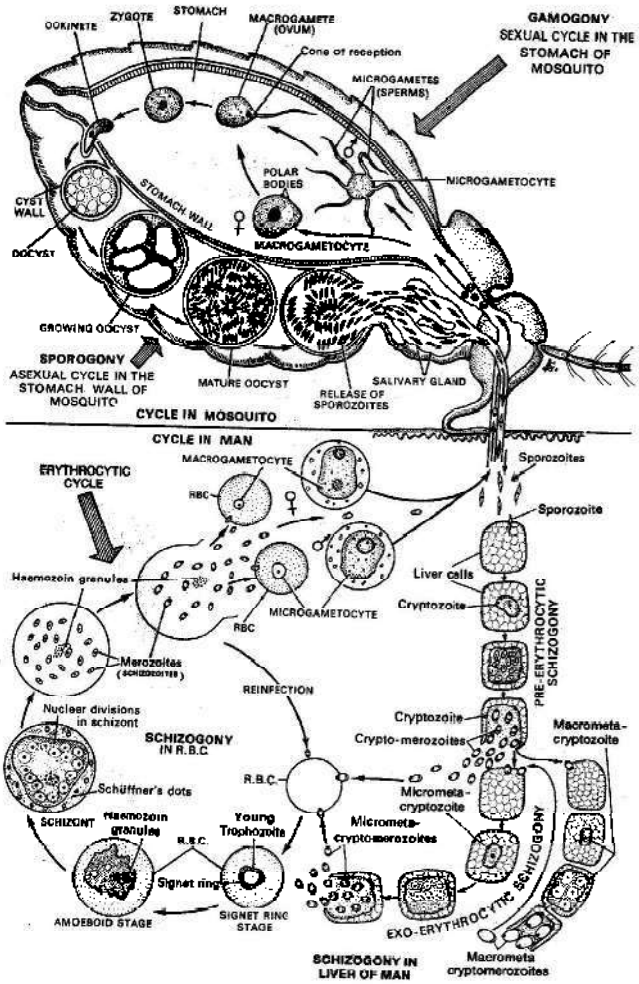
(a) Gametogenesis

(b) Fertilization

(c) Post zygotic stage

(a) Gametogenesis :

- Microgametocytes undergo the process of spermatogenesis in which its nucleus is divided into four haploid nuclei by meiotic division.
- Further mitosis occurs and these are converted into 8 nuclei.
- All nuclei are arranged on periphery.
- At the site of every nucleus, plasmalemma projects outward and eight spindle shaped projections are formed.
- Every projection contains a nucleus and small amount of cytoplasm.
- These projections are called sperms.
- Sperm formation process is called **exflagellation**.
- Every sperm detaches itself from microgametocyte by constricting at its base.
- So eight sperms are formed by a single microgametocyte.
- Macrogametocytes form ovum by the process of oogenesis in which meiosis occurs and one ovum and three polar bodies are formed.
- Polar bodies are destroyed further.



Life cycle of Plasmodium

(b) Fertilization :

- A projection appears on ovum, which is called **reception cone**.
- This is the penetration site of sperm, at the time of fertilization.
- The nucleus of the megagamete also comes to lie near its receptive cone.
- When a lashing microgamete comes in contact with a megagamete, the former penetrates the latter through its reception cone and fertilization takes place.
- Zygote is formed as a result of fertilization.
- Whole of this process up to zygote formation occurs in lumen of crop.
- Zygote can form in any type of mosquito e.g. male or female anopheles.
- **Culex and Aedes** etc. but further development of zygote is possible only in female anopheles.
- This is the host specialisation of plasmodium.

(c) Post Zygotic Stage :

- To understand this stage 2 theories had been given –

1. Old view :

- Proposed by "Grassi". This theory says that all zygotes are converted into long worm like structures called **ookinete or vermicule** with the help of gliding and wriggling movements.
- These ookinete enters the crop wall and are placed beneath the outermost layer called peritoneum of crop wall.

2. Modern view :

- Given by 'L.H. Ward'. According to this theory, some zygotes are converted into ookinete but they can not penetrate the crop wall and hence are digested by mosquito.
- Rest of the zygotes do amoeboid movement, enters the crop wall and placed below peritoneum.
- A thin and elastic coat is secreted around these zygotes, by both zygote and cells of crop wall.
- This stage is called **oocyst**. At this stage 50-100 small projections of oocyst are found on the crop wall.

II. SPOROGONY

- Oocyst takes nutrition from crop wall and develop into 5-6 times bigger structure called **sporont**.
- Many small vacuoles are now formed in the cytoplasm of sporont.
- Nucleus of sporont is converted by free nuclear divisions into approximately 10,000 nuclei, all these nuclei are arranged on periphery of vacuoles.
- Later on, cytoplasm is divided and converted into 10,000 parts around every nucleus, Like that 10,000 sporozoites are formed.
- This sporont is called as **sporocyst**. Outermost layer of crop and wall of sporont bursts and these sprozoites are now free in haemocoel of mosquito.
- Haemocoel is a blood filled cavity. This blood is colourless and is called **hemolymph.**
- All sporozoites are stored in salivary glands from haemolymph.
- About 2,00,000 sporozoites are stored in salivary glands of mosquito, which are further infected to human through saliva.
- Most common is - *Plasmodium vivax*
- very rare is - *Plasmodium ovale*

TYPES OF MALARIA

- Their types recognized on basis of periodicity of paroxysms.

(1) Tertian malaria or common ague :

- It is caused by *P. vivax*, *P. falciparum* and *P. ovale*. Reccurence of fever is after every. 48 hours.
- Vivax and ovale causes **'Benign Tertian Malaria'** with low death rate, becouse merozoites generally invade and destroy old and mature R.B.C.
- Malaria caused by **Plasmodium Falciparum** is called **lethal malaria**. It is also termed as sub tertian fever, tropical fever, cerebral fever, **black water fever**, Malignant fever or Aestivo-autumnale fever.
- This is the most dangerous malaria because infected. RBC adhere and form thrombus which may interfere the blood circulation.
- Carotid artery is feeding artery of brain. So when this artery is blocked by thrombus then brain may suffer from less blood circulation which is unfavourable for it.
- Longer duration of this condition may cause death.
- When thrombus is formed in coronary arteries (which gives nutrition to heart), heart attack may occur, loss of Haemoglobin through urine (Haematuria) occurs in which colour of urine changes from yellow to black.
- Hence, it is also called as **'black water fever'**.

(2) Quartan malaria :

- It is caused by *P. malariae.* Paroxysm occurs at intervals of about 72 hours.

– It generally leads to secondary complications, because of large scale destruction of young RBC.

(3) Quotidian malaria :

– In this, paroxysm are irregular and almost daily.

– It may result from secondary complications of malignant tertian or due to multiple or mixed infections by more than one species of Plasmodium.

(4) Relapse malaria :

– Exoerythrocytic cycles continue uninterrupted in *P. vivax, ovale, malariae* even after the disease is completely cured.

– Merozoites of these cycles, can any time attack RBC and cause a relapse of malaria.

– Malaria by *Plasmodium malariae* is difficult to diagnose because this species may remain dormant in liver for a very longer period.

HISTORY OF MALARIA

1. **Mucculoch :** Named Malaria (Malaria = Mal (Harmful) + air).
2. **Lancisi :** Suspect that there is any relation in between mud mosquito and malaria.
3. **Charles laveran :** Discovered **plasmodium.** He observed plasmodium first, in RBC of human and revealed that malaria is caused by plasmodium.
4. **Sir Ronald Ross :** Proved the relation between mosquito and malaria.
   – He saw oocyst first on crop of female anopheles.
   – About 25,000 mosquitoes were dissected by Sir Ronald Ross in his life.
   – He told that female anopheles is the carrier of plasmodium.
   – The discovery of Sir Ronald Ross was awarded by **Nobel prize on 29th of August 1902**.
   – Hence this day is celebrated as **"Malaria day".**
   – It was an incident that Sir Ronald Ross die of Malaria.
5. **Grassi :** Studied the life cycle of plasmodium in female anopheles.
6. **Mc. Collum :** Explained in detail the sexual cycle of plasmodium.
7. **Shortt, James, Huff & tate :** Studied the life cycle of **plasmodium** in human.
8. **Golgi & Celli :** Explained erythrocytic cycle. So this is also called golgi cycle.
9. **Schauddin :** Detailed study of ***Plasmodium vivax*** life cycle in human and mosquito.
10. **Rudzinska :** Study of ultra structure of plasmodium by electron microscope.
11. **Patric Manson :** Malaria by mosquito biting.
12. **E shortt** – Studied liver schizogony.

SYMPTOMS & PHASES OF MALARIA

– Toxic effects on body due to which symptoms of malaria appear.

– Initial symptoms of malaria - Nausea, constipation, bodypain, Dyspnoea, weakness in body.

– After 2 to 3 erythroytic cycles haemozoin granules increase in number and actual symptoms of malaria now begin to appear.

– This is called paroxysm of malaria. It has three stages.

1. **Rigor stage :** Alternate contraction and relaxation in muscles causes shivering and cold sensations.
2. **Febrile stage :** After some time, shivering stops and body temp rises due to contraction of muscles. Rise in temperature is beneficial for patient, because internal high temp is unfavourable for parasite plasmodium.
3. **Difer vescent stage :** After rise in temperature, excessive sweating occurs and body temperature decreases. Now patient considers himself healthy, but at this time, erythrocytic cycle starts again and fever is repeated at a constant interval of time.

CONTROL OF MALARIA

– We use two methods- [1] Direct - by killing plasmodium [2] Indirect - by killing mosquitoes

[1] Indirect : following procedures are used to kill mosquitoes.

[a] Insecticides like = DDT (It is now banned) Gamaxene, malathion etc. are sprayed.

[b] Biological control - This is the more suitable procedure. In this larvivorous fishes are used. They eat larva of mosquitoes. e.g. Gambussia Trout, minnows, stickle back

[2] Direct method : Plasmodium is destroyed by chemotherapy

[a] Old medicines like **Quinine** - it is obtained from **cinchona as quinine sulphate salt.** It destroys only those stages of plasmodium which are present in blood.

[b] Mapacrine - It destroys merozoites present in blood.

[c] Plaudrine and sulphadoxine - These medicines destroy all the stages either in blood or in liver. But are not generally used because they cause harm to liver cells.

SPECIAL POINTS

[1] **Malaria day- 29th August**

[2] Plasmodium is a member of class-**sporozoa**

[3] Monkey acts as Reservoir host of plasmodium

[4] Lysolecithin secreted by spleen destroys infected RBC's

[5] Normally primary host is the host in which parasite completes its sexual life cycle but in plasmodium. Human is primary host exceptionally. Although sexual cycle is completed in mosquito and asexual in human.

[6] Maximum amount of Haemozoin granules is present in gametocyte stage

[7] Temperature of malaria patient may rise up to 104-105° F

[8] Some other symptoms & side effects may appear from malaria like Anaemia, Jaundice, Megaly, Thrombosis, insomnia

[9] The most effective medicine for malaria is deraprim, it destroys gametocytes

[10] Number of lymphocytes is increased in malaria infection.

CONTROL OF MALARIA

Two Method :

1. INDIRECT METHOD	2. DIRECT METHOD
Use of pesticide for mosquito	**Use of medicine for Plasmodium**
* Mainly prepared by malathion	* Oldest medicine Quinine
Others	Quinine effective only in blood
* Kerosine oil	* **Sulpha drugs**
Most safe method – Biological control	Eg. : Metakelfin. Daraprim
Eg. :- Utricularia (Plant)	
Larvivorous Fishes	
Eg.:– Gambusia. Minnous. Stickle backs	
Danio. Mansonia	

CLASSIFICATION

[1] Division	**- Radiata**	– Radial symmetry
		– Tissue grade
		– Common digestive and body cavity. (gastrovascular cavity)
[2] Phylum	**- Cnidaria or**	– Mouth encircled by tentacles.
	- Coelenterata	– Stinging cells (Nematocyst) present
		– No aboral sense organ
[3] Class	**- Hydrozoa**	– Life cycle includes alternating polyp and medusa stages.
		– Medusa usually small with a velum (craspedote)
		– Mesogloea non cellular
[4] Order	**- Hydroidea**	– Polyp phase dominant
		– Medusa phase present/absent
[5] Suborder	**- Anthomedusae**	– Athecate polyp
		– Absence of balance vesicles
[6] Genus	**- Hydra**	– Tentacles 6 - 10
		– Stalk less developed

HISTORY OF DISCOVERY

[1] Hydra was discovered by Leeuwenhoek (1703)

[2] Hydra name was proposed by Linnaeus (1758)

[3] Full description of Hydra by Trembley (1744-1784)

DIFFERENT SPECIES OF HYDRA

– 20 species are known, four species more common in India

Species	Colour
H.viridissima (chlorohydra)	Green
H.fusca (oligactis)/Pelmatohydra	Brown
H.vulgaris	Colourless
H.gangetica	Pink

HABIT & HABITAT

– Carnivorous, Fresh water, Solitary, most of the time it remains attached to submerged stones, sticks, vegetation, Free Living, Regeneration & division of labour

EXTERNAL MORPHOLOGY

Size and Shape :

- Hydra's body is like a thin, cylindrical hollow tube, contractile in nature & possessing Radial symmetry.
- Hydra is a cylindrical polyp coelenterate.
- The polypoid body of Hydra is 3-4 mm to 1 cm in length.

Hydra body divided into two parts.

[a] Somewhat thinner basal or proximal part, called stalk or Peduncle and

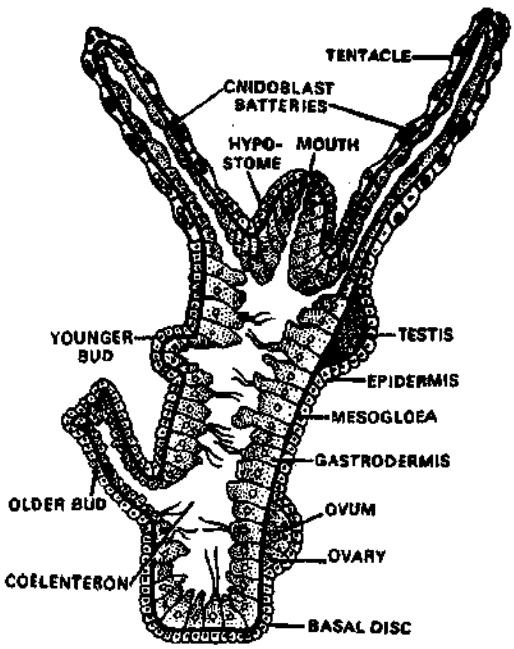
[b] The remaining thicker and Darker distal part called Gastric region.

(a) Stalk :

- The closed basal or proximal end of Body is flattened forming an adhesive basal disc for attachment to a Substratum.
- It consist of glandular zone which secretes adhesive substance for attachment and gas bubble for floating.

(b) Gastric region :

- Conical part of Gastric region is known as Hypostome or oral cone or Manubrium.
- 6 to 10 slender, thread like tentacles arise from the circular base line of hypostome.
- Tentacles help in feeding, Locomotion and Protection.
- Hydra have both unisexual and bisexual species.



Bud :

- During the favorable season Hydra develops one or more buds.
- A well developed bud possesses its own mouth, hypostome and tentacles.
- On detachment it gives rise to a new individual.

Gonads :

- During breeding season, **temporary gonads** in the form of small and solid protuberances, can also be seen upon the gastric region.
- Number of Testes in no. 1-8, conical in shape & situated in distal part.
- Ovaries round, number .1-2 & situated in Basal Region.

INTERNAL STRUCTURE

1. Coelenteron or Gastro Vascular Cavity
2. Body Wall

1. Coelenteron or gastro vascular cavity :

- Hydra has a single large internal cavity, surrounded by a thin body wall. The cavity is called Coelenteron or gastrovascular cavity.

– **Hydra :** Acoelomate. It communicates with the exterior only by terminal mouth. It also extends into the hollow tentacles.
– **Function :** Some extracellular digestion of food occurs in it.
– **Coelenteron :** Originates from Archenteron of Gastrula.

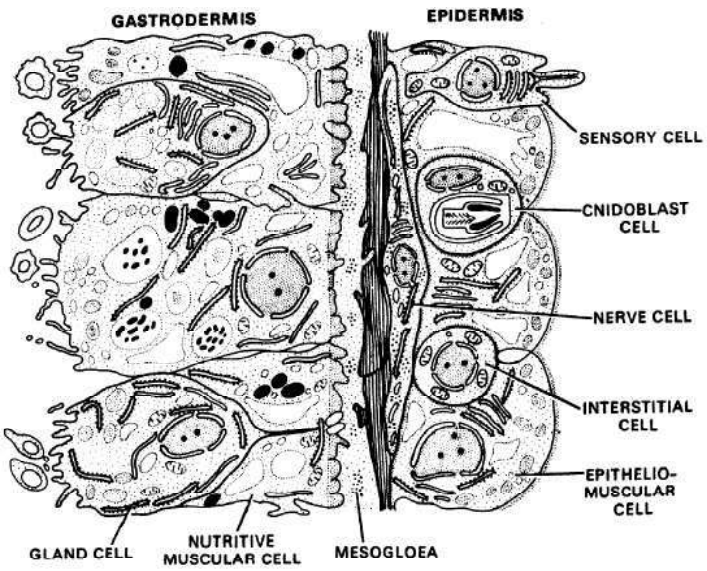
2. Body wall :

– Hydra's body wall has two epithelial layers. Hydra is Diploblastic.

[i] Epidermis or Ectoderm — Thinner, Semitransparent sensitive, help in protection.

[ii] Gastrodermis or Gastroderm — Thick, help in digestion

– Thin, elastic and nonliving cementing layer of mesogloea present in between Epidermis and gastrodermis.
– Mesogloea is a viscous transparent and jelly like mucopolysaccharide layer, secreted by cells of both epithellia. Absence of Mesoderm.
– Body of Hydra is covered by a thin and transparent cuticle. Cuticle is absent on basal disc.



T.S. of Body wall

[i] Epidermis

Histology of Epidermis :

– Cuboidal cells, Development from ectoderm of embryo, Function : Protection, sensory layer, 6 types of cells are present.

1. Epithelio-muscular Cells :

– Epithelio-muscular cells are Pear shaped or conical shaped.
– Epithelio-muscular cells is divided into two parts Outer flat part (Epithelium Part). Inner narrower (Muscular part).
– Two types of smooth myofibrils run within inner process and hence it is a muscular process. Most fibrils are thin but at least one is thick called **Myoneme**.
– Due to contraction of myoneme. Size of body of Hydra and that of tentacles decreases. Flat free end of epithelium bears Microvilli & contain fat globules and non contractile Vacuoles.
– The nucleus is large and subspherical, Mitochondria, Golgi body, endoplasmic reticulum are scattered. These cells contain membrane bound masses of mucus granules

Functions

[1] These form a continuous protective layer around the Body.
[2] The myofibrils of their Basal processes are contractile. Presumably, these contain Actin and myosin proteins and help in Contraction as like Vertebrate muscles.

[3] The basal processes form almost a continuous "Longitudinal muscle layer" upon the outer surface of mesogloea.

[4] These secrete mucus like material which forms an adhesive, cuticle like protective covering over epidermis.

[5] These help in locomotion & bending the body.

2. "Glandulo - muscular cells" :

- These form the epidermis of basal disc. These secrete abundant mucus for adherence of hydra with its substratum.
- Mucous is secreted by Golgi Body.
- Presence of endoplasmic reticulum and Microvilli.
- These cells have muscular process. Sometimes, these cells form Pseudopodia causing slow crawling or gliding of Hydra upon its substratum.

Function :

- Secrete adhesive material for the attachment of the animal to a substratum. Help in gliding.
- Help in floatation by the secretion of gas Bubbles.

3. Sensory cells

- These are narrow, spindle - shaped cells, wedged singly, here and there, between the epithelio muscular cells.
- The outer free end of each forms a shallow cup like depression, from which a sensory cilium projects out at body surface.
- These cells are more abundant in the epidermis of tentacles and hypostome.
- The cilium is formed of a group of fibrils arising from a basal granule.
- Another group of fibrils, called rootlets extend from the basal granule into the cytoplasm. 9 + 2 fibrils arrangement in cilium.
- The opposite inner end of each sensory cell is in direct contact with nerve cells.

Function :

- The sensory cells receive external stimuli and transmit the sensory impulses to the neurons.
- Sensory cells of Hydra are general receptors or are distinguished to receive various types (mechanical, chemical, thermal, photic etc.) of stimuli.

4. Interstitial cell :

- These cells are small and spherical or oval cells located in groups between the narrow basal parts of epithelio muscular cells. Diameter - 5µ.
- Structure-Distinct Nucleus and nucleolus, mitochondria, endoplasmic reticulum, Golgi body, ribosomes are abundant.
- These cells are undifferentiated, totipotent cells, capable of modifying into all other types of cells.
- These cells are not present in tentacles and basal disc.
- Most abundant at the base of tentacles in gastric region - growth zone.

Function :

- These cells are capable of modifying in any type of cells.

– According to Brien, all cells of hydra's body are renewed once in about 45 days from its interstitial cells.
– These cells help in growth. These cells help in Regeneration.
– Help in Budding and repair. These cells form germinal cells and Nematoblast.

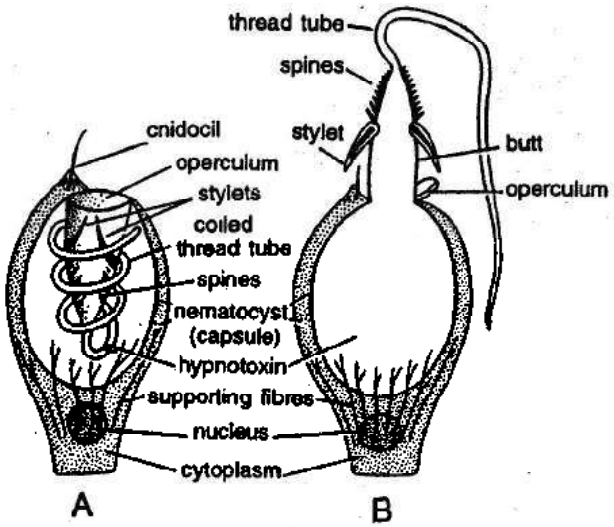
5. Nerve cells

– These cells are originated by interstitial cells.
– These cells are more numerous in the epidermis of basal parts of tentacles, hypostome and Basal disc.
– Other name is neuron. Their branched Processes (neurites) are not differentiated into afferent (dendrites) and efferent (axon) fibres and are intermingled to form a nerve net or Plexus just outside the epidermal muscular-layer.
– The cell bodies (cytons) of these neurons are small and contain, besides the nucleus and other usual organelles, several long and thick microtubules, extending even into the neurites.
– Microtubules maintain a chemical pathway between the nucleus and cytoplasm. Microtubules Absent in Basal disc of Hydra.

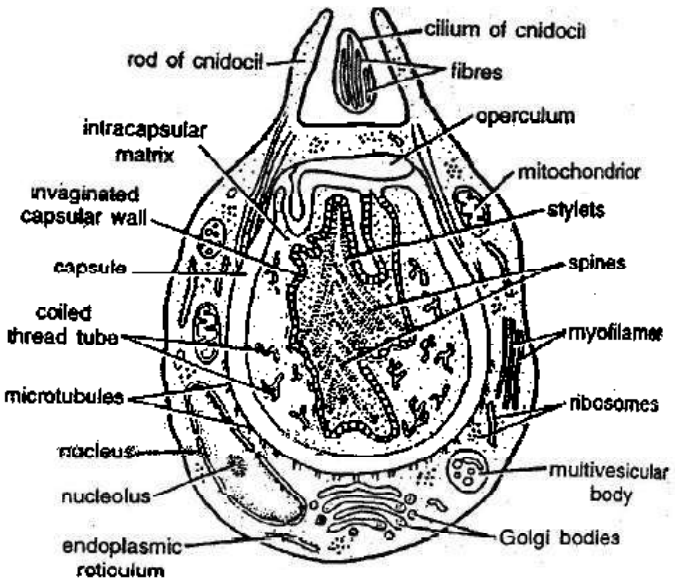
Function : Neurons transmit impulses.

6. "Nematoblast or cnidoblast" :

– These cells are present only in cnidaria group.
– These occur in entire epidermis except that of Basal disc.
– When fully developed, they migrate to the tentacles through the mesogloea by means of amoeboid movement.
– Projection in between the epithelio–muscle cells or lying inside the bodies of these cells (host cells), the cnidoblasts act as organs for offence and defence.
– Group of stinging cells present in tentacles are called battery.
– One battery have 10-12 stinging cells.
– These cells are formed by modification of interstial cells.
– Each cnidocyte possesses a unique type of large and centrally located sac like organelle, called nematocyst which pushes the cell cytoplasm to a thin Peripheral layer.



Cnidobast (Undischarged) **Cnidobast (discharged)**



Internal structure of cnidocyte

Structure of stinging cells :

– Cnidocytes have a nucleus, small golgi complex, scattered mitochondria, ribosomes, endoplasmic reticulum and some fat globules.

- Cnidocytes posseses sac like organelle called "nematocyst".
- Nematocyst is filled with a poisonous fluid called "Hypnotoxin" (in capsular fluid) which is mixture of Protein and Phenols.
- It is a stronger poison than snake venom.
- The free end of each cnidocyte at epidermal surface bears a small and stiff conical spine like projection, called cnidocil or trigger.
- A slender cilium forms the central axis or case of the Cnidocil. 20 or 21 fine tubular processes of the cell membrane itself extend around the cilium, forming the remaining part of Cnidocil.
- These are called "supporting rods of Cnidocil".
- Another set of 20 or 21 hollow rods called "supporting rods of cnidocyte" arise from around the base of cilium and fan out up to the equatorial plane of nematocyst.
- Nematocyst wall is thick & composed of a collagen like protein.
- At the tip of Nematocyst, an operculum is present.
- The invaginated capsular wall forms a very long and coiled tubule, called the "thread".
- The proximal part of the thread, extending up to the base of the capsule is fairly wide and termed as "Butt" or shaft.
- Thread bears, on its inner surface, three spiral rows of pointed spines, out of which the first of each row (3 in all) is very large and termed barb or stylet & other spines are smaller and called Barbules.
- The free distal ends of stylets and spines converge at the central axis of the butt, forming an overlapping pyramid.
- A thick and coiled bundle **" Thread of Lasso"** of contractile myofilaments extends from the region of nematocyst to the Basal end of the cell.

Origin of Nematocyst :

- Origin of Nematocyst by the Vacuole of Interstitial cells of epidermis.

Occurrence of nematocysts :

- Occur scattered, mostly singly throughout the epidermis of the body, absent on the basal disc.
- Abundant in the epidermis of the oral region and the tentacles.

Function of Nematocysts :

- The nematocyst are weapons of offence and defence of Hydra.
- They also serve in food capture, locomotion and anchorage.
- Main function of nematocyst is paralyzing the prey.

Discharge of Nematocyst :

- When properly stimulated, the nematocyst of a cnidocyte is discharged, i.e., its thread pushed, open the operculum and shoots out of Body surface in a twinking turning completely inside out like the sleeve of a shirt.
- Presence of Both Mechanical and chemical stimulation are required.
- The discharge of nematocyst is completely independent of Nervous control i.e. Cnidocytes are "Independent Effectors".
- Time of discharge = .3 – .5 part of second. Microfibrils of Microtubules (attached to capsule) also help in discharge of Nematocyst by increasing Internal Pressure.

– It is therefore discarded from tips of tentacles and aboral pore.
– Worn out nematoblasts are replaced within 48 hours.

Different views about Discharge of Nematocyst :

– According to **Iwanzoff (1895), Yanagita (1943)** water enters into the capsule from surrounding cytoplasm. A nematocyst is discharged due to increase in hydrostatic pressure of capsular fluid.
– According to **Will (1914), Picken (1953), Robson,** water diffusing into the capsule from cytoplasm, enormously swells like a Jelly. Intracapsular Substance causes discharge of the thread.
– According to **Jones (1974)** - The nematocyst are always in a state of tension. Stimulation of Cnidocil causing sudden opening of operculum. Hence the thread is discharged.
– Some others believe that contraction of myofibril exert pressure on capsule for its discharge.

Types of Nematocyst : On the basis of size, Thread structure and function.

(1) Stenoteles or penetrants
(2) Desmonemes or Volvents
(3) Streptoline glutinants or Holotrichous isorhizas
(4) Stereoline glutinants or Atrichous isorhizas

(1) Stenoteles or Penetrants :

– These are the largest (16μ) and most complicated type of nematocysts.
– Their thread is long with a Butt, Spiny, terminally open and coiled several times around the Butt.
– Thread is bearing three large stylets and three, rows of small spines at its stout base. Presence of Hypnotoxin.

Function :

[1] Penetrants or stenoteles are discharged upon enemies and preys suitable for food. The thread shoots out straight with such a force that it pierces into prey's body and injects the Hypnotoxin like a hypodermic needle.
[2] This paralyses and ultimately kills the prey.

(2) Desmonemes or Volvents :

– These are the smallest nematocysts (9μ).
– These are spherical or oval with a short, thick and terminally closed thread which is without butt, but bears a few spines.
– Within the capsule, the thread is coiled only once.
– Hypnotoxin is not present in capsule.

Function : They assist in food capture.

(3) Streptoline glutinants or Holotrichous isorhizas or Large glutinant :

– These are smaller (9μ) and elliptical.
– Their thread is long, thicker and terminally open, but it has a single spiral row of spines and no Butt.

Function :

– Holotrichous isorhizas usually discharge upon enemies and thus help in defence and offence.
– Their spiny threads also shoot out straight.

(4) Stereoline glutinants or Atrichous isorhizas or Small glutinant :

– These are smaller (9μ). Elliptical, spineless, open thread.

Function : These discharge during locomotion to adhere the tentacles with a Substratum.

Difference between Four nematocyst

S.No.	Cause of Difference	Stenoteles	Desmonemes	Streptoline	Stereoline
1	Size of filament	Pointed, Long	Round, Long	Round, Long	Round, Small
2	Bult	With spines	Absent	Absent	Absent
3	Terminal end of fibre	Open	Closed	Open	Open
4	Spines	Present	Present	Present	Absent
5	Material in capsule	Hypnotoxin ¯ Poisonous	×	Mucous substance and Hypnotoxin	Mucus substance
6	Function	Help in offence and defence	Round up aound pery	Help in defence and offence	Help in Locomotion

(II) Histology of Gastrodermis :

– Internal layer of body wall of Hydra. Thick. Columnar in shape. Origin - embryonic endoderm. 5 types of cells.

(1) Nutritive Muscle cells or Endothelial muscular cells :

– **Shape :** Club shaped. They form the Bulk of gastrodermis. Adjacent cells joined by Desmosomes.

– Basal ends of these cells are also drawn out into muscle processes lying upon inner surface of mesogloea and form a "Circular Muscle layer" upon mesogloea.

– Obviously, the body becomes thin and long on contraction of these processes.

– Each nutritive-muscular cell besides a nucleus and other organelles, also having several food vacuoles, fat globules, glycogen granules and irregular vacuoles.

– Its free end is covered by a thin, membrane like, film of a fibrous substance and bears several branched and interconnecting microvilli and a pair of flagella.

– Besides forming the lining of gastrovascular cavity, they bring about extension of body and tentacles by contracting their basal processes.

– The nutritive muscular cells ingest partially digested food from gastrovascular cavity by means of pseudopodia by phagocytosis method.

– Digestion occur intracellularly in food vacuoles.

– Nutritive muscular cells of green Hydra have zoochlorella Algae, Brown Hydra have Zoozanthellae Algae.

– These resemble the epithelio–muscular cells of the epidermis in all respect, except that their basal contractile processes are much more delicate and oriented at right angles to the long axis of the body.

Function :

– Help in Digestion. Beating of the flagella of these cells serves to circulate the fluid present in gastrovascular cavity and also churns the food.

- Internal lining of gastrovascular cavity.
- They form sphincter around mouth Green alga occurs in these cells exhibiting symbiosis.

(2) Gland cells :

- These are smaller, club shaped cells found singly between nutritive muscular cells.
- These are most numerous in the gastrodermis of hypostome, fewer in gastric region and rather scanty or either Absent in tentacles, stalk and basal disc.
- These also bear flagella and fewer Microvilli. These cells are of two types

Enzyme Secretory cells or Zymogen cell : Present in gastric region.

Mucous Secretory cells : Present in hypostome region

Function :

- Secretion of mucus lubricates the passage of food.
- Digestion of food. Gland cells are independent effector.

(3) Nerve cells :

- Like the epidermis, the gastrodermis also contains neurons in its deeper zone, but these are so scanty that their branched neurites form less developed nerve net. Non Polar.

(4) Sensory cells :

- Same as epidermis sensory cells.
- These are receptors of Internal stimulation.

(5) Interstitial cells :

- Same as epidermis Interstitial cells.
- These cells are capable of modifying into all other types of cells.

(III) Mesogloea :

- Non cellular layer. Mesogloea have proteinaceous matrix in which jelly like mucopolysaccharides occurs.
- Matrix have Elastin and Collagen fibers.

Nutrition :

(1) Food :

- Hydra is carnivorous. It feeds upon small aquatic Animals.
- It is especially fond of small crustacean like :- water fleas, cyclops, daphnia etc.
- If prey animal having glutathione then, hydra often swallows preys much larger than itself and, consequently, becomes highly inflated.

(2) Feeding :

- Hydra feeds only when it is attached to a substratum.
- It keeps its body extended and waves about its extended tentacles in all directions in search of a prey.
- As a prey brushes against a tentacles, thread of numerous desmonemes and possibly of atrichous isorhizas, shoot out at once and wrap around the Bristles and appendages of the prey to prevent its escape.
- Immediately, the threads of stenoteles and probably of holotrichous isorhizas also shoot out and penetrate into prey's body to inject "Hypnotoxin".

- The prey is consequently paralysed.
- Glutathione stimulates the Hydra to perform feeding operation.
- The tentacles holding the prey, contracts and bends towards the mouth.
- The latter opens to receive and swallow the prey.

Digestion :

- As food reaches into the gastric region.
- The zymogen cells of gastrodermis begin pouring out an alkaline secretion into the cavity.
- This secretion contains proteolytic enzymes which are said to split the prey's proteins in to Polypeptides.
- The prey's tissue consequently loosen and swell.
- The peristalsis and lashing movements of flagella of gastrodermal cells create churning movements in the fluid of gastrovascular cavity.
- The prey's Body is broken down into small fragments.
- Hydra is unable to digest starch.

The Digestion in Hydra is completed in two phases.

[i] Extracellular Phase in gastrovascular

[ii] Intracellular Phase in the food vacuoles (medium $\rightarrow$ first acidic and then Alkaline)

Egestion : Through mouth which also acts as Anus. Anus - Absent.

Nervous system :

- In Hydra, unpolarized nerve cells of epidermis form a nerve net just outside the basal processes of epitheliomuscular cells.
- It is unpolarized. Therefore transmit impulses equally well in all directions.
- Nerve net connected to sensory cells. Such a combination of muscle processes of epithelio–muscle cells, sensory cells and nerve net is referred to as neuro–muscular system.
- Cnidocyte and gland cells normally receive stimuli directly and respond as independent effectors.
- There is a layer of neurons just inside the basal processes of nutritive muscular cells of Gastrodermis.
- Most neurons form synapses with each other and other Body cells.

Muscular System :

- The contractile basal processes of epitheliomuscular cells of epidermis and nutritive muscular cells of gastrodermis respectively form longitudinal and circular muscle layers upon outer and inner surface of mesogloea.
- Myofibrils are smooth. Their Myosin and Actin proteins bring about the contraction of the processes probably by same mechanism as in vertebrate Muscles.
- The mesogloea functions like a skeletal axis. By filling the gastrovascular cavity with water through mouth, Hydra uses it also as a Hydraulic Skeleton for relaxation and extensions of Body.

Respiration :

- Through Body surface. Gaseous exchange by diffusion. Storage of energy in form of ATP.

Excretion :

- Through cell membrane. Excretory Substance - NH_3. Ammonotelic. Excrete Ammonia by Diffusion.

MOVEMENT AND LOCOMOTION

- Locomotion in Hydra is due to following reason
  - [a] In search of food.
  - [b] Protection
  - [c] Response to stimuli.

(1) Contraction & Expansion of Body

- When Hydra is hungry, it attaches to a substratum, exhibits contraction & expansion movement at intervals.
- This behaviour of Hydra is called as contraction burst.
- It is initiated by a pacemaker located near the base of the hypostome.
- These movement help to bring food organisms in contact with the tentacles which are waved all around in water.
- Its Body remains flexed due to contraction of circular muscle processes and the tentacles contract, extend, or Bend and move about in different directions in search of food.
- Periodically the Body suddenly contracts due to maximum contraction of longitudinal muscle Processes.

(2) Gliding :

- The glandulo-muscular cells of the epidermis of Basal disc sometimes form pseudopodia.
- Consequently, Hydra starts slowly gliding or crawling upon its substratum. Gliding - Slow movement.

(3) Floating :

- Sometimes, glandulo-muscular cells secrete a gas bubble, which remains stuck to the disc due to mucus.
- Consequently Hydra loses contact with its substratum, turns upside down and passively floats at water surface.
- It is now drifted hither and thither by water waves and winds.

(4) Walking :

- Occasionally, Hydra stand upside down and walks upon its Substratum using the tentacles as legs.
- During walking, the Body remains somewhat contracted and Both Body and tentacles remains stiff due to Hydraulic Skeleton.
- This Locomotion is cuttle fish like, Movement.

(5) Swimming :

- Tentacles of Hydra help in swimming.
- Peristaltic movement and lashing of tentacles help in Swimming.

(6) Looping :

- The Body first elongates, bends over to one side and fixes its tentacles to the substratum with the help of Atrichous isorhizas.
- Now the pedal disc glides close to the tentacles.
- Next, the tentacles are disengaged and the normal upright posture is regained.
- By repeating this caterpillar or leech like looping, Hydra rapidly locomotes in search of food.

(7) Somersaulting :

- The Body elongates, bends on to a side and fixes its tentacles to the substratum.
- Then the aboral end is released from the substratum and lifted up, so that the Body now stands upside down on its tentacles.
- Next, the Body again bends, fixes its pedal disc to the substratum, releases the tentacles and lifts up its oral end standing upright in normal position. Thus, the Hydra moves fast like an Acrobat.

(8) Climbing or Dragging :

- Hydra can even climb by attaching its long tentacles to some object, releasing the foot & then contracting the tentacles, so that the body is lifted up.

Behaviour of Hydra (Irritability) :

(1) Touch : Thigmotaxis. When touched by a rod or Needle, hydra's Body contract. i.e. Negative movement.

(2) Light : Phototaxis. Negative movement in both strong & dim light. Like to stay in moderate Light.

(3) Temperature : Hydra like 20-25°C temperature. Variation in temperature → Hydra show negative movements.

(4) Chemicals : Hydra show Negative Response to Harmful and strong chemicals. Show Positive Response to food.

(5) Water currents : No Response.

(6) Electric current : When a moving Hydra comes in contact with a weak electric current, it bends towards the cathode, but dies in a strong current. In a fixed Hydra the tentacles bend towards anode.

Internal stimuli :

- Hunger is an internal stimulus to which Hydra responds by extending and hectically waving its tentacles in all directions in search of food.
- If unsuccessful, it moves on to a new location.

Reproduction :

[1] Asexual Reproduction

[2] Sexual Reproduction

(1) Asexual reproduction :

- It occur in favourable condition. (in winters from OCT. NOV. to JAN.).
- Hydra reproduces asexually by Budding.
- Buds form upon the body near junction of stalk and gastric region.
- A bud first appears as a small bulge formed due to rapid proliferation of epidermal cells and cells of gastrodermis.
- Shortly, the gastrovascular cavity extends in to the bud, making it hollow.
- Cells now become arranged around the cavity of the bud, forming a regular two layered wall.
- Mesogloea is also secreted by the two cellular layers. As the bud grows further, its distal end starts modifying into a hypostome, and blunt tentacles appear one after the other around the base of hypostome.
- Eventually the hypostome acquires terminal mouth. Within two to three days, a bud becomes fully developed.

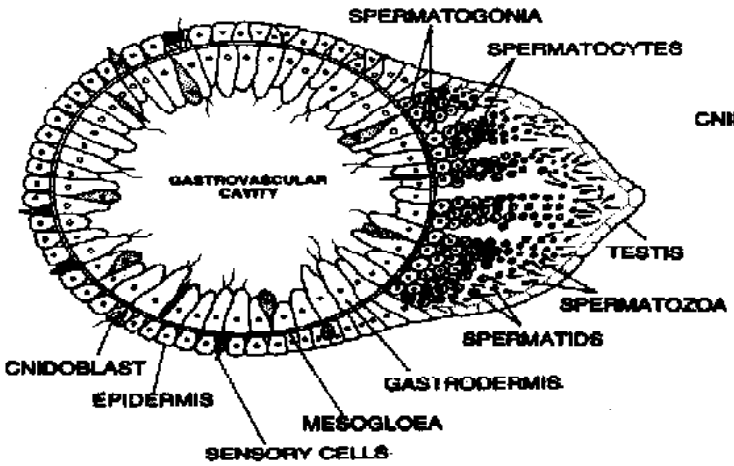
– Simultaneously to these changes, the proximal end of the bud progressively constricts until the bud is separated from parent's body.
– Several buds may form simultaneously when conditions are very favourable.

(2) Sexual reproduction :

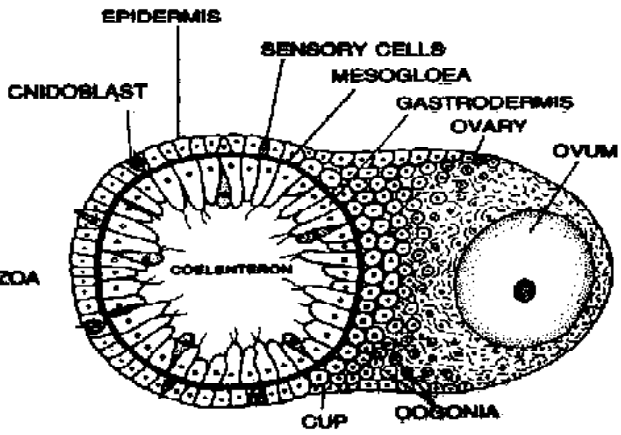
– Unfavourable Condition (From Feb, March to the end of summer).
– Towards the end of winter and start of summer Sexual Reproduction begins.
– Hydra have both Unisexual and Bisexual species.
– Hydra oligactis is unisexual but Hydra Viridis species is Bisexual- "Gonads"-Testes, Ovary.
– Temporary - found only in breeding season. A gonad is simply a group of modified Interstitial cells which migrate from other parts of body and collect beneath the epidermis. Gonidial ducts are absent.

Testes :

– Number -1 - 8, Situated near Hypostome region, Shape - conical, Testes are more numerous and always anterior to the ovaries. (Bisexual sp).
– Testes of unisexual Hydra are spherical and knob like, but those of Bisexual forms are conical with an apical nipple like cap for exit of sperms.



T.S. of Testes



T.S. of Ovari

– Process of Sperm formation is known as Spermatogenesis.
– The gonia of a testis, termed spermatogonia, multiply and grow into primary spermatocytes.
– Each primary spermatocyte undergoes two maturation division – first meiotic, second mitotic, yeilding haploid spermatid.
– This transforms into tailed sperm and this process known as spermateleosis.
– Mature sperms are shed in water either through a pore formed in the nipple of a testis or by rupture of overlying epidermis.
– Liberated sperms actively swim about by means of their tails.
– Protandry Condition - i.e. the testes form earlier than Ovaries and therefore sperms mature earlier than ova.

Ovaries :

– Number -1 to 2, Spherical and knob like, situated near stalk region.
– Each ovary form only one ovum. Formation of ova known as Oogenesis.

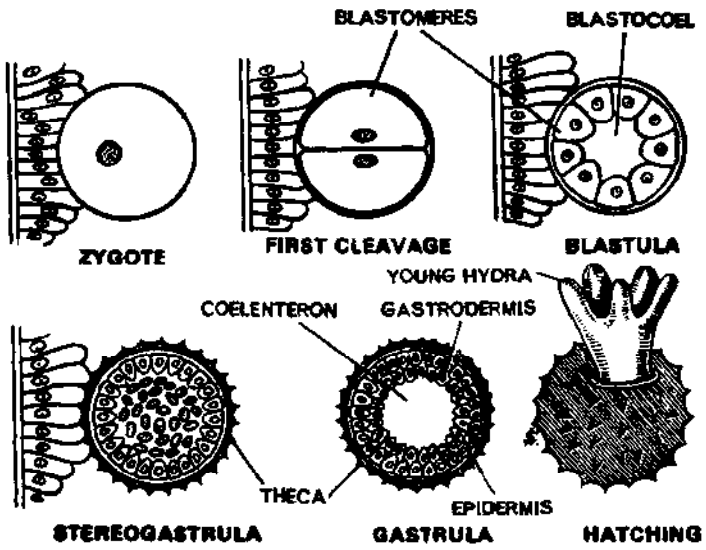
– The overlying epidermis ruptures and shrinks to a cup like Cushion or Calyx around the Base of the ovum exposing the ovum in water.

Fertilization :

– External fertilization. Cross fertilization. Bisexual Hydra have Protandrous condition, so cross fertilization promotes.
– An exposed ovum must be fertilized by a sperm within 24 hours, otherwise it dies and disintegrates.
– As the sperms, swim in the water, they come in contact with an ovum, they stick to it, but only one of these succeed in entering in to it.
– Only sperm head enters into the ovum, the tail is left outside.
– The sperm nucleus fuses with ovum nucleus. This is called fertilization which transforms the ovum into a diploid zygote.

DEVELOPMENT OF HYDRA

– Immediately after fertilization, the zygote starts dividing repeatedly by mitosis.
– This is called its segmentation or cleavage. Cleavage is holoblastic and equal.
– First two cleavages are vertical at right angles to each other.
– The third one is horizontal and equatorial.
– These three divisions results into formation of 8 equal embryonic cells or Blastomeres forming a Morula stage.



Stages of embryonic development and hatching in *Hydra*

– As cleavage proceeds further, the embryo acquires a fluid filled central blastocoel cavity.
– All Blastomeres arrange in a single layer around Blastocoel. This is the Blastula stage.
– Its cells multiply rapidly and soon obliterate the cavity by a process termed as delamination.
– The Blastula, thus changes into a solid gastrula stage called Stereogastrula.
– Outer layer of gastrula secretes a thick and sticky chitinous sheath called theca.
– The theca is Spherical or Spindle shaped and smooth or Spiny.
– Thecated stereogastrula drops off from the parent Hydra and sticks to the object on which it falls.
– When favourable condition come, stereogastrula undergoes certain changes.
– Thus the embryo becomes regular, hollow and double layered (diploblastic).
– The two cell layers collectively secrete the Mesogloea in between.
– A hypostome and tentacles also start forming. As the next winter approaches, the young Hydra hatches out of the theca and soon grows into an adult Hydra.

REGENERATION

- Regrowth of injured or lost parts is called Regeneration. Trembley (1874) discovered that Hydra has a tremendous Power of regeneration.
- According to Trembley if a Hydra is cut in to 1.6 mm pieces, then each piece regenerates into a complete hydra by growing the missing parts.
- Trembley eventually succeeded in Producing a 7- headed Hydra. When all the 7 heads were injured, they formed again by regeneration.
- Greek Mythology has reference to a 9-headed demon serpent named hyder. On this very basis, Linnaeus coined the name 'Hydra' for these Animals.

Grafting :

- Hydra has been extensively used in grafting experiments.
- Zoologists have been able to graft pieces of different Hydra of the same species together producing peculiar specimens.

IMMORTALITY IN HYDRA

- According to Brien (1955), Gansen (1951) and Lentz (1960) etc. Hydra is potentially Immortal. According to them, Hydra has a growth zone just below the level at which tentacles arise.
- Interstitial cells acting as an "Undifferentiated embryonic reserve continuously multiply and transform into other types of cells in the growth zone.
- Consequently, older cells are progressively pushed towards the pedal disc and tips of tentacles, from where these are continuously shed off. In this way, cells of the whole body of Hydra are replaced or renewed in about 45 days and there occurs no natural death of the Animal.

PHYSIOLOGICAL "DIVISION OF LABOUR"

- Milne - Edwards introduced the concept of "Physiological Division of labour" in multicellular organisms.
- It implies that, instead of all cells of body participating in all its vital activities, the cells become differently specialized for limited specific functions.
- Division of Labour also conserves energy in multicellular animals.

SPECIAL POINTS

- From the piece of the Hydra, whole body is formed, this process is known as Morphollaxis
- Among the coelenterates, hydra is one of the smallest polyps.
- Chlorohydra viridissima is called green hydra. It is green because of symbiotic association.
- The trigger needle of cnidoblast is called cnidocil.
- Hydra has a nervous system but no brain.
- Hydra has nerve cells but no nerves.
- In the development of hydra, there is no moulting or ecdysis occur.
- Larval stage absent in hydra.

ASCARIS

Ascaris is also known as round worm or thread worm.

CLASSIFICATION

Phylum - Aschelminthes or Nemathelminthes :

- The animals of this phylum are triploblastic and their body shows bilateral symmetry.
- The whole body is covered by thick cuticle.
- The unique characteristic feature of the animals of this phylum is "presence of Pseudocoel".
- Pseudocoel is originated by blastocoel.

Note : The worms of phylum Aschelminthes are "true-worms" only, rest of the worms are called false - worms.

Class - Phasmidia : Phasmids are present in the body of the animals. Well developed excretory system.

Order - Ascaroidia : Oral opening is triangular or triradiate, it is guarded by three lips.

Genus - Ascaris : All the species of Ascaris are endoparasite of ileum of mammals e.g.

Species - *Ascaris lumbricoides* : Endoparasite of ileum of man.

***Ascaris megacephala* :** Endoparasite of ileum of horse.

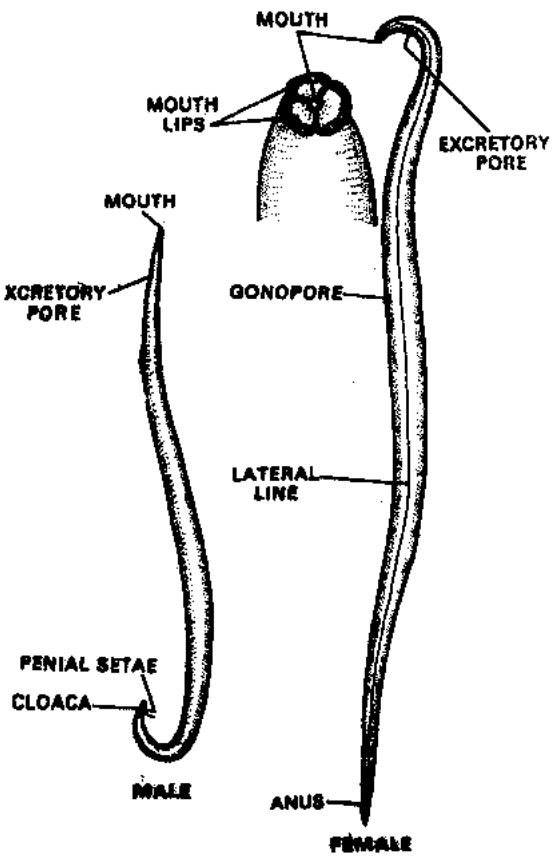
***Ascaris suam* :** Endoparasite of ileum of Pig.

HABIT & HABITAT

- The worms remain free in the intestine of the host and ingest the chyme of the host for nutrition. Nutrition is holozoic.

MORPHOLOGY (Shape, Size and Colour)

- The body of Ascaris is long, cylindrical and tapering at both the ends.
- It is pale - yellowish or pinkish in colour. Its colour shows due to body coelomic fluid.
- Sexual dimorphism is distinct in Ascaris.
- Male- Small and thin (15-30 cm long and 2-4 mm wide).
- Female - Long and stout (20-40 cm long and 6-8 mm wide).
- The tail end of male Ascaris is curved where as the body of female Ascaris is straight.
- Along with these differences, there are some more differences, in male and female Ascaris.



Ascaris lumbricoides (lateral view)

External features :

- The body of both (male and female) Ascarises is covered by thick coat of cuticle, this cuticle prevents the body of Ascaris from the digestive juices/enzymes.
- It is the main parasitic adaptation of Ascaris.
- Cuticle is permeable for water, gases and excretory matters.
- Cuticle has transverse striations/lines due to this the body of Ascaris appears segmented, but it is not true segmentation.
- So Ascaris is an example of **pseudosegmentation**.
- True segmentation is found in the animals of phylum Annelida.
- Body of Ascaris has 4 longitudinal lines, these are called Epidermal or Ectodermal lines, these lines are formed due to evagination of epidermis of bodywall.

Positions of these lines :

1. **Dorsal line :** Thin and whitish
2. **Ventral line :** Thin and whitish
3. **Lateral lines :** thick and brownish.

Mouth :

- At the anterior end of the body of male and female Ascaris both, having triangular mouth, it is guarded by three lips, one is dorsal and 2 ventrolateral lips.
- Each lip of Ascaris is formed by the fusion of 2 lips of embryonal stage.
- Lips in Ascaris are thick horny and tough like leather.
- On inner margin of each lip there are small teeth, these are called **Denticles**.
- Lips of Ascaris have receptors, so these lips are sensory in nature.

Pores of Ascaris :

- All pores in the body of Ascaris are mid-ventral in position.

Excretory pore :

- At a distance of 2mm from anterior end in both (male and female) excretory pore is present.
- With the help of this pore all excretory matters are thrown out side the body.

Genital Pores :

In females :

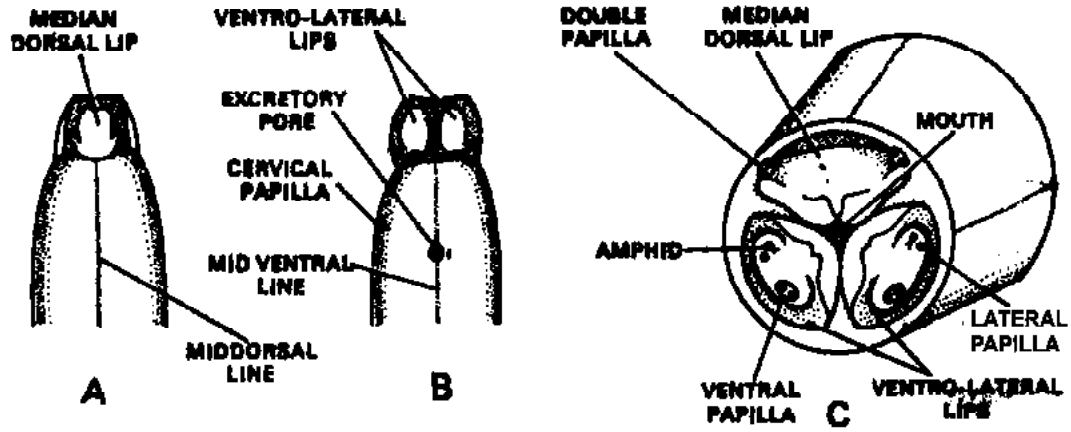
- At about 1/3rd distance from anterior end of body **gonopore** is present.
- Anus lies near the posterior end of the body.

In males :

- There is no separate gonopore in male Ascaris.
- Male Ascaris has a single **cloacal aperture** near posterior end which functions as anus and genital pore both.
- During copulation, 2 spine like structures emerge out from cloacal aperture known as **pineal setae** which help in copulation.

DIFFERENT TYPES OF RECEPTORS

1. **Labial papilla :**
   - These are Tangoreceptors (Sensitive to touch).
   - These are formed in the form of conical outgrowths on lips.
   - Dorsal lip has one pair of double papilla and each ventrolateral lip has one double and one single papilla.



***Ascaris lumbricoides;* Anterior end in dorsal (A), ventral (B) and end on (C) views.**

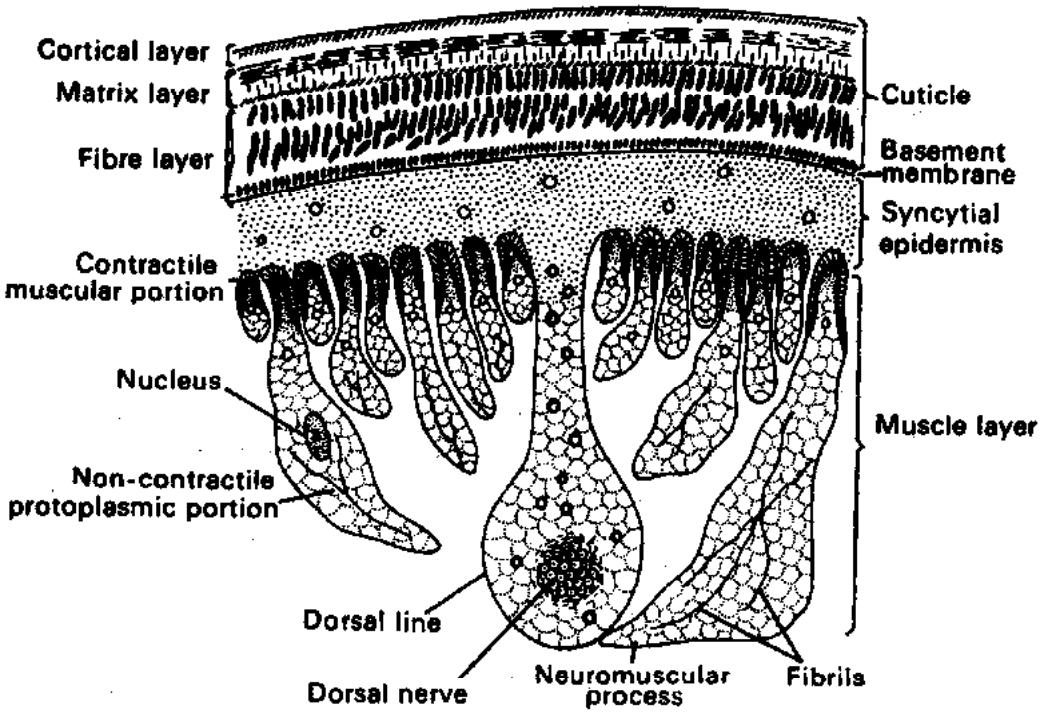
2. **Amphids :**
   - These are chemoreceptors i.e. olfactory or gustatory.
   - These are in the form of a depression on lips.
   - On each ventrolateral lip there is one amphid close to single papilla's underside.
3. **Cervical papilla :**
   - These are tangoreceptors, one pair, present on the lateral side of body at the level of excretory pore.
4. **Phasmids :**
   - These are unicellular, glandular chemoreceptors.
   - One pair of phasmids are present on the lateral side of the body at the posterior end and near anus in females and near cloacal aperture in males.
5. **Genital papilla :**
   - Tail of male Ascaris has 55 pairs of papillae called genital papillae.
   - Out of these 50 pairs are located before precloacal aperture and are called precloacal papillae.
   - Rest of 5 pair are located after post cloacal aperture and are called post cloacal papillae.
   - First 2 pair out of 5 pair papillae are double papillae and all other are single papillae.
   - Genital papillae help in copulation and due to these male Ascaris holds female Ascaris tightly.

Body wall : There are 3 main layers in body wall.

l. Cuticle

ll. Epidermis

lll. Muscle Layer



T.S. of body wall of Ascaris

I. Cuticle :

- The outermost layer is cuticle.
- Cuticle is thick and is secreted by epidermis.
- Cuticle is further subdivided into 5 sub layers.

1. Cortical layer :

- It is outermost sublayer and is made of keratin protein, polyphenols and quinones.
- In electronic microscopy, outermost part of cortical layer appears as composed of a very thin layer of lipids.

2. External Fibrilar layer : This sublayer is made of fibres of Elastin and provide flexibility to body wall.

3. Matrix or medula layer : It is a spongy layer, made of sulphur containing protein - matricine.

4. Internal Fibrilar layer : It is made of fibres of collagen.

5. Basement membrane : It is a innermost layer of cuticle which provides support to epidermis.

II. Epidermis :

- It is syncytial and multinucleated.
- Nuclei of syncytium are arranged in long rows along epidermal layer.
- Function of Epidermis :
  (a) Cuticle secretion.
  (b) Storage of food in form of glycogen and some amount of oil or fat.

III. Muscle Layer :

- It is the innermost layer of body wall.
- Body wall of Ascaris has only longitudinal muscle layer and circular muscle layer is absent, so Ascaris is almost incapable of changing its body length.

- It can change only 15% of its length with the help of longitudinal muscle layer.
- Ascaris can performs undulating or threshold movement with the help of longitudinal muscle layer in the ileum.
- This type of movement is a parasitic adapatation of body.
- With its help it counteracts the effect of peristalsis of ileum.
- Muscle layer of Ascaris is made up of giant cells, as cell division takes place during embryo stage only.
- Body growth after embryo stage takes place by cell enlargement, this phenomenon is termed as **Eutely** or **Nuclear consistency**.
- Each muscle cell is divided into 3 parts :

(i) Contractile part :

- This is a outer part and is made of Actin and Myocin.

(ii) Protoplasmic part :

- It is a broader part and contains cytoplasm and nucleus.
- It also contains non-contractile protein fibres.
- It stores food in the form of glycogen.

(iii) Neuro Muscular process :

- With its help muscle cells keep a contact with motor nerves of Ascaris.
- At 4 places epidermis of body wall forms inbulgings.
- From outside these bulgings appear in form of epidermal lines.
- Out of these 2 are lateral. 1 dorsal and 1 ventral.
- Each lateral line has 3 lateral nerves and each lateral line has 1 excretory canal.
- Brown colour of lateral line is due to excretory material is present, in the excretory canal.
- Due to epidermal lines, muscle layer of body wall is divided into **4 quadrants** called as longitudinal columns.
- Out of these 4, 2 are dorsolateral and 2 ventrolateral.
- Each quadrant or column has 150 muscle cells, so total no. of musle cells is 600.
- The process of muscle cells of dorsolateral are connected to dorsal nerve and ventrolateral are connected to ventral nerve.
- Arrangement of Muscle cells in muscle layer of Ascaris is called as "**Polymyarian**" and "**Coelomyarian**" because there are many muscle cells in each strip of quadrant an they extend well into the pseudocoel.
- Number and arrangement of muscle cells is a factor of taxonomic significance in Nematoda/ Aschelminthes.

BODY CAVITY

- Body cavity is called as Pseudocoel. In Ascaris, coelom is not true coelom. [True coelom is derived from mesoderm and surrounded on both sides by mesoderm.]

– Outer one is Parietal Peritonium and inner one is Visceral Peritonium.
– While in body cavity of Ascaris outer side muscle layer & innerside cuticle of ileum. So pseudocoel is found in Ascaris. Pseudocoel during young stage has **5 giant cells**.
– These are called **Pseudocoelomocytes**. These shrink in adult stage.
– Remnants of Pseudocoelomocytes in Ascaris are cell bodies which are of star shape.
– Adult Ascaris has 5 cell bodies out of which one is located on dorsal surface of pharynx and 4 on lateral lines at varied distance.
– Body cavity is filled with pink coloured Pseudocoelomic fluid or perienteric fluid.
– Which serves for the transportation of metabolites and keeps the body distended.
– Pseudocoel acts as a hydrostatic skeleton to keep the body in tension.
– Smell in pseudocoelomic fluid is due to fatty acid like butyric, valeric & caproic acid which form during aerobic respiration.

PHYSIOLOGY

Digestive System :

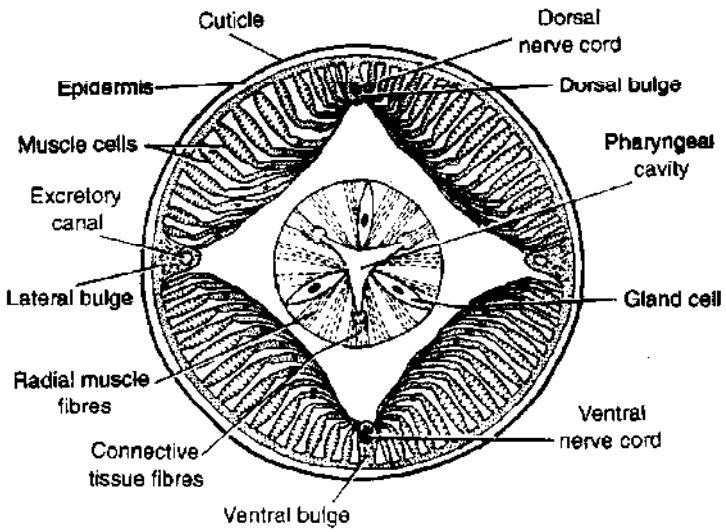
– It is poorly developed in Ascaris.
– Alimentary canal is simple because pre-digested food is feeded in it.

Mouth :

– Mouth opens in a small and thin walled Buccal cavity. Buccal Cavity - It opens in a thick walled pharynx.

Pharynx :

– Wall in pharynx is syncytial. Wall has radial muscles due to which pharynx has the capacity of contraction and expansion.
– In feeding, pharynx acts as a suction organ.
– Lumen of pharynx is triradiate.
– At every angle of lumen of pharynx, protein fibres are attached, these fibres are called marginal fibres, these fibres maintain the **triradiate shape** of lumen. 3 branched gland cells are associated with lumen of pharynx and these secret digestive juice.



T.S. of Ascaris through the region of pharynx

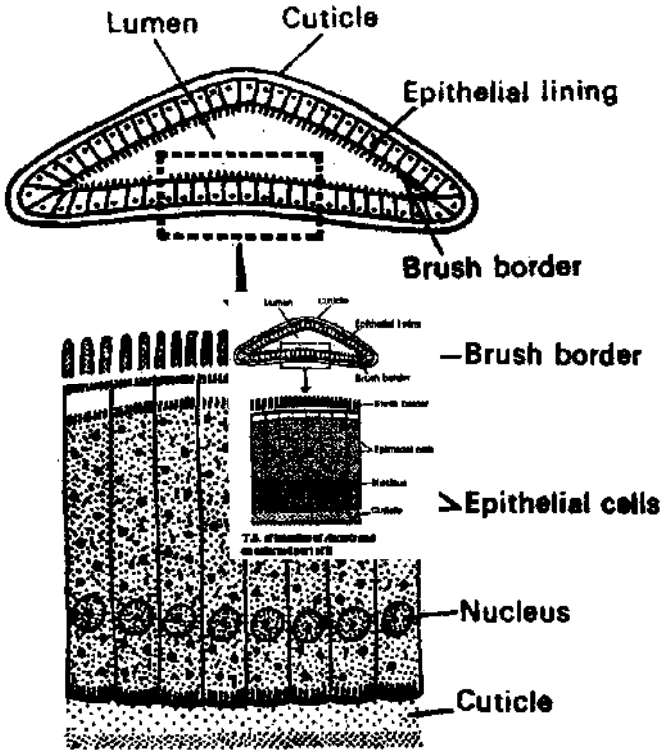
Intestine :

– Intestine is thin walled flat tubular structure, pharynx opens in intestine.
– There is a sphincter between pharynx and intestine to regulate the passage of food.
– Wall of intestine is made up of a single layer of endodermal columnar epithelial cells.

– On inner surface these cells have brush border of microvilli.
– On outer side these cells secret a thin cuticle.

Rectum :

– It is a farthest organ of alimentary canal. It's wall has mucous secreting rectal glands. 6 Rectal glands in male and 3 in female.
– In female, rectum directly opens out side, by anus.
– Some muscles controls opening and closing of anus, these are called **depresser ani muscles**.
– In male, rectum opens in a cloacal chamber and this chamber open outside the body through cloacal aperture.
– On the basis of origin, alimentary canal of ascaris may be divided into 3 parts.



T.S. of intestine of *Ascaris* and an enlarged part of it

1. Fore gut or stomodaeum : It is ectodermal in origin, is formed in embryo stage by the invagination of body wall. so cavity of fore gut is lined by a cuticle. foregut includes mouth to pharynx .
2. Mid gut or mesenteron : It is endodermal in origin.In ascaris, intestine is mid gut.
3. Hind gut or proctodaeum : Origin similar to fore-gut and has cuticle same as fore-gut.
   – In ascaris the portion from rectum to anus or cloacal aperture is hind-gut.

Food :

– Ascaris feeds on chyle i.e. liquid predigested food present in ileum of host. sometimes ascaris with the help of denticles, punctures the wall of ileum and feeds on blood.

Digestion :

– Digestion is mainly extracellular in the cavity of intestine. some digestion is intracellular.
– Digestion is completely **extracellular** in the cavity of intestine and is aided by the enzyme-proteases, amylase and lipase.
– Digested food is absorbed by intestinal cells and distributed by the pseudocoleomic fluid.
– Intestinal cells also engulf small solid particles and digest them **intracellularly**.
– Distribution of digested food is by pseudocoelomic fluid.

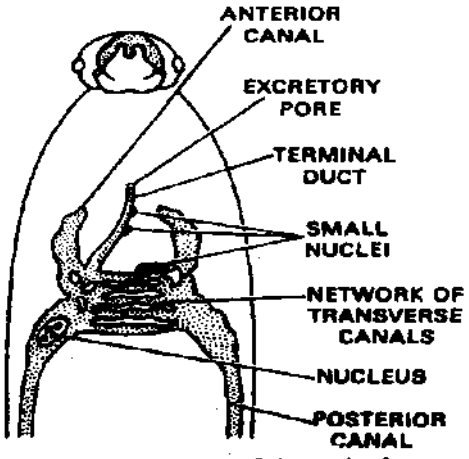
RESPIRATORY SYSTEM

– Respiration is of anaerobic type and its by products are some fatty acids like butyric acid, caproic acid and valerianic acid.

- Ascaris is facultative anaerobe. Aerobic respiration occur if O_2 is available. when O_2 is not available in host, anaerobic respiration occur.
- Aerobic respiration takes place in ascaris it is evident by presence of traces of haemoglobgin in body wall and body cavity.
- Besides body wall also has cytochromes.
- There is reddish - pink tinge in the colour of ascaris due to presence of haemoglobin and cytochromes.
- There are no respiratory organs found in ascaris.
- Glycogen is the respiratory material in ascaris, In anaerobic respiration, the glycogen breaks into CO_2 and fatty acid, these material escape by diffusion through body wall.

EXCRETORY SYSTEM

- It is a H-shaped canal system in ascaris.- It has 2 longitudinal excretory canals located inside the lateral lines in anterior side of body near pharynx.
- These 2 canals are interconnected by a transverse connection.
- These 2 canals interconnect to form a common duct which open outside of the body through excretory pore.
- The whole excretory system originates from a single **renette cell**.
- So excreory canals in ascaris are intracellular.



Excretory system of Ascaris shown only in anterior part of body

- Renette cell are mesodermal cell so Excretory System is mesodermal But terminal duct is Ectodermal Renette cell have 4 nuclei, 2 in common duct, 1 in transverse connection and 1 in left excretory canal.
- Ascaris mainly excretes urea so it is ureotelic it also excretes ammonia so it is also ammonotalic. But it is more ureotelic and less ammonotelic.

NERVOUS SYSTEM

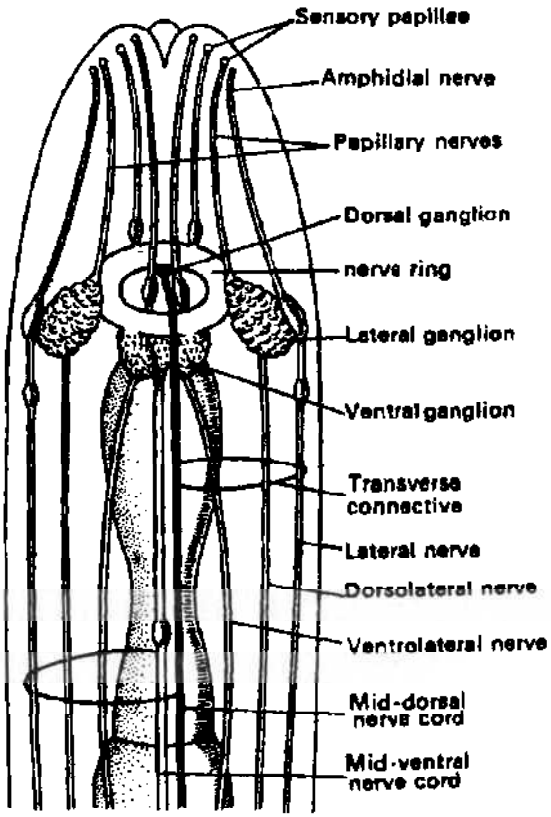
- It is made up of 162 nerve cells. There is a brain ring or nerve ring around pharynx. this ring acts like a brain. or circumpharyngeal ring .
- Brain ring has 7 ganglia associated to it. They are located as -
  1. Dorsal Ganglion
  2. Ventral Ganglia
  3. Lateral Ganglia
- Total no. of nerve ganglia are 7 but only 5 ganglia are visible because each lateral ganglion is formed by fusion of 2 ganglia.
- Brain ring or nerve ring supplies 8 nerves on anterior side of body. Their position.
  (i) 2 from dorsal side of ring

(ii) 2 from ventral side of ring

(iii) 2 from dorsolateral side of ring.

(iv) Last 2 from lateral ganglia - called the Amphidial Nerves.

- Amphidial nerves supply to the amphids of lips. Rest 6 nerves are called Papillary Nerves and supply labial papilla.
- On posterior side, ring supplies 8 thick nerves:
- 1 dorsal nerve which originates from dorsal ganglion of ring.- 1 ventral nerve cord which originates from ventral side of nerve ring. It is the thickest and ganglionated. It is main nerve of Ascaris.
- 1 pair ventro-lateral nerves which originate from ventral ganglion.
- 1 pair dorso-lateral nerves which originates from lateral ganglion.
- 1 pair lateral nerve also originate from lateral gangion.
- Only Dorsal nerve and ventral nerve are motor nerves and rest all 14 nerves (all 8 anterior and 6 posterior) are sensory.



NERVOUS SYSTEM

REPRODUCTIVE SYSTEM

- Ascaris is a unisexual animal. There is clear sexual dimorphism in male and female Ascaris.

Male Reproductive system :

- Male Ascaris has only one unpaired testis so it is called monorchic or monodelphic condition.

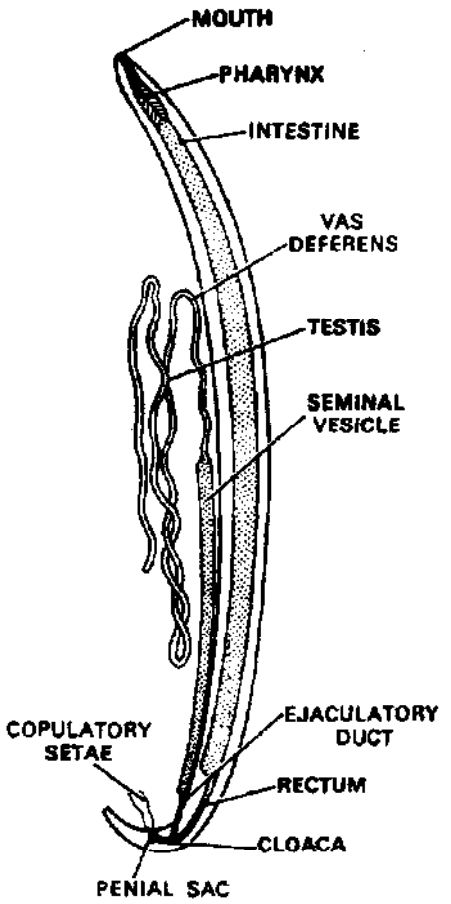
1. Testis : Single testis, long thread like thin and coiled. It is divided into 3 zones.

(i) Proximal part or Germinal part or Proliferation part :

- It has a large germinal at its tip. This cell by budding forms spermatogonia. Formation of spermatogonia is called Telogonic.

(ii) Growth zone : Here spermatogonia grows and primary spermatocytes are formed.

(iii) Maturation zone : Here maturation division takes place and sperms are formed.



Genitalia of male Ascaris

Wall of Testis :

- It is composed of simple cuboidal epithelium In cavity of testis there is a central rachis which is formed of semi solid cytoplasm.
- Rachis provides nutrition to sperms.
- Sperms of male Ascaris are tailless and amoeboid.
- Testis continues in a Vas-deferens.

2. Vas Deferens :

- In this central Rachis is absent.
- A special function in vas deferens of Ascaris takes place. i.e. structural maturation in testes i.e., sperm obtains activity and capacity of fertilization when pass through vas-deferens.

3. Seminal Vesicle :

- It is a long, cylindrical and thick tubular structure which stores sperm.

4. Ejaculatory Duct :

- It joins the rectum to form the cloaca.
- Prostate gland is located in side the ejaculatory duct and its secretion provides nutrition to sperm.

5. Pineal Sac :

- 2 big sacs are associated to cloacal chamber.
- These sacs are called pineal sac and each of it has 1 pineal setae.
- Pineal setae is found only in male Ascaris. 2 types of muscles are associated with penial setae.**Protractor muscle -** Paus out, **Retractor muscle -** Paus in
- Setae come out during copulation and they open female gonopore during copulation.

Female Reproductive System :

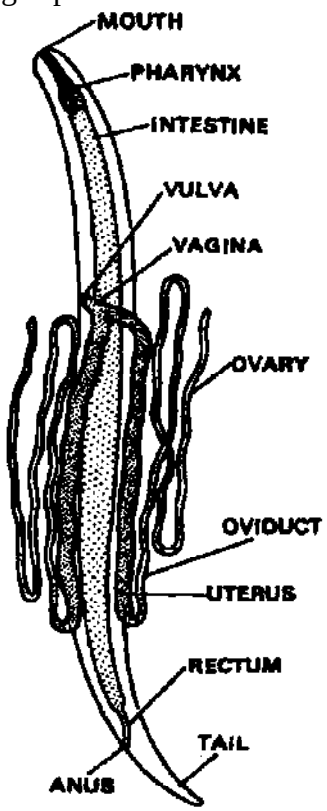
Ovary :

- Female reproductive organs are paired, it includes pair of ovary, oviduct and uterus and this condition is called as **Didelphic**.
- Structure of ovary is similar to male testes i.e. layered by cuboidal epithelium and central rachis is also present.
- Structure of oviduct is similar to that of vasa-deferens and it is deprived of central rachis.

Uterus :

- Each oviduct spreads at distal part to form uterus.
- Distal part of oviduct or proximal part of uterus is called Seminal Receptical.
- It stores sperms which received from male Ascaris after copulation.
- Fertization also takes place here where as in other animals fertilization occurs in anterior part of oviduct.
- Wall of uterus is muscular and glandular.This wall has 3 layers:

(i) Outermost - oblique muscle layer.



Female Reproductive System

(ii) Middle - circular muscle layer.

(iii) Innermost - Tufted cuboidal epithelium.

- It has tufts of cilia.
- Both uteri unite to form vagina which opens outside the body through female gonopore.

Copulation :

- Copulation takes place in ileum of host.
- During copulation male and female remains at right angle to each other.
- Male opens female gonopore with penial setae and transfers sperms.
- These sperms are collected in seminal receptical of female.

Fertilization :

- It takes places in seminal receptical.
- In Ascaris fertilization takes place at secondary oocyte stage.
- After fertilization a shell is formed around fertilized egg. this shell is 3 layered.

(i) Lipoidal layer : It is the innermost layer which is made of esterified glycosides and proteins.

(ii) Chitinoid Layer : It is made of chitin, glycogen, and protein. This layer is actually fertilization membrane.

(iii) Albumin Layer : It is outermost layer and is made up of albumin proteins.

- The lipoidal and chitinoid layers are secreted by egg itself and outermost layer of albumin is secreted by uterus.
- The shelled eggs are liberated by female Ascaris in ileum of host.
- A female Ascaris lays around 15000 to 2 lac eggs at a time and in whole life it lays 2.5 crore eggs.
- Shelled eggs are given out through excreta from the body of host.

DEVELOPMENT

- For further development, eggs require optimum temperature (30°C) and oxygen because embryo needs O_2 for respiration (obligate aerobes)- As soon as eggs come out, cleavage become start.
- Cleavage is **spiral**, **equal holoblastic** and **determinate**.
- Spiral cleavage is a distinguishing feature of phylum Aschelminthes.
- With in 10-14 days, a juvenile stage of Ascaris is formed which is called the Rhabditoid Larva.
- In next 7 days, this larva under goes 1 moulting which helps in growth of larva.
- After moulting II stage of larva is emerge out.
- Eggs with larva are called **embryonated eggs**.
- These embryonated eggs are **infectious stage** of Ascaris in man.
- Contaminated water or food helps them to reach in intestine of host.
- The embryonated eggs of Ascaris may survive outside hosts's body for 6-8 years.
- This long survival period is called as **cryptobiosis**.
- When embryonated eggs reaches duodenum of host, its shell is dissolved and larva becomes free (hatching).

– Hatching is induced by high CO_2 concentration, high temperature and alkaline PH.

– After hatching, II stage larva starts wondering in body of host this wondering is called visceral migration.

There is 2 types of migration occur -

1. First Migration :

IInd stage larva ➡ Duodenum wall ⟶ Blood Vessel ⟶ Hepatic Portal vein ⟶
Right auricle ⟵ post caval ⟵ hepatic vein ⟵ Liver ↲
↓
Right ventricle ⟶ pulmonary artery ⟶ Lungs ⟶ Alveoli wall

II stage larva :

– Penetrates/punctures the duodenum wall of host and enters the blood capillaries.
– This larva reaches liver through hepatic portal vein.
– From liver through hepatic vein and Post caval it reaches right auricle of heart.
– Then via pulmonary artry it enters into lungs.
– It takes 6-8 days for completing Ist visceral migration.
– In lungs it stays for about 10 days (In walls of alveoli).
– During its stay in lungs, it under goes 2 successive moultings.
– Ist time on 6^{th} day. and becomes III stage larva, then II moulting on 10^{th}day and forms IV stage larva. III stage larva is formed from II stage larva and ultimately IV stage larva is formed.

2. Second Migration

– IV Stage larva ⟶ Alveoli cavity ⟶ Bronchiole ⟶ Bronchus ⟶ Trachea.
Ileum ⟵ Duodenum ⟵ Stomach ⟵ Oesophagus ⟵ Buccopharyngeal Cavity ↲

– IV stage larva now moves to trachea via alveoli cavity. It enters Bucco pharyngeal cavity due to coughing. It ultimately reaches illeum passing through oesophagus stomach and Duodenum
– Free larva passes only once through oesophagus. The complete journey period is about 3 weeks.
– **Last IV moulting** of Larva takes place in **ileum** of host and it enters in V stage which is the adult stage of Ascaris. In next 6-8 weeks, it becomes sexually mature and starts reproduction.

CLEAVAGE

– Cleavage in Ascaris is determinate i.e. fate of each blastomere is definite.- 4 celled embryo of Ascaris is initially 'T' shpaed then changes it's shape to rhomboid shape, and has 4 blastomeres.
– 1 blastomere on dorsal side is called B.
– 1 on ventral side called **S_2 or EMST.**
– 1 on anterior side called **A and 1** on posterior side called **P_2.**

A and B : Forms whole ectoderm of body except posterior body.

EMST : Divides into two forms (2 blastomeres) i.e. E and MST. E forms endoderm of complete body.

– MST forms Mesoderm and Stomodaeum.

- **P_2 -** Divides into **P_3** and **C** blastomeres.
- P_3 again divides into **P_4** and **D**. C and D Together form ectoderm of posterior body and P_4 forms germ cells in gonads.

EFFECTS OF ASCARIS

- Life span of Ascaris in host is about 9-12 months. If infection does not occur during this period then disease automatically cured.- Infection of Ascaris in man is called Ascariasis.
- Larva and adult have different effects on human body.

EFFECTS OF ADULT ASCARIS

(i) Indigestion :

- Ascaris blocks the passage of bile duct and due to insufficient bile juice indigestion is there.
- Waste materials of ascaris destroy the protein digestive enzyme of host mainly trypsin.
- Indigestion causes insomnia, vomiting, nausea and abdominal pain, or severe infection can cause even fever.

(ii) Appendicitis :

- Some times it enters vermiform appendix of host so it swells and inflammation is called appendicitis.

(iii) Eosinophilia :

- Increased count of eosinophils in blood is called Eosinophilia.
- It causes allergy, this disease can also be caused by other worms.

EFFECT OF LARVA ASCARIS

- Larva causes enteritis or peptic ulcer, inflammation of lungs, liver damage which causes jaundice.
- Most harmful because of abberent migration. Some time it reaches kidneys, brain and spinal cord and dies there interfering normal activities of concerned organ.
- When it enters brain it leads to delirium. Mostly larva dies here and dead body is surrounded by calcified cyst. this cyst interfere normal activities of organs and causes damage.

Diagnosis and Therapy : Stool test confirms the Ascaris infection as eggs are present in excreta.

Treatment :

a- Oil of chenopodium	**b-** Decaris
c- Antipar	**d-** Vermisol
e- Piperazine	**f-** Santonin
g- Alcopar	**h-**Hexyl resorcinol etc.

PARASITIC ADAPTATIONS OF ASCARIS

- Body is long and narrow for easy accomodation in the intestine of the host.
- Since it feeds upon the chyme of the host it possesses gustatory receptors concentrated upon the lip

around the mouth.

- Cuticle is well adapted for protection.
- Muscle cells of its body wall contract against the pressure of pseudocoelomic fluid to bring about undulations of the body that counteract the force of peristalsis of host intestine . Thus pseudocoelomic fluid is well adapted for hydrostatic skeleton.
- Digestive system is simple, b'coz alomost predigested nutrients are available to the worm in the chyme of the host.
- The pharynx is adapted as a sucking and pumping organ to suck in the chyme and pump into the intestine.
- There are no special organs for locomotion & respiration. Respiration is mostly anaerobic
- Nervous system- and sensory organs are relatively simplified.

SPECIAL POINTS

- Body cavity of Ascaris is pseudocoel
- Salivary glands do not occur in Ascaris
- Reserve food is in the form of glycogen stored in syncytial epidermis
- Ascaris is dioecious or unisexual
- Monogenetic, no intermediate host
- Aberrant migration is the migration from lungs to brain, spinal cord, eyes etc.

EARTHWORM (PHERETIMA)

CLASSIFICATION

Kingdom	:	Animalia
Branch	:	Eumetazoa
Division	:	Bilateria
Subdivision	:	Protostomia
Section	:	Eucoelometa

Phylum : Annelida

- True coelomic body cavity arising as a split in mesoderm (schizocoel) and lined by mesodermal coelomic epithelium (Peritoneum).
- "Bilateral symmetry", triploblastic". Metamerically true segmented body - Body cavity segmented like body wall. Excretory organ - "Nephridia" , Nonchitinous body, Locomotion = "Setae"

Class : Oligochaeta

- Cephalization - absent. Head, eye, tentacles - absent. Setae in body wall. Clitellum = Permanent for "Cocoon formation". Usually hermaphrodite and no free living larval stage. Parapodia absent

Order : Terricola

(1) Clitellum Multilayered

(2) Terrestrial animals

Genus : Pheretima – (Termed by Kinberg) :

Female gonopore single. Male gonopore one pair.

Clitellar segments 14, 15, 16.

MOST COMMON SPECIES OF INDIA

"*P.Posthuma*" -North Indian earthworm

Discoverer - K.N. Bahl

Pheretima - In Japan, Srilanka and Australia

P. eutyphaeus - North Indian Earthworm

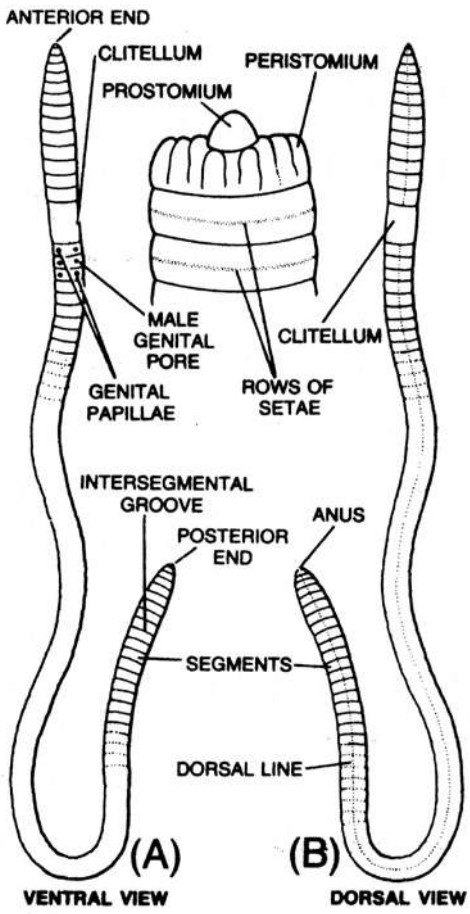
P. megascolex - South Indian earthworm-Longest with 3 m in length (In world megascolides australis is longest = 3.5 mtr)

P. drawida - South Indian earthworm

P. lumbricus - American and Europian earthworm.

HABIT AND HABITAT

- Fossorial (lives in burrows). Burrows found in moist soil, with more humus, maximum in garden soil, Nocturnal animals.
- Cutaneous respiration, absent in dry soil. It feeds on dead organic matter present in the soil.
- The food and soil are ingested together and the latter along with indigested food is finally egested in the form of worm casting.



A. Ventral view of *P. posthuma*;
B. Dorsal view of its anterior end

MORPHOLOGY

Shape - Bilaterally symmetrical animal. Body is cylindrical, elongated, pointed in front, blunt behind.

Colour - Glistening deep brown colour is annular row (= perichaetine arrangement) of about 80-120 minute, S-shaped and yellowish setae (made up of chitin) = Chaetae.

- Seta are half embedded in body wall and half projected backwards upon body surface. They help in locomotion.
- In lumbricus eight setae present on each segment. This arrangement of called lumbriching or octochaetine. This Setae found in pair.

Young Pheretima :

- Setae present on clitellum also. Middle part of setae is swollen = Nodulus or seta bulb.
- Lodged in a deep and narrow invagination of the epidermis called setal or setigerous sac.
- A Large cell known as "Formative Cell" is found at base of sac.
- It secretes seta. Circular Muscle layer divided into 2 parts at the place of seta. Outer circular muscle layer = "Protactor" muscles (1 Pair). Inner circular muscle layer = Retractor muscle (unpaired one).

Segmentation :

- Body of pheretima has "100-120" segments. Segments are known as Metameres (or somites).
- Inter segmental groove present between every two segments.

Clitellum :

- "14-15-16" segment have a pink coloured layer around them.
- This thick collar or girdle like thickening is known as "Cingulum" or clitellum. This is made up of glandular cells.

Mouth : First segment - "Peristomium, Peristomium bears a terminal slit like mouth.

- A dorsal fleshy lobe like process overhangs the mouth like a hood and is called **prostomium.**
- Prostomium helps in digging burrows. Photoreceptor also found in it.

Aperture :

- Spermathecal pores - in each of the four intersegmental grooves between segments 5/6, 6/7, 7/8, 8/9, there is a pair of ventro-lateral elliptical Spermathecal pores.
- Genital pore - First segment of clitellum or 14th segment has a "female gonopore". or female genital pore is located in the mid-ventral line of this 14th segment.
- 18th segment - "Ventro-lateral" - 1 pair of male gonopore. 17 and 19 segments - Pair of genital papilla. on ventro-lateral position. They help in binding two pheretima in ventro lateral condition at the time of copulation.
- Nephridiopores : They are 200–250 minute pores of integumentary nephridia scattered upon the surface of each segment except the first six. Upon clitellar segments, their number is about 2000 to 2500, so called **forest of nephridia**.
- Dorsal pores - Mid - dorsal pores in each intersegmental wall after twelvth segment.
- Dorsal pores absent in last groove.
- Body-fluid always oozes out from these pores. This fluid moistens and smoothens the skin for cutaneous respiration.

– When salt or alcohol is sprinkled on its body, the fluid rapidly oozes out and causes its death.

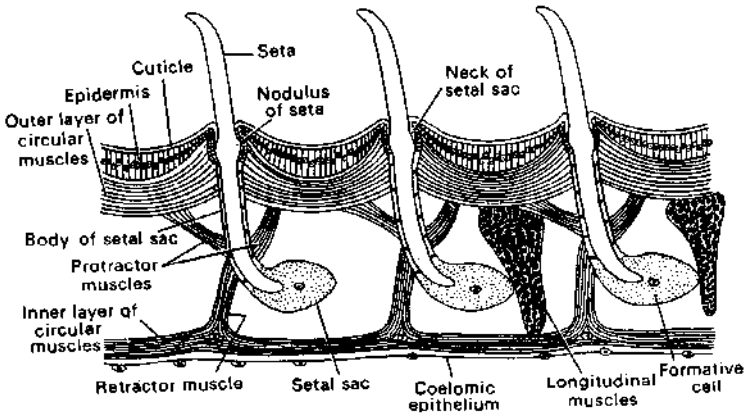
– Anus - A small and vertical slit like aperture at the end of last anal segment (Pygidium) is known as Anus.

BODY WALL

– 4 main layers

(a) Cuticle : "Thin" & semitransparent cuticle composed of white coloured irregularly arranged collagen fibres "Non chitinous" Protective covering, Pores present.

(b) Epidermis : Second Layer - Made up of columnar epithelial cells- 4 types of cells are found in epidermis.



(1) Supporting Cells : Narrow, ordinary, unspecialized epithelial cells. Forms major part. So these are main cells.

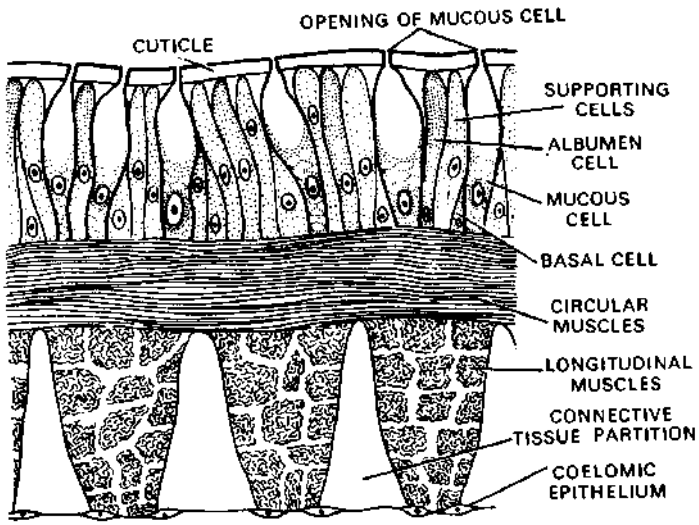
(2) Basal Cell : Shorter, Conical cells, wedged in between and narrower basal parts of other cells. Present at the base. Also known as replacement. cell, as it replaces the destroyed cells of epidermis.

(3) Sensory Cells : Narrow columnar cells occuring here and there.

– Each cell has small sensory hairs at its free end - Receives stimuli.

(4) Gland cells : Thicker cell interspersed between the supporting cells. They are of two types :

(i) Mucous Gland cell :



T.S. Body wall

– Numerous, Club - shaped. Secretes mucus which moistens & smoothens the body (moist & slimy).
– Also known as Goblet cells Each goblet cell opens by a minute ductule upon body surface through a minute pore.
– The mucus keeps the walls of burrows smoothen or lubricated.

(ii) Albuminous cell :

– Fewer, Narrower. Secrete nutritious substance in cocoons. Helps in excretion.

(c) Muscle Layers : Outer = Circular muscle layer Inner = Longitudinal muscle layers

Circular Muscle layer :

– Continuous layer around the body. Porphyrin pigment present.
– Brown colour is due to this pigment. Protects from ultra violet rays.
– This is obtained by the decomposition of chlorophyll.

Longitudinal Muscle Layers :

– (Discontinuous)- It is broken into several longitudinal strips of bands, separated from each other by thin connective tissue partitions.
– They appear elliptical or club shaped in transverse Section.

(d) Parietal Coelomic Epithelium (= peritoneum) : Inner Most layer :

– Found next to the longitudinal muscle layer. Thin, membrane like, originate from mesodermal epithelium of flattened squamous cells.
– Outer envelope of coelomic cavity and hence, called parietal or somatic layer of coelomic epithelium or peritoneum.

FUNCTION OF BODY WALL

(1) Provides fixed shape and size to the body.
(2) Provides protection:- mucous prevents harmful bacteria.
(3) Fluid moistens the body surface and facilitates in respiration.
(4) Seta and Muscles of body wall helps in locomotion.
(5) The sensory cells of epidermis work as the receptors. They compensate the absence of special sense organs in earthworm.

Body Cavity :

– Is "True Coelom" mesodermal in origin and lined by two layers of mesoderm. Outer layer (Parietal - Peritonium) Inner layer (Visceral - Peritonium).
– Space between two above layers is called Body Cavity.
– Body Cavity is segmented. Septa present between each two segments.
– They are known as intersegmental septa.
– First intersegmental septa between "4^{th}-5^{th}" segments. 9^{th} and 10^{th} segments do not have this septa. Ist septa is - thin and straight. Next 5 septa - Thick and funnel shaped. Rest all septa - Thin. First 9 septa are - non porous. All posterior septa - Porous. Each septa has "136 - pores".
– These pores are surrounded by Sphincter.
– Body cavity contains coelomic fluid which is - Milky and alkaline fluid.

– Matrix of watery plasma containing proteins and salts and minute nucleated cells or corpuscles. They are of 4 types

(1) Granulocytes or eliocytes or phagocytes :

– Oval - shaped or subspherical shaped with a concavity on one side and distinct folds on the other. Their one end is flattened.

– Function : Phagocytosis of Bacteria. Granular Cytoplasm present which serves to store nutrients.

(2) Amoebocyte cells : Irregular shaped and phagocytes bacteria.

(3) Mucocytes : Spiral cell. It has an expanded fan like part and a narrow, nucleated, stalk - like part. Function unknown.

(4) Leucocytes or circular cells : Flattened and circular cells with a wrinkled surface and clear, hyaline cytoplasm.

Function : Uncertain

(5) "Yellow cell or Chloragogen cell" : Analogous to liver of higher animals. Shape : Star shaped. Liver like functions. Found in the wall of alimentary canal and on maturity, it falls in the body cavity and gets destroyed.

FUNCTION OF COELOMIC FLUID

(1) Works as hydrostatic skeleton which facilitates locomotion.
(2) The fluid helps in respiration .
(3) Chloragogen cells help in storage of food and excretion too.
(4) Because of this fluid, the body of earthworm is lusturous.
(5) It keeps the body wall moist.

LOCOMOTION IN EARTHWORM

– Given by "Grey" and "Lismann". Lateral appendages absent.

(1) Setae - fix the body to substratum
(2) Muscular layer of body wall C.M.L. = elongates body L.M.L. (Shortens and thickens the body)

– Contraction (wave - like) moves the body in opposite direction of wave.

– In pheretima contraction in total 9 - segments takes place at a time.

(3) Body fluid - "Hydraulic - skeleton"
(4) Mucous = helps in locomotion on smooth surface.
(5) Speed of earthworm = 25 cm/min.

PHYSIOLOGY

Digestive system :

Buccal chamber :

– It is lined by cuticle and extends upto middle of the 3rd segment.

– It has sense organ for olfaction and taste. Because of Radial muscle the buccal cavity is reverted.

Pharynx :

– Dorsal wall of pharynx is thick and is known as "Pharyngeal bulb".

– In this cavity are present two lateral septa .

– These then divide the cavity into two chambers "incompletely".

– In Dorsal part - Dorsal Chamber - Salivary chamber.

– In the dorsal part of salivary chamber is present, saliva secreting cells known as "**Chromophil Cells**" which secrete mucus and proteases.

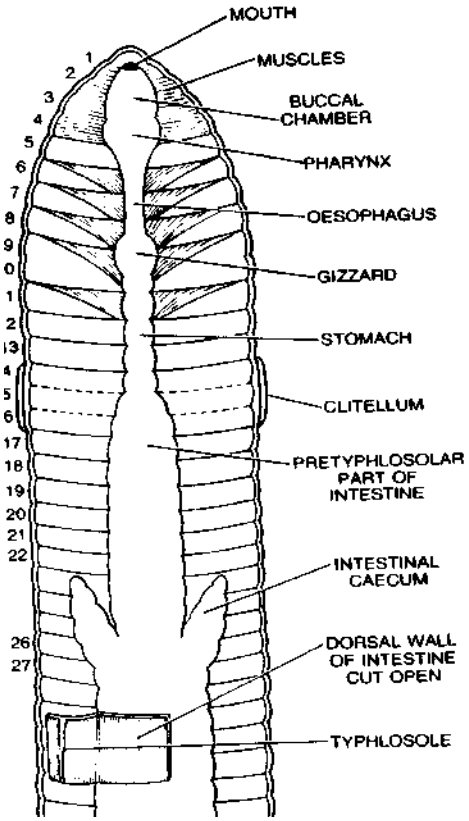
– In Ventral part - "Conducting Chamber" : This is a passage of food - Pharynx located in 3rd and 5th segment.

Oesophagus : 6-7 segment have oesophagus. Oesphagus opens into a thick walled "Gizzard".

Gizzard : This is located in 8th segment.

Stomach : In "9th - (13-14) th" segments. Sphincters present on both ends. Gland Cell in wall secretes "**Proteolytic**" Juices or enzymes.

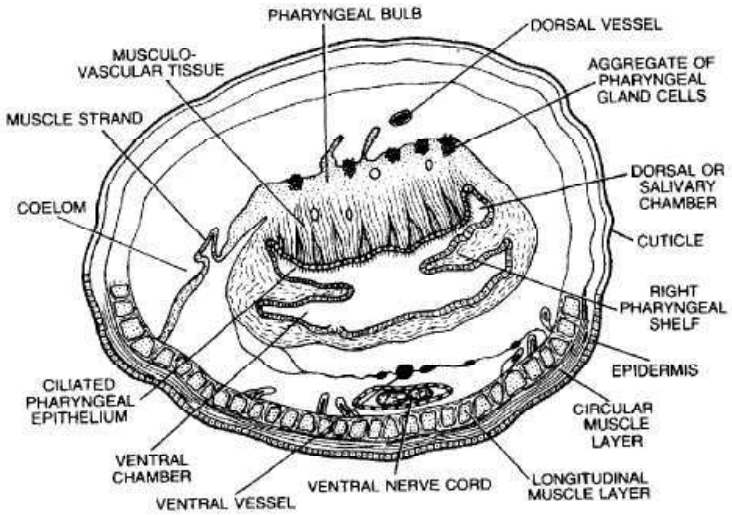
– In other earthworms (not in pheretima) "**Calciferous gland**" are found in wall of stomach. Calciferous gland - neutralise Humic acid by secreting lime.



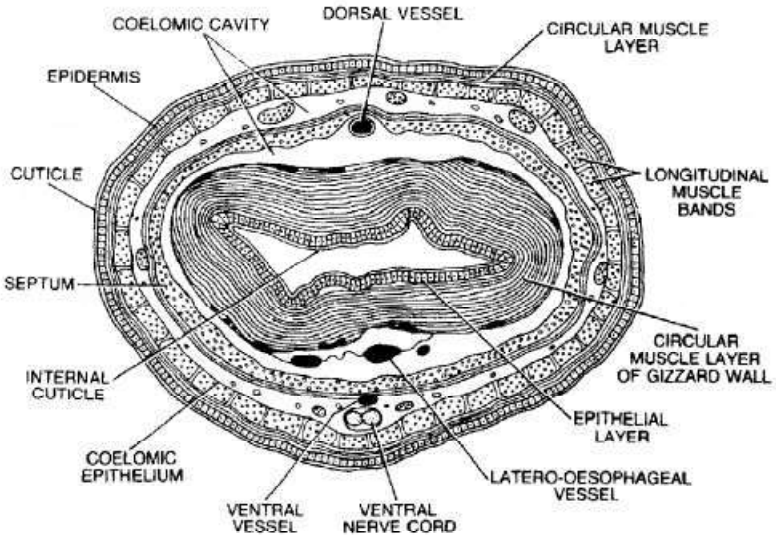
ALIMENTARY CANAL

Intestine :

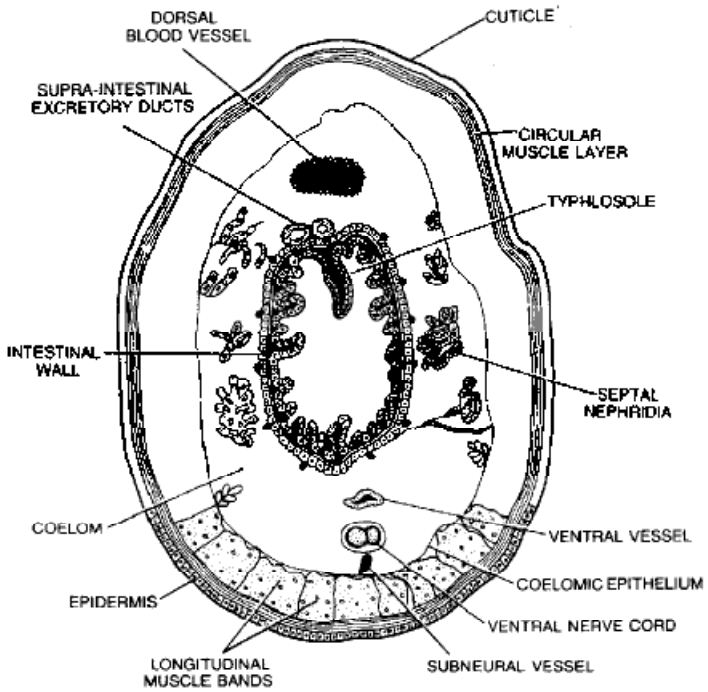
– Longest and widest part of alimentary canal.
– Extends behind from the beginning of 15th segment to the last 20-25 segments.
– This is somewhat compressed by each inter-segmental septum.
– It has a segmentally beaded appearance.
– Wall thin and highly vascular and glandular.
– It bears several villi-like internal longitudinal folds in most part.
– A specially large and prominent fold, called **typhlosole** hangs internally into the intestinal lumen from its mid-dorsal line.
– Beginning from the anterior end of **27th segment** and ending in front of the last 24 or 25 segments.
– Due to typhlosole, intestine is distinguished into **pretyphlosolar, typhlosolar and post-typhlosolar regions**.
– Last 20-25 segments contain rectum.
– Second longest part of alimentary canal.
– Two "blind duct" present in 26th segment attached to intestine.
– They are known as **intestinal caeca**.
– This is situated upto 22nd segment. Secretes digestive enzymes. Typhlosole & villi – Increases the absorption area in intestine.



T.S. of Pharynx



T.S. of Gizzard



T.S. of Intestine

HISTOLOGY OF ALIMENTARY CANAL WALL

(a) Outermost = Visceral peritonium :

– Type of coelomic –epithelium (Mesodermal cell). "Chloragogen cells" found in it. These are analogous to liver.

(1) Storage of food : (Glycogen + lipid) The yellow colour is due to stored lipids.

(2) "Deamination and Urea formation"

(3) Glycogenesis

(4) Lipogenesis : When the cell matures, it breaks from the visceral peritonium and falls into the body cavity where it gets decomposed.

(b) Longitudinal muscle layer – outside

(c) Circular muscle layer – Inside

- Muscle layer are less developed in intestine but In pharynx and gizzard, they are well development.
- Only circular muscle layer in gizzard-Longitudinal muscles are absent.

(d) Enteric epithelium – Ciliated columnar epithelium

- This is glandular in some parts e.g. in pharynx, stomach walls.
- Maximum glands in wall of intestine. A layer called cuticle is also found.

Cuticle : "Buccal cavity and gizzard" Wall of gizzard have thickest cuticle.

FEEDING AND FOOD

- "Omnivorous"

Food - Humus, dead insects, dead leaves and twigs.

In feeding - Buccal cavity helps maximally while pharynx help as sucking organ.

DIGESTION

- Starts in pharynx

Wall :

- Saliva (Mucous, protein digesting enzyme e.g. endopeptidase).
- This enzymes acts on protein and helps in the digestion of large protein molecules into smaller ones.
- Gizzard - Performs grinding Stomach - digestion same as in pharynx

Intestine - Maximum digestion takes place here.

(1) Amylase – Starch $\longrightarrow$ Maltose

(2) Maltase – Maltose $\longrightarrow$ Glucose

(3) Amylopepsin – Glycogen $\rightarrow$ Glucose

(4) Chitinase – Chitin $\rightarrow$ N. Acetyl glucosamine

(5) Cellulase – Cellulose $\rightarrow$ glucose

(6) Sucrase or invertase– Sucrose $\longrightarrow$ Glucose + Fructose

(7) Lipase – Fats $\longrightarrow$ fatty acid + glycerol

(8) Exopeptidase – Peptones and proteose $\longrightarrow$ Amino acid

Absorption :

- Takes place in intestine, mainly with the help of typhlosole.
- Absorption takes place after 26th segment.
- Blood distributes the digested food.

Defaecation :

- The wall of rectum absorbs water from the undigested substances.
- Faeces - in the form of dry pellets- "Castings".

RESPIRATORY SYSTEM

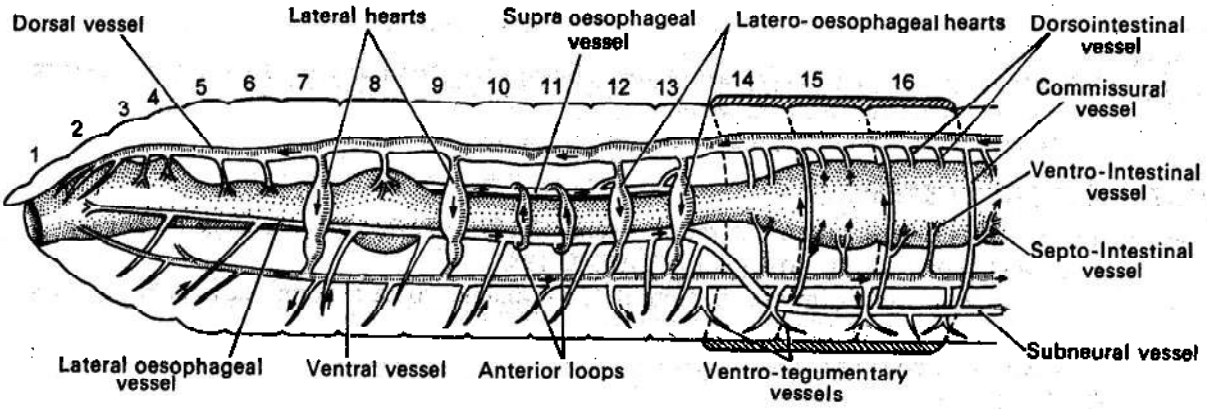
- "Cutaneous respiration" **Skin :** Well adapted for cutaneous respiration, it is thin, moist, highly vascular.
- A dense network of capillaries is present. **Normally –** Aerobic respiration.
- But can also live without oxygen for 30 hrs.

BLOOD VASCULAR SYSTEM [B.V.S.]

Closed : Vascular system. It consist of heart, true blood vessels and blood gland.

Blood : Red colour (Haemoglobin present) Hb - dissolved in plasma

R.B.C. : absent (Nonchordata) this Hb is known as "Erythrocruorin" or "Inter cellular" Hb.



Blood Vascular System [B.V.S.] of pheretima

Blood vessels :

1. Dorsal Vessel :

- Main Blood vessel. From the **3rd to last** segment at dorsal side of alimentary canal.
- It can be seen externally. Wall of dorsal vessel is muscular and lumen have valves.
- Flow of blood occurs from posterior to anterior side.
- Behind the 13th segment, it functions as "**Collecting Vessel**" from last segment to 14th segment.
- In each segment two pair of vessels arise from alimentary canal.
- These are "Dorso intestinal Vessels". These collect blood from alimentary canal and takes blood to dorsal vessel.
- Dorsal vessel in anterior part :- "Distributing Vessel".
- 3rd Segment - It gets branched into three branches.
- They supply blood to the wall of alimentary canal of first three segments.
- In 3, 4, 5, 6, 8th segments, dorsal vessels give out a pair of vessels.
- These supply blood to the wall of alimentary canal.

2. Ventral-Vessel :

- Extends from second to last segment.
- Present on the ventral side of alimentary canal. Wall - Non Muscular. Valve - Absent.
- Blood flows from - Anterior to posterior side.
- Ventral Vessel is a "distributive Vessel" in its whole length.
- V.V. in each segment gives out one pair of "Ventro Integumental Vessel".
- These (VIV) supply blood to body wall and related structures.
- Septa, nephridia, gonads, etc. get the blood supply.
- After 13th segment V.I.V. supplies blood to the posterior segments.
- After 13th segment, a small branch originates from the VIV. It is "septo nephridial" Vessel. It supplies blood to "Septal nephridia" and Inter Segmental septa.
- After 13th Segment, one "Ventro-Intestinal Vessel" comes out from V.V. in each segment which then supplies blood to alimentary canal.

– V.V. receives blood from dorsal vessel. The blood comes from dorsal vessel to ventral vessel by 4 pairs of "**lateral Hearts**".

Hearts :

– Present in 7, 9, 12, 13 segment. 7, 9, - "Lateral Hearts". 12, 13 - "Lateral oesophageal Heart".
– The hearts are muscular and have valves. Lateral Hearts - have 4 pair of Valves. Lateral oesophageal Heart - "3 pairs of Valves". Heart supplies blood from dorsal vessel to ventral vessel.

3. Lateral oesophageal vessel :

– These are 2 vessels lying on either ventro lateral side of the gut, running from anterior end of the body, upto the 13th segment.
– It is a collecting vessel, non muscular. Valves are absent in it.
– Blood flows from anterior to the posterior region.
– In each segment, this collect blood from the body wall septa, nephridia, and reproductive organs, including seminal vesicles.

4. Subneural Vessel :

– It extends from last segment to 14th segment. Ventral side of Nerve Cord.
– In 14th segment it branches into two parts.
– These are "Lateral oesophageal vessel".
– Both branches are situated upto the 2nd segment in the lateral side of alimentary canal.
– S.N.V. do not have muscular wall.
– It is without valves and blood flows from forward to backward.
– It act as "Collecting Vessel" along whole length of animal.
– S.N.V. collects blood only from Body wall. S.N.V. - 1 Pair of commissural Vessel comes out from each segment.
– This supplies blood to "dorsal Vessel."

Commisural Vessel :

– Collects blood from "Septa" and Septal nephridia.
– From each commissural, one "Septo - Intestinal Vessel" comes out.
– They supply blood to alimentary canal.
– Commissural Vessel - is present at posterior face of septa (Intersegmental plates).

5. Supra Oesophageal Vessel :

– In 9-13th segments, on dorsal surface of alimentary canal i.e. on stomach.
– Collects blood from "Gizzard wall" and "Stomach wall".
– In 10th and 11th segments are situated 2 pair of "anterior loops".
– They take blood from L.O.V. to S.O.V. Blood also reach from L.O.V. to S.O.V. by a dozen looplike ring vessels.
– Blood collected in S.O.V. reaches the Lateral - Oesophageal heart.
– From L.O.H. the blood reaches the ventral vessel.

Blood Glands :

– 3 Pairs of blood glands. Situated on dorsal part of alimentary canal in 4, 5, 6, segments.
– They form Hb, Blood cell (W.B.C.) / Leucocytes.

Lymph glands :

– On dorsal part of alimentary canal. From 26th segment to last segment. 1 (one) pair in each segment.
– They form phagocytes and pour them into body cavity.

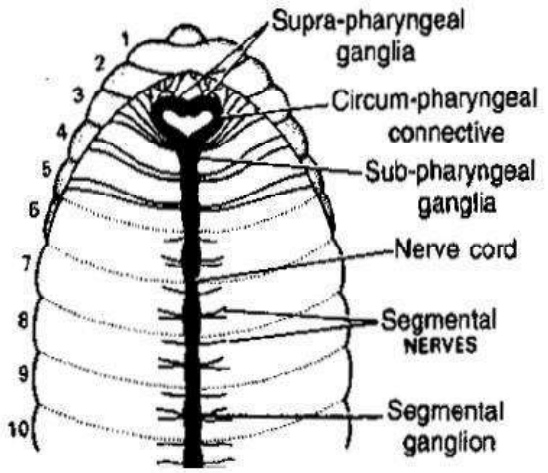
NERVOUS SYSTEM

Central Nervous System :

(1) Brain Ring (2) Nerve Cord

(1) Brain Ring :

- This is present around pharynx.
- One pair of supra-pharyngeal ganglion are present in 3rd segment at dorsal surface of pharynx.
- These are fused to form cerebral ganglion.
- It is also known as brain of pheretima.
- On the ventral side in 4th segment, "sub-pharyngeal ganglion" are present (below the pharynx).
- Nervous strip joins both the two ganglia known as "circum pharyngeal connective".



NERVOUS SYSTEM

Nerve Cord :

- A ventral nerve cord comes out from sub-pharyngeal-ganglia.
- Ventral nerve cord extends upto last segment on ventral side of alimentary canal. Nerve cord in each segment has one segmental ganglion.
- Ventral Nerve cord of Pheretima - double but appears to be single because it has only one common integument around it. The integument has three layers :

[1] Visceral Peritonium (outer).

[2] Longitudinal Muscle layer.

[3] Epineurium (inner most).

- 4 Giant cells on dorsal surface of Nerve cords.
- These giant cells start from 4th segment and lasts upto last segment.
- They are known as "**Neuro-cords**". This is a unique character of Pheretima.
- Pheretima gives rapid - response because of Neuro cords.
- All Ganglia of Pheretima - formed by fusion of "2 ganglion" in embryonic stage.

Peripheral - Nervous System :

- Supra - Pharyngeal ganglia gives out 8-10 pairs of nerves.
- Circum Pharyngeal connective 2 pairs of nerve.
- Sub pharyngeal - 3 pairs of nerves. Nerve Cords - 3 pair nerves in each segment, that arises as:
- 2 pairs from ganglia and 1 pair directly from nerve cord. "All Nerves" - Mixed types of nerves (Sensory + Motor + Adjustor).

Autonomous nervous system :

- This includes the nerve plexuses located in gut wall and some other internal organs.

Receptor : 3 types

[1] Epidermal receptors : In epidermis - tangoreceptors

[2] Buccal receptors : in Buccal cavity ; Chemoreceptors - ("Olfactory + gustatory)

[3] Photoreceptors : or "ocelli" or "little eyes" Maximum in prostomium and peristomium on dorsal side.

– Each photoreceptor have a large optic cell. Inside optic cell there is an "L" shaped. lense or phaosome.

– A network of nerve fibers is associated with lens. This network is is known as"Retinella".

– Nerve fibers - combine to form an optic nerve. They take sensory impulses to supra pharyngeal ganglia. "Alimentary Canal - In the wall of alimentary canal, two network (Plexus) of blood capillaries are present .

(i) Outer plexus - at surface of wall of alimentary canal between visceral peritoneum and longitudinal muscles layer.

(ii) Inner plexus - In the depth of wall of alimentary canal between circular muscle layer and "Enteric Epithelium"

EXCRETORY SYSTEM

– E. Organ - "Nephridia" 3 types of Nephridia

Septal Nephridia :

– Found on "inter segmental septa". Starting from 15-16 segment.

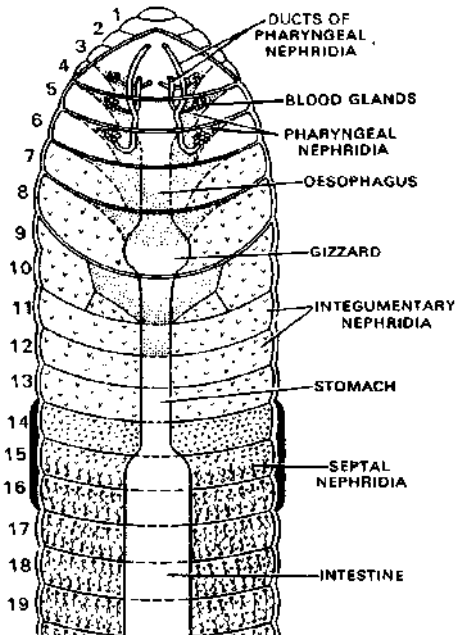
– All posterior septa have nephridia.

– Arranged in two rows on each plane of septa.

– Each row has 20-25 nephridia". 40-50 nephridia on each face of septa.

– Septal nephridia on one septa (80-100).

– In 15th and last segment, there are 40-50 septal nephridia



Types & location of nephridia

Structure of septal nephridia : Consist of 4 parts

(i) Nephrostome : A slit like hole is surrounded by two lips. Upper lip - (8-9 marginal cells) .Lower lip - (made up of 4-5 cells). Nephrostome - Intracellular hole in a large central cell. It is a ciliated funnel communicating with the coelom.

(ii) Neck : After nephrostome, this part is a straight tube like structure. Inside the neck is aciliated canal, nephrostome opens into the ciliated canal.

(iii) Body of the nephridia : Made up of 2 parts

(a) Twisted loop

(b) Straight lobe

– Twisted loop consists of proximal and distal limbs which are twisted. 9 to 13 times around each other like a rope.

– At the base of the nephridium, the straight lobe itself continues as the distal limb of twisted loop, while the proximal limb is formed by fusion of neck and terminal duct.

– In apical part of twisted lobes, there are only 2 non ciliated canals.

– Straight lobe has 4 canals - 2 ciliated, 2 non cilliated.

– All types of canals found in Nephridia are intra-cellular.

(iv) Terminal duct : Last part of nephridia. One ciliated canal inside the terminal duct. Nephridia absorbs body fluid with the help of nephrostome.

- In twisted loops - reabsorption process takes place, useful material absorbed and poured into the body cavity.
- All excretory substances get concentrated and reach the "**Terminal-duct**".
- All terminal ducts present at the lateral side of septa fuses and forms a septal nephridial duct. It is formed in the posterior part of septum.
- In 15th segment, septal nephridial duct is absent it first seen in 16th segment.
- Two large ducts are present at the dorsal side of alimentary canal. From 15th to last segment they are known as supra intestinal duct. S.N.D. - opens in S.I. Excretory duct.

Supra : Intestinal excretory duct open through a small pore in each segment into alimentary canal.

- Alimentary canal absorbs water from excretory materials. Excretory substances with undigested food is thrown outside from anus.
- Septal nephridia - "**Endonephiric**" or "**Entero nephric**".
- In order to check the loss of water, excretory substances are thrown into alimentary canal. So septal nephridia help in "Osmoregulation" because septal nephridia have nephrostome, it is also known as **metanephridia**.
- These are large in size but less in number. That is why, also known as **holonephridia**.

(2) Integumentary nephridia : Present on the internal surface of body wall. After 6th segment - each segment has 200-250 nephridia.

- In clitellar segments they are 10 times (2000-2500). They are known as "**Forest of nephridia**".
- Small in size so - they are known as "**Meronephridia**". Nephrostome absent - called - "**Protonephridia**".
- If Nephrostome present - Meta nephiridia e.g. septal nephridia.
- Twisted loop 'V' shaped. Their terminal duct - opens outside the body so are "Exonephric".

(3) Pharyngeal Nephridia : Present on dorsal side of alimentary canal. In 4^{th} 5^{th} 6^{th} segments they are mixed with blood glands.

- In each group :- 100 nephridia. Total 600 nephridia.
- Size is same as septal nephridia. Structure is same as integumentary nephridia. Terminal ducts of each group unite to form a common duct. The two common ducts of 6th segment extend forwards and open into the buccal chamber in the second segment.
- Common ducts of 4-5th segment open in pharynx lying in 4^{th} segment while of 6^{th} segment open in Buccal cavity lying in 2^{nd} segment.
- According to modern scientists - They are not related with excretion but perform the function of digestive glands.
- Known as "peptonephridia".
- Septal and pharyngeal nephridia are enteronephric (Finally excretory product poured into intestine).
- Pheretima - **"ureotelic"** When water content is more than **"Ammonotelic"**.

REPRODUCTIVE SYSTEM

- Earth worm is "Monoecious" - hermaphrodite. Reproductive Organ - Present on Ventral side of alimentary canal.

Male Reproductive Organ : 10th & 11th segment has testes sac.

– Testes Sac. - Formed by coelomic cavity. Each testes sac has a pair of testes.
– Free end of testes is divided in 4 lobes. These lobes produce spermatogonia
– Testes - **Mesodermal in Origin.** Ist testes sac - smaller IInd testes sac - larger
– A pair of seminal vesicles associated with each testes sac. I pair - 11th segment - smaller seminal vesicle. II pair - 12th segment - large seminal vesicle
– Each seminal vesicle is connected to testis sac by a pair of tubules. Spermatogenesis - in "Seminal Vesicle" Testes forms only spermatogonia. Monocystic protozoa, found in testes or seminal vesicle. They destroy the sperm - "Male sterility.
– From each testes sac, arises a pair of vasa deferentia. They extend upto 18th segment. A pair of prostate gland found from 17th to 20th segment. Vasa deferentia along with duct of prostate gland open via male genital pore.
– Three ducts open in male genital pore. 2 Vasa deferentia and one prostate gland duct.
– Male gential pore is a group of three pores.

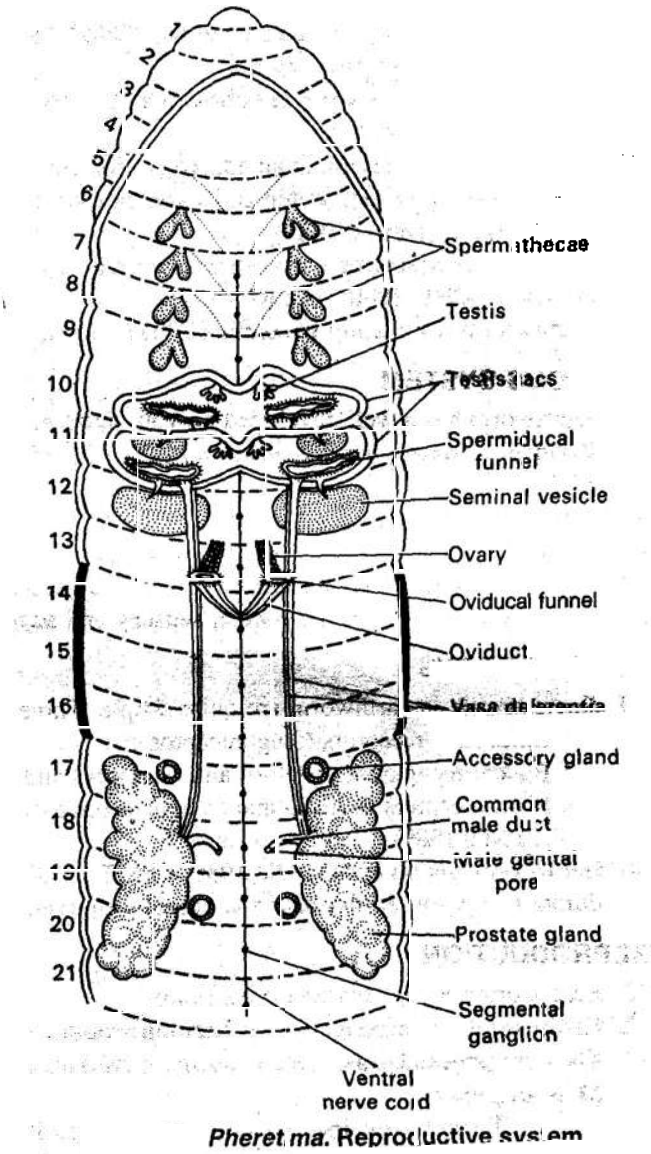
Female reproductive system : Located in 13th segments, is one pair of ovary. They are connected to Intersegmental septa.

– The free end of ovary is divided into many lobes. In each lobe are found, rows of eggs. Eggs - "**Acropetal order**". Two oviducts are located beneath ovary. Both oviduct combines and opens outside the body by female genital pore in Ist clitellar segment.
– Spermatheca - from 6th to 9th segments, one pair in each. Two part of spermatheca.
  1. Ampula 2. Neck
– A duct is associated with the neck. This is known as **diverticulum**.
– After copulation, sperms are stored in it.
– "**Ampulla** - Secretes nutritive liquid, this provides nutrition to sperms.

Accessary glands : One pair in 17th and 19th segment. These open outside the body at the apex of genital papilla. Their secretion helps to bind two Pheretima during copulation.

Copulation : Breeding season - In the night of rainy season.

– The two Pheretima come closer to each other and lie in opposite direction 18th segment of one comes in contact with 5th 6th segments of other Pheretima.
– A small tube (papilla) is formed around the male genital aperture. These are known as copulation tubes or copulation pegs.



Pheretima. Reproductive system

– The copulation tubes of one earthworm inserts into spermathecal pore of other. Then, the transfer of sperms takes place.
– Spermatheca gets filled with sperms in 1 hour.

Cocoon Formation : Pheretima is **Protandrous**.

– A slimy fluid is secreted by glandular cells of clitellum. This then comes in contact with air and forms a pouch around clitelum. This is known as cocoon.
– The eggs comes out from female genital pores and gets filled up in cocoon.
– Earth worm wriggles back side and cocoon proceeds towards front side.
– When cocoons passes over the spermatheca, the sperms get filled in it.
– Nutritive fluid is given by albumen gland of epidermis. Pheretima completely wriggles out from the cocoon.
– Fertilization takes place in cocoon only .
– This is known as "**External fertilization**".
– Only one egg develops and rest gets destroyed.

DEVELOPMENT

– In 2-3 weeks". Pheretima gets fully developed and they comes out by Hatching.
– They do not have clitellum. Soon, they develop clitellum. In young earthworm,
– setae present in clitellar part. Cleavage - "**unequal**" "**Holoblastic**" **Spiral, determinate**.

Gastrulation :

– Invagination". "Neurohormone" - Secreted from Supra pharyngeal ganglion.
– These hormones control regeneration of injured tissue, development of clitellum, and other accessory sexual organs, maturation of gametes, cocoon-formation and shedding of gametes etc.

REGENERATION AND GRAFTING

– Earthworm do not reproduces asexually, but they have great capacity for regeneration.
– It is observed that if a worm is cut into two parts accidentally, the anterior half will develop a tail, but in the posterior half, the head can be formed only if 4 to 6 anterior segments are removed.
– Grafting is also possible in the earthworm. A cut part of an earthworm can be grafted to another worm.

ECONOMIC SIGNIFICANCE OF PHERETIMA & OTHER EARTHWORMS

[1] Pheretima used to cure Rheumatism, piles Asthma, Pyorrhoea impotency, Ulcer, Jaundice etc. Losses : it harms the root of Betal. Natural life cycle of pheretima - 3.5 to 10.5 years.
[2] The burrows makes the soil (land) porous.
[3] They are natural ploughman of land. So they are friends of farmers.
[4] They act as Bait for fishing process.
[5] They are also used for class study because of easy availability and convenient size for dissection.

Harms caused by Earthworms :

[1] Increases soil erosion, Pheretima elongata - harms the roots of Betal plant. Some earthworms also harm the plants of paddy and "Elaichi plants - e.g. "Malabaria padudicola"
[2] A sporozoan protozoa - Monocystis - resides in seminal vesicles and testes as a parasite.

[3] Acts as hosts for transmission of some parasites (e.g. gape worm of chickens)

[4] Some times they get burried with dead bodies. Thus they bring up the infection and harmful microbes with them on the surface.

SPECIAL POINTS

- Nephridia of Earthworm are analogous to kidney of vertebrates .
- Metamorphosis absent in Earthworm.
- Fertilization takes place in cocoon.
- Nephridia are mesodermal in origin.
- Life cycle - 3½ to 10 years.
- Larval stage absent in Earthworm.
- Some earthworm serve intermediate hosts for some parasites such as tapeworm of chicken and long nematode of pigs.
- The nephridia extract H_2O and excretory substance from both blood and coelomic fluid by ultra filtration.
- If the skin of the earthworm dries, it cannot respire. It will then die due to asphyxia.
- The absorptive area of earthworm is more than its volume, so earthworm does not require any respiratory organ.

COCKROACH

CLASSIFICATION

Phylum : **Arthropoda** :**Largest Phylum :** 90% animal out of total animals belong to this phylum
Body Segmented.
Jointed appendages
Blood containing cavity called"Haemocoel"
Exoskeleton made up of chitin

Subphylum : **Mandibulata** : having mandibulate (biting and chewing) type of mouthparts

Class : **Insecta** : Largest class
75% animals included in this class.
Body is distinctly divided into head, thorax and abdomen.
Three pair of legs [Hexapoda]

Subclass : **Pterigota** - Two pairs of wings.

Super order : **Exopterygota** : wings arise externally from body surface.

Order : **Orthropetra**. Wings dissimilar type.

Genus : **Peripleneta** : Body relatively large and flattened, antennae long.

Common cockroaches of India

Peripleneta americana, also known as "Common Cockroach" or "American Cockroach, or Ship cockroach or Bombay canary. *Blatta (Stylopaga) orientalis*. *Blattella germanica* - smallest cockroach. Male Blatta have wings - female wingless. Blatta name - Linnaeus. Periplaneta - "Burmeister"

SPECIAL FEATURES

– Body is dorsoventrally flattened. "Nocturnal Animal". Cursorial animal - fast runner and less capacity of flight (On 25º C Ave. 130 cm/ sec.). Body divided into three parts called "Tegmeta".

3-Tegmeta	**Head**	**Thorax**	**Abdomen**	
Embryo stage	6 segment	3	11	**Total = 20**
Adult stage	1	3	10	**Total 14 segment**

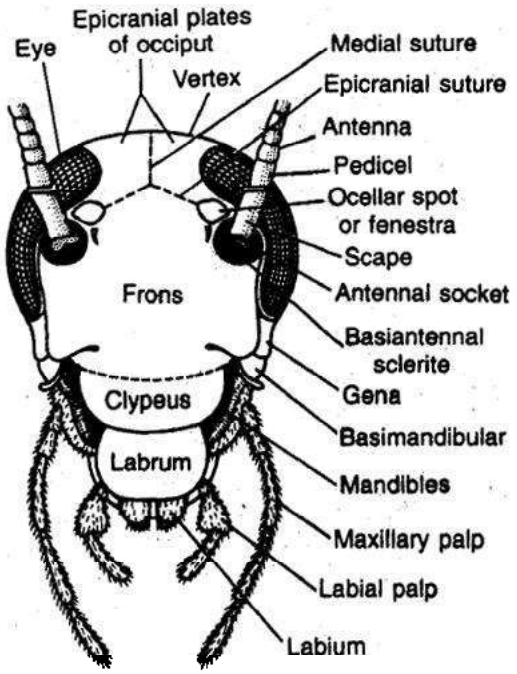
– Exo skeleton made up of chitin plates occured in each segment. Chitin plate called "Sclerites".
– Sclerites join with each other by "Membrane" called "Articular a Arthroidal Membrane."
– Sclerites of dorsal side - tergum or tergite. Sclerites of Ventral side - Sternum or sternite. Sclerites of Lateral side- Pleurons or pleurites.
– Dioecious and oviparous.

MORPHOLOGY

1. Head

– "Hypognathus Condition : Bent downwards at an angle of 90° from the long axis of body.
– Sclerites of the head are join fully and form Head capsule.
– Top part of Head is called "Vertex" and on the vertex a chitin plate is present called as "Occiput".
– An inverted Y-shaped epicranial or medial structure divides the occiput into right and left part called as "Epicranial plates".

– On the lateral side of Head apex, 1 pair of compund eyes are present.
– Each compound eye made up of 2000 units called "Omatidia".
– A small light coloured spot called Fenestra or **Ocellar spot** is located upon dorsal surface close to each eye.
– In insect it function as a **photoreceptor organ**. In Cockroach eyes are inactive and called as "Vestigial simple eye".
– Lateral side of Head apex bear 1 pair of Antennae.
– These are the main receptors of touch, temp, vibration in cockroach.



Anterior View of Head

II segment of Head - Antennae
III segment of Head - Labrum
IV segment of Head - Mandibles
V segment of Head - I Maxillae
VI segment of Head - II Maxillae (Labium)
I segment do not from appendages

Antennae :

– Long filliform, unbranched.Each antenna extending forwards from an antennal socket located dorsally upon head capsule near the compound eye of its side. These are free moving.

Made up of 3-main segments :

[1] Scape [2] Pedicel [3] Flagellum- Several Segment, "Sensory setae"

– A big chitin plate situated below the vertex called frons or Forehead.
– Two long Flattened chitin plates situated on lateral side called "gena" or "Cheeck".
– A big chitin plate present in anterior part of frons called "Clypeus".
– A movable chitin plate joined with anterior part of clypeus known as "Labrum" or "Upper lip".
– A big pore situated in the ventral part of head called "Occipetal Foramen".
– Neck joined with head on the "Occipetal Foramen".
– Occipetal foramen - surrounded by two pair of chitin plate.
  Internal : Post Occiput
  External : Post Gena

Mouth :

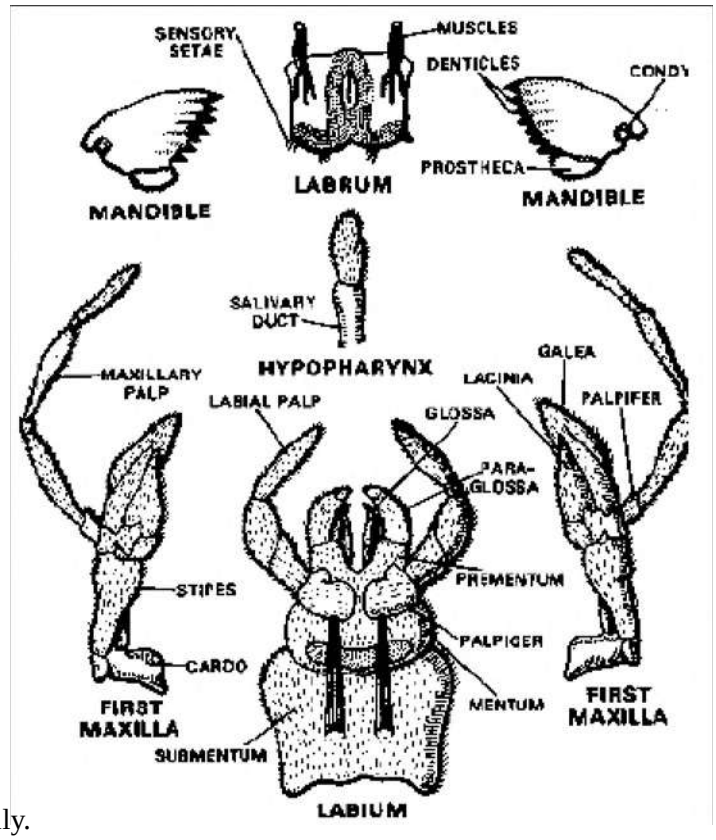
– A mouth situated in the anterior side of head which is surrounded by many chitinous structure called "Mouth Parts".
– Mouth part : According to food habits. "Mouth Parts of Cockroach" : "Bitting and chewing type" .
– A cavity formed due to mouth parts called "Preoral Cavity" or "Cibarium".

[A] Labrum or Upper lip :

– Board and flattened terminal sclerite of the dorsal side of head capsule, moving, articulated to the clypeus.
– It dorsally overhangs the mouth and hence referred to as "Upper lip".
– Several gustatory sensory setae are located on both sides of the Indentation.

[B] Mandibles :

- Jaw. 1-pair of mandibles. They form the lateral wall of preoral cavity.
- Their Margins towards the mouth are serrated in to three large and a few small, strong and pointed teeth like processes called Denticles.
- Horizontal movement occurs in mandibles.
- Abductor and adductor muscle associated with mandibles.
- A soft structure present at base of mandibles called "Prostheca". Prostheca have sensory setae.



[C] First Maxillae : One-pair and form lateral wall of preoral cavity.Three parts.

[a] Protopodite : articulates maxillae with head capsule

[i] Cardo [ii] Stipe

[b] endopodite : Surrounds preoral cavity laterally.

(Lacinia" - inner part : spine attached on free end. It helps in chewing food outer - Galea

[c] Exopodite : "Maxillary palp"

[i] Made up of five segment

[ii] First segment joined on stipe called "Palpifer"

[iii] Setae present on maxillary palp, it is sensory for touch, olfaction and Gustation.

[iv] With the help of maxillary palp cockroach pickup its food and put it in preoral cavity for chewing. Maxillary palps also used as brush to clean antenna and wing.

[D] IInd Maxillae or "Labium" or lower lip :

[i] Form floor of preoral cavity

[ii] Cover Ventral side.

[iii] Made up of three flate chitin plate, i.e. Submentum, Mentum, Prementum.

[iv] All three plates denote "Protopodite".

Three pair of appendages join to form prementum :

- 1-pair - Labial palps - which join to Prementum with the help of chitin peice called "Palpiger".
- These represent "Exopodite". These are 3 segmented structure and have touch, Gustatory, olfactory setae.
- 1-pair glossae- Two segmented structure. 1-pair para Glossa.
- Glossa + para glossa - "**Ligula**". These are "Endopidite". These prevent outwarding of food from pre oral cavity.
- Labium are one pair in embryo stage. Both Labium become fuse in adult stage.

[E] Hypopharynx : or "**Lingua**" **:**

- This is a small, cylindrical mouth part, sandwitch between first maxillae on the sides and covered by Labrum and labium respectively on dorsal and ventral sides.

– It bears several sensory setae at its free end, and the opening of common salivary duct occur upon its basal part (Called Salivarium).

"Neck" - 'Soft Neck". or "Cervicum"

– 8 - chitin plates form exo-skeleton of neck. 2 - tergum, 2 - sternum, 2 pairs - pleurons

2. Thorax :

– Three segemented (Prothorax, Mesothorax, Metathorax).

– Exoskeleton of each segment made up of 4-chitin plate 1-tergum, 1-sternum and one pair pleurone. tergum of thorax - "Notum"

Prothorax	-	Pronotum
Mesothorax	-	Mesonotum Pronotum is "Largest notum" covers neck
Metathorax	-	Metanotum

Legs : One-pair of legs present in each segment of Thorax. 3-pairs of legs (6 legs) legs - five main segment.

[A] Segment - "Coxa" : Broadest segment

[B] Segment - Trochanter : Smallest segment

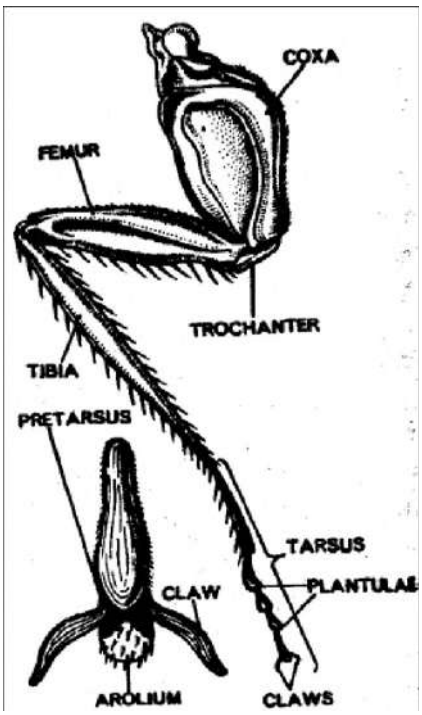
[C] Long segment - femur

[D] Tibia - longest segment

[E] Tarsus - tarsus made up of five subsegments, a piece of chitin on end segment is present called as "Pretarsus" two structure

[i] Arolium or Pulvilus : These are adhesive pads

[ii] One pair claws : Move on the smooth surface by the help of "Arolium" and on rough surface with the help of claws.



In Blatta :

– Arolium is absent. Small pads present in between of tarsus segment called "Plantuli".

– Cockroach climb on the wall by the help of plantuli and Arolium.

– Tactile setae present on each segment of legs.

Wings - 2-pair wing :

[1] Fore wings : Present on mesothorax, these are long, narrow, leathery, strong .

– Fore wings are so long so cover full abdomen, In male these are projecting out ward.

– These are called as Elytra or Tegmina. It helps in protection

[2] Hind wings : Present on Metathorax, these are small, broad, thin, soft.

– These wings helps in flight. Wing originate as evagination of body wall and made up of two layers of cuticle.

– A network of fine tubules called "Nurvures" is present between two layers.

– Haemocoel is filled with haemocoelomic fluid. Tubules communicate with haemocoel which circulates in tubules provide nutrition to the wings.

– After ageing these tubules become dry and provide strongness to wings.

– Two-pair Muscles connected to each wing. 1-pair to tergum, 1-pair to sternum

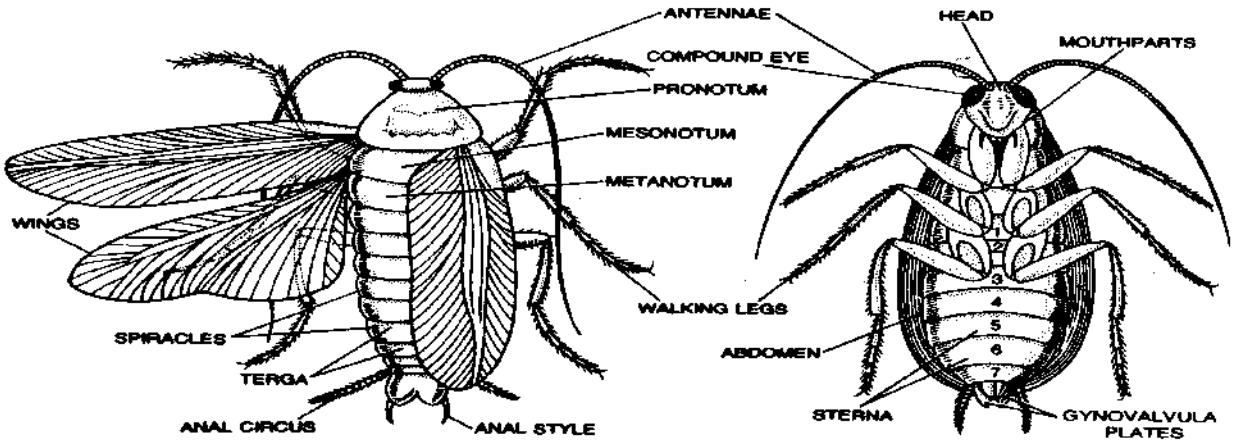
These are called flight muscle. These are not more active in cockroach. i.e.

(1) Tergosternal Muscles (2) Dorsolongi tudinal muscle

(3) Anterior Pleural muscle (4) Basalar Muscle

3 Abdomen : 10 segmented. 9 segment in male. 7 segment in female.

- Remaining segment : "modified and reduced. Each segment of Abdomen having 1- tergum, 1- sternum, 2- pleurons.



(A) Male in dorsal view **(B) Female in ventral view**

- 7th tergum is largest in male and female and covers 8th and 9th terga. 10th tergum - bowl shaped and Bifurcated. From 10th tergum 1 pair - "Anal Cerci" arise. Each "Anal Cerci" - "15 segmented" : These are main sound receptor.
- Sternum - In male - 9 sternum In female - 7 sternum
- One-pairs of spine like structure projected from 9th sternum of male called "Analstyles". These are nonsegmented and help in copulation. 7th sternum of female - special type of Boat shaped. Free end - divided in to two plates
- Plates : "Gynavalvular plates" or "Apical lobs".
- These plates surround a pore called "Ootheca pore".
- All characters of sexual dimorphism in cockroach present in abdomen. Stink gland present in between 5th and 6th tergum, it produce smell - which repel the enemies. Striated muscles occurs in insect.

Endoskeleton :

- Made up of chitin plates called "Apodemes". Apodemes formed from invagination of Sclerites.
- Apodemes : Provide attachment surface to muscles of cockroach.
- 1-Apodem in head - Tentorium (Tentorium - Tent like).
- 3- pairs of arms attached to tentorium. Plate like apodems occure in each segment of thorax. Apodemes absent in Abdomen.

BODY WALL

Made up of three layers :

(i) Outermost - thick cuticle.

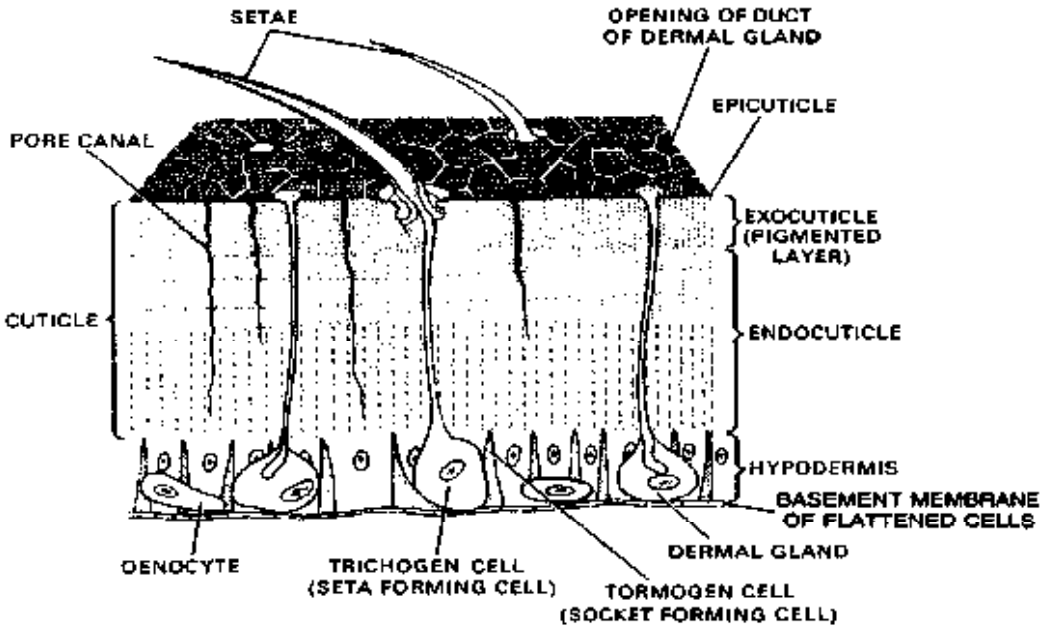
(ii) Hypodermis

(iii) Inner most - basement layer

(i) Outermost cuticle : It differentiated into two parts. Outer - Epicuticle, Inner - Procuticle.

Epicuticle : Chitin - absent, made up of brown scleroprotein. A waxy layer occurs on epicuticle.

Procuticle : Made up of alternate layer of protein and chitin.



T.S. of Body wall

Procuticle : Two parts [a] Outer - thin exocuticle

[b] Inner - thick endocuticle

[a] Exocuticle : Attached with protein, and granules of Quinone and Melanin, dark in colour.

[b] Endocuticle : Melanin and Quinone- absent, light coloured.

– Epicuticle and Exocuticle - Discontinuous, absent in joints of sclerites.

– Endocuticle : Continuous, endocutile become thin in joints and form Articular Membrane.

(ii) Hypodermis (Epidermis) : Made up of columnar epithelium . It contains some special cells.

[i] Dermal gland cell : Secretion of chitinase and proteinase enzyme at the time of moulting. They separate old cuticle from body and secrete new cuticle.

[ii] Trichogen cell : elongated cell and reach up to the epicuticle.

– These secrete "sensory setae" on Epicuticle.

[iii] Tormogen cell : long, cup like cell.

– These cells secrete flexible membrane on the base of setae.

[iv] Neurosensory cell : These situated in the invagination of tormogen cell. One end of Neurosensory cells join setae and other end join with nerves.

– Trichogen + Tormogen + neurosensory cell : All three form sensory unit called "Sensilla".

[v] Oenocytes : Function - uncertain perhaps these secrete wax on epicuticle

(iii) Inner Most Layer : "Basement Layer" – "Simple squamous epithelium."

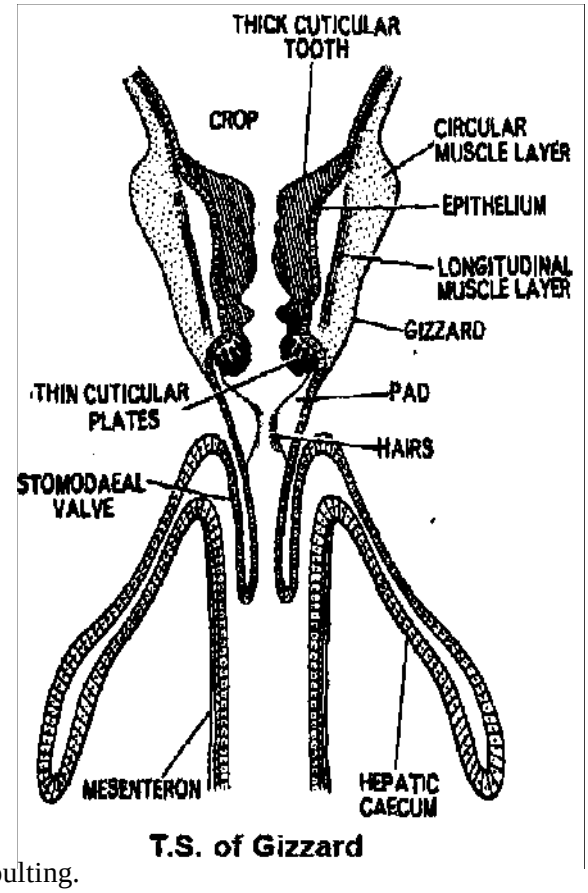
Body cavity :

– Called Heamocoel Blood filled cavity. Blood of cockroach - "Heamolymph". "Blood almost colourless. Blood not related with respiration.

– Trehalose sugar in blood - Disaccharide.

Haemocoel :

- Not true coelom. It is a "large blood sinus".
- In embryo stage several small blood sinuses" fuse and form "Large Blood sinus".
- All arthropods : "True coelomate" But coelom is highly reduced and found only in the form of cavity of Gonads".
- Cavity of Gonads : "True Coelom"
- Large fat body present in Haemocoel of cockroach. Analogous of liver of higher animals



T.S. of Gizzard

Four types of cells are present in fat body :

[i] **Trophocytes :** These store food in the form of glycogen + protein + fats.

[ii] **Mycetocytes :** Presence of "Symbiotic Bacteria".

- These symbiotic bacteria synthesize amino acid and vitamin.
- These change glucose in to glycogen (glycogenesis).
- Possibly "Uric Acid" is converted into protein.
- This reaction is called as "reverseassimilation".

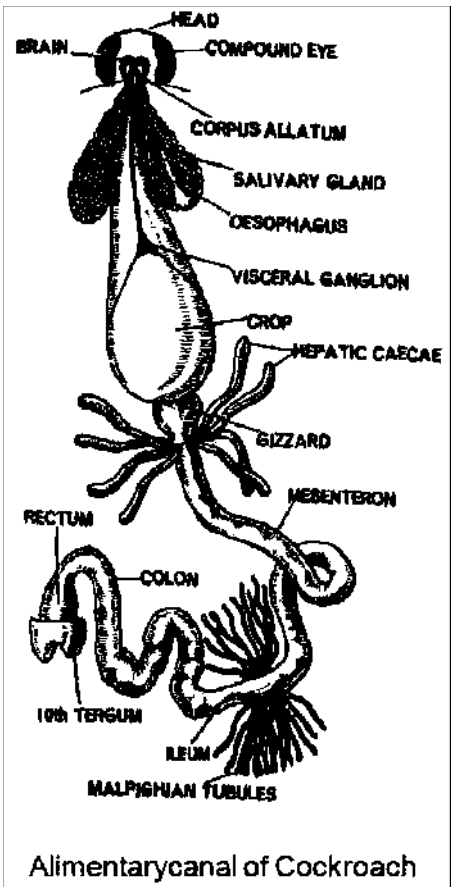
[iii] **Oenocytes :** These cells related with metabolism of moulting.

[iv] **Urate cell :** Absorption of extretory material from heamocoel and storage in the form of "Uric Acid" so called "Storage excretion".

Digestive system : Alimentary canal divided into 3 - parts–

[1] Fore gut (Stomodaeum) : Ectodermal" : Formed by the Invagination of Body wall. Lined with cuticle.

- Fore gut include mouth to gizzard. Mouth open in the small buccal cavity.
- Buccal Cavity - opens in tubular pharynx.
- Pharynx - open near occipetal foramen in "Oesophagus" thro' sphincter.
- Sphincter is present between pharynx and oesophagus.
- In thorax, oesophagus expand and called "Crop". Crop opens into thick walled gizzard.
- Wall of Gizzard - "circular muscle "layer" well developed. Cavity of gizzard called - "Armarium".
- Six cuticular teeth occur in cavity. These made up of longitudinal muscle layer and sharp cuticle.
- Fine grinding of food. Cuticular hairs present in the posterior part of gizzard, these form "sieve".
- Grinding occur in upper part, filteration in lower part.



Alimentarycanal of Cockroach

(2) "Mesenteron" or "Mid gut" (endodermal epithelium) cuticle absent :

Anterior Part - Cardia. Gizzard open in cardia by "stomodial valve".

- Eight small and tubular, finger like blind processes called hepatic caeca, project freely into the haemocoel form the front end of Cardia.
- These secrete "Digestive Juice" . Muscular wall of mesenteron. Inner - circular muscle. Outer - longitudinal muscle, cavity lined by endodermal epithelium.

(3) "Hind gut or Proctodaeum" :

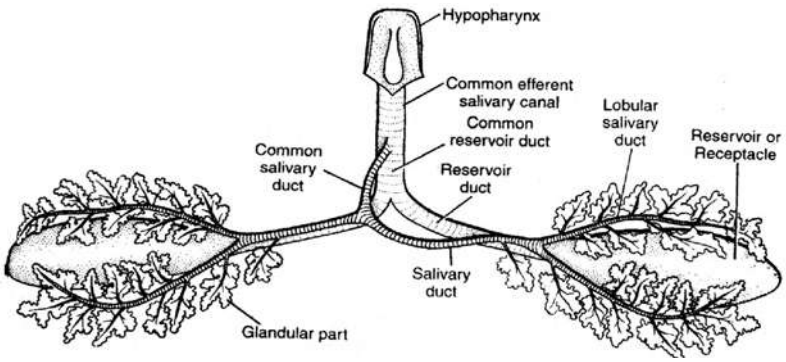
- Ectodermal epithelium is found and lined with cuticle.
- Thin tubules attached at the junction of hind gut and mid gut called "Malphighian tubules" these are excretory organ.
- Hind gut - first part Ileum Its wall is thin and internally folded. Its cuticle bear minute spines which serve to break the peritrophic membrane. Colon - longest and broader part.
- Rectum - last part, oval shaped and internally folded wall. Its wall - 6 folds - called rectal papillae.
- These absorb water. Anus : at the end of 10th abdominal segment. Which is surrounded by 2 plates called podial plates.

Salivary gland :

- 1-pair and attached with oesophagus and present in thorax.
- Two parts of each salivary gland.

[1] Reservoir part : Cylindrical and storage of saliva.

[2] Glandular part : Leaf like and Bifurcated. Synthesis of saliva occurs in this part, each part have separate tubules.



Salivary gland of cockroach

Reservoir duct	**and**	**Glandular duct**
Reservoir duct of both side fused to form "common reservoir duct"		glandular duct of both side fused to form "common glandular duct"

- Both common ducts fuse to forms efferent salivary duct.
- This duct open in preoral cavity at base of hypopharynx.
- Rings of cuticle occur in wall of duct of salivary gland.
- Which prevents these tubules from collapsing.

Saliva : "Carbohydarate-digestive enzymes". ex. Amylase, chitinase cellulase.

Food "Omnivorous" : Bread, food grain, vegetable, wood, clothes, Insects (dead), Nymph, moulted Exoskeleton. Identification of food by the help of Antenna.

Digestion : Most of the food digest in crop. Start from preoral cavity.

Saliva : Enzymes of saliva act upon the food till it reaches the crops. Digestion of carbohydrate takes place.

In crop : Heaptic caeca - Complete digestive juice reaches in crop through the gizzard.

Gizzard : Food throughly grinded in to a paste by the thick and sharp edged cuticle of internal folds and grooves.

– Grinded food enter in to the midgut through stomodial valve.

Wall of Cardia :

– A membrane secreted around the food called peritrophic membrane.
– It is made up of Glycogen + Protein. It serves to protect the wall of midgut from friction with food particles.
– This membrane is permeable to digestive enzyme and digestive food.
– Undigested food with peritrophic membrane enter into the Ileum.
– Spine which is present in the wall of ileum- break the peritrophic membrane, so undigested substance free in Ileum, Digestion completed in the anterior part of midgut.
– Absorpiton of digested food occurs in the posterior part of mid gut.
– Maximum absorption of H_2O occur in rectum by rectal papilla.
– Distribution of Digested food : By "Heamocoelomic fluid"

Respiratory system :

– Respiratory organ - "Respiratory tubules".
– Network of respiratory tubules found in the body.
– This network open out side the body by the spiracles".

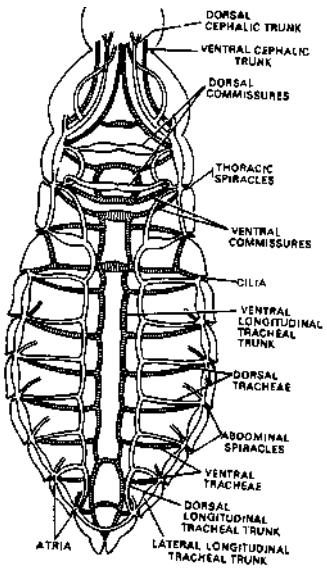
10-pair spiracles/stigmata :

2-pair on thorax : 1 pair between prothorax and mesothorax, 1 pair between mesothorax and metathorax

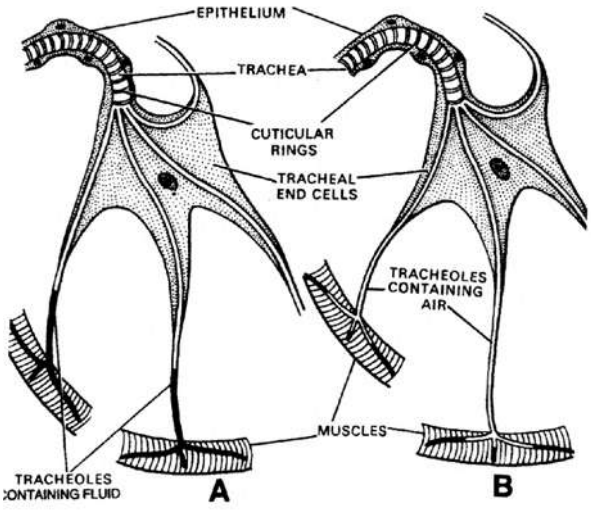
8-pair on Abdomen, on first 8 abdominal segment.

All spiracles **:** Present on "Pleurone"

– First pair of spiracle of abdomen situated on lateral side of "tergum".
– Each spiracles surrounded by a ring shaped sclerites called "Peritreme".
– Each spiracle is guarded by a valve and bears cilia like bristles for filtering the incoming air.
– Valve absent in 1-pair spiracles of thorax and abdomen both.
– Each spiracles open into chamber called "Atrium" or tracheal chamber.
– The tracheal chambers are connected with several main tracheal trunks which repeatedly branch in to a diffuse network of small trachea.



Respiratory Tubules of cock



Tracheoles

- Last branches of trachea called "Tracheal Capillaries" or "tracheoles" Tracheal capillaries - "**Intra - cellular**". Tracheal capillaris closed in a cell called as "Tracheal end cell".
- Long process found in tracheal end cell.
- These process deeply merge in tissues of body.
- Each cell of body is directly in contact with processes Blood not related with respiration.
- In Blood respiratory pigment absent.
- During day time - cockroach is less active so osmotic pressure of tissue fluid - low.
- Tissue fluid rises in to tracheoles. Exchange of gases occur during day time by the tissue fluid.
- Cockroach is more active in night so O.P. of tissue fluid is high so, tissue fluid do not enter into tracheoles.
- Direct exchange of gases take place.

HISTOLOGY

Respiratory Tubules :

- Ectodermal cuticle on inner side and ectodermal epithelium lines outerside of wall.
- Spiral rings of chitin occur in the wall of respiratory tubules.
- They prevent collapsing of wall. Spiral rings also called as "Tenidia".
- Spiral rings absent in tracheal capillaries.
- There are 6 longitudinal tracheal tubes, 2 dorsal, 2 ventral and 2 lateral which are interconnected by transverse commissure.

Breathing :

- Several tergo - sternal muscles extend between the tergites and sternites of all abdominal segments.
- When the abdomen expands, atmospheric air gets filled in the tracheal system through spiracles.
- This is Inspiration. When the abdomen contracts, the air is forced out.
- This is Expiration. Expiration take place through first pairs of spiracles of thorax.
- The spiracular valves control and regulate the in and out passages of the air and abdomen.
- The cuticle of cockroach is very permeable to CO_2, but not to O_2. Most of the CO_2 diffuse out side from body wall, rest CO_2 go out through spiracles.

Blood Vascular System

- "Open types" or "Lacunar types" blood filled in blood sinuses.
- True blood vessel - absent. Largest blood sinus - "Haemocoel". Blood of cockroach - "Haemolymph". Colourless - plasma Blood corpuscles (Haematocytes)

Haematocytes : Function :

(i) Phagocytosis of Bacteria

[ii] Related with blood clotting.

Blood - Function :

(i) Not related with respiration because respiratory pigment is absent.

(ii) It works as "Hydrolic Skeleton".

(iii) Exchange of food, hormones and excretory materials.

Two horizontal septa :

(1) Dorsal diaphragm

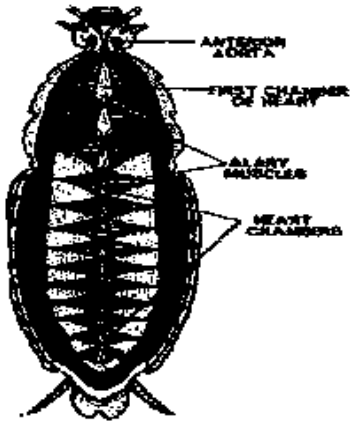
(2) Ventral diaphragm - these have pores called "Fenestrae"

Diaphragms divide the haemocoel in three chambers i.e.

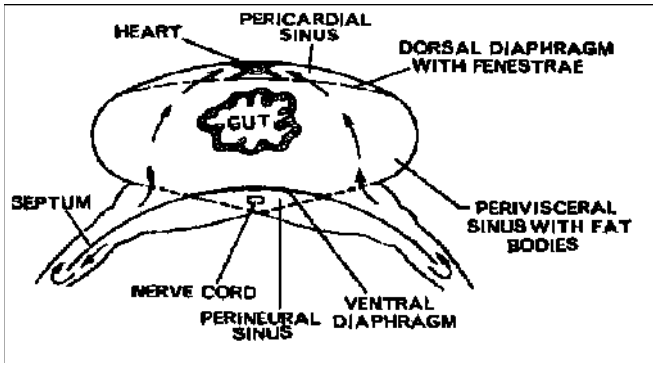
(1) P.C.S. have heart in Dorsal part (Peri cardial sinus)

(2) Middle sinus - P. Visceral sinus it have alimentary canal and fat body.

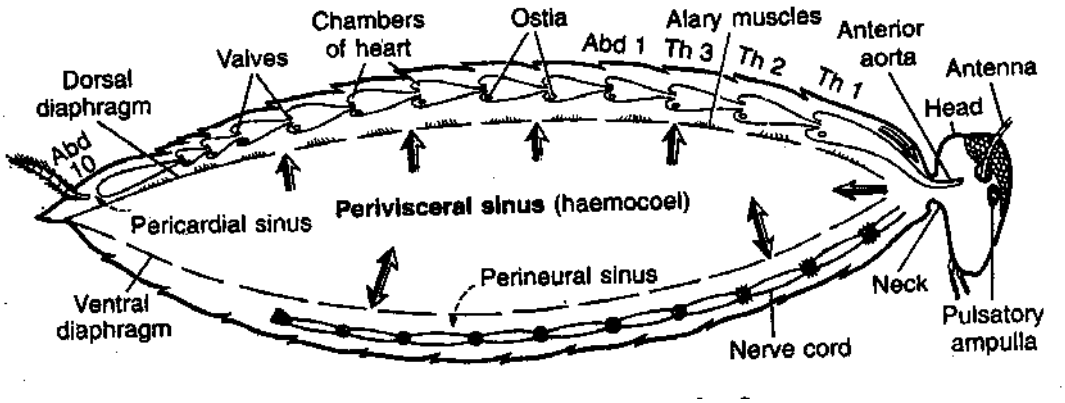
(3) Ventral Chamber - Perineural sinus have nerve cord.



Alarymuscles



T.S. of thoracic segment



Circulation of blood (L.S.)

Heart of Cockroach :

- Divided in to 13 chamber. Chamber - inverted funnel like.
- Each chamber connected with P.C.S. by 1-pair of pores, called "Ostia".
- These pores act as valve. Blood enters from P.C. Sinus to heart through Ostia.
- Each posterior chamber of Heart connected with anterior chamber by a valve like pore.
- These pore help in flow of blood from posterior to anterior part.
- Heart wall is two layered - Outer layer-Fibrous connective tissue, Inner layer- Muscular.
- Special type of cells attached with heart wall called "Nephrocytes".

Functions of nephrocytes :

(i) These control Heart beat. **Heart Beat - 49 heartbeat/minute**

(ii) "Storage excretion" storage of excretory substance in the form of "uric Acid.

Blood vessels :

- First chamber of heart in the form of long tubule called "Anterior Aorta" It opens into head sinus. Beside Anterior Aorta.
- Second blood vessel arises from heart chamber of mesothorax and 3-6 from heart chamber of abdominal segments. These are not true blood vessels because

- (a) These are not divided into capillaries
- (b) Having open ends. 13-pair fan like muscles present in P.C.S. called Alary Muscles.
- One end which is pointed is attached to tergum and other end is broad - connected to dorsal diaphragm.
- These also fused with heart wall these help in "Blood circulation".
- Tergosternal muscle also help in blood circulation mainly these concerned with respiration. "Pulsatile Ampulla" present at base of each Antennae and base of each wing.
- Pulsatile Ampulla help in blood circulation in Antenna and wings.

Passage of B. circulation :

- From P.V.S. blood goes to paricardial sinus and then by ostia blood enter into heart (in Diastole).
- Systole phase - when the heart is filled, it contracts from behind to forwards and blood enters in head sinus by Anterior Aorta.
- From Head sinus $\rightarrow$ In neck $\rightarrow$ "P.N. Sinus". Oesophagus prevents flow of blood into P.V. sinus.
- Two path of blood flow from P.N.S. to P.V.S.
  [a] By fenestrae
  [b] Through legs
- A vertical septa present in cavity of legs, these septa divide cavity of legs in two chamber :

Dorsal chamber - Connected with p. visceral sinus

Ventral Chamber - Connected with P. Neural sinus

Excretory System :

- Main excretory organ - Malpighian tubules.
- These associated with Alimentary canal at the junction of midgut and hind gut. 90-tubules (60-120).
- Arrange in group of six to eight and each group have 15 tubules.
- These are"Ectodermal". **Two parts of malpighian tubule :**
  [a] Proximal Part - absorptive part
  [b] Distal Part - secretory part
- Wall - cuboidal epithelium with Brush border of microvilli Outer Coating of a membrane made up of fibrous connective tissue and muscles.
- Pulsation due to muscle, 5-15 pulsation/minute.
- Excretory substance enter in to alimentary canal by pulsation.
- Distal part of malpighi tubules collects excretory substance from Heamocoel.
- Excretory substance mainly in the form of "potassium urate".
- Potassium urate converted into "Uric Acid" and potassium bicarbonate by the cells of cuboidal epithelium.
- They secrete these substances into cavity of malpighian tubules.
- Reabsorption process occurs in proximal part.
- All essential materials absorbed and return into heamocoel.
- Water absorbed by alimentary canal and excretory materials along with undigested substances excreted outside.
- Malpighian tubules are enteronephric and help in Osmoregulation Storage excretion
  [i] Urate cell
  [ii] Nephrocytes
  [iii] Body wall

– Absorbs excretory materials from Haemocoel and store in cuticle.
– Then at the time of moulting excretory substances and cuticle separate out from body.

[iv] Uricose glands - These help in excretion in male cockroach.

Nervous System :

Three types of nervous system.

[1] Central Nervous system :

[i] Brain ring :

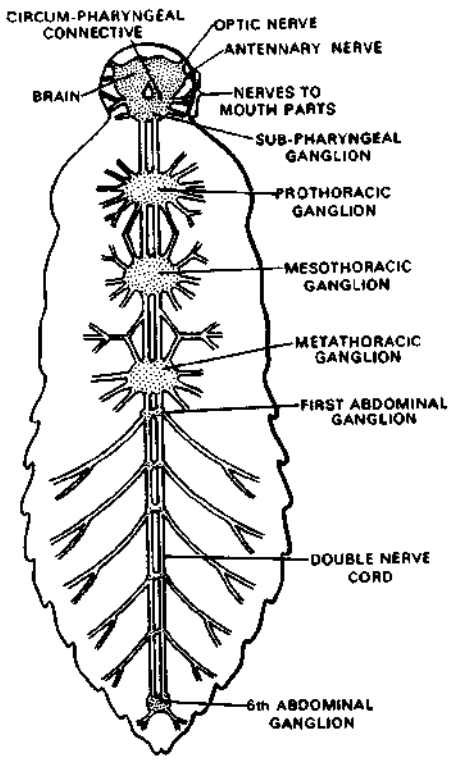
– It is located in the head around the pharynx, just in front of tentorium.
– Its dorsal part is a thick and bilobed supraoesophageal ganglion or "Cerebral ganglion" formed by fusion of three pairs of cephalic ganglia.
– 3 pairs of ganglia are -
  [a] Protocerebrum
  [b] Deutrocerebrum
  [c] Tritocerebrum
– Sub-oesophageal ganglion on ventral side of alimentary canal.
– Sub oesophageal ganglion formed by the fusion of three pairs of ganglia.
– Both ganglia connected to each other by circumoesophageal connective.

[ii] Ventral Nerve Cord :

– Double solid and ladder like.
– Nerve cord have nine segmental ganglia. i.e. There are There large ganglia in thorax and six in abdomen.
– Last ganglion is located in 7th abdominal segment.
– All ganglia formed in embryo stage by the fussion of 2-ganglia. last segmental ganglion formed by fusion of many ganglia.

[2] Peripheral Nervous System :

– 3-pair of nerves comes out from cerebral ganglion.
– 1-pair from protocerebrum - supply - compound eye.
– 1-pair deutocerebrum - in antennae.
– 1-pair tritocrebrum - in labrum.
– Three pairs of nerves connect the suboesophageal ganglion with mandibles, maxillae and labium and other parts of the head and neck.
– Six pairs of nerves from prothoracic ganglion and five pairs from each of the mesothoracic and metathoracic ganglia innervate different parts of their respective segments.
– A single pair of nerves arises from each of the first five abdominal ganglia to innervate muscles, spiracles, heart chambers and other partrs in their respective segments.
– From the last abdominal ganglion three pairs of nerve arise.
– All nerves - mixed nerves, motor nerve, sensory nerve.



(3) "Autonomous System" : It is divisible into three parts :

[i] Stomogastric Nervous System : This includes the following five ganglia and the nerves arising from these to innervate the anterior part of gut as follows.

– This system regulates involuntary activity of foregut.

[a] Frontal ganglion :

– This is a small median ganglion located dorsally upon the pharynx just in front of brain to which it is connected by a pair of short and thick frontal connectives.

[b] Hypocerebral ganglion :

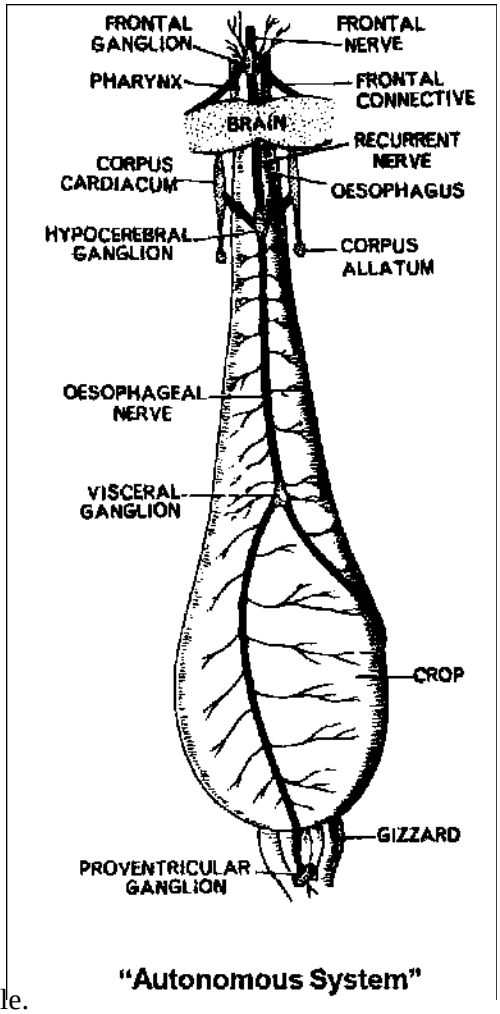
– This is also a small median ganglion located dorsally upon oesophagus behind the brain.

– It is connected in front with the frontal ganglion by means of a thick recurrent nerve.

– It is also connected, by means of two pairs of fine connectives, with two pairs of adjacent endocrine glands.

– Glands named - (i) corpra allata
(ii) Corpora Cardiaca

– All three form "Retrocerebral Complex" (Hypocerebral ganglion + corpora Cardiaca and Corpora Allata)



"Autonomous System"

[c] Visceral ganglion :

– This is located mid-dorsally upon the crop at about its middle.

– A thick oesophageal nerve connectes it with hypocerebral ganglion.

– In front several fine branches of the oesophageal nerve innervate the salivary glands.

[d] Proventricular ganglia (Last ganglia) :

– These are two small ganglia, one upon dorsal and the other upon ventral surface of gizzard.

– Each of these is connected with visceral ganglion by means of a long and thick viscreral nerve.

– These regulate the activity of forgut as of "Peristalsis".

[ii] Spiracular Nervous System :

– These control the activities of spiracles.

– A nerve plexus found around the each spiracle.

– These conected with segmental ganglia of nerve chord.

– These regulate the activity of spiracle.

[iii] Caudal Nervous System :

– Regulate the activity of hindgut, gonads and abdominal appendages.

– This nervous system formed by the last segmental ganglion of nerve chord. (7^{th}).

– This includes certain fine nerves that arise from the last abdominal ganglion and innervate various parts.

Endocrine glands :

[i] Inter cerebral endocrine cells :

– These cell found in cerebral ganglia and secrete brain harmone.

– It regulates the activity of prothoracic gland.

[ii] Corpora Cardiaca :

- It secrete growth hormone in childhood to control the growth of nymph.
- In adult stage these gland regulate heart beat.

[iii] Corpora - Allata :

- These glands secrete Juvenile hormone - "**Neotinin**" in childhood stage.
- Neotinin regulates the growth and differentiation of tissues, preventing untimely moulting and metamorphosis.
- These glands secrete "Gonadotropic" harmone in adult stage - It regulates the activity of reproductive organs.

[iv] Prothoracic Gland :

- Found only in Nymph stage. Secretion of Ecdysone harmone (Moulting harmone) in nymph - this hormone induce moulting.

Sense organs : Receptors cells are present on general body surface.

[1] **Proprioceptors** → For receiving vibration, present on maxillary palp and joints of leg.

[2] **Auditory receptors** → For hearing, present on antennae and anal cerci.

[3] **Thigmoreceptors** → For touch, present on body surface, antennae, maxillary palp and legs.

[4] **Olfactory receptors** → For smell, present on antenna and palp.

[5] **Gustatory** → For taste, present on maxillae, labrum, mandible and hypopharynx.

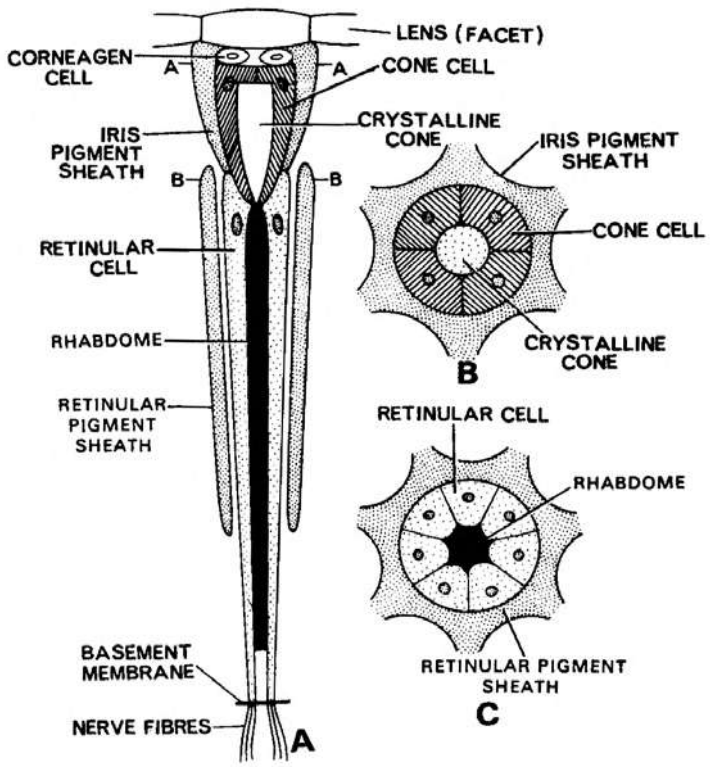
[6] **Thermoreceptor** → For temperature, present on antennae.

[7] **Photoreceptors** → For light and present at the base of antennae and compound eye.

Compound Eyes : Compound eye made up of 2000 units called "Omatidia". Each omatidia having 2 parts.

(1) **Dioptric** - upto cone cell

(2) **Receptive** - Rhabdome and retinal cell together form receptive part.



T.S. of Compound Eyes

- Outer Part of omatidia - hexagonal lens or "Corneal Lens" which is formed of transparant cuticle.
- Just beneath each lens 2 small cells called "Corneagen cells" are present.
- These secrete lens. At the time of moulting, lens also shed from body so cockroach becomes blind for some time.
- Corneagen cell - secretion of a new lens.
- Beneath these cells is a crystalline cone formed by four surrounding conical cells (-vitrella or cone cells). Crystalline cone - Serves as an accessory lens.
- Part of omatidia up to cone cell known as dioptric part or focussing part.
- Beneath the crystalline cone there is a circle of seven cells called "Retinular cells".
- The inner border of each retinular cell bears microvilli.
- The microvilli of the seven rhabdomeres interdigitate to form a long narrow refractile structure called "rhabdome". Image formed on Rhabdom.
- Region of retinular cells is called receptor region. A nerve fibres arise from each retinular cell.
- All nerve fibers of a compound eye together form "Optic Nerve".
- These nerves supply protocerebrum of cerebral ganglion.
- Omatidium surrounded by a "Pigmented sheath" Two Parts Upper part - Irish pigment sheath lower part- Retinular pigment sheath.
- Pigment sheath seperate omatidia from each other.
- These prevent the light rays entering into one ommatidium from crossing over to the adjacent ommatidia.

Mechanism : Two types of vision

[1] Apposition or Mosaic vision :

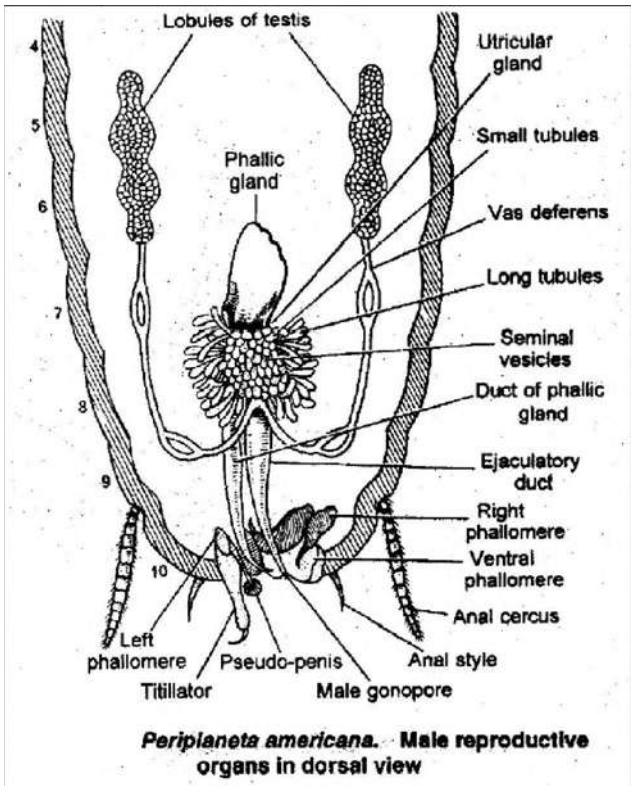
- Apposition vision form in bright light.
- Omatidia fully covered by pigmented membrane.
- The light rays reflected from an object enter in to a number of Omatidia.
- An oblique light ray, that enters into the focussing part of an ommatidium, strikes against its pigment sheath and becomes absorbed.
- A straight light ray that enters into an ommatidium on the other hand reaches into its receptor region and forms the image of corresponding part of the object.
- Thus all the straight light rays entering into an eye from an object form separate images of different parts of the object in the different Ommatidia.
- The totality of these small image is, however, a compund image of the whole object such an image is called apposition image, it is clear and detailed

[2] Superposition image :

- In dim light in nocturnal insect.
- In the night, the pigment sheath of ommatidia contracts and shrinks to thier bases, hence the light rays can easily cross over from one ommatidium to adjacent ommatidia.
- Complete images are formed in all ommatidia.
- This results in the formation of blurred superpostion of the objects.
- In cockroach only apposition image formed (day and night).
- No contraction power in pigmented sheath.

Reproductive System : Cockroach - "Unisexual"

Male reproduction system :



Periplaneta americana. **Male reproductive organs in dorsal view**

- 1-pair of testis in "3-6" abdominal segment. Each testis formed of "3 to 4 lobes". each lobe divided into many lobules.
- Vasa deferentia 1 pair, U shaped - A vesadeferense arise from each testis these open in an ejaculatory duct.
- Ejaculatory duct from 7^{th} – 9^{th} segment open outside by male genital pore. Seminal vesicle form of vesicles located upon ejaculatory duct.
- A gland associated with seminal vesicles called **Mushroom gland** or **Ultricular gland** having two types of tubules.
- Small tubules on inner side-utriculi brevivores. Large tubules outside - utriculi majores Tips of long tubules called "Uricose gland" These absorb excretory material from haemocoel.
- A gland located on mushroom gland called **phallic gland** or **conglobate gland present** on 6^{th} abdominal segment. It opens out side by a long duct "Phallic aperture.
- Chitinous structures associated with phallic apperture and male genital pore called "Phellomeres" or Gonapophysis."

3 phellomeres :

[i] Left Phellomere [ii] Right phellomere [iii] Ventralphellomere

- Phallic aperture present on left phellomere.
- Male genital pore situated on Ventral phellomers.

[1] **Left phellomers :**

[i] Made up of a flate chitinous plate

[ii] Four types of lobes attached with it

- Lower most lobe titilator, with a hooks on tips. "Pseudopenis" - long with bulbow apex.
- Asperate lobe -lobe of spiny surface, phallic duct opens at the base of asperate lobe Innermost lobe - "Acutolobe - with a hook.

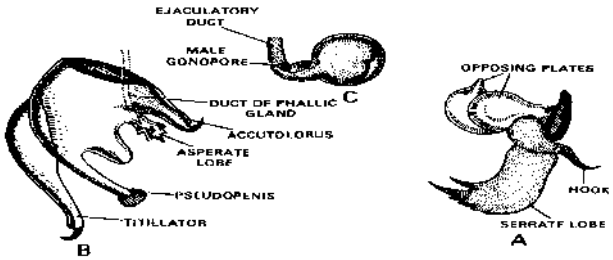
[2] **Right phellomers :** Two lobes

[a] Upper lobe2-"Opposing plate"

[b] Lower lobe Serrate lobe"

- Two large hooks present at apex of serrate lobe.
- A hook present on base of serrate lobe.

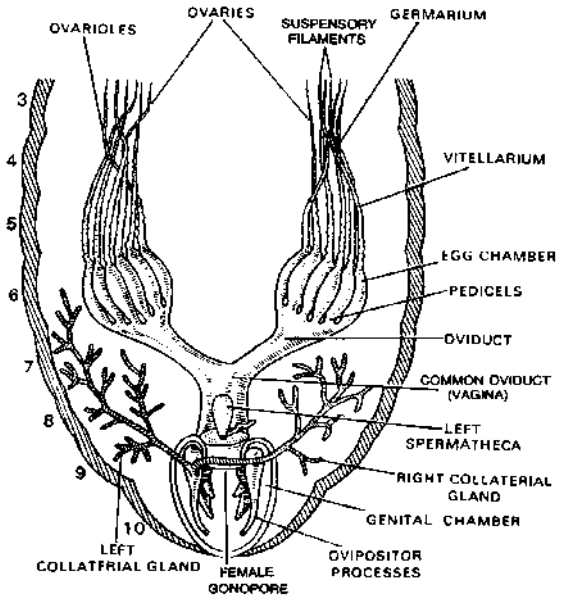
[3] **Ventral - phellomeres :**



(A) Ventral (B) Left (C) Right

- Simplest and formed of a flate chitinous plate Hooks absent.
- Hooks are help to opening of oothecapore of female. Phellomeres : "External genital organ"
- **Spermatogenesis** "Completed in testis". **Seminal Vesicle** - Store the sperms. All sperms glue together to form a ball called "sperm Ball".
- Long tubules secrete a memberane around sperm ball called spermatophore
- Small tubules - secrete a nutritive fluid in spermatophore.
- At the time of copulation spermatophore enters into ejaculatory duct.
- Ejaculaotry duct secrete another coat on spermatophore.
- Spermatophore - "Double layered". When they go out side from male genital pore then phallic gland secrete another layer so spermatophore become three layered.

FEMALE REPORDUCTIVE SYSTEM



Female reporductive organ

- 1-pair of ovary situated in "2 to 6 segment of abdomen". Each ovary made up of 8-long tubules called "Ovarioles".
- Each ovariole differentiated into five parts.
- Upper most part : "Syncytical filament which is made up of multinucleate cytoplasm. These filaments suspend ovarioles to dorsal body wall.
- "Germarium" : It contain oogonia"
- "Vitellarium - "Beaded" due to growing oocytes".
- Egg chamber - each egg chamber have mature ovum. At a time 16 ova are matured.
- "Pedicel" - arrow and contracted and these help in retaining ovum in egg chamber. All pedicel of a ovary joined to form a small oviduct. Both oviduct fuse and form 'Vagina".
- Vagina - vagina opens inside body in a genital chamber.
- Genital chamber - formation of genital chamber by the fusion of 3 abdominal sternum,
- 7th sternum - forms the floor of genital chamber.
- 8th and 9th sterum - become telescoped inwards to form the roof and sides of this pouch, the pouch itself is divisible into a genital chamber in front and oothecal chamber behind.

- A pair of "Spermatheca" associated with gential chamber. Spermatheca unequal in size. Both spermatheca open by a pore in gential chamber.
- A plategorm in genital chamber just beneath spermatheca pore called "Spermatheca Papilla". 1-pair of collaterial glands associated with genital chamber.
- These are branched tubular gland's. Left collaterial gland = More branched. Both glands open in genital chamber by a common pore.
- Three pairs of chitinous porcesses hanging from the roof of genital chamber into its cavity are the external ganitalia of female cockroach.
- These are called ovipositor porcesses because these serve to arrange the ova in a newly forming ootheca, and possibly help in giving proper shape to the oothecae.

COPULATION

- "Breeding season : from march to september. The females secrete a highly odorous and volatile "Sex attracting scent from their scent glands called pheromones or ectohormones.
- Male perceive the smell of this scent with the help of olfactory sensillae located upon their antennae.
- Male cockroach opens the ootheca pore with the help of hooks.
- The male insert whole of its phallomeres into the female's genital pouch. Then it inserts its pseudopenis into the female gonopore for firm anchorage.
- In this position male genital pore situated on spermathecal papilla.
- Discharge spermatophore by male genital pore upon the spermathecal papilla of female.
- After that the secretion of its phallic gland upon the spermatophore occurs. Copulation time $\Rightarrow$ one hour
- The spermatophore remains plastered to the spermathecal papilla of female for about 20 hours. During this period all its sperms escape out and fill in the two spermathecae of the female. Then the female drops out the case of empty spermatophore.
- Sixten ova, one from each ovariole of the two ovaries, are discharged at a time into the genital pouch where these are arranged by the gonapophyses into parallel row.
- Simultaneously, sperms stored in the spermathecae are also discharged into the genital pouch to fertilize the ova.

FERTILIZATION

- "Inernal Fertilization".
- After fertilization the left collaterial gland secretes a soluble "milky protien" while the right one secrete dihydroxyphenol.
- Both secretions mix to form a brownish scleroprotein.
- Scleroprotien forms a common egg. case, called ootheca.
- Formation time-24 hours.
- One end of ootheca like a saw and these close the mouth of ootheca.
- The female deposits it in some dark and dry place.

DEVELOPMENT

- 1-female form 15-40 ootcheca in life time. Development of egg inside ootheca.
- Ootheca are adaptation of terresterial life to prevent the "Water loose".
- Developement time -"4 to 8" weeks. Juvenile stage inside ootheca called "Nymph".

- Nymph appear like adult except for wings and reporductive organs.
- Nymph changed into adult in -1 year. During metamorphosis -7 to 12 times moulting occurs.
- Average -10 times moulting. Time interval between two moulting called "stadium. 6 - 11 stadium.
- Between two moulting nymph is called as "Instar" Adult insect called Imago". "Cleavage" = "superficial mroblastic".
- Gastrulation - "Poly Invagination" or "ingression"
- Egg - "Megalecithal" and "Centrolecithal".

SPECIAL POINTS

1. Parental Care donot found in Cockroach
2. Cannibalism - if food is not available then own species eaten as food.
2. Cockroach word - originated from spainy word "Cucaracha"
3. Cockroach belong to Tropical climate of Africa
4. Cockroach (Periplaneta) - on 25°C run 130 cm/sec.
5. Cockroach Chromosome no. = 34
6. Cilia absent
7. Abdomen without appandages except for anal cerci
8. Mosaic vision found in diurnal insect except for cockroach
9. The first animal to fly were insect
10. Metamorphosis – **"Incomplete or paurometabolus"** . In Insect which have larva stage have complete or holometabolous metamorphosis.

EXERCISE - 1

AMOEBA

Q.1 Amoeba was first discovered by-
(1) Rosel von rosenholf (2) Hirschfield
(3) Doyle (4) Mast and Schneider

Q.2 In Amoeba uroid is
(1) Posterior end
(2) Wrinkled plasmamembrane
(3) Definite polarity (4) All of the above

Q.3 In *Entamoeba histolytica* encystment takes place by action of-
(1) Trypsin (2) Zymase
(3) Pepsin (4) Amylase

Q.4 The streaming movement of endoplasm is called-
(1) Cyclosis (2) Endosmosis
(3) Sol-gel theory (4) None of the above

Q.5 Amoeba belong to-
(1) Sub class Rhizopoda
(2) Class sarcodina
(3) Order lobosa/Amoebia
(4) All of the above

Q.6 How many Pseudopodia present in *Entamoeba histolytica* is-
(1) One (2) Two
(3) Many (4) Five

Q.7 Hyalin cap formed by-
(1) Ectoplasm (2) Endoplasm
(3) Pseudopodia (4) Nucleus

Q.8 Rejuvenation process, immortality and regeneration power found in-
(1) Amoeba (2) Plasmodium
(3) Earthworm (4) All of the above

Q.9 Cyst of Amoeba is-
(1) Trilayered
(2) Made up of chitin
(3) Permeable for gases
(4) All of the above

Q.10 Endosmosis in Amoeba takes place because outer medium is-
(1) Hypertonic (2) Hypotonic
(3) Isotonic (4) Colloid

PLASMODIUM

Q.11 King of fever is called-
(1) Malaria (2) Filaria
(3) Viral (4) Both 1 and 3

Q.12 Maurer's dots related with-
(1) Plasmodium vivax
(2) Plasmodium falsiparum
(3) Plasmodium ovale
(4) Plasmodium malarie

Q.13 Antidose of malaria is-
(1) Paludrine (2) Plasmoquin
(3) Fencidor (4) All

Q.14 The plasmodium can not be detected in blood during-
(1) Incubation period (2) Prepatent period
(3) Erythrocytic cycle
(4) Exoerythrocytic cycle

Q.15 Plasmodium cause thrombosis in human beings-
(1) *Plasmodium vivax*
(2) *Plasmodium falciparum*
(3) *Plasmodium malariae*
(4) *Plasmodium ovale*

Q.16 Shuffner dots are absent in-
(1) *Plasmodium falciparum*
(2) *Plasmodium ovale*
(3) *Plasmodium vivax*
(4) None of the above

Q.17 "Megaly" of spleen during malarial infection is due to-
(1) Plasmodium infection
(2) Increased number of phagocytes
(3) More blood circulation
(4) Disintegration of its cells

Q.18 In man Plasmodium is mainly-
(1) Coelozoic (2) Histozoic
(3) Cytozioc (4) Neutrozoic

Q.19 Quinine can kill Plasmodium in-
(1) Blood (2) Liver
(3) Muscle (4) Heart

Q.20 Fever occurs in which stage-
(1) Rigor (2) Febrile
(3) Defervescent (4) All

Q.21 "Malaria" name is given by-
(1) Macculoch (2) Ronald Ross
(3) Lancisi (4) Laveran

Q.22 Gametocytstes of Plasmodium are found in abundance
(1) Peripheral Blood vssels
(2) Hepatic B.V.
(3) Peptic B.V. (4) Coronary B.V.

Q.23 Adult stage of Plasmodium is found in-
(1) RBC (2) Liver cell
(3) Crop wall (4) Salivary gland

Q.24 One hundred microgametocytes of Plasmodium will produce how many sperms-
(1) 400 (2) 800
(3) 1600 (4) 3200

HYDRA

Q.25 Symbiotic algae in Hydra is-
(1) Extra-cellular (2) Intra-cellular
(3) Inter cellular (4) None of the above

Q.26 The Complete replacement of old cells of Hydra take place in-
(1) 20 days (2) 45 days
(3) 100 days (4) 60 days

Q.27 In Hydra sperms are produced in the month of-
(1) January (2) March
(3) October (4) September

Q.28 Larva of Hydra is-
(1) Hydrula (2) Planula
(3) Bipinnaria (4) Absent

Q.29 Thinest mesoglea is found in-
(1) Tentacles (2) Hypostome
(3) Basal disc (4) All of the above

Q.30 Fastest method of locomotion in Hydra-
(1) Looping (2) Gliding
(3) Walking (4) Somer saulting

Q.31 Dense cytoplasm and large nucleus occurs in which cells of Hydra-
(1) Sensory cells (2) Nerve cells
(3) Interstitial cells (4) Nematoblast

Q.32 In development of Hydra, gastrulation is the result of
(1) Emboly (2) Delamination
(3) Invagination (4) Epiboly

Q.33 Mesoglea composed of-
(1) Chitin
(2) Glycoprotein
(3) Mucopolysaccharides
(4) Albumin

Q.34 Gastrodermis of Hydra is-
(1) Thin
(2) 1/3 part of body wall
(3) 2/3 part of body wall
(4) 3/4 part of body wall

Q.35 Which of the following is more digested in gastro vascular cavity of Hydra-
(1) Proteins (2) Lipids
(3) Carbohydrates (4) All the above

Q.36 Which part of Hydra have maximum number of nematoblasts-
(1) Stalk (2) Hypostome
(3) Tentacles (4) (2) and (3) both

Q.37 Hydra is-
(1) Asymmetrical
(2) Radially symmetrical
(3) Bilaterially symmetrical
(4) Bilateral when young and radial in adults stage

Q.38 Hydra can suddenly contract the body by-
(1) Nutritive muscular cells
(2) Epithelio muscular cells
(3) Glandulo muscular cells
(4) Masoglea

Q.39 Optimum temperature for Hydra is-
(1) 20 - 25° F (2) 20 - 25° C
(3) 10 - 15° C (4) 5 - 10° C

Q.40 Who explained discharge of nematocyst in Hydra-
(1) Jones (2) Tremblay
(3) Linnaeus (4) Leeuwenhoek

Q.41 Which is not found in Hydra-
(1) Ovulation (2) Amphimixis
(3) Cellulation (4) Metabolism

Q.42 How many cells are present in battery of Hydra-
(1) 5 (2) 50-60
(3) 10-12 (4) 100-120

ASCARIS

Q.43 Ascaris is found in-
(1) Muscles (2) Pseudocoel
(3) Coelom (4) Intestine

Q.44 Ascaris is-
(1) Coelozoic Parasite (2) Cytozoic Parasite
(3) Histozoic Parasite (4) 1 and 2 both

Q.45 Which of the following maintains triradiate shape of lumen in pharynx-
(1) Lining of cuticle (2) Radial muscles
(3) Branched gland cell (4) Marginal fibres

Q.46 In Ascaris, number of sensory and motor nerves respectively-
(1) 8, 8 (2) 15, 1
(3) 14, 2 (4) 10, 6

Q.47 On the basis of origin Excretory system of Ascaris-
(1) Intra cellular (2) Inter cellular
(3) Multi cellular (4) Acellular

Q.48 Which is not in migration route of Ascaris-
(1) Hepatic portal vein (2) Hepatic vein
(3) Hepatic artery (4) Pulmonary artery

Q.49 In Ascaris only anterior part of testes is functional in division such gonads are called-
(1) Monorchic (2) Didelphic
(3) Telogonic (4) Hologonic

Q.50 In Ascaris median rachis is found in-
(1) Ovary (2) Oviduct & uterus
(3) Ovary & testes (4) Ovary & oviduct

Q.51 Depressor - ani muscles associated with-
(1) Mouth (2) Uterus
(3) Vagina (4) Anus

Q.52 Infective stage of Ascaris in Man-
(1) Rhabditoid larva (2) Embryonated egg
(3) Unfertilized egg (4) Third stage larva

Q.53 The cuticle in Ascaris is secreted by-
(1) Muscular layer of body wall
(2) Epidermis
(3) Mesoderm (4) None of the above

EARTHWORM

Q.54 Body of nephridia is V-shaped in-
(1) Septal nephridia
(2) Integumentary nephridia
(3) Pharyngeal nephridia
(4) All the above

Q.55 Which of the following is not correctly matcned-
(1) Lumbricus-Europe
(2) Megascolex & Drawida - South India
(3) Pheretima - Shri Lanka, North India
(4) Eutyphaeus - N. America

Q.56 Clitellum of Pheretima is-
(1) Permanent (2) Multilayered
(3) Single layered (4) 1 & 2 both

Q.57 Arrangement of setae in Lumbricus-
(1) Perichaetine (2) Octochaetine
(3) Lumbricine (4) 2 & 3 both

Q.58 Which structure secretes hormone in Earthworm-
(1) Nerve cord (2) Lymph gland
(3) Cerebral ganglia (4) Chloragogen cells

Q.59 The muscles of alimentary canal in Earthworm are-
(1) Striped (2) Unstriped
(3) Both (4) None of these

Q.60 Calciferous glands are present in Earthworm in-
(1) Pharynx & gizzard
(2) Stomach & buccal cavity
(3) Pharynx & stomach
(4) Only in stomach

Q.61 In dry soil, Earthworm dies due to-
(1) Lack of water (2) Lack of food
(3) Asphyxia (4) Toxicity

Q.62 In earthworm skeleton like function is performed by-
(1) Coelomic fluid
(2) Alimentary canal filled with food
(3) Typhlosole (4) Clitellum

Q.63 Appendages in Earthworm are-
(1) Monoramous (2) Biramus
(3) Poly ramus (4) Absent

Q.64 Normal speed of Locomotion in Earthworm is-
(1) 25 meter/sec. (2) 75 cm/min.
(3) 25 cm/min. (4) 25 km/hour

Q.65 One of the following is unpaired in Earthworm-
(1) Male genital pore (2) Female genital pore
(3) Genital papillae (4) Spermathecae

Q.66 Which of the following is incorrectly matched-
(1) Male genital pore - 18th segment
(2) Female genital pore - 14 - segment
(3) Lateral oesophageal hearts - 7 & 9 segments
(4) Seminal vesicles - 11th & 12th segments

Q.67 Which structure is represented typically in almost every body segment-
(1) Septal nephridia (2) Hearts
(3) Genital pores (4) Ganglia

Q.68 Under anaerobic condition pheretima-
(1) Dies
(2) Lives normally
(3) Remains alive for 30 hours
(4) Regeneration

Q.69 If subpharyngeal ganglion is destroyed then pheretima-
(1) Die immediately
(2) Carry on normal life
(3) Stops all types of movements
(4) Uncertain

Q.70 Inner most layer on nerve cord of pheretima is-
(1) Peritonium (2) Perineurium
(3) Epineurium (4) Connective tissue

Q.71 Number of giant fibres on nerve cord of pheretima-
(1) One (2) Two
(3) Three (4) Four

COCKROACH

Q.72 The type of egg in cockroach is called-
(1) Microlecithal (2) Centrolecithal
(3) Isolecithal (4) Telolecithal

Q.73 From egg laying to the development of adult cockroach, the number of moultings are-
(1) 10 - 12 times (2) 9 times
(3) 6 times (4) 3 - 4 times

Q.74 Ootheca is formed in cockroach by-
(1) Phallic gland (2) Conglobate gland
(3) Utricular gland (4) Collaterial gland

Q.75 Common between the trachea of rabbit and cockroach-
(1) Both start in head region
(2) Both are filled with air and fluid
(3) Wall in both is strengthened which does not allow to collapse
(4) None of them

Q.76 What type of vision is found in cockroach-
(1) Mosaic (2) Superposition
(3) Binocular (4) None of them

Q.77 Saliva of cockroach contains enzyme-
(1) Lipase (2) Amylase
(3) Pepsin (4) Trypsin

Q.78 Blood of cockroach does not contain haemoglobin because-
(1) It respires through atmosphere
(2) Respires through book lungs
(3) It does not respire
(4) It has some other means to carry oxygen direct into the tissues

Q.79 Tergum is joined on the sides by-
(1) Pleuron (2) Sternum
(3) Alimentary canal (4) Muscles

Q.80 Wings of cockroah are mainly helpful in-
(1) Egg laying (2) Preying
(3) Finding the male
(4) Protecting against danger

Q.81 Hepatic caecae in cockroach are derived from-
(1) Crop (2) Gizzard
(3) Midgut (4) Hind gut

Q.82 An animal which feeds upon organic matter, dead insects and own cast off cuticle may be called-
(1) Herbivorous (2) Scavanger
(3) Omnivorous (4) Carnivorous

Q.83 Common feature between cockroach and earthworm is-
(1) Hermaphroditism
(2) Moulting of cuticle
(3) Excretion by nephridia
(4) Ventral nerve cord

Q.84 Plantulae are found in cockroach upon-

(1) Tarsus (2) Femur

(3) Trochanter (4) Coxa

Q.85 Most swollen segment in leg in cockroach is-

(1) Tarsus (2) Coxa

(3) Femur (4) Trochanter

Q.86 Unique characteristic of group insecta is-

(1) Jointed appendages

(2) 3-pair of jointed legs

(3) Chitinous exoskeleton

(4) Compound eyes

Q.87 Stomodeal valve in cockroach is found in-

(1) Between gizzard and midgut

(2) Between midgut and hindgut

(3) Gizzard (4) Pharynx

Q.88 The number of teeth in the gizzard of cockroach is-

(1) 6 (2) 8

(3) 7 (4) 12

Q.89 Vestigeal wing is found in-

(1) Male blatta

(2) Female blatta

(3) Male periplaneta

(4) Female periplaneta

Q.90 Which of the parts in cockroach are fundamentaly similar in structure-

(1) Labrum & style

(2) Mandible & antenna

(3) Ist maxilla & labium

(4) Wings & Cerci

Q.91 What would you call cockroaches which can run fast and rarely resort to flight-

(1) Cursorial (2) Diurnal

(3) Nocturnal (4) None of the above

Q.92 Basal part of antenna in periplaneta americana is known as-

(1) Elytra (2) Galea

(3) Scape (4) Stalk

Q.93 How many salivary glands are found in cockroach-

(1) One pair

(2) Two pairs

(3) Three pairs

(4) One pair of bilobed structure

Q.94 The undeveloped simple eyes in cockroach are know as-

(1) Frons (2) Clypeus

(3) Fenestra (4) Genae

EXERCISE - 2

AMOEBA

Q.1 The nucleus of Amoeba proteus contain-
(1) One nucleoli (2) Two nucleoli
(3) Three nucleoli (4) No nucleoli

Q.2 *Entamoeba histolytica* is-
(1) Monogenetic (2) Digenetic
(3) Free living (4) None of the above

Q.3 Crystals of carbonyl diurea are found in.....
(1) Food vacuole (2) Contractile vacuole
(3) Endoplasm (4) Centrosome

Q.4 Which is absent in Amoeba-
(1) Glycogen (2) Centrosome
(3) Ribosome (4) Amino acids

Q.5 In the process of multiple fission how many progenies are formed by one amoeba-
(1) 200 (2) 500
(3) 1000 (4) 20

Q.6 Which of the following form polyenergrid nucleus in amoeba-
(1) Binaryfission (2) Encystement
(3) Sporulation (4) Rejuvenation

Q.7 At which place contractile vacuole burst to release water outside-
(1) Anterior end (2) Posterior end
(3) Cytopyge (4) Place not fixed

Q.8 Which maintains the shape of nucleus in Amoeba-
(1) Nuclear membrane (2) Honey comb lattice
(3) Nucleoplasm (4) Chromidia

Q.9 In amoeba proteus, the nucleus contains extremely minute, chromatin granules. The number of these granules is between-
(1) 100 to 200 (2) 200 to 400
(3) 500 to 600 (4) 600 to 800

Q.10 The gaint amoeba is called-
(1) *Amoeba proteus* (2) *Radiosa*
(3) Pelomyxa (4) Foraminiflera

Q.11 Pyorrhoea is caused by-
(1) *Entamoeba gingivalis*
(2) *Trichomonas buccalis*
(3) *Leishmania donovani*
(4) *Trypanosoma gamibiense*

PLASMODIUM

Q.12 How many species of Plasmodium occur in world-
(1) 5 (2) 4
(3) 60 (4) 8

Q.13 Vaccine is not available for malaria because-
(1) Plasmodium hides in liver
(2) Plasmodium does not produce antibodies
(3) Host's body does not produce antibodies against Plasmodium
(4) Plasmodium kills lymphocytes

Q.14 Sporozoites of Plasmodium if inoculated in a dog then dog-
(1) Becomes carrier
(2) Develops malaria
(3) Remain unaffected
(4) Becomes a reservoir host

Q.15 Which Plasmodium species have longest incubation period-
(1) *Plasmodium vivax*
(2) *Plasmodium falciparum*
(3) *Plasmodium malariae*
(4) *Plasmodium ovale*

Q.16 Difference in micro and macro gametocytes of Plasmodium is due to-
(1) Size
(2) Position of nucleus
(3) Hemozoin granules
(4) All of the above

Q.17 Paired organelle of Plasmodium help in-
(1) Locomotion (2) Nutrition
(3) Penetration (4) Reproduction

Q.18 Which are termed as phanerozoites-
(1) Cryptozoite (2) Metacryptozoite
(3) Schizont (4) Merozoites

Q.19 Exflagellation in Plasmodium concerned with-
(1) Oogenesis (2) Spermatogenesis
(3) Fertilization (4) Locomotion

Q.20 In man, Plasmodium starts its life cycle in liver instead of blood-
(1) For protection from host W.B.C.
(2) For obtaining more food
(3) For increasing number
(4) All the above

Q.21 Relapse of malaria is due to-
(1) Erythrocytic cycle
(2) Pre erythrocytic cycle
(3) Exo erythrocytic cycle
(4) Post erythrocytic cycle

Q.22 In Plasmodium pseudopodia-
(1) Never form
(2) Form only during ingestion
(3) Form only during some stages of life cycle
(4) Only sporozoites have pseudopodia

Q.23 which stage of paroxysm profuse sweating occurs-
(1) Riger stage (2) Febrile stage
(3) Defervescent stage (4) Prepatent period

HYDRA

Q.24 If an animal which is devoid of glutathione is artificially introduced in coelenteron of Hydra then-
(1) Hydra digest it
(2) It is thrown out of mouth immediate
(3) It is expelled out through aboral pore
(4) None is correct

Q.25 Nematoblast cells of Hydra not sensitive for-
(1) Daphnia (2) Kerona
(3) Tricodina (4) Both 2 and 3

Q.26 Testes are formed in Hydra from-
(1) Inter stitial cells
(2) Epithelio - muscular cells
(3) Nerve cells
(4) All the above

Q.27 Contractile Fibrils of myoepithelial cells in Hydra are arranged-
(1) Obliquely on body
(2) Transverse to longitudinal axis of body
(3) Parallel to the longitudinal axis of body
(4) None of these

Q.28 In Hydra digestion in coelenteron is-
(1) Extra cellular (2) Intra cellular
(3) Inter cellular (4) No digestion

Q.29 Musculo-glandular cells are chiefly found on-
(1) Basal disc (2) In the gastrodermis
(3) On the hypostome (4) On the tentacles

Q.30 Hydra is-
(1) Ammonotelic (2) Ureotelic
(3) Urecotelic (4) None of these

Q.31 Which tissues is totally absent in Hydra-
(1) Epithelial tissue (2) Connective tissue
(3) Muscular tissue (4) Nervous tissue

Q.32 Hydra is-
(1) Insectivorous (2) Frungvivorou
(3) Omni vorous (4) Carnivorous

Q.33 Hydra has nervous system which is represented by-
(1) Polarised nerve cells
(2) Nerves
(3) Ganglionated nerve cells
(4) Non-polarised nerve cells

Q.34 Nematocysts are developed from-
(1) Interstitial cells
(2) Epithelio muscular cells
(3) Ectodermal cells (4) Endodermal cells

Q.35 The mesogloea is-
(1) Partly cellular & partly fibrous
(2) Neither cellular nor fibrous
(3) Only fibrous (4) Cellular

Q.36 Larva of Hydra is called-
(1) Planula (2) Amphiblastula
(3) Blastula (4) None

Q.37 Hydra can be called-
(1) Monoecious (2) Marine
(3) Viviparous
(4) Monoecious or dioecious

ASCARIS

Q.38 Intermediate host of Ascaris is-
(1) Culex (2) Anopheles
(3) House fly (4) Absent

Q.39 In Ascaris, the excretory system is-
(1) Z-shaped (2) J-shaped
(3) N-shaped (4) H-shaped

Q.40 Which of the following has no intermediate host-
(1) Plasmodium (2) Fasciola
(3) Ascaris (4) Taenia

Q.41 Pineal setae of Ascaris arise from-
(1) Anus of male
(2) Cloaca of male Ascaris
(3) Vulva of female Ascaris
(4) All

Q.42 Radial symmetry does not occur in-
(1) Star fish (2) Sea anemone
(3) Ascaris (4) Jelly fish

Q.43 Ascaris has a thick cuticle on its body surface, it is an adaptation for-
(1) Growth (2) Parasitism
(3) Reproduction (4) Locomotion

Q.44 Excretory organs of Ascaris are-
(1) Osmoregulatory (2) Renette cell
(3) Excretory canals (4) All

EARTHWORM

Q.45 In Earthworm neurons are-
(1) Motor (2) Sensory
(3) Adjustar (4) All

Q.46 Canals of nephridia is-
(1) Schizogenous (2) Lysigenous
(3) Intra-cellular (4) Inter cellular

Q.47 Valves are absent in lumen of-
(1) Sub-neural vessel
(2) Ventral vessel & Anterior loop
(3) Dorsal blood vessel
(4) 1 & 2 both

Q.48 Porphyrin pigment of skin in pheretima helps in-
(1) Protection from harmful radiations
(2) Camouflage
(3) Sexual attraction (4) 1 & 2 both

Q.49 In Pheretima phaosome is-
(1) Convex (2) Concave
(3) Biconcave (4) L-shaped

Q.50 Number of loops in body of septal nephridia-
(1) 2 - 6 (2) 3 - 7
(3) 9 - 13 (4) 3 - 4

Q.51 Ventral blood vessel does not supply blood to-
(1) Gonads (2) Septal nephridia
(3) Rectum (4) Stomach

Q.52 Ring vessels in Earthworm occur in muscular coat of-
(1) Stomach (2) Intestine
(3) Pharynx (4) Gizzard

Q.53 In Earthworms, the chromophil cells serve to-
(1) Secrete mucus (2) Regulate skin colour
(3) Stored fat (4) Secrete saliva

Q.54 Locomotion in Earthworm is directly facilitated by-
(1) Mucus secreted by epidermis
(2) Segmentation of body
(3) Rhythmic contractions of prostomium
(4) Setae

Q.55 Vessel in which blood from seminal vesicles of Earthworm is collected-
(1) Lateral oesophageal vessel
(2) Subneural vessel
(3) Ventral vessel
(4) Dorsal vessel

Q.56 Cuticle of annelids is-
(1) Non-chitinous (2) Chitinous
(3) Albuminous (4) All the above

Q.57 Spermatheca of earthworm represents-
(1) Organ for coating over sperms
(2) Male copulatory organ
(3) Female copulatory organ
(4) Structure for storing sperms

Q.58 How many accessory glands are present in earthworms-
(1) One pair (2) Two pairs
(3) Four pairs (4) Two only

Q.59 Pharynx of earthworm is divided into-
(1) Dorsal salivary & ventral conducting chambers
(2) Ventral salivary & dorsal conducting chamber
(3) Dorsal & ventral salivary chamber
(4) None of the above

Q.60 Blood glands of earthworm serve for-
(1) Manufacturing blood corpuscles
(2) Synthesis of haemoglobin
(3) Excretion according to some workers
(4) All of the above

Q.61 In cocoon of earthworm embryo developed within-
(1) 3 to 4 weeks (2) 2 to 3 weeks
(3) Six month (4) One year

Q.62 Smallest longitudinal blood vessel in earthworm-
(1) Dorsal blood vessel
(2) Ventral blood vessel
(3) Supra oesophageal
(4) lateral oesophageal

Q.63 Sperms are stored in which part of spermatheca in earthworm-
(1) Diverticulam (2) Ampulla
(3) Both 1 & 2 (4) None of these

Q.64 Nerve ring of pheretima is-
(1) Vertical (2) Transverse
(3) Oblique (4) Horizontal

Q.65 Earthworm is-
(1) Ammonotelic (2) Uricotelic
(3) Ureotelic (4) Aminotelic

Q.66 In pheretima fertilization is-
(1) External & cross type
(2) Internal & self type
(3) Both (1) and (2) (4) Only internal

COCKROACH

Q.67 Most of the digestion in cockroach occurs in-
(1) Pharynx (2) Mid gut
(3) Gizzard (4) Crop

Q.68 Which type of blood cells are present in cockroach-
(1) Amoebocytes (2) Erythrocytes
(3) Haemocytes (4) Leucocytes

Q.69 Testes in cockroach are-
(1) Bilobed
(2) 4 lobed
(3) Small vesicular bodies
(4) Trilobed with numberous follicles

Q.70 The moulting in a nymph of cockroach is stimulated by a hormone secreted by-
(1) Corpora allata (2) Juvenile gland
(3) Nymph gland (4) Prothoracic gland

Q.71 Each tarsus of leg of cockroach consists of the linear series of-
(1) Three segments (2) Five segments
(3) Six segments
(4) Variable number of segments

Q.72 Gonopore in female cockroach is surrounded by-
(1) One pair of gonapophyses
(2) Two pair of gonapophyses
(3) Three pairs of gonapohyses
(4) None of the above

Q.73 In cockroach the eggs are fertilized-
(1) Into a common oviduct
(2) In the genital chamber of female cockroach
(3) Within the ootheca
(4) In the oviducts

Q.74 Cockroach is-
(1) Nocturnal (2) Diurnal
(3) Cursorial (4) 1 and 3 both

Q.75 Ventral nerve cord has how many ganglia in cockroach-
(1) 3 (2) 6
(3) 9 (4) 13

Q.76 Part of alimentary canal where maximum digestion occurs in cockroach is-
(1) Mesenteron (2) Ileum
(3) Colon (4) Crop

Q.77 No. of longitudinal tracheal trunks in cockroach-
(1) 3 (2) 6
(3) 2 (4) 8

Q.78 Cuticle of bodywall in cockroach is permeable for-
(1) Water (2) CO_2
(3) O_2 (4) All the above

Q.79 Male and female cockroach are differentiated by-
(1) Mouth parts (2) Thorax
(3) Legs (4) Abdomen

Q.80 Which part in the respiratory system of cockroach is non cuticularised-

(1) Spiracles (2) Trachea

(3) Tracheole (4) Atrium

Q.81 Ecdysone is secreted by-

(1) Prothoracic gland

(2) Corpora allata

(3) Corpora cardiaca

(4) Cerebral-neuro-secretory

AMOEBA

Q.1 Food reserve in encysted Entamoeba is- **[CPMT 1993]**
(1) Starch (2) Glycogen
(3) Fat (4) None

Q.2 Amoeba secretes digestive enzymes for hydrolysing- **[AFMC 1994]**
(1) Protein (2) Starch
(3) Fat (4) All the above

Q.3 Entamoeba coli causes- **[CBSE 1994]**
(1) Pyorrhoea (2) Diarrhoea
(3) Dysentery (4) None

Q.4 Destruction of nucleus in Amoeba results in- **[RPMT 1995]**
(1) Immediate death
(2) Slowing down of metabolic activity and ultimate death
(3) Quick locomotion (4) No change

Q.5 Amoeba touched with needle will- **[RPMT 1995]**
(1) Die (2) Divided quickly
(3) Develop pseudopodia
(4) Move away

Q.6 Amoeba takes food through- **[RPMT 1995]**
(1) Phagocytosis (2) Pinocytosis
(3) Endocytosis (4) All the above

Q.7 Which is absent in Amoeba- **[RPMT 1995]**
(1) Golgi apparatus (2) Lysosome
(3) Centriole (4) Plasmalemma

Q.8 Amoeba is- **[Orissa JEE 1995]**
(1) Multicellular (2) Cellular
(3) Acellular (4) Subcellular

Q.9 Which one resides in the mouth of human beings- **[MPPMT 1995]**
(1) Entamoeba coli
(2) Entamoeba histolytica
(3) Entamoeba gingivalis
(4) Amoeba proteus

Q.10 In Amoeba, pseudopodia are formed due to- **[RPMT 1995]**
(1) Contact with food
(2) Sol $\rightleftharpoons$ gel change
(3) Movement towards area of higher temperature
(4) All the above

Q.11 Pseudopodia occur in- **[RPMT 1995]**
(1) Sarcodina (2) Sporozoa
(3) Ciliata (4) Mastigophora

Q.12 Nitrogen waste product of Amoeba is- **[CPMT 1993 ; RPMT 1995]**
(1) Ammonia (2) Urea
(3) Uric acid (4) None of the above

Q.13 *Entamoeba histolytica* excretes through- **[MPPMT 1996]**
(1) Food vacuole (2) General surface
(3) Contactile vacuole (4) Malpighian tubules

Q.14 Infection of *Entamoeba histolytica* is prevented by- **[CPMT 1996]**
(1) Avoiding kissing
(2) Avoiding clothes of patient
(3) Uncontaminated food
(4) None of the above

Q.15 Under unfavourable conditions, Amoeba produces a three-layered dissemule. The phenomenon is- **[CPMT 1996]**
(1) Sporulation (2) Encystment
(3) Conjugation (4) Regeneration

Q.16 Amoeba is immortal. It occurs all over the world due to- **[CPMT 1996]**
(1) Binary fission
(2) natural death do not occur
(3) Amoeba is not differentiated into germplasm and somatoplasm
(4) All of these

Q.17 In Amoeba, osmoregulation occurs through- **[BHU 1996]**
(1) Plasmalemma (2) Food vacuole
(3) Lysosome (4) Contractile vacuole

Q.18 Posterior end of Amoeba is characterised by- **[Bih. PMT 1996]**
(1) Plasmid (2) Amphid
(3) Uripygium
(4) Lack of food vacuoles

Q.19 A cyst of *Entamoeba histolytica* produces trophozoites- **[Bih. PMT 1996]**
(1) 1 (2) 2
(3) 4 (4) 18

Q.20 Amoeba sticks to substratum by means of- **[RPMT 1996]**

(1) Rough surface (2) Plasmalemma

(3) Protein (4) None of the above

Q.21 Which one is not a symptom of Entamoeba histolytica infection- **[BHU 1996]**

(1) Relapsing fever (2) Abdomial pain

(3) Blood in stool (4) Irregular bowls

Q.22 Waste material in Amoeba is taken out by - **[RPMT 1998]**

(1) Plasmalemma (2) Cytoplasm

(3) Nephron (4) Vacuole

Q.23 Amoeba is eucaryotic because it possesses- **[APMEE 1999]**

(1) Plasmid (2) Nucleus

(3) Plasmalemma (4) DNA

Q.24 Infective stage of *Entamoeba histolytica* is- **[Pb. PMT 1999]**

(1) Trophozoite (2) Pre-cyst

(3) Uninucleate cyst (4) Tetranucleate cyst

Q.25 Broad description of *Amoeba* given by : **[RPMT 1999]**

(1) Ronald Ross (2) Aristotle

(3) Harshfeild (4) Rosenholf

Q.26 In *Amoeba* binary fission is by :**[RPMT 1999]**

(1) amitosis (2) mitosis

(3) meiosis (4) all of these

Q.27 Funciton of contractile vacuole in *Amoeba* is: **[RPMT 1999]**

(1) osmoregulation (2) nutrition

(3) respiration (4) excretion

Q.28 In *Amoeba* hyaline cap is formed by : **[RPMT 1999]**

(1) around the food vacuole

(2) around the contractile vacuole

(3) around the nucleus

(4) on pseudopodia

Q.29 Formation of pseudopodia due to : **[RPMT 1999]**

(1) chemical changes

(2) viscosity changes

(3) difference in pressure

(4) changing in temperature

Q.30 In Amoeba, contractile vacuole is present- **[CPMT 2000]**

(1) Near trailing end

(2) Near advancing end

(3) At the middle of body

(4) Any where inside body

Q.31 *Entamoeba histolytica* does not form cysts in- **[AMU 2000]**

(1) Liver (2) Ascending colon

(3) Transverse colon (4) Descending colon

Q.32 Which one does not spread disease - **[RPMT 1995 ; Pb. PMT 2000]**

(1) *Entamoeba coli*

(2) *Entamoeba histolytica*

(3) *E. gingivalis*

(4) *Plasmodium ovale*

Q.33 Which one of the following is associated with osmoregulation in *Amoeba* ? **[RPMT 2000]**

(1) Plasma membrane (2) Contractile vaculoe

(3) Mitochondria (4) Endoplasm

Q.34 In *Entamoeba histolytica* cytochromes are found in which one of the following ? **[RPMT 2000]**

(1) Ectoplasm (2) Mitochondria

(3) Endoplasmic reticulum

(4) Endoplasm

Q.35 In case of *Amoeba proteus* which temperature is optimum ? **[RPMT 2000]**

(1) 5^0C to 10^0C (2) 20^0C to 25^0C

(3) 15^0C to 16^0C (4) 30^0C ot 35^0C

Q.36 In *Amoeba* who gave contraction hydraulic theory ? **[RPMT 2000]**

(1) Schultze (2) Claude

(3) Simpson (4) Swan

Q.37 In *Entamoeba histolytica* intestinal ulceration is caused by which one of the following? **[RPMT 2000]**

(1) Metacystic trophozoites

(2) Binucleate stage

(3) Tetranucleate stage

(4) Trophozoites

Q.38 Locomotory structures of Amoeba are- **[BHU 2001]**

(1) Cilia (2) Flagella

(3) Pseudopodia (4) None of these

Q.39 Marine protozoans lack contractile vacuole bacause **[DPMT 2002]**

(1) Their body cannot accomodate it

(2) They are hypoosmotic to their environment

(3) They are isotonic with their environment

(4) Osmoregulation is done by cell membrane

Q.40 In *Amoeba* which controls the cytoplasmic osmality : **[RPMT 2002]**

(1) nucleus (2) ectoplasm

(3) biurets (4) contractile vacoule

Q.41 What happens in anterior part of *Amoeba* at the time of formation of pseudopodia ? **[RPMT 2002]**

(1) plasma gel convert into plasma sol

(2) plasma sol convert into plasma gel

(3) ectoplasm convert into endoplasm

(4) endoplasm convert into ectoplasm

Q.42 In Amoeba, osmoregulation takes place by- **[RPMT 2004]**

(1) Contractile vacuole (2) Ectoplasm

(3) Pseudopodia (4) Hyaloplasm

Q.43 During unfavourable conditions Amoeba reproduces through- **[RPMT 2004]**

(1) Binary fission (2) Sporulation

(3) Multiple fission (4) Conjugation

Q.44 What will happen due to needle piecing in Amoeba- **[RPMT-2005]**

(1) Amoeba will die

(2) Amoeba will produce cyst

(3) Amoeba will runway

(4) Amoeba reproduces

Q.45 If nucleus of Amoeba is destroyed- **[RPMT-2005]**

(1) Sudden death occurs

(2) Decreases in metabolic activities and death

(3) Fast locomotion

(4) No effect

Q.46 In Amoeba cyst formation occurs during- **[RPMT-2005]**

(1) Unfavourable condition

(2) After sexual reproduction

(3) Before sexual reproduction

(4) Favourable condition

Q.47 Which one of the following is a function of pseudopodia of amoeba besides locomotion- **[RPMT-2006]**

(1) Regeneration

(2) Excretion

(3) To obtain various materials

(4) Reproduction

Q.48 Amoeba is- **[RPMT-2006]**

(1) Asymmetrical (2) Biradial

(3) Radial (4) Bilateral

PLASMODIUM

Q.49 The part of life cycle of malarial parasite *Plasmodium vivax*, that is passed female Anopheles is- **[C.B.S.E. 1992]**

(1) Sexual cycle

(2) Pre–erythrocytic schizogony

(3) Exoerythrocytic schizogony

(4) Post–erythrocytic schizogony

Q.50 Schizont stage of Plasmodium occurs in human cells **[C.B.S.E. 1993]**

(1) Erythrocytes (2) Liver cells

(3) Erythrocytes and liver cells

(4) Erythrocytes, liver cells and spleen cells

Q.51 Exflagellation in Plasmodium occurs in- **[C.P.M.T. 1993]**

(1) Merozoites

(2) Megagametocytes

(3) Microgametocytes

(4) Metacryptomerozoites

Q.52 Erythrocytic cycle of Plasmodium occurs in **[C.P.M.T. 1993]**

(1) Liver (2) Spleen

(3) RBC (4) Gut

Q.53 In Plasmodium, gametocytes are formed from **[Bih. P.M.T.1994]**

(1) Schizont (2) Trophozoite

(3) Sporozoite (4) Merozoite

Q.54 The secondary host of Plasmodium is **[M.P.P.M.T. 1994]**

(1) Male Anopheles (2) Female Anopheles

(3) Female Culex (4) Male Culex

Q.55 Common enteritis infection in India occurs by **[M.P.P.M.T. 1994]**

(1) Mosquito bite

(2) Viruses

(3) Ingesting cysts with food and drinks

(4) Eating spice rich food

Q.56 Which one is not a protozoan protist- **[Manipal 1995]**

(1) *Plasmodium vivax*

(2) *Paramecium caudatum*

(3) *Enterobius vermicularis*

(4) *Trypanosoma gambiense*

Q.57 In malaria, which causes chills and fever **[B.H.U. 1995]**

(1) Hematin (2) Haemozoin

(3) Schuffner's granules

(4) Hematocrit

Q.58 Development and functioning of gametocytes of Plasmodium in the body of Mosquito are depend upon- **[R.P.M.T. 1996]**

(1) Temperature (2) Food

(3) Position (4) All the above

Q.59 Who was awarded Noble Prize in 1902 for discovery of oocyst Plasmodium **[R.P.M.T. 1996]**

(1) Golgi (2) Ronald Ross

(3) Laveran (4) Shortt

Q.60 Which one is spindle–shaped mobile with microtubules **[R.P.M.T. 1996]**

(1) Sporont (2) Ookinete

(3) Cryptozoite (4) Sporozoite

Q.61 Which stage of Plasmodium is infective for Mosquito **[R.P.M.T. 1996]**

(1) Trophozoite (2) Gametocyte

(3) Ookinete (4) Sporozoite

Q.62 Trophozoites of Pladmodium occur in **[Bih. P.M.T. 1996]**

(1) Liver cells

(2) Spleen

(3) Lymph channels

(4) Red blood corpuscles

Q.63 Multiple fission in Plasmodium is- **[D.P.M.T. 1996]**

(1) Gamogony (2) Schizogony

(3) Sporulation (4) None of the above

Q.64 Development of gametocytes from merozoite of Plasmodium occurs in- **[D.P.M.T. 1996]**

(1) Red blood corpuscles

(2) Liver cells

(3) Stomach of female Anopheles

(4) All of the above

Q.65 Malarial species found in South America and West Africa is **[B.H.U. 1996]**

(1) *Plasmodium falciparum*

(2) *P. vivax*

(3) *P. malariae* (4) *P. ovale*

Q.66 Recurrence of high temperature in malaria at intervals is due to completion of- **[B.H.U. 1996, A.I.I.M.S. 1996]**

(1) Erythrocytic schizogony

(2) Sporogony

(3) Gamogony

(4) Exoerythrocytic schizogony

Q.67 Symptoms of malaria in spleen and skin are due to **[B.H.U. 1996]**

(1) Schuffner's granules

(2) Hemozoin

(3) Hamaton (4) Blood sugar

Q.68 Sporogony in malarial parasite occurs in- **[B.H.U. 1996, A.P.M.E.E. 1996]**

(1) Human liver

(2) Human red blood cells

(3) Stomach of female Anopheles

(4) Stomach wall of female Anopheles

Q.69 In Plasmodium, diploid stage is **[A.P.M.E.E. 1996]**

(1) Oocyst (2) Gamont

(3) Schizont (4) Sporozoite

Q.70 Exo–erythrocytic cycle is absent in- **[B.H.U.1997]**

(1) *Plasmodium malariae*

(2) *P.ovale*

(3) *P. viivax*

(4) *P. falciparum*

Q.71 High temperature in malaria occurs after completion of- **[C.P.M.T. 1997]**

(1) Erythrocytic cycle

(2) Exo–erythrocytic cycle

(3) Pre–erythrocytic cycle

(4) Gametogony

Q.72 Plasmodium is inoculated in humans by **[M.P.P.M.T. 1997]**

(1) Female Culex (2) Male Culex

(3) Female Anopheles

(4) Male and female Anopheles

Q.73 Secondary host for *Plasmodium vivax* is **[Orissa1997]**

(1) Anopheles female (2) Anopheles male

(3) Culex male (4) Culex female

Q.74 Sporozoites of Plasmodium are formed in **[A.F.M.C. 1997]**

(1) Gametocytes (2) Oocysts

(3) Sporoblasts (4) Trophozoites

Q.75 After how many days could a patient commonly feel malaria from the time of biting of mosquito- **[C.P.M.T. 1998]**

(1) 2–8 days (2) 8 – 10 days

(3) 10–20 days (4) 20–30 days

Q.76 A person suffering from malaria runs fever when **[C.P.M.T. 1998]**

(1) Exoerythrocytic cycle is completed

(2) Signet ring stage is formed

(3) RBCs rupture and a haemozoin granules are released

(4) All of the above

Q.77 Symptoms of paroxysm in malaria are due to **[R.P.M.T. 1998]**

(1) Sporozoite (2) Gametocyte

(3) Pre–erythrocytic cycle

(4) Erythrocytic cycle

Q.78 Relapsing malaria is due to- **[R.P.M.T. 1998]**

(1) *Plasmodium falciparum* and *P. vivax*

(2) *Plasmodium ovale* and *P. vivax*

(3) *Plasmodium falciparum and P. ovale*

(4) *P. falciparum only*

Q.79 Symptom of paroxysm in malaria (infection) are dipicted in stage- **[RPMT 1998]**

(1) Sporozoite (2) Gametocyte

(3) Pre erythrocytic cycle

(4) Erythrocytic cycle

Q.80 Which of the following groups cause relapse malaria- **[RPMT 1998]**

(1) Plasmodium falciparum and Plasmodium vivax

(2) Plasmodium ovale and Plasmodium vivax

(3) Plasmodium falciparum and Plasmodium ovale

(4) Only Plasmodium falciparum

Q.81 Motile elongate zygote of Plasmodium occurs in **[C.P.M.T. 1999]**

(1) Human RBCs (2) Human liver

(3) Salivary glands of mosquito

(4) Gut of mosquito

Q.82 Haemozoin formed in malaria is produced by- **[M.P.P.M.T. 1999]**

(1) Globin part of haemoglobin

(2) Haeme of haemoglobin

(3) Cryptozoites (4) Dead leucocytes

Q.83 Incubation period of Plasmodium vivax is- **[D.P.M.T. 1999]**

(1) 14 days (2) 20 days

(3) 30 days (4) 45 days

Q.84 Which pigment is caus of malaria ? **[RPMT 1999]**

(1) hemocyanine (2) haemoglobin

(3) haemozoine (4) none of these

Q.85 Malignant malaria is cause by :**[RPMT 1999]**

(1) *Plasmodium falciparum*

(2) *Plasmodium ovale*

(3) *Plasmodium vivax*

(4) *Plasmodium malariae*

Q.86 Malarial parasite harmful for liver cells in which cycle ? **[RPMT 1999]**

(1) Erythrocytic cycle

(2) After erythocytic cycle

(3) Before erythrocytic cycle

(4) None of these

Q.87 Malarial parasite is observed by : **[RPMT 1999]**

(1) Sir Ronald Ross (2) Laveran

(3) Patric Mantion (4) Grassi

Q.88 Poisonous substance released on rupturing of schizont in RBCs of malarial patient is- **[B.H.U. 2000]**

(1) Haematin (2) Haemozoin

(3) Haem (4) Haemoglobin

Q.89 Common malaria parasite of India is- **[A.M.U. 2000]**

(1) Placmodium falciparum

(2) P. vivax

(3) P. ovale (4) P. malariae

Q.90 Which one of the following is pernicious quotidian, malignant and tropical malarial parasite? **[RPMT 2000]**

(1) *Plasmodium vivax*

(2) *Plasmodium falciparum*

(3) *Plasmodium mallarie*

(4) *Plasmodium ovale*

Q.91 In *Plasmodium* which one of the following is not distinct ? **[RPMT 2000]**

(1) Mitrochondria (2) Golgi body

(3) Cilia (4) Nucleus

Q.92 Which stage of *Plamodium* contains rhoptries? **[RPMT 2000]**

(1) Sporozoite (2) Merozoite

(3) Signetring stage (4) Ookinete

Q.93 What is the chromosome number of *Plasmodium?* **[RPMT 2000]**

(1) 9 (2) 14

(3) 10 (4) 4

Q.94 In which city Ronald Ross worked for malarial parasite? **[RPMT 2000]**

(1) Delhi (2) Calcutta

(3) Hyderabad (4) Madras

Q.95 Which is wrong combination- **[A.I.I.M.S 2001]**

(1) Haemocyanin-Prawn

(2) Haemoglobin in mammals- RBC

(3) Haemoglobin in plasma-Pheretima

(4) Haemozoin - Plasmodium cytoplasm.

Q.96 Sprinkling oil over ponds would control malaria because- **[A.F.M.C. 2001]**

(1) Fishes die

(2) Water gets oil layer

(3) Larvae are asphyxiated

(4) Mosquitoes are repelled

Q.97 Life cycle of Plasmodium species causing benign tertiary malaria consists of- **[A.M.U. 2001]**

(1) Erythrocytic cycle

(2) Post–erythrocytic cycle

(3) Pre–erythrocytic cycle

(4) All of the above

Q.98 Highest incubation period occurs in Plasmodiumb - **[C.P.M.T.2002]**

(1) *P. malariae* (2) *P. vivax*

(3) *P. ovale* (4) *P. falciparum*

Q.99 Black water fever is caused by- **[C.P.M.T. 2002]**

(1) *Plasmodium malariae*

(2) *P. ovule*

(3) *P. falciparum* (4) *P vivax*

Q.100 Where does exoerythrocytic cycle take place in life cycle of *Plasmodium*? **[RPMT 2002]**

(1) RBC of human (2) Human liver

(3) Stomach of *Anopheles* mosquito

(4) Salivary gland of *Anopheles* mosquito

Q.101 Incubation period of Plasmodium vivax is - **[RPMT 2003]**

(1) 4 days (2) 6 days

(3) 14 days (4) 30 days

Q.102 The infective stage of Plasmodium in humans is- **[RPMT 2004]**

(1) Sporozoite (2) Trophozoite

(3) Gametocyte (4) Merozoite

Q.103 In Plasmodium ookinete is formed by- **[RPMT 2004]**

(1) Trophozoite (2) Zygote

(3) Sporozoite (4) Merozoite

Q.104 In Plasmodium signet ring stage is formed during- **[RPMT 2004]**

(1) Exo-erythrocytic scizogony

(2) Erythrocytic schizogony

(3) Sporogony

(4) Gamogony

Q.105 Who recieved Nobel Prize in 1902 for the discovery of oocyst- **[RPMT-2005]**

(1) Ronald Ross (2) Van Mohl

(3) Petric Mehsin (4) Grassi

Q.106 Which stage of plasmodium produce malaria in human- **[RPMT-2005]**

(1) Sporozoite (2) Trophozoite

(3) Metazoite (4) Cyst

Q.107 Malaria fever is controlled by which of the following drug- **[RPMT-2006]**

(1) Penicillin (2) Quinine

(3) DDT (4) Streptomycin

Q.108 Infective stage of malarial parasite is- **[RPMT-2006]**

(1) Trophozoite (2) Merozoite

(3) Sporozoite (4) Gametozoite

HYDRA

Q.109 Nematocysts take part in – **[MPPMT 1993]**

(1) Locomotion

(2) Offence and defence

(3) Food capture

(4) All of the above

Q.110 A radially symmetrical diploblastic animal is – **[AFMC 1993]**

(1) Roundworm (2) Earthworm

(3) Hydra (4) Liver fluke

Q.111 Budding is a normal mode of a sexual reproduction in- **[CBSE 1993]**

(1) Starfish and Hydra

(2) Hydra and sponges

(3) Tapeworm and Hydra

(4) Sponge and starfish

Q.112 Which one of the following animals possesses nerve cells but no nerves – **[CBSE 1993]**

(1) Hydra (2) Tapewarm

(3) Earthworm (4) Frog's tadpole

Q.113 Common between trichocysts of paramecium and nematocysts of Hydra is– **[CPMT 1994]**

(1) Attachement and defence

(2) Defence only

(3) Sensitivity

(4) Food capturing

Q.114 Nematocysts are activated by- **[Bih. PMT 1994]**

(1) Water (2) Touch

(3) Brain (4) None of these

Q.115 Testes/gonads are formed in Hydra from- **[RPMT 1995, Bihar PMT 1995]**

(1) Interstitial cells

(2) Epithelio–muscular cells

(3) Nerve cells

(4) All of the above

Q.116 Food of Hydra is – **[RPMT 1995]**

(1) Aquatic plants

(2) Aquatic animals

(3) Algae and aquatic animals

(4) Some crustaceans

Q.117 Which pair of cells is present in epidermis of Hydra but not in its endoderm– **[Bih. PMT 1995]**

(1) Stinging cells and interstitial cells

(2) Gland cells and germ cells

(3) Stinging cells and germ cells

(4) Stinging cells and gland cells

Q.118 Hydra is- **[Orissa JEE 1995, RPMT 1995]**

(1) Monoblastic (2) Diploblastic

(3) Triploblastic (4) Tetrablastic

Q.119 Nerve cells are found in – **[RPMT 1995]**

(1) Hydra (2) Sycon

(3) Paramecium (4) Amoeba

Q.120 Cnidaria is characterised by – **[RPMT 1996]**

(1) Pneumatoblasts

(2) Coelenteron

(3) Tissue level of organisation

(4) All of the above

Q.121 Mesogloea of Hydra is made of-**[RPMT 1996]**

(1) Mucopolysaccharides

(2) Protein

(3) Protein and fat

(4) Reticulate tissue

Q.122 Characteristic feature of coelenterata is- **[CPMT 1996]**

(1) All are marine

(2) Presence of tentacles around mouth

(3) Polyp

(4) Gastrovascular cavity

Q.123 Hydra is famous for a type of reproduction – **[CPMT 1996]**

(1) Budding
(2) Gametogenesis
(3) Position of sex organs
(4) Both 2 and 3

Q.124 Hydra cut into two pieces will result in – **[CPMT 1996]**

(1) Growth without mouth and basal disc
(2) Growth of mouth and disc according to their position in the parent
(3) Growth of mouth and disc at any end
(4) No regeneration is possible

Q.125 In Hydra, new nematocysts develop from– **[BHU 1996]**

(1) Cnidocils (2) Glandular cells
(3) Germ cells (4) Interstitial cells

Q.126 If Hydra is broken into pieces- **[RPMT 1995,1996]**

(1) Hydra will die
(2) Every fragment will grow into complete Hydra
(3) Some fragments will form complete Hydra
(4) Hydra will undergo sexual reproduction

Q.127 The largest nematocysts of Hydra are- **[BHU 1997]**

(1) Volvents (2) Penetrants
(3) Atrichous isorhizas
(4) Holotrichous isorhizas

Q.128 Hydra is – **[BHU 1998]**

(1) Fresh water, radial and diploblastic
(2) Fresh water, biradial and triploblastic
(3) Marine, radial and triploblastic
(4) Marine, radial and diploblastic

Q.129 In Hydra, digestion is- **[BHU 1999. CPMT 1999]**

(1) Extracellular
(2) Intracellular
(3) First extracellular and then intracellular
(4) First intracellular and then extracellular

Q.130 A number of buds have developed on Hydra- **[APMEE 1996, Pb. PMT 1999]**

(1) Oldest bud is towards oral region
(2) Oldest bud is towards aboral region
(3) Both 1 and 2 (4) There is no order

Q.131 Poisonous fluid present in nematocysts of Hydra is- **[CPMT 1993, 2001]**

(1) Hypnotoxin (2) Haematin
(3) Haemozoin (4) Agglutinogen

Q.132 Larval stage of *Hydra* is : **[RPMT 1999]**

(1) planula (2) rhabditiform
(3) trochophore (4) none of these

Q.133 In *Hydra*, which substance of nematocyst worked as hipnotizing substance ? **[RPMT 1999]**

(1) Glutatheone (2) Heparin
(3) Histamin (4) Hypnotoxine

Q.134 *Hydra* is : **[RPMT 1999]**

(1) triplobastic, radial symmetrical and acoelomate
(2) triploblastic, radial symmetrical and coelomate
(3) diplobalstic, radial symmetrical and acoelomate
(4) diploblastic, radial symmetrical and coelomate

Q.135 *Hydra* is : **[RPMT 1999]**

(1) herbivorous (2) more developed
(3) carnivorous (4) omnivorous

Q.136 How many ovum are developed in ovary of *Hydra* ? **[RPMT 1999]**

(1) Two (2) Many
(3) One (4) Three

Q.137 Cell–tissue organisation occurs in– **[CBSE 2000]**

(1) Amoeba (2) Hydra
(3) Tapewarm (4) Ascaris

Q.138 Characteristic cells of Hydra are– **[AMU 2000]**

(1) Trichocysts (2) Nematocysts
(3) Cnidoblasts (4) Sporocysts

Q.139 Coelenterates are mostly – **[AMU 2000]**

(1) Asymmetrical
(2) Radially symmetrical
(3) Bilaterally symmetrical
(4) Irregular

Q.140 Hydra is – **[AMU 2000]**

(1) Coral (2) Worm
(3) Polyp (4) Medusa

Q.141 In ectoderm of Hydra, bulk of cells are – **[Pb. PMT 2000]**

(1) Musculo–epithelial (2) Interstitial
(3) Nematoblasts (4) Germ cells

Q.142 Hydra is coelenterate because it possesses- **[Pb. PMT 2000]**

(1) Mesogloea (2) Nematocysts
(3) Body cavity (4) Tentacles

Q.143 Germ cells of Hydra are derived from– **[BHU 2000]**

(1) Ectoderm (2) Endoderm
(3) Mesoderm (4) Mesogloea

Q.144 What is the diameter of stenoteles ? **[RPMT 2000]**

(1) 16 microns (2) 25 microns
(3) 10 microns (4) 5 microns

Q.145 *Hydra* belongs to which of the following? **[RPMT 2000]**

(1) Biradially symmetrical
(2) Radially symmetrical and coelomate
(3) Coelomate and bilaterally symmetrical
(4) Radially symmetrical and acoelomate

Q.146 Recombinant nodules are found during whichof the following ? **[RPMT 2000]**

(1) Prophase (2) Anaphase
(3) Telophase (4) Metaphase

Q.147 Which type of reproduction is found in *Hydra*? **[RPMT 2000]**

(1) Sexual (2) Asexual
(3) Sexual and asexual (4) None of these

Q.148 Which is correct about nematocyst in Hydra– **[A.F.M.C 2001]**

(1) It is re–used
(2) Ejection is conditioned reflex
(3) Ejection occurs in response to contact and pierces the prey
(4) Prevents coming in contact with other Hydra

Q.149 In Hydra, egestion of undigested food and excretion of nitrogenous wastes occur through- **[CBSE 2001]**

(1) Mouth and tentacles
(2) Mouth and body wall
(3) Mouth
(4) Body wall and body cavity

Q.150 Hydra will regenerate from a fragment, if it contains- **[AFMC 2001]**

(1) Tentacles
(2) Epidermis and gastrodermis
(3) Tentacles, epidermis and gastrodermis
(4) Epidermis, hypodermis and gastrodermis

Q.151 Characteristic free swimming larva of coelenterates is- **[CPMT 2000, BHU 2001]**

(1) Onchosphere (2) Rhabditiform
(3) Planula (4) Cysticercus

Q.152 One of the characteristic of *Hydra* is : **[RPMT 2002]**

(1) Predation (2) Metamerism
(3) Hibernation (4) Mimicry

Q.153 If *Hydra* is cut transversly in three equal parts then : **[RPMT 2002]**

(1) all there parts will die
(2) regeneration will occur in all the three parts
(3) regeneration will occur only in anterior
(4) regeneration occurs only in middle part

Q.154 Trichocyst and nematocysts are meant for- **[RPMT 2003]**

(1) Defense (2) Nutrition
(3) Respiration (4) Excretion

Q.155 Digestion and distribution of nutrients both functions are performed by- **[RPMT 2003]**

(1) Blastocoel
(2) Coelom
(3) Spongocoel
(4) Gastrovascular cavity

Q.156 In Hydra reproduction occurs in favourable conditions- **[RPMT 2004]**

(1) By budding (2) By gametes
(3) By gemmules (4) Binary fission

Q.157 Nematoblasts are formed by- **[RPMT 2004]**

(1) Interstitial cells (2) Gland cells
(3) Mesoepithelial cells (4) Nerve cells

Q.158 Hydra is- **[RPMT-2005]**

(1) Omnivorus (2) Carnivorus
(3) Herbivorus (4) Sporophytic

Q.159 Which animal lacks neurons but has nerve cells- **[RPMT-2005]**

(1) Hydra (2) Ascaris
(3) Earthworm (4) Amoeba

Q.160 In Hydra, gastrodermis formed by- **[RPMT-2005]**

(1) Epithaliomuscular cell
(2) Nutritional muscular cell
(3) Muscular sensory cell
(4) Nematoblast

Q.161 What is the function of Nematocyst of Hydra- **[RPMT-2005]**

(1) To catch prey (2) To paralise prey
(3) To intake food (4) To locomotion

Q.162 Hydra belongs to class- **[RPMT-2006]**

(1) Cnidaria (2) Hydrozoa
(3) Schiphozoa (4) Actinozoa

Q.163 Asexual reproduction in hydra- **[RPMT-2006]**

(1) Budding (2) Sporulation
(3) Binary fission (4) Fragmentation

ASCARIS

Q.164 The first and last moults of Ascaris occur in- **[CPMT 1993]**

(1) Heart (2) Kidney
(3) Liver (4) Intestine

Q.165 Which one used in treatment of ascariasis- **[CPMT 1994]**

(1) Chenopodium oil (2) Paludrin
(3) Terramycin (4) None of these

Q.166 Embryonated egg of Ascaris is – **[BHU 1994]**

(1) An egg with gastrula
(2) An egg with blastula
(3) An egg with juvenile
(4) An egg within an egg

Q.167 A thick layer of cuticle on the surface of Ascaris indicates – **[CPMT 1994]**

(1) Reproduction (2) Growth
(3) Parasitism (4) Evolution

Q.168 Pseudocoel occurs in- **[CPMT 1994]**

(1) Hydra (2) Ascaris
(3) Cockroach (4) Earthworm

Q.169 Which one spreads through food contamination- **[APMEE 1995]**

(1) Taenia (2) Schistosoma
(3) Ascaris (4) Fasciola

Q.170 Excretory pores present in Ascaris are– **[RPMT 1995]**

(1) One (2) Two
(3) One pair (4) Two pairs

Q.171 Sensory structures in Ascaris are- **[RPMT 1995]**

(1) Phasmids (2) Amphids
(3) Papillae (4) All of the above

Q.172 The infective stage of Ascaris is- **[CPMT 1994, 96]**

(1) Fertilized egg (2) Embryonated egg
(3) Rhabditoid (4) Larva

Q.173 Ascaris has three lips – **[APMEE 1996]**

(1) One median dorsal and two ventrolateral
(2) All dorsal
(3) Two lateral and one ventral
(4) Two dorso–lateral and one median ventral

Q.174 Life span of Ascaris is – **[RPMT 1996]**

(1) 6–9 months (2) 9–12 months
(3) 4–10 years (4) 10–12 years

Q.175 Which is not true of Ascaris infection- **[RPMT 1996]**

(1) More common in children
(2) Does not produce tonsilitis
(3) Number can be 500-5000
(4) Infection is cured even without medication

Q.176 Which larval stage of Ascaris is infective– **[RPMT 1996]**

(1) First (2) Third
(3) Second (4) Third and fourth

Q.177 Find out the correct sequence in body wall of Ascaris- **[RPMT 1998]**

(1) Cuticle, epidermis, longitudinal muscles and circular muscles
(2) Cuticle, epidermis and longitudinal muscles
(3) Epidermis, cuticle, longitudinal muscles and circular muscles
(4) Epidermis, longitudinal muscles, cuticle and circular muscles

Q.178 Number of juvenile stages found during development of Ascaris is – **[RPMT 1998]**

(1) 1 (2) 2
(3) 3 (4) 4

Q.179 Sexual dimorphism occurs in– **[CPMT 1998]**

(1) Ascaris (2) Amoeba
(3) Pheretima (4) All of the above

Q.180 Metazoan parasite which is transmitted through contaminated food is – **[DPMT 1999]**

(1) Filarial Worm (2) Guinea Worm
(3) Entamoeba (4) Ascaris

Q.181 Sensory structures/cheomoreceptors located in the anterior part of Ascaris are- **[APMT 1999]**

(1) Amphids (2) Copulatory bursa
(3) Pineal setae (4) Pineal spicules

Q.182 Respiration of *Ascaris* is : **[CPMT 1999]**
(1) aerobic respiration
(2) anaerobic respiration
(3) both '1' and '2'
(4) none of these

Q.183 Infective stage of *Ascaris* is : **[CPMT 1999]**
(1) embryonated eggs (2) sporozoite
(3) cysticercus larva (4) rhabditiform larva

Q.184 *Ascaris* is completed its life cycle : **[CPMT 1999]**
(1) only in Human (2) Human and Sheep
(3) Human and Mosquito
(4) Human and Cow

Q.185 Female reproductive organ of *Ascaris* are : **[CPMT 1999]**
(1) protandrous (2) polydelphic
(3) didelphic (4) monodelphic

Q.186 Penial setae are present in male *Ascaris*: **[CPMT 1999]**
(1) in cloaca (2) in rectum
(3) anus (4) mouth

Q.187 Size of female Ascaris lumbricoides is- **[RPMT 2000]**
(1) 50–80 mm (2) 100–150 mm
(3) 150–250 mm (4) 200–350 mm

Q.188 Ascaris lumbricoides is – **[AMU 2000]**
(1) Hermaphrodite (2) Sexually dimorphic
(3) Polymorphic
(4) Sexually undifferentiated

Q.189 Intermediate host of Ascaris lumbricoides – **[AMU 2000]**
(1) Mosquito (2) Pig
(3) Snail (4) None of the above

Q.190 Body cavity of Ascaris is– **[CPMT 2000]**
(1) Acoelom (2) Pseudocoelom
(3) Schizocoelom (4) Enterocoelom

Q.191 Infective stage of Ascaris is – **[Karnataka 2000]**
(1) Adult worm (2) Second juvenile
(3) Fourth juvenile (4) Egg

Q.192 Excretory system of *Ascaris* is made up of : **[CPMT 2000]**
(1) single cell (2) many cells
(3) four cells (4) two cells

Q.193 What is the length of male *Ascaris lumbricoides*? **[CPMT 2000]**
(1) 50-60 mm (2) 100-200 mm
(3) 150-310 mm (4) 160-315 mm

Q.194 Muscle cells of *Ascaris* are arranged in: **[CPMT 2000]**
(1) coelomyarian (2) platymyarian
(3) polymyarian (4) holomyarian

Q.195 What is the length of female *Ascaris lumbricoides* ? **[CPMT 2000]**
(1) 200-350 mm (2) 150-320 mm
(3) 100-150 mm (4) 50-80 mm

Q.196 Larvae of Ascaris hatch out in –**[CPMT 2001]**
(1) Soil (2) Intestine
(3) Liver (4) Lungs

Q.197 The animal in which sexes can be differentiated from external morphology is- **[Manipal 2001]**
(1) Taenia (2) Krait
(3) Ascaris (4) Sea Anemone

Q.198 Which of the two characters are typical of *Ascaris* ? **[CPMT 2002]**
(1) Sexual dimorphism and rhabditiform larva
(2) Hermaphroditism and pseudocoelomic
(3) Parasitism and metamerism
(4) Multilocular heart

Q.199 The body cavity of *Ascaris* is :**[CPMT 2002]**
(1) lined by mesoderm
(2) not lined by mesoderm
(3) formed by ectoderm
(4) filled with parenchyma

Q.200 Pseudocoel is present in- **[RPMT 2004]**
(1) Periplaneta (2) Ascaris
(3) Pheretima (4) Hydra

Q.201 Ascaris is found in- **[RPMT 2004]**
(1) Body cavity (2) Lymph nodes
(3) Tissue (4) Alimentary canal

Q.202 Ascaris is- **[RPMT 2004]**
(1) A parasite (2) A autotroph
(3) Facultative autotrophs
(4) Facultative heterotroph

Q.203 The male ascaris is differentiated from female ascaris in which character- **[RPMT 2005]**
(1) It is long
(2) Penial setae with curved tail
(3) Penial setae in long tail
(4) Curved tail without penial setae

Q.204 In ascaris, cuticle is derived from- **[RPMT 2005]**

(1) Epidermis
(2) Muscles of endodermis
(3) Syncitium (4) Mesoglea

Q.205 Ascaris in man is found in- **[RPMT 2006]**

(1) Stomach (2) Intestine
(3) Urinarybladder (4) Rectum

EARTHWORM

Q.206 What is common between earthworm, leech and centipede- **(CBSE 1993)**

(1) Absence of legs
(2) Presence of ventral nerve cord
(3) Presence of malpighian tubules
(4) They are hermaphrodite

Q.207 Photoreceptor in pheretima are-**(CPMT 1993)**

(1) On ventral side of skin
(2) On dorsal side of skin
(3) On both
(4) In clitellum

Q.208 Trait common amongst Earthworm, Leech and Centipede is- **(PCS 1993)**

(1) Absence of legs
(2) hermaphrodite nature
(3) Ventral nerve cord
(4) Malpighian tubules

Q.209 In Earthworm, testes occur in segments- **(CPMT 1994)**

(1) 12 and 13 (2) 10 and 11
(3) 14 and 15 (4) 17 and 18

Q.210 In Earthworm, arrangement of blood vessels is- **(BHU 1994)**

(1) Different in last fifteen segments
(2) Different in first thirteen segments
(3) Same throughout
(4) Different in middle thirteen segments

Q.211 In a copulatory pair of earthworms, there occur- **(BHU 1994)**

(1) Reciprocal fertilization and internal fertilization
(2) Cross fertilization and external fertilization
(3) External fertilization and internal fertilization
(4) Cross fertilization and reciprocal fertilization

Q.212 Excretory organs of Earthworm are- **(RPMT 1995)**

(1) Coelom (2) Flame cells
(3) Nephridia (4) Gizzard

Q.213 In Earthworm, setae are absent from- **(RPMT 1995)**

(1) Clitellum
(2) First segment
(3) Clitellum and last segment
(4) Clitellum, first and last segment

Q.214 Excretory organ of Earthworm are- **(Manipal 1995)**

(1) Nephridia (2) Solenocytes
(3) Green glands (4) Kidneys

Q.215 Just as there are nephridia in earthworm so are- **(CBSE 1996)**

(1) Myotomes in fish (2) Statocyst in prawn
(3) Parotid gland in toad
(4) Flame cells in liver fluke

Q.216 Spermathecal pores in Pheretima are present in segments- **(CPMT 1996)**

(1) 1/2, 2/3, 3/4, 4/5
(2) 6/7, 7/8, 8/9, 9/10
(3) 5/6, 6/7, 7/8, 8/9
(4) 14/15, 15/16, 16/17, 17/18

Q.217 Life span of Earthworm are is-**(RPMT 1996)**

(1) 1-3 years (2) 2-8 years
(3) 3.5-10.5 years (4) 6-8 years

Q.218 Copulation period of Earthworm is- **(RPMT 1996)**

(1) One hour (2) Two hours
(3) Four hours (4) About one week

Q.219 Dorsal vessel of Earthworm is- **(APMEE 1996)**

(1) Distributing (2) Collecting
(3) Collecting in first thirteen segments and distributing in the rest
(4) Distribution in first thirteen segments and collecting in the rest

Q.220 Spermathecal pores of pheretima are present in- **(CPMT 1996)**

(1) 5/6, 6/7, 7/8 and 8/9
(2) 6/7, 7/8, 8/9 and 9/10
(3) 1/2, 2/3, 3/4 and 4/5
(4) 14/15, 15/16, 16/17 and 17/18

Q.221 Typholosole found in Pheretima occurs in- **(CPMT 1996)**

(1) Oesophagus (2) Stomach

(3) Gizzard (4) Intestine

Q.222 Chromophil cells present in pharynx of Earthworm take part in secretion of- **(RPMT 1996)**

(1) Mucus (2) Lipases

(3) Carbohydrases (4) All the above

Q.223 Who wrote the memoir on pheretima and described its anatomy- **(BHU 1997)**

(1) M.L. Bhatia (2) B.I. Sunderraj

(3) K.N. Bahl (4) Beni Prasad

Q.224 Chloragogen cells in pheretima are specialised for- **(CPMT 1998)**

(1) Nutrition (2) Excretion

(3) Reproductive (4) Respiration

Q.225 Spermatheceae of Earthworm take part in- **(RPMT 1998)**

(1) Collection of sperms of other worm

(2) Collection of sperms of the same worm

(3) Sperm maturation

(4) Fertilization

Q.226 Nephrostome occurs in- **(RPMT 1998)**

(1) Septal nephridia

(2) Integumentary nephridia

(3) Pharyngeal and septal nephridia

(4) Pharyngeal and integumentary nephridia

Q.227 Haemoglobin is dissolved in blood plasma of- **(CPMT 1998)**

(1) Rabbit (2) Cockroach

(3) Earthworm (4) Frog

Q.228 Role of typhlosole of earthworm is to- **(BHU 1997; CPMT 1998)**

(1) Emulsify

(2) Control blood flow

(3) Increase absorption area of digested food

(4) Produce digestive enzymes

Q.229 Function of spermatheca in Earthworm is - **[RPMT - 1998]**

(1) Sperm maturation

(2) Collection of sperms of same animal

(3) Collection of sperms of other animal

(4) Fertilization

Q.230 Nephrostome is a component of - **[RPMT - 1998]**

(1) septal nephridia

(2) integumentary nephridia

(3) pharyngeal and septal nephridia

(4) pharyngeal and integumentary nephridia

Q.231 Which one exhibits concentric tube-within tube plan- **(Manipal 1999)**

(1) Arthropoda

(2) Oligochaeta/Earthworm

(3) Mollusca

(4) Echinodermata

Q.232 Closed circulatory system occurs in- **(Manipal 1999)**

(1) Earthworm (2) Cockroach

(3) Grasshopper (4) Housefly

Q.233 Which one is not deuterostome-

(1) Chordata (2) Cephalochrodata

(3) Annelida (4) Echinodermata

Q.234 In earthworm mouth is situated on- **(APMEE 1999)**

(1) Protomium (2) Peristomium

(3) Stomium (4) Protostomium

Q.235 Annelida is advanced over nematoda in having- **(DPMT 1999)**

(1) Closed circulation

(2) Metameric segmentation

(3) True coelom (4) All the above

Q.236 Haemoglobin in Earthworm is present in : **[RPMT 1999]**

(1) RBC (2) protoplasm

(3) coelomic fluid (4) plasma

Q.237 Fertilization in Earthworm is : **[RPMT 1999]**

(1) cross fertilization

(2) combined fertilizaion

(3) self-fertilization (4) all of these

Q.238 Segments of Earthworm are called : **[RPMT - 1999]**

(1) metamere (2) sarcomere

(3) prostomium (4) podomeres

Q.239 Which parasite is present in seminal vessicle of Earthworm ? **[RPMT - 1999]**

(1) *Monocystis* (2) *Nosema*

(3) *Sasrcocystis* (4) *Nictotherus*

Q.240 In Earthworm dorsal blood vessel is collecting channel- **(AMU 2000)**

(1) Behind 13th segment

(2) Anterior 13 segment

(3) Throughout

(4) In typhlosolar region

Q.241 In Pheretima, septa are absent-**(CPMT 2000)**

(1) 5/6, 10/11 (2) 5/6, 7/8

(3) 6/7, 7/8 (4) First four segments

Q.242 Blood vessel in Pheretima having valves is- **(AIIMS 2000)**

(1) Dorsal (2) Ventral

(3) Lateral (4) Integumentary

Q.243 Male genital apertures of earthworm are located in the segments- **(CBSE 2000)**

(1) 14 (2) 18

(3) 13 (4) 19

Q.244 Chloragogen cells of Earthworm are similar to an organ of vertebrates- **(Har. PMT 2000)**

(1) Liver (2) Lung

(3) Kidney (4) Spleen

Q.245 In *Pheretima* blood glands are found in which of the following segments ? **[RPMT - 2000]**

(1) 1, 2, 3 (2) 7, 8, 9

(3) 4, 5, 6 (4) 10, 11, 12

Q.246 How many lateral hearts are in *Pheretima* ? **[RPMT - 2000]**

(1) 12 (2) 16

(3) 8 (4) 4

Q.247 In pheretima lymph gland produces : **[RPMT - 2000]**

(1) lymphocyte cells (2) phagocyte cells

(3) oxynitic cells (4) amoebocyte cells

Q.248 In *Pheretima* mouth develpos form which of the following ? **[RPMT - 2000]**

(1) Ectoderm (2) Mesoderm

(3) Blastopore (4) Endoderm

Q.249 In *Pheretima* which nephridia is present ? **[RPMT - 2000]**

(1) Protonephridia

(2) Coelom duct

(3) Micro-metanephridia

(4) Solenocytes

Q.250 The animal which respires without respiratory organs is- **(CPMT 2000)**

(1) Frog (2) Fish

(3) Earthworm (4) Cockroach

Q.251 Septum is lacking in Pheretima in segments- **(CPMT 2001)**

(1) 7/8, 6/7 (2) 3/4, 9/10

(3) 4/5, 8/9 (4) 6/7, 8/9

Q.252 Neurons of Pheretima are- **(CPMT 2001)**

(1) Only motor (2) Only adjustor

(3) Only Sensory (4) All

Q.253 Blood vessel in earthworm are- **(AFMC 2002)**

(1) Different in last 15 segments

(2) Different in first 13 segments

(3) Same through out

(4) Different in middle segments

Q.254 Which one is not true about earthworm- **(CPMT 2002)**

(1) It can live in deficiency of O_2 for 3-10 hours

(2) It has life span of 3½ to 10 years

(3) Pineal setae are dissolved in KOH

(4) It is soilivorous

Q.255 Enteronephric nephridia of earthworm also performs function of- **(CBSE 2002)**

(1) Respiration (2) Excretion

(3) Osmoregulation (4) Thermoregulation

Q.256 In *Pheretima*, locomotion occurs with the help of : **[RPMT - 2002]**

(1) circular muscles

(2) longitudinal muscles and setae

(3) circular, longitudinal muscles and setae

(4) parapodia

Q.257 The functiion of clitellum in *Pheretima* is : **[RPMT - 2002]**

(1) formation of cocoon

(2) secretion of hormone

(3) nutrition of sperm (4) respiration

Q.258 Metameric segmentation is the main feature of- **[RPMT - 2004]**

(1) Annelida (2) Echinodermata

(3) Arthropoda (4) Coelenterata

Q.259 Earthworm takes food by which method- **[RPMT-2005]**

(1) Ciliary feeding (2) Detritus feeding

(3) Liquid feeding (4) None of these

Q.260 Nerves in earthworm are- **[RPMT-2005]**
(1) Motor (2) Sensory
(3) Adjuctor (4) All

Q.261 The brown colour of Earthworm is due to- **[RPMT-2005]**
(1) Melanin (2) Haemoglobin
(3) Porphyrin (4) 1 & 3 both

Q.262 In earthworm gizzard is found in which segment- **[RPMT-2006]**
(1) 7 (2) 8
(3) 9 (4) 10

Q.263 Cocoon is formed in earthworns in- **[RPMT-2006]**
(1) Chitinous setae (2) Cutitcle
(3) Clitellum (4) Epidermal muscles

COCKROACH

Q.264 The principal function of blood vascular system in cockroach is - **(CPMT-1993)**
(1) Distribution of absorb nutrients
(2) Distribution of oxygen
(3) Transportation of enzymes
(4) Transportation of heat

Q.265 Function of stomodael valve in the gut of cockroach is to prevent the entry of food from- **(CPMT-1993)**
(1) Gizzard into midgut (2) Preoral cavity
(3) Hindgut to midgut (4) Midgut into gizzard

Q.266 One common feature of tracheae of cockroach and rabbit is that both- **(CBSE-1993)**
(1) Have ciliated inner lining
(2) Are paired and branched
(3) Have cartilagenous ring
(4) Have non collapsible wall

Q.267 The total no of ganglia present on the nerve cord of cockroach is - **(AFMC-1993)**
(1) 6 (2) 9
(3) 10 (4) 12

Q.268 A - Periplaneta americana is nocturanal omnivorous, house hold pest- **(CBSE-1993)**
R - It is because it act as scavenger
(1) A is true but R is false
(2) A is false but R is true
(3) A and R is true and R is the right explanation of A
(4) A and R is true but R is not correct explanation of A

Q.269 Basic difference between periplaneta americana and Blatta orintalis is in - **(CPMT-1994)**
(1) Body size (2) wings length
(3) length of antenna (4) life history

Q.270 Alary muscles in cockroach occur in- **(CPMT-1994)**
(1) Heart wall and help in blood circulation
(2) Dogsal septum and connect the septum with heart and tergite
(3) wall of gizzard and help in its contraction
(4) intestinal wall and help in digestion

Q.271 Insects excrete nitrogen as- **(CMEET-1994)**
(1) Uric acid (2) Guanine
(3) Urea (4) Ammonia

Q.272 Two common Indian cockroaches are - **(CPMT-1994)**
(1) Periplaneta american and Blatta indica
(2) Periplaneta orientalis and Blatta americana
(3) Periplaneta americana and Blatta orientalls
(4) Periplaneta indica and Blatta orientalis

Q.273 Number 16 in cockroach is concerned with - **(CPMT-1995)**
(1) Body segments (2) malpighian tubule
(3) tracheae (4) ootheca

Q.274 Which part of cockroach has both exoskeleton and endoskeleton - **(RPMT-1995)**
(1) Head (2) Thorax
(3) Both of these (4) None of these

Q.275 Male and female cockroaches can be distingushed externally through - **(RPMT-1995)**
(1) Anal styles in male
(2) Anal cerci in female
(3) Anal style and antennae in female
(4) both (2) and (3)

Q.276 The component units of compound eye of cockroach are called -**(KME Manipal-1995)**
(1) Eyelets (2) Fenestra
(3) Ommatidia (4) Ocelli

Q.277 Metamorphosis in the life history of periplaneta is- **(RPMT-1995)**
(1) Absent (2) Incomplate
(3) Complete (4) Pupa

Q.278 Young cockroach is called - **(RPMT-1995)**
(1) Maggot (2) Ephyra
(3) Nymph (4) Pupa

Q.279 The first animals to fly were - **(RPMT-1995)**
(1) Mammals (2) Lizards
(3) Birds (4) Insect

Q.280 Periplaneta americana differs from blatta orientalis in having - **(CPMT-1996)**
(1) no wings
(2) only first pair of wings
(3) well developed wings
(4) only second pair of wings

Q.281 Diagnostic feature of insects in **(PCS-1996)**
(1) Three pairs of legs (2) Compound eye
(3) Chitinous body (4) Two pairs of wings

Q.282 The pincer like structures present on the stipes of maxilla of cockroach are -**(EAMCET-1996)**
(1) Cardo (2) lacinia
(3) galea (4) paraglossa

Q.283 The longest segment in the leg of cockroach is- **(CMEET-1996)**
(1) Coxa (2) femur
(3) tibia (4) trochenter

Q.284 The respiratory system of cockroach consist of- **(CMEET-1996)**
(1) Bronchus (2) Trachea
(3) Bronchiole (4) Capillary

Q.285 Reduced (vestigial) wings are found in - **(CPMT-1997)**
(1) Periplaneta (2) mosquitoes
(3) female blatta (4) male blatta

Q.286 In arthropoda, the body cavity is called- **(AFMC-1997)**
(1) Interon (2) Pseudocoel
(3) Haemocoel (4) Coelom

Q.287 13 chambered tubular heart is present in- **(AFMC-1997)**
(1) Cockroach (2) Earthworm
(3) Frog (4) Rabbit

Q.288 Open blood vascular system without haemoglobin or any other respiratory pigment is found in- **(CBSE-1998)**
(1) cockroach (2) earthworm
(3) Hydra (4) Nereis

Q.289 Malpighian tubules remove excretory products from- **(CPMT-1998)**
(1) alimentary canal only
(2) haemolymph only
(3) both (4) none

Q.290 Superposition image forms in cockroach during- **(CPMT-1998)**
(1) dim light (2) dark light
(3) bright light (4) none of these

Q.291 Collaterial gland is found in - **(CPMT-1998)**
(1) male cockroach (2) female cockroach
(3) none (4) both

Q.292 How many segments are present in cockroach's head - **(RPMT-1998)**
(1) 6 (2) 5
(3) 9 (4) 10

Q.293 Haemocoel is found in - **(RPMT-1998)**
(1) Hydra and Aurelia
(2) Taenia and Ascaris
(3) Cockroach and pila
(4) Herdmania and Balano glosses

Q.294 If corpora allata are removed from Ist instar of a nymph then - **(RPMT-1998)**
(1) It will remain nymph forever
(2) It will enter into secondary stage of juvenile
(3) It will become adult immediately
(4) None

Q.295 An insect which undergoes complete metamorphosis is called - **(RPMT-1998)**
(1) Ametabola (2) Hemimetabola
(3) Holometabola (4) None of these

Q.296 Pericardial space in cockroach is regularly altered by muscles - **(CPMT-1998)**
(1) Ciliary (2) Alary
(3) Circular (4) Longitudinal

Q.297 Antennae of Cockroach function as **(RPMT-1998)**
(1) tactile and sensory receptor
(2) gustatory receptor
(3) auditory receptor (4) olfactory receptor

Q.298 Male Cockroach can be identified by - **(RPMT-1998)**
(1) anal style (2) anal cerci
(3) antennae (4) wings

Q.299 Function of ecdysone hormone in insect is - **(RPMT-1998)**
(1) the growth and development of larva
(2) the maturation into adult and laying eggs
(3) to carry moulting in larval stage to form pupa
(4) the secretion of cuticle in adult

Q.300 Which of the spiracles in Cockroach are larger keep open always - **(RPMT-1998)**
(1) First and second pair
(2) First and third pair
(3) First and tenth pair
(4) Second and third pair

Q.301 Oxygen carrying respiratory pigment of cockroach and other insect is- **(CBSE-1999)**
(1) Haemoglobin (2) Haemocynin
(3) Haemoerythrin (4) none

Q.302 Body of an insect is divisible into - **(CBSE-1999)**
(1) Head, thorax and abdomen
(2) Head, trunk and abdomen
(3) Cephalo thorax, head and abdomen
(4) Trunk, thorax and abdomen

Q.303 What is similarity between fly, mosquitoes and cockroach - **(BHU-1999)**
(1) 13 chambered heart
(2) 3 pairs of legs
(3) open excretory system
(4) house fly

Q.304 Respiration pigment of blood Cockrocach is : **(RPMT-1999)**
(1) haemozoine (2) haemocyanin
(3) haemoglobin (4) absent

Q.305 Changing of a small Cockroach into adults is know as : **(RPMT-1999)**
(1) moulting (2) metamorphosis
(3) ecdysis (4) transformation

Q.306 Cockrocach is an animal of which class ? **(RPMT-1999)**
(1) Hexapoda (2) Apoda
(3) Meriopoda (4) Cephalopoda

Q.307 Which type of image is found in eye of Cockroach ? **(RPMT-1999)**
(1) Mosaic (2) Superposition
(3) Overlappring (4) None of these

Q.308 Mandibles are present in the mouth parts of - **(BHU-2000)**
(1) locust (2) cockroach
(3) bedbug (4) housefly

Q.309 The palpiger of cockroach bears - **(EAMEET-2000)**
(1) lingula (2) submentum
(3) labrum (4) labial palp

Q.310 Hormone prouduced by corpora allata in insects is - **(HPMT-2000)**
(1) growth hormone (2) juvenile hormone
(3) inhibiting hormone (4) moulting hormone

Q.311 Ecdysone is produced by - **(PCS-2000)**
(1) prothoracic gland (2) corpora cardiaca
(3) corpore allata (4) abdominal gland

Q.312 The number of eggs in ootheca of Cockroach is : **(RPMT-2000)**
(1) 8 (2) 16
(3) 32 (4) 64

Q.313 Which one of the following mouth parts are found in Cockroach ? **(RPMT-2000)**
(1) Cutting and chewing
(2) Piercing
(3) Sucking
(4) Drilling

Q.314 In *Periplaneta* the cuticular lipid is secreted by: **(RPMT-2000)**
(1) hypodermal cells (2) oenocyte cell
(3) dermal gland cells (4) basal cell

Q.315 How many Malpighian tubules in Cockroach are present ? **(RPMT-2000)**
(1) 80-90 (2) 100-150
(3) 50-60 (4) 200-250

Q.316 Mouth parts of cockroach is **(CPMT-2001)**
(1) Piercing and sucking type
(2) Biting and sucking type
(3) Biting and chewing type
(4) sponging type

Q.317 Basic unit of compound eyes of Cockroach is: **(RPMT-2001)**
(1) ocselli (2) ommatidia
(3) ratinule (4) crystalline cone

Q.318 In Cockroach vision is due to :**(RPMT-2002)**
(1) one compound eye
(2) only two compound eyes
(3) two simple eyes
(4) two compound and two simple eyes

Q.319 Haemocoel is present in- **(RPMT-2004)**
(1) Pheretima (2) Periplaneta
(3) Sponge (4) Ascaris

Q.320 Chitinous exoskeleton found in-**(RPMT-2004)**
(1) Periplaneta (2) Ascaris
(3) Pheretima (4) Hydra

Q.321 Which type of hearts are found in Cockroach- **[RPMT-2005]**

(1) Neurogenic (2) Myogenic
(3) Neuromyogenic (4) None

Q.322 The enormous amount in saliva of cockroach- **[RPMT-2005]**

(1) Amylase (2) Protease
(3) Lipase (4) None

Q.323 Anterior wings of cockroach is called as- **[RPMT-2006]**

(1) Alitra (2) Pedpalps
(3) Antenna (4) Chelicera

Q.324 In cockroach number of segaments in muscle abdomen are- **[RPMT-2006]**

(1) 10 (2) 12
(3) 14 (4) 16

Q.325 Which one of the following organisms is scientifically correctly named, correctly printed according to the International Rules of Nomenclature and correctly described ? **[AIPMT Mains 2012]**

(1) *Musca domestica* - The common house lizard, a reptile
(2) *Plasmodium falciparum* - A protozoan pathogen causing the most serious type of malaria.
(3) *Felis tigris* - The Indian tiger, well protected in Gir forests.
(4) *E. coli* - Full name *Entamoeba coli*, a commonly occurring bacterium in human intestine

These questions consist of two statements each, printed as Assertion and Reason. While answering to choose any one of the following four responses.

(1) If both Assertion & Reason are True & the reason is correct explanation of the Assertion.

(2) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.

(3) If Assertion is True but the Reason is False.

(4) If both Assertion & Reason are false.

Q.1 **A :** Zoochlorella alge prsence in Hydra.
R : Hydra is not benefited but algae obtains CO_2.

Q.2 **A :** Tester are more on the oral half and ovary is one on the oboral half of Hydra.
R : More number of sperms Increase the chances of Fertilization.

Q.3 **A :** Stero - gastrula presence in Hydra.
R : Gastrula in Hydra is formed by Delamination

Q.4 **A :** Nematablast cells are presence in Hydra.
R : Maximum Nematablast are found in Basal disc.

Q.5 **A :** Presence of polyp and medusa is a salient feature of class Hydrozoa
R : Hydra has more dveloped poly and less developed medusa.

Q.6 **A :** Symboitic algae is transmitted from generation to generation in Hydra.
R : Transmitted the algae by both bud and ovum.

Q.7 **A :** Nematoblast is used once only in Hydra.
R : They are special modification of the interstitial cells.

Q.8 **A :** Hydra do not exhibit any response to the water Temperature.
R : It is negative to cathode and positive to anode when mild current is passed.

Q.9 **A :** Cross fertilization is presence in Hydra.
R : Protandrous candition is presence in Hydra.

Q.10 **A :** Hydra is unable to digest starch.
R : Amylash enzyme is absence in Hydra.

Q.11 **A :** The head of cockroach is hypognathus.
R : Proximal part of lower lip of cockroach is called pastmentum.

Q.12 **A :** The heart of cockroach is neurogenic.
R : He heart beats in cockroach are 49 perminute.

Q.13 **A :** Albectoreceptors are found on the antennae.
R : Phonoreceptors are found on the joints of legs.

Q.14 **A :** Corpora allata glands secrete maulting harmone.
R : Carpora cardiaca secrets juvenile harmone.

Q.15 **A :** Earthworm is brown or clay coloured.
R : Because of presence of pigment parphyrin.

Q.16 **A :** Chlorogogen cells are considered, analogous to liver of vertebrates.
R : Because it is concerned with storage of reserve food, deamination of protiens, formation of urea etc.

Q.17 **A :** Earthworm is saprozoic.
R : Because it feed on small insect.

Q.18 **A :** Earthworm is hermophrodite.
R : Because in earthworm both sexes are separate.

Q.19 **A :** Earthworms are enemy of farmer.
R : Because they destroy the crop in field.

Q.20 **A :** In body of earthworm porphyrin pigment is found.
R : Because it protect earthworm from chemicals.

Q.21 **A :** In earthworm development is direct.
R : Because in development larval stage is not found.

Q.22 **A :** In anus of earthworm, depressor ani muscle are found.
R : Which help in elimination of excretion from rectum.

Q.23 **A** : Plasmodium is blood- parasites.

R : Plasmodium is Digenetic parasites

Q.24 **A** : Malaria is spread by female Anopheles.

R : Female Anopheles is secondary host of plasmodium.

Q.25 **A** : Ascaris is a Resevoir host of plasmodium.

R : Plasmodium is unecellular parasits.

Q.26 **A** : Ziemann's dots found in plasmodium vivax.

R : Maurer's dots found is plasmodium malaria.

Q.27 **A** : Incubation period of plasmodium Ovale is 12-14 days.

R : Incubation period of plasmodium Malaria is 12-14 days.

Q.28 **A** : Lethal malaria spread by plasmodium vivax.

R : Quartan malaria spread by plasmodium Ovale.

Q.29 **A :** The Round worm are ecucoelomate.

R : They have a fluid- filled coelom.

Q.30 **A :** Reproductive system male ascaris is Telogonic.

R : They have only one Testes.

Q.31 **A :** The ascaris is pseudocoelomate.

R : Body cavity is not lined by mesoderm.

Q.32 **A :** During migration the ascaris stays 10 days in lungs

R : Larva of ascaris moults only once in lungs.

Q.33 **A :** Epidermis of ascaris is syncytium.

R : Epidermis of ascaris is multinucleated.

Q.34 **A :** Body cavity of ascaris have three cell bodies.

R : All cell bodies are present on pharynx.

Q.35 **A :** The ascaris have amoeboide tail less sperm

R : They have two uterus

Q.36 **A :** The ascaris have thick cuticle on body.

R : It is the mainparasitic adaptatios.

Q.37 **A :** Ascaris have poorly developed digestive system.

R : They gets pre digested food.

Q.38 **A :** Ascaris used glycogen in anaerobic respiration

R : Ascaris have cytochrome in body wall.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

ANIMAL KINGDOM-I

INTRODUCTION

- Taxomony (Gr.) - study of **nomenclature, classification** and their **principles.** This word was given by **''Candolle''** (**Taxis** – arrangements. Nomos - Law).
- Division of animals species on the basis of similiarity and dissimilirity is known as classification.
- **Systematics** is the scientfic study of the diversity of organisms.
- The term systematic was coined by **Carolus Linnaeus** in 1735.
- **Founder of modern taxonomy** is **Carolus Linnaeus,** a Swedish botanist.
- The foundation of modern classification was laid in the book Linnaeus, 'Systema Nature' (10th edition) in 1758.
- Linnaeus introduced **binomial nomenclature.**

HISTORICAL BACKGROUND OF TAXONOMY

- **Aristotle : -** "father of zoology ". (Book : **Historia Animalium)**
  Father of ancient animal – Classification. He classified animals into two groups on the basis of their natural similarities and differences into –

(i) Anaima :- Those animals which don't have Red blood or in which RBC are absent e.g. Sponges, Cnidaria, Mollusca, Arthropoda. Echinodermata like Invertebrates.

(ii) Enaima :- These animals have red blood. This group includes all vertebrates and it has been further divided into two sub groups.

(a) Vivipara :- It incldues animals which give birth to young-ones e.g. Man, Whale and other mammals.

(b) Ovipara :- It includes animals which lay eggs. e.g. Amphibians, Pisces, Aves, Reptiles etc.

- **Pliny :-** He classified animal into groups : -
  (a) Flying **(b) Non-flying**
- **John-Ray :-** He gave & defined the term **'' species''** as the smallest unit of classfication. He gave **''concept of species ''**. According to him, the organisms which develop from the similar type of parents, belong to the same-species.
- **Mayr : -** According to him similar species are those which are capable of interbreeding in natural conditions. Modern definition of species is coined by **''Mayr''.**
- Binomial system of Nomenclature was devised by **Gesparrd-Bauhin.** But the detailed information about Binomial system was given by **Linnaeus**. In 1758 in the 10^{th} edition of his book **''Systema Naturae''** he gave the classification of known 4236 animals and presented the Binomial system of nomenclature of animal. He is also known as **''Father of Modern-Taxonomy''**
- In binomial system the name of each animal has two parts. First part has its **genus** name and second part has its **species** name. First letter of genus name must be written in **Capital letter** species name is written in **small letters** eg. **Canis familiaris.** In certain species, sub-species are also found. For naming the sub species three words are used. First name is for genus, second for species and third for sub-species. The method of nomenclature of Sub-species is termed as the **Trinomial nomenclature** and it was given by **''Huxley** and **Strickland''**. eg. ***Homo sapiens sapiens.***
- **G.L. Cuvier : -** Coined the term **Phylum.**
- **Julian-Huxley** (1940) : - Proposed **New systematic.**
- **Engler and Prantl : -** Proposed **Phylogenetic classification.**

- **Key** for identification of animal was developed by **John Ray.**
- **Invertebrate** and **Vertebrate** term was given by **Lamarck.**
- **Robert Whittaker** (1969) **: -** Proposed **Five-Kingdom system classification** to show phylogenetic relationship.
  (1) Monera (2) Protista (3) Fungi (4) Plantae (5) Animalia
- **Linnaeus** classified animal kingdom into 6-classes.
  (1) Mammalia (2) Aves (3) Amphibia (4) Insecta (5) Pisces (6) Vermes
- **Storer and Usinger** classified whole animal kingdom into 31 phyla. Out of which 10 are major and 21 are minor phyla. Main phyla are :

Phylum	**Protozoa** (Single-celled)	Euglena, Amoeba, Paramecium, Trypanosomes, malarial parasite.
Phylum	**Porifera** (porous)	Sponges.
Phylum	**Coelenterata** (sac-like, two layers of cells separated by non-cellular mesogloea; stinging cells (nematoblasts)	Hydra, colonial hydroids, jellyfish, sea anemones, corals
Phylum	**Platyhelminthes** (flatworm)	Planarians, Parasitic flukes, tapeworm
Phylum	**Nematoda** (round worms)	Ascaris, hookworms, Wuchereria (filaria)
Phylum	**Annelida** (ringed worms, segmented)	
	Polychaeta	Neris (ragworm), fanworms, lugworm.
	Oligochaeta	Earthworm
	Hirudinea	Leeches
Phylum	**Mollusca** (soft-bodied typically with shell)	
	Gastropoda	Whelks, Limpets, snails, slugs.
	Lamellibranchiata (bivalves)	Mussels, clams, oysters.
	Cephalopoda	Squids and octopuses
Phylum	**Arthropoda** (jointed limbs, hard exoskeleton)	
	Crustacea	Water fleas, Sacculina, Barnacles, Shrimps, Woodlice, Prawns, Crayfish, Lobsters, Crabs
	Myriapoda	Centipedes and millipedes
	Arachnida	Eurypterids (fossils), horseshoe crab (Limulus), scorpions, mites, ticks,
	Insecta	Spiders, Cockroach, lucust, aphids, lice, mosquitoes, flies, fleas, bees, bug (e.g. rhodnius), butterfish and moths
Phylum	**Echinodermata** (Spiny-skinned, pentaradiate)	starfish, brittle stars, sea urchins, sea cucumbers, sea lilies.
Phylum	**Chordata** (possess notochord at some stage in life history)	

	Protochordata (invertebrate chordates) Vertebrata (notochord replaced by vertebral column) Cyclostomata (jawless fishes) Pisces (true fishes) Amphibia Reptilia Aves (birds)	sea squirts, acorn worms, amphioxus Lampreys and hagfishes Elasmobranchs (Modern cartilaginous fish) e.g. dogfish, rays, sharks, teleosts (modern bony fishes) e.g. cod. Newts, salamanders, frogs, toads Dinosaurs, lizards, crocodiles, turtle snakes Pigeons, gulls, kiwi, ostrich etc.
	Mammalia	
	Monotremes (egg-lying) Marsupials (pouch mammals with rudimentary non-allantoic placenta) Eutherians (have true placenta)	duck-billed platypus, spiny anteater opossums, tasmanian wolf (thylacinus), koala bear, kangaroos the many group include the rodents great cats, and primates (e.g. baboons, chimpanzee, man)

SEQUENCE OF CLASSIFICATION

- Smallest unit of classification is **''Species''. Genus** includes various types of species. **Family** is made up of various genera. Many families join together to form an **Order,** many order join together to form a **class** and many classes form a **Phylum.** All the phyla unite to form the largest unit i.e. **Kingdom.**
  Various grouping levels or ranks in classification known as Obligate categories.
  e.g., kingdom — Phylum — Class — Order — Family — Genus — Species
- Based on this, all animals are included in the animals kingdom – groups and written in the following Hierarchical manner. For example obligate category of man can be written as

TAXA		**Category**
Kingdom	⟶	Animalia
Phylum	⟶	Chordata
Class	⟶	Mammalia
Order	⟶	Primates
Family	⟶	Hominidae
Genus	⟶	***Homo***
Species	⟶	***Sapiens***

BASIS OF CLASSIFICATION

Some Term related to Animal Body :

1. **Anamniotes :** Vertebrates without embryonic membranes e.g., fishes, amphibians.
2. **Amniotes :** Vertebrates with embryonic membranes (chorion, amnion, allantois, yolk sac) e.g., reptiles, birds, mammals.

3. **Acraniata or Protochordata :** Chordates without cranium (brain box). It includes urochordata and cephalochordata.
4. **Chordates :** Animals with notochord dorsal tubular nerve cord, paired pharyngeal gill slits. All urochordates, cephalochordates and vertebrates are called chordates.
5. **Craniata or Vertebrate :** Chordates with cranium. It includes cyclostomes, pisces, amphibians, reptiles, birds and mammals.
6. **Nonchordates :** Animals without notochrod (a rod like elastic structure which supports the body). Phylum Porifera to phylum Hemichordata are called nonchordates.
7. **Invertebrates :** Animals without vertebral coloumn (backbone) All the nonchordates, urochordates and cephalochordates are collectively called invertebrates.
8. **Levels/Grades of organization :** Four levels of organization are found in muticellular animals.
   (i) **Acellular or Molecular or Protoplasmic level :** It is present in protozoans .
   (ii) **Cellualr level :** The body consists of many cells which may be similar or show minor division of labour. Distinct tissues are not formed e.g., sponges.
   (iii) **Tissue level :** The body is multicellular. The cells form poorly defined tissues. The cells occur in two distinct layers or tissues of specialized cells e.g., coelenterates.
   (iv) **Organ-system level :** The body is multicellular. The cells are organised into tissues, tissues into organs, organs into organ systems. Except sponges and coelenterates, all the animals of the kindom animalia have organ-system level of organization.

METAZOA

- The multicellular eukaryotic organisms with holozoic mode of nutrition are called as **metazoans.** Based on complexity of organization, metazoans are further sub-divided into two sub-kingdoms, the **Parazoa** and **Eumetazoa.**
- **Parazoa :** Parazoa includes the sponges in which the cells are loosely aggregated and do not form tissues or organs.
- **Eumetazoa :** Eumetazoa includes the rest of the animals, the cells are organized into structural and functional units called as tissues, organs and organ systems.

HABITAT

- The place on the earth, where an animal finds optimum conditions for food and shelter is called its **habitat**. Habitat can be defined as the physical and geometrical space where an organism lives.
- The habitat may be water, soil or earth's surface. On the basis of their habitat, animals can be of following types :

1. Terrestrial habitat :

- Animals which live on land or dry earth's surface, are said to have terrestrial habitats.
- Terrestrial animals are adapted for following types of habitat modes :
  a. Aerial or flying : These animals possess wings and therefore can fly. *e.g.,* Birds, bats.
  b. Arboreal : These animals mainly live on trees. *e.g.,* Bat, Monkey.
  c. Fussorial : These animals live in burrows or underground. *e.g.,* Rabbits, rat, earthworm etc.
  d. Scansorial : These animals can climb on walls, rocks etc. *e.g.,* Wall lizard, flying squirrel.
  e. Cursorial : These animals are adapted to run very fast. *e.g.,* Tiger, horse, dog etc.

2. Aquatic animals :

- These animals live in water. They may be **fresh water or marine water.**
- The aquatic animals may further be of following types :
  a. Zooplanktons : The animals which flow passively, with water current, on the surface of water, are called zooplanktons. *e.g.,* many aquatic protozoans, larvae, crustaceans etc.
  b. Nektons : These animals can float actively in water body even against water current. *e.g.,* many fishes such as sharks, many skates and rays.

c. Benthos : These animals live at the bottom of the water body. *e.g.,* Deep sea fishes, many echinodermates, sponges and corals.

d. Pelagic : These animals usually live at the surface or water body. These include both zooplanktons and Nektons.

HABITS

✯ Nature of living is called habit. Animals lead various types of life and on this basis, they are of following types:

a. Solitary animals : Animals which have singly (not in groups). *e.g.,* Taenia, Earthworm etc.

b. Colonial animals : Animals which live in groups and form colony. *e.g., Volvox,* honeybee, termites, wasp etc.

c. Gregarious animals : Animals which live in groups, but do not interact with each other. *e.g.,* locust.

d. Free living animals : Animals, which do not depends on other organisms for food and shelter and live independently. *e.g.*, cat, dog etc.

e. Parasitic animals : Animals which depends on other living organisms for food are called parasitic organisms. *e.g., Entamoeba, Taenia, Fasciola, Ascaris, Louse* etc.

f. Saprophagous animals : Animals which obtain their food from dead and decaying organisms and organic matter are called saprophagous animals. *e.g.,* house fly etc.

g. Sanguivorous animals : Animals which feed on the blood of other organisms. *e.g.,* Mosquitoes, Leech etc.

h. Sessile (sedentary) animals : Animals which do not move here and there are remain immotile, are called sessile organisms. *e.g., Herdmania*.

i. Motile animals : Animals, which have locomotory organs and can move here and there, are called motile organisms. *e.g.,* man horse etc.

j. Diurnal animals : Animals, which are active during day time for obtaining their food, are called **diurnal organisms**. *e.g.,* man, horse, dog etc.

k. Nocturnal animals : Animals, which are active at night for obtaining food are called **nocturnal animals**. *e.g.,* Cockroach etc.

l. Crepuscular animals : Animals which are active at dusk (evening) for obtaining their food are called crepuscular animals. *e.g.,* rabbit.

m. Vasperal animals : Animals which are active early morning. *e.g.,* Birds.

n. Caprophagous animals : Animals which can eat their own faecal matter to re-digest it. *e.g.,* Rabbit.

SYMMETRY

Animal Body symmetry is the similarity of parts in different regions and directions of the body. When the body is not divisible into equal havles by any plane it is called asymmetrical or asymmetric as found in Amoeba and some sponges. An animal is said to be symmetrical if its body is divisible into equal havles by one or more planes. Four types of symmetry found in animals are –

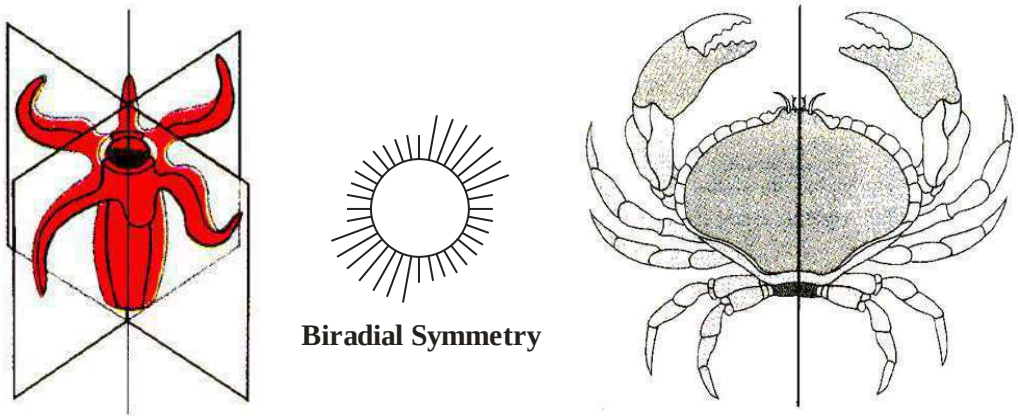
(a) Spherical symmetry : In this type of symmetry, any plane passing through the centre divides the body into equivalent of mirrored havles. It is found in animals whose body resembles a sphere e.g., Protozoans such as *Volvox*, *Heliozoa*, *Radiolaria*.

(b) Radial symmetry : In this type of symmetry, a number of similar parts radiate out from a central axis. The body of the individual can be divided into equal halves by any plane passing through the centre from top to bottom. This type of symmetry is found in some sponges (*Sycon*), coelenterates (e.g., *Hydra, jelly fish*), echinoderms (e.g., star fish).

(c) Biradial symmetry : In this type of symmetry, only two planes passing through the longitudinal axis. The body can be divided into two similar havles by one or two vertical planes only. This type of symmetry is found in sea walnuts (phylum ctenophora) and sea anemones (Anthozoa). The animals which show radial

and biradial symmetry have oral and aboral sides. The oral side is that which has mouth, whereas the aboral side is one which is opposite to oral side.

(d) Bilateral symmetry : In this type of symmetry the body can be divided into two equal havels by a median longitudinal or sagittal plan only. The appearance of bilateral symmetry in animal evolution was a major advancement, because bilateral animals are much better fitted for directional (forward) movement than in radial symmetrical animals. This type of symmetry is found in many invertebrates and all vertebrates.

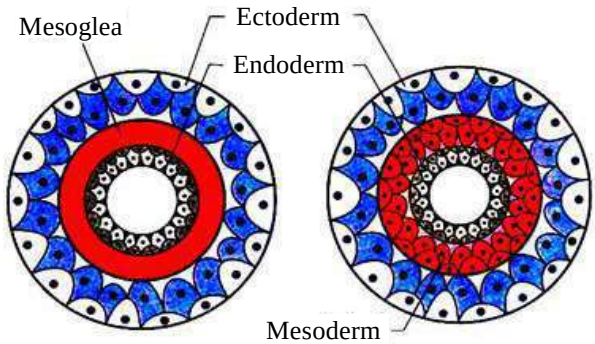


Radial symmetyry **Biradial Symmetry** **Bilateral symmetry**

Table 4.1 Difference between bilatral and radial symmetry

S. NO.	Bilateral Symmetry		Radial Symmetry
(i)	Body can be divided into two similar havles (the left and right) in one plane only.	(i)	Body can be divided into two equal parts by a number of radial divisions (lines passing through the centres).
(ii)	Examples. Invertebrates like roundworms, segmented worms, arthropods, molluscs and all vertebrates	(ii)	Examples. Sponges, coelenterates, adult echinoderms like starfish etc.

GERM LAYERS



Diploblastic **Triploblastic**

- Germ layers give rise to all the tissues/organs of the fully formed individuals. On the basis of germ layers, animals can be

(i) Diploblastic : In **Diploblastic animals** the body cells are arranged in two layers, an outer **Ectoderm** and an internal **Endoderm** with an intervening **Mesoglea.**

(ii) Triploblastic : If the body wall in animals is made up of three germ layer i.e. **ectoderm, mesoderm** and **endoderm**, they are called as **triploblastic animals.**

Table 4.2 Difference between bilatral and radial symmetry

S. NO.	Diploblastic animals		Triploblastic animals
(i)	These animals develop from two cellular layers only.	(i)	These animals develop from three cellular layers called three primary germ layers.
(ii)	The outer one is ectoderm and the inner one is endoderm. These layers are separated by a gelatinous non-cellular layer called mesoglea.	(ii)	There are three primary germ layers–outer ectoderm, middle mesoderm and inner endoderm. The layer mesoderm is significant in many aspects.
(iii)	Present in the lower metazoans (tissue level organisation) like coelenterates (Cnidaria)	(iii)	Present in the higher metazoans (organ-level organisation) like platyhelminthes, annelids, arthropods, echinoderms, molluscs and vertebrates

BODY PLAN

- Animals have three types of body plan :

(i) Cell aggregate : Cell aggregate type of body plan is present in sponges.

(ii) Blind sac : Blind sac type of body plan is present in **Platyhelminthes** and **Coelenterates,** where the alimentary canal has only one opening.

(iii) Tube within tube : Tube within tube type of body plan is present in **Nemathelminthes, Annelida, Arthropoda, Mollusca, Echinoderms Hemichordates** and **Chordates**. The digestive system is a continuous tube with an opening at each end. Tube-within-a-tube body plan has been **achieved in two different ways** in two evolutionary lines. In one called the **Protostomes,** the first opening to develop in the embryonic digestive tube is the mouth; the anus develops later. **This is seen in the annelid, mollusc and arthropod line.**
In the other, the **Deuterostomes,** the anus develops first and the mouth is formed later. This occurs in the Echinoderms Hemichordates and Chordates (including the vertebrates). We are thus evolutionarily closer to the **echinoderms (starfish)** than to insects or molluscs.

BODY CAVITY OR COELOM

- On the basis of coelom, animals can be

(i) Acoelomate : The animals in which the coelom is absent are called as **Acoelomates**, for example flatworms. In them the space between ectoderm and endoderm is filled with parenchyma e.g., Platyhelminthes.

(ii) Pseudocoelomate : The body cavity is not completely lined with mesoderm. Instead, the mesoderm is present as scattered pouches in between the ectoderm and endoderm. Such a body cavity is called as pseudocoelom **e.g roundworm.**

(iii) Eucoelomate : The true coelom is a body cavity which arises as a cavity in embryonic mesoderm. In this case, the mesoderm of the embryo provides a cellular lining, called as coelomic epithelium or peritoneum, to the cavity. The coelom is filled with coelomic fluid secreted by the peritoneum. The coelom is found in **Arthropods, Molluscs, Annelids, Echinoderms, Hemichordates** and **Chordates.** True coelom is of two types :

(a) Schizocoelom : It develops by the splitting up of mesoderm. It is found in annelids, arthropods and molluscs. **Body cavity of arthropods is called heamocoel.**

(b) Enterocoelom : The mesoderm arises from the wall of the embryonic gut or enteron as hollow outgrowths or enterocoelomic pouches. It occurs in Echinoderms, Hemichordates and Chordates.

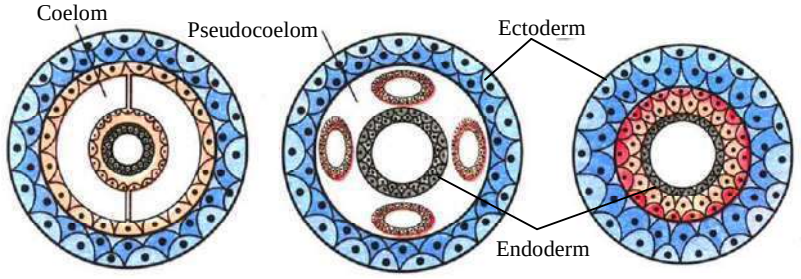


Table 4.3 Comparison amongst coelom, pseudocoelom and haemocoel

S. NO.	Coelom		Pseudocoelom		Haemocoel
(i)	The body cavity is lined with **mesoderm** on both the sides.	(i)	The body cavity is lined with **ectoderm** outside and endoderm inside.	(i)	A large blastocoel lined by ectoderm from outside and mesoderm on the inside.
(ii)	Contains a fluid called coelomic fluid.	(ii)	Contains large vacuolated cells having protein-rich fluid.	(ii)	Contains blood with colourless plasma called haemolymph.
(iii)	(a) Acts as a shock absorber (b) Provides space for enlargement of internal organs.	(iii)	Osmoregulatory in function	(iii)	Helps distend the body during moulting so that cuticle can slit open.

Table 4.4 Comparison between acoelomate and coelomate animals

S.NO.	Acoelomate animals		Coelomate animals
(i)	No body cavity, i.e., without coelom	(i)	True body cavity, i.e., coelom
(ii)	Mesoderm fills the entire area.	(ii)	Coelom is lined by mesoderm on both the sides.
(iii)	Lower metazoans like platyhelminthes	(iii)	Higher metazoans like annelids, vertebrates.

SEGMENTATION

- In some animals, the body is externally and internally divided into segments or metameres with serial repetition of atleast some organs. For example, in earthworm, the body shows metameric segmentation and the phenomenon is known as metamerism.

Table 4.5 Comparison amongst kinds of body segmentation

S. NO.	Unsegmented		Pseudosegmented or non-metamerically segmented		Metamerically segmented
(i)	Body is not divided into any segments e.g. platyhelminthes, roundworms.	(i)	body is divided into number of pseudosegments.	(i)	Body is divided into number of segments.
		(ii)	The segments are independent of each other.	(ii)	The segments are interdependent and together work as an organism.
		(iii)	Each segment is able to perform all the vital functions of the body.	(iii)	Each segment is specialised to perform certain important functions along with common functions.
		(iv)	Body grows by addition of new segments from the anterior end e.g. tapeworm	(iv)	Body has a specific growth pattern e.g. annlids, arthropods and all higher animals.

NOTOCHORD

- Notochord is mesodermally derived rod-like structure formed on the mid-dorsal surface during embryonic development in some animals. Animals with notochord are called chordates and those animals which do not form this structure are called non-chordates, e.g., Porifera to Echinoderms or Hemichordates.

Table 4.6 Differences between notochord and nerve cord

S.NO.	Notochord		Nerve cord
(i)	First skeleton laid during embryonic stages	(i)	Anterior part develops into brain and the remaining part into the spinal cord.
(ii)	Present on the dorsal side (below) of the nerve cord.	(ii)	Present above the notochord.

BLOOD VASCULAR SYSTEM

- Blood vascular system is basically of two types : Open and Closed.

(i) Open type : In **open type,** the blood is pumped by the heart into the blood vessels that open into blood spaces (sinuses). There is no capillary system (i.e., most arthropods, some molluscs **except** cephalopods and tunicates). These sinuses are actually the body cavitites, and are called **haemocoel.** The pressure of the blood is low; it moves slowly between the tissues, and finally, returns to the heart via the opened veins. In fact, distribution of blood in the tissues is very poorly controlled. The pigments, which carry oxygen, remain dissolved in blood plasma. Body tissues and visceral organs exhange respiratory gases, nutrients and waste products, directly with blood.

(ii) Closed type : Many invertebrates and all the vertebrates, including humans, have a **closed circulatory system.** In closed type, the blood flows around the body through the specific blood vessels. In this system, the same blood regularly circulates in the body under high pressure, and returns back to the heart without leaving the system of tubes. The heart pumps the blood into the aorta, which branches in the body into the arteries, and in the tissues into the arterioles, to form the capillary network. The venules of the capillary network carry the blood back to heart via veins and vena cava. This helps in supplying the nutrients and oxygen to the tissues, and removing waste materials and carbon dioxide from tissues.

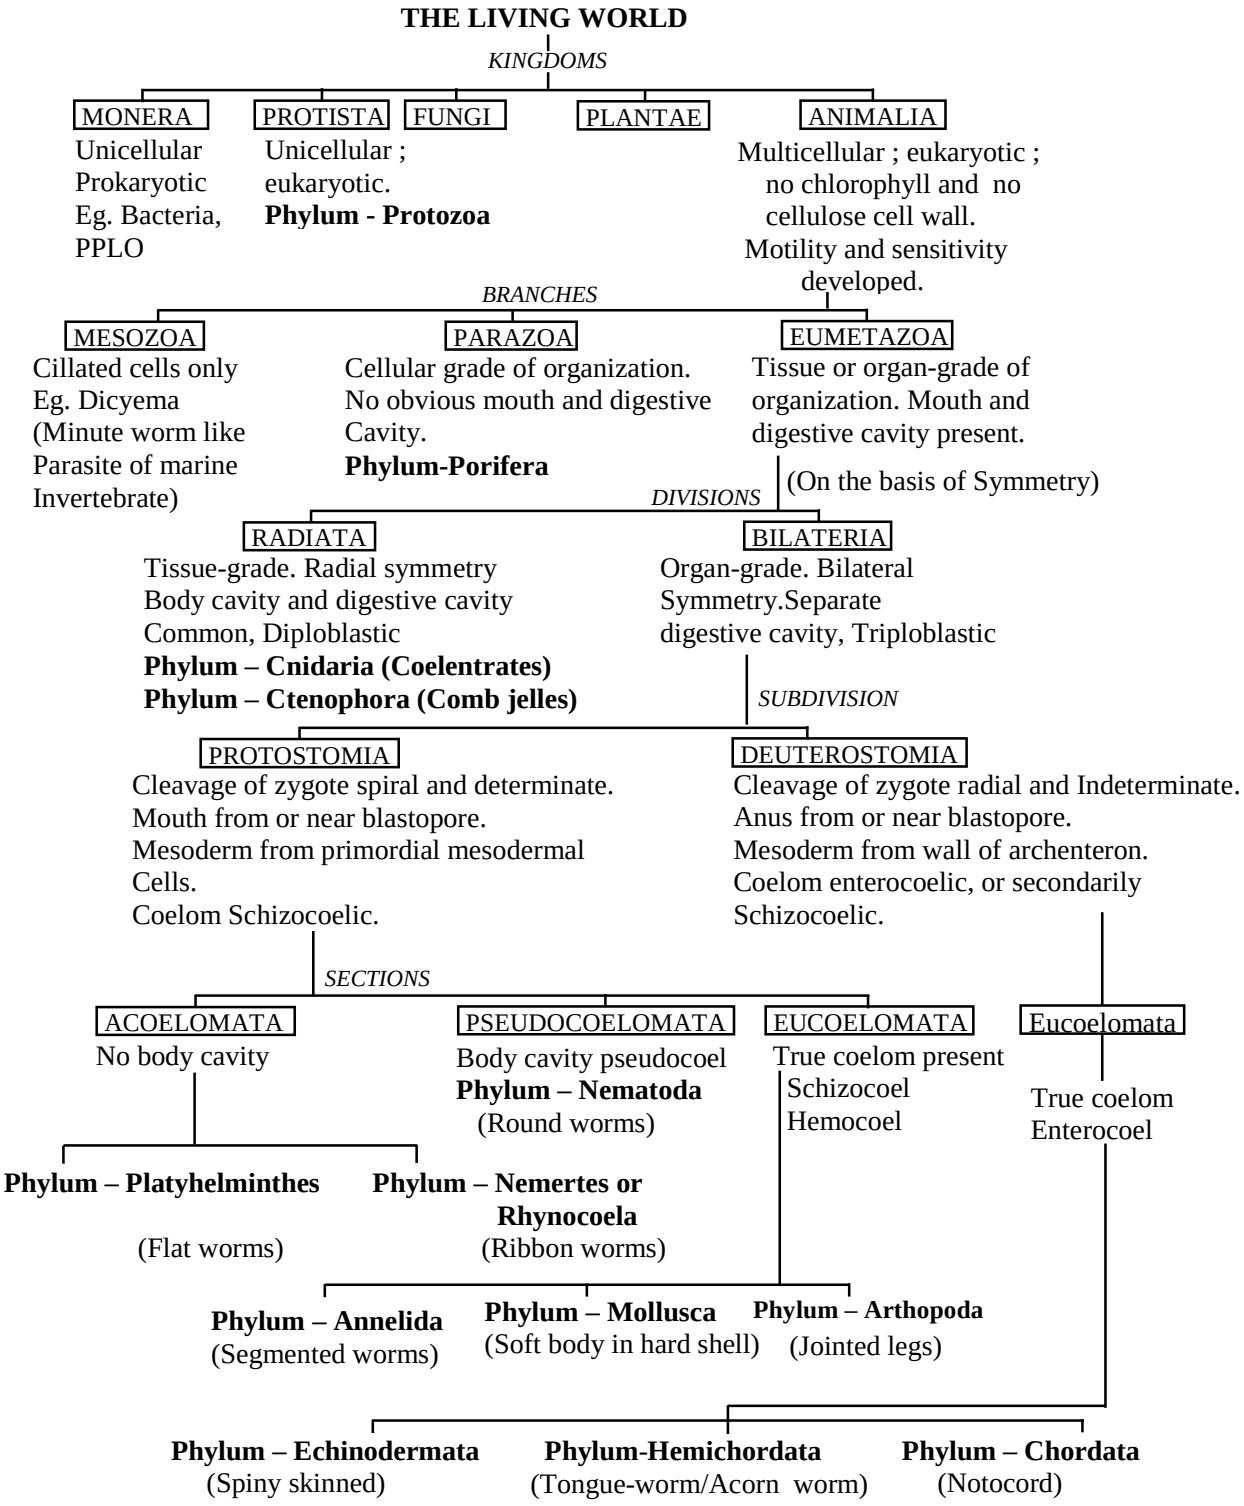
Comparison of Open and Closed Circulatory Systems

Open System	Closed System
These are usually low pressure systems.	These are usually high pressure systems.
Blood is conveyed directly to the organs without formation of capillaries.	Blood is conveyed directly to the organs through capillaries.
Distribution of blood to different organs is not well regulated.	Distribution of blood to different organs is well regulated.
Blood returns to the heart slowly.	Blood returns to the heart rapidly.
Found in most arthropods, non cephalopod mollusks and tunicates.	Found in cephalopods (octopus, squids) and vertebrates.

Table 4.7 Difference between exoskeleton and endoskeleton

S.NO.	Exoskeleton		Endoskeleton
(i)	Formed by the deposition of hard protective material on the body surface.	(i)	Formed by the formation of hard protective material within the body
(ii)	(a) **Chitinous** as cuticle (impervious to water) in arthropods (b) Calcareous as in the shells of molluscs. (c) **Ossicles** as in echinoderms (d) In the form of scales in fish, beak and feather in birds, and hair and nails in reptiles and mammals.	(ii)	(a) **Notochord** in lower vertebrates (b) **Bones** in vertebrates all over the body (c) **Cartilage** in cartilage fish, extremities of bones and parts of vertebrates like none and ear.

(iii)	**Functions** (a) To survive in dry or wet environment. (b) To protect the soft body. (c) To give ability to fight as organs of defense.	(iii)	**Functions** (a) To support the whole body. (b) To give shape, flexibility and rapid movement. (c) To protect vital organs like heart and lungs. (d) To helps vertebrates to attain a large size.



Note : *Whittekar removed protozoa from animal kingdom & kept in kingdom protista.*

PHYLUM - PROTOZOA

1. It is **3rd largest phylum.** One celled performed all the biological activities like multicellular animals. So they are termed as **''Acellular''** organism, proposd by **Dobell.**
2. Protozoans were first studied by **Leeuwenhoeck.**
3. And the name Protozoa was coined by **Goldfuss.**
4. Study of protozons is known as **Protozoology.**
5. They are world wide, Cosmopolitan and mostly **Microscopic, Aquatic, Terrestrial, free living** (Amoeba) or parasitic (Plasmodium).
6. Solitary or colonial (Proterospongia).
7. Many causes serious diseases or pathogenic.
8. Protozoans are small microscopic, **Eukaryotic Unicellular,** Colourless, Spherical, Oval, Bell shaped, Spindle shaped slipper like having irregular Symmetry.
9. Level of body organisation of Protozoans is Protoplasmic level.
10. Consists of uninucleate or multinucleate protoplasm mostly **necked** or some have body bounded by delicate membrane or a firm **pellicle/Test/Lorica/shell.**
11. In few groups of protozoa **$CaCO_3$ & Silica shell** as exoskeleton is found. e.g. **Radiolarian group** & **Foraminiferan group.**
12. Number of nuclei vary from one to many. Few show nuclear **dimorphism.** e.g. Paramecium.
13. Body performs all necessary biological activity so in them **subcellular – Physiological division of Labour** is found.
14. Locomotion by means of

    (1) Finger-like Pseudopodia e.g. ***Amoeba*** (2) Whip like Flagella e.g. ***Euglena***

    (3) Hairy cillia e.g. ***Paramecium*** (4) By contraction

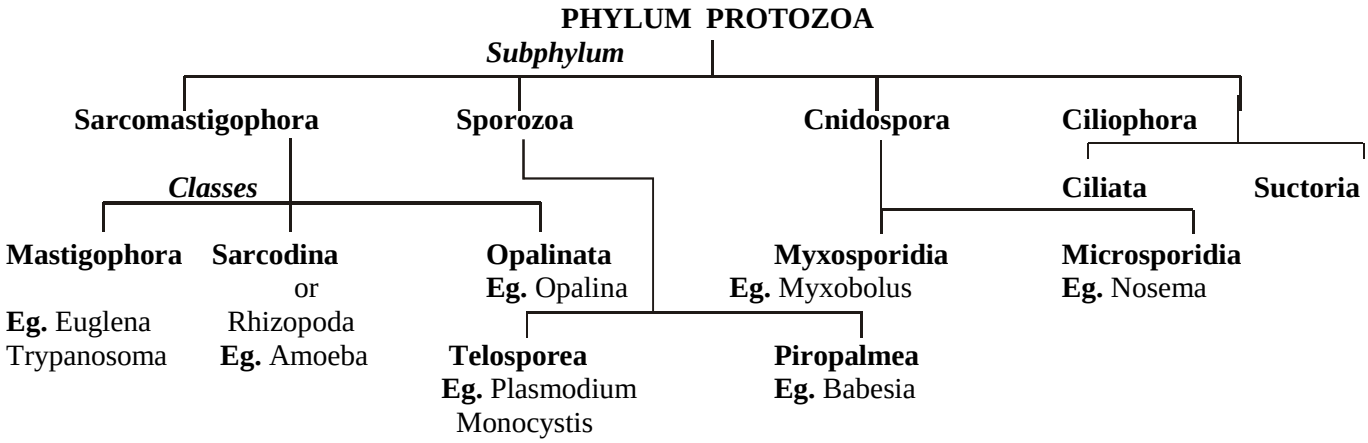
    (5) No locomotory organelles
15. Nutrition of Protozons are mainly **holozoic** (Amoeba), **Mixotrophic.** (Euglena), Parasitic, **Saprozoic** (Plasmodium) and Digestion is **intracellular** take place in **food vacuole.**
16. **Respiration** and **Excretion** takes place by exchange of gases through body surface. Some excretion may occur through **contractile vacuole.**
17. Nitrogenous waste is **Ammonia.**
18. Some fresh water protozoans get rid of excess water through contractile vacuole and phenomenon known as **Osmoregulation. Amoeba** has one and **Paramecium** has two vacuoles.
19. **Reproduction** takes place by

Asexual	Sexual
(1) Binary fission ***(Amoeba)***	(1) Syngamy ***(Plasmodium)***
(2) Transverse fission ***(Paramecium)***	(2) Conjugation ***(Paramecium)***
(3) Longitudinal fission ***(Trypansoma, Euglena)***	
(4) Multiple fission ***(Plasmodium)***	
(5) Budding	

20. Some also form cyst which help in unfavorable condition for reproduction of organism. They do not have natural – death because in unicellular animals there is no division of somatoplasm & germplasm so these are considered as **immortal.**

CLASSIFICATION OF PROTOZOA AT GLANCE

Based on Locomotary organs



SUB – PHYLUM SARCOMASTIGOPHORA

- Locomotary organs are **pseudopodia or flagella or both**,
- Nucelus one or many and similar type.

These are divided into 3 classes -

✯ **Class – 1 : Mastigophora or Flagellata**

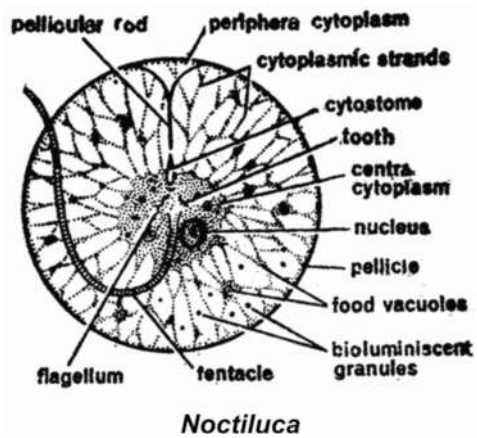
(a) Locomotary organs are one or many **flagella**.
(b) Many members have **chlorophyll** e.g. ***Euglena***.
(c) Their body has **pellicle** so they have a definite shape.
(d) **Nucleus one**.
(e) Binary fission is longitudinal. Sexual Reproduction is absent.
(f) **Contractile - Vacuole is present for Osmoregulation**.
(g) Nutrition is **mixotropic.**

Examples :

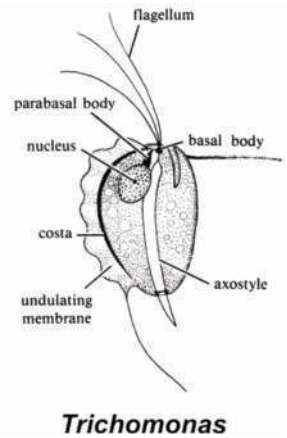
1. ***Euglena***.
2. ***Proterospongia* :** This is a colonial protozoan. **It is a connecting link between protozoa and porifera.**
3. ***Mastigamoeba* : It is a connecting link between mastigophora and Sarcodina.**
4. ***Leishmania donovani* -** This parasite is responsible for **kala-azar disease in man**.

- This disease spreads through ***sand - fly (phlebotomus)***.
- This parasite is dimorphic and digenetic. Disease caused by it is also known as **"Dum-dum fever"** or visceral Leishmaniasis or Tropical splenomegaly. (L. Tropica causes – **Delhi Boils** or **oriental sores** disease.)

5. ***Trypanosoma gambiens* :** This parasite causes **"African sleeping sickness"** in man-This disease spreads through **Tse-Tse fly *(Glossina palpalis/tachinoides)*** . T. gambiens is polymorphic-Leptomonad form, crithidial form, Trypanosomal forms.
6. ***Trypanosoma cruzi* -It causes Chagas disease**.
7. ***Giardia intestinalis* :** It is termed as **Grand-old man of Intestine"**. It causes diarrhoea in humans.
8. ***Trichomonas vaginalis* :** It is a parasite in the vagina. It causes **"Vaginitis = Leucorrhoea".**
9. ***Trichonympha* :** This is a symbiont in the intestine of termite and wood cockroach. It helps in the digestion of cellulose.
10. ***Noctiluca* -** It shows **bioluminiscense due to Luciferin protein. It is also called the Fire of Sea"**.



Noctiluca



Trichomonas

✯ **Class – 2 : Sarcodina or Rhizopoda**

(a) Locomotary organs are pseudopodias. Different types of pseudopodias are
  (i) ***Lobopodia*** **-** in Amoeba
  (ii) ***Filopodia*** **-** in Euglypha, Chlamydophorus
  (iii) ***Reticulopodia*** **-** in Globigerina
  (iv) ***Axopodia*** **-** in Actinophyrus, Actinosphaerium.

(b) Body is naked so shape is changeable, few have different types of shells.

(c) Pseudopodia help in feeding and locomotion.

(d) Nutrition is Holozoic or Saprozoic or others.

(e) Cytoplasm is divided into Ectoplasm and Endoplasm.

(f) Nucleus is one or many but monomorphic.

(g) Animals may be free-living or parasitic.

(h) Contractile vacuole found in only fresh water species like **amoeba**. But in **parasites** and **marine-animals** the **contractile-vacuoles are absent**. e.g. **Entamoeba histolytica**

(i) Asexual reproduction normally takes place by Binary-fission, which is transverse, Sexual reproduction is absent.

Example :

1. ***Amoeba*** **–** Simplest animal
2. ***Pelomyxa - chaos*** – **This is the largest amoeba**. Size = 6 mm. **It is multinucleated**.
3. ***Entamoeba histolytica*** **-** It is a parasite in the **colon of man**. **It causes amoebic dysentery** in man. In it contractile vacuoles are absent. It is dimorphic-
  (i) Magnum-Pathogenic
  (ii) Minuta-Nonpathogenic.
4. ***Entamoeba gingivalis*** **- It is found in between the teeth of man**. It increases **Pyrea** disease but does not cause it. **Pyrea** is caused by **"Trichomonas-tinax"**.
5. ***Arcella*** **-** It has an exoskeleton of tectin.
6. ***Elphidium (Polystomella)*** **-** It has a multichambered shell of $CaCO_3$, silica and magnesium sulphate.
7. ***Allogromia*** **-** It has internal skeleton.
8. ***Actinophrys*** **-** It is termed as the "Sun aninmalcule".
9. ***Entamoeba coli*** - It is found in the intestine of man. **It shows commensalism**.
10. ***Aulocantha*** **-** It have maximum chromedia.
11. ***Radiolarian*** **–** Exoskelaton present.

✯ **Class - 3 : Opalinata or Protociliata**

(a) Locomotory organs are flagella which are found on the whole surface of body.
(b) Body has pellicle over it.
(c) Nuclei many but isomormphic.
(d) Binary fission common, sexual reproduction takes place by **syngamy**.
(e) **Contractile-vacuole is absent**.
(f) All flat and parasite in the intestine of amphibia.
(g) Cytostome absent.

Example : ***"Opalina"*** - It is found as a parasite in the intestine of frog.

SUB-PHYLUM SPOROZOA

Characteristics :

1. All the members of this **group are endoparasite**. These are found in cells (called ***cytozoic***) tissues (called **histozoic**) or in vacuoles (called **coelozoic**).
2. **Locomotory organs are absent**.
3. A thick pellicle is present on the body.
4. **Cytostome, cytopyge and contractile vacuoles are absent**.
5. Binary-fission absent, In place of that asexual reproduction takes place with the help of multiple fission.
6. Sexual reproduction takes place by **syngamy**. Spore formation takes place in most of the members.
7. Life-cycle is complex. Polar filaments are absent in spores.
8. Sub-phylum sporozoa is divided into four classes on the basis of presence or absence of spores in life cycle.

✯ **Class (1) Telosporea :**

Sporozoites elongated and mostly find in spores

Examples :

(1) ***Plasmodium*** **-** Four species spread malaria fever in human. **Female anopheles is the carrier of plasmodium. P. falciparam** causes – **"Malignant Malaria"** or "Black water fever" or "Cerebral Malaria".

(2) ***Monocystis*** **-** It is found in **seminal vesicle of earthworm**, and causes sterility in earthworm. It is monogenetic in nature.

(3) ***Eimeria*** **-** It is found in epithelial cells of liver of rabbit.

✯ **Class - 2 : Piroplasmea**

- Microscopic parasites of the RBC of animals in which spores are not formed, the sporozoites are naked.

Example : ***Babesia*** **-** It causes the **"Texas cattle fever"** in animals. This disease also called "**Red water fever**" or **"Haemoglobin-uric fever".**

✯ **Class - 3 : Toxoplasmea & Sarcocystis.**

Example - ***Toxoplasma & Sarcocystis***

✯ **Class - 4 : Haplosorea**

Example - ***Coelosporidium***.

SUB-PHYLUM CNIDOSPORA

- Parasites of other animals like **sporozoa**.
- Absence of locomotary organs and **contractile vacuoles**.
- Spore-formation takes place in life-cycle the spores have polar - filaments.
- Cnidospora has been classified into 2 classes on the basis of development of spores

✯ **Class-1 : Mixosporea**

Spores develop from many nuclei. Spore shell made of 2 or 3 valves. Example - Ceratomyxa, Myxidium.

✯ **Class-2 : Microsporea**

- Spores develop from 1 nucleus. Spore shell made of only 1 valve.
  Example : ***Nosema*** **-** It is an endoparasite of the tissues of **silk-worm**. It causes harm to **"Sericulture".** This disease is called **"Pebrine disease".**

SUB-PHYLUM CILIOPHORA

- These are complex protozoa.
- In at least one stage of life cycle cilia are present for locomotion & feeding.
- Nuclei are dimorphic or two types the larger one is **Macronucleus** (vegetative nucleus) and the smaller is **Micronucleus** (generative nucleus).
- Body surface has a rigid-pellicle.
- Asexual reproduction by **Binary fission** and sexual reproduction by **Conjugation**. Ciliophora is divided into two classes ciliata and suctoria.

✯ **Class-1 : Ciliata**

(a) Life-cycle is complex. A rigid-pellicle is found around body.
(b) Locomotary organs are **cilia** and present on the whole body surface
(c) Nutrition is **Holozoic**.
(d) Nuclei are dimorphic. i.e. Macro nuclei or vegetative and micro nuclei or generative
(e) Asexual reproduction takes place by transverse binnary fission and sexual reproduction takes place by **Conjugation**, Autogamy, Hemimixis, Endomixis and Cytogamy
(f) Two contractile - vacuoles are found; present at the anterior and posterior ends of the body. These help in **osmo-regulation**.
(g) For the ingestion and egestion of food permanent pores are present. For ingestion ***cytostome*** is present and for egestion **cytopyge** or ***cytoproct*** are also cell-anus is present.
(h) Below the pellicle, "**Trichocysts**" are found which are **defence organelles**.

Example :

(1) **Paramecium -** It is termed as the "Slipper-animalcule". In the cytoplasm of paramecium some toxic particles are found called **"Kappa particles" and "Sigma particles"**. Both these particles shown cytoplasmic inheritence.
Kappa-particles produce "Paramecin which destroys the sensitive species. Paramecium which have Kappa-particles are called ***killer*** *and which don't have them are called* ***Non-Killer****. Lambda, Mu, Pi particles are also present in cytoplasm. They are transferred to next generation by cytoplasmic inheritance.*
(2) **Vorticella -** It is called "**Bell animalcule. It is a pedicellate protozoan.**
(3) **Didinium -** It is called **"Water-Bear"**.
(4) **Spirostomum -** It is the **largest living ciliate**. It is 4 mm long.
(5) **Balantidium coli** - This parasite cause ulcer in the colon of man and causes diarrhoea.
(6) **Nyctotherus -** It is a parasite in the rectum of frog. It is also found in the rectum of cockroach.
(7) **Neummulites - In the form of fossils largest member of protozoa**.
(8) Stentor.

✯ **Class-2 : Suctoria**

(a) The members of this class are sessile and stalked.
(b) Locomotary organs in adults are the "Sucking-tentacles."
(c) Pellicle is found.
(d) Cytostome and cytopyge are absent.
(e) Asexual reproduction by external budding.
(f) Binary fission is absent.
(g) Nuclei are dimorphic i.e. a macronucleus and micronucleus are present, but the macronucleus is branched.
(h) Only 1 contractile vacuole is present.

Example - Arcineta, Ephelota

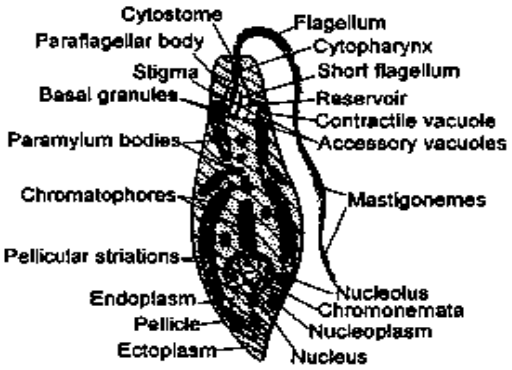
Special points :

1. **Largest protozoa - Pelomyxa Palustris** - 1.4 cm long.
2. **Longest live protozoa -** Euglena gracilis - 20 years.
3. Paramecium bursaria possesses green algae.
4. Fastest running protozoan is **"Monas Steigmata".**
5. Some protozoans have a loose exoskeleton called **"Lorica-hourse"** on them e.g. Difflugia, Tintinn opsis.
6. The fastest reproducing protozoan is **"Glaucoma".** It produces 6-generation within 24 hrs.
7. The largest euglena is "E. oxyuris".
8. When Euglena is kept in dark, then its chlorophyll disappears.
9. "**Heliozoans**" are mainly fresh-water rhizopods and termed **"Sun - animalcules.".**
10. Oblique binary fission in ceratium.
11. **Ceratium** and **Notoiluca** are **bioluminiscent** due to presence of **luciferin protein**.

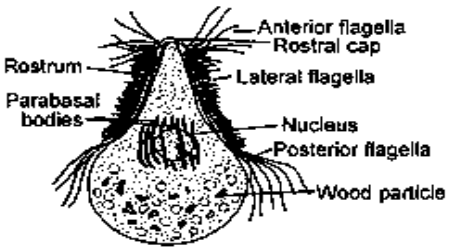
Comparative study of characters of three classes of protozoa

S. No.	Character	Sub-phylum-Sarcomastigophora			Sub-phylum Sporozoa	Sub-phylum-Ciliophora	
		a. Mastigophora	b. Rhizopoda	c. Oplinata		a. Ciliata	b. Suctoria
1	Locomotary organs	Flagella	Pseudopodia	Flagella	Absent	Cilia	Sucking-tentacles
2	Pellicle	*Present*	Absent	Present	Present	Present	Present or Absent
3	Nucleus	One	One or Many, monomorphic	Many, monomorphic	One or Many, monomorphic	Two or Many, dimorphic	Two dimorphic Macronucleus-branched
4	Asexual Reproduction (Binary fission)	Longitudinal	Transverse	Longitudinal	Absent	Transverse	Simple by budding
5	Sexual Reproduction	Absent	Absent	Present	Present	Present	Present
6	Contractile vacuole	Present	Present or Absent	Absent	Absent	Present	Present
7	Nutrition	Mixotrophic or Parasitic	Holozoic or Saprozoic	Parasitic	Parasitic	Holozoic or saprozoic	Holozoic
8	Trichocysts	Absent	Absent	Absent	Absent	Present	Absent
9	Cytopyge & Cytostome	Absent	Absent	Absent	Absent	Present	Absent

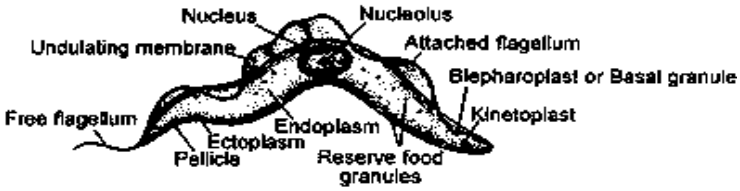
WITNESS FEW COMMON PROTOZOANS



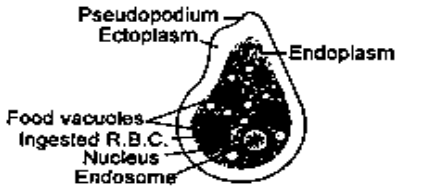
Euglena viridis



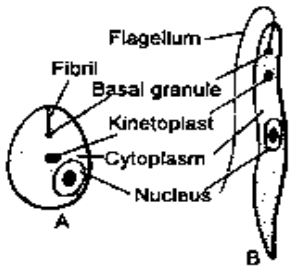
Trichonympha



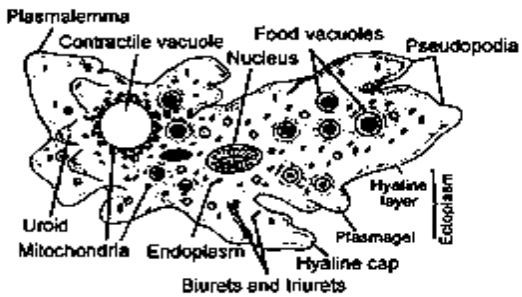
Trypanosoma gambiense



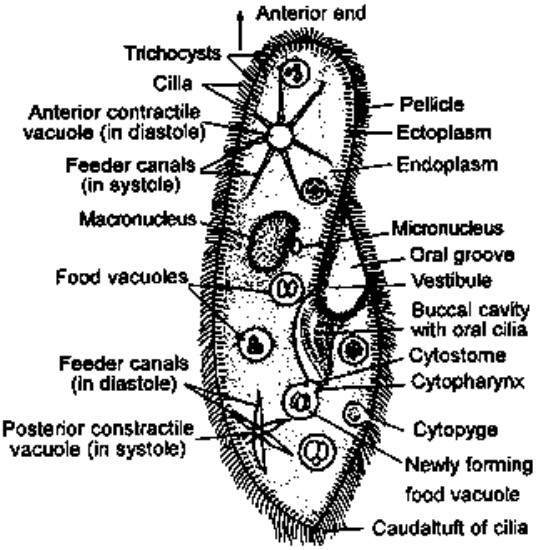
Trophozoite of Entamoeba histolytica



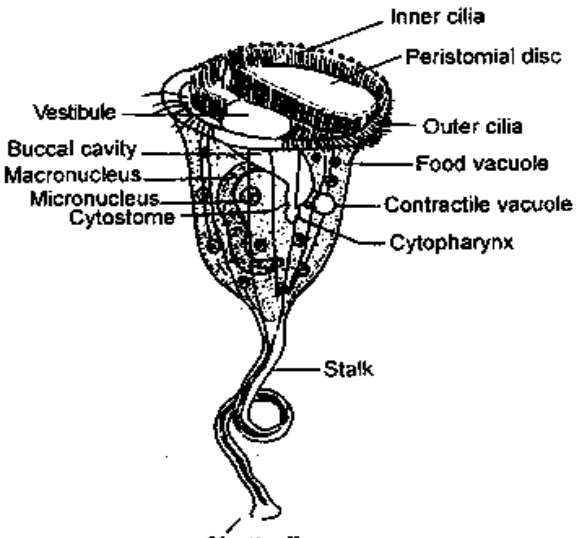
Leishamania donovani :
(A) Leishmania form,
(B) Leptomonad form



Structure of Amoeba proteus



Paramecium caudatum



Vorticella

PHYLUM - PORIFERA

(Common Name - Sponge)

1. **Ellias** proved that sponges are animals.
2. **Robert Grant** gave the name Porifera.
3. Study of sponges is known as **Parazoology.**
4. Phylogenetically evolved from choano flagellates **(Proterospongia)**
5. Mostly marine but few are found in **fresh water** also. They are **sessile, solitary** or **colonial.** Entire body with pores i.e. numerous mouthlets **Ostia** and one opening for exit **Osculum.**
6. Sponge have various body form and shapes i.e. **Vase shape, cylindrical** with radial symmetry ***(Leucosolenia),*** **irregular** shape (asymmetrical).
7. Sponges have **Cellular level** of organisation with two germ layer i.e. **Diploblastic** and do not posses head and appendages.
8. Body wall consists of

(i) Outer <u>Dermal</u> layer or <u>Pinacoderm</u>

(a) Pinococytes (Flat cell)

(b) Porocytes (oval)

In case of Sycon **pinacoderm** is divided into **exopinacoderm** and **endopinacoderm.** Endopinacoderm lines the incurrent canal.

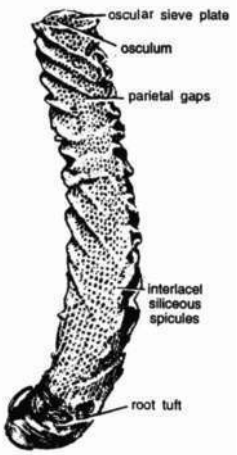
(ii) Inner <u>Choanocytic</u> layer or <u>Choanoderm</u> / Gastral layer Collar cell or Choanocytes (Flagellated)

- Characteristic of Porifera
- Choanocytes discovered by - **H.J. Clark**

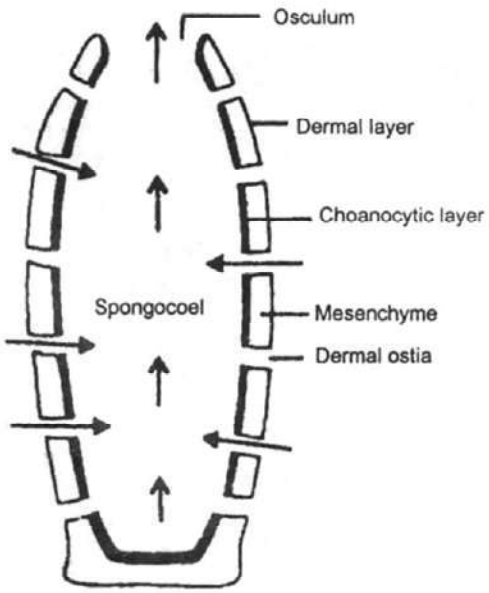
(iii) Between these two layers gelatinous material Mesenchyme (Mesohyl) is present which is non-cellular. It Consist of Amoebocytes = gives rise to different types of cells of both pinacoderm and Choanoderm

Amoebocytes

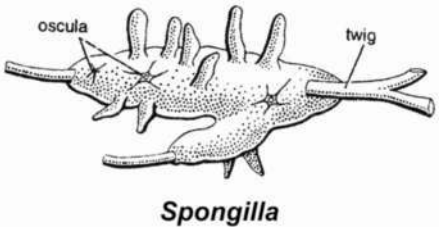
Scleroblast	–	For skeleton
Spongioblast	–	For skeleton
Thesocytes	–	For food storage (Glycogen)
Phagocytes	–	To engulf by phagocytosis
Trophocytes	–	For Distribution of food
Archaeocytes	–	Formation ova & spermatozoa (Totipotent cells)
Collenocytes	–	Connective tissue cell
Chromocytes	–	Pigmented
Myocytes	–	Highly contractile (at osculum)
Gland cells	–	Secrete shiny substance
Germ cells (Sex cells)	–	Form sperm & ova during breeding season.



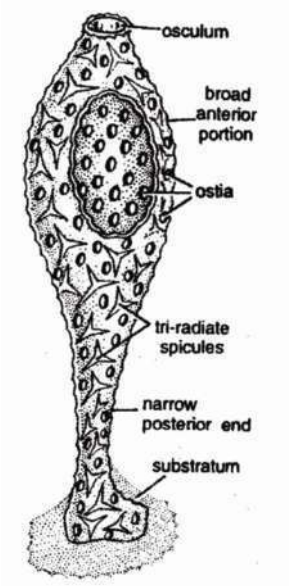
Euplectella



BODY WALL OF PORIFERA



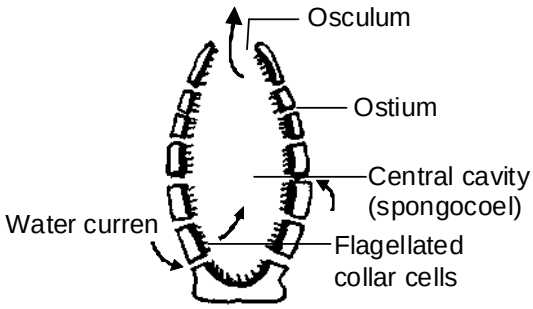
Spongilla



Clathrium (= Olynthus)

9. Body wall enclose a large cavity the **spongocoel** or **paragastric cavity.**
   Choanocytes with flagella is lined in Spongocoel and radial canal.
10. Ceaseless beating of flagella cause current of water which enter through ostia perforating porocytes and various canals and enters in spongocoel and finally leave through large aperature **osculum.**
11. **Canal system :** Canal system of porifera helps in **nutrition**, **respiration**, **excretion** and **reproduction.** Canal are developed due to folding of inner wall. There are four types of canal systems.

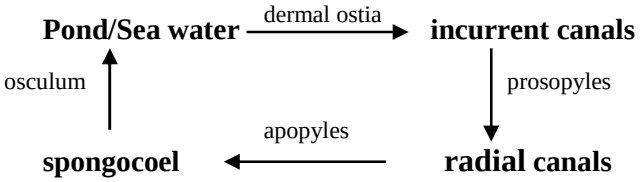
(i) **Asconoid** (Simplest canal)



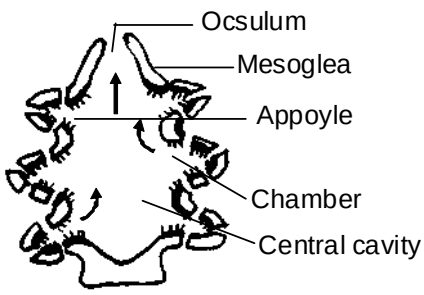
Asconoid

Ex. - Lencosolenia, Olynthus

(ii) **Syconoid**

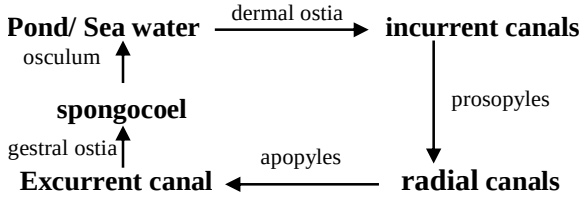


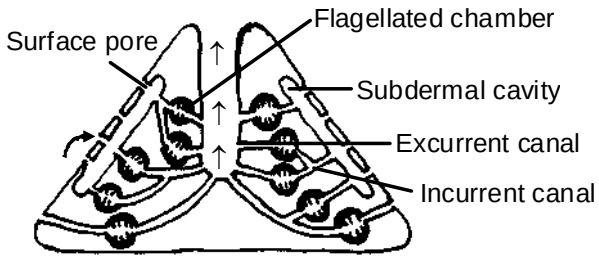
Ex. - Scypha



Syconoid

(iii) **Leuconoid** (complex and most efficient canal system)





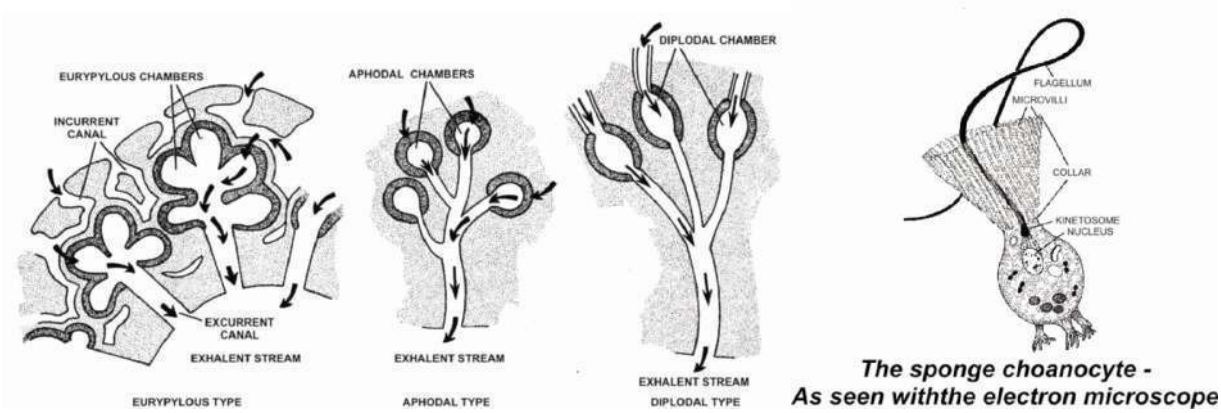
Leuconoid

Ex. - Euspongia, Spongilla

(iv) **Rhagon**

Ex. Larva of Demospongia

It is further of 3 types Eurypylous, Aphodal, Dipodal types.



The sponge choanocyte - As seen withthe electron microscope

12. Skeleton is internal, consist of tiny calcarious **Spicules (calcoblast)** or silicaceous spicules **(silicoblast)** or fine spongin fibre **(spongioblast)**, or of both located in mesenchyme.

    There are four types of spicules in sponges

    (1) Monaxon (Usually at osculum) (2) Triaxon

    (3) Tetraxon (4) Polyaxon [Hexa - radiated]

    Scleroblast secrets spicules and **Spongioblast** secrets spongin fibre.

13. **Digestive cavity** and mouth is absent. Nutrition is holozoic. Digestion is **intracellular** and occurs in food vacuoles of choanocytes.

    Food particle is taken by collar cell and pass them to amoebocyte.

    Food is stored in **thesocytes.**

    Distribution of food from ingestive cell to other is brought about by the movable amoeboid cell. -Trophocytes

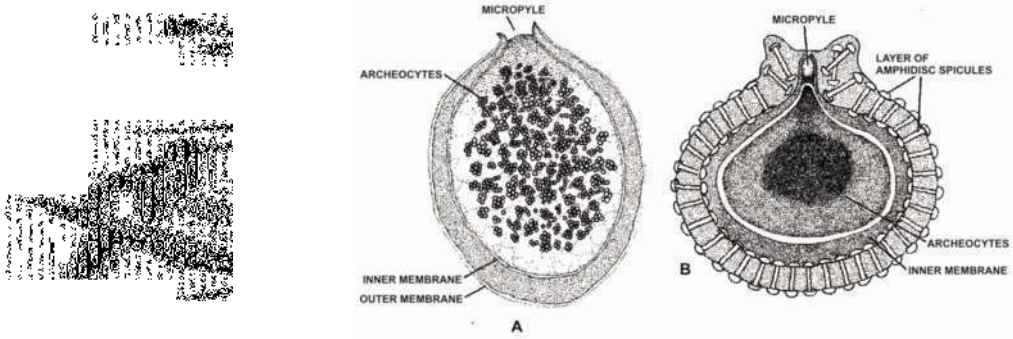
14. **Respiration** and **Excretion** takes place by diffusion of gases through body surface. Excretory matter is Ammonia.
15. Sponges do not have **nervous system.**
16. **Reproduction** takes place by means of

    (i) Asexual -

    By Fragementation : Regeneration in sponges was demonstrated by Wilson. It is brought about by archaeocytes.

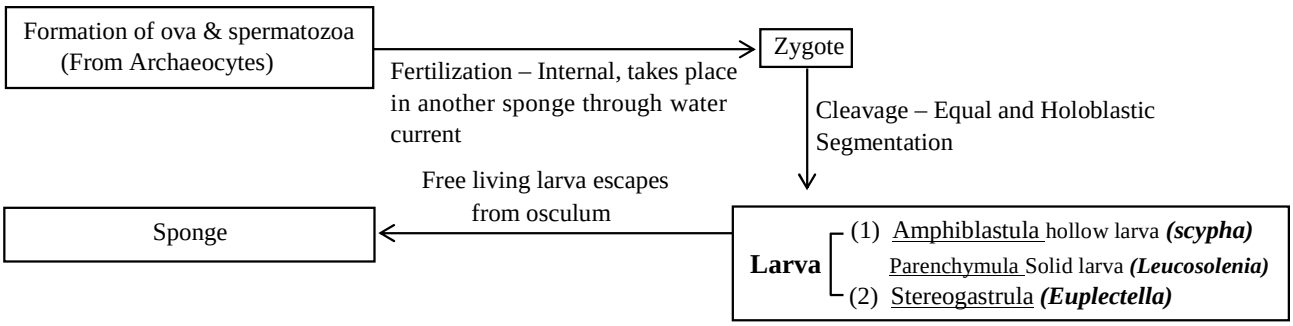
    By Budding : Special cell mass **Gemmules** containing **Archaeocytes.**

    Also called as **Endogenous budding** and the process is known as **Gemmulation**.



Sponge larvae A. The parenchymula larva of leucosolenia B. The amphiblastula larva of sycon

(ii) Sexual - Sponges are Hermaphrodite, fertilization internal and cross fertilization, Protogynous condition is found .



CLASSIFICATION OF PORIFERA

(On the basis **Skeleton** divide into three classes)

Classes	Calcarea	Hexactinellida	Demospongia
Skeleton	- Calcareous spicules	6 rayed siliceous spicular (Glass sponge)	1 or 4 rayed silicious spicules or sponging fibre or both
Choanocytes	- Relatively large.	Collar cells small	Small collar cells
Inhabit	- Exclusively marine in shallow water	Exchesively marine and inhabit in deepwater	Marine or fresh water in deep or shallow water.
Canal system	- Ascon or sycon type C.S.	Leucon type	Leucon/Rhagon
e.g.	***Leucosolenia (smallest)***	***Euplectella*** - (Venus flower basket, Bridal gift in Japan)	***Spongia (Euspongia)*** - (Bath sponge)
	Scypha (Sycon -Urn sponge	***Hyalonema*** - (Glass rope sponge)	***Spongilla*** - (Fresh water sponge)
	Leucilla	***Pheronema*** -(Bowl sponge)	***Ephydatia*** - (Sulphur sponge) Freshwater
	Clathrina		***Cliona*** - (Boring sponge) harm ful to Oyster
	Grantia		***Hippospongia*** - (Horse-sponge or Horny sponge)
			Chalina - Marmaid's gloves
			Poterion - Neptune's Cup
			Oscarella - Skeleton absent
			Chondrosina – Skeleton absent
			Halichondria – Bread sponge
			Haliclona – Finger sponge

⇒ Proterospongia = connective link between Protozoa-Porifera
⇒ Largest sponge – ***Spheciospongia***
⇒ Hypothetical simple sponge & between larva & sponge – ***Olynthus***
⇒ Shrimps – (also called as **Spongicola** fish) A crustacean, shows commensalisms with ***Euplectella***

PLYLUM-COELENTERATA

1. Leuckart coined name **Coelenterate.**
2. **Hatschek** named **Cnidaria** on the basis of stinging cells. **Peyssona**l & **Trembley** established **animal nature** of Coelenterata.
3. Cnidology-Study of cnidaria
4. Mostly **marine, few fresh-water** (Hydra.) Carnivorous, some are fixed or free floating.
5. Coelenterates have two types of **forms** (Dimorphic)

(1) Polyp	(2) Medusa
- Cylindrical in shape - Mostly sessile, but some are motile - May be solitary or Colonial - Types of structures : Gastrozooids (Hydranth) - For Nutrition Dactylozooids - For Protection Gonozooids - For Reproduction	- Umbrella like - Free swimming - Always solitary - Types of structures : Phyllozooids - For Protection Nectophore - For swimming Gonophore - For Reproduction Pneumatophores - For Swimming

Either or both zooids may occur in a species.
If both forms are found in a group it is called **Cormidia.**
If both are found in a species, two form alternate in life cycle. (**Alternation of generation** or **Metagenesis**)

6. Group of different types of zooids in polyp or medusa shows polymorphism.
7. Coelenterates are usually having **radial symmetry,** Some Anthozoans have **Biradial symmetry.**
8. Coelenterates have two **Germ layers (1) Ectoderm (2) Endoderm** i.e. They are **Diploblastic**
9. Coelenterates have **Tissue level of organisation.**
10. No head and appendages. The oral end (mouth) often bears slender, flexible process hollow tentacles.
11. **Body wall** consists of -
    (a) Epidermis (Outer layer) **-** Formed of 7 different types of cells.
    Stinging cells or **<u>Nematoblast</u>** or Cnidoblast (for offence & defence) characteristic of coelenterata.
    Inject **Hypnotoxin.**

Cnidoblasts : A – Undischarged ; B – Discharged discovered and regeneratin in *Hydra*.

Interstitial cells (Totipotent and act as reserve to replace worn out cells/germ cells/Nematocyst); Epithelio - muscular cells ; Glandulo – muscular cells ; Sensory cells ; Germ cells

(b) Gastrodermis (Inner layer) - Formed of 5-different types of cells such as
Endothelia - muscular cells or Nutritive cells (with food vacuole) ; Interstitial cells ; Sensory cells; Nerve cells ; Germ cells

12. Between these two layers, gelatinous **Mesogloea** is present which contain free cells. **Mesogloea** is secreted by both the above layers.

- **Structure of nemetocyte :** The cytoplasm of a cnidoblast contains a conspicuous nucleus lying to one side, and a oval or pyriform sac filled with a poisonous fluid, **hypnotoxin**. The sac is known as the **nematocyst.** The outer end of nematocyst is invaginated into a long, hollow, and tubular thread tube, coiled like a watch-spring inside the sac itself. The tip of thread tube is open and its base is swollen to form the **butt or shaft.** The inturned thread is covered over at the base by a lid-like structure, the operculum. At the base of the thread tube pointing inward are three large spines, called **barbs or stylets,** and three spiral row of minute spines, called **barbules or spines.** The outer end of the cell projects freely beyond the epidermal surface, as a tiny, pointed process, the cnidocil; a restraining thread, called ***lasso,*** **is attached to the base of nematoblast. It prevents the nematocyst from being thrown out of it.**

- **Occurence of nematocysts :** The nematocysts occur scattered mostly singly, throughout the epidermis of the body but remain absent on the basal disc. They are abundant in the epidermis of the oral region and the tentacles where they cluster as wart-like **''nematocyst batteries''.**

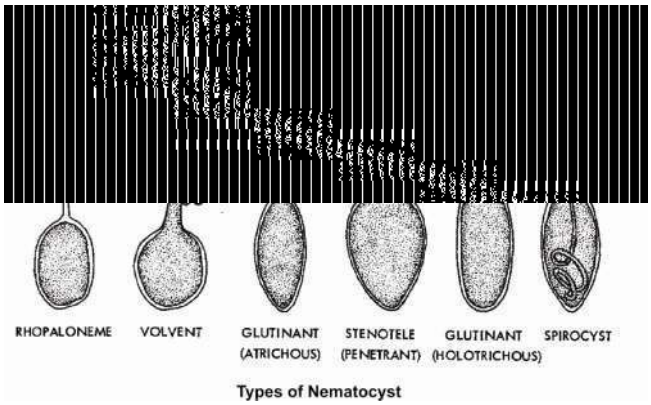
- **Mechanism of discharge :** The sudden eversion of the thread tube is caused by an increased osmotic pressure inside the capsule, probably due to rapid intake of water. As a result, the lid is forced open, the thread tube turns inside out and the entire nematocyst explodes to outside. Under normal conditions, the discharge is brought about by mechanical stimulation of the cnidocil, such as contact with prey. The thread tube once

discharged cannot be withdrawn. Such nematoblasts migrate to the gastrovascular cavity and are digested, to be replaced by fresh nematoblasts, developed from the interstitial cells.

- **Types of nematocysts :**

(a) ***Penetrant*** or **stenotele** is the largest and most complex nematocyst. It's structure has been discussed earlier. When discharged it pierces the skin or chitinous exoskeleton of the prey and injects the poisonous fluid, *hypnotoxin,* that either paralyzed the victim or kills him.

(b) ***Volvent*** or ***desmoneme*** is a small and pear-shaped nematocyst. It contains a short, thick, spineless, smooth and elastic thread tube forming a single loop and closed at the far end. When discharged, it tightly coils around the prey. They are smallest nematocysts.



Types of Nematocyst

(c) ***Stereoline glutinant*** or ***atrichous isorhizas.*** The thread tube is long with a narrow butt and forms three or four transverse coils. It bears a spiral row of small spines and may coil upon discharge.

The glutinants secrete a sticky substance possibly used in locomotion by fastening the tentacles of Hydra to solid objects as, well as in food-caputre.

13. Body of coelenterates may be supported by horny or calcareous exoskeleton.
14. Cavity of the **Coelenteron** is having single aperture. Mouth serve both purpose i.e. **incomplete digestion tract (Blind sac).**

    Digestion is first time **Extra-cellular** as well as **Intracellular** i.e. takes place in Coelenteron as well as food vacuole. Coelenteron is also responsible for distribution of food besides partly digesting it. This dual role named coelenteron as **Gastrovascular** cavity.
15. **Respiration** and **Excretion** takes place by diffusion of gases through **body surface.**

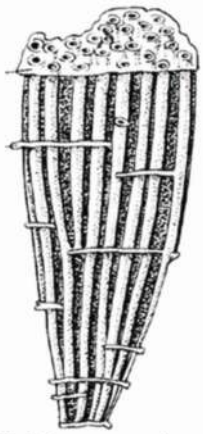
    Excretory matter is Ammonia.
16. **Nervous system** present both in polyp & medusa and form a loose net work of nerve fibres on either side of mesogloea (Diffused type). Neurons are non-polar. Sensory cell are also present. Medusa have sense organ **Rhopalia** or **statocyst/**Tentaculocyst.
17. Sexes may be separate or united. Coelenterates can reproduce **Asexually** by Budding (Polyp) and by **Sexually**-(Medusa).
18. Gonads have no duct. Fertilization may be **External** or **internal**. Cleavage is **Holoblastic.**
19. Development includes larva.
20. Larva of ***Obelia*** – **Planula** (free living) and **scyphistoma** larva fixed polyp like.

    Larva of *Aurelia* – **Ephyra** , Scyphistoma

METAGENESIS AND POLYMORPHISM

Colenentrata members shows polymorphism most common is polyp & medusa forms.

In the life-cycle there is an alternation of the asexual polyp phase and the sexual medusa phase and it is termed as **Metagenesis**.



Tubipora musica
(Skeletan of entire colony)

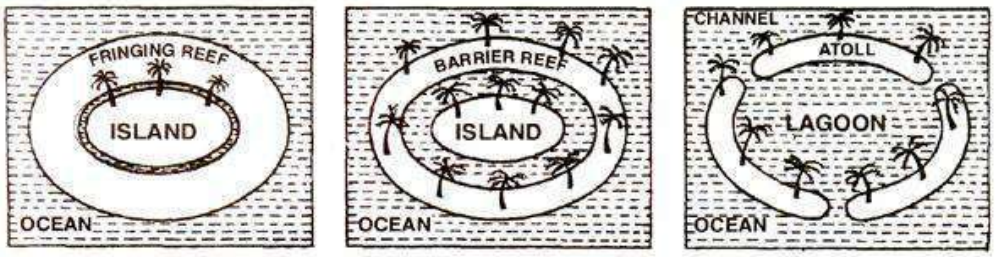
Coelenterata is classified into three classes		
Hydrozoa	**Scyphozoa**	**Anthozoa (Actinozoa)**
– Fresh water as well as marine – Polyp & medusa often show polymorphism & metagenesis. – Polyps with manubrium – Medusa have a velum (Craspedote) – Mesogloea is Acellular – Gastrovascular cavity undivided. – Gonads are Ectodermal and shed gametes directly in to the surrounding water. – Cnidoblast is present only in epidermis e.g. **Hydra -** Fresh water polyp **Obelia -** the sea fur, (Polyp, Blastostyles, Medusa shows metagenesis) **Physalia -** the Portuguese man-of-war. (Neurotoxic, gas gland present) **Bougainvillea** **Porpita** **Vellela -** Little sail **Tubularia** **Millipora (Sting coral)**	– Exclusively marine – Medusa form is more common – Polyp form reduced or absent and have small manubrium – Velum absent. [Acraspedote] – Mesogloea is thick, gelatinous and contains cells. – Gastrovascular cavity undivided. – Gonads are Endodermal and shed the gametes into the digestive tract when escape through the mouth. – Cnidoblast is present in epidermis & Gastrodermis e.g. **Aurelia -** the Jelly fish, Moon jally, Larva - Ephyra **Rhizostoma -** Many mouth (Polystomum) **Pilema** **Cyanea -** Sun Jelly **Atolla** **Periphylla**	– Exclusively marine – Only polyp form – No manubrium – Velum absent. – Mesogloea contains cells & fibres – Gastro vascular cavity have compartment i.e. mesenteries – Gonads -Endoermal and shed gametes into the digestive tract escape via mouth – Cnidoblast is present in epidermis & Gastrodermis e.g. This class has two types of animal (1) **Anemones** - Skeleton absent **Adamsia** - sea anemone **Metridium** - Sea anemone (2) **Coral** - $CaCO_3$ Skeleton **Astraea** - the star coral **Pennatual** - the sea pen **Gorgonia** - the sea fan **Pteroides** - Sea feather **Renilla** - Sea pansy **Tubipora** - Organ - pipe coral **Alcyonium** - Dead man's finger (Soft coral) **Corallium** - Red coral (Moonga) **Heliopora** - Blue coral **Oculina** - Eye coral **Meandrina** - Brain coral **Madrepora** - Stag-Horn coral **Fungia** - Mushroom coral

- **Coral Reefs :** A coral reef is a ridge or mound in a shallow, tropical sea, has its upper surface near the surface of water, supports a variety of animals and plants. It is formed of calcium carbonate produced by some of its

inhabitant, chiefly medreporarian corals. Coral reefs form stable marine ecosystems. The coral reefs are of three kinds :

(i) Fringing Reefs : The coral reefs lying close to the shores of some volcanic island or part of some continent are called the **fringing reefs.** Hawaiian is lands are an ideal example of permanent fringing reefs.

(ii) Barrier Reefs : They are like the fringing reefs but are located some distance from the shore. The stretch of water of **lagoon** separates the barrier reefs from land. **Australia's Great Barrier Reef** is an example of such a reef which is about 900 nautical miles long and 90 miles from sea shore.



Different types of coral reefs

(iii) Atoll reefs : An atoll reef is also called **coral island** or **lagoon island** which is a circular or horse shoe shaped reef that encircles a lagoon but not an island. It may be complete or broken by a number of channels of which only a few are navigable. The Lakshadweep and Maldive islands in the Indian Ocean are composed of Atoll reef.

PHYLUM – CTENOPHORA

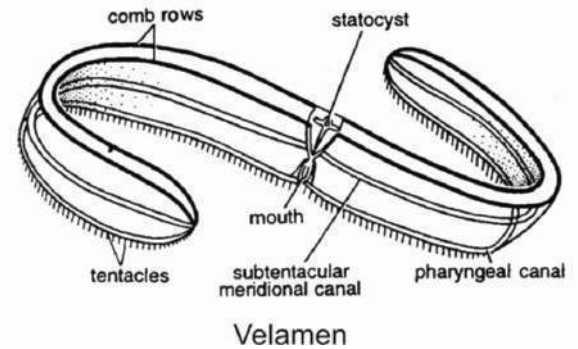
1. **Ctenophora** name was given by **Eschescboltz.** Commonly called **''Sea-gooseberries''** or **''Comb-jellies''** or **''Sea-walnuts''.**
2. Nematoblasts are absent, so they are also called **''acnidaria''**
3. Exclusively **marine** and **pelagic** (float on sea surface) and show **Bioluminescence.**
4. Body form may be **spherical, cylindrical** or **Pear-shaped.**
5. Body is soft **transparent** jelly like having **Biradial symmetry** with **tissue grade** body organization.
6. **Triploblastic** Mesoglea contains amoeboid **mesodermal cells called Colloblast,** Amoeboid cells and smooth muscle cell.
7. Locomotion takes place by the presence of **8 ciliary comb plates** on the body surface.
8. Special sensory structure statocyst at the opposite end (absoral end) of the mouth is present.
9. Tentacles may be present or absent. **When present, the number of tentacles are 2.** They are solid and possess adhesive cells called as **colloblasts** (lasso cells).
10. Digestion is both extracellular and intracellular. These are carnivorous animals.
11. The **animals move by cilia,** which join together to form **comb plates,** there are eight median comb plates forming locomotory organs.
12. Resp. system, skeletal, circulatory & excretory system are absent. Nervous system is diffuse type.
13. All animals are **Bisexual.** Complex type of **sexual reproduction** is found. Metagenesis is absent. Gonads = endodermal, Fertilization is external.
14. Regeneration is normally found.
15. Development is of **indirect type.** Life cycle involves a free living **Cydippid** larval stage.
16. Cleavage is **Holoblastic** determinate and **unequal.**

17. Asexual reproduction is absent.
18. **Regeneration** & **paedogenesis** is normally found.

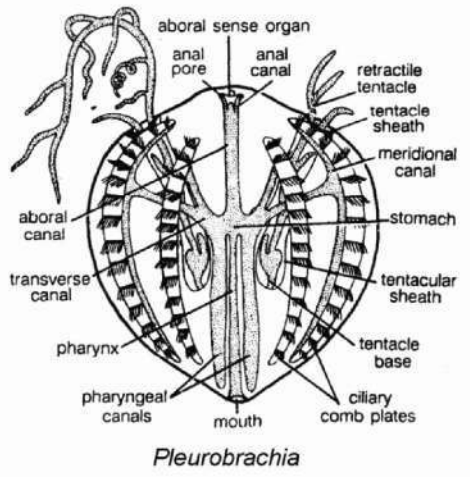
Ctenophora is divided into **two classes** on the basis of presence or absence of tentacles

TENTACULATA (Tentacles present)
e.g. Pleurobrachia
Velamen
Cestum – ''Venus's girdle''
Ctenoplana – Commensal with **Alcyonium.**
Hormiphora
Euchlora rubra – with cnidoblast (Exception)

NUDA (Tentacles absent)
Beroe - Swimming eye of cat.



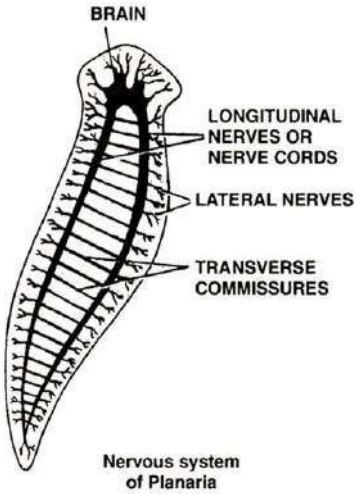
Velamen



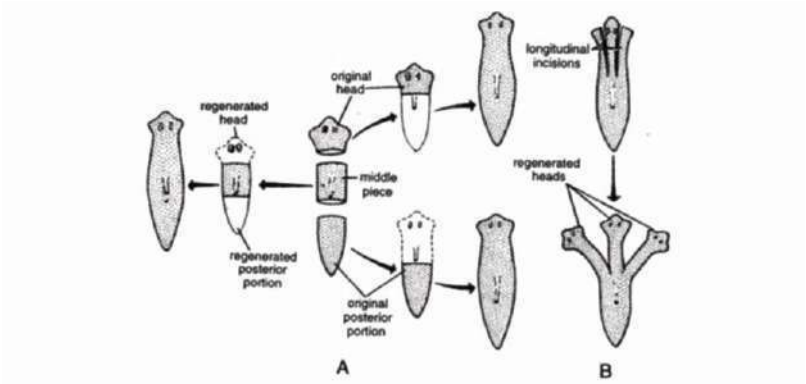
Pleurobrachia

PHYLUM – PLATYHELMINTHES

1. **Gagenbaur** suggested the name **Platyhelminthes.** Includes flat worms, **free living** (terrestrial, fresh water or marine) or **parasitic.**
2. Study of worms causing parasitic infestation in human is **Helminthology.** Most members of this phylum are the parasites of vertebrate. Some are found in aquatic habitat.
3. Body organisation is of organ and organ system level of organisation.
4. Body is **Triploblastic.**
5. Body is **Bilaterally** symmetrical. Ist bilateral animals.
6. Anterior and posterior parts are clear. (Ist phylum to have **cephalization**).
7. Locomotary organs are absent in these animals but **adhesive organs** are present like **suckers, hook** etc.
8. Epidermis is **syncytial** and is some times ciliated. On the body wall of parasitic animals a thick cuticle is present which protects from the digestive-enzymes of the host. It is secreted by Epidermis.
9. Muscles in the body-wall are **mesodermal.** Below the epidermis **longitudinal, circular** and **oblique** muscles are present.
10. **Nervous system** is **Primitive** and **ladder like** having brain ring and 1-3 paired longitudinal nerves connected at intervals by transverse commissures. Sense organs occur in free living form.



Nervous system of Planaria



Regeneration in planarians
(A) Three individuals regenerate from an individual cut into three parts
(B) Formation of a heteromorph with three heads

11. These are **acoelomate.** In between various organs a solid, loose mesodermal tissue called **Mesenchyma** or **Parenchyma** is present, which helps in transportation of food material.
12. In Turbellaria and Trematoda classes an **incomplete** (Blind sac body plan and without anus) digestive system is present. In animals of class Cestoda, digestive system is completely absent.
13. **Skeleton** and **circulatory** systems are absent. Turgidity of the fluid in the parenchymal meshes maintains the form of the body (Hydroskeleton).
14. Animal **respire** through **body surface. Anaerobic** respiration in internal parasite like Taenia.
15. **Excretory** organs are **protonephridia** or flame-cells. **Flame - cells** are also termed as the **Solenocytes.** They also help in **osmoregulation.**

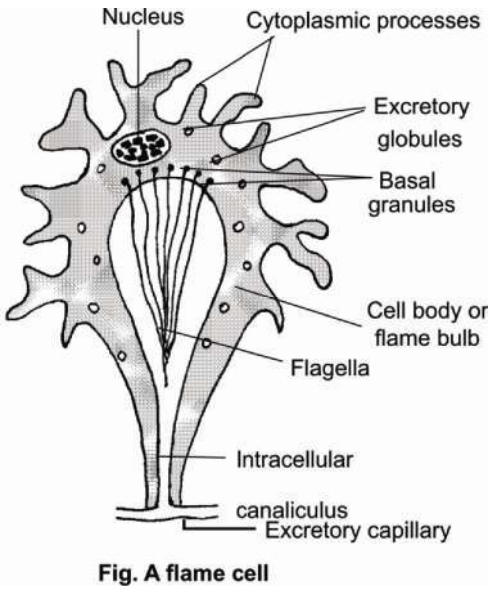


Fig. A flame cell

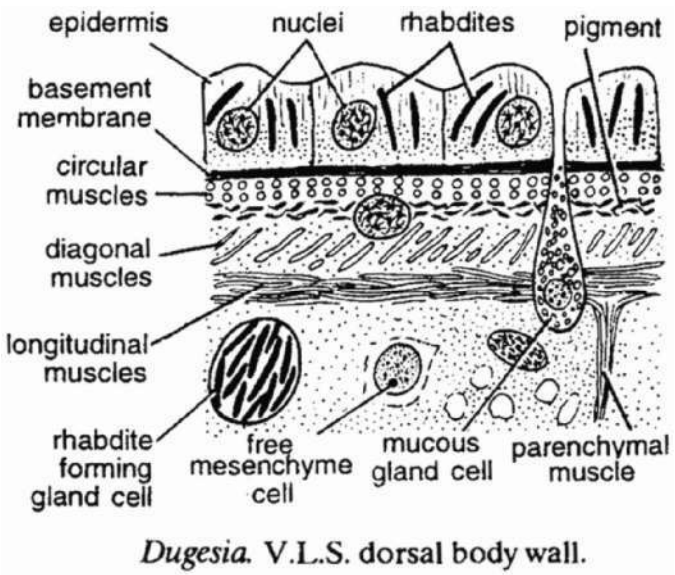


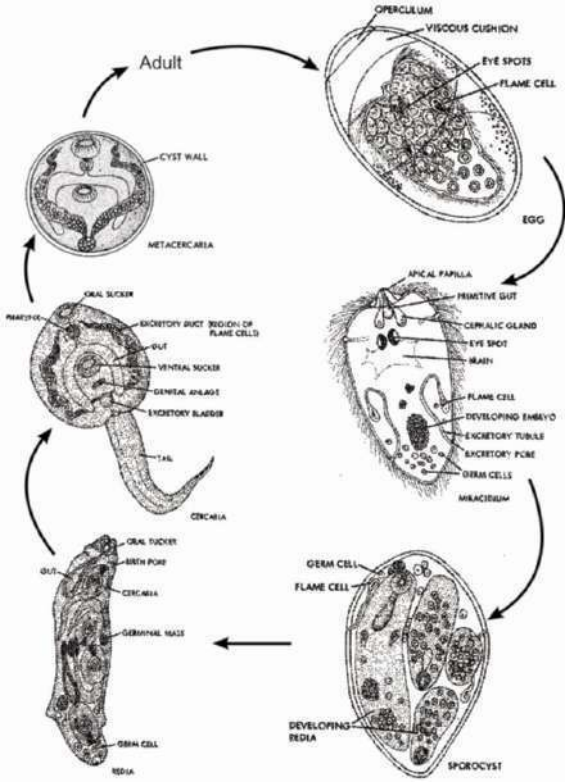
Dugesia. V.L.S. dorsal body wall.

16. All animals of this phylum are **Bisexual** except **Schistosoma** (blood fluke). Reproductive system is **complex** and well-developed. **Fertilization** may be **self** or **cross** and **internal.** Cleavage is **spiral** & **determinate.**
17. Development may be **direct** or **indirect.** In indirect development, larva may be one or of more types. In these animals **yolk/vitelline glands** are present which provide nutrition to the eggs.

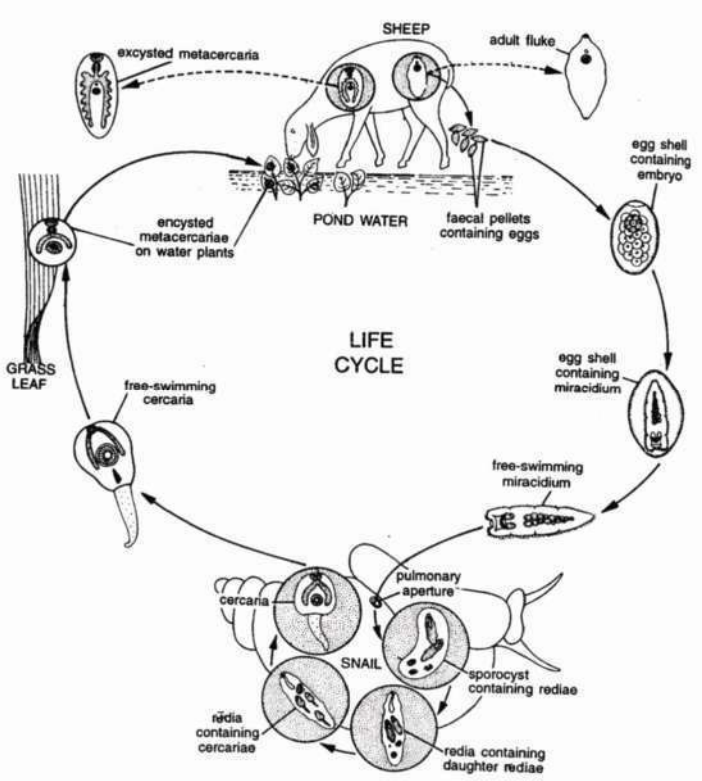
CLASSIFICATION

Divided into three classes

Turbellaria	Trematoda	Cestoda
– Free living fresh water or marine known as Planarians or Eddy worm. – Body is unsegmented and leaf like covered by delicate ciliated epidermis Rod shaped Rhabdites in epidermis. – Mouth is often ventral and anus absent. Alimentary canal is present. (Branched) – Reproduction - asexual sexual and shows good power of regeneration, no larva. – Suckers - absent e.g. **Dugesia - (Planaria)** **Dugesia** (Planaria) - fresh water, Nocturnal, Cannibalism, slow creeping omnivorous. Sexual as well as asexual (Transverse Binary fission), good power of regeneration. Pharynx can be everted. Reproduction **Microstomum** -Enemy of **Hydra** **Macrostomum** **Mesostoma** **Gunda** **Convoluta** - Symbiont on **Zoochlorella** and Diatoms, algae. **Ichthyophaga** -Parasite on fishes.	– Endo-Parasite, known as flukes, or flat worms. – Body-Unsegmented and leaf like, covered by tegument, (Fine spines) No epidermis in adult. – Mouth - anterior & anus is absent. Alimentary canal-branched. – Life history - includes larval stage & involve, more than one host. – Suckers - for attachment in the host e.g. **Fasciola** (Sheep liver flukes) Cause liver rot disease Prim. Host - Sheep & Goat Sec. host – Snail (Planorbis ; Limnea ; Bulinus) Show polyembryony , Life-cycle involves, Miracidium, Sporocyst, Redia, Cercaria and Metacercaria larval form Miracidium (free-swimming larva). **Schistosoma** (the blood flukes) **Paragonimus** (Lung fluke worm) (In lungs of man and pig) **Diplozoon** - Ectoparasite on the gills of fish. (Monogenetic) **Opisthorchis** - Human liver fluk or chinese liver fluk	– Endo-Parasite Intestinal parasite, known as tape worms. – Body-Ribbon like, covered by tegument. No epidermis in adult. – Mouth and Anus absent (food from body surface). Alimentary canal absent. –Life history - includes larval stage & involve, more than one host. Each proglottids has one or two sets of male & female reproductive organ. – Scolex has suckers & hooks for attachment – Body divided into scolex, neck and strobilla of few to numerous proglottids. No true segments **Taenia solium** - Pork tapeworm Prim. Host = Man (cysticercus in the infective stage) Sec. Host = Pig (Concosphere is the infective stage) Shows multiplication in larva stage namely – Oncosphere, Hexacanth, Bladderworm and Cysticercus. Causes disease Taemiasis or Cysticercosis. **Taenia saginata** - Beef tapeworm **Echinococcus** - Dog tapeworm **Hymenolepis** - Smallest tapeworm in man's intestine - 10 cm, 200 proglottids (Monogenetic) **Amphilina** **Rellietina** - Bird's tape worm **Phyllobothrium** **Moniezea** - Endoparisite of ruminates



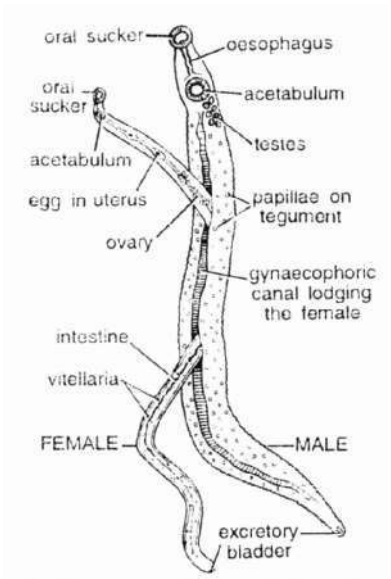
Different Larval forms of Fasciola Hepatica



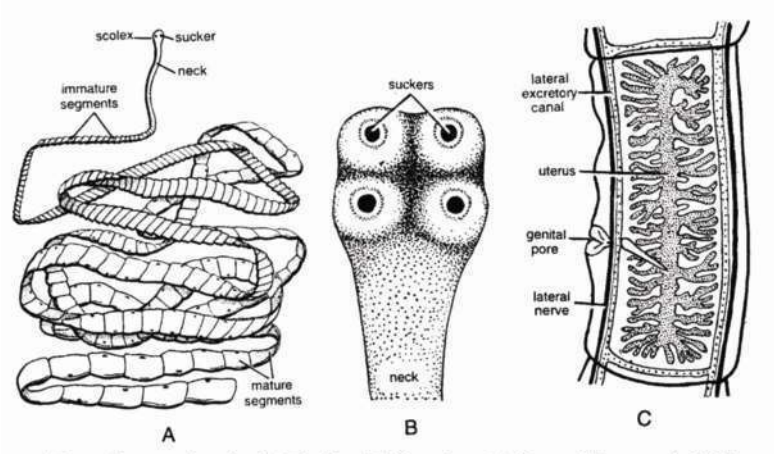
Life Cycle of Fasciola Hepatica

FASCIOLA HEPATICA

It is a sheep liver fluke. It causes liver rot in them. Its complex life cycle have many stages. One larvastage produces many other larva. This is termed as **polyembryony** According to Steenstrup liver fluke also shows metagenesis. It performs asexual reproduction in immature stage i.e. in sporocysts & rediae during adult stage it reproduced sexually.



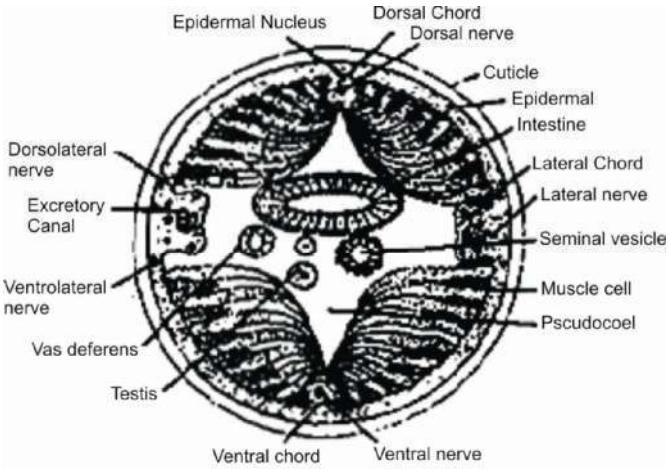
***Schistosoma* Male and Female**



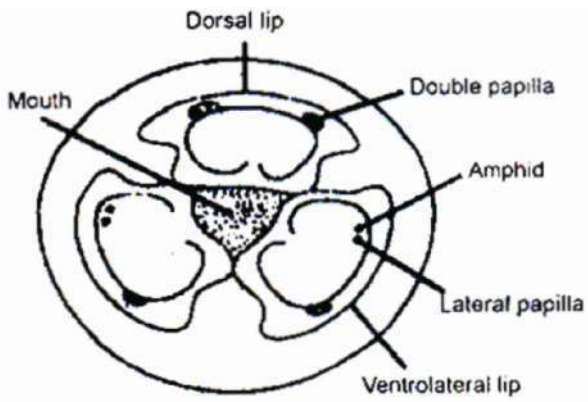
***Taenia saginata* A-Entire B-Scolex C-Gravid proglottid**

PHYLUM - ASCHELMINTHES (NEMATHELMINTHES OR NEMATODA)

1. **Grobben gave the name = Aschelminthes**.
2. **Gagenbaur** named as Phylum Nemathelminthes. Phylum includes round worms.
3. Aquatic, tarrestrial, free-living or parasites.
4. Animal of this phylum are **Cylindrical,** tapering at both end **without** segmentation.
5. **Bilaterally Symmetrical - Triploblastic, Organ-system** level and having **tube within tube plan.**
6. Anterior end does not show distinct head.
7. No appendage.
8. **Body wall** consist of
   Cuticle - Firm, non living, resistant to digestive enzymes of host.
   Moult (changed) many times during growth period (usually four times).
   Epidermis - Syncytial
9. **Muscle layer** - Longitudinal fibres divided into four quadrants. (each with 150 muscle cells)



Body Plan of Ascaris



Mouth and Lips Ascaris

10. **Body cavity** is **Pseudocoel** (developed from blastocoel) and contain **Pseudocoelomic fluid.**
11. High fluid pressure in the pseudocoelom maintains body shape. It is called **Hydroskeleton.**
12. **Digestive tract** is **complete** and differentiated into mouth, pharynx, intestine & Anus. Mouth is surrounded by 3 - lips having sensory papillae and amphids. Pharynx is **muscular.** It is used to suck food. Intestine is non muscular.
13. **Respiration** is through body surface by diffusion.
14. **Circulatory system** is undeveloped.
15. **Nervous system** comprises of circum pharyngeal ring (Brain).
16. Sense organs like **Papillae** (Tangoreceptors), **Amphids** (chemoreceptor) are present on lip. Paired unicellular **Phasmids** (chemoreceptor) are found near hind end of body.
17. **Excretory system** is H-shaped formed by single cell called **Renette cell.** Excretory substance is **ammonia**.
18. **Reproductive system** is developed and sexes are generally separate. **Sexual dimorphism** is present. **Male** is smaller than female and curved from its caudal end.
    Male has penial spicule for copulation. Genital tract joins digestive tract to form cloaca.

Female is larger than male and straight. Genital tract open independently. Female lays numerous eggs with Chitinous shell.

Fertilization is **internal** and development is mostly **direct**.

Cleavage is **Holoblsatic spiral** and **determinate** type.

Number of cells are **fixed** from larva to adult such development is known as **Eutely.**

CLASSIFICATION

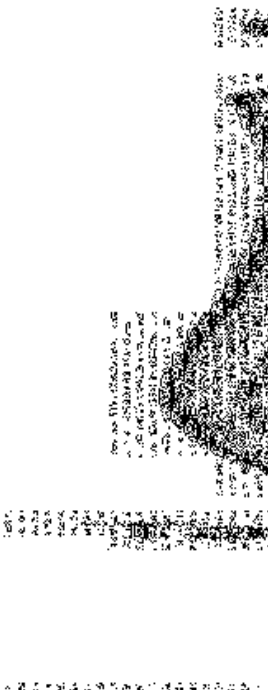
On the basis of caudal receptor or phasmids, Aschelminthes can be divided into 2 classes-

Aschelminthes

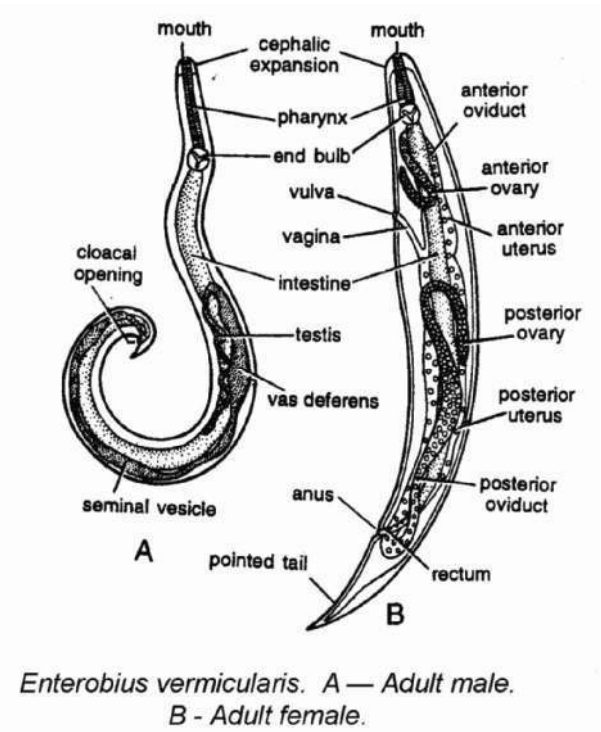
Class

Aphasmidia | Phasmidia

Class–Aphasmidia	**Class–Phasmidia**
(i) Members of this class lack phasmid. (ii) Many types of amphids are found. (iii) One pairs of excretory canal are present. (iv) Caudal adhesive glands are found. **Ex. : Enoplus , Desmoscolex, Trilobus, Lapillaria**	(i) Phasmid is present. (ii) Caudal adhesive glands are not found. **Ex. : Ascaris, Entrobious, Wuchereria**



(A) Male, (B) Female



Enterobius vermicularis. A — Adult male. B - Adult female.

Ex – Ascaris

- It is parasite of small intestine.
- It is also called **round worm**.
- **Rhabditiform larva** exists in the life cycle of Ascaris.
- Ascaris leads to disease called **Ascariasis**.
- **Infective stage** of *Ascaris* to man is embryonated egg with 2nd stage juvenile.

– **Trichinella spiralis (Trichinia worm) :** occur in voluntary muscles cause trichinosis.
– **Trichuris trichiura**
– It is also called **whipworm**.
– It is parasite of large intestine of man.
– No larval stage in the life cycle.
– It leads to **anaemia** and **Diarrhoea.**
– **Enterobius**
– It is also called **pinworm** or **seatworm**.
– It is parasite of human intestine.
– It causes **enterobiasis**.
– No intermediate host.

Ancyclostoma

– Cause - Ancyclostomiasis.
– It is also called hookworm.
– Its larva penetrate through sole of the person.
– Live in intestine and suck tissue fluid.

Wuchereria

– It is also **filaria worm**.
– Its life cycle gets completed in two hosts. Man is the primary host, while female culex/Aedes mosquito is the secondary host.
– It leads to a disease called **Elephantiasis**.
– Adult worm blocks lymph duct this leads to swelling of limbs.
– Females are ovoviviparous. Female lays juvenile microfilaria.
– Infective stage to man is microfilarae.

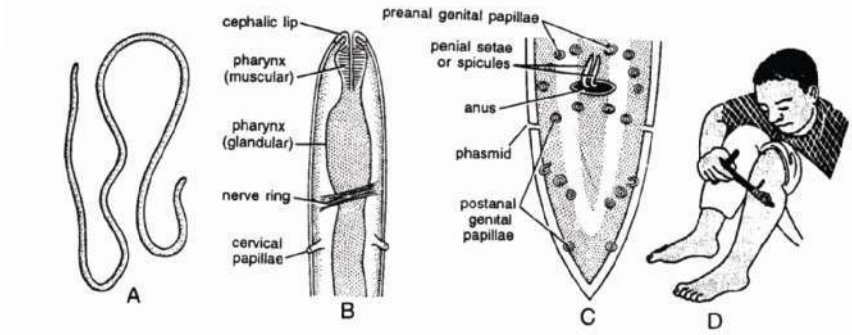
Dracunculus

– They are also called **Guinea worm** and also referred to as "fiery serpent".
– They are digenetic, man is the primary host while **waterflea** (*Cyclops*) is the **secondary host**.
– Completely eradicated from India (eye worm)

Loa-loa (eye worm)

– Found in subdermal connective tissues. Some times they pass across eye ball.
– Tabanas fly act as vector.

Loa loa - Adult across the bulbar conjunctiva ofr human eye



Dracunculus medinensis **A – Entire worm. B – Anterioe end of male. C – Posterior end of male in ventral view. D – Guinea worm being wound on a stick.**

PHYLUM – ANNELIDA

1. **Lamarck** coined the term **Annelida.**
2. Free living found in moist soil, fresh water, sea or few are parasite.
3. Body is Soft, elongated, cylindrical or flattened divided into segments or metameres by ring like, grooves called Annuli.
4. **Symmetry – Bilateral, Triploblstic, Organ-system** level having **tube within tube plan, metamerically segmented.**
5. Anterior end forms a distinct head with sense organ in few annelids.
6. Appendages are simple unjointed, and locomotory having **Chitinous Setae** and **Parapodia with setae.**
7. **Body wall** consist of

   Cuticle – Thin moist albuminoid cutical allow free exchange of gas.

   Epidermis – Single layered epidermis made up of supporting cell, sensory and glandular cell.

   (i) Muscle layer –

   (1) Circular layer**,**

   (2) Longitudinal layer. Muscle are smooth/unstriated.

   Body wall may have minute chitinous setae.
8. Locomotion by means of setae or parapodia or both. Absent in leeches.
9. **First Protostomi animals.**

   Body cavity is true coelom lined by mesodermal coelomic epithelium **(Schizocoel.)**

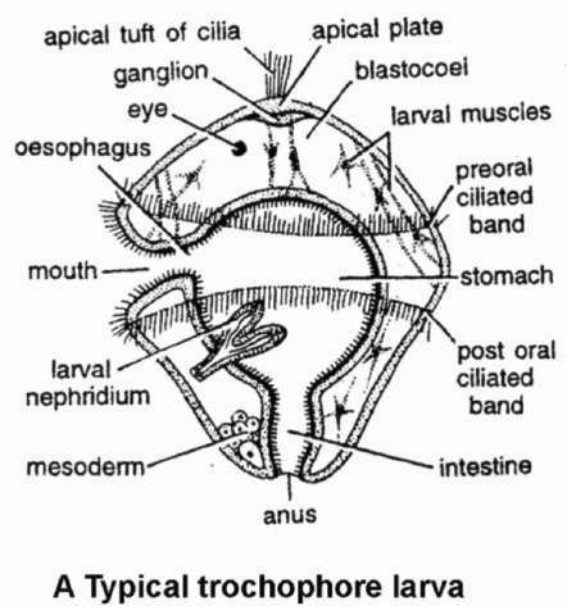
   It is divided by transverse septa into compartment. It is filled with coelomic fluid that contains cells.
10. As such there is no **Skeleton.** Fluid filled coelom serves as a **hydrostatic skeleton.**
11. **Digestive tract** is **complete,** straight and extends through entire body. The gut has both circular and longitudinal muscles. Few annelids are **sanguivorous.** Digestive gland are developed for the first time in Annelida.
12. **Respiration** is through moist **skin** i.e. **Cutaneous respiration**. Some have **gills** (branchial respiration).
13. **Circulatory system is closed.** Some blood vessels enlarge to act as pumping heart. (Heart appear first time in annelids). The blood is red with haemoglobin dissolved in plasma **(Erythrocruarin).** It has amoeboid corpuscles only.
14. Few Annelids like ***Sabella*** have **Chlorocruarin** as a respiratory pigment.
15. **Hirudinaria** has circulatory system with **haemocoelomic system.**
16. **Excretory organ is Nephridia.** Coiled tubules also helps in osmoregulation.

   Excretory matter (1) **Ammonia** in aquatic form (2) **Urea** in land form
17. **Nervous system** consist of a **circumentric nerve ring,** double, midventral, nerve cord with ganglia. Sense organ chemoreceptor, photoreceptor & tentacle, palp, eyes may be present.

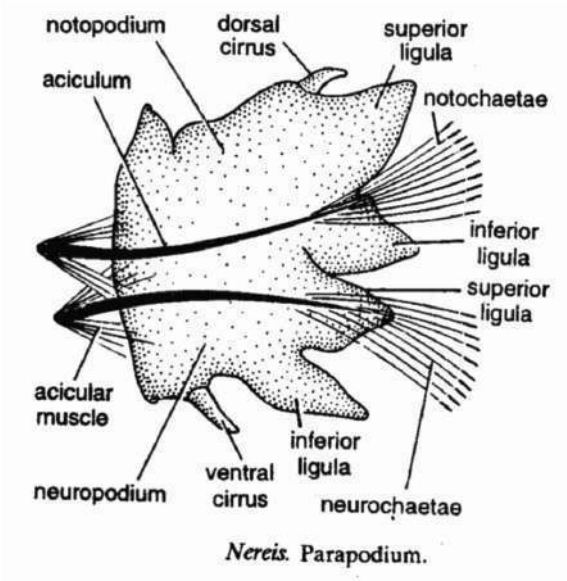
18. Sexes may be separate or united. **Asexual** reproduction by **budding** or fission. In some cases. **Atoke** (asexual), **Epitoke** (sexual) phenomenon also found ***(Nereis).***
19. Cleavage is **spiral** and **determinate unequal & holoblastic.** Regeneration is usually found. Life history includes a **trochophore** larva in few annelids.

NEREIS

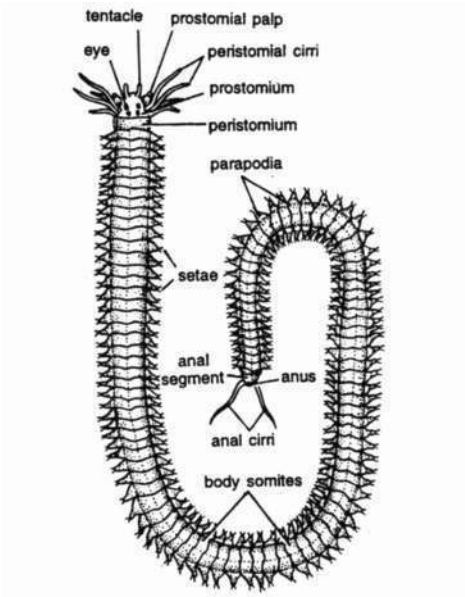
Inhabits in sea - shore between tide mark, burrower, nocturnal, carnivorous, gregarious, fertilization - in sea. Parapodia in each segment except first & last. During breeding body divides in two parts. Anterior asexual part - **Atoke** and posterior sexual portion **Epitoke**. This change is known as **epitoky.**



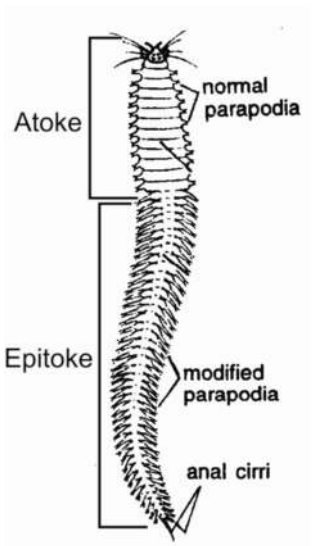
A Typical trochophore larva



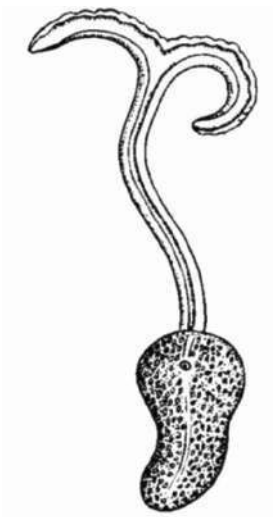
Nereis. Parapodium.



Nereis. External features in dorsal view.



Heteronereis



BONELLIA VIRIDIS, ENTIRE ANIMAL (FEMALE) WITH THE PROBOSCIS MODERATELY EXTENDED

CLASSIFICATION OF ANNELIDA

Based on presence or absence/of Parapodia, Setae and Sense organs

Polychaeta	Oligochaeta	Hirudinea	Archiannelida	Echiuridia
1. Almost all are marine	1. Most of the members are terrestrial, but some are aquatic.	1. Aquatic, terrestrial, ectoparasite and sanguivorous.	1. All Marine	1. Without external and internal segmentation.
2. Cephalisation is more distinct. Head with well developed eyes, tentacles and olfactory palps.	2. Cephalisation absent. No distinct head, eyes, tentacles and olfactory palps.	2. Cephalisation absent. No distinct head, eyes, tentacles and olfactory palps.	2. Cephalistion absent. No distinct head, eyes, tentacle present and olfactory palps.	2. Seate are rare and usually have long prostomium or proboscis. e.g., **Bonelia, Echiuris**
3. Setae numerous and are present in parapodia helps in locomotion and also in respiration. Suckers are absent.	3. Setae for locomotion. Number of seatae is limited and situated in setal sac present in body wall, a single setae is present in a bag. Parapodia & sucker are absent.	3. Parapodia and seatae are absent. Suckers at both the ends.	3. Parapodia and seatae are absent.	
4. Clitellum absent	4. Clitellum is present permanently for cocoon formation. Fertilization is external and is held in cocoon.	4. Clitellum (9-11 segments) develop only in breeding season.	4. Clitellum absent.	
5. Animals unisexual and gonads are formed only during breeding season.	5. Bisexual or hermaphrodite cross fertilization & external.	5. Animals of this class are bisexual. Fertili zation is external.	5. Animals are unisexual	
6. Development is indirect. Larval stage is called Trochophore.	6. Development is direct. No larva.	6. Development is direct.	6. Development is indirect. Larval stage is called Trochophore.	
e.g. ***Nereis*** – Sand worm/clamworm ***Aphrodite*** – Sea mouse ***Arenicola*** – Lug worm ***Seballa*** – Peacock worm ***Chaetopterus*** - paddle worm Shows bio-florescence, great power of regeneration. ***Eunice*** – Palalo worm ***Polynoe*** –	e.g. ***Pheretima*** ***Eutyphaeus*** ***Lumbricus –*** European earthworm ***Dravida*** ***Megascolex –*** Largest earth worm (S. India) ***Dero*** – Fresh watered ***Nais*** – Fresh watered ***Tubifex*** – Blood worm (Fresh water) Indicator of organic loading	– Number of segments are fixed ie. 33 segments. Each segment subdivided into numberous rings. called "Secondary external annulation" – Anticoagulant Hirudin – in the saliva – Saw like chitinous teeth in buccal cavity Circulation with haemo-coelomic system. – Coelom is divide in tubes having coelomic fluid and	– Segmentation is Mainly intermal e.g. ***Polygordius*** – Connecting-link between Annelida & Mollusca (living fossil) Larva known as Loven's Larva ***Protodrillus*** ***Dinophilus*** ***Nerilla***	

Scale worm ***Terebella*** - respire by gills ***Glycera*** – Smooth blood worm		haemoglobin. A special mesodermal tissue Botryoidal tissue made up of adipose tisssue for fat storage /supposed to be excretory. e.g. ***Hirudinaria*** – Fresh water leech ***Pontobdella*** – Skate sucker. ***Hirudo*** – Medicinal leech (Highly modified) ***Glossiphonia*** – Fresh water leech ***Haemadipsa*** – Terrestrial leech ***Haemopis*** – Horse leech ***Acanthobdella*** – Exo-parasite with setae connecting-link between oligochaeta – Hirudinea		

PHYLUM – ARTHROPODA

1. It is the largest phylum in the animal kingdom, including 900,000 species. ***The largest class is insecta with 750,000 species.*** General characters are.
2. They are triploblastic coelomate and bilaterally symmetrical animals.
3. The body cavity is full of haemolymph (blood) and it's known as haemocoel. The true coelom is restricted to gonads.
4. The body is covered by chitinous cuticle, which forms the exoskeleton. Strengthen by deposition of minerals (Cal. Phosphate & Carbonate).
5. They have a segmented body, each segement bearing a pair of jointed appendages covered by a jointed exoskeleton.
6. Exoskeleton is made of chitinous cuticle that is shed at intervals.
7. The process of casting off of skin or integument is known as ***ecdysis*** or moulting. ***Chitinous exoskeleton is secreted by the underlying epidermis***.
8. The body is divided into head, thorax and abdomen. In some cases the head and thorax is fused to form cephalothorax. In insects the thoracic segments have legs and wings, the abdomen has no legs in insects.
9. Muscles are striated.***Respiratory organs are gills, book lungs, book 1st time developed in Arthropoda. lungs or tracheal system***.
10. Excretion takes place through green glands or malpighian tubules, coxal gland.
11. Excretory matter = Ammonia (Aquatic) ; Uric Acid (Terrestrial) Nephridia (Perepatus)

12. Sensory structures in arthropods are **antennae** for perceiving odour, eyes, statocysts or balance organs and sound receptors (in chirping crickets and cicadas). Eyes are compound. In honey bees, butterflies and months and insects, the gustatory receptors are present on their feet.
13. The heart is dorsal pulsatile, many chambered and the circulatory system is open (Haemocoel). Blood haemolymph colourless.
14. The central nervous system consists of a circumentric ring formed by paired pre-oral ganglia connected by commissures to a solid, dorsal ganglionated, ventral nerve chord.
15. In land arthropods, the fertilization is always internal. Few aquatic has external fert.
16. Arthropods are oviparous. In some like the scorpion, the eggs hatch within the female body. They bring forth the young ones alive. They are viviparous.

Advancement Over Annelida

- Distinct-head in all species.
- Jointed appendages serving a variety of functions.
- Jointed exoskeleton for protection and muscle attachment.
- Striped muscles arranged in bundles for moving particular parts.
- Special respiratory organs such as gills, trachea, book lungs in majority of cases.
- Well developed sense organs such as compound eyes, statocysts, auditory organs, taste receptors etc.
- Endocrine glands and pheromone secretion for communication

CLASSIFICATION

- The phylum arthropoda is divided into five classes.

✯ **Class-1 : Crustacea**

- The body is divisible ***into cephalothorax*** (head + thorax) and ***abdomen***.
- Dorsally, the cephalothorax is covered by a thick exoskeletal ***carapace.***
- ***There are present two pairs of antennae and a pair of stalked compound eyes.***
- Respiration is carried out either by body surface or by gills.
- ***Excretion takes place usually by antennary glands (= green glands)***
- Sexes are usually separate. Sexual dimorphism is also seen.
- Development is usually indirect

Examples : Palaemon (Prawn), Macrobrachium (Prawn), Atacus (Cray fish), Palinurus (Lobster), cancer (Crab), Lucifer (Shrimp), Eupagurus (Hermit crab), Oniscus (wood louse), Daphnia (Water-flea), Cyclops, Balanus (barnacle). Tiny crustaceans such as Daphnia and Cyclops act as zooplankton which form important link in the food chain in water.

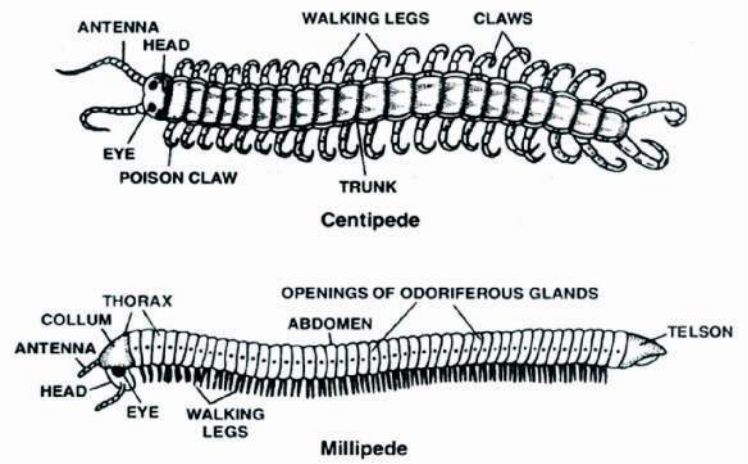
✯ **Class - 2 : Chilopoda**

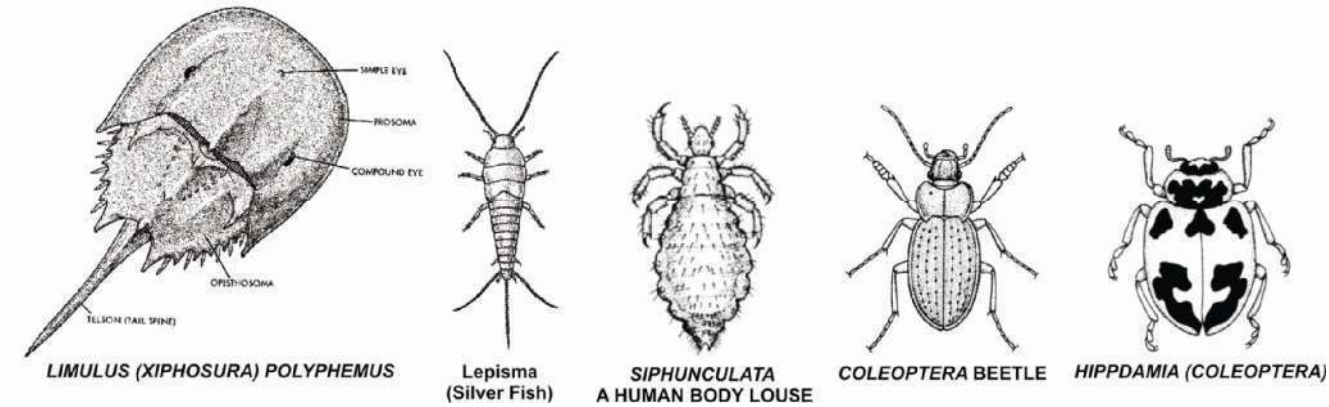
- Body is long and segemented, which is divisible in to head and trunk.
- Each trunk segment bears a pair of legs. The first pair of legs are modified in to poison claws.
- There is a single pair of antennae and ocelli.
- There are present many legs.
- Respiration occurs by tracheae.
- Excretion takes place by Malpighian tubules.
- Development is direct

Examples : Scolopendra (Centipede)

✯ Class-3 : Diplopoda

- Body is divisible into head, thorax and abdomen.
- There is a single pair of antennae and ocelli.
- Except first thoracic segment, (It does not have legs) each thoracic segment bears a pair of legs, ***however each abdominal segment has two pairs of legs***
- Respiration occurs by tracheae
- Excretion takes place by Malpighian tubules
- Development is generally direct e.g. julus (Millipede)





✯ Class-4 : Insecta (Hexapoda) [Largest number of species]

- Body is divisible into head, thorax and abdomen.
- There is a pair of antennae, and a pair of compound eyes.
- The thorax consists of three segments with three pairs of legs and usually two pairs of wings. Mesothorax has thick and leathery false wings called as **tegmina** and membranous metathoracic wings.
- The abdomen may consists of ten segments.
- Respiration usually takes places by tracheae. ***(No respiratory pigments)***.
- Heart is tubular and divided into chambers
- Malpighian tubules are the excretory organs. Uric acid is chief excretory waste.
- Sexes are separate.
- Development may be direct or indirect e.g. silverfish, cockroach, bedbug, locust, termites, butter flies, rat flea, beetle , wasp, aphid***, glow worm*** etc.
- **Maggot is the larva of Housefly**

  Insects communicate with each other by ectohormone called as ***Pheromones***. Pheromones are chemicals secreted to the outside of the body and perceived (as by smell by other individuals of same species). They help in communication amongst the organisms of same species.

Ex.:	Musca domestica	–	House fly
	Tachardia lacca	–	Lac Insect
	Dactylopis	–	Cochineal bug
	Lytta	–	Blister Beetle

The insects may be divided into five groups on the basis of their mode of development.

1. **Ametabola insects** – metamorphosis absent. The young ones resemble adult.

   Eggs ⟶ Young ⟶ Adult ***ex.*** *Lepisma* (Silver fish)

2. **Paurometabola insects –** gradual metamorphosis

   Eggs ⟶ Nymph ⟶ Adult ***ex.*** Cockroach, Grasshopper, Locusts etc.

3. **Hemimetabola insects** – incomplete metamorphosis. Habitat of young ones is different from adults.

   Eggs ⟶ Naiads ⟶ Adult ***ex.*** Dragon flies (Naiads aquatic but adults aerial)

4. **Holometabola insects** – complete metamorphosis

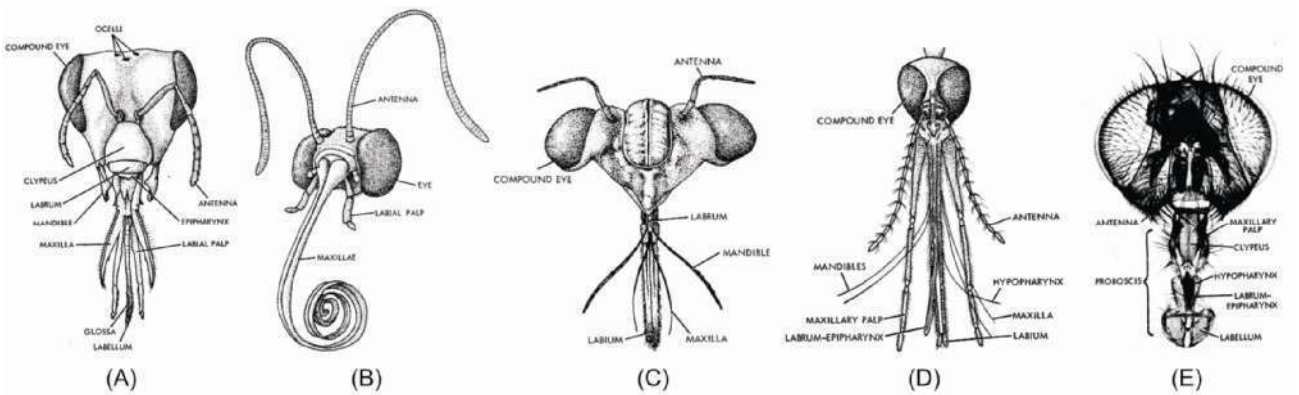
   Eggs ⟶ Larva ⟶ Pupa ⟶ Adult ***ex.*** House flies, Butterflies, Mosquitoes etc.

5. **Hypermetabola insects –** various forms of larvae

   Eggs ⟶ Larva(1) ⟶ Larva(2) ⟶ — ⟶ Pupa ⟶ Adult ***ex.*** Blister beetle.

Type of Mouthparts in insects :

- Generally mouth parts of an insect are one ***labrum***, one ***labium***, one ***hypopharynx***, two ***mandibles*** and two **maxillae.** Following type of mouth parts are found is insects.
- ***Biting and chewing type*** e.g., Grass-hooppers, cockroaches and crickets.
- ***Piercing and sucking type***.e.g. mosquitoes, bedbugs
- ***Chewing and lapping type***. Lap means to drink by scooping with tongue and lapper is that which laps liquid e.g. honey bees.
- ***Sponging type.*** eg. House fly. (Musca domestica.) ***It lacks mandibles. Feeds on sugar by dissolving in saliva and sucking.***
- ***Siphoning type*** e.g. Butterflies and moth. Here the proboscises formed by the modification of maxilla.



Insect mouthparts : (A) Honeybee. (B) Butterfly. (C) Squash Bug. (D) Mosquito. (E) Housefly

Differences between Butterfly and Moth

Butterfly	Moth
1. It is diurnal (active in day)	1. It is nocturnal (active in nignt)
2. Its body is not robust	2. Its body is often robust
3. Its antennae are knobbed distally	3. Its antennae taper distally
4. When it is at rest, it keeps the wing held together vertically on its back.	4. When it is at rest it keeps the wings held out horizontally

Table : Differences between Culex and Anopheles

Culex	Anopheles
Eggs	
1. Eggs are laid vertically in clustrers.	Eggs are laid horizontally singly
2. Rafts are formed.	Rafts are not formed
3. Egg cigar-shaped	Egg boat-shaped
4. Egg without lateral air float.	Egg with lateral air floats
5. Usually 200-400 eggs in dirty water 	Usually 40-100 eggs are laid in fresh and clean water Larva	
6. Bottom feeder	Surface feeder
7. The head hangs downwards at an angle with the surface	The head lies horizontally parallel to the surface of water
8. Without palmate hairs	With palmate hairs on the abodomen
9. Long conical respiratory siphon 	Respiratory siphon absent (= exceedingly short) Pupa	
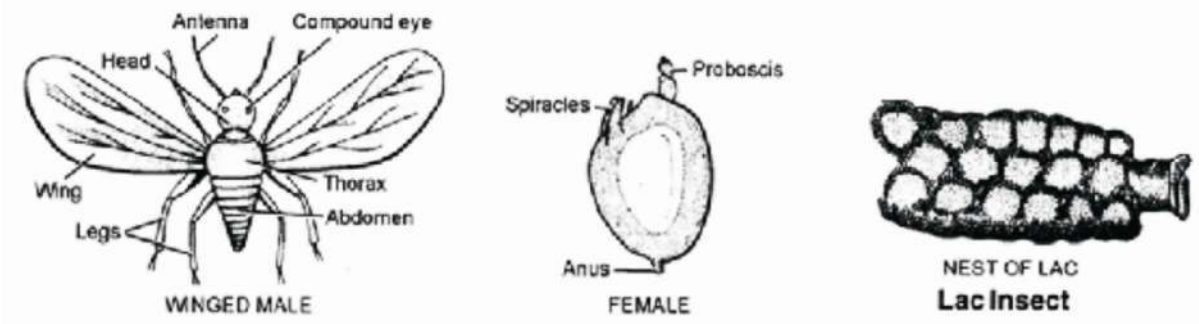
10. Pupa colourless	Pupa green in colour
11. Respiratory trumpet long 12. No palmate hairs 	Respiratory trumpet short with palmate hairs 
Lac Insect

- Lac is produced commercially by an insect *Tachardia* lacca *(Laccifer lacca).*
- Lac is actually secreted for its protection and not for the food of the insect.
- Male insects are winged and structurally complete, but females are degenerated.
- Lac or shellac is an exuviate (secretion) of mainly female.
- Lac is resinous substance



Cochineal Bug

- Dactylopis cocccus lives upon cactus. Dead and dried bodies are used for making a dye called cochineal dye.

Blister Beetle

- Lytta is a genus of blister beetle. The drug ***cantheridine*** is prepared from its blood.
- Cantheridine is widely used for healthy growth of hair

Red Ants

- Red ants are used for the production of ***formic acid***.

Glow worm

Wingless female and larva of certain beetles like Lymphyris notiluca which emits greenish light. Also yields **luciferin**

Honey Bee

A hive consists of a vertical sheet of wax with a number of hexagonal cells for rearing young bees (**brood cells**), storing food (**storage cells**), **royal chamber** and chamber of themselves.

Honey bee is a social, polymorphic and colonial insect. It has three main castes – ***queen, drones*** and ***workers***.

Queen is the only fertile female of the colony which continues to lay eggs for 2–5 years.

Drones are male honey bees. They develop from unfertilized eggs. Drones and virgin queens take part in ***nuptial flight***. After copulation the drones are not allowed to come back into hive.

Workers are sterile females.

Scout bees search for food and intimate the same to worker bees by ***dances-round dance*** for less than 75m and ***tail wagging dance*** for longer distances.

Prof. karl von Frisch got Nobel prize 1973 for decoding the language of bee dances. Workers have pollen collecting apparatus, honey storing mechanism and wax secreting glands.

Young workers secrete royal jelly. Royal jelly is given to queen or potential queens.

Honey contain simple sugars (**fructose and levulose**), Vitamins and minerals. It is a tonic, laxative and sweetening agent. True product of honey bee is bees wax.

House Fly (*Musca nebulo, M. domestica*)

It is active in warm months and during winter it may die. The body is differentiated into head, thorax and abdomen.

Head has two compound eyes, three simple eyes, a pair of antennae and ***sponging*** type of mouth part.

Labrum forms proboscis, mandibles are absent, maxilla is in the form of maxillary palps, labrum and hypopharynx are represented by chitinous sclerites.

Only liquid food can be taken by housefly. Solid food is first liquidized by action of saliva, then taken by capillary action into pseudotrachea. Mesothrorax bears a pair of transparent wings. Metathorax has a pair of ***halters*** for balancing. Female lays eggs in moist organic debris like dung. Larva is called ***maggot***.

Housefly transmits a number of diseases like conjunctivitis, trachoma, gangrene, plague, cholera, dysentery, poliomyelitis, diarrhoea, typhoid, etc

Mosquito

Mosquitoes are small nocturnal insects having a pair of wings and mouth parts modified for piercing and sucking.

Mandibles are absent in males.

Pedicel of antenna has a auditory receptor called **Johnston's organ** for perceiving vibrations.

Male mosquitoes usually feed on flower sap or nectar while female mosquitoes feed on blood.

The common mosquitoes are Anopheles, Culex and Aedes.

✯ **Class - 5 : Arachnida**

- The body is usually divisible into cephalothorax and abdomen.
- The cephalothorax bears simple eyes and six pairs of appendages (One pair of *chelicerae, one pair pedipalpi and four pairs of legs)*
- *Antennae are absent.*
- *Respiratory organs are book lungs or trachea or both*
- Excretion takes place by Malpighian tubules or *coxal glands* or both
- Development is generally direct.

  Examples : Scorpion, spider, Tick, Mite, Aranaeus (garden spinder), Palamneus (Scorpion), Buthus (Scorpion)
- ***Spiders spins the web by means of a secrection of abdominal glands.***
- There are two more classes in the phylum Arthropods. These classes are **Onychophora** and ***Merostomata. Peripatus is an important examples of the class Onychophora***, which has characters of Phylum Annelida and Arthopoda. Hence it is called ***"connecting link"*** between annelida and arthropoda **.** It breathes by trachea.
- ***Limulus***. ***(the king crab or horseshoe crab)*** is good example of class Merostomata which respires with book gills. The king crab are called "living fossils". A living fossil is a living animal of ancient origin with many primitive characters.
- Larvae of different Arthropods

  (a) Bombyx (Slikworm) — Caterpillar / Silkworm
  (b) Beetles, honey bee — Grub
  (c) Musca (Housefly) — Maggot
  (d) Culex, Anopheles — Wriggler
  (e) Pennaeus (Marine prawn) — Mysis, nauplius, protozoea
  (f) Cancer (Crab) — Megalopa metanauplius, zoea
- Arthopoda is **the biggest phylum.** About 9,00, 000 species are there . Largest class is insecta.
- **Von Siebold** established phylum **Arthoropoda.**
- Arthopods are Aquatic (Freshater/marine), Terrestrial, burrower, parasitic.

PHYLUM – MOLLUSCA

1. It is **second largest** Phylum.
2. Mollusca (Soft bodied) are **marine** or **fresh water** or terrestrial. **Johnston** coined the name **Mollusca.**
3. Study of this phylum is known as **Malacology** & study of shells of molluscan is known as **Conchology.**
4. Body is unsegmented with variety of shapes. **Neopilina** is exceptionally segmented. (connecting link).
5. Molluscs are usually **bilateral.** Few are secondarily **asymmetrical** (snail) due to twisting (Torsion) during growth.
6. Triploblastic with Organ system level.
7. **Body wall** includes one layered epidermis (usually cilited) with unstripped muscles found in bundles.
8. Body parts consist of

   (i) **Head** with sense organ. Head is absent in Pelecypoda & Scaphopoda.

   (ii) Dorsal **visceral mass** containing organ system.

   (iii) **Ventral foot** for locomotion.

(iv) Thin fleshy fold or outgrowth of dorsal body wall covers the body. This fold is called **mantle or pallium.** It encloses a space mantle or pallial cavity between itself and the body. The mantle usually secretes an external limy **shell**. Shell is made up of **Calcium carbonate and Concheolin protein**.

Shell may also be internal (Cuttle fish), reduced and even absent (Octopus)

9. **Coelom** is greatly **reduced.** It is represented by cavities in the **pericardium, kidneys** and **gonads**. Space among the viscera contain blood and form **haemocoel**.
10. **Digestive tract** is complete. Buccal cavity contain a rasping organ the **Radula**, with transverse row of teeth.
11. Anus opens into the mantle cavity.
12. Digestive glands are known as **hepatopancrease.**
13. **Respiration** is usually by **gills** i.e., **Ctenidia.** But respiration may takes place by **body surface** also. **Dentalium** respire by **Mantle.**
14. **Pila** respire by **pulmonary sac on land** and by **gills** in water.
15. **Circulatory system is open.** It includes dorsal **pulsatile heart** and a few arteries that open into sinuses.

    Cephalopoda has **closed** type of circulatory system.

    Blood has a copper containing, blue respiratory pigment **Haemocyanin.** Blood is colourless with amoebocytes.
16. **Excretory system** includes 1 or 2 pairs of sac like **kidneys,** which open into the mantle cavity. Kidney of molluscans are **Metanephridia** known as **Kaber's organs** or **Organ of Bojanus.** Excretory matter is **ammonia** or uric **acid.**
17. **Nervous system** comprises three paired **ganglia**

    (1) **Cerebral** (above the mouth)

    (2) **Pedal** (In the foot)

    (3) **Visceral** (in visceral mass)

    These are inter connected by

    (1) **Commissure** (Joins similar ganglia) (2) **Connectives** (Joins dissimilar ganglia)

    Senses organ includes

    (1) **Eye** - Present over a stalk called **ommatophore** (Gastropoda).

    (2) **Statocyst/Lithocyst -** For equilibrium in foot

    (3) **Osphradia -** Chemoreceptor/Olfactory as well as for testing chemical & physical nature of water.
18. **Sexes** usually **separate** (snail has **ovotestis**). Gonads have ducts.
19. Fertilization may be **external** or **internal.**
20. Cleavage is **spiral, determinate, unequal** and **holoblastic.**

    Development is - **Direct** or **indirect.**

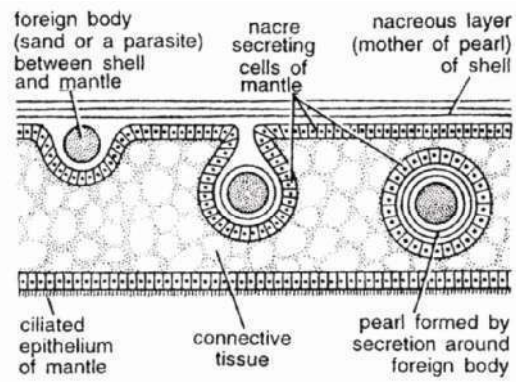
    Trochophore is very common larva of Mollusca phylum.

    Larva - **Glochidium** (Fresh water mussel) and **Veliger (Pila)**

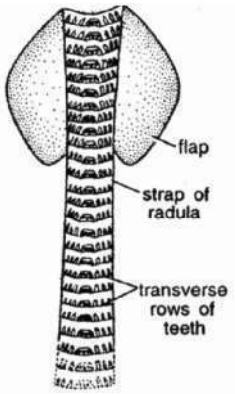
⇒ Precious pearl of the size of tennis - ball is made by a molluscs - **Tridekna**

⇒ **''Nacre layer''** is called **''Mother of Pearl''.** This layer is made up of $CaCO_3$ and choncheolin protein.

⇒ Father of pearl industry - **Kokichi Mikimoto**

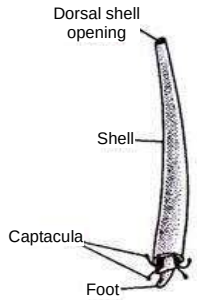


Stages in pearl formation.

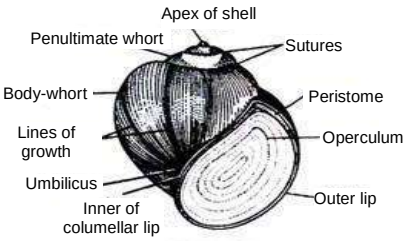


Pila. The radula.

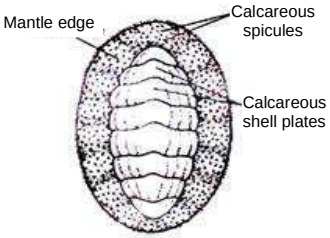
Molluscs are classified on the basis of shell, Foot, Nervous system and Gills into seven classes :



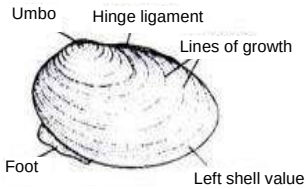
SCAPHOPODA (DENTALIUM)



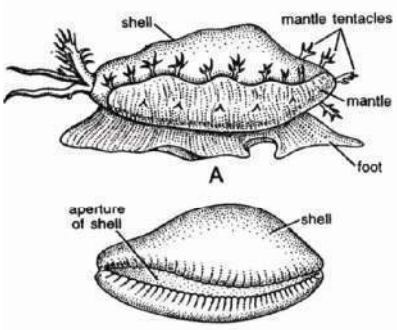
GASTROPODA (PILA)



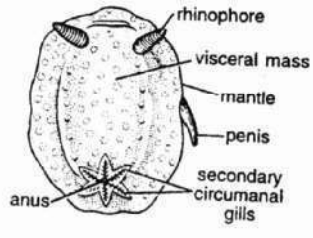
POLYPLACOPHORA (CHITON)



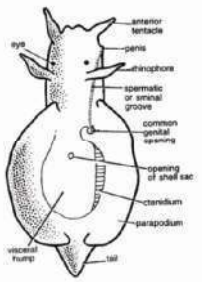
PELECYPODA (UNIO)



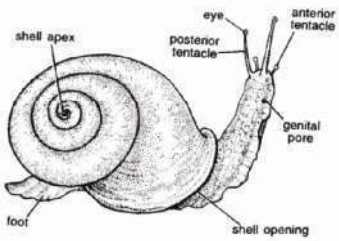
Cypraea (cowrie). A – Living cowrie. B – Shell of cowrie



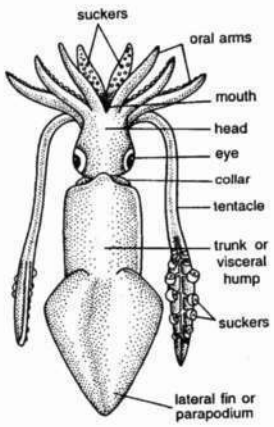
Doris. – Dorsal view



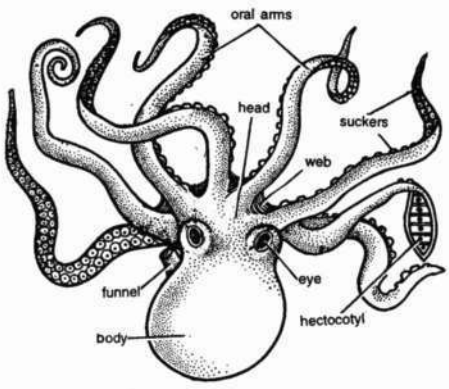
Aplysia. – Dorsal view



Helix



Loligo. – Dorsal view

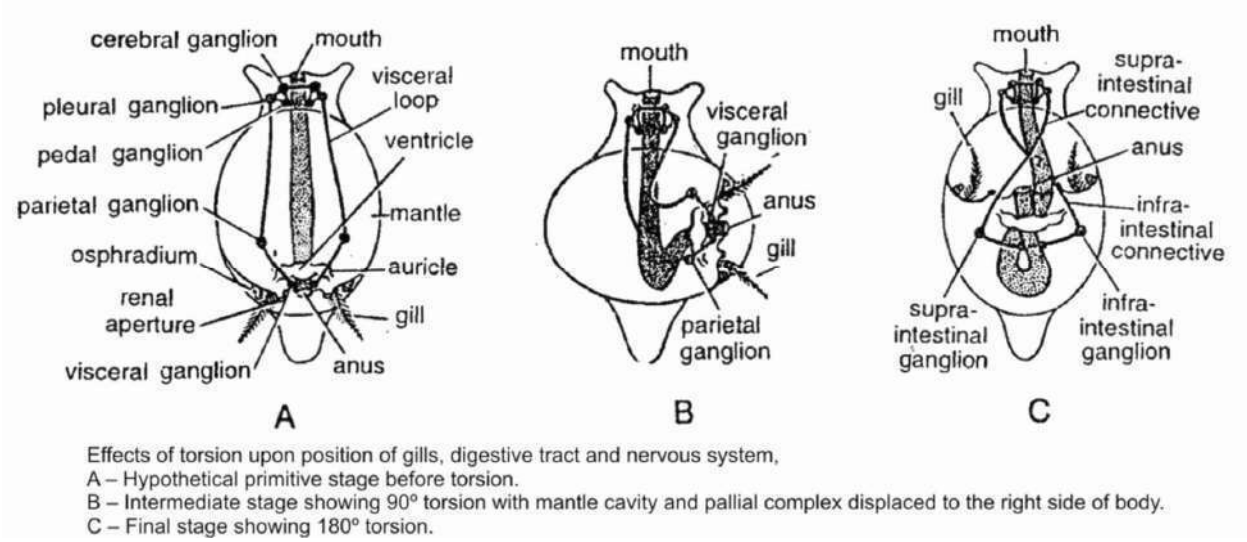


Octopus – Dorsal view

Monoplacophora	Aplacophora	Polyplacophora/ Amphineura	Scaphopoda	Gastropoda	Pelecypoda Bivalvia or Lamellibranchiata	Cephalopoda
- Marine, common character of Annelida and Arthropoda. **Body** - Bilaterally symmetrical and segmented. **Head** - Indistinct **Shell** - Dome-shaped with mantle. **Radula** - Present **Foot** - Flat muscular **Larva** - Trochophore e.g. - **Neopilina** Living fossils Connecting link of Annelida and Mollusca and only segmented molluscs with nephridia.	- Marine, Worm like **Body**-Small covered by thick mantle **Head**-Small without eyes & tentacles **Shell** - Absent. **Redula** - Present **Foot**-Reduce/absent. **Larva**-Trochophore e.g. - **Neomenia**	- Marine **Body** - Bilateral **Head** - reduced without eyes and tentacles. **Shell** - Present or absent. 8 dorsal plates present. (Multivalved) **Radula** – Present **Foot** - Reduced/absent. **Larva**-Trochophore e.g. **Chiton**-The coat of mail shell (Sea-mica) **Chaetopleura**-	- Marine **Body** - Bilateral **Head** - absent. Shell-Tubular, open at both end. **Redula**-Present **Foot** - Conical and use for digging **Larva** - Trochophore e.g. **Dentalium**-Tusk-shell. (Respire by mantle)	- Marine/fresh water /moist soil. largest class. **Body**-Symmetrical embryo grows into an asymmetrical adult due to twisting/torsion of visceral mass during development. mouth & anus lie on same side. **Head**-With eyes & tentacles. **Shell** - Spirally coiled **Radula** – Present **Foot** - Large & flat **Larva** - Trochophore or Veliger. e.g. **Pila**-Apple-snail (Shell used in but-tons) **Cypraea**-Old currency **Limex**-Slug (shell less) **Helix** **Turbinella**-Shankh **Turbo**-Cat's eye **Doris**-Sea lemon **Aplysia**- Sea hare **Planorbis**-Land snail **Lymnea**-Land snail **Achatina**- Land snail **Xancus**-Holy chank **Potella**-Limpet **Fissurella**-Keyhole limpet	- Marine/fresh water **Body**-Bilateral and flat **Head**-Absent **Shell**-Consist of two valves Movably hinged dorsally. **Redula**-Absent Foot-Plough or Wedge shaped for burrowing **Redula**-absent **Larva**-Glochidium, Trochophore e.g. **Unio**-Mussel (fresh water) **Mytilus**-Mussel (marine) **Lamellidens**-mussel **Ostrea** **Teredo**-Ship worm. **Pinctada**-Pearl oysters. **Pteria**- Indian pearl oyster. **Spondilus**-edible oyster **Tridekna**-Highest economic value **Pecten** - Scallop **Cardium**-Jumping bivalvia **Solen** - Blade fish	- Marine **Body** - Bilateral head & foot combined cephalopoda Shell-Internal and reduced it may be external (Nautilus) or absent (Octopus) **Redula** - Present **Foot** - Modified into a funnel and partly into 8 or 10 sucker bearing arms that surround the mouth Locomotion is by expelling water in jet through siphon (Jet propulsion). Ink glands in some squids for offense and defense. When the squid is attacked, it emits a cloud of inky fluid through its siphon. This 'smoke screen' interferes with the vision and chemoreceptors of the predator and thereby helps the squid to escape. - Closed blood circulation. - Hectocotyle for sperm transfer - Larva absent e.g. **Sepia**-Cuttle fish 10 arms having Chromatophores. **Tethys** - Sea-fly **Loligo** - Squid (Radula absent) **Architeuthis** - Giant squid (Largest invertebrate) **Octopus** - Devil fish 8 arms **Nautilus - Tiger shell**

What is torsion ?

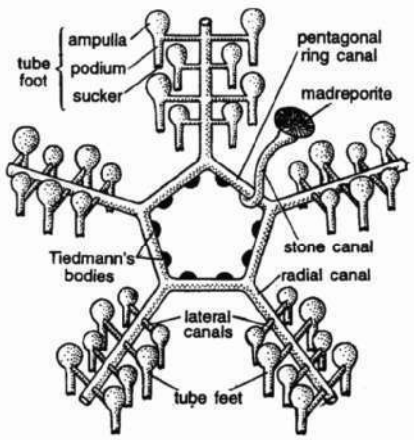
Torsion or twisting is a process during larval development of gastropids, which rotates the viscero-pallium anti-clockwise through 180° from its initial position, so that mantle cavity, with its pallial complex, is brought in front of the body in adult.



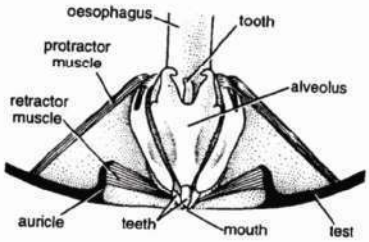
Effects of torsion upon position of gills, digestive tract and nervous system,
A – Hypothetical primitive stage before torsion.
B – Intermediate stage showing 90° torsion with mantle cavity and pallial complex displaced to the right side of body.
C – Final stage showing 180° torsion.

PHYLUM – ECHINODERMATA

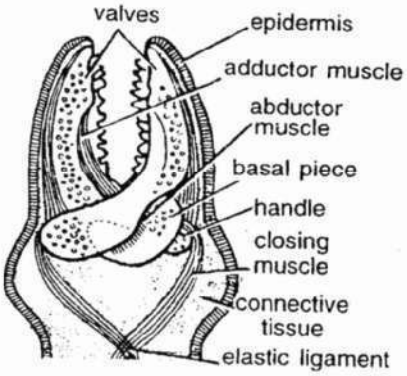
1. Name **Echinodermata** was given by **Jacob Klein.**
   All are Marine except **Synapta similis.**
   Generally live at **bottom** and slow moving.
2. Body shape is **star like, cylindrical like, melon-like, disc-like, flower like.**
3. Body unsegmented with **bilateral symmetry** in larva and **radial pentamerous** (arranged in five or multiple) in adult.
   Echinoderms are **triploblastic** with **organ - system level** of organization
4. Echinoderms do not have **head.**
   Tube feet (podia) which comes out through radial area i.e. **Ambulacral** used for locomotion. They are extended and retracted by variation in **hydraulic pressure** of fluid in them and by contraction of their muscle.
5. **Body wall** of echinoderms consists of
   (i) **Epidermis** - Single layered & ciliated.
   (ii) **Dermis** - Below the epidermis thick dermis having **mesodermal endoskeleton** of calcareous plate (Ossicles). It has spines.
   (iii) **Muscles** - Smooth and lie below dermis.
   Minute pincerlike structure **pedicellariae** comes out through skin. They keep body surface clear of debris by opening & closing. These are made up of three calcareous plates.
6. Echinoderms have true **Coelom** lined by **ciliated mesothelium. Enterocoelous** contain fluids with free amoeboid cells called **coelomocytes.**
7. Coelom is divided into many tubes and sinuses, which together form **3** systems.
   (i) A unique water filled **ambulacral** or **water vascular system** with tube feet to help in locomotion. A perforated plate **madreporite** permits entry of water into ambulacral system which also help in food and gas transport system. Structures like Pollian vesicle, tiedmann body or recemose, stone canal are also found in water vascular system.
   (ii) **Haemal system.**
   (iii) **Perihaemal system.**



Asterias. Water-vascular system.



Aristotle's lantern in situ



***Asterias* - Crossed type pedicellaria**

8. **Respiration** takes place by **gills** called **dermal branchiae** or papulae in most of Echinoderms like Starfish, **genital bursae** in Brittle star, **cloacal respiratory trees** Sea- Cucumber, **Peristomial gills** - Sea urchin. tube - feets also helps in respiration in all Echinoderms
9. **Digestive tract** is **complete,** (incomplete -brittle star).
   Circulation system is reduced and **open type** called **haemal system** /Perihaemal system. No heart or pumping vessel.
10. There is no **specialised excretory organ system**. Nitrogenous waste (ammonia) diffuses out via **gills, bursae, respiratory tree and tube feet**. Amoeboid cells in coelomic fluid also perform excretory function by absorbing excretory matter.
11. **Nervous system** is simple and primitive type includes a Nerve ring and radial nerve cord with simple sense organ. (No brain)
12. Echinoderms resemble **chordates** in early embryonic development.
13. Echinoderms have separate sexes.
14. **Fertilization** is **external** (no copulation). Life history includes ciliated, bilaterally symmetrical larva that undergoes metamorphosis and change into a adult (Deuterostome).

LARVA

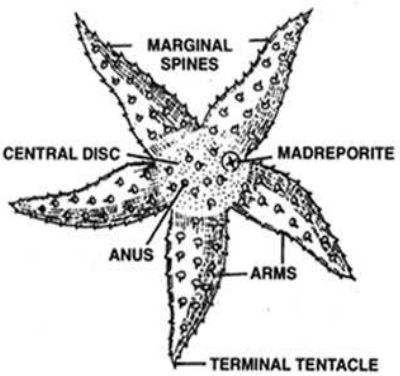
Star fish	➡	**Bipinnaria,**
Brittle star	➡	**Ophiopluteus**
Sea urchin	➡	**Echinopluteus**
Sea cucumber	➡	**Auricularia**
Feather star	➡	**Doliolaria,**

Few echinoderms (star fish) have great power of **regeneration**. They break off their arms fordefence purpose. This phenomenon is known as **Autotomy**

Echinoderms in angry or frightened state vomits out viscera (internal organ). This phenomenon is known as **Evisceration.**

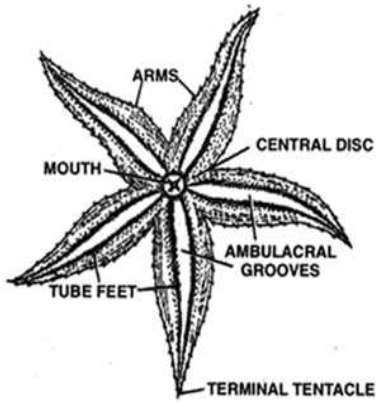
Heart urchin has **lophophore** (Ciliary structure)

Divided into Five classes				
Asteroidea	**Ophiuroidea**	**Echinoidea**	**Holothuroidea**	**Crinoidea**
Body Flat & star like. Arms - Five or multiple of five not sharply marked with the central disc (Show Autotomy). Spines - Present. Pedicellariae - Present. Ambulacral groove - Situated at oral surface. Madreporite - at Aboral surface Anus - At aboral end. Viscera - Extend upto arms Respiration - Dermal branchiae or papulae Suckers - Present Larva - Bipinnaria - Brachiolaria - Dipleura **Asterias** - starfish **Solaster** - Sea star **Pentaceros** - Sea pentagen **Astropecten**	Body form - Flat & star like Arms - Five or multiple of five. Sharply marked with the central disc Spines - Present Pedicellariae - Absent Ambulacral groove - Not visible Madreporite - Oral Anus - Absent Viscera - No Viscera into arms. Respiration - Genital bursae Suckers – Absent Larva - Ophiopluteus **Ophiothrix** (Brittle star) **Ophiura** **Gorgonocephalus**-Basket star.	Body form - Globular/disc like. Arms - Absent Spines - Present Pedicellariae - Present Ambulacral groove – Absent Madreporite - Aboral Anus – Aboral Viscera - No Viscera into arms. Respiration - Peristomium gills Suckers – Present Larva - Pluteus Mouth - with biting & chewing tooth apparatus **Aristotle's lantern** (Masticating apparatus with 5 teeth) **Echinus**-sea urchin **Clypeaster**- Cake urchin **Echinarachinus**-sand dollar **Echinocardium**-heart urchin **Salmacis**	Body form-Long & cylindrical Arms - Absent Spines Absent Padicellariae - Absent Ambulacral groove – Absent Madreporite - Internal Anus – Aboral Viscera - No Viscera into arms. Respiration-Cloacal tree Suckers – Present Larva - Auricularia **Cucumaria** - Sea cucumber **Holothuria** **Synapta**	Body form - Plant like fixed with cirri. Arms - Highly branched Spines - Absent Pedicellariae - Absent Ambulacral groove - Oral and ciliated Madreporite - Absent Anus – Oral Viscera - Extend upto arms Respiration - Tube feet Suckers – Absent Larva - Doliolaria **Antedon** - Sea lilly (most primitive) **Holopus** **Neometra** - Feather star **Neometra** - Feather star

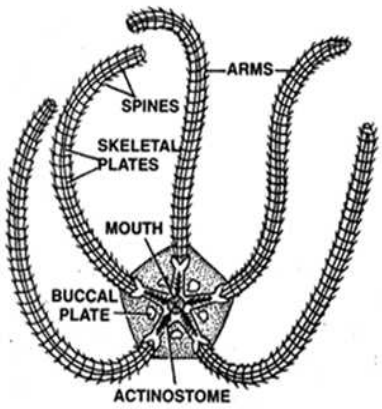


Aboral surface of star fish

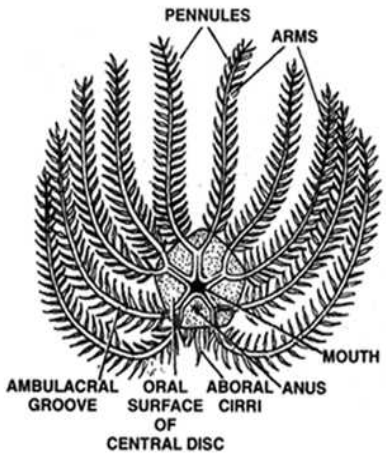
(a)



Oral surface of star fish



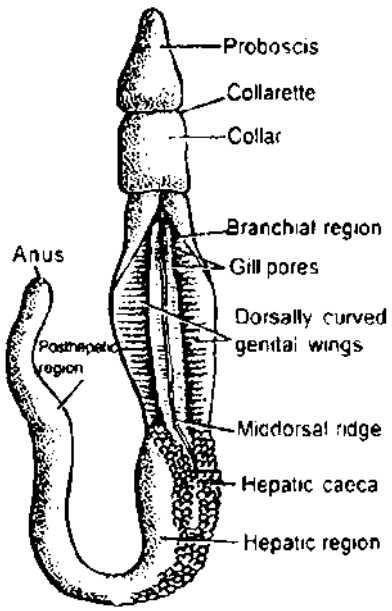
(b) Brittle star



(c) Feather star

HEMICHORDATA

1. The term Hemichordata was given by **Bateson.**
2. Animals of this phylum are all **fossorial,** and their tunnels are 'U' - shaped.
3. Body **worm like,** and soft.
4. Body is divided into **three parts.**
   A - **proboscis** B - **Collar** C - **Trunk**
5. Body wall has **single layered epidermis.** No dermis
6. Body cavity is **enterocoelus,** that is divided into **Protocoel, Mesocoel** and **Metacoel**.
7. Mostly **ciliary feeders.** Complete alimentary canal is present in digestive system. This is **straight or 'U' - shaped.**
8. Circulatory system is **open type.** Blood is colourless with ameoboid corpuscles.
9. Heart is dorsal.
10. Skeletal tissue is absent.
11. **True notochord** is **absent**.
12. A notochord like structure is found in their **buccal cavity,** that is called **''Buccal diverticulum''** or **''Stomochord''** (a hollow out-growth arises from roof of buccal cavity).
13. Post anal tail is Absent.



Balanoglossus :
External features in dorsal view

14. Dorsal heart, ventral nerve cord, no respiratory pigment.
15. Respiration by gills.
16. **Excretion** is done by a **single glomerulus.** This single glomerulus is situated in the proboscis known as **Proboscis gland.**
17. **Central nervous system** is just **like non chordates. Brain** is present in the form of **nerve - ring.**
18. Mostly animals are **unisexual** and reproductin is sexual.
19. Fertilization is **external.** Cleavage holoblastic.
20. **Development** is **direct** or **indirect** because some animals have **tornaria larva** just like **bipinnaria larva** of echinodermata in their developmental stages.

Hemichordata is divided into **two Classes**

(1) Enteropneusta **(2) Pterobranchia**

e.g.

– **Balanoglossus.**
– **Rhabdopleura** (Tongue worm or Acorn worm)
– **Cephalodiscus**
– **Saccoglossus**
– **Protoglossus**
– Earlies included Hemichordata in **Chordata phylum. Hyman** (1959) kept in **separate phylum** Hemichordata in **invertebrates.**
– **Hemichordata is connecting link between Non-Chordata & Chordata.**

EXERCISE – 1

ANIMAL CLASSIFICATION

Q.1 The blind sac body plan is found in the animals of
(1) Coelenterata (2) Gastropoda
(3) Flatworms (4) (1) and (3) both

Q.2 Cell aggregate body plan is found in the
(1) Volvox
(2) Colonial protozoans
(3) Porifera
(4) (1) and (3) both

Q.3 When only single opening is present in the alimentary canal, then the body plan is
(1) Open (2) Blind sac
(3) Cell aggregate (4) Tube in tube

Q.4 The tube in a tube plan is not present in the
(1) Taenia (2) Pheretima
(3) Leech (4) Ascaris

Q.5 Secondarily asymmetrical type of symmetry is present in
(1) Unio (2) Snail
(3) Holothuria (4) Star fish

Q.6 Enterocoelic type of coelom is present in the
(1) Echinodermata (2) Mollusca
(3) Arthropoda (4) Chordata

Q.7 Schizocoelic type of coelom is present in the
(1) Protochordata (2) Echinoderms
(3) Nematodes (4) Annelids

Q.8 Acoelomate group is
(1) Coelenterata only (2) Porifera only
(3) Platyhelminthes (4) All of the above

Q.9 Which one of the following is the connecting link between chordata and non-chordata
(1) Tachyglossus (2) Amphioxus
(3) Balanglossus (4) Sphenodon

Q.10 An animal with unsegmented coelom, superficial radial symmetry and bilateral symmetrical larva belongs to
(1) Arthropoda (2) Mollusca
(3) Echinodermata (4) Annelida

Q.11 Which of the following is represented by the largest number of species
(1) Insects (2) Protozoans
(3) Mammalia (4) Aves

Q.12 Diploblastic acoelomate condition is found in
(1) Planaria (2) Ascaris
(3) Rotifer (4) Sea anemone

Q.13 Which of the following group is Deuterostome
(1) Annelida, Arthropoda, Mollusca
(2) Echinodermata, Hemichordata, Chordata
(3) Annelida, Mollusca. Chordata
(4) Arthropoda, Mollusca, Echinodermata

Q.14 The animals, giving birth to young ones, are called
(1) Coelomate (2) Viviparous
(3) Amphibious (4) Triploblastic

Q.15 Sometimes parasites themselves are parasitised by other organism, such parasites known as
(1) Symbionts (2) Endoparasites
(3) Ectoparasites (4) Hyperparasites

Q.16 Which one of the following pairs of animals is correctly matched with the kind of their body symmetry
(1) *Hydra* and shark – Bilateral symmetry
(2) Tapeworm and octopus – Radial symmetry
(3) *Amoeba* and sea urchin – Asymmetry
(4) Jellyfish and starfish – Radial symmetry

Q.17 Which one feature is common to Amphioxus, frog, sea horse and crocodile
(1) Pharyngeal gill slits, at least in the developmental stages
(2) A three-chambered heart
(3) Dorsal solid nerve chord
(4) Skeleton formed of cartilage and bones

Q.18 Given below are four matchings of an animal and its kind of respiratory organ
1. Silver Fish – trachea,
2. Scorpion – book lung,
3. Sea squirt – pharyngeal gills,
4. Dolphin – skin
(1) 3 and 4 (2) 1 and 4k
(3) 1, 2 and 3 (4) 2 and 4

Q.19 A coelom (body cavity) derived from blastocoel is known as
(1) Enterocoel (2) Schizocoel
(3) Haemocoel (4) Pseudocoelom

Q.20 Maximum diversity is found in which phylum
(1) Chordata (2) Arthropoda
(3) Protozoa (4) Annelida

Q.21 Bilaterally symmetrical but acoelomate animal is
(1) Liver fluke (2) Jelly fish
(3) Round worms (4) Crab

Q.22 When embryo develops in the body of female but it does not obtain nutrients from the mother
(1) Ovo-viviparous (2) Viviparous
(3) Oviparous (4) None of these

Q.23 Genus is a group of similar and related
(1) Order (2) Genera
(3) Families (4) Species

Q.24 Animals of which group are not fresh water
(1) Crustacea (2) Insecta
(3) Echinodermata (4) Sponge

Q.25 Who is/are known as 'Father of Taxonomy'?
(1) C. Darwin (2) Lamarck
(3) Carolus Linnaeus
(4) Bentham and Hooker

PROTOZOA

Q.26 Which is the locomotory organ of class Sporozoa-
(1) Pseudopodia (2) Flagellum
(3) Cilia
(4) None of the above

Q.27 Organellae of defence in Paramecium are-
(1) Nematocyst (2) Oocyst
(3) Sporocyst (4) Trichocyst

Q.28 Conjugation in Paramecium is for-
(1) Binary division
(2) Sexual reproduction
(3) Asexual reproduction
(4) Metamorphosis

Q.29 Why Amoeba has been kept in protozoa-
(1) Due to contractile vacuole
(2) Because of nutrition being insectivorous
(3) Cell wall
(4) Acellular body

Q.30 Nutrition in paramecium-
(1) Holophytic (2) Saprophytic
(3) Saprozoic (4) Holozoic

Q.31 Protozoan considered link between plants and animals-
(1) Paramecium (2) Amoeba
(3) Euglena (4) Plasmodium

Q.32 Character of sporozoa-
(1) Aquatic life
(2) Holophytic nutrition
(3) Spore formation
(4) Holozoic nutrition

Q.33 Which group of protozoans have pseudopodia-
(1) Ciliate (2) Sporozoa
(3) Mastigophora (4) Sarcodina

Q.34 Which animals are of similar genus-
(1) Histolytica and coli
(2) Histolytica and plasmodium
(3) Histolytica and falciparum
(4) Histolytica and bancrofti

Q.35 Micronucleous of paramecium is associated with-
(1) Somaric functions
(2) All body functions
(3) Reproduction (4) Locomotion

Q.36 Contractile vacuole is absent in-
(1) Entamoeba (2) Amoeba
(3) Euglena (4) Paramecium

Q.37 Which of the following is not a parasite-
(1) Monocystis (2) Giardia
(3) Nosema (4) None

PORIFERA

Q.38 Sponges differ from other animals in having-
(1) Dermal papillae (2) Hollow body
(3) Coelenteron (4) Choanocytes

Q.39 Classification of phylum Porifera is based on-
(1) Canal system (2) Spicules
(3) Shape of choanocytes
(4) Ascocytes

Q.40 Sponges are not found in-
(1) Sea water (2) Cold water
(3) Sandy sea shore (4) None

Q.41 The structure which functions as mouth in sponges is-
(1) Osculum (2) Ostia
(3) Prosopyle (4) None

Q.42 The body cavity of sponge is-
(1) Incurrent canal (2) Radial canal
(3) Coelenterone (4) Paragastric cavity

Q.43 Name bath sponge is of-
(1) Spongilla (2) Chalina
(3) Euspongia (4) Cliona

Q.44 Parenchymula is-
(1) An embryonic stage
(2) A type of morula
(3) Coelenterata larva
(4) None

Q.45 Sponges exhibits-
(1) Only intracellular digestion
(2) Only intercellular digestion
(3) Only extra cellular digestion
(4) 1 & 2

Q.46 The water current in the body of sponge is controlled by-
(1) Amoebocyte (2) Porocyte
(3) Choanocytes (4) Pinacocytes

Q.47 Sponges are provided with-
(1) Water vascular system
(2) Water canal system
(3) Sub-vascular system
(4) Sub-canal system

CNIDARIA (COELENTERATA) & CTENOPHORA

Q.48 Common name of fungia is-
(1) Mushroom coral (2) Red coral
(3) Brain coral (4) Organ pipe coral

Q.49 The species of coral which is used in jwellery-
(1) Corallium (2) Anthocodium
(3) Gorgonium (4) Fungia

Q.50 Corals are formed by-
(1) Molluscs (2) Coelenterates
(3) Protozoans (4) Echinoderms

Q.51 Medusae are found in the life history of-
(1) Obelia (2) Hydra
(3) Star fish (4) None of them

Q.52 Statocyst is found in-
(1) Cockroach (2) Obelia
(3) Paramecium (4) Earthworm

Q.53 Mesogloea is found in which group of animals-
(1) Porifera (2) Coelenterata
(3) Hydrozoa (4) Annelida

Q.54 Which level of body organization is found in cnidaria-
(1) Organ grade
(2) Cellular grade
(3) Organ system grade
(4) Tissue grade

Q.55 Sea anemone belongs to phylum-
(1) Porifera (2) Cnidaria
(3) Echinodermata (4) Protozoa

Q.56 Metazoa includes-
(1) Sporozoa (2) Sarcodina
(3) Cnidaria (4) Protista

Q.57 Portuguese man of war is-
(1) A soldier of world war
(2) Portuguese soldier
(3) A sponge
(4) A polymorphic, colonial coelenterate

Q.58 Which of the following is a larva of Hydra-
(1) Planula (2) Parenchymula
(3) Cydipidd (4) No larva in hydra

Q.59 Comb jelly are the animals of which of the following phylum
(1) Ctenophora (2) Coelenterata
(3) Hydrozoa (4) Protozoa

Q.60 Which of the following is associated with corals-
(1) Corallium (2) Corallita
(3) Corallum (4) All

Q.61 Coral animals are found in-
(1) All type of sea water
(2) Fresh & marine water
(3) In equatorial sea on both the sides upto 30°
(4) Antarctica

Q.62 One of the following is not a coelenterata-
(1) Sea pen (2) Sea fan
(3) Sea hare (4) Sea feather

Q.63 Red moonga is a -
(1) Type of stone
(2) Type of shell
(3) Structure similar to pearl
(4) Type of coral skeleton

Q.64 Coloblasts are found in-
(1) Beroe (2) Hydrozoa
(3) Anthozoa (4) Scyphozoa

Q.65 Which of the following is unmatched-
(1) Sea pen (2) Sea fan
(3) Sea feather (4) Sea horse

Q.66 Blue coral is-
(1) Metridium (2) Heliopora
(3) Cavernullaria (4) Renilla

Q.67 Cavernullaria is -
(1) Red coral (2) Sea feather
(3) Sea stick (4) Sea fan

Q.68 Which class exhibits polymorphism-
(1) Hydrozoa (2) Scyphozoa
(3) Crinoidea (4) Gastropoda

Q.69 The body cavity of phylum coelenterata is-
(1) Coelom (2) Haemocoelom
(3) Pseudocoelom (4) None

PLATYHELMINTHES

Q.70 Platyhelminthes are generally called-
(1) Round worms
(2) Flat worms
(3) Tubiculous worms
(4) Blind worms

Q.71 Primary host in the life history of Fasciola-
(1) Pig (2) Sheep
(3) Man (4) Snail

Q.72 Alimentary canal is not found in-
(1) Arachnida (2) Apoda
(3) Gastropoda (4) Cestoda

Q.73 Active movement is not found in Taenia because-
(1) Body is segmented
(2) Hooks and suckers, are found
(3) It is parasite
(4) Alimentary canal is absent

Q.74 Disease filariasis is caused by-
(1) Fasciola (2) Wuchereria
(3) Taenia (4) Ascaris

Q.75 Secondary host of tape worm is-
(1) Cat (2) Man
(3) Horse (4) Pig

Q.76 Tapeworms do not have alimentary canal because they get food from-
(1) Suckers (2) Mouth
(3) Body surface (4) All of them

Q.77 Order-trematoda includes-
(1) Flat-worms (2) Tape-worms
(3) Flukes (4) Round-worm

Q.78 Turbellarians are-
(1) Independent round-worms
(2) Independent flat-worms
(3) Parasitic tape worms
(4) Parasitic-worms

Q.79 Infection of Taenia leads to-
(1) Burning sensation in alimentary canal
(2) Blisters on skin
(3) Itching (4) Hungerlessness

Q.80 Filaria pathogen is a-
(1) Bacterium (2) Mosquito
(3) Protozoan (4) Helminth

Q.81 Bladder worm is a stage found in the development of-
(1) Liver flake (2) Planaria
(3) Thread worm (4) Tape worm

Q.82 Miracidium is found in the life history of-
(1) Leech (2) Ascaris
(3) Taenia (4) Fasciola

Q.83 Cercaria is found in the life history of-
(1) Unio (2) Liver fluke
(3) Tape worm (4) Honey bee

Q.84 Powerful suckers for attachment are found in-
(1) Taenia (2) House fly
(3) Earth worm (4) Mosquito

Q.85 Infective stage for primary host in the life history of liver fluke-
(1) Redia (2) Cercaria
(3) Miracidium (4) Cysticerus

Q.86 Taenia solium passes on to secondary host at which stage-
(1) Onchosphere (2) Hexacanth
(3) Cysticercus (4) Bladderworm

Q.87 Excretory organs of Taenia solium are-
(1) Nephrida
(2) Flame cells
(3) Malpighian corpuscle
(4) Green gland

ASCHELMINTHES

Q.88 Which of the following has no alternative host-
(1) Ascaris (2) Plasmodium
(3) Tapeworm (4) Periplaneta

Q.89 Pseudocoelom is a salient feature of-
(1) Porifera (2) Nematods
(3) Cestoda (4) All

Q.90 One of the following is a group of round worms-
(1) Whipworm, Ascaris, Shipworm
(2) Eyeworm, Filaria, Hookworm
(3) Pin worm, Hook worm, Tapeworm
(4) All

Q.91 Animals which exhibit moulting-
(1) Ascaris
(2) Animals of class hexapoda
(3) Animals of class nematoda
(4) All

Q.92 One of the following is a member of group nematoda-
(1) Ship worm (2) Calm worm
(3) Silk worm (4) Guinea worm

Q.93 Synctitial epidermis is a salient feature of-
(1) Ascaris (2) Tape worm
(3) Amphioxus (4) Opalina

Q.94 Life cycle of which lack secondary host-
(1) Plasmodium (2) Fasciola
(3) Ascaris (4) Taenia

Q.95 Body of which is unsegmented-
(1) Tape worm (2) Mosquito
(3) Earthworm (4) Round worm

Q.96 Animal which completes its life cycle in one host-
(1) Ascaris (2) Monocystis
(3) Entamoeba (4) All

ANNELIDA

Q.97 Which is as annelid-
(1) Ant (2) Crab
(3) Nereis (4) Octopus

Q.98 Larva is not found in the life history of-
(1) Ascaris (2) Taenia
(3) Frog (4) Pheretima

Q.99 Leech is-
(1) Free swimming (2) Parasitic
(3) Flat-worm (4) Round-worm

Q.100 Definite number of body segments are found in-
(1) Cockroach (2) Earthworm
(3) Taenia (4) Hydra

Q.101 Botrydall tissues are found in -
(1) Hirudenaria (2) Aphrodite
(3) Chaetopterus (4) Lumbricus

Q.102 Which of the following does not form cocoon-
(1) Leeches (2) All annelids
(3) Earthworm (4) Nereis

Q.103 Heteronereis is-
(1) A larval stage
(2) An embryonic stage
(3) A sexual stage (4) An inactive stage

Q.104 Common name of nereis is-
(1) Sand worm (2) Calm worm
(3) Rag worm (4) All

Q.105 Which one of the following functions like heparin in blood-
(1) Haematin (2) Histamine
(3) Hirudin (4) Hirudo

Q.106 Annelid which exhibits transverse fission-
(1) Syllis (2) Aphrodite
(3) Sabella (4) Polynoe

Q.107 Which of the following is largest annelid-
(1) Chaetogaster (2) Megascolex
(3) Microchaetus (4) Syllis

Q.108 Animal with red blood & annulated body-
(1) Peacock worm (2) Peanut worm
(3) Paddle worm (4) All

Q.109 In which the body is segmented-
(1) Coelenterata (2) Porifera
(3) Mollusca (4) Annelida

Q.110 Animal which inhabits deep fresh water-
(1) Tubifex (2) Leech
(3) Nereis (4) All

ARTHROPODA

Q.111 Blood in Arthropods may be light blue due too presence of
(1) Haemoglobin (2) Haematin
(3) Haemocyanin (4) Haemapoetin

Q.112 Indian species are-
(1) Periplanata americana and Blata indica
(2) Periplanata americana and Blata americana
(3) Periplanata americana and Blata orientalis
(4) Periplanata indica and Blata orientalis

Q.113 Which structure is found in male cockroach but is absent in female-
(1) Anal cerci (2) Anal style
(3) Antennae (4) Gonapophyses

Q.114 Myriapod has-
(1) Chitinous exoskeleton, ventral nerve cord, three pair of antennae
(2) Chitinous exoskeleton, ventral nerve cord, many body segments, one pair of antennae
(3) Soft body, ventral nerve cord, many body segments, two pair of antennae
(4) Chitinous exoskeleton, dorsal nerve cord, three body segments, one pair of antennae

Q.115 Chitinous exoskeleton is found in-
(1) Birds (2) Turtle
(3) Insects (4) Fishes

Q.116 Palaemon belongs to which phylum-
(1) Crustacea (2) Insecta
(3) Arthropoda (4) Mollusca

Q.117 Which is not an insect-
(1) Mosquito (2) Spider
(3) Housefly (4) Bedbug

Q.118 Number of (paired) legs in centipede are approximately-
(1) 100 (2) 50
(3) 40 (4) 20

Q.119 Which of the following is colonial insect-
(1) Mosquito (2) Locust
(3) Bed bug (4) Termites

Q.120 Which is not a fish-
(1) Cat fish (2) Dog fish
(3) Silver fish (4) Lung fish

Q.121 Common character of mosquito, rat flea, bedbug and leech is-
(1) All have nephridia
(2) Saliva contains anticoagulant
(3) Lay eggs in stagnant water
(4) All are insects

Q.122 Common character in almost all insects-
(1) 2 pair of wings (2) 3 pair of legs
(3) 2 pair of antennae
(4) One pair of abdominal appendage

Q.123 Respiratory organs of insects-
(1) Book lungs (2) Trachea
(3) Lungs (4) Fat body

Q.124 Which set includes pathogenic arthropods-
(1) Tse-tse fly, mosquito, flea-plague
(2) Crab, Culex, prawn
(3) Anopheles, culex, cray-fish
(4) Silver-fish, housefly, sand-fly

Q.125 The blood in the body of insects-
(1) Flows in open circulation
(2) Contains haemoglobin in erythrocytes
(3) Flows in arteries and veins
(4) Resembles human beings in colour

Q.126 Which animal has fixed number of legs-
(1) Hydra (2) Ant
(3) Amoeba (4) Earth-worm

Q.127 Which phylum has highest number of species-
(1) Protozoa (2) Metazoa
(3) Arthropoda (4) Insecta

Q.128 Respiratory pigment in insects-
(1) Haemoglobin (2) Cytochrome
(3) Haemocyanin (4) None

Q.129 Locusts are closely related to-
(1) Butterfly (2) Moth
(3) Grasshopper (4) Beetle

Q.130 Malpighian tubules are-
(1) Excretory organs of frog
(2) Respiratory organs of insects
(3) Excretory organs of insects
(4) Endocrine glands

Q.131 Glow worm is a-
(1) Mollusc (2) Annelid
(3) Insect (4) Helminth

Q.132 Spiders form web which is secreted from-
(1) Salivary glands
(2) Mouth
(3) Last part of abdomen
(4) Legs

MOLLUSCA

Q.133 The elephant tusk shell is
(1) Cypraea (2) Dentalium
(3) Limax (4) Nautilus

Q.134 Which are the exclusive marine molluscs
(1) Gastropods (2) Pelecypods
(3) Cephalopods (4) Scaphopods

Q.135 Mytilus belongs to class
(1) Amphineura (2) Cephalopoda
(3) Gastropoda (4) Pelecypoda

Q.136 Ovo testis is found in-
(1) Snail (2) Housefly
(3) Cockroach (4) Prawn

Q.137 Sepia and Octopus are two common marine animals. They show active movement in water by-
(1) Movement of oral arms
(2) Jet of water propelled through siphon
(3) Attachment with other animals through its suckers
(4) Undulating movement of lateral fins

Q.138 Cephalopoda has character-
(1) Foot located on head
(2) Head is located on foot
(3) Head fused with thorax
(4) Notochord found in head

Q.139 Pearl oyster belongs to-
(1) Gastropoda (2) Cephalopoda
(3) Scaphopoda (4) Pelecypoda

Q.140 Molluscan animals with reduced or without shell
(1) Octopus (2) Teredo
(3) Aplysia (4) All

Q.141 Animal which is solitary, free living & marine-
(1) Terado (2) Glossiphonia
(3) Balanus (4) All

Q.142 Common name of Doris is-
(1) Sea lemon (2) Sea hare
(3) Sea mussel (4) Sea mouse

Q.143 A free living animals whose larva is ectoparasite-
(1) Pila (2) Unio
(3) Snail (4) Octopus

Q.144 The phylum of largest invertebrate is-
(1) Annelida (2) Mollusca
(3) Arthropoda (4) Echinodermata

Q.145 The class of amphibious molluscs is-
(1) Gastropoda (2) Pelecypoda
(3) Cephalopoda (4) Bivaliva

Q.146 What is studied under conchiology-
(1) Shells (2) Worms
(3) Insects (4) Scorpion

Q.147 Study of molluscans is called as-
(1) Conchology (2) Etiology
(3) Acrology (4) Malacology

Q.148 Ospharadium is_
(1) Chemoreceptor (2) Thermoreceptor
(3) Olfactoreceptor (4) Excretory organ

ECHINODERMATA

Q.149 In which class of Echinodermata, a pluteus larva is formed
(1) Holothuroidea (2) Echinoidea
(3) Asteroidea (4) Ophiuroidea

Q.150 Which group includes all marine animals-
(1) Mollusca (2) Porifera
(3) Echinodermata (4) Coelenterata

Q.151 Water vascular system is found in-
(1) Echinodermata (2) Cnidaria
(3) Sponges (4) Arthropoda

Q.152 In star-fish which has dual function of locomotion and respiration-
(1) Axial sinus (2) Ampullae
(3) Tube feet (4) Tiedmann's body

Q.153 The connecting link between, echinodermata & chordata is-
(1) Balanoglossus (2) Peripatus
(3) Archeopteryx (4) None

Q.154 Star fish for protection leaves it's arm. It is called as-
(1) Autotomy (2) Autophagy
(3) Autogamy (4) Autolysis

Q.155 Animals which respire by respiratory tree belong to-
(1) Mollusca (2) Protochordata
(3) Echinodermata (4) Proterospongia

Q.156 Larva of holothuria is-
(1) Auricularia (2) Hexacanth
(3) Tornaria (4) Trochosphere

Q.157 Skeleton in echinoderms is -
(1) Chitinous
(2) Siliceous
(3) Made up of tunicin
(4) Calcareous

Q.158 Echinoderms keep -
(1) Radial symmetry
(2) Bilateral symmetry
(3) Elastic skin
(4) Porous body

EXERCISE – 2

ANIMAL CLASSIFICATION

Q.1 A species is defined as ''the group of actually or potentially inter-breeding natural population producing fertile offspring and reproductively isolated from such other groups''. The above statement is given by
(1) Carolus Linnaeus (2) Mayr
(3) J.B. lamarck (4) Charles Darwin

Q.2 Which set is correct
(1) Euglena–cilia
(2) *Paramecium*–Flagella
(3) Snail–Foot
(4) *Amoeba*–Foot

Q.3 Which phylum belongs to *Duterostomia*
(1) Echinodermata (2) Mollusca
(3) Arthropoda (4) Annelida

Q.4 Metazoans without tissue grade organization are called as
(1) Parazoa (2) Protozoa
(3) Eumetazoa (4) Deuterostomia

Q.5 Among the following organisms point out a completely non-parasitic form
(1) Sea anemone (2) Leech
(3) Tape worm (4) Mosquit

Q.6 On the basis of body organization, animals are grouped as
(1) Metazoa and eumetazoa
(2) Protozoa and parazoa
(3) Parazoa and metazoa
(4) Protozoa and metazoa

Q.7 Binomial nomenclature means writing the name of animals in two words which are
(1) Genus and species
(2) Order and family
(3) Genus and variation
(4) Family and genus

Q.8 *Systema Naturae* is concerned with
(1) Solar system (2) Ecosystem
(3) Classification of plants and animals
(4) Natural selection

Q.9 Which of the following classes has largest number of animals
(1) Mammalia (2) Pisces
(3) Insecta (4) Reptilia

Q.10 An animal that transforms from bilateral to radial symmetry in its life history is
(1) Hydra (2) Obelia
(3) Starfish (4) Sponge

Q.11 Which of the following does not have any alimentary canal
(1) Earthworm (2) Frog
(3) *Taenia* (4) *Ascaris*

Q.12 Founder of ''*Taxonomy''* is
(1) Aristotle (2) John Ray
(3) Haeckel (4) Linnaeus

Q.13 The meaning of taxon in the classification of animals
(1) A group of same species
(2) A group of animals on the basis of number of chromosomes
(3) A group of same type of animals
(4) A group of similar genera

Q.14 Which one of the following is a matching set of the class and some of its main distinguishing features
(1) Sporozoa – Infection by sporozoites, transmision by intermediate host and a contractile vacuole
(2) Trematoda – Well developed suckers, flat unsegmented body
(3) Arachnida – 3 pairs of legs, chitinous exoskeleton and poisonous sting
(4) Insecta – Compound eyes, segmented body and nephridia

Q.15 Most important criteria used for the present day classification of living organisms is based on
(1) Presence and absence of notochord
(2) Resemblances in external features
(3) Breeding habits
(4) Anatomical and physiological characteristics

Q.16 Radial symmetry is usually exhibited in animals which
(1) Have one opening of alimentary canal
(2) Have ciliary mode of feeding
(3) Are attached to the substratum
(4) Live in water

Q.17 The suffix '*idae*' refers to
(1) Family (2) Genus
(3) Order (4) Division

Q.18 Segmentation of body is not represented in
(1) Cray fish (2) Frog
(3) Grasshopper (4) Star fish

Q.19 Members of which phylum exhibit adaptations to widely varied environmental conditions
(1) Annelida (2) Platyhelminthes
(3) Echinodermata (4) Mollusca

Q.20 Alternation of generation is exhibited by
(1) Porifera (2) Protozoa
(3) Platyheminthes (4) Nemathelminthes

Q.21 Radial symmetry is seen in
(1) Molluscs (2) Star fishes
(3) Sponges (4) Fishes

Q.22 Two or more species occupying identical or overlapping areas are known as
(1) Sympatric species (2) Allopatric species
(3) Sibling (4) Subspecies

Q.23 The term '*New systematics*' was introduced by
(1) Adolf Engler (2) Karl prantl
(3) George Bentham (4) Julian Huxley

Q.24 Which one of the following phylums is characterized by the absence of a true coelom
(1) Echinodermata (2) Mollusca
(3) Annelida (4) Nematoda

Q.25 Animal in which larval stage is absent-
(1) Cockroach & Ascaris
(2) Earthworm & Hydra
(3) Frog & Amoeba
(4) Ascaris & Earthworm

Q.26 Tube feet for locomotion are found in-
(1) Porifera (2) Echinodermata
(3) Cnideria (4) Some annelida

Q.27 Protozoans reproduce by many methods. Which of the following reproduces both by binary fission & conjugation-
(1) Monocystis (2) Paramecium
(3) Amoeba (4) Euglena

Q.28 Excretion in Taenia is by-
(1) Malpighian body (2) Flame cell
(3) Green gland (4) Nephridia

Q.29 Entamoeba is a member of which class-
(1) Sporozoa (2) Sarcodina
(3) Protozoa (4) Calcaria

Q.30 Two nuclei dimorphism is found in-
(1) Amoeba (2) Paramecium
(3) Hydra (4) None

Q.31 The classification of porifera is based on-
(1) Ascocystes (2) Canal system
(3) Spicules (4) Choanocytes

Q.32 Aristotle lantern is found in-
(1) Star fish (2) Sea Urchin
(3) Sea anemone (4) Aurelia

Q.33 The salient feature of Echinodermata is-
(1) Bilateral symmetry & spiny skin
(2) Asymmetry & spiny skin
(3) Radial symmetry & spiny skin
(4) Radial symmetry & normal skin

Q.34 Sponges are provided with water canal system. The simplest type of water canal system is-
(1) Ascon type (2) Sycon type
(3) Leucon type (4) Regon type

Q.35 Filariasis can be irridicated out completely by destroying-
(1) Cockroach (2) Fly
(3) Culex (4) Anopheles

Q.36 Mollusca of which class has large & vertebrate-like eyes-
(1) Gastropoda (2) Bivalvia
(3) Pelecypoda (4) Cephalopoda

Q.37 Star fish is member of which class-
(1) Cephalopoda (2) Ophiuroidea
(3) Asteroidea (4) Pisces

Q.38 The species of coral which is used in jwellery-
(1) Corallium (2) Anthocodium
(3) Gorgonium (4) Fungia

Q.39 The important feature of sponges is-
(1) Choanocytes in all
(2) Sexual reproduction in all
(3) Coelenterone in all
(4) All herbivorous

Q.40 Precious Red Coral is/Coral used in ornaments is
(1) Astraea (2) Fungia
(3) Corallium (4) Tubipora

Q.41 Which one of the following animals possesses nerve cells but no nerves
(1) Hydra (2) Tapeworm
(3) Earthworm (4) Frog's tadpole

Q.42 Planaria, liver fluke & tapeworms are-
(1) All segmented (2) All endoparasites
(3) All coelomate (4) All flat worms

Q.43 The correct statement regarding *Taenia saginata* is-
(1) Absence of rostellar hooks
(2) Presence of 2 rows of hooks on the rostellum
(3) Pig is a secondary host in the life cycle
(4) Scolex has 2 large suckers

Q.44 Cyclops is intermediate host of-
(1) Planaria/Dugesia (2) Echinococcus
(3) Drancunculus (4) Ancyclostoma.

Q.45 Limulus belongs to group-
(1) Insecta (2) Crustacea
(3) Merostomata (4) Onchophora

Q.46 Respiratory pigment found in the Mollusca animal-
(1) Haemoglobin (2) Myoglobin
(3) Haemocyanin (4) None

Q.47 Which of the following is not a class of Mollusca
(1) Decapoda (2) Gastropoda
(3) Scaphopoda (4) Cephalopoda.

Q.48 Echinoderms are
(1) Fresh water forms
(2) Both fresh water and marine
(3) Exclusively marine
(4) None of the above

Q.49 Corals belong to phylum
(1) Cnidaria (2) Porifera
(3) Mollusca (4) Annelida

Q.50 Special character of coelenterates is-
(1) Polymorphism (2) Nematocysts
(3) Flame cells (4) Hermaphroditism

Q.51 Bladderworm/cysticercus is the larval stage of
(1) Tapeworm (2) Roundworm
(3) Pinworm (4) Liver Fluke

Q.52 Anus is absent in-
(1) Fasciola (2) Pheretima
(3) Periplaneta (4) Unio

Q.53 Ascaris larva is called
(1) Cysticercus (2) Rhabditiform
(3) Hexacanth (4) Onchosphere

Q.54 Pseudocoel occurs in
(1) Hydra (2) Ascaris
(3) Cockroach (4) Earthworm

Q.55 Vestigial wings occur in-
(1) Housefly (2) Mosquito
(3) Blatta (4) Periplaneta.

Q.56 Natural parthenogenesis is found in
(1) Pheretima (2) Frog
(3) Star Fish (4) Honey Bee

Q.57 Insects excrete nitrogen as-
(1) Uric acid (2) Guanine
(3) Urea (4) Ammonia

Q.58 Closed circulatory system occurs in-
(1) Snail (2) Cockroach
(3) Cuttle Fish (4) All the above

Q.59 Animals producing natural pearls belong to
(1) Echinodermata (2) Cyclostomata
(3) Mollusca (4) Fishes.

Q.60 Mollusca blood contains
(1) Haemoglobin (2) Haemozoin
(3) Haemocyanin (4) All the above

Q.61 Which molluscan group is primarily used in pearl production ?
(1) Pelecypoda (2) Gastropoda
(3) Cephalopoda (4) Monoplacophorana

Q.62 Which group does not contain polyp-
(1) Hydrozoa (2) Scyphozoa
(3) Anthozoa (4) Calcarea

Q.63 An insect without mandibles is-
(1) Musca (2) Aphids
(3) Anopheles (4) Blatta

Q.64 Which is nonpoisonous-
(1) Scorpion (2) Centipede
(3) Crab (4) Spider

Q.65 Filter feeding occurs in
(1) Dentalium (2) Unio
(3) Pila (4) Amoeba

Q.66 Which one is an ophiuroid
(1) Brittle Star (2) Sea Star
(3) Sand Dollar (4) Sea Urchin.

Q.67 The basis of protozoan classification is-
(1) Measurement (2) Shape
(3) Locomotory organelles
(4) Number of nuclei

Q.68 The correct statement for sponge is-
(1) They are found in sea water only
(2) They are radial symmetry
(3) They have spicules
(4) They have power of regeneration

Q.69 Excretion in *Entamoeba histolytica* is by-
(1) Contractile vacuole
(2) Normal body surface
(3) Food vacuole
(4) None

Q.70 Cnidaria is characterised by
(1) Nematoblasts
(2) Coelenteron
(3) Tissue level of organisation
(4) All the above

Q.71 Mesogloea of Hydra is made of-
(1) Mucopolysaccharides
(2) Protein
(3) Protein and fat
(4) Reticulate tissue

Q.72 Common name of Fungia is
(1) Mushroom Coral (2) Red Coral
(3) Brain Coral (4) Organ Pipe Coral

Q.73 Wuchereria causes a disease in parts of India
(1) Filariasis-South India
(2) Elephantiasis -Bihar
(3) Elephantiasis –Karnataka
(4) None of the above

Q.74 Sandfly is-
(1) Ancyclostoma (2) Musca
(3) Phlebotomus (4) Drosophila

Q.75 Which is associated with pearl formation ?
(1) Pecten (2) Ostrea
(3) Nautilus (4) Pinctada.

Q.76 Salient feature of cephalopoda is-
(1) Head & thorax are fused
(2) Presence of arms in place of head
(3) Arms on the head
(4) All the above

Q.77 The sailent feature of class sporozoa of phylum protozoa is-
(1) Flagella (2) Cilia
(3) Parasitism (4) Pseudopodia

Q.78 Polymorphism occurs in
(1) Anthozoa (2) Scyphozoa
(3) Rhizopoda (4) Hydrozoa.

Q.79 The animal which does not show any metamorphosis or larval stage is-
(1) Pheretima posthuma
(2) Astarias
(3) Musca domestica (4) Butterfly

Q.80 Nereis belongs to
(1) Mollusca (2) Arthropoda
(3) Echinodermeta (4) Annelida.

Q.81 Endocrine glands of insects which releases juvenile hormone are-
(1) Corpora allata
(2) Corpora albicans
(3) Corpora myecaena
(4) All the above

Q.82 Honey is-
(1) Alkaline
(2) Acidic
(3) Neutral
(4) Basic after some days

Q.83 Which is presently most infective ?
(1) Aedes (2) Anopheles
(3) Culex (4) Trilobite

Q.84 Rocky Mountain Fever is spread by-
(1) Tick (2) Housefly
(3) Cockroach (4) Mosquito

Q.85 Silk is a product of
(1) Laccifera indica (2) Nosema bombycis
(3) Bombyx mori (4) Apis dorsata

Q.86 Class bivalvia is characterised by-
(1) Presence of tentacles around mouth
(2) Absence of head
(3) Coiled shell
(4) Absence of gills

Q.87 Structure of paramecium for protection is-
(1) Sporocyst (2) Trichocyst
(3) Nematocyst (4) Oocyst

Q.88 Which character differentiates sponges from other animals-
(1) Coelenterone (2) Hollow body
(3) Collar cells (4) Dermal papilla

Q.89 Body cavity of Hydra is called-
(1) Enterocoel (2) Coelenteron
(3) Gastrovascular cavity
(4) Both 2 and 3

Q.90 Which is a coelenterate
(1) Sea Pen (2) Sea Urchin
(3) Sea Fish (4) Sea Cucumber

Q.91 Laurer's canal is found in -
(1) Amoeba (2) Paramecium
(3) Fasciola (4) Hydra

Q.92 Which is true of Taenia ?
(1) Anterior proglottides contain male organs while ripe proglottides have uterus filled with eggs
(2) All proglottides have both male and female organs
(3) Female organs are confined to anterior proglottides
(4) Male organs are confined to posterior proglottides

Q.93 Solenocytes are found in-
(1) Platyhelminthese (2) Arthropoda
(3) Annelida (4) Aschelminthese

Q.94 Animals having multiple or numerous setae are included under
(1) Polychaeta (2) Oligochaeta
(3) Hirudinea (4) Onchophora.

Q.95 In which of the following setae are found in parapodia-
(1) Oligochaeta (2) Polychaeta
(3) Hirudenia (4) Arthropoda

Q.96 Matching pair of vector and disease is
(1) Sandfly-Plague
(2) Culex-Filariasis
(3) Body Louse –Typhoid
(4) Housefly-Yellow Fever.

Q.97 A class with the largest number of animals is
(1) Mammalia (2) Insecta
(3) Reptilia (4) Pisces

Q.98 Cray Fish is-
(1) Crustacean (2) Edible fish
(3) Poisonous fish (4) Mammal.

Q.99 Green glands found in some arthropods take part in
(1) Excretion (2) Respiration
(3) Digestion (4) Both 1 and 2.

Q.100 Most common silkworm of India is
(1) Bombyx mori (2) Antherea assamensis
(3) Antherea roylei (4) Antherea paphia

Q.101 A respiratory pigment is absent in-
(1) Earthworm (2) Frog
(3) Rabbit (4) Cockroach

Q.102 Millipede (Julus) and Centipede (Scolopendra) are both included under-
(1) Arachnida (2) Myriapoda
(3) Scaphopoda (4) Pelecypoda.

Q.103 Yellow fever is transmitted by
(1) Culex (2) Aedes
(3) Anopheles (4) Bed Bug

Q.104 Father of pearl industry is-
(1) Ivanovisky (2) Luis Pasteur
(3) C. Mikimotto (4) Harvey

Q.105 Pearl oyster is associated with-
(1) Cephalopoda (2) Scaphopoda
(3) Gastropoda (4) Pelecypoda

Q.106 Aristotle's lantern occurs in class
(1) Echinoidea (2) Asteroidea
(3) Holothuroidea (4) Ophiuroidea

Q.107 Which class of protozoa includes all parasitic forms-
(1) Sarcodina (2) Mastigophora
(3) Sporozoa (4) Opalina

Q.108 Sponge which is found in river water-
(1) Pheronema (2) Chalina
(3) Cliona (4) Spongilla

Q.109 Members of which phylum are commonly called as comb jelly-
(1) Ctenophora (2) Coelenterata
(3) Echinodermata (4) Hemi-chordata

Q.110 Sense organs of Aurelia are
(1) Tentilla (2) Tentaculocyst
(3) Nematocyst (4) Otolith

Q.111 Enterobius infection Occurs through
(1) Mosquito (2) Contamination
(3) Inoculation (4) Piercing

Q.112 Which of the following worm is unsegmented & viviparous-
(1) Ascaris (2) Wuchereria
(3) Taenia (4) Fasciola

Q.113 Annelida is advanced over nematoda in having
(1) Closed circulation
(2) Metameric segmentation
(3) True coelom
(4) All the above

Q.114 Which of the following exhibit "tube-within-a tube" arrangements-
(1) Arthropoda (2) Oligochaeta
(3) Mollusca (4) Echinodermata

Q.115 Mouth parts of Cockroach are meant for-
(1) Biting and chewing
(2) Sponging
(3) Sucking (4) Cutting

Q.116 Silver Fish, Lepisma, is
(1) Mammal (2) Insect/Arthropod
(3) Fish (4) Echinoderm

Q.117 Metamorphosis of insects is regulated through-
(1) Haemolymph (2) Thyroxine
(3) Ecdysone (4) All the above

Q.118 Hind wings of Mosquito are represented by-
(1) Elytra (2) Halteres
(3) Tentorium (4) Coxa

Q.119 Spider prepares the web with the help of-
(1) Legs (2) Mouth
(3) Spinnerets (4) Salivary glands

Q.120 Shell is internal in
(1) Loligo (2) Chiton
(3) Dantalium (4) Unio

Q.121 One of the following is called as elephant tusk shell-
(1) Chitin (2) Dentalium
(3) Teredo (4) Antedon

Q.122 An enterocoelomate invertebrate group is -
(1) Annelida (2) Echinodermata
(3) Arthropoda (4) Mollusca.

Q.123 Which of the following is not found in the water of river-
(1) Arthropoda (2) Crustacean
(3) Mollusca (4) Echinodermata

Q.124 One of the following is autotroph-
(1) Amoeba (2) Monocystis
(3) Euglena (4) None

Q.125 Cells forming skeleton in sponges-
(1) Scleroblasts (2) Spongioblasts
(3) Chorioblasts (4) Thesocytes

Q.126 Characteristic larva of coelenterates is
(1) Onchosphere (2) Rhabditiform
(3) Planula (4) Cysticercus

Q.127 Dropping of gravid proglottides by cestodes is-
(1) Autophagy (2) Autotomy
(3) Paedogenesis (4) Apolysis

Q.128 Free swimming ciliated stage of Liver Fluke is-
(1) Redia (2) Miracidium
(3) Metacercaria (4) Cercaria

Q.129 Which organism resides in lymph nodes ?
(1) Taenia (2) Wuchereria
(3) Plasmodium (4) Diplococcus

Q.130 Which nematoda worm are discovered first-
(1) *Enterobios vermicularis*
(2) Ancylostoma
(3) *Ascaris lumbricoides*
(4) *Dracunculus medinesis*

Q.131 Hard exoskeleton, cephalothorax and gills for respiration are characteristics of
(1) Insecta (2) Myriapoda
(3) Polychaeta (4) Crustacea.

Q.132 Which among the following is a social. insect
(1) White Ants (2) Locusts
(3) Bed Bugs (4) Mosquitoes.

Q.133 Arthropods lack
(1) Jointed appendages
(2) Cilia
(3) Respiratory organs
(4) Segmented body

Q.134 Which of the following invertebrate is pentamerous & enterocoelic-
(1) Pila (2) Ascaris
(3) Aphrodite (4) Asterias

Q.135 Structure present in amoeba for motility is-
(1) Cilia (2) Flagella
(3) Pseudopodia (4) None of them

Q.136 Amphiblastula is a larva of-
(1) Hydra (2) Sycon
(3) Planaria (4) Leucosolenia

Q.137 Filariform is a larva of-
(1) Arthopoda (2) Platyhelminthes
(3) Aschelminthes (4) Protozoan

Q.138 Ancylostoma effects through-
(1) Contaminated food
(2) Skin
(3) Blood
(4) Kissing

Q.139 Which of the following structure will help in identifying Arthropoda from Annelida-
(1) Segmented body (2) Nephridia
(3) Eyes (4) None

Q.140 Which of the following is most modified annelid-
(1) Arenicola (2) Chaetopterus
(3) Pontobdella (4) Hirudo medicinalis

Q.141 Sand fly is a vector host of-
(1) Sleeping sickness (2) Kala-azar
(3) Diarrhoea (4) Pyorrhoea

Q.142 Name bath sponge is of-
(1) Spongilla (2) Chalina
(3) Euspongia (4) Cliona

Q.143 Food is ingested in sponges by-
(1) Trophocytes (2) Choanocytes
(3) Pinococytes (4) Porocytes

Q.144 Which of the following group has cnidoblasts-
(1) Porifera (2) Ctenophora
(3) Coelenterata (4) Platyhelminthese

Q.145 Cells which are found only in cnideria animals-
(1) Nematoblasts (2) Gland cells
(3) Muscle cells (4) All

Q.146 In Metaphire, the glands that help in binding the worms during copulation are-
(1) Prostate glands (2) Albumin glands
(3) Accessory cells (4) Mucous glands

Q.147 Sycon belongs to a group of animals, which are best described as-
(1) Unicellular or acellular
(2) Multicellular with a gastrovascular system
(3) Multicellular without any tissue organization
(4) Multicellular having tissue organization, but no body cavity

Q.148 In Arthropoda, head and thorax are often fused to form cephalothorax, but in which one of the following classes, is the body divided into head, thorax and abdomen ?
(1) Insecta (2) Crustacea
(3) Myriapoda
(4) Arachnida and Crustacea

Q.149 'Filarial worm' is technically called-
(1) *Echinococcus* (2) *Fasciola hepatica*
(3) *Wucheria bancrofti*
(4) *Ancyclostoma duodenale*

Q.150 Some insects feed on fluids using specialized mouthparts for piercing and sucking, as for example-
(1) Aphids (2) Fruitfly
(3) Butterfly (4) Housefly

Q.151 Visceral mass undergo torsion in-
(1) Gastropoa (2) Cephalopoda
(3) Pelecypoda (4) None of the these

Q.152 Contractile vacuole is absent in-
(1) Sporozoa (2) Sarcodina
(3) Zooflagellate (4) Slime molds

Q.153 Which is wrongly matched ?
(1) Euglenoidae – Myonemes
(2) Ciliophora – Axonema
(3) Annelida – Notopodia
(4) Cnidaria – Parapodia

Q.154 In evolution..... evolved first time in annelids-
(1) True coelom
(2) Cephalization
(3) Bilateral symmetry
(4) Triploblastic nature

Q.155 Which is not correctly matched-
(1) Annelida–Enterocoelomata
(2) Arthropoda–Schizocoelomata
(3) Platyhelminthes– Acoelomate
(4) Nemathelminthes–Pseudocoelomata

Q.156 Metameric segmentation is the main feature of-
(1) Annelida (2) Echinodermata
(3) Porifera (4) Coelenterata

Q.157 It lives underwater for upto three years in 'nymph' before emerging as a flying insect. Fossils of this insect dating back about 300 million years have been found-
(1) May fly (2) Stone fly
(3) Caddis fly (4) Scropion fly

Q.158 Which one of the following animals belongs to class Scaphopoda ?
(1) Oyster (2) Loligo
(3) Chiton (4) Dentalium

Q.159 The animals with bilateral symmetry in young stage, and radial pentamerous symmetry in the adult stage, belong to the phylum-
(1) Cnidaria (2) Annelida
(3) Mollusca (4) Echinodermata

Q.160 From the following statements select the wrong one-
(1) Prawn has two pairs of antennae
(2) Nematocysts are characteristics of the phylum Cnidaria
(3) Millepedes have two pairs of appendages in each segment of the body
(4) Animals belonging to phylum porifera are exclusively marine

Q.161 The coelom of the animals which are commonly known "tooth shells" originates-
(1) from the blastocoel
(2) by enterocoelic method
(3) by schizocoelic method and filled with coelomic fluid
(4) by splitting of embryonic mesoderm and filled with the blood

Q.162 Which of the following features is common in silverfish, scorpion, dragonfly and prawn?
(1) Three pairs of legs and segmented body
(2) Chitinous cuticle and two pairs of antennae
(3) Jointed appendages and chitinous exoskeleton
(4) Cephalothorax and tracheae

Q.163 Food storage in Leucosolenia occur by-
(1) Ostia (2) Osculum
(3) Thesocyte (4) Spongocoel

Q.164 The following are the features associated with Cnidaria-
(I) Radial symmetry
(II) Presence of gastrovascular cavity
(III) Animals are in either of the two forms- polyp and medusa or both
(IV) Alternation of generation in their history
(1) All
(2) Only (I) and (II)
(3) Only (II) and (III)
(4) Only (I), (II) and (IV)

Q.165 Which one is mismatched?
(1) *Obelia* – Sea water
(2) *Physalia* – Sea water
(3) *Hydra vulgaris* – Sea water
(4) *Hydra gangetica* – Freshwater

Q.166 A triploblastic pseudocoelomate, bilaterally symmetrical human parasite which is oviparous and the transmission is by contact. It is-
(1) Tapeworm (2) Hookworm
(3) Palaloworm (4) Filarial worm

Q.167 Solenocytes and nephridia are respectively found in-
(1) Cnidaria and Mollusca
(2) Annelida and Nematoda
(3) Molluscs and Echinodermata
(4) Platyhelminthes and Annelida

Q.168 Earthworm are-
(1) Ureotelic when plenty of water is available
(2) Uricotelic when plenty of water is available
(3) Uricotelic under conditions of water scarcity
(4) Ammonotelic when plenty of water is available

Q.169 What is common about Trypanosoma, Noctiluca, Monocystis and Giardia ?
(1) They have flagella
(2) They produce spores
(3) These are all parasites
(4) These are all unicellular protists

Q.170 Biradial symmetry and lack of cnidoblasts are the characteristics of-
(1) Hydra and starfish
(2) Ctenoplana and Beroe
(3) Aurelia and Paramecium
(4) Starfish and sea anemone

Q.171 Two common characters found in centipede, cockroach and crab are-
(1) Book lungs and antennae
(2) Green gland and tracheae
(3) Compound eyes and anal cerci
(4) Jointed legs and chitinous exoskeleton

Q.172 Which one of the following is matching set of a phylum and its three examples-
(1) Mollusca – Loligo, Teredo, Octopus
(2) Cnidaria – Bonellia, Physalia, Aurelia
(3) Porifera– Spongilla, Euplectella, Pennatula
(4) Platyhelminthes – Planaria, Schistosoma, Enterobius

Q.173 Diagnostic character of the phylum Echinodermata is the presence of-
(1) Spiny skin
(2) Pedicellariae
(3) Water vascular system
(4) All of these

Q.174 Which one of the following is a matching pair of a body feature and the animal possessing it?
(1) Ventral Central — Leech nervous system
(2) Pharyngeal gill slits absent in embryo — Chamaeleon
(3) Ventral heart — Scorpion
(4) Post-anal tail — Octopus

Q.175 Which one of the following pairs is mismatched-
(1) Apis indica — honey
(2) Kenia lacca — lac
(3) Bombyx mori — Silk
(4) Pila globosa — Pearl

Q.176 Which of the following pairs are correctly matched-

Animals Morphological features

(1) Crocodile – 4-Chambered heart
(2) Sea Urchin – Parapodia
(3) Obelia – Metagenesis
(4) Lemur – Thecodont

(1) B, C and D (2) Only A and D
(3) Only A and B (4) A, C and D

Q.177 Middle layer of sponge is-
(1) Mesoderm (2) Ectoderm
(3) Mesenchyma (4) Mesoglea

ANSWER KEY

EXERCISE – 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Which of the following amimal have lophophore **[RPMT 2000]**

(1) Waldheimia (2) Wallago

(3) Wall-lizard (4) Heart-urchin

Q.2 Which animal is eukaryotic unicellular **[RPMT 2000]**

(1) Synapta (2) Sun animalcule

(3) Mitre jelly fish (4) Sea lemon

Q.3 In which of the following class polymorphism is very distinct **[RPMT-2000]**

(1) Eucestoda (2) Hydrozoa

(3) Crinoidea (4) Gastropoda

Q.4 Which of the following animal has rhabdites **[RPMT 2000]**

(1) Syllis (2) May fly

(3) Bongainvillea (4) Dugesia

Q.5 Which animal has pseudocoelom : **[RPMT 2000]**

(1) Dragon fly

(2) Wouchereria bancroftii

(3) Amia (4) Lepisma

Q.6 Which of the following Nematode parasite to be first discovered **[RPMT 2000]**

(1) Ancylostoma duodenale

(2) Enterobius vermicularis

(3) Ascaris lumbricoides

(4) Dracunculus medinensis

Q.7 Highly modified annelids is **[RPMT 2000]**

(1) Pontobdella (2) Chetopterus

(3) Arenicola (4) Hirudo medicinalis

Q.8 Which of the following is a free living flat worm **[RPMT 2001]**

(1) Planaria (2) Taenia

(3) Fasiola (4) Pheretima

Q.9 Now protozoans are not included in kingdom Animalia because these are **[RPMT 2001]**

(1) Unicellular prokaryotes

(2) Multicellular prokaryotes

(3) Unicellular eukaryotes

(4) Mostly asymmetrical

Q.10 Which type of coelom is found in frog **[RPMT 2001]**

(1) Enterocoel (2) Schizocoel

(3) Pseudocoel (4) Heamocoel

Q.11 Correct order of excretory organs in cockroach, Earthworm and Rabbit respectively : **[RPMT 2001]**

(1) Skin, malpighi tubules, kidney

(2) Malpighi tubules, nephridia, kidney

(3) Nephridia, malpighi tubules, kidney

(4) Nephridia, kidney, green gland

Q.12 In Cephalopod-Sepia **[RPMT 2001]**

(1) Inner shell is found

(2) Outer shell is found

(3) A folded shell is found

(4) Shell is absent

Q.13 What will happen if a Sponge is cut into maximum possible pieces **[RPMT 2001]**

(1) These will die

(2) These will differentiate

(3) Every piece will form a sponge

(4) Some pieces will develop in organs

Q.14 Which one of the following is not a correct pair **[RPMT 2001]**

(1) Trochophore - Annelida

(2) Bipinnaria - Echinodermata

(3) Tornaria - Arthropoda

(4) Planula - Coelenterata

Q.15 Why does the Ctenophora is a minor phylum **[RPMT 2001]**

(1) It includes small sized animals

(2) It includes only few genera

(3) It does not includes animals of economic Importance

(4) It was included earlier in cnidaria

Q.16 In which of the following water vascular system is present **[RPMT 2001]**

(1) Porifera only

(2) Echinodermata only

(3) Both Porifera and Echinodermata

(4) None of them

Q.17 Pila is the example of which class **[RPMT 2001]**

(1) Gastropoda (2) Pelecypoda

(3) Cephalopoda (4) Scaphopoda

Q.18 In which class of phylum mollusca Octopus is included **[RPMT 2001]**

(1) Gastropoda (2) Cephalopoda

(3) Pelecypoda (4) Scaphopoda

Q.19 In which class of Coelenterata the polyp and medusa both are found in one animal **[RPMT 2001]**

(1) Hydrozoa (2) Scyphozoa

(3) Anthozoa (4) None of them

Q.20 Which of the following group is Duterostome **[RPMT 2001]**

(1) Annelida, Arthropoda, Mollusca

(2) Echinodermata, Hemichordata, Chordata

(3) Annelida, Mollusca, Chordata

(4) Arthropoda, Mollusca, Echinodermata

Q.21 Which is not an adaptation of parasitic life in flat worms **[RPMT 2001]**

(1) Flat body

(2) Thick cuticle on body

(3) Production of eggs in great number

(4) Presence of hook

Q.22 Which of the following phylum are included in enterozoa **[RPMT 2001]**

(1) Annelida, Mollusca, Porifera

(2) Echinodermata, Hemichordata, Porifera

(3) Mollusca, Arthropoda, Hemichordata

(4) Porifera, Mollusca, Arthropoda

Q.23 Which of the following have ‘‘omatidia’’ as unit of eye **[RPMT 2001]**

(1) Pheretima (2) House fly

(3) Pila (4) Sepia

Q.24 In Demospongia skeleton is composed of- **[RPMT 2001]**

(1) Calcium spicules (2) Silicious spicules

(3) Keratin fibres (4) Spongin fibres

Q.25 In which phylum nerve cells are found but nerves are absent **[RPMT 2001]**

(1) Porifera (2) Coelenterata

(3) Platyhelminthes (4)Nematohelminthes

Q.26 Blind sac is characteristic of which animal **[RPMT 2001]**

(1) Sponge (2) Hydra

(3) Pheretima (4) Periplenata

Q.27 In which class of Echinodermata stalk is found for attachment with substratum -**[RPMT 2001]**

(1) Asteroidea (2) Echinoidea

(3) Ophiuroidea (4) Crinoidea

Q.28 Conjugation in Protozoa is found in :- **[RPMT 2001]**

(1) Sarcodina (2) Flagellata

(3) Sporozoa (4) Ciliata

Q.29 Classification of sponges is primarily based on the **[RPMT 2002]**

(1) Body organisation (2) Body plan

(3) Skeleton (4) Canal system

Q.30 In crustaceans, respiration takes place by **[RPMT 2002]**

(1) Gills (2) Book lungs

(3) Ctenidia (4) Trachea

Q.31 Ctenophora shows affinities with **[RPMT 2002]**

(1) Cnidaria (2) Aschehelmenth

(3) Cephalopoda (4) Turbelaria

Q.32 Which of the following molluscs is formed by a larva which have torsion **[RPMT 2002]**

(1) Lamelledens (2) Pila

(3) Sepia (4) Octopus

Q.33 Insect's eggs are **[RPMT 2002]**

(1) Microlecithal & centrolecithal

(2) Megalecithal & isolecithal

(3) Megalecithal & centrolecethal

(4) Megalecithal & telolecithal

Q.34 Solenocytes and Nephridia are respectively found in **[RPMT 2002]**

(1) Platyhelmenth and Annelids

(2) Annelids and Nematoda

(3) Cenidaria and Mollusca

(4) Mollusca and Echinodermata

Q.35 Arthropoda characterised by **[RPMT 2003]**

(1) Chitinous exoskeletan, segmentation and jointed appendages

(2) Hairs, exoskelaton and three pairs of legs

(3) Exocutaneous scales, metamerism, one pair antennae

(4) One pair chelicerae, one pair pedipalp and one pair antennae

Q.36 Class sporozoa of phylum protozoa consists of **[RPMT 2003]**

(1) Fresh water forms (2) Free living forms

(3) Parasites (4) Hosts

Q.37 Coelentrata differ from other animals in having **[RPMT 2003]**

(1) Polymorphism

(2) Nematocyst

(3) Bilateral symmetry

(4) Skeleton

Q.38 Chitin exoskeleton is found in **[RPMT 2004]**

(1) Cockroach (2) Ascaris

(3) Nematoda (4) None

Q.39 Haemocoel is found in **[RPMT 2004]**

(1) Hydra (2) Ascaris

(3) Earthworm (4) Cockroach

Q.40 Metamerism is characteristic of **[RPMT 2004]**

(1) Ascaris (2) Pheretima

(3) Periplaneta (4) Hydra

Q.41 Radial symmetry is found in **[RPMT 2004]**

(1) Planaria (2) Taenia

(3) Fasciola (4) Sea anemone

Q.42 Crab, lobster & cray fish are **[RPMT 2004]**

(1) Isopods (2) Copepods

(3) Decapods (4) Diplopods

Q.43 Which of the following is pseudoc-eolomate **[RPMT 2004]**

(1) Hydra (2) Periplaneta

(3) Ascaris (4) Pheretima

Q.44 Which of the following is not an insects **[RPMT 2004]**

(1) House fly (2) Cockroach

(3) Spider (4) Mosquito

Q.45 Alimentary canal is absent in **[RPMT 2004]**

(1) Gastropoda (2) Monogenia

(3) Cestoda (4) Nematoda

Q.46 Botryoidal tissue is found in **[RPMT 2004]**

(1) Porifera (2) Acanthocephala

(3) annelida (4) Echinodermata

Q.47 Which organism is considered of non-photosynthetic form of originally photosynthetic flagellates **[RPMT 2005]**

(1) Zoo-flagellates (2) Sarcodina

(3) Sporozoa (4) None

Q.48 Which cell absent in sponge **[RPMT 2005]**

(1) Nerve cell (2) Sensory cell

(3) Gland cell (4) All of these

Q.49 In which of the following animal of echinodermata, arms, spines and pedicillariae are absent **[RPMT 2005]**

(1) Sea cucumber (2) Sea lily

(3) Sea star (4) Sea urchin

Q.50 Which is the visual unit of compound eye of insects **[RPMT 2005]**

(1) Ommatidia (2) Rod

(3) Rhabdom (4) None

Q.51 Cryfish belongs to which of the following group **[RPMT 2005]**

(1) Pisces (2) Mollusca

(3) Arthropoda (4) Echinodermata

Q.52 Canal system is the speciality of which phylum **[RPMT 2006]**

(1) Porifera (2) Coelenterata

(3) Echinodermata (4) None

Q.53 Enzyme Hirudin is present in the saliva of **[RPMT 2006]**

(1) Leech (2) Earthworm

(3) Scorpion (4) Cobra

Q.54 Solenocytes occur in **[AIPMT 1998]**

(1) Platyhelminthes (2) Arthropoda

(3) Annelida (4) Aschelminthes

Q.55 Which characteristic is true for Obelia **[AIPMT 1998]**

(1) Metagenesis (2) Morphogenesis

(3) Apolysis (4) Pedogeny

Q.56 Practical purpose of taxonomy or classification **[AIPMT 1999]**

(1) Facilitate the identification of unknown species.
(2) Explain the origin of organisms.
(3) To know the evolutionary history
(4) Identification of medicinal plants

Q.57 Which arrangement is in correct ascending order **[AIPMT 1999]**

(1) Species < genus < order < family
(2) Genus < species < family< order
(3) Order < family < Genus < species
(4) species < genus < family < order

Q.58 Similarity in Ascaris lumbricoides and Anopheles stephensi **[AIPMT 2000]**

(1) Sexual dimorphism
(2) Metamerism
(3) Anaerobic respiration
(4) Endoparasitism

Q.59 Which of the following animals have scattered cells with cell - tissue grade orgnisation **[AIPMT 2000]**

(1) Sponge (2) Hydra
(3) Liver fluke (4) Ascaris

Q.60 In Hydra, waste material of food digestion and nitrogenous waste material removed from **[AIPMT 2001]**

(1) Mouth and mouth
(2) Body wall and body wall
(3) Mouth and bodywall
(4) Mouth and tentacles

Q.61 In Protozoa like Amoeba and Paramecium, a organ is found for osmoregulation which is **[AIPMT 2002]**

(1) Contractile vacuole
(2) Mitochondria
(3) Nucleus (4) Food vacuole

Q.62 In which of the animal dimorphic nucleus is found **[AIPMT 2002]**

(1) Amoeba proteus
(2) Trypanosoma gambiens
(3) Plasmodium vivax
(4) Paramoecius caudatum

Q.63 Given below are four matchings of an animal and its kind of respiratory organ **[AIPMT 2003]**

A. Silver fish - trachea
B. Scorpion - book lung
C. Sea squirt - pharyngeal gills
D. Dolphin - skin

The correct matchings are :-

(1) A and D (2) A, B and C
(3) B and D (4) C and D

Q.64 Which one of the following is a matching pair of an animal and a certain phenomenon it exhibits **[AIPMT 2003]**

(1) Pheretima - Sexual dimorphism
(2) Musca - complete metamorphosis
(3) Chameleon - Mimicry
(4) Taenia - Polymorphism

Q.65 During its life-cycle, Fasciola hepatica (liver fluke) infects its intermediate host and primary host at the following larval stages respectively **[AIPMT 2003]**

(1) Redia and miracidium
(2) Cercaria and redia
(3) Metacercaria and cercaria
(4) Miracidium and metacercaria

Q.66 Sycon belongs to a group of animals, which are best described as **[AIPMT 2003]**

(1) Unicellular or acellular
(2) Multicellular without any tissue organization
(3) Multicellular with a gastrovascular system
(4) Multicellular having tissue organization, but no body cavity

Q.67 The animals with bilateral symmetry in young stage and radial pentamerous symmetry in the adult stage, belong to the phylum **[AIPMT 2004]**

(1) Mollusca (2) Cnidaria
(3) Echinodermata (4) Annelida

Q.68 In Arthropoda, head and thorax are often fused to form cephalothorax, but in which one of the following classes, is the body divided into head, thorax and abdomen **[AIPMT 2004]**

(1) Myriapoda
(2) Crustacea
(3) Arachnida and Crustacea
(4) Insecta

Q.69 Which one of the following is not correctly matched **[AIPMT 2004]**

(1) Culex pipiens - Filariasis

(2) Aedes aegypti - Yellow fever

(3) Anopheles culifacies - Leishmaniasis

(4) Glossina palpalis - Sleeping sickness

Q.70 In contrast to Annelids the Platyhelminths show **[AIPMT 2005]**

(1) Absence of body cavity

(2) Presence of pseudocoel

(3) Radial symmetry

(4) Bilaterla symmetry

Q.71 Which of the following unicellular organism has a macronucleus for trophic function and one or more micronuclei for reproduction **[AIPMT 2005]**

(1) Trypanosoma (2) Paramecium

(3) Euglena (4) Amoeba

Q.72 Evolutionary history of an organism is known as **[AIPMT 2006]**

(1) Ontogeny (2) Phylogeny

(3) Ancestry (4) Paleontology

Q.73 What is common about Trypanosoma, Noctiluca, Monocystis and Giardia **[AIPMT 2006]**

(1) These are all prasites

(2) These are all unicellular protists

(3) They have flagella

(4) They produce spores

Q.74 Which one of the following is a matching set of a phylum and its three examples **[AIPMT 2006]**

(1) Porifera : Spongilla, Euplectella, Pennatula

(2) Cnidaria : Bonellia, Physalia, Aurelia

(3) Platyhelminthes : Planaria, Enterobius Schistosoma

(4) Mollusca : Loligo, Teredo, Octopus

Q.75 Metameric segmentation is the characteristic of- **[AIPMT 2006]**

(1) Mollusca and Chordata

(2) Platyhelminthes and Arthropoda

(3) Echinodermata and Annelida

(4) Annelida and Arthropoda

Q.76 Two common characters found in Centipede, Cockroach and Carb are - **[AIPMT 2006]**

(1) Book lungs and antennae

(2) Compound eyes and anal cerci

(3) Jointed legs and chitinous exoskeleton

(4) Green gland and tracheae

Q.77 Biradial symmetry and lack of cnidoblasts are the characteristic of : **[AIPMT 2006]**

(1) Hydra and Starfish

(2) Starfish and Sea Anemone

(3) Ctenophora and Beroe

(4) Aurelia and Paramoecium

Q.78 Which one of the following has an open circulatory system **[AIPMT 2006]**

(1) Octopus (2) Pheretima

(3) Periplaneta (4) Hirudinaria

Q.79 Biological organization starts with - **[AIPMT 2007]**

(1) Atomic level

(2) Submicroscopic molecular level

(3) Cellular level

(4) Organismic level

Q.80 Which one of the following is a matching pair of a body feature and the animal possessing it **[AIPMT 2007]**

(1) Ventral heart - Scorpion

(2) Post-anal tail - Octopus

(3) Ventral central nervous system -Leech

(4) Pharyngeal gill slits absent in embryo- Chamaeleon

Q.81 What is true about Nereis, Scoprion, cockroach and Silver fish **[AIPMT 2007]**

(1) They all belong to the same phylum

(2) They all have jointed paired appendages

(3) They all possess dorsal heart

(4) None of them is aquatic

Q.82 Which one of the following pairs is mismatched **[AIPMT 2007]**

(1) Bombyx mori - Silk

(2) Pila globosa - Pearl

(3) Apis indica - Honey

(4) Kenia lacca - Lac

Q.83 Which one of the following is NOT a characteristic of phylum annelida **[AIPMT 2008]**

(1) Closed circulatory system
(2) Segmentation
(3) Pseudocoelom
(4) Ventral nerve cord

Q.84 Which one of the following phyla is correctly matched with its two general characteristics **[AIPMT 2008]**

(1) **Arthropoda :** Body divided into head, thorax and abdomen and respiration by tracheae
(2) **Chordata :** Notochord at some stage and separate anal and urinary openings to the outside
(3) **Echinodermata :** Pentamerous radial symmetry and mostly internal fertilization
(4) **Mollusca :** Normally oviparous and development through a trochophore or veliger larva

Q.85 Ascaris is characterized by **[AIPMT 2008]**

(1) absence of true coelom but presence of metamerism
(2) presence of neither true coelom nor metamerism
(3) presence of true coelom but absence of metamerism
(4) presence of true coelom and metamerism

Q.86 Which one of the following group of the three animals each is correctly matched with their one characteristic morphological feature **[AIPMT 2008]**

	Animals	**Morphological feature**
(1)	Liver fluke, Sea anemone, Sea cucumber	- Bilateral symmetry
(2)	Centipede, Prawn, Sea urchin	- Joined appendages
(3)	Scorpion, Spider, Cockroach	- Ventral solid central nervous system
(4)	Cockroach Locust, Taenia	- Metameric segmentation

Q.87 The middle layer in body wall of Porifera is **[AIIMS 1999]**

(1) Mesoderm (2) Mesenchyme
(3) Mesoglea (4) Mesentery

Q.88 Medusa of Obelia is **[AIIMS 1999]**

(1) Carnivorous (2) Hrbivorous
(3) Detritous feeder (4) Omnivorous

Q.89 Sense organ of Aurelia are **[AIIMS 1999]**

(1) Tenlitta (2) Tentaculocyst
(3) Nematocyst (4) Otolith

Q.90 Characteristic of class crustacea is **[AIIMS 2001]**

(1) Cephalothorax, biramous appendages and gills
(2) Head & Thorax, book lung and chitinous exoskeleton
(3) Cephalothorax, book lungs and chitinous exoskeleton
(4) Head & thorax, biramous appendages & book lungs

Q.91 After drying, a bath sponge contains **[AIIMS 2002]**

(1) hold fast (2) Tentacles
(3) spicules (4) spongin fibre

Q.92 Which organism resides in Lymph nodes **[AIIMS 2000]**

(1) Taenia (2) Wuchereria
(3) Plamodium (4) Diplococcus

Q.93 Adult Wuchereria bancrofti attacks **[AIIMS 2002]**

(1) Nervous system (2) Lymph vessels
(3) Muscular system (4) Blood vessels

Q.94 Just as Xenopsylla is for Yersenia pestis, so is **[AIIMS 2003]**

(1) Glossina palpalis to Wuchereria bancrofti
(2) Culex to Plasmodium falciparum
(3) Homo sapiens to Taenia solium
(4) Phlebotomus to Leishmania donovani

Q.95 Which one of the following features is common in silverfish, scorpion, dragonfly and prawn **[AIIMS 2005]**

(1) Three pairs of legs and segmented body
(2) Chitinous cuticle and two pairs of antennae
(3) Jointed appendages and chitinous exoskeleton
(4) Cephalothorax involves

Q.96 Tape worms obtain their food from the host by **[BHU 1982]**

(1) Sucking
(2) Scraping
(3) Absorption through integument
(4) Autotrophic

Q.97 Tapeworm does not possess digestive system as it **[BHU 1984, 85]**

(1) Does not require solid food
(2) Obtains food through general surface
(3) Does not require food
(4) Lives in intestine

Q.98 Haemoglobin is dissolved in blood plasma of **[BHU 1985]**

(1) Frog (2) Rabbit
(3) Cockroach (4) Earthworm

Q.99 Which is characteristic feature of Echinodermata **[BHU 1992]**

(1) Vascular system (2) Radial symmetry
(3) Radial canal (4) Ambulacral system

Q.100 Anus is absent in **[BHU 1994]**

(1) Fasciola (2) Pheretima
(3) Periplaneta (4) Unio

Q.101 Pick up the correctly matched pair **[BHU 1994]**

(1) Water vascular system - Sponge
(2) Blubber - Kangaroo
(3) Marsupium - Platypus
(4) Flame cell - Flatworm

Q.102 Body of Euspongia is mainly composed of **[BHU 1995]**

(1) Spicules (2) Spongin fibres
(3) Mesogloea (4) Nematoblasts

Q.103 Trochophore larva occurs in **[BHU 1995]**

(1) Annelida and Porifera
(2) Coelenterata and Annelida
(3) Mollusca and Coelenterata
(4) Annelida and Mollusca

Q.104 An animal having unsegmented coelom superficial radial symmetry in adult but bilateral symmetry in larva is member of **[BHU 1996]**

(1) Mollusca (2) Echinodermata
(3) Arthropoda (4) Annelida

Q.105 Osculum occurs in **[BHU 1997]**

(1) Star fish (2) Ray fish
(3) Hydra (4) Sponge

Q.106 Trilobites evolved in **[BHU 1997]**

(1) Precambrian (2) Ordovician
(3) Silurian (4) Cambrian

Q.107 Limulus belongs to group **[BHU 1998]**

(1) Insecta (2) Crustacea
(3) Merostomata (4) Onychophora

Q.108 Cray fish belongs to **[BHU 1998]**

(1) Pisces (2) Mollusca
(3) Arthropoda (4) Anthozoa

Q.109 Green glands found in some Arthropods take part in **[BHU 1998]**

(1) Excretion (2) Respiration
(3) Digestion (4) Both 1 and 2

Q.110 In sponges there is **[AFMC 1985]**

(1) The symmetry is radial
(2) Present a true coelom
(3) A single exit and a number of mouths
(4) A single mouth and a number of exist

Q.111 Miracidium is the larval stage of **[AFMC 1985]**

(1) Tapeworm (2) Roundworm
(3) Pinworm (4) Liver Fluke

Q.112 In insects, oxygen is carries to different tissues by **[AFMC 1985]**

(1) Diffusion through surface
(2) Tracheal tubes
(3) Respiratory pigment through blood
(4) Gills

Q.113 The excretory structures of flatworms /Taenia are **[AFMC 1987]**

(1) Flame cells (2) Protonephridia
(3) Malpighian (4) Green glands

Q.114 Cephalization is absent in **[AFMC 1989]**

(1) Molluscs (2) Arthopods
(3) Both 1 and 2 (4) Echinoderms

Q.115 Larva of Schistosoma is **[AFMC 1991]**

(1) Cercaria (2) Planula
(3) Cysticercus (4) Muller's larva

Q.116 A radially symmetrical diploblastic animal is **[AFMC 1993]**

(1) Roundworm (2) Earthworm
(3) Hydra (4) Liver fluke

Q.117 Antedon is a member of class **[AFMC 1993]**

(1) Echinoidea (2) Asteroidea
(3) Crinoidea (4) Ophiuroidea

Q.118 A sponge harmful to oyster industry is **[AFMC 1997]**

(1) Spongilla (2) Euspongia
(3) Hyalonema (4) Cliona

Q.119 In which book has Binomial Nomenclature been used for the first time **[MP PMT 1999]**

(1) Histoire Naturelle (2) Systema Naturae
(3) Historia Naturalis (4) Historia Plantarum

Q.120 Who developed the ''key'' for identification of animals **[MP PMT 1999]**

(1) John Ray (2) Goethe
(3) Georges Cuvier (4) Theophrastus

Q.121 What is the name of the book written by Aristotle **[MP PMT 1999]**

(1) Historia Animalium
(2) Histoire Naturelle
(3) Systema Naturae
(4) Philosophie Zoologique

Q.122 Who is the ''Father of Zoology'' **[MP PMT 1999]**

(1) Aristotle (2) Theophrastus
(3) Lazzaro Spallanzani
(4) Carolus Linnaeus

Q.123 Karyotaxonomy is the modern branch of classification which is based on **[MP PMT 1999]**

(1) Number of chromosomes
(2) Bands found on chromosomes
(3) Organic Evolution
(4) Trinomial Nomenclature

Q.124 Phylum Annelida resembles Mollusca in Embryonic features because both have **[MP PMT 1999]**

(1) Spiral cleavage and mesoderm formation
(2) Identical conspicuous segmentation in body muscles and nervous system
(3) Meroblastic cleavage and ectoderm formation
(4) Special types of mouth parts

Q.125 In which phylum is Water Vascular System found **[MP PMT 1999]**

(1) Protozoa (2) Arthropoda
(3) Porifera (4) Echinodermata

Q.126 In Honey bee, drones are produced by **[MP PMT 1999]**

(1) Unfertilized eggs
(2) Fertilized eggs
(3) Low feed larvae
(4) Larva feed with Royal Jelly

Q.127 Which disease is caused be female Culex **[MP PMT 1999]**

(1) Malaria (2) Pneumonia
(3) Typhoid (4) Filaria

Q.128 Which one of the following invertebrates is a deuterostome and enterocoelous coelomate **[MP PMT 2000]**

(1) Pila (2) Ascaris
(3) Aphrodite (4) Asterias

Q.129 Echinoderms are Heartless, brainless headless yet from evolutionary point of view, they have been placed on the top of the invertebrate phyla because of the presence in them of **[MP PMT 2000]**

(1) power of reproduction
(2) great power of regeneration
(3) exclusively marine
(4) presence of enterocoel

Q.130 Holophytic nutrition is found in **[MP PMT 2000]**

(1) Amoeba (2) Giardia
(3) Entamoeba (4) Euglena

Q.131 The class of Trichonympha is **[MP PMT 2000]**

(1) Calcaria (2) Scyphozoa
(3) Sporozoa (4) Mastigophora

Q.132 In poriferans the skeleton forming cells are **[MP PMT 2000]**

(1) Amoebocytes (2) Thesocytes
(3) Archiocytes (4) Sclerocytes

Q.133 Dropping of gravid proglottids by cestodes is called **[MP PMT 2000]**
(1) Apolysis (2) Autotomy
(3) Paedogenesis (4) Autophagy

Q.134 Which of the following does not belongs to phylum coelenterate **[MP PMT 2002]**
(1) Sea pen (2) Sea feather
(3) Sea cucumber (4) Sea fan

Q.135 Nematocysts are found in **[MP PMT 2002]**
(1) Porifera (2) Coelenterata
(3) Nematodes (4) Annelida

Q.136 Commercial bath sponge is called **[MP PMT 2002]**
(1) Euspongia (2) Spongilla
(3) Euplectella (4) Cliona

Q.137 "Systema Naturae" was written by : **[Kerala PMT 2010]**
(1) Ariostotle (2) Linnaeus
(3) Lamarck (4) Charles Darwin

Q.138 Basic unit of taxonomy is : **[MPPMT 2010]**
(1) Genus (2) Order
(3) Species (4) Phylum

Q.139 A group of related genera is classified as : **[AFMC 2009 ; DUMAT 2010]**
(1) Order (2) Class
(3) Phylum (4) Family

Q.140 Who has added the word "Phylum" in taxonomy? **[MPPMT 2010]**
(1) Plato (2) John Ray
(3) Leopold Cuvier (4) Linnaeus

Q.141 The correct sequence of taxa is : **[Orissa JEE 2010]**
(1) Class – Order – Family – Tribe – Genus – Species
(2) Class – Order – Tribe – Family – Genus – Species
(3) Phylum – Order – Class – Tribe – Genus – Species
(4) Phylum – Tribe – Class – Order – Genus – Species

Q.142 Mayr's biological concept of species is mainly based on : **[CPMT 2009]**
(1) Morphology
(2) Reproductive isolation
(3) Modes of reproduction
(4) Morphology and reproduction

Q.143 The five kingdom classification of living organisum was proposed by : **[MPPMT Pharmacy 2009]**
(1) Altmann (2) Hutchinson
(3) Whittaker (4) Adolf Engler
(5) Bentham and Hooker

Q.144 Prokaryotes are included in the kingdom : **[JKCMEE 2009]**
(1) Monera (2) Protista
(3) Protozoa (4) Basidiomycetes

Q.145 Which one of the taxonomic aids can give comprehensive account of complete compiles information of anyone genus or family at a particular time? **[Kerala PMT 2009]**
(1) Flora (2) Dictionary
(3) Herbarium (4) Monograph
(5) taxonomic key

Q.146 Single-celled eukaryotes are included in : **[CBSE 2010]**
(1) Protista (2) Fungi
(3) Archaea (4) Monera

Q.147 A common means of sympatric speciation is : **[DUMET 2010]**
(1) Polyploidy
(2) Temporal segregation of breeding season
(3) Spatial segregation of mating sites
(4) Imposition of geographic barrier

Q.148 Populations are said to be sympatric when …… **[Karnataka CET 2010]**
(1) Two populations live together and freely inbreed to produce sterile offspring
(2) Two populations are physically isolated by natural barriers
(3) Two populations are isolated but occasionally come together to interbreed
(4) Two populations share the same environment but cannot interbreed

Q.149 Classification of organism based on evolutionary as well as genetic relationships is called : **[DUMET 2010]**
(1) Phenetics (2) Cladistics
(3) biosystematics
(4) Numerical taxonomy

Q.150 "Taxa" differs from "taxon" due to this being : **[DUMET 2010]**

(1) A higher taxonomic category than taxon

(2) A lower taxonomic category than taxon

(3) The singular of taxon

(4) The plural of taxon

Q.151 Which of the following statements regarding universal rules of nomenclature is wrong? **[Kerala PMT 2010]**

(1) The first word in a generally name represents the genus

(2) Biological names are generally in Greek and written in italics

(3) The first word denoting the genus starts with a capital letter

(4) Both words ina biological name when hand written are separately underlined

Q.152 Which one of the following group of animal is bilaterally? **[CBSE 2009]**

(1) Sponges (2) Ctenophores

(3) Coelenterates (Cnidarians)

(4) Aschelminthes (Roundworms)

Q.153 Deuterostome condition and indeterminate radial cleavage are characteristics of : **[AMU 2009]**

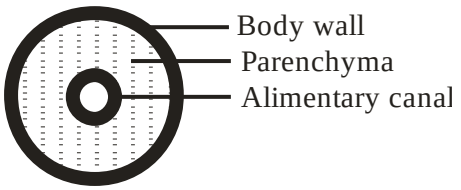
(1) Chordates and arthropods

(2) Chordates and echinoderms

(3) Arthropods and echinoderms

(4) Chordates, arthropods and annelids

Q.154 The cross section of the body of an invertebrate is given below. Identify the animal which has body plan. **[Karnataka CET 2009]**



(1) Planaria (2) Earthworm

(3) Cockroach (4) Roundworm

Q.155 What is the best way to test relatedness 0f two species? **[Orissa JEE 2009]**

(1) RNA and Proteins

(2) DNA and Proteins

(3) Antibodies and transposons

(4) None of the above

Q.156 Which one of the following statements about all the four of *Spongilla*, Leech, Dolphin and Penguin is correct? **[CBSE 2010]**

(1) Spongilla has special collared cells called choanocytes, not found in the remaining three

(2) Penguin is homoeothermic while the remaining three are poikilothermic

(3) Leech is a freshwater form white all others are marine

(4) All are bilaterally symmetrical

Q.157 Which of the following statements are correct witgh regard to Deuterostomes? **[EAMCET 2010]**

A. The blastopore develops into anus in adult.

B. The balstopore develops into mouth in adult.

C. Cleavage is radial and indeterminate.

D. Cleavage is spiral and determinate.

(1) 1 and 3 (2) 1 and 2

(3) 2 and 4 (4) 2 and 3

Q.158 Choose the animal which exhibits the following characteristics : **[EAMCET 2010]**

A. Marine habitat.

B. Bilateral symmetry and cephalization.

C. Haemocoel as principal body cavity.

D. Eyes similar to that of vertebrates.

(1) Silverfish (2) Dogfish

(3) Jellyfish (4) Cuttle fish

Q.159 The plane that divides the body into right and left haves : **[EAMCET 2010]**

(1) Transverse (2) Frontal

(3) Sagittal (4) Radial

Q.160 The mian basis of classification of Protozoa is : **[AFMC 2009 ; MPPMT 2010]**

(1) Size (2) Shape

(3) locomotory device (4) Number of nuclei

Q.161 Which class of Protozoa includes all parasitic forms? **[CPMT 2009]**

(1) Mastigophora (2) Ciliata

(3) Sporozoa (4) Sarcodina

Q.162 Infective stage of Entamoeba histolytica : **[BHU 2007; CPMT 2009]**

(1) Trophozoite (2) Precystic form

(3) Metacystic form (4) Quadrinucleate cyst

Q.163 Stage of Plasmodium infective to man and injected into human blood by mosquito is : **[Orissa JEE 2010]**

(1) Trophozoite (2) Merozoite
(3) Sporozoite (4) Cyst

Q.164 Which of the following glands is enlarged in malaria? **[Orissa JEE 2009]**

(1) Pancreas (2) Liver
(3) Spleen (4) All of these

Q.165 Which is not true for Paramecium? **[Orissa JEE 2009]**

(1) Use pseudopodia for capturing prey
(2) Under unfafvourable conditions form cysts
(3) Presence of large number of cilia on whole body surface
(4) Contain contractile vacuoles for osmoregulation

Q.166 Match the following : **[EAMCET 2010]**

List I	List II
A. Reticulopodia	1. Lecithium
B. Lobopodia	2. Collozoum
C. Filopodia	3. Globigerina
D. Axopodia	4. Ceratium
	5. Entamoeba

The correct match is :

(1) A = 3, B = 4, C = 2, D = 1
(2) A = 3, B = 5, C = 1, D = 2
(3) A = 4, B = 5, C = 1, D = 3
(4) A = 2, B = 3, C = 1, D = 4

Q.167 When a freshwater protozoan is placed in marine water, … : **[Karnataka CET 2010]**

(1) The contractile vacuoles becomes bigger in size
(2) The number of contractile vacuoles increase
(3) The contractile vacuoles disapper
(4) The contractile vacuoles remain unchanged

Q.168 Which of the following is a flagellated protozoan? **[Kerala PMT 2010]**

(1) Amoeba (2) Entamoeba
(3) Palsmodium (4) Trypanosoma

Q.169 The type of nutrition present in Entamoeba is : **[Orissa JEE 2010]**

(1) Saprozoic (2) Parasitic
(3) Autotrophic (4) None of these

Q.170 Sponges possess : **[CPMT 2009]**

(1) No tissues
(2) Epithelial tissues only
(3) Epithelial and connective tissues only
(4) All four types of tissues

Q.171 Which one of these is referred to as "Venus Flower basket"? **[Kerala PMT 2009]**

(1) Euplectella (2) Sycon
(3) Cliona (4) Spongilla
(5) Proterion

Q.172 Choanocytes form the lining of paragastric cavity in : **[JKCMEE 2009]**

(1) Jellyfish (2) Sponges
(3) Helminthes (4) Echinoderms

Q.173 Which is not correct for spongers? **[Orissa JEE 2009]**

(1) Internal fertilization
(2) External fertilization
(3) Gemmule formation
(4) Gametes are formed from epidermal cells

Q.174 One of the following is not a characteristic feature of sponges : **[Kerala PMT 2010]**

(1) Presence of ostia
(2) Indirect development
(3) Intracellular digestion
(4) Body supported by chitin
(5) Cellular level of organization

Q.175 Ephyra is the larva of : **[AFMC 2009]**

(1) Obelia (2) Sea anemones
(3) Physalia (4) Aurelia

Q.176 Which one of the following has a biradial symmetry? **[JKCMEE 2007, Orissa JEE 2010]**

(1) Jellyfish (2) Cockroach
(3) Paramecium (4) Sea anemone

Q.177 Digestion in Hydra takes place within : **[Orissa JEE 2009]**

(1) Pelvic cavity
(2) Abdominal
(3) Gastrovascular cavity
(4) Pericardial cavity

Q.178 Budding as normal mode of asexual reproduction occurs in : **[Orissa JEE 2010]**
(1) Hydra and starfishes
(2) Hydra and Sponges
(3) Hydra and tapeworms
(4) Sponges and starfishes

Q.179 The type of asexual reproduction found in Hydra is : **[Kerala PMT 2009]**
(1) Budding (2) Multiple fission
(3) Sporulation (4) Binary fission

Q.180 Primitive nervous system is formed in : **[PMT 2009]**
(1) Sponge
(2) Cnidaria
(3) Porifera
(4) Cnidaria(Coelenetrata)

Q.181 Siphonophora is the order in : **[JKCMEE 2009]**
(1) Protozoa (2) Cnidaria
(3) Porifera (4) Annelida

Q.182 Biradial symmetry is found in : **[Orissa JEE 2010]**
(1) Beroe (2) Hydra
(3) Sponges (4) Labeo

Q.183 Cysticercus is the larval stage of : **[WB. JEE 2010]**
(1) Liver fluke (2) Pinworm
(3) Tapeworm (4) Roundworm

Q.184 Which of the following animals does not have a body composed of many segments? **[Orissa JEE 2009]**
(1) Lobster (2) Earthworm
(3) Flatworm (4) Grasshopper

Q.185 All flatworm differ from all roundworms in having : **[CBSE 2010]**
(1) Solid mesoderm
(2) Triploblastic body
(3) Bilateral symmetry
(4) Metamorphosis in the life history

Q.186 One example of animals having a single opening to the outside that serves both as mouth as well as anus is: **[CBSE 2010]**
(1) Octopus (2) Asterias
(3) Ascidia (4) Fasciola

Q.187 Which one of the following kinds of anilmals are triploblastic? **[CBSE 2010]**
(1) Corals (2) Sponges
(3) Flatworms (4) Ctenophores

Q.188 Which of the following is found in the lymph nodes? **[CPMT 2007, 2009]**
(1) Taenia (2) Plasmodium
(3) Wuchereria (4) Diplococcus

Q.189 Pesudocoelom is the characteristic of : **[Orissa JEE 2009]**
(1) Annelida (2) Mollusca
(3) Nematoda (4) Echinodermata

Q.190 Which one of the following statements about certain given animals is correct? **[CBSE 2010]**
(1) Molluscs are acoelomates
(2) Insect are pseudocoelemates
(3) Flatworms (Platyhelminthes)
(4) Roundworm (Aschelminthes) are pseudo-coelomates

Q.191 The pseudocoelomate among these is : **[Kerala PMT 2010]**
(1) Porifera (2) Annelida
(3) Aschelminthes (4) mollusca
(5) Platyhelminthes

Q.192 Wuchereria bancrofti is transmitted by : **[MPPMT Pharmacy 2010]**
(1) Flies (2) Pigs
(3) Louse (4) mosquitoes

Q.193 Which of the following has closed circulatory system? **[AFMC 2009]**
(1) Molluscs (2) Arthropods
(3) Annelids (4) Platyhelminthes

Q.194 The clitellum of Metaphire is present in segments : **[AFMC 2010]**
(1) 12, 13 and 14 (2) 13, 14 and 15
(3) 14, 15 and 16 (4) 16, 17 and 18

Q.195 In earthworm, septa are absent in segments : **[EAMCET 2010]**
(1) 8 – 12 (2) 17 – 21
(3) 1 – 4 (4) 14 – 26

Q.196 The gas exchange surface in an earthworm is : **[Orissa JEE 2009]**
(1) Skin (2) Gills
(3) Ctenidia (4) Tracheae

Q.197 Animal which respires, but has no respiratory organs : **[VMMC– Safdarjung 2008]**

(1) Fish (2) Frog

(3) Earthworm (4) Cockroach

Q.198 Paired spermatheceae occur in MEtaphire in segments : **[Ketala PMT 2010]**

(1) 4, 5, 6 , 7 (2) 5, 6, 7, 8

(3) 6, 7, 8, 9 (4) 3, 4, 5, 6

Q.199 In earthworm, gizzard is found in : **[CPMT 2009]**

(1) 8 – 10 segment (2) 27^{th} segment

(3) 8 th segment (4) 8 – 11 segment

Q.200 Metameric segmentation is the main feature of: **[MPPMT 2010]**

(1) Annelida (2) Echinodermata

(3) Porifera (4) Coelenterata

Q.201 If a live earthworm is pricked with a needle on its outer surface without damaging its gut, the fluid that comes out is : **[CBSE 2009]**

(1) Slimy mucus (2) Heamolymph

(3) Excretory fluid (4) Coelomic fluid

Q.202 Which one of the following correctly describes the location of some body parts in the earthworm Pheretima? **[CBSE 2009]**

(1) Four pairs of spermathecae in 4 – 7 segments

(2) Two pairs of testes in 10th and 11th segments

(3) Two pairs of accessory glands in 16 – 18 degment

(4) One pair of ovaries attached at intersegmental septum of 14th and 15th segment

Q.203 In the earthworm : **[AMU 2009]**

(1) Intergumentary and pharyngeal nephridia are exonephric

(2) Intergumentary and septak nephridia are enteronephric

(3) Pharygeal and septal nephridia are enteronephric

(4) Pharygeal and septal nephridia are exonephric

Q.204 Choose the correct combination of labeling from the options given : **[Kerala PMT 2009]**

(1) A = Testis, B = Specmatheca, C = Seminal vesicle, D = ovary, E = vas defferns, F = Accessory gland

(2) A = Specmatheca, B = Testis, C = Seminal vesicle, D = ovary, E = vas defferns, F = Accessory gland

(3) A = Specmatheca, B = Testis, C = ovary, D = Seminal vesicle, E = vas defferns, F = Accessory gland

(4) A = Specmatheca, B = Testis, C = Accessory gland, D = ovary, E = vas defferns, F = Seminal vesicle

(5) A = Specmatheca, B = ovary, C = Seminal vesicle, D = Testis, E = vas defferns, F = Accessory gland

Q.205 In pheretima, the open type of nephridia are located in these segment : **[EAMCT 2010]**

(1) 4^{th} , 5^{th} and 6^{th} (2) 2^{nd} to the last

(3) 16^{th} to the last (4) 7^{th}, 9^{th} and 13^{th}

Q.206 The lateral hearts in earthworm have : **[AMU 2010]**

(1) Four pairs of valves and are situated in the segments 7 and 9

(2) Four pairs of valves and are situated in the segments 6 and 8

(3) Four pairs of valves and are situated in the segments 8 and 10

(4) Four pairs of valves and are situated in the segments 6 and 11

Q.207 Which one of the following species of earthworm is not recommended for vermicomposting? **[EAMCT 2010]**

(1) Eudrilus eugeniae (2) Elsenia fetidae

(3) Perionyx excavates

(4) Pheretima postuma

Q.208 Number of chambers in the heart of cockroach is : **[CPMT 2001, 2009]**

(1) 23 (2) 13

(3) 4 (4) 3

Q.209 oxygen carrying respiratory pigment of cockroach and other insects are : **[Orissa JEE 2010]**

(1) Haemoglobin (2) Haemocyanin

(3) Haemoerythrin (4) None of these

Q.210 Main excretory product in cockroach and other insects is : **[CPMT 2009]**
(1) Ammonia (2) Urea
(3) Uric acid (4) Amino acid

Q.211 Hormone produced by corpora allata in insects is : **[AMU 2009]**
(1) Growth hormone (2) Juvenile hormone
(3) Inhibiting hormone
(4) Moulting hormone

Q.212 Which of the following hormones regulates growth and metamorphosis in insect? **[DUMET 2009]**
(1) Ecdyson (2) Brain hormone
(3) Juvenila hormone
(4) Prothoracicotropic hormone

Q.213 Stink gland is found in : **[CPMT 2007, 2009]**
(1) Bird (2) Insect
(3) Reptile (4) Worm

Q.214 Periplaneta Americana has thermoreceptor sensillae on : **[EAMCET 2007, 2010]**
(1) 1^{st}, 2^{nd} and 3^{rd} segment of tarsus of legs
(2) 3^{rd}, 4^{th} and 5^{th} segment of tarsus of legs
(3) 15^{th} segment of anal cerci
(4) Pedical of antenna

Q.215 Which of the following are examples of Arthropoda? **[Orissa JEE 2010]**
(1) Silverfish, Starfish, Prawn
(2) Clamworm, Apple snail, Honebee
(3) Seastar, Tongueworm, Scorpion
(4) Cockroach, Scorpion, Prawn

Q.216 Which animal of the following belongs to class Crustacea? **[CPMT 2007, 2009]**
(1) Cockroach (2) Cyclops
(3) Grasshopper (4) Mosquito

Q.217 The cells present in the fat bodies of cockroach, which contain certain symbiotic that synthesize amino acids are : **[EAMCET 2010]**
(1) Trophocytes (2) Mycetocytes
(3) Oenocytes (4) Urate cells

Q.218 Which one of the following arthropods is viviparous? **[EAMCET 2010]**
(1) Palaemon (2) Palamnaeus
(3) Pediculus (4) Periplaneta

Q.219 Malpighian tubules are analogous to : **[AFMC 2010]**
(1) Trachea of cockroach
(2) Gills
(3) Flame cells
(4) None of these

Q.220 In the mouthparts of cockroach, the galea and lacinia form parts of the : **[AMU 2010]**
(1) Mandible (2) Maxilla
(3) Labium (4) Labrum

Q.221 Cockroaches can climb smooth or steep surfaces due to the presence of adhesive pads found on the tarsus of their legs. They are called …….. : **[Karnataka CET 2010]**
(1) Plantulae (2) Tibia
(3) Pretarsus (4) Arolium

Q.222 Bee keeping is known as : **[MPPET 2010]**
(1) Sericulture (2) Tissue culture
(3) Apiculture (4) Pisciculture

Q.223 The larva of bombyx mori is : **[DUMET 2009]**
(1) nymph (2) Trochophopre
(3) Cocoon (4) Caterpillar

Q.224 Of the following, which is the largest bee? **[MPPET Phaemacy 2010]**
(1) Apis florae (Little Bee)
(2) Apis dorsata (Rock Bee)
(3) Apis indica (Indian Bee)
(4) Apis mellifera (European Bee)

Q.225 Workers of honeybee society are : **[CPET 2009]**
(1) Sterile males (2) Sterile females
(3) Females without gonads
(4) Males without gonads

Q.226 The lifespan of honeybee drone is : **[WB. JEE 2009]**
(1) 1 – 2 months (2) 3 – 4 months
(3) 6 – 7 months (4) 10 – 12 months

Q.227 In honey the percentage of maltose and other sugars is : **[WB. JEE 2010]**
(1) 9.2 (2) 8.81
(3) 10.5 (4) 11.2

Q.228 Nosema bombycis which causes pebrine in silkworms is a : **[Karnataka CET 2009]**
(1) Virus (2) Fungus
(3) Bacterium (4) Protozoan

Q.229 A dorsal horn is present on the mulberry silkworm (caterpillar) :
[Karnataka CET 2009]
(1) Head
(2) 2nd thoracic segment
(3) 8th abdominal segment
(4) 5th abdominal segment

Q.230 The scirpophaga incertulas is an example of :
[WB. JEE 2009]
(1) Aedes aegypti
(2) Aedas albopictus
(3) Aedes albolineatus
(4)Aedes taeniorhynchus

Q.231 Scirpophaga incertulas is an example of :
[WB. JEE 2009]
(1) Diphagous pest
(2) Polyphagous pest
(3) Oligophagous pest
(4) Monophagous pest

Q.232 Which one of the following diseases is spread by housefly? **[WB. JEE 2010]**
(1) Filariasis (2) Typhoid
(3) Encephalities (4) Dengue fever

Q.233 **Statement (S) :** Biting and chewing mouthparts are the most primitive type of mouthparts of insects.
Reason (R) : Holometabolous insects have biting and chewing type of mouthparts in their larvae. **[EAMCET 2010]**
(1) Both (S) and (R) are true and (R) is correct explanation to (S)
(2) Both (S) and (R) are true and (R) does not explain (S)
(3) (S) is correct but (R) is wrong
(4) (S) is wrong but (R) is correct

Q.234 Similarity between Anopheles and Culex is :
[AFMC 2010]
(1) Eggs have lateral air floats
(2) Eggs are laid in floating raft
(3) Respiratory siphon is present
(4) Males of both suck juices of flowers and fruits

Q.235 The most commonly maintained species of bee by bee keepers is : **[AMU 2010]**
(1) Apis mellifera (2) Apis dorsata
(3) Apis indica (4) Apis florae

Q.236 How do you differentiate a butterfly from a moth? **[Karnataka CET 2010]**
(1) Moth has feathery antennae but butterfly has club-shaped antennae
(2) Moth has one pair of wings but butterfly has two pairs of wings
(3) Moth is diurnal but butterfly is nocturnal
(4) Moth has simple eyes but butterfly has compound eyes

Q.237 Which one of the following diseases is caused by Nosema bombycis?**[Karnataka CET 2010]**
(1) Pebrine (2) Flacherie
(3) Grasserie (4) Muscadine

Q.238 Percentage composition of fibroin and sericin in silk is : **[WB. JEE 2010]**
(1) 50 : 40 (2) 80 : 20
(3) 30 : 70 (4) 40 : 60

Q.239 Radula is presentin : **[WB. JEE 2010]**
(1) Loligo (2) Mytilus
(3) Unio (4) Pila

Q.240 Neopilina is a connecting link between :
[AFMC 2010]
(1) Arthropoda and Mollusca
(2) Annelida and Mollusca
(3) Mollusca and Echinodermata
(4) Mollusca and Helminthes

Q.241 Which one of the following molluscs was formerly used as currency (money)?
[MPPMT Pharmacy 2010]
(1) Dentalium (2) Chiton
(3) Oyster (4) Loligo

Q.242 The second largest phylum in the animal kingdom is : **[JKMCEE 2009]**
(1) Annelida (2) Arthropoda
(3) Cephalopoda (4) Amphineura

Q.243 The phenomenon of torsion occurs in :
[AMU 2010]
(1) Gastropoda (2) Pelecypoda
(3) Cephalopoda (4) Amphineura

Q.244 Phylum Mollusca can be distinguished from other invertebrates by the presence of :
[DUMET 2010]
(1) Bilateral symmetry and exoskeleton
(2) A mantle and gills
(3) Shell and non-segmented body
(4) A mantle and non-segmented body

Q.245 Arrange the shell layers of pearl oyster in correct order and select the answer from the code given below :

1. Mantle 2. Periostracum
3. Nacreous layer 4. Prismatic layer

[WB. JEE 2010]

(1) 1, 4, 3, 1 (2) 4, 2, 1, 3
(3) 2, 4, 3, 1 (4) 1, 2, 3, 4

Q.246 Which of the following traits is not characteristic of echinoderms?

[Orissa JEE 2009]

(1) Water vascular system
(2) Trochophore larva
(3) Tube feet
(4) Enterocoel

Q.247 Organs of locomotion in Echiniodermata are :

[Orissa JEE 2010]

(1) Pseudopodia (2) Parapodia
(3) Foot (4) Tube feet

Q.248 The presence of tube feet is a characteristic feature of the phylum : **[Kerala PMT 2009]**

(1) Annelida (2) Mollusca
(3) Arthropoda (4) Echinodermata
(5) Nemathelminthes

Q.249 Tube feet are characteristic structures of :

[CPMT 2009]

(1) Starfish (2) Cuttlefish
(3) Crayfish (4) Jellyfish

Q.250 Which of the following is properly matched?

[Karnatake CET 2009]

(1) Arthropoda – Insecta – Spider
(2) Mollusca – Cephalopoda – Unio
(3) Echinodermata – Asteroidea – Starfish
(4) platyhelminthes – Trematoda – Planaria

Q.251 Which of the following is an exclusively echinoderm character? **[AMU 2010]**

(1) Tube feet
(2) Coelom divided
(3) Rasial sysmmetry
(4) Mesodermal endoskeleton

Q.252 Water vascular system is found in :

[WB. JEE 2010]

(1) Sea pen (2) Sea horse
(3) Sea anemone (4) Sea cucumber

Q.253 What will you look for to identify the sex of the following? **[CBSE PMT 2011]**

(1) Female Ascaris-sharply curved posterior end
(2) Male frog – a copulatory pad on the first digit of the hind limb
(3) Female cockroach – anal cerci
(4) Male shark – claspers borne on pelvic fins.

Q.254 One very special feature in the earthworm Pheretima is that **[CBSE PMT 2011]**

(1) Fertilization of eggs occurs inside the body
(2) The typhlosole greatly increases the effective absorption area of the digested food in the intestine
(3) The S-shaped setae embedded in the integument are the defensive weapons used against the enemies
(4) It has a long dorsal tubular heart.

Q.255 Which one of the following groups of animals is correctly matched with its characteristic feature without any exception?

[CBSE PMT 2011]

(1) Reptilia : Possess 3-chambered heart with an incompletely divided ventricle.
(2) Chordata : Possess a mouth with an upper and a lower jaw
(3) Chondrichthyes : posses cartilaginous endoskeleton.
(4) Mammalia : Given birth to young ones.

Q.256 Which of the following happens in the common cockroach? **[CBSE PMT 2011]**

(1) Malpighian tubules are excretory organs projecting out from the colon
(2) Oxygen is transported by haemoglobin in blood
(3) Nitrogenous excretory product is urea
(4) The food is grind by mandibles and gizzard.

Q.257 In which one of the following, the genus name, its two characters and its phylum are not correctly matched, whereas the remaining three are correct ? **[AIPMT Pre 2012]**

	Genus Name	Two characters	Phytum
(1)	*Asterias*	(a) Spiny skinned (b) Water vascular system	Echinodermata
(2)	*Sycon*	(a) Pore bearing (b) Canal system	Porifera
(3)	*Periplanein*	(a) Jointed appendages (b) Chitinous exoskeleton	Arthropoda
(4)	*Pila*	(a) Body segmented (b) Mouth with Radula	Mollusca

Q.1 What are not true about Taenia saginata?
(a) Taenia saginata is longer than Taenia solium
(b) The scolex bears four adhesive suckers
(c) Rostellum and hooks are present
(d) Life history has pig as an intermediate host
(1) a, c and d (2) a and c
(3) c and d (4) c only

Q.2 Which of the following statements are correct about metagenesis in the life cycle of Cnidarians?
(a) Alternation of asexual and sexual phases in the life cycle of Obelia is called as metagenesis
(b) It is similar to alternation of generation found in plants
(c) Both the asexual and sexual forms are diploid
(d) Asexual form (polyp) is haploid and sexual form (medusa) is cijploid
(1) a, b and c (2) a, band d
(3) a and d (4) a and c only

Q.3 What are not true?
(a) Karl von Frisch got Nobel Prize for decoding the language of 'bee dances
(b) The bee wax is secreted by the abdominal glands of worker bee
(c) Queen bee lays two types of eggs one forming queen and workers and second forming drones
(d) Queen bee lays one type of eggs from which all castes develop
(e) 'Royal jelly' to feed young larvae is secreted by queen bee
(1) c and e (2) a, band c
(3) b, c and e (4) d and e

Q.4 Locust are the plant pests which can be solitary or gregarious. It depends upon
(1) Season (2) Availability of food
(3) Their population size
(4) Their species

Q.5 Third and fourth moulting during development of Ascaris takes place in which part of its host?
(1) Alveoli, intestine (2) Intestine, alveoli
(3) Soil, intestine (4) Stomach, uterus

Q.6 Select the true statement
(1) Male Schistosoma has a gynaecophoric canal on dorsal side for holding the female
(2) Male Schistosoma has a gynaecophoric canal on ventral side for holding the female
(3) Female Schistosoma has a gynaecophoric canal on dorsal side for holding the male
(4) Female Schistosoma has a gynaecophoric canal on ventral side for holding the male

Q.7 In case of honey bees, the queen bee substance or antiqueen pheromone is given out by
(1) Developing queen bee
(2) Worker
(3) Drones (4) Adult queen

Q.8 Blood of cockroach function as transporter of various materials like waste products etc. However, it doesn't have any role in
(1) Phagocytic activity
(2) Healing of injuries
(3) Respiration (4) Nutrient reservoir

Q.9 Which of the following cells control the inflammation during heliminthic infection?
(1) Neutrophils (2) Basophils
(3) Eosinophils (4) Monocytes

Q.10 In earthworm testis are present in
(1) 10^{th} and 11^{th} segment
(2) 18^{th} segment
(3) 17^{th} and 19^{th} segment
(4) 12^{th} and 13^{th} segment

Q.11 Find the odd one out
(1) Mushroom gland (2) Phallic gland
(3) Spermatheca (4) Ejaculatory duct

Q.12 Which of the following is not a character of Pheretima posthuma?
(1) The skin of earthworm is brown due to the presence of porphyin
(2) The first segment is called as prostomium
(3) Blood glands are present in 4^{th} , 5^{th} and 6^{th} segments, they produce blood cells and haemoglobin which is dissolved in plasma
(4) There are four pairs of spermathecal pores in Pheretima which are located in intersegmental grooves between segments 5/6, 6/7, 7/8, 8/9

Q.13 Which blood vessel of earthworm acts as collecting as well as distributing blood vessel?
(1) Dorsal (2) Ventral
(3) Lateral (4) Subneural

Use the following options of the following questions (Q.14 to Q.23) for chose the correct answer.

(1) If both **Assertion** & **Reason** are true and the reason is the correct explanation of the assertion.
(2) If both **Assertion** & **Reason** are true but the reason is not the correct explanation of the assertion.
(3) If **Assertion** is true statement but **Reason** is false.
(4) If both **Assertion** and **Reason** are false statements.

Q.14 **A :** Spongocoel of the sponges is also called paragastric cavity.
R : Trophocytes are present in the spongocoel & release digestive enzyme outside causing the digestion of food in spongocoel.

Q.15 **A :** Blood in the insects is colourless i.e., without any respiratory pigment.
R : Tracheal network is present all over the body, supplies oxygen directly to the different body parts.

Q.16 **A :** Type of metamorphosis in Periplaneta is of paurometabolus type.
R : The development of Periplaneta involves.

Egg $\longrightarrow$ naiad $\longrightarrow$ imago

Q.17 **A :** In earthworm, lymph glands are white, fluffy bodies which are arranged on either side of dorsal blood vessel from 26^{th} segment.
R : These lymph glands produce the phagocytes of coelomic fluid.

Q.18 **A :** Bidder's canal are present in the kidney of frog for passage of sperms.
R : Vasa efferentia from the testes open into the anterior part of Bidder's canal.

Q.19 **A :** Collaterial glands play important role in the reproductive system of Male cockroach.
R : Collaterial glands take part in the secretion of layer around spermatozoa to form spermatophore.

Q.20 **A :** The pearl may be considered an 'inside out' shell.
R : The normal outer material of the shell is secreted first and forms the nucleus of pearl. Around this core layers of iridescent pearly layers are then secreted.

Q.21 **A :** Giardia is called as **grand old man** of intestine.
R : It is a protozoan transmitted by mosquito.

Q.22 **A :** Ancylostoma duodenale is odd world hook worm.
R : Human are infected when filariform larvae in the moist soil penetrate the skin, usually of feet or legs.

Q.23 **A :** Taenia solium is a cestode acquired by eating undercooked pork.
R : Adult Taenia causes cysticercosis in humans.

EXERCISE – 4

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23
Ans.	3	4	4	4	1	2	1	3	3	1	3	2	1	3	1	3	2	1	4	1	3	2	3

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

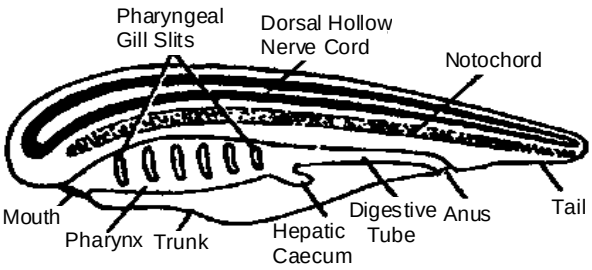
EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

ANIMAL – CLASSIFICATION PROTOCHORDATA TO MAMMALIA

- Chordates were evolved during **ordovician** period of **palaeozoic era.**
- The term **''Chordata ''** was coined by **''Frances Balfour''** for animals having notochord.
- Notochord supports the body of these animals.
- So, chordates are the animals in which notochord is present in any stage of their life – span.



Body Plan of Chordates

- Animals, which do not have notochord, are called **non - chordates.**
- In chordates, species of maximum life animals is pisces group and minimum life animals is Amphibian group.

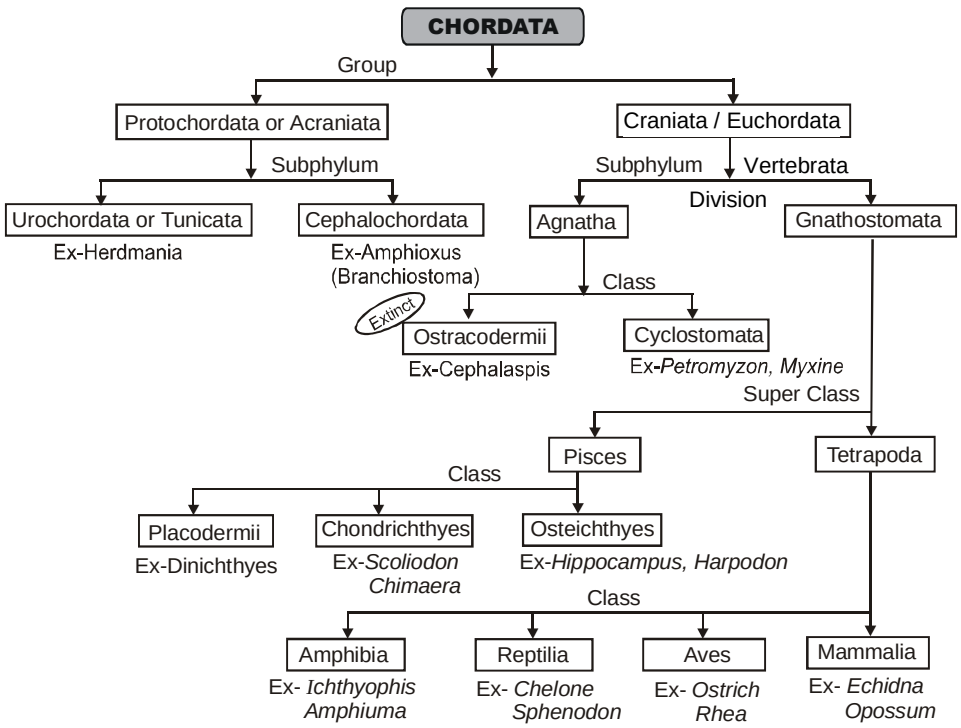
Three Fundamental Characters of Chordates :

- In all choradate animals, there are some specific characters in any stage of their life span, these are called fundamental chordate characters.
  These are as follows : -
  <u>Presence of notochord/Chorda dorsalis</u> : - In the embryonal stage of chordate animals there is a solid rod like structure (Just below the central nervous system and above the alimentary canal), this is called **notochord.**
- Extend from anterior end to posterior end of the body at the mid dorsal surface.
- Mesodermal in origin. It forms a primary endoskeleton which gives support to central nervous system and muscles.
- In **Protochordata** group, notochord is present throughout the life span but in **vertebrata**, it is modified into **back bone** or **vertebral column** in adults.
- **Notochord** is replaced by **vetebral column** around spinal cord and Cranium around the brain.
  <u>Presence of Dorsal Tubular Nerve Cord</u> : -
- In chordates **nerve cord** is situated at the mid **dorsal surface** of body.
- A **hollow, tubular** structure is present which is situated just **beneath the bodywall** and just **above the notochord.**
- **Ectoderma**l in origin.
- **Ganglia** are **absent** in the nerve cord of chordates.
  <u>Presence of pharyngeal gill –clefts</u> : -
- In each chordate animal, there are paired, lateral **gill clefts** in the walls of pharynx for **respiration** in any stage of its life span.
- In **higher chordate** animals, pharyngeal **gill clefts** are found only in **embryonic stages.** These are absent in adults.
- In **aquatic chordates** (pisces) and **lower chordates,** Pharyngeal gill clefts are present **throughout their life span** for respiration.
- In **terrestrial chordates,** gill clefts are absent in adults, because main respiratory organ is **lung** for adults.

– Above three fundamental characters are necessarily found in primary embryonic stages of chordates, but in adult stage, these are either absent or modified into other structure.
– Apart from this, post anal Tail which may be reduced or absent in higher chordates is another important character.

General characters of chordata : -

– These animals are **aquatic, terrestial** or **aerial**, free living.
– Body is **bilaterally symmetrical.**
– Bodywall **triploblastic,** in which all the three germinal layers **ectoderm, mesoderm** and **endoderm** are present.
– **Metamerism** is found in (arrangement of **muscles in embryonic stages)** and in **adults** (arrangement of **vertebrae** and **ribs.**)
– True **coelom** (**enterocoelous** type) & Deuterostomous animals.
– Alimentary canal and digestive system is **complete**. Digestive glands are present and digestion is **extracellular.**
– In these animals, **heart** is **Ventral.**
– Blood vascular system is **closed** type. Respiratory pigment is haemoglobin present in RBC.
– **Hepatic portal system** is found in **all chordates** but **Renal portal system** is present in all except **birds** and **mammals.**
– **Exoskeleton** is present.
– **Mesodermal endoskeleton** is present which is made up of **cartilage** and **bones**
– In **embryonic stages** of chordates a muscular tail is found that is known as **post anal tail.** In some Chordates this tail is reduced/Absent e.g. man, apes.
– **Proto, meso** and **metanephric kidneys** are found in the form of **excretory organs.**
– **Sexual** reproduction is **dominant.**
– **Males** and **females** are separate. Metamorphosis or development of embryo is **direct**. In some it is indirect.
– May be **cold blooded** (Poikilothermous) e.g. – **Fishes, Amphibians, Reptiles** or **warm blooded** (Homeothermous) e.g. **Birds** and **Mammals**.



– Phylum **chordata** is divided into **two groups** on the basis of **cranium, vertebral column** and **paired appendages** : -
[A] Acraniata or **Protochordata**
[B] Craniata or **Euchordata.**

Group A. Acrania (Protochordata) or Lower Chordata	Group B. Craniata (Euchordata) or Higher Chordata
Exclusively marine, small-sized chordates	Aquatic or terrestrial, mostly large sized vertebrates
No appendages, cephalization and exoskeleton	Usually 2 pairs of appendages, well-developed head and exoskeleton present
Coelom enterocoelic, budding off from embryonic archenteron.	Coelom schizocoelic, arising by splitting of mesoderm
Notochord persistent. No skull, cranium and verterbral column	Notochord covered or replaced by a vertebral column. Skull and cranium well developed.
Phyrynx with permanent gill clefts. Endostyle present	Phraryngeal gill clefts persist or disappear Endostyle absent
Heart chamber less when present. No red blood corpuscles in blood	Heart made of 2, 3 or 4 chambers. Blood contains R.B.C
Kidneys protonephridia	Kidneys meso– or metanephric
Sexes separate or united. Reproduction asexual as well as sexual. Gonoducts usually absent	Sexes separate. Only sexual reproduction, Gonoducts always present
Development indirect with a free-swimming larval stage	Development indirect or direct, with or without a larval stage

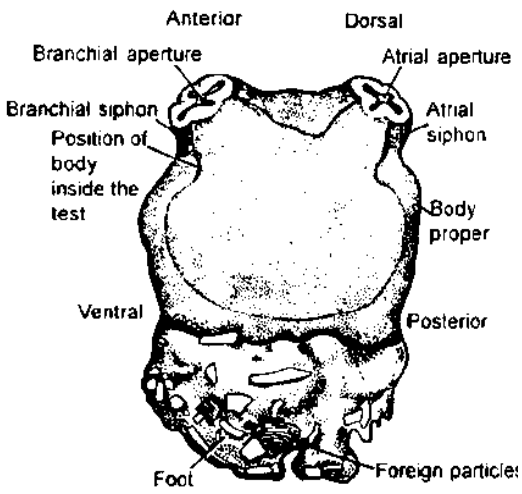
Acraniata or Protochordata

– All **marine.**
– Respiration is by **gills.**
– **Pharyngial gill clefts** throughout life
– **Notochord** persists through out the life, **Skull, brain** and **vertebral column** is **absent** in them.
– **Exoskeleton, head** and **paired appendages** are also **absent.**
– These are **unisexual** or **bisexual** animals. Reproduction is **asexual** as well as **sexual.**
– **Larval stage** is present and shows metamorphosis.

• **Acraniata** group is divided into two subphylums :-
(1) Urochordata
(2) Cephalochordata

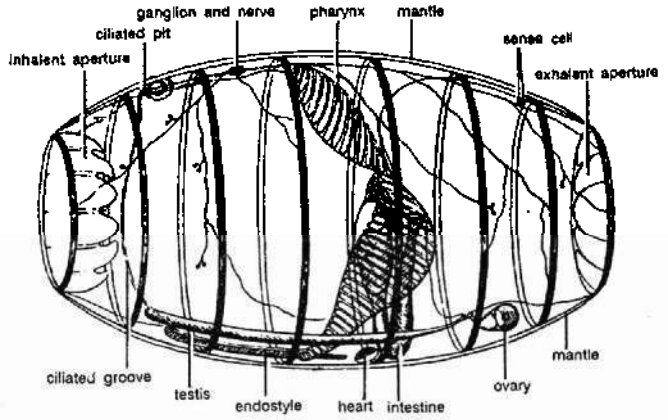
1. UROCHORDATA OR TUNICATA

– All are exclusively marine, Sedentary.
– **Adults** are normally **fixed** and larva is free swimmng.
– All the adult members have leathery test all over their body, made up of cellulose like material called **tunicin** so these animals are also called tunicata. The test is secreted by specific cells of **mesoderm.**
– Metameric segmentation and coelom are also absent.
– **Ciliary** feeder.
– A ciliary glandular slit is present at the ventral surface of pharynx it is called **endostyle,** it absorbs iodine from marine water.



Herdmania : External features in left view

- **Endostyle** is homologous to **thyroid gland** of mammals.
- The pharynx is perforated by numerous apertures called **stigmata** formed by sub-division of the larval gill slits : The stigmata open into an ectoderm lined cavity, the **atrium.**
- Blood vascular system is **open type** heart is **ventral**, tubular and **neurogenic shows alternate forward & backward.**
- Respiratory pigment is **Vanadium** in blood which is stored in purple blood corpuscles known as **Vanadocytes.** Absent in Herdmania.



Doliolum : SEXUAL GONOZOOOID IN LATERAL VIEW

- Notochord is limited only in tail of larva. Tail is lost during metamorphosis therefore named as **Urochordata.**
- Excretion is by **supra neural gland, pyloric gland** and **nephrocytes.**
- Dorsal tubular nerve cord is found only in larval stage. In adult nerve cord is modified into a neural ganglion.
- Mostly bisexual.
- **Asexual** reproduction if present is normaly by **budding.**
- Gonads are termed as ovo- testes.
- Fertilisation is **external** and mostly cross-fertilisation.
- A free swimming larva stage is found called **tadpole larva.**
- All the members of this subphylum show **''Retrogressive metamorphosis''.** During this metamorphosis, a well developed free swimming larva is changed into less developed, fixed adult.
- In these animals larval stage is more developed.
- Only one chordata character is found in adults i.e. **pharyngeal gill clefts**.
- Subphylum Urochordata is divided into **three classes** on the basis of test, atrial cavity, gill apertures and condition of life - cycle.

CLASSIFICATION OF SUB PHYLUM-UROCHORDATA

(Based on Test, Life cycle, Atrial cavity, Gill slits)

Class-I	**Class-II**	**Class-III**
ASCIDIACEA	**THALIACEA**	**LARVACEA**
1. Solitary or Colonial	Solitary or colonial	Solitary
2. Bottom living	Pelagic	Pelagic
3. Test thick, parmanent	Permanent thin with muscle bands	Test temporary jelly like
4. Atriopore dorsal Posterior	Absent	
5. Gills-many	2 to many gills	One large gill slit
eg. *Ascidia, Cliona, Herdmania*	eg. *Pyrosoma, Doliolum, salpa*	eg. *Oikopleura*

Class (a) Ascdiacea : –

Herdmania - Sea - potato or sea - squirts.

Ascidia, Ciona, Molgula, Botryllus

Class (b) Thaliacea : -

e.g.* : –** ***Pyrosoma **-** Biolumniscene is found. (Strongest light among marine organism)

Doliolum – Barrel shaped.

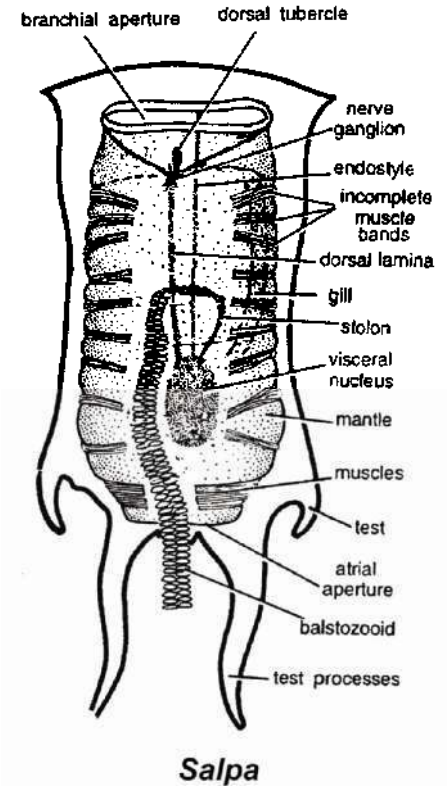
Salpa

Class (c) Larvacea -

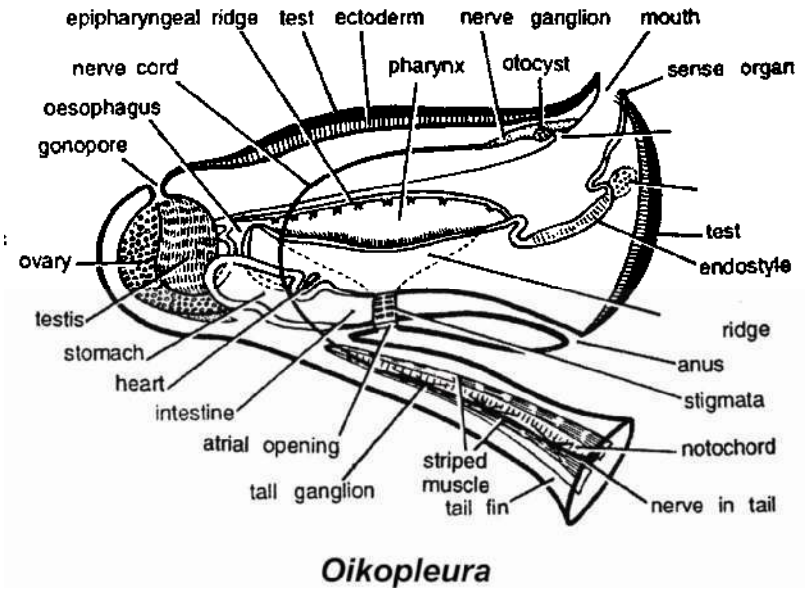
– larve does not metamorphose into adult, but attains sexual maturity and reproduces like an adult. This condition is called **Neoteny** or **Paedogenesis.**

e.g.* : –** ***Oikopleura - Shows pseudomorphism - A gelatinous shellt envelops the animal.

Appendicularia

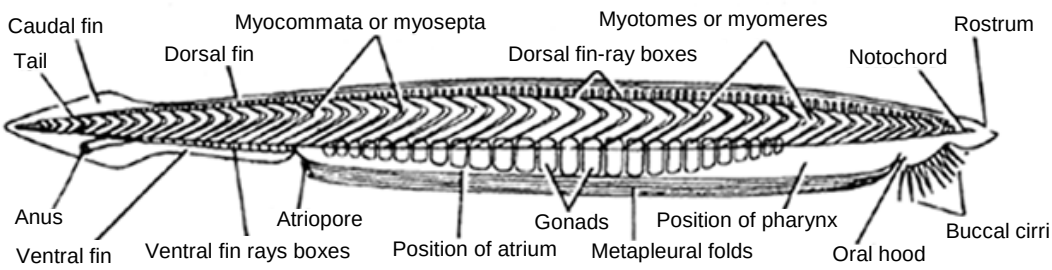


Salpa



Oikopleura

2. CEPHALOCHORDATA :



– Found in shallow **sea water**.
– Animals form burrows in sand and are nocturnal.
– Body is laterally compressed like fish, and is segmented.
– Head is absent. Body is divided into **trunk** and **tail.**

- Paired appendgaes absent. Median fins (Dorsal, ventral and caudal) are presents.
- Alimentary canal **complete**.
- Buccal opening is covered by oral hood from all the four sides.
- Just beneath it, **''Wheel organ''** or "Ciliated organ of Muller" present. This organ helps in the ingestion of food by proudcing circular currents in water.
- **Hatschecks** pit is found on the wall of oral hood which secretes mucus.
- **cillary feeders**, feed on diatoms and microbes. Oral cirri is present.
- Blood vascular system is **closed type** and respiratory pigment **absent.**
- Hepatic portal system present.
- For excretion **protonephredia** are present in the form of **flame cells** or **solenocytes**. **Hatscheck's nepheridium** (single kidney) is present which helps in excretion.
- Dorsal, tubular hollow nerve cord is present.
- Notochord and nerve cord remain extended from posterior end of the body to the anterior end hence named as cephalochordata.
- Pharyngeal gill slits are numerous. Larva and adult both show chordata characters.
- These are **unisexual** animals.
- Fertilization is **external.**
- Development is indirect i.e. larval stage is found.
- Members of this group are the **first complete chordate animals**
  e.g. : - ***Branchiostoma*** or ***Amphioxus*** (Lancelet). Posses 26 pairs of gonads. ***Assymetron***

CRANIATA or EUCHORDATA

- These animals are known as **higher chordates.**
- These animals have **head, Vertebral column, Jaws** and **Cranium.**

SUB – PHYLUM – VERTEBRATA :

- In these animals, notochord is **completely** or partially replaced by **vertebral column.**
  Vertebral column is made up of **many vertebrae.**
- Brain is covered by a protective covering made up of **bones** or **cartilage, called cranium.**
- There is a prominant head and well developed and complicated **brain.**
- Nerve cord **remains enclosed** within the **vertebral column.**
- Single or paired nostrils.
- 2 - 3 semicircular canals is each internal ear.
- Animals are unisexual.
  Sub-phylum Vertebrata is further divided into two division.
  (1) Agnatha
  (2) Gnathostomata

Division I. Agnatha	Division II. Gnathostomata
Without true jaws	True jaws present
Paired appendages absent	Appendages paired (pectoral & pelvic)
Inner ear with 2 semi-circular canals.	Inner ear with 3 semi-circular canals
Notochord persistent in adults	Notochord persists or replaced by vertebrae

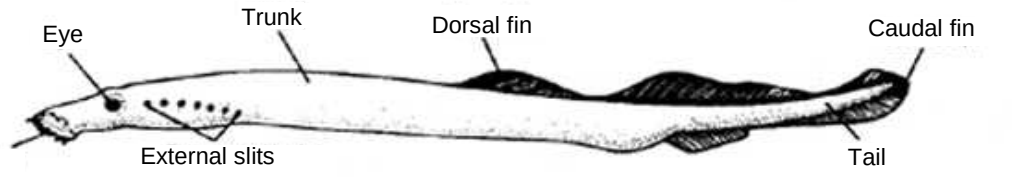
(1) Agnatha (Jawless) :

– Jaws are absent in these animals .
– Notochord persistant.
– Mouth at the anterior end of body, **round, funnel shaped and suctorial.**
– Paired appendages (fins) are absent.
– No exoskeleton.
– Single nostril.
– cold blooded.
– Genital ducts are absent.
– **Two semi - circular** canals are found in **internal** ear.
– One median **pineal eye** is found along with lateral eyes on head.
Group Agnatha is divided into two classes.

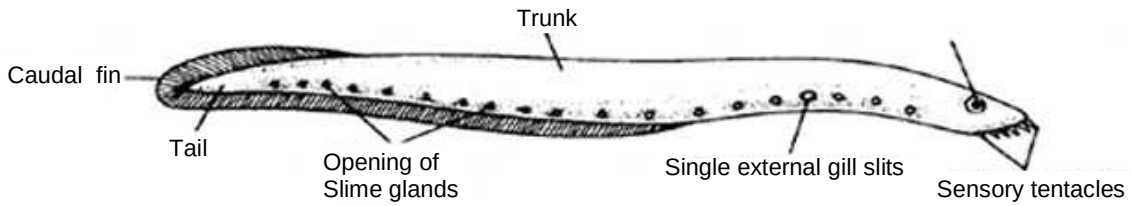
Class [A] - Ostracodermi

– All are extinct. These **were freshwater fishes the first vertebrates.**
– These were shell skinned with exoskeleton of bony plates.
e.g. – Cephalaspis (Primitive vertebrate of Ordovician period)
– Drepanaspis

Class [B] - Cyclostomata :



Petromyzon



Myxine

– Mostly marine, except some fresh water species.
– These are **parasite** as well as **scavanger.**
– Also called as **Jawless fishes (false - fishes).**
– Body long, thin, tubular, tail is flat.
– Skin soft, smooth and scaleless.
– **Mouth** is rounded, sucker like and biting - eating type.
– **Three eyes** are found on the head, one median **pineal eye** and two lateral eyes.
– Only one Nostril **(Monorhynous).**
– Internal ear contains **one** or **two semicircular canals.** Internal ear works as **statoreceptor** only. *i.e.*, Organ of balance.
– Gill clefts are **6** to **15 pairs.**

– Digestive system is without stomach. Intestine has **spiral typhlosole.**
– Notochord and vertebral column both are present. Cranium and Vertebral column is made up of **cartilage.**
– Bones are absent.
– Heart is two - chambered. It is called **Venous - heart.**
– Kidneys are **protonephric** or **mesonephric** type.
– Paired fins absent. Dorsal median and tail fin is present.
– Tail is **protocercal type**. In this type of tail, notochord is extended at the last end of tail and tail fin is divided into two equal dorsal and ventral lobes.
– Animals **unisexual**, fertilization **external**, larval stage absent,
– In Petromyzon - **Ammocoete** larva is present.

⇒ ***Petromyzon* or *Lamprey* :**

– It is a living fossil.
– Ectoparasite (Sanguivorous) on true fishes. Many teeth are found in mouth.
– Shows **Anadromous** migration.
Larva Ammocoete is considered as connecting link between Cephalochordata and Cyclostomata.

⇒ **Myxine or Hag fish : -**

– It has wrinkled lips just like an old woman.
– It usually remain attached with the gills of host.
– It has **Archaenephric kidney** in young ones i.e. which can filter blood and coelomic fluid.

(2) Gnathostomata :

– Mouth is surrounded by true jaws.
– Vertebral column well developed.
– Movement by paired fins or legs.
– Gonads are paired, genital ducts are present.
– 3 Semi circular canals are found in internal ear.
– Pineal eye is absent.
– Animals are unisexual.
– Gills or lungs are meant for respiration.
– Gnathostomata is classified into two super classes on the basis of locomotory organs, respiratory organs, heart and blood vascular system.

Super Class : -

(1) Pisces (2) Tetrapoda

(1) Super class - Pisces

– **"Devonian period"** is called **"Golden period of fishes"**
– Study of fishes **Icthyology**.
– Includes **true fishes**. Fresh water or marine.
– Body is long, boat shaped and streamlined, which is divided into **head, trunk and tail**.
– Neck is absent.

- Slime glands are present on the skin.
- Body is covered by **dermal scales**. But Cat fish, **Torpedo** & **Wallago** are **scale less**.
- Colour in fish is produced by **iridocytes** present in the dermis.
- Paired fins are present for swimming. e.g. Pectoral and pelvic fins are paired.
- Unpaired fins are also found on the body e.g., **mid dorsal fin** and **caudal fin.**
- External nares are one pair. **[Dirhynous condition.]**
- External and middle ears are absent, only internal ear is present in which **three semi - circular canals** are present. Eyes are without lids.
- Respiration by **gills**, gills are **4 to 7 pairs. Naked** or covered by **operculum**.
- **"Air bladder"** is present which helps in swimming as well as in respiration in bony fishes **only**.
- Heart two chambered, known as **"Venous heart",** because it contains only impure blood, which from heart goes to gills for purification, pure blood is then distributed to all parts of body directly from gills, i.e. circultion of blood is **unicircuit**.
- RBC are **nucleated. Sinus venosus, renal** and **hepatic portal** systems are found in circulatory system.
- Endoskeleton is made up of **cartilage** or **bones**.
- Vertebrae in fishes are **amphicoelous.** (centrum is concave at both the surfaces)
- Only one occipital condyle is present, so that skull is **monocondylic type**.
- Cranial nerves are **10 - pairs**.
- **Lateral line system** is present in the body of fishes, which can detect vibrations (Rheoreceptor) and Electric field.
- Kidneys in fishes are **mesonephric** type.
- **Cartilagenous** fishes excrete **urea**, Marine bony fishes excrete **trimethylamine oxide** and fresh water fish excrete **ammonia**. Urinary bladder is absent.
- Fishes are **unisexual**.
- Fertilization is **internal** or **external**.
- Eggs are **mesolecithal** or **megalecithal** type.
- **Extra embryonic membranes** are **absent [anamniota]**.
- Development is direct.
- These are **cold blooded**, poikilothermic animals (Exception - Tuna fish, endothermic).
- Small fishes (Baby fishes) are called **Fry or Hatchling**.
- Fishes show a **seasonal migration**.

[A] **Anadromous migration :** Migration of fishes from marine water to fresh water.
e.g., (1) **Salmon** (2) **Sturgeon** (3) **Hilsa**

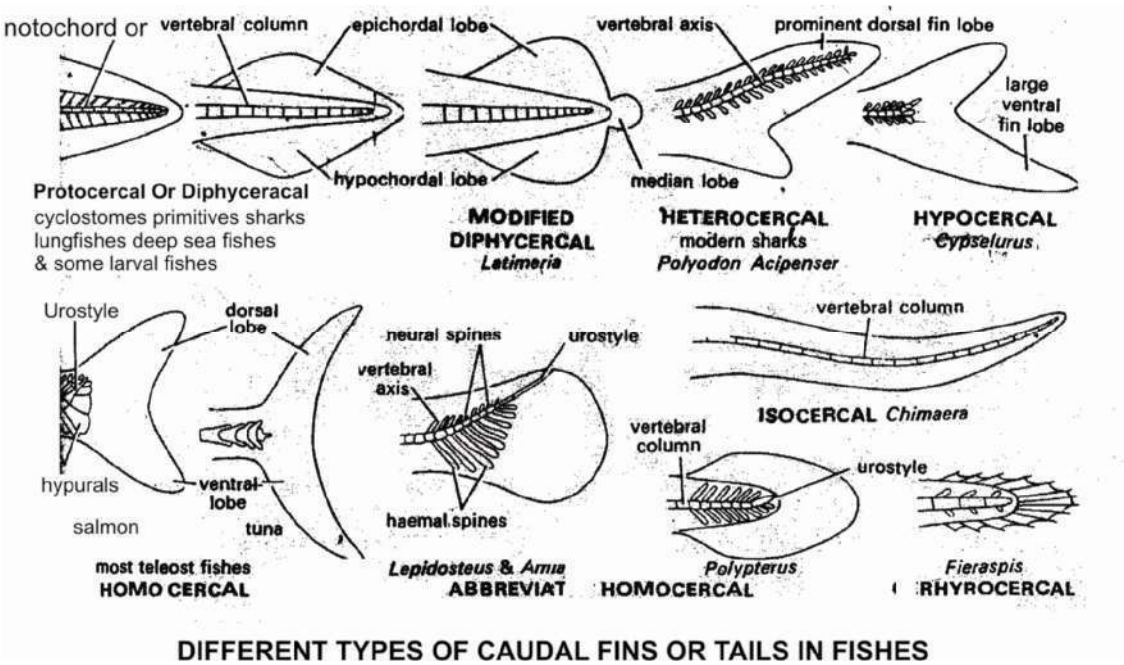
[B] **Catadromous migration :** Migration of fishes from fresh water to marine water. ***e.g., Anguila***

[C] **Potamodromous migration :** Migration of fishes from Fresh water to fresh water

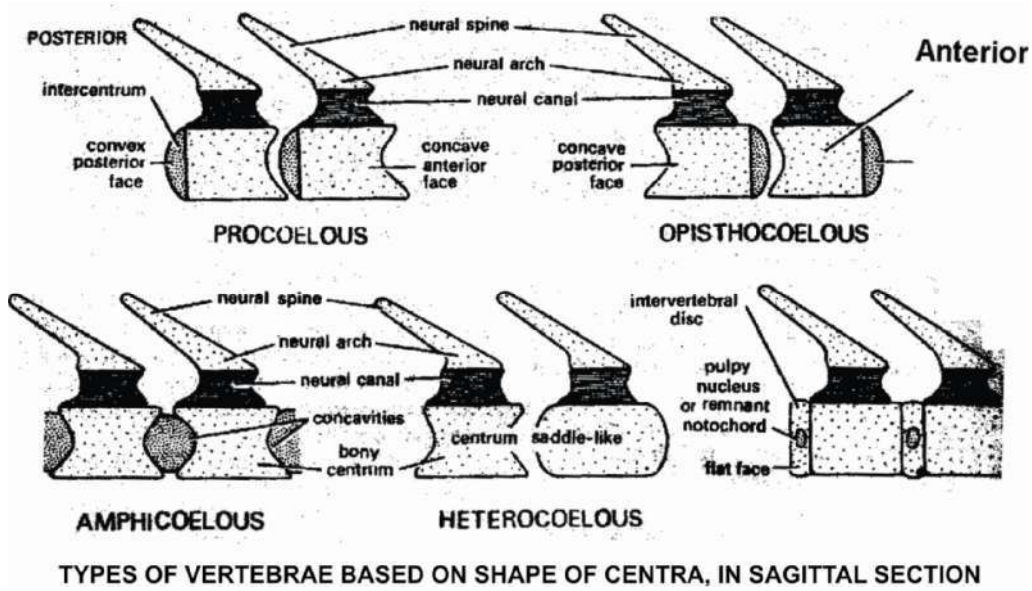
[D] **Oceanodromous migration :** Migration of fishes Marine to Marine water

⇒ **Stenohaline : -** Fish which can tolerate a narrow range of salinity in water.

⇒ **Euryhaline : -** Fish which can tolerate a wide range of salinity in water.



DIFFERENT TYPES OF CAUDAL FINS OR TAILS IN FISHES



TYPES OF VERTEBRAE BASED ON SHAPE OF CENTRA, IN SAGITTAL SECTION

Super Class Pisces has been classified into 3 classes.

Super Class Pisces

Class Placodermi (Extinct)

- Primitive earliest jawed fishes of Palaeozoic.

  Ex. : Placoderms. Climatius, Dinichthys.

Class Chondrichthyes

- Mostly marine and Cartilaginous endoskeleton.

  Ex. : Scoliodon (dogfish), Chimaera (ratfish).

Class Osteichthyes

- Freshwater and marine and bony endoskeleton.

  Ex. : Labeo (rohu), Protopterus (lungfish), Hippocampus (sea horse).

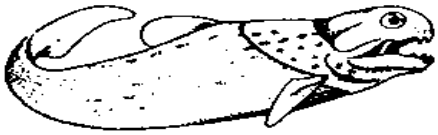
(a) Class - Placodermi :

– In this class, **extinct** fishes (Fossil fish) are included, which use to live from devonian era to permian era. So these were the first fresh water true fishes.

– Their body was covered by **bony plates**, so these are called **"Armoured fishes"**

e.g. : - – **Climatius** – First jawed fish

– **Dinichthyes**



Dinichthyes

(b) Class - Chondrichthyes or Elasmobranchi

– This includes **cartilagenous fishes** i.e. endoskeleton is made up of **cartilage**.

– Fishes are generally **marine**.

– Exoskeleton over the skin is made up of **placoid** scales. These scales are like denticle and are originated from dermis of skin.

– In these fishes, **5 - 7 pairs** of gills are present, which open directly outside the body by gill slits, operculum is normally absent in these fishes, except is **chimaera** where operculum is present.

– Mouth is present at the **ventral surface** of head.

– **Suspensorium** of jaws is **Hylostylic type**.

– Air - bladder or lungs are absent.

– **Spiracles** present.

– A **spiral valve** or **scroll valve** is found in intestine.

– Cloacal aperture is present.

– There is special structure at the dorsal surface of head in these fishes, which is called **"Ampulla of Lorenzini"**, this works as **thermoreceptor.**

– Tail is **heterocercal** type.

– Genital ducts open into cloacal aperture.

– Fertilization is **internal** – male fishes have **"Claspers"** as copulatory organs, which are developed by the inner edges of pelvic fins.

– Fishes are oviparous or viviparous (few have yolk sac placenta).

– **Scoliodon : -** Dog fish - Dog like sense of smell. It is also known as **Indian shark - viviparous**

– **Sphyrna/Zygaena -** Hammer headed shark

– **Stegostoma** - Tiger Fish / Zebra shark

– **Carcharodon -** great white shark

– **Rhinobatus -** Guitar Fish

– ***Pristis* : -** Saw - fish

– ***Trygon* : -** Sting ray - Its dorsal fin has poisonous spines.

– **Torpedo : - Electric ray -** In this fish an electric organ is found which is a modified muscle, it can give shock of about 100 volts. Scales are absent.

– **Rhinodon : -** Whale shark - It is the largest fish. Its length is 13 – 14 meters.

– **Chimaera : -** "Rat fish" or "King of herrings" or Ghost fish. Connecting link between bony & cartilagenous fish. Operculum present. Cartilage fish with operculum is placed under **holocephali** group.

(c) Class - Osteichthyes or Teleostomi

- Includes **Bony fish**. **Endoskeleton** of these fishes is made up of **bones**.
- Found in fresh water as well as marine water.
- **Exoskeleton** is made up of scales, such as cycloid or ctenoid or ganoid type. Placoid scales are absent.
- Respiration by **4 - pairs** of gills. These are covered by **operculum**.
- Mouth is normally terminal or subterminal.
- Suspensorium of Jaw is **autosytylic**.
- Accessory respiratory organ **"air bladders"** is present. This helps in swimming as well as in respiration both.
- Spiracle is absent.
- Scroll valve in intestine is absent.
- Cloaca absent, in place of cloacal aperture **anus** is present.
- No Ampulla of Lorenzini.
- Tail is normally homocercal type but sometimes it may be **diphycercal** type.
- Genital ducts open outside the body through separate apertures.
- Fertilization is **external, claspers** are absent in male fishes.
- Fishes are **oviparous** but may be **ovoviviparous** or **viviparous**.
- ***Labeo*** "Rohu" or "Indian carp" - It is a fresh water fish.
- ***Clarias*** "Cat fish" or **magur**
- **Wallagon** Lachi (scale less)
- ***Catla*** - Catla (Fresh water)
- **Heteropneustis** - Singhi
- **Channa** – Lata Fish
- **Laphius** – Angler Fish
- ***Hippocampus*** - "Sea – horse" or **"Pregnant male" :** - It swims in water in its vertical position. A pouch like structure is present at the abdomen of male fishes known as "Brood - pouch" in this pouch male collects the eggs. Secondary vivipary and parental care is found in Hippocampus.
- **Anabas** - Climbing perch.
- **Sardinella** - Salmon
- **Acipensor** - Sturgeon - Endoskeleton is **cartilaginous.**
- ***Betta*** - Fighting Fish
- **Pterophyllum** - Angel Fish
- ***Exocoetus*** - Flying fish - Its dorsal fin is long, it can fly (glide) over 400 metre with the help of this fin.
- **Anguila** - Eel : - Snake like. migrate to sea for spawning. Young eel (Elver) migrate back to fresh water
- **Solea** - Flat fish
- **Fistularia** - Flute fish
- **Harpodon** - Bombay Duck
- **Amia** - Bow fish
- **Echeneis** (Remora) - Sucker fish. Shows commensalism with shark and whales. Dorsal fin modified into sucker.
- **Mystus** - Singhara
- **Cirrhinia** - Mrigal
- **Latimaria or coelacanth - Living fossil** – It is the **oldest living vertebrate** known till date. Belongs to group **Crossopterygii**.
- **Chenocephalus** - Ice fish only vetebrate without haemoglobin.
- **Opsanus** - Toad fish
- **Synanceja horrida** - Stone fish it is the most poisonous fish.
- **Gambusia** (Top minnow) - Larvivorous fish.

DIPNOI GROUP

- Fishes of dipnoi group are called **Lung-fishe**s or **"Uncle of amphibia"** because lungs helps in respiration.
- Three chambered heart.
- External and internal both the nares are present.
- Their tail is **heterocercal** type, Scale is **cycloid** type.
- These are freshwater fishes.
- **Lepidosiren** : - South American lung fish. Respire though lungs only.
- **Protopterus : -** African lung fish : - It is living fossil fish. Paired lungs are present.
- **Neoceratodus : -** Australian lung fish. Respire by gills only. single lung is present which is used in stressful condition.

Special Points :

- **Shagreen** is dried skin of Cartilaginous fish.
- **Cod liver** oil is rich in Vitamin D, Shark liver oil is rich in Vitamin A.
- **Maltese cross** is found in vertebra .of cartilaginous fishes such as shark.
- **Mermaid's purse** refers to Egg capsule of shark.
- **Isinglass** is a gelatinous product from air bladder of certain fish for making cement, Jelly & for cleaning of wine & beer.
- Smallest fish **Mystichthyes** - Goby fish - Pandaka (8 - 10 mm).
- Algae in aquarium provided oxygen & selter to fishes.
- Catfish is a true fish. It has sensory barbels and is without scales.

COMPARISON OF CHONDRICHTHYES AND OSTEICHTHYES

S.No.	Characteristic	Chondrichthyes (cartilaginous fishes)	Osteichthyes (bony fishes)
1	Habitat	Mostly marine	Both marine and freshwater
2	Shape	Usually dorsoventrally flattened	Usually bilaterally flattened
3	Caudal fin	Heterocercal	Homocercal or diphycercal
4	Pelvic fins	Usually posterior. In male form claspers for transferring sperms into genital tract of female	Usually anterior, posterior Claspers absent
5	Mouth opening	Ventral on head. Large and crescentic	Terminal on head. Variable in shape size
6	Gill openings	Usually 5 pairs of naked gill slits. No operculum	5 pairs of gill-slits covered by a flap of skin called operculum.
7	Spiracles	Usually Ist gill slits become spiracles which open just behind eyes	Spiracles are lacking
8	Cloaca	Between two pelvic fins lies midventrally common cloacal opening for alimentary, urinary and genital products	Cloaca absent. Anus and urinary and genital apertures open separately

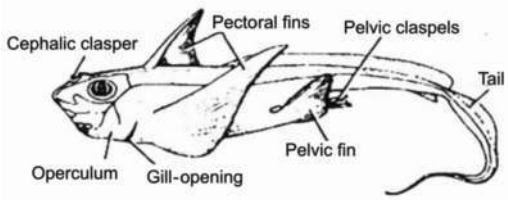
9	Exoskeleton	Separate dermal placoid scales	Overlapping dermal cosmoid, ganoid, cycloid or ctenoid scales
10	Endoskeleton	Wholly cartilaginous	Mostly bony
11	Jaw suspension	Hyostylic	Hyostylic and autostylic
13	Intestine	Short and with an internal fold or **scroll valve** in lumen	Long and without scroll valve
14	Rectal gland	Present	absent
15	Liver	Generally has 2 lobes	Generally has 3 lobes
16	Type of gill	Lamellibranch with long interbranchial septum	Filiform with reduced interbranchial septum
17	Air (swim) bladder	Absent	Usually present
18	Conus arteriosus	Present in heart	Absent
19	Afferent branchial vessels gills	5 pairs from ventral aorta to	Only 4 pairs
20	Efferent branchial vessels	9 pairs	4 pairs
21	Brain	Primitive with larger olfactory lobes & cerebrum and smaller optic lobes and cerebellum	Advanced with smaller olfactory lobes and cerebrum and larger optic lobes and cerebellum
24	Retina	Lacks cones	Cones present
26	Ampullae of Lorenzini	Present	Absent
29	Urinary and genital apertures	United and urinogcnital apertures lead into common cloaca	Separate and open independently to exterior
30	Fertilization	Internal	External in water
31	Eggs	Few, large with much yolk	Numerous, small with less yolk
32	Development	Internal in ovoviviparous types. Externally inside egg cases in oviparous types	Usually external without an egg case

Common Food Fishes Of India

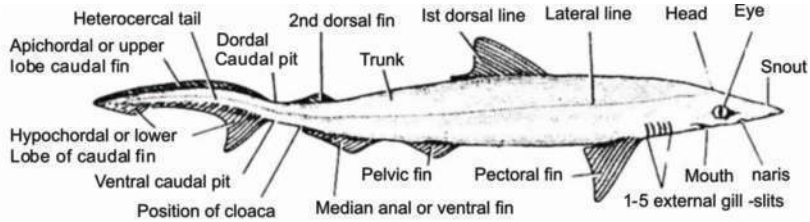
S.No.	Fresh water food fishes	Marine water food fishes
1.	*Lebeo rohita* (Rohu)	*Stromateus* (Pomfret)
2.	*Lebeo calbasu* (Calbasu)	*Harpodon* (Bombay Duck)
3.	*Catla catla* (Katla)	*Sardinella* (Salmon)
4.	*Cirrhina mrigala* (Mrigal)	*Hilsa* (Hilsa)
5.	*Mystus seenghala* (Singhara)	*Anguilla* (Eel)

False Fishes

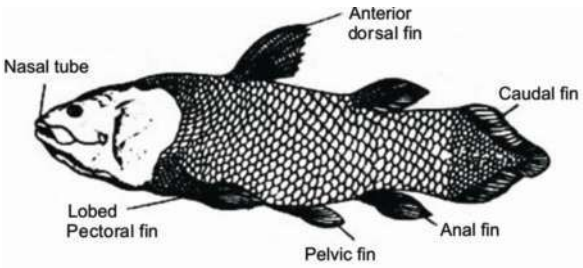
Sr.No.	Common Name	Genus	Phylum
1.	Jellyfish	*Aurelia*	Coelenterata
2.	Silverfish	*Lepisma*	Arthropoda
3.	Crayfish	*Astacus*	Arthropoda
4.	Razorfish/Shellfish	*Solen*	Mollusca
5.	Cuttlefish	*Sepia*	Mollusca
6.	Devilfish	*Octopus*	Mollusca
7.	Starfish	*Asterias*	Echinodermata
8.	Hagfish	*Mysine*	Chordata
9.	Whalefish	*Balaenoptara*	Aquatic mammles



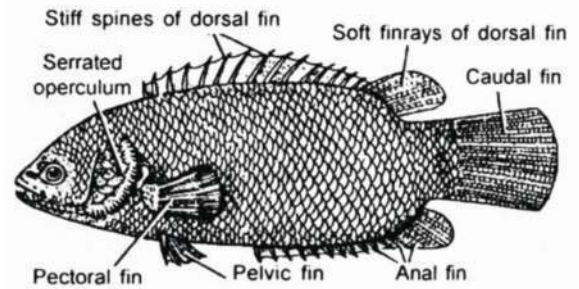
Ratfish or Chimaera



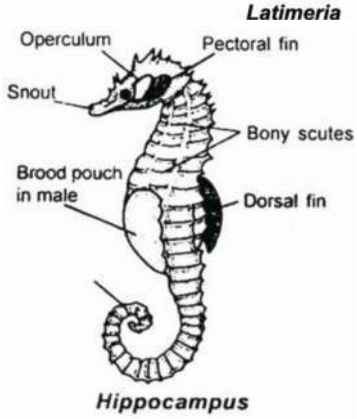
Female Indian dogfish shark (Scoliodon sorrakowash) in lateral view



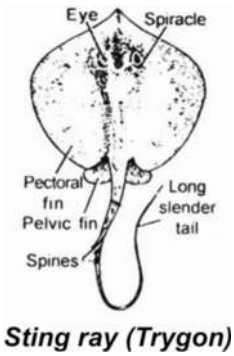
Latimeria



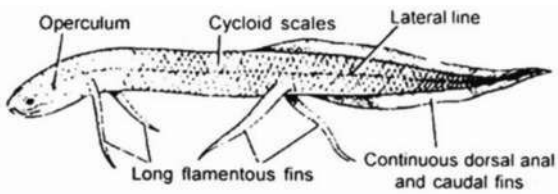
Climbing perch (*Anabas testudineus*)



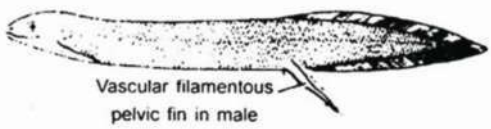
Hippocampus



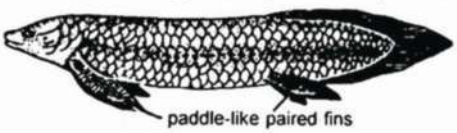
Sting ray (Trygon)



African lungfish *Protopterus*

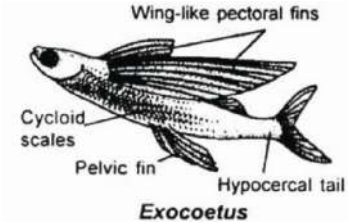


American lungfish *Lepidosiren paradoxa*

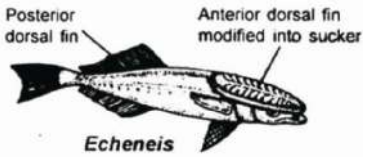


Australian lungfish *Neoceratodus forsteri*

Lung fishes (Dipnoi)



Exocoetus

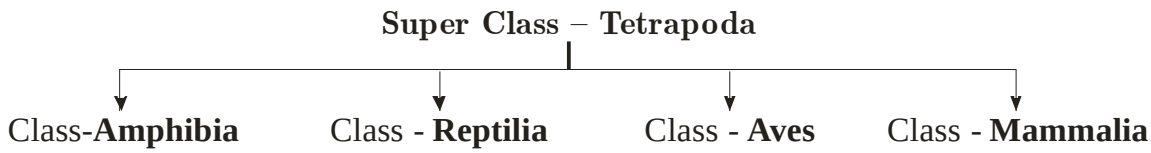


Echeneis

(2) Super Class – Tetrapoda

- Members of this superclass are found in water and on land.
- Locomotion by 2 pairs of **pentadactylous** limbs.
- Gills are present only in embryonic stages. Main respiratory organ in adults is **lung**.
- Exoskeleton is made up of scales, feathers or hair.
- Endoskeleton is made up of **bones**.
- Heart is three or four chambered and **double circulation** is found in them.
- Kidneys are **mesonephric** or **metanephric** type.
- Middle ear is present. **Birds** and **mammals** have external ears also.

Superclass - Tetrapoda is divided into four classes.



(A) Class - Amphibia

- Originated is **Devonian**.
- Carboniferous Age of Amphibians
- Includes vertebrates with dual life - can live in water as well as on land.
- No marine forms.
- These are the first chordate which can live on land but not permanently, these depend on water for their reproduction.
- Their eggs do not have protecting covering to check the evoporation.
- Body is divided into head, trunk and tail. Some amphibians lack tail e.g. frog, toad etc.
- Skin is smooth and mostly **scale less**, but whenever scales are present they are embeded in the skin e.g. **Ichthyophis**.
- Skin is gladndular which keep the skin moist. Members show cutaneous respiration.
- Some poisonous glands are also found in the skin of some animals e.g. **Bufo**.
- Pigment cells are also found as **chromatophore** for colouration. Few amphibians have ability to change colour by expansion and contraction of pigment cells. This phenomenon is known as **Metachrosis**.
- Two pairs of limbs help in swimming in water or moving on land. Forelimbs have four fingers and hind limbs have five fingers.
- Their digits do not have **nails** or **claws** at all.
- Mouth is bigger in size. Upper or both the jaws have similar teeth (Frog - Acrodont). Teeth are **pleurodont, homodont** and **polyphyodont**.
- Suspensorium of jaws is **Autostylic**.
- A well developed and complete alimentary canal along with digestive glands are present in digestive system (Salivary glands are absent in frog.)
- Alimentary canal, urinary bladder and genital ducts open into **cloaca**.
- Respiration by **gills, skin, lungs** or **buccopharyngeal** cavity.
- Two nostrils are found, this condition is called **dirhynous**.
- Heart is three **chambered**, 2 auricles and 1 ventricle (arteriovenous).
- **Sinus venosus** and Truncus **arteriosus** is well developed,
- R.B.Cs are biconvex, oval and **nucleated**.
- In these animals, **renal portal system** and **hepatic portal system** are found.

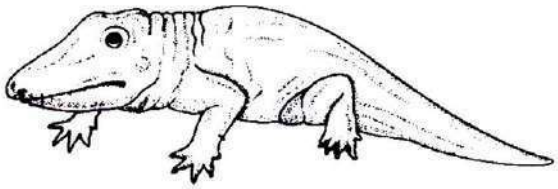
- Endoskeleton is made up of bones, but **cranium** is **cartilagenous**.
- Skull has **two occipital condyles**, **(dicondylic skull).**
- Ribs absent, but may be present in some animals, but **ribs** are fused with **sternum**.
- Vertebrae, are **procoelus** type, in which centrum is **concave** from anterior side and **convex** from posterior side.
- External ear absent, only one ear ossicle **columella** present in middle ear.
- Cranial nerves are **10 – pairs**.
- **Lateral line sensory system** is necessarily found. In any stage of development. In frog it is found only in larval stage.
- Kidneys are paired, **mesonephric** or **opisthonephric** type. Animals are **Ureotelic.**
- But salamanders & larva are **Ammonotellic**.
- These are cold blooded or **poikilotherm**.
- Undergo **hibernation** or **aestivation** to protect themselves from extreme cold and heat and to overcome unfavourable conditions.
- These are unisexual, males lack copulatory organs. These animals return to water from land for reproduction.
- Fertilization is **external** and occur in water.
- These are oviparous, lay their eggs in water. Eggs are **mesolecithal.** Extra embryonic membranes absent, so these are placed under, anamniota group.
- Cleavage in eggs is **holoblastic** and **unequal**.
- Development is **indirect type** ie. **tadpole larva** is found.
- This class is divided into three orders : -

Classification of Class Amphibia

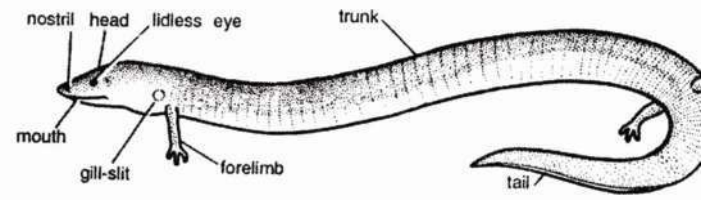
Order-I	**Order-II**	**Order-III**
Gymnophiona or Apoda	**Caudata or Urodela**	**Anura or salientia**
(1) Skin have dermal scales	Skin smooth	Skin smooth
(2) Legs absent	Present	Present
(3) Copulatory organ present	Absent	Absent

Order – I : Gymnophiona or Apoda or Caecilian :

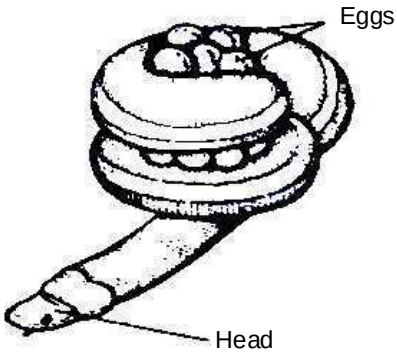
- Commonly called as Blind - worms.
- Body is **worm** like.
- These are **primitive amphibians**, burrowing in nature.
- **Limbless**
- Skin is soft, and moist, with mucous glands, small scales (cycloid) are found embeded in the skin.
- Eyes are covered by opaque skin.
- Middle ear and tympanic membrane absent.
- Protrusible copulatory organ is present in male.
- Fertilization **Internal**.
- Parental care is found.
- Tail is absent.
- ***Ichthyophis (Caecilian)* : -** Blind worm without tounge.
- **Uraeotyphlus : -** Dermal scales are found in the skin.
- **Gymnophis**



Stegocephalia (Amphibian Ancestor)



Amphiuma



Ichthyophis

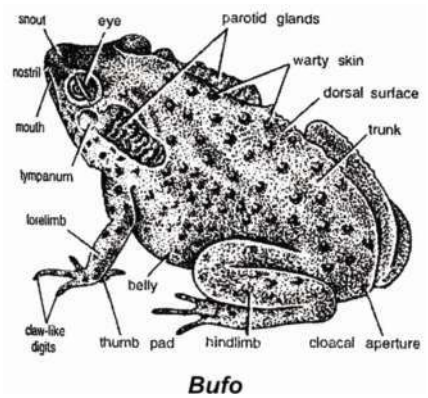
Order - II : Caudata or Urodela :

- Body is distinctly divided into **head trunk** and **tail**. Tail may or may not have caudal fin.
- Normally two pairs of limbs are found which are of **equal** size. Sometimes hind limb is absent.
- **Scaleless** skin.
- Middle ear and tympanic membrane absent.
- External gills are present only in larval stage.
- **Copulatory organ absent** in males. Fertilization **Internal**.
- Vertebrae are numerous, centrum is **amphicoelous** or **opisthocoelous** type.
- Characterstic feature of this order is Neoteny.
- Larva attains sexual maturity without undergoing **Metamorphosis**, and starts reproduction.
- ***Salamandra* : -** It is viviparous. Its larva is called **Axolotl larva.** It sometimes show neoteny. (Longest gestation period - 36 months).
- **Trilotriton** - Indian salamander found in himalayas.
- **Proteus** - Cave - salamander (Blind)
- **Ambystoma** - Tiger salamander **(Axolotl larva)**
- **Triton** - Newt
- **Necturus -** Water dog or mud puppy , Gills in adult also. It shows **permanent neoteny**.
- **Amphiuma -** Congo-eel , Largest RBC is present.
- **Siren -** Mud-eel
- **Cryptobranchus** - Hell Bender : - Largest Amphibian, aquatic

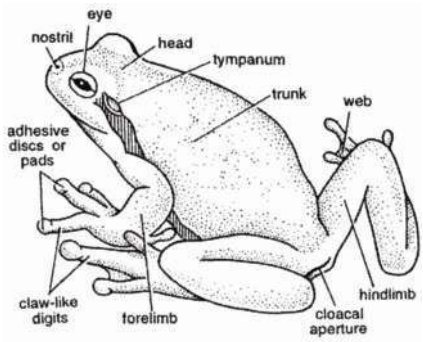
Order - III : Anura or salientia :

- Tail is absent in adult stage.
- All the frogs and toads are included in this order.
- Skin is moist with **mucous**.
- 2 pairs of limbs are found. Fore limbs are short and hind limbs are long. Digits of hind limbs are webbed, which help in swimming.
- Gills are absent in adults.
- Vertebral column small, in which only **5 - 9 vertebrae** are found. Last vertebra is stick like **urostyle**.
- Eyes **with lids, tear** glands present. (Lower lid movable & upper immovable).
- Maxillary teeth are present in the upper jaw (absent in Toad).
- **Middle** ear and **Tympanic membrane present**.

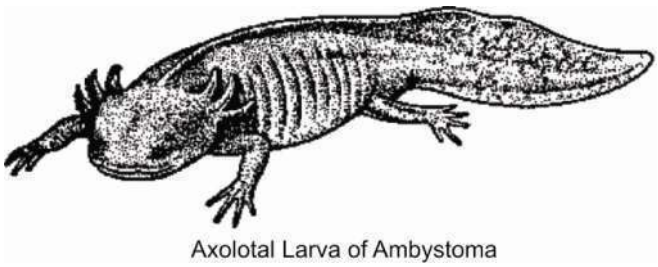
- Egg laying, fertilisation and development is always in **water**.
- Males have well developed **vocal sacs** i.e. power of voice.
- Development **indirect** i.e. **tadpole larva** is found.
- Complete Metamorphosis.
- ***Bufo*** – Common toad (Poison glands are modification of parotid gland.)
- ***Hyla* –** Tree - frog
- ***Rana tigrina*** – Indian bull frog. Mentomeckanial bone is found (Tip of the lower jaw).
- **Rhacophorus** – Flying frog
- **Alytes –** Midwife toad – Parental care is well developed in them. Male toads carry eggs in their limbs.
- **Pipa americana –** Surinam toad – carries eggs, Secondary vivipary. (Tongue absent)
- **Rana goliath –** Largest frog
- **Phyllobates –** Smallest frog (found in Cuba)
- **Discoglossus** or **Bombinator** – Fire bellied toad
- **Xenopus –** African toad



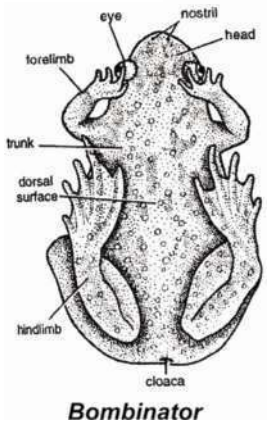
Bufo



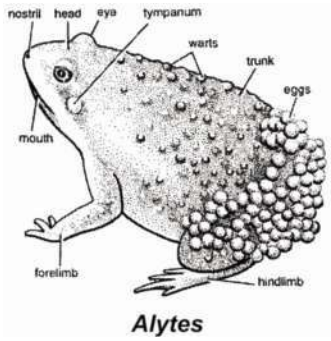
Hyla



Axolotal Larva of Ambystoma



Bombinator

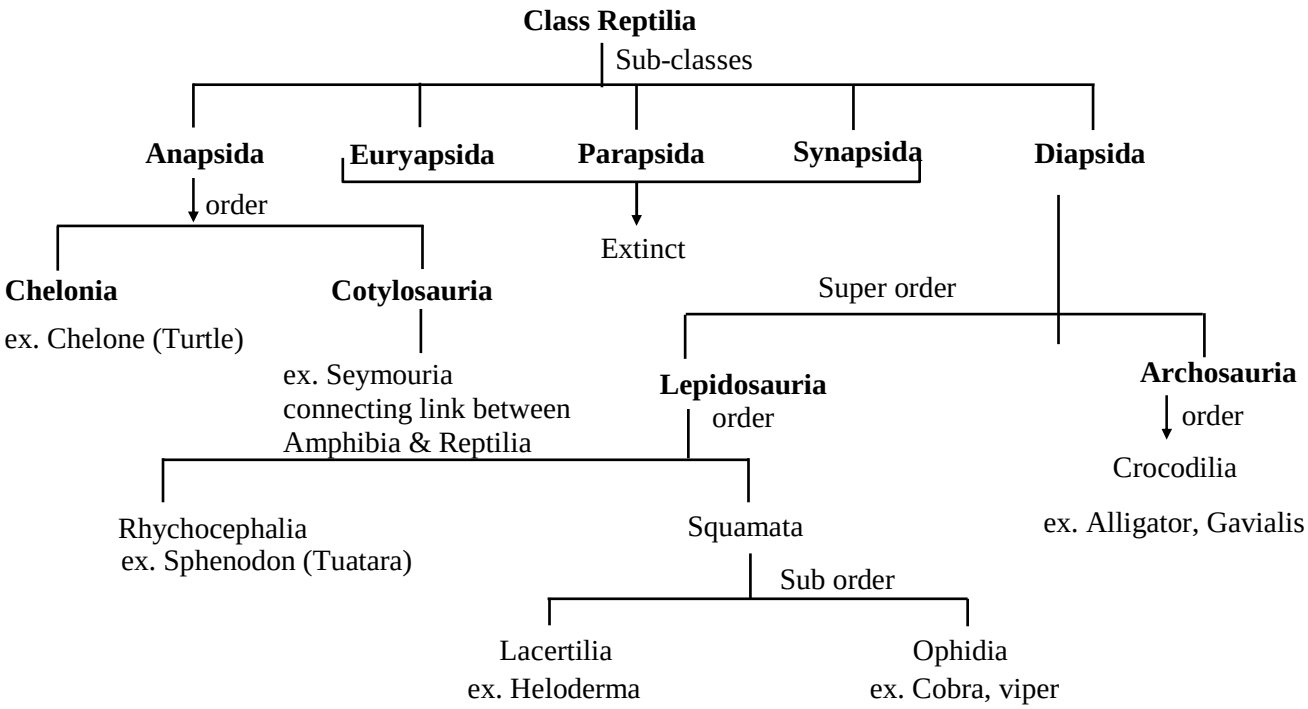


Alytes

(B) Class - Reptilia

- Reptiles were originated during **carboniferous** period of palaeozoic era. Mesozoic era is Golden age of Reptile.
- Study of reptiles is known as **''Herpetology''.**
- Members of this class are the **first successful terrestrial animals.**
- First reptiles are called **Stem reptiles** or **Cotylosaurs.**
- These are **Cold blooded, Poikilothermal animals.** Their body temperature varies according to climate.
- Mostly, terrestrial, but some are aquatic.
- Body is divided into head, neck, trunk and tail.
- Skin is **dry, cornified, rough, nonglandular** (Femoral gland in male lizard).
- Pentadactyle limbs. Each digit has **curved claws.**
- Some **lizards and snakes** do not have limbs e.g. **Ophiosaurus** lizard is a limbless lizard.
- Exoskeleton is made up of horny **epidermal scales** or **bony scales** or **bony plates.**

- A complete alimentary canal is found in these animals, which opens into cloaca.
- Teeth are **acrodont, thecodont, pleurodont** type.
- Tounge is **protrusible.**
- Respiration is by lungs, but members of order **Chelonia** can respire through their cloaca, it is known as **''Cloacal respiration''**
- Heart is incompletely four chambered, 2 complete auricles and two incomplete ventricles. Right and left both systemic arches are present.
- Ventricle of animals of order **Crocodilia** is completely divided into two, i.e. heart is **four chambered** in **Crocodiles.**
- External ear aperture is absent.
- Tympanum represents external ear.
- Tympanum is absent in snakes.
- Sinus venosus is underdeveloped and trunkus arterious is absent. RBC are **oval** and **nucleated.**
- Bony endoskeleton.
- Skull is **monocondylic**
- True well developed sternum is present.
- Centrum are **procoelous** type. **Sternal ribs** are found in reptiles.
- A **chevron bone** is found in caudal vertebrae of these animals.
- One pair of **Metanephric** kidneys help in excretion.
- Members are **uricotelic** for water conservation.
- Brain is well developed **12 - pairs** of cranial nerves are present.
- Lateral line system is absent.
- At the roof of buccal cavity **Jacobson's organ** (olfactory) is present.
- Ureters, genital ducts and alimentary canal open into a **single cloacal aperture.**
- Unisexual animals. Fertilization is **internal.**
  One or two penis (Hemipenis) is found in male as copulatory organ.
- Mostly **oviparous**, but some are viviparous also. Large amount of yolk in their eggs. i.e. eggs are **Megalecithal** & **Telolecithal**, Cleidoic & leathery eggs are present.



- All the four embryonic membranes **amnion, chorion** and **allantois** present in the embryo. **Yolksac** is also attached with embryo. So this class is grouped under **Amniota group.**
- Cleavage is **Discoidal, Meroblastic.**
- Development direct i.e. larva stage is absent.
- Parental care is often marked.
- Class Reptilia is classified on the **basis of presence or absence of temporal fossae in the temporal region of skull and their number**.

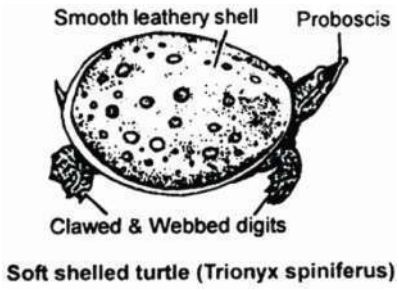
  Class reptilia is divided into following Major Five sub-classes :

  (i) Anapsida (ii) Euryapsida (iii) Parapsida (iv) Synapsida (v) Diapsida

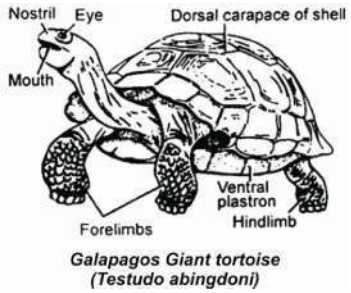
(i) Sub-Class – Anapsida :

Order – Chelonia

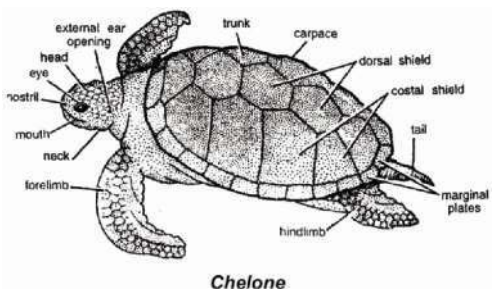
- Temporal fossae are absent in the temporal region of the skull i.e. roof of skull is complete.
- Limbs are strong.
- Body is broad and oval.



Soft shelled turtle (Trionyx spiniferus)



Galapagos Giant tortoise (Testudo abingdoni)



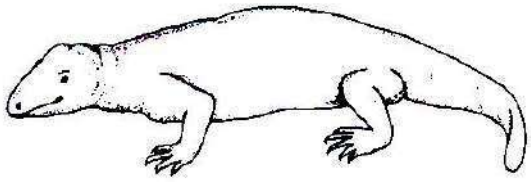
Chelone

- They are terrestrial, marine and fresh water animals.
- This order includes live and extinct both the animals.
- Whole body is covered by firm bony shell.
- Exoskeleton of dorsal region of body is called **carapace** and skeleton of ventral region of body is called **plastron.**
- Horny, **teethless, beak like** jaws are found.
- **Sternum** is absent.

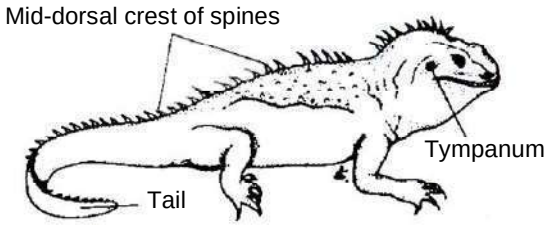
  Bony plate present on the body are called **osteoderms.**
- Clawed digits. Web or membrane of found in between the digit for swimming.
- Scales are found on **neck, limbs** and **tail.**

  All these three organs can be pushed into the **carapace.**
- Thoracic vertebrae and **ribs** are attached with **carapace.**
- Cloacal aperture is vertical and it helps in respiration. (cloacal respiration)
- **Single** copulatory organ is found in male animal.
- Animals are **oviparous.**
- **Testudo** - Land tortoise
- **Trionyx** - Fresh water terrapins (edible)
- **Chelone** - Marine (tortoises) turtles

Order - Cotylosauria



A cotylosaurus Seymouria
(First /Stem reptile)



Sphenodon (Tuatara)

e.g. **Seymouria :** Connecting link between **amphibia & reptilia.**

(ii) Sub-Class – Diapsida :

– One pair superior and one pair inferior temporal fossae are found in the temporal region of skull. Sub-class Diapsida is divided into two super orders.
  - **Lepidosauria**
  - **Archosauria**

Super order Lepidosauria :-

This super order is divided into two orders.

Order - Rhynchocephalia :

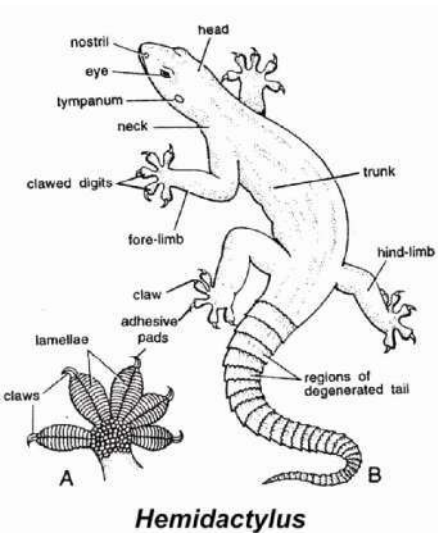
– Most of the species of this order are found in the form of fossils.
– Body is small and lizard like.
– Tail is laterally compressed.
– Limbs are pentadactyl and digits clawed.
– A functional **third eye** or **pineal eye** is found in the head.
– Vertebrae are **amphicoelous** type.
– Teeth are **acrodont** type.
– Penis or copulatory organ is absent in male.
– Long life span living $\simeq$ 100 years

Sphenodon punctatum - Tuatara **(living fossil)** It is found only in **NewZealand.** Only living member.

Order - Squamata :

– Largest number of species of reptiles are found in this order in modern era. All the lizards & snakes are included in this order.
– One or two pairs of temporal fossae are found in temporal region of skull, which disappear after sometimes.
– Limbs clawed.
– Some of the lizards and all snakes are limbless.
– Scales are found on body.
– Vertebrae are procoelus type.
– Teeth are pleurodont, i.e. tooth is situated at lateral side of jaw bone.
– Copulatory organs are paired (hemipenis).
– Order squamata is divided into **two** suborders

Sub-Order (i) Lacertilia ; (ii) Ophidia

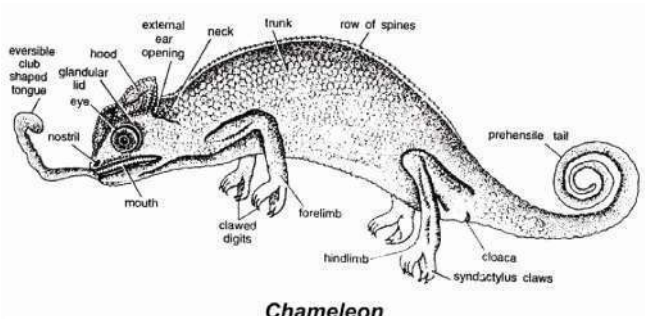


Hemidactylus

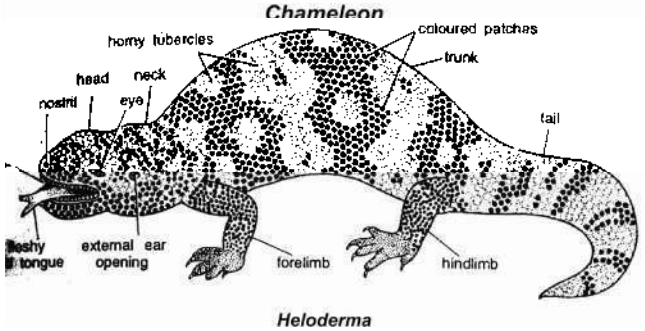
Sub-Order (i) Lacertilia :-

– Normally the members of this suborder is **''Lizards''.**

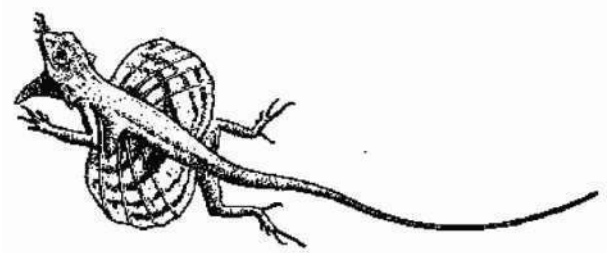
– Study of lizards is called **''Saurology''**
– Girdles and pendactyle clawed limbs are well developed.
– Eyelids are **movable** and **nictitating membrane** is found in eye.
– **Auditory aperture or auditory opening** and **tympanum** is present.
– Autotomy (for breaking of tail) is found in lizards only.
– Urinary bladder is present.
– **Foramen of panizzae** is present in the heart of lizard.
– Both lungs are well developed.
– ***Hemidactylus*** - Common lizard, **wall lizard.** Power of regeneration is well marked.
– ***Calotes*** - Blood sucker, Garden lizard/Girgit. it can change its colour according to environment.
– **Draco** - Flying lizard. Its body skin expands in the form of 2 wings or **patagia.** With the help of these patagia, it can glide from one tree to another tree or its branches. It can not fly.



Chameleon



Heloderma



Draco

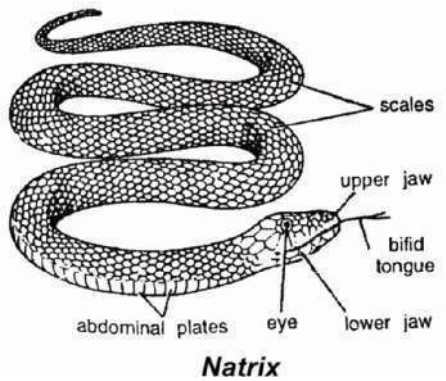
– ***Chameleon*** - Arborial lizard (Viviparous) (Girgit)
– **Varanus** -Goh, Monitor lizard. **Varanus komodoensis** - Ferocious Dragon - **Largest living lizard.**
– **Rhineura** - Limb - less lizard.
– ***Ophiosaurus*** - It is **limbless lizard.** It is also called **glass - snake.**
– **Anguis** - limbless lizard
– **Burkudia** - limbless lizard found in south India.
– **Heloderma** - Gila - monster/Beaded lizard. It is the **only poisonous lizard.**
  Its poison glands are modified sublingual glands (Maxico & USA).
  two sps (H. suspectum, H. horidema).
– **Mobuya** - Viviparous lizard.
– **Phrynosoma** - Horned toad (viviparous)
– **Uromastix** - Sand lizard or Sanda

Sub-Order (ii) Ophidia :-

– Members commonly called **''Snakes''**.
– The study of snakes is called **ophiology** or **serpentology.**
– Body long, thin, smooth and limbless.
– Eyelids are immovable and nictitating membrane in eyes are absent.
– Girdles, sternum and urinary bladder **absent.**
– **Auditory opening** and **tympanum** absent. No middle ear.
– Tongue thin, long and **bifid** and sensitive to odour and vibration.
– Left lung is ill developed.
– Snake poison is proteinaceous and good digesting enzyme.

NON-POISONOUS SNAKES :

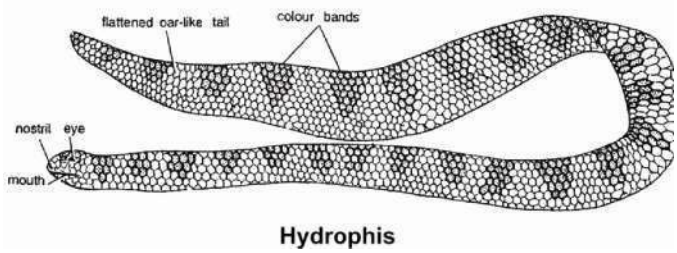
- **Python molurus -** Azgar. It is the **largest snake,** its length is about 25 feet. Rudiments of hind limbs are found on the body. It is non-poisonous snake.
- **Ptyas mucosus - Zamenis** or Rat snake. It is commonly called **Dhaman.** It feeds on rats, so it is also called ‘‘Friend of farmers’’. It is a non-poisonous snake.
- **Eryx Johni - Sand boa.** It is also called **Dumuhi** snake. It is a non-poisonous snake.
- **Typhlops** - Blind snake. Non poisonous.



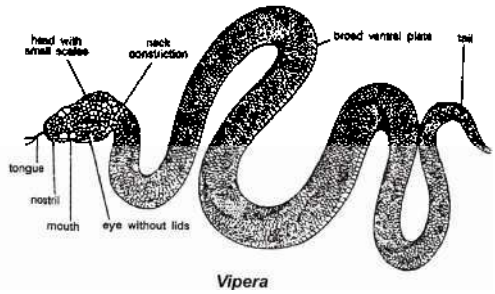
Natrix

POISONOUS SNAKES :

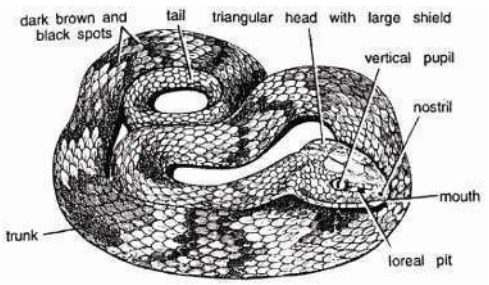
- **Hydrophis -** Marine snake. It is a **deadly poisonous snake.** Its tail is laterally compressed. It is a viviparous snake.
- **Enhydrina** - Sea snake (Poisonous)
- ***Naja* - Indian cobra.** Poisonous snake. Its poison is **neurotoxic** cause paralysis of respiratory muscles.
- **Naja naja or** - King cobra, poisonous snake. It is the largest snake among poisonous snakes **N.hannah** (Head with one or two circular mark).
- ***Bungarus*** - Krait : Poisonous (neurotoxic) snake
- ***Vipera*** - Viper snake : Head is differentiated from body. Poisonous snake (viviparous). Its venom is **haemotoxic/Cardiotoxic Proteolysin is present and damages tissue Loreal pit** is found which is a **thermoreceptor.** Largest viper is Russel viper (V mark on head).
- **Micrurus** - Coral snake.
- **Crotalus** - Rattle snake : It produces a characteristic rattling sound of ‘‘Rate - rate - rate’’, so it is called **rattle snake.** It is poisonous and ovoviviparous snake.



Hydrophis



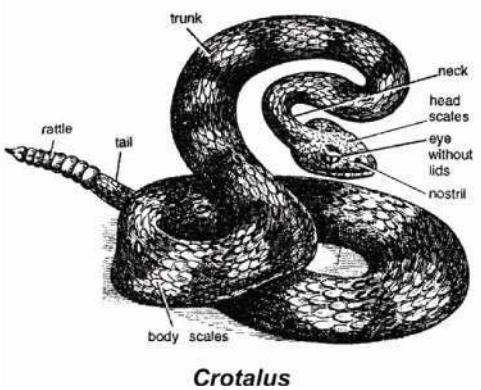
Vipera



Ancistrodon

Characteristic features of poisonous snakes :-

- Small scales are found on head or hood.
- Laterally compressed tail is present in marine snake.
- Ventrally placed scales of the body are broad.
  Two teeth mark is of poisonous snake. (V-shaped - Non posionous)
- Poison glands of poisonous snakes are modified **labial glands.** Probably these glands are homologous to parotid salivary glands of Mammals.
- Poisonous teeth (fangs) are modified maxillary teeth.
- Treatment of poisonous snake bite is done by **Antivenom dose. Antivenom** is produced at



Crotalus

(i) Central Research Institute Kasuali - Shimla
(ii) Hoffkins Institute, Mumbai.
Biggest **Serpentorium** is located in India - **Chennai**

(2) Super order - Archosauria

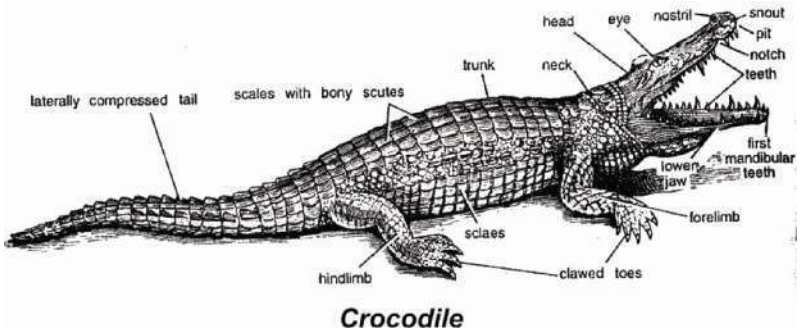
This super order is classified into

(i) Order - Crocodilia

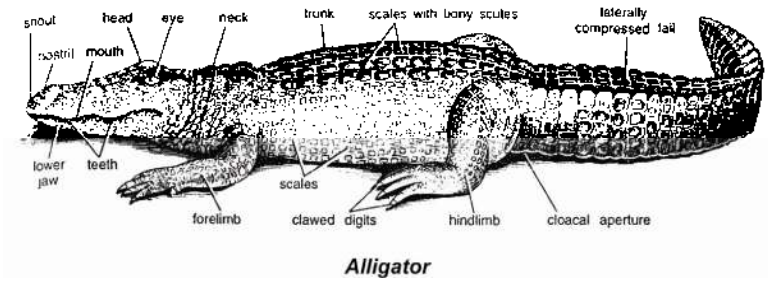
(ii) Order - Saurischia

Order - Crocodilia

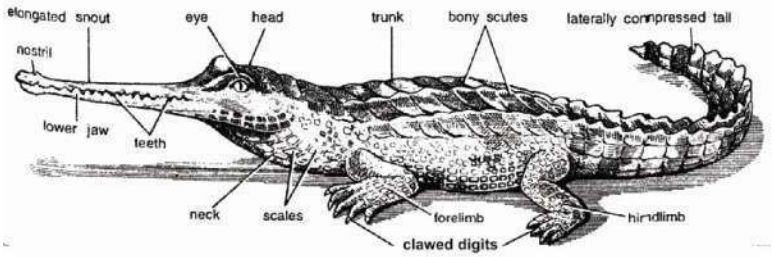
- Crocodiles, Alligator etc. are included in this order.
- Amphibious in nature.
- These are **largest modern reptiles.**
- Skin is covered by lines of **bony scutes.**
- Snout is long. External nares are situated at the distal end of snout and nares have cover also.
- Diaphragm is present in between thorax and abdomen.
- Sternum and abdominal bifid ribs are present.
- Heart is completely four chambered.
- Ventricle is completely divided into two chambers.
- Teeth are thecodont type.
- Urinary bladder **absent.**
- A median erectile grooved penis is present in male animals.
- **Crocodiluss (Crocodile) -** It is only found in Indian subcontinent.
- **Gavialis -** Gharial. Snout very long.
- ***Alligator* -** Maxican crocodile.



Crocodile



Alligator



GAVIAL OR GHARIAL (*Gavialis gangeticus*)

Differences between Crocodile, Alligator and Gavialis

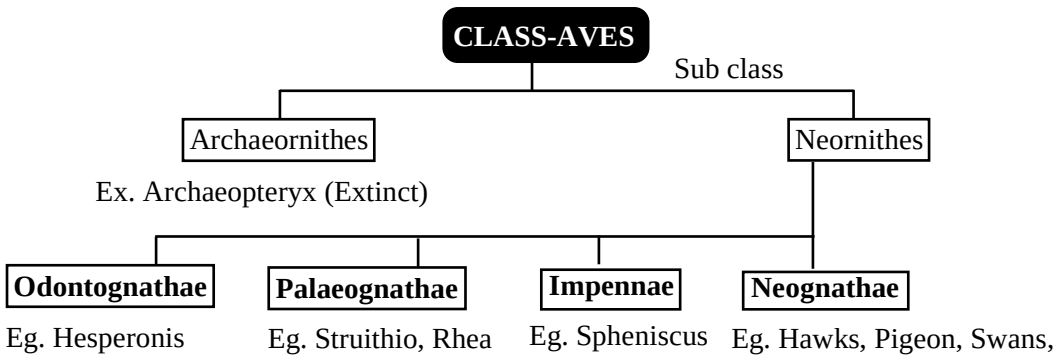
S.No.	Characters	Crocodile	Alligator	Gavialis (Gharial)
1.	Distribution	Asia, Central America, Africa, Malaya, Indonesia and North Australia.	North America, China	India. It is also found in Myanmar (Burma) Pakistan and Nepal
2.	Habits	More aggressive,dangerous to man	Less aggressive, attack when provoked.	Can eat only fish because of narrow throuat.
3.	Snout	Moderately long and pointed	Short and broad	Very long
4.	Teeth	Unequal	Very unequal	Almost equal
5.	Hump	Such structure does not develop.	Such structure does not develop.	During breeding a hollow hump (ghara-like) develops on the snout of the male. Hence it is commonly called **gharial**.

6.	Body Length	8 metres	3 metres	6 metres
7.	Colour	Olive green with black spots of bands.	Steel grey	Dark olive green
8.	Fourth mandibular tooth	Fits into a maxillary groove and visible externally.	Fits into a pit and not visible externally.	—

(C) Class – Aves :

- Originated at the end of **Jurassic period** of Mesozoic era & advancement took place in **cretaceous**
- Study of birds is known as **''Ornithology''**
- **Dr. Salim Ali** was the great ornithologist of India and known as **''Birdman of India''**
- Study of bird's egg is known as **Oology.**
- Study of bird's Nest is known as **Nidology.**
- Birds are glorified reptiles stated by **Huxley.**
- Arrangement of wings on the body of bird is known as **Pterylosis.**
- Body is boat shaped. It is divided into **head, neck, trunk** and **tail.** Neck is **long** and **flexible.**
- A cover of soft feathers **(derivative of stratum corneum)** is present all over the body, that is called **''plumage''**
- Scales are found only on **hind limbs.**
- Birds are **warm blooded** or **Homeothermic** or **endothermic animals** i.e. Body temperature remains almost constant.
- Skin is dry and without glands. But oil glands or **Preen glands** are found on tail or **Uropygium.** These glands secrete oil, which makes feathers soft and water proof.
- Two pairs of limbs are present. Birds are feathered bipeds.
- Forelimbs (with three digits) are modified into wings, which help in flying.
- Four clawed digits are found on hind limbs. these are best adapted for perching, for walking on land, or for swimming in water.
- **Oesophagus** is modified into **Crop** for quick food ingestion and storage and **Gizzard** for crushing the food which is swallowed unmasticated. **Pigeon milk** is secreted by **both sexes** (Crop product).
- Gall bladder is absent.
- A three chambered **cloaca** is present in the birds.
- Teeth are absent in jaws. Jaws are modified into horny beak. Beak is toothless. An epidermal horny sheath is present on beak, which is called **Ramphotheca.**
- Spongy lungs are present for respiration. Air sacs are also found attached to lungs forming accessory resp. organs these help in flying.
- Sound producing organ at the junction of trachea and bronchi of birds is called **syrinx.**
- Heart is four **chambered.**
- Hepatic portal system is well developed in birds, but renal portal system is vestigeal developed. Sinus venosus absent. Only Right aortic arch persist.
- R.B.Cs are **nucleated,** small and oval. No. of RBC/mm^3 is max. in among animals.
- Endoskeleton is **bony.** These bones are hollow, air is filled, and are called **pneumatic bones.** These make the body light in weight and help in flying.
- **Skull monocondylic.**
- Centrum of the vertebra is **heterocoelous. (**Saddle - Shaped**)**
- Some vertebrae of the posterior body portion join together to form **synsacrum**
- Last four caudal vertebrae fuse to form **pygostyle.**

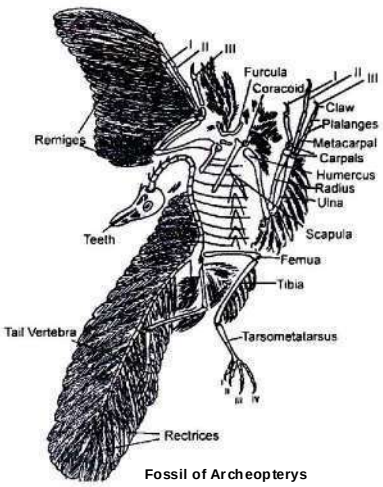
- Sternum is large. Swollen basal part of sternum is called **''Keel''** This keel offers a joint plane for **flight muscles.**
  Keel is highly developed in flying birds.
- Ribs of birds are **bifid** and **uncinate processes** are present in ribs.
- Exoskeleton is in the form of soft **feathers** all over the body (except hind limbs)
- **Foramen of triosseus** is found in their pectoral girdle.
- Two bones, **clavicle** and **interclavicle** fuse to form **V - shaped furcula or wish bone** or **Merry thought bone.** Act as a spring between two girdles .
  Furcula is **absent** in flight less birds.
- Kidneys **metanephric** (Trilobbed). Ureters open into **cloaca.**
  Members are always **Uricotelic.**
  Uric acid is a semisolid substance. Excreta of marine birds is known as **guano.**
- Most of the birds do not have **urinary bladder.**
- Brain is large, smooth, highly developed. Cerebellum is well developed for aerial mode of life.
- Cranial nerves are **12 - Pairs.**
- The skin around the nostrils is sensory in birds, that is called **''Cere''.**
- **Eyes** are large and well developed which are surrounded by rings made up of bony plates known as **Sclerotic ossicles.**
- Eyes are large and **nictitating membrane** is present. Vision is **monocular.**
- A specific comb like structure **Pecten** is found in the eyes of all birds except kiwi's eyes. Pecten helps in Acomodation of eye and provides nutrition to eye balls . It also control pressure of liquid present in eye. **Acute** and **Telescopic vision** of birds is due to pecten.
- External ears are present but ear pinnae are absent. **Columella bone** (Stapes) (one ossicle) is found in middle ear. Cochlea (not coiled) is present in internal ear.
- Olfactory organs are less - developed.
- Birds are **monodelphic** i.e. only left ovary and left oviduct is functional in females.
- Birds are **unisexual. Sexual dimorphism** is well marked. Copulatory organ absent in males.
- Fertilization is **internal, oviparous.** Eggs are **large, megalecithal, telolecithal** and **cleidoic.** Shell is perforated. Cleavage is **meroblastic** and **discoidal.**
- Embryonic development is **direct.** Birds are included under group amniota.
- **Parental care** is well marked. Young one without feather is known as **Nidiculous** and with feather is known as **Nidifugous.**



Subclass - Archaeornithes

- Primitive **''Reptile like birds''** are included in this subclass, which belong to Jurassic period. All the members have becomes extinct.

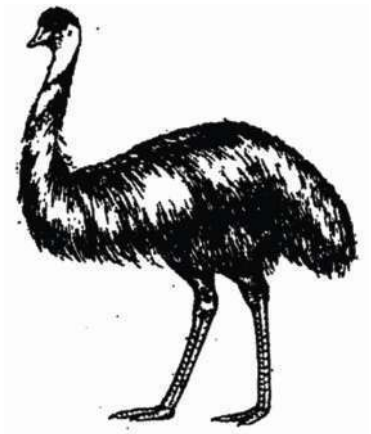
– Wings are ill developed, i.e. capacity of flying was very less.
– **Pygostyle** was **absent.**
– **Keel** on sternum was **absent.**
– There were present 3 - 3 clawed digits of forelimb at the free edges of wings.
– **Uncinate processes** on ribs were **absent.**
– Teeth were present in the jaws of skull.
– All the members of this subclass are the **connecting links** between **reptiles** and **birds.**
– **Archaeopteryx lithographica - Lizard bird.** (Extinct in Cretaceous period) Its fossil was discovered by Andreas wagner in 1861 from Bavaria (Germany).
– **Archaeornis**



Fossil of Archeopterys

Sub class - Neornithes

– This includes living as well as **extinct** birds of post jurassic period.
– Wings are well developed which are used in flying (except some birds)
– Last few vertebrae fuse to form **pygostyle.**
– Sternum is bigger and with keel.
– Digits of forelimbs are fused and claws absent.
– Thoracic ribs are having uncinate processes.
– Except some species (which are extinct) rest of the birds are toothless.
– In living members of this subclass, vertebrae are **heterocoelous.**
– Last few vertebrae joins to form pygostyle.
– This subclass is classified under four super orders.



Australian Emu
(Dromaitus novaehollandiae)

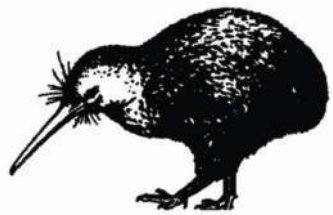
Super order - Odontognathae :-

– These extinct birds were having teeth.
– Pygostyle was absent.
– Keel in sternum is absent
– **Hesperornis** (Flightless marine bird)
Icthyornis (Flightless marine bird)

Super order - Palaeognathae or Ratitae

– It includes large and massive birds, which are flightless in nature.
These are able to run fast. Wings are reduced / rudimentary / vestigeal or absent.
– Caudal vertebrae are free and **pygostyle** is absent.
– Sternum is **raft like** which lacks **Keel.**
– Uncinate processes on ribs, **Oil glands** or **preen glands** and sound producing organ syrinx is absent.
– ***Struthio*** **-** African ostrich or Camel-bird - It is the **largest living bird** of modern period. Polygamous, male incubate the eggs (Largest egg). In this bird **urinary bladder** and **penis** is present.
– **Rhea -** South american ostrich :- It also has **urinary - bladder** and **penis.**

- **Apteryx -** Kiwi - It is National bird of New zealand. It has hair like feathers all over its body. It is smallest flightless bird.
- **Dromaeus -** Emu - It is a monogamous bird in which only males look after their young ones and eggs.
- **Aepyornis** - Elephant bird
- **Casuarius** - Cassowary (found in New Guinea/Australia)



Large grey Kiwi
(Aptery haasti)

Super order - Impennae

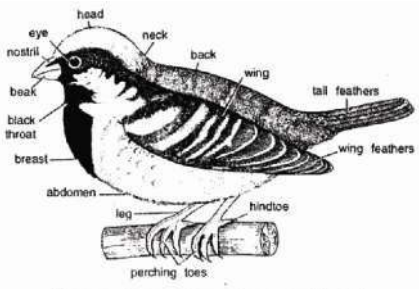
- All are **aquatic birds**
- **forelimbs** are modified into **flippers**
- Limbs are webbed.
- **Teeth** are **absent**
- **Sternum** without **keel.**
- **Spheniscus** -Penguin - It is also called **''sea bird of Antarctica''** (Emperor Penguin)
- **Aptenodytes** -Penguin

Aftrical Ostrich
(Struthio camelus)

Super order - Neognathae or Carinatae

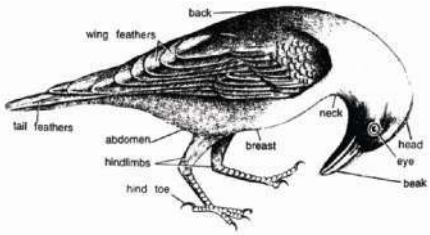
- This super order includes **flight birds** of modern era. Wings are well developed
- **Pygostyle** is present
- **Keel** in sternum is highly developed.
- Its crop glands secrete pigeon milk
- Uncintate processes at ribs are well marked.
- Oil glands or preenglands are found.
- **Toothless** beak
- Sound producing **syrinx** is present.
- ***Pavo – cristatus*** - Peacock - It is the national bird of India.
- ***Psittacula krameri*** - Indian parrot. (upper jaw movable - Psittaciformes)
- ***Columba livia*** - Blue rock pigeon its crop glandssecrete pigeon milk (columbiformes)
- **Streptopelia** - Dove
- **Passer domesticus** - Sparrow - It shows commonsalism with man.
- ***Corvus splendens*** - Crow
- **Molpaster** - Bulbul
- **Cygnus** - Swan - Aquatic bird having webbed limbs
- **Bubo bubo** - Bubo or owl or ''III of oman''
- **Cuckoo** - It lays its eggs in the nest of other birds (Crow)
- **Eudynamis** - Indian Koel (Nest - Parasitism)
- **Anas** - Duck
- **Phoenicopterus** - Flemingo
- **Alcedo** - King fisher
- **Raphus didus** - Dodo (Mauritian extinct bird in 17th centuary)

Colomba livia

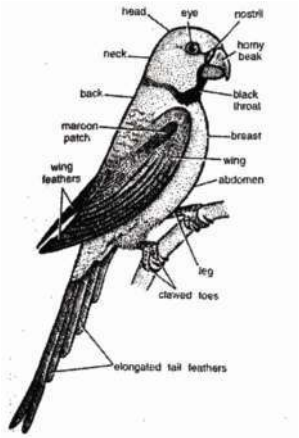


Passer domesticus (sparrow) male

– **Dinopium** - Wood pecker - Kathphorva
– **Diomedea** - **Albatross -** Marine bird with **largest wings** in flying birds.
– **Milvus** - Kite (Predatory birds)
– **Falcon** - Falcon (Predatory birds)
– **Neophron** - Vulture (Scavenger bird)
– **Choriotis-nigriceps** - Great Indian bustard. It is also called Gondavan. It is the **state bird of Rajasthan.** (local name - Godavan)
– **Helena** - Humming bird - It is also called sunbird. It feeds on nector of flowers it is the smallest bird. It is found in cuba. It can fly in forward and backward both the directions. It can fly like helicoptor. Its size is about 3 to 4 cm
– **Ploceous** - Weaver bird (Baya)
– **Micropodus** - Pitohiudicthous/pathua - It is the only poisonous bird, which is found in Newguinea.
– **Swift spine tailed** - Fastest flying bird, it is found in **Japan.**
– **Poor bill** - Bird which shows sleeping stage and undergoes hibernation. **Migratory Birds**
(Phenolosy = Study or bird migration)
– **Pluvialis dominica**- It is an American bird which migrates from south to north and from north to south.
– **Scolopax eusticoa** - It migrates from hill area to planes.
– **Himalyan partiges** - It can fly over 6000 miles
Sterna parasisaea - Champion bird - Arctic to Antarctic and back.



Corvus splendis



Psittacula euparia (parrot)

Dendrocopus mahrattensis (wood pecker)

Feathers

There are different types of feather namely

(1) **Quill** (flight feather) consists of (a) **Remiges -** feather of wings (b) **Retrices -** feather of tail

(2) **Coverts -** small just like quill for filling gap on wings & tail.

(3) **Contours -** small feather to cover the body

(4) **Filoplums -** Beneath the contours

(5) **Down feather -** Cover the body of newly hatched bird. (Filoplume and Down feather make body surface as heat - resistant.)

Differences between Ratitae and Carinatae

S.No.	Character	Super order–III Palaeognathae or Ratitae	SuperorderIV Neognathae or Carinatae
1	Distribution	Restricted, discontinuous. Not found in India	Cosmopolitan, found all over the world
2	Habitat	Terrestrial	Arboreal, terrestrial or aquatic
3	Locomotion	Flightless running birds	Flying birds
4	Size		Usually large-sized
5	Wings	Vestigial or absent	Well developed
6	Legs	Large cursorial	Variously adapted
7	Feathers	Without interlocking mechanism Barbs free	Barbs interlocked due to barbules and barbicels
11	Downfeathers	Absent	Present
12	Horny sheath of beak or marnphotheca	Divided in several pieces	Undivided
13	Oil gland	Usually absent	Present
14	Skull sutures	Remain distinct for a long time	Disappear very early
15	Type of skull	Dromaeognathous or palaeognathous	Neognathous, never dromaeognathous
16	Vomer	Large, broad, interpolated between palatines	Small, narrow, allows palatines to meet
17	Palatines	Short, do not articulate with rostrum	Long, articulate with parasphenoidal rostrum
18	Pterygoids	Immovable	Movable
19	Basipterygoid processes	Well-developed	Small or absent
20	Pygostyle	Small or absent	Well developed
21	Sternum	Plat, raft-like due to vestigial or no keel	Well-developed mid-ventral keel
22	Uncinate processes	Vestigial or absent	Present
23	Coracoid and scapula	Comparatively small, and fused at an obtuse angle	Comparatively large, not fused but meet' at an acute angle
24	Clavicles	Small or absent, no furcula	Both clavicles and interclavicle fused to form a V -shaped furcula
25	Ilium and ischium	Usually remain free posteriorly	Become fused posteriorly
26	Pelvic symphyses	Pubic in ostrich, ischiatic in rhea	Public and ischiatic symphyses absent
27	Limb bones	Not pneumatic	Pneumatic
28	Pectoral muscles	Poorly developed	Well developed
29	Caecum	Large	Small
30	Syrinx	Usually absent.	Present

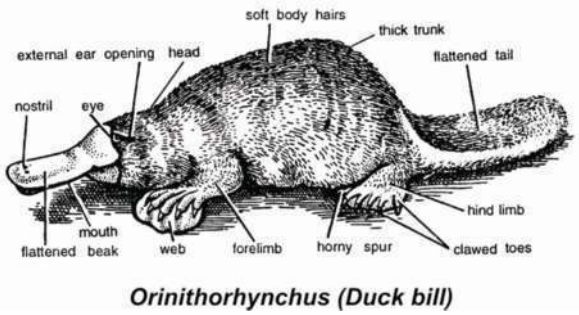
31	Air sacs	Poorly developed	Well developed
32	Penis in male	Present	Absent
33	Clitoris in female	Present	Absent
34	Eggs	Shell thick, hard. Pore canal branched	Shell thin, fragile, Pore canal unbranched
35	Newly hatched young	Precocial, not dependent on parents	Altricial, helpless dependent on parents

Types of Feet in Birds			**Types of Beaks in Birds**		
Sr.No.	**Type**	**Example**	**Sr.No.**	**Type**	**Example**
1.	Perching	Sparrow	1.	Seed eating	Sparrow
2.	Raptorial	Owl	2.	Cutting	Crow
3.	Scratching	Fowl	3.	Fruit eating	Parrot
4.	Swimming	Duck	4.	Insect eating	Hoopoe
5.	Running or cursorial	Ostrich	5.	Fish eating	Kingfisher
6.	Climbing and clinging	Woodpecker	6.	Flower probing	Humming bird
7.	Wading	Jacana and Heron	7.	Spatulate	Spoonbill
			8.	Water and mud straining	Duck
			9.	Tearing and piercing	Eagle and owl

(D) Class – Mammalia

- Evolved in **Triassic period** of Mesozoic era.
- **Coenozoic** era is **golden era of mammals.**
- Study of mammals is known as **Mammology.**
- The members of this class are **cosmopolitan,** Homeiothermal, Endothermic.
- Skin of mammals is thick, water proof, glandular
- Epidermal hairs are present. These act as thermo resistant layer and helps in maintaining internal body temperature. In aquatic mammals hairs are lost and homeothermic condition is maintained by layer of sub-cantaneous fat.
- Mainly two types of glands are found in skin - sweat and sebaceous glands.
- Sweat glands release sweat and helps in regulating body temperature. It is excretory in nature also.
- Sebaceous glands release only secretion and keep the skin and hairs water-proof.
- Body is divided into **head, neck, trunk** and **tail.**
- A horizontal, **diaphragm** is present in the body cavity of all the members of this class without any exception.
  This diaphragm is present in between thorax and abdomen.
  Diaphragm helps in **respiration, defaecation, micturition** and **parturition.**
- So many types of glands are present in the skin as **sweat glands, oil glands** or **sebaceous glands** and **mammary glands.**
- **Mammary glands** are modified sweat glands found in females for baby feeding and on the basis of this, the class mammalia was so named.
- Other skin derivatives such as **nails**, **claws** or **hoof** or horns are found, which provide protection.

- Two pairs of limbs are present in trunk. Limbs are **pentadactyle** which help in swimming, walking running etc. Hind limbs are absent in Cetacea and Sirenia.
- Alimentary canal is **complete**, Anus and urinogenital apertures are separate. Cloaca is absent except in sub class - Prototheria.
- Teeth are **Thecodont, Heterodont, diphyodont**.
- Jaw suspension is **Craniostylic type**
- Lower jaw is made up of dentary bone.
- Paired pulmonary resp. by paired lungs enclosed in pleural cavity.
- **Larynx** or sound organ is found in the trachea for the production of sound.
- Heart **four chambered.** Double circulatory system is present. No sinus venosus. Only **left aortic**/systemic.
- RBCs small, circular and **enucleated**. Family **Camilidae-Lama** and **Camel** which has **nucleated** RBCs.
- Endoskeleton is bony, skull is **dicondylic.**
- Vertebrae are **acoelous** or **amphiplatyan type** i.e. centrum is flat at both the sides. **Epiphysis** is present on either side of centrum & long bones.
- Neck is having **7 cervical vertebrae :** (**Bradypus/Sloth** has **9 or 10** cervical vertebrae and **Sea - cow/Mantees** has **6** cervical vertebrae.)
- Ribs are **bifid.**
- Paired **Metanephric** kidneys located in abdominal cavity.
- These animals are **ureotelic.**
- Brain is comparatively large and highly developed.
- **Cerebrum** and **Cerebellum** are very complex in structure and highly developed.
- **Corpus - callosum.** (Absent in Monotermes & Marsupial) connects both the cerebral hemispheres of brain
- 4 Solid optic lobes collectively known as **corpora quadrigemina** are present.
- 12 - **pairs** of cranial nerves.
- External ear is present in the form of ear pinna and auditory meatus (canal)
- **Malleus, Incus** and **stapes** are the three ear ossicles in middle ear.
- **Cochlea** of internal ear is spirally coiled. 3 pairs of semi circular canals are present.
- Unisexual animals. Testes of males are situated (out side the body) in the **scrotal sacs.** A distinct penis is present in males for copulation.
- Ovaries are found in females
- Fertilization is **internal** and it takes place in **fallopian tubes.**
- Development internal occurs in uterus. Extra embryonic membranes amnion, chorion, allantois and yolk sac are found in embryos **(Amniota).**
- Eggs are **alecithal** or **microlecithal** & **homolecithel** except eggs of prototherians **megalecithal.**
- Placenta is present, so these animals are also called placental animals.
  Placenta helps in the **nutrition, respiration** and **excretion** of embryo
- Mostly mammals are viviparous. Some mammals are oviparous [Prototherians], some mammals are ovoviviparous [Metatherians]
- Parental care is well marked in mammals.
- Living mammals are classified into three subclasses.



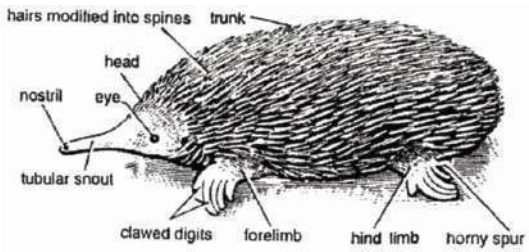
Orinithorhynchus (Duck bill)

Subclass :- Prototheria

- Primitive egg laying mammals are included.
- Eggs are large, yolky and shelled. (**Megalecitha**l)
- Mammary glands are **without nipples.**

– **Gynaecomastism** is found in these animals i.e. male and female both feed their child. Mammary glands are functional in males and females both.
– **Cloaca** is present.
– **Testes** are abdominal
– Pinnae are absent and cochlea is less coiled.
– **Corpus - callosum** is **absent** in brain.
– A toothless horny beak is found in adult animals, but teeth are present in child hood.
– These are partially homeothermic animals.
– Members of this subclass are found in **Australia, New Guinea** and **Tasmania.**

Only one order is included in this subclass.



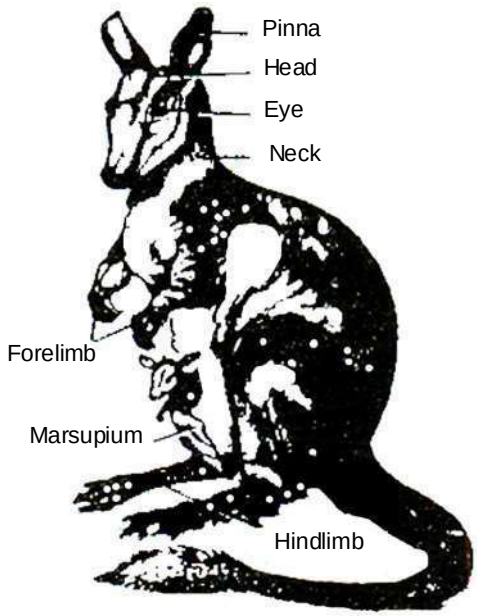
Echidna (Spiny anteater)

Order - Monotremata

Connective links between **reptiles** and **mammals.**

e.g.

– ***Ornithorhynchus*** *or* ***Duck billed platypus*** **- poison glands** are found in **male platypus.**
– **Tachyglossus** or **Echidna** or **spiny anteater.**



Kangaroo

Sub-class Metatheria or Marsupials

– An abdominal pouch called **marsupium** is found in these animals, in which immature young ones are developed till maturity.
– Mammary glands are present and **nipples** are also found on these mammary glands, these are situated in **marsupium.**
– **Two vagina, two clitoris** and **two uteri** are present in a **female** animal and bifid penis present in male.
– **Yolk sac,** placenta are found.
– Cochlea is more coiled in internal ear.
– Teeth are present in adult animals, which are **monophyodont** and **heterodont** type.
– **Corpus callosum** is also **absent.**

Only one order is included in this sub-class

Order - Marsupialia

Animals are **ovoviviparous**

– ***Macropus*** **-** Kangaroo - Found in Australia only. Saltatorial locomotion (Tail to use as body balance)
– **Didelphys** - Opossum - Found in North America. Shortest gastation period (12-13 days).
– **Dasyurus -** Tiger cat.

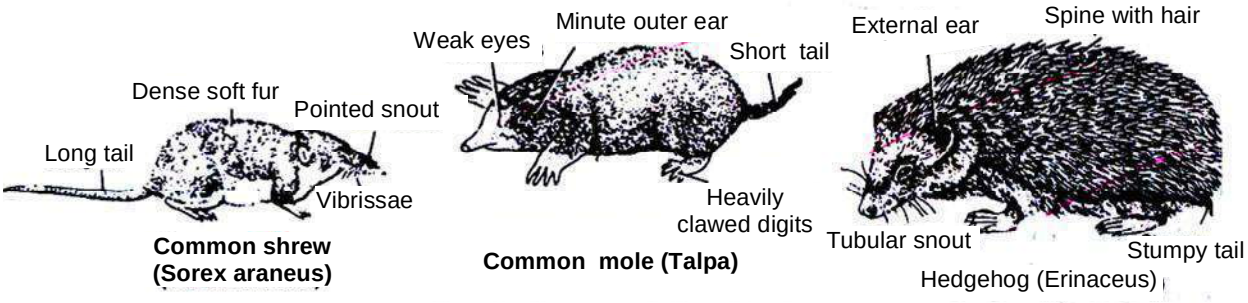
Sub-class - Eutheria

– These are **true mammals.** that give birth to a mature child. A true placenta is found, which is **Allanto-chorionic** type.
– Cochlea is highly coiled.
– Nipples are well developed in mammary glands.
– Uterus and vagina are **single** i.e. only one uterus and only one vagina are present in a female. Penis simple.
– **Corpus callosum** is found in brain.
– Completely **endothermic** animals.

Sub-class **Eutheria** is divided into **16 orders :-**

Order : Insectivora -

– These are burrowing nocturnal and insectivorous animals.



Insect eating mammals (Insectivora)

Erinaceous - Jhau - Chuha/Hedge Hog
Serox - Shrews : smallest mammals size is about 3 - inches : Chhachhunder
Talpa - Mole

Order : Dermoptera/Flying lemurs

Gliding mammals with patagium

– These are furit eaters (frugivorous)
– Only two existing sps. present.

Galeopithecus - Flying lemur

Order : Chiroptera

– In this group bats are included which can fly in air. These are true **flying mammals.**
– Skin between forelimbs and hindlimbs is expanded in the form of **patagium,** it work as wing, which helps in flying.
– Testes are abdominal.
– **Ecolocation** (Radar system) sensory system is found which helps in flying.

***Pteropus* -** Flying fox, It is a fruit eater animal.

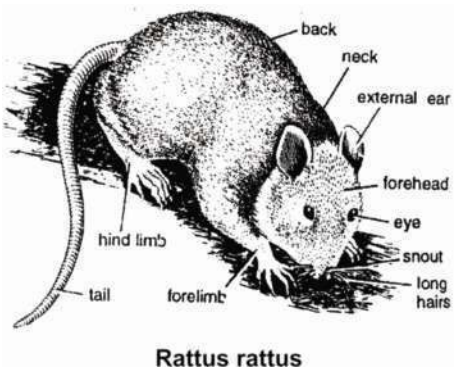
Vespertilo - Insectivorous bat, it is also called filtter mice.

Desmodus - Vampire bat, it is a **sanguivorous** animal

Order : Rodentia

– It is the biggest order in mammals
– These are small, terrestrial, herbivore or omnivore animals.
– Incisor teeth grow continuously in these animals and canines are absent, empty space of canine is called **diastema.**

Funambulus - Squirrel
Rattus rattus - Rat
Hystrix - Porcupine = Sehi = Body hair are modified into quills.
Cavia - Guinea Pig
Dipodomys - Kangaroo rat - Desert rat (Never drink water)
Beavers - Aquatic Rodents

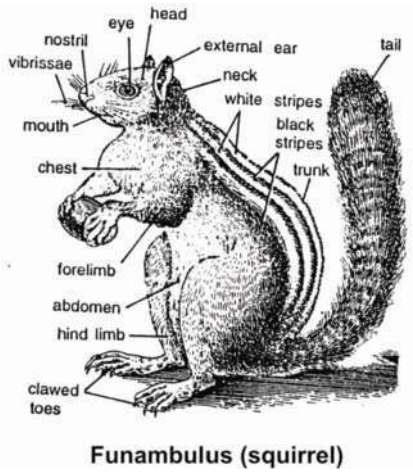


Rattus rattus

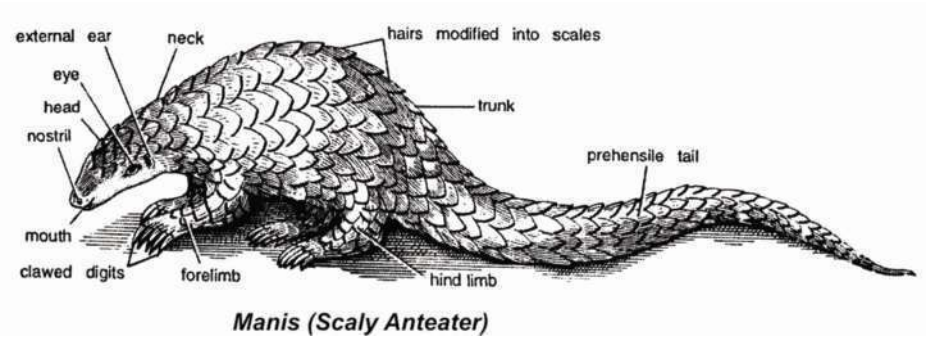
Order : Edentata (Ant - eaters)

- **Insectivorous** animals.
- Tongue of these animals is long, thin and sticky.
- Digits are clawed.
- Teeth ill developed or absent.
- It is the only mammal, which has **exoskeleton** of **bonyplates** and **horny scales.**

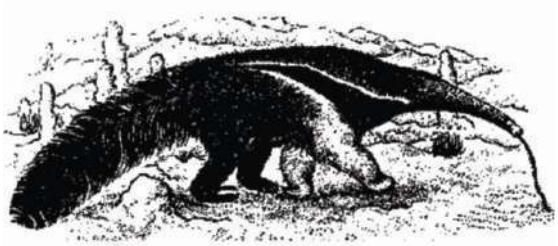
Myrmecophaga	-	Giant ant eater.
Dasypus or **Armadillo**	-	It shows **polyembryony** (4 - 8 embryoes)
Bradypus	-	Slowest animal



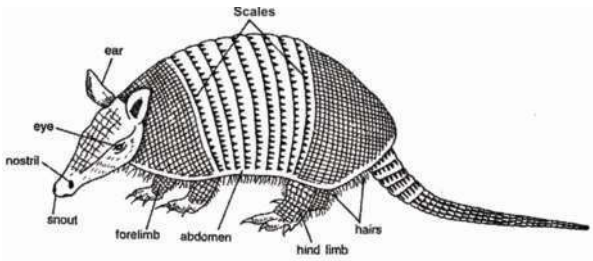
Funambulus (squirrel)



Manis (Scaly Anteater)



Great ant-eater, myrmecophaga



Dasypus

Order : Pholidota - (Scaly ant - eater)

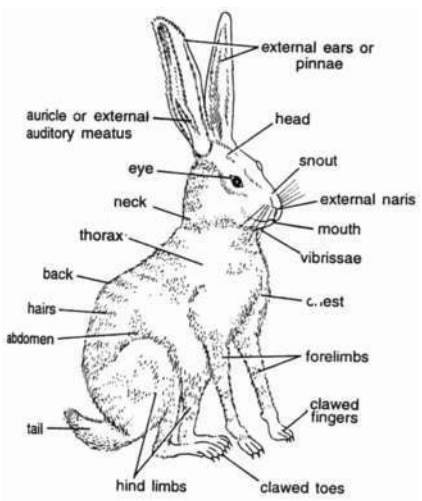
- Teeth are absent. Tongue is long.

  Manis/Pangolin - Scaly ant eater

Order : Lagomorpha

- Rodent like mammals
- Complete herbivore
- Canines absent, **diastema** is present

Oryctolagus	-	Rabbit
Lepus	-	Hare
Ochotona	-	Pika (Tail less)



Lepus (Hare)

Order : Carnivora

- Canines well developed.
- Strong and carnivorous animals.
- Upper **last premolar** and lower first molar are Specialized for tearing the flesh these are called **carnassial teeth.**

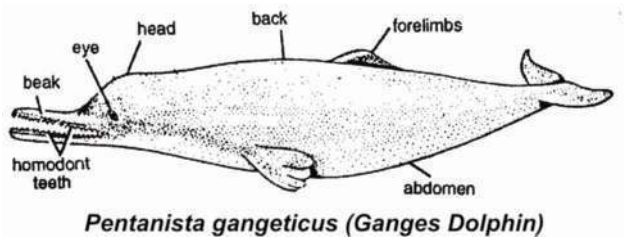
– **Digitigrade** locomotion.
– Terrestrial carnovorous animals are called **Fissipedia** & Marine carnivores are called **Pinnipedia.**

Giant Panda, Ailuropoda

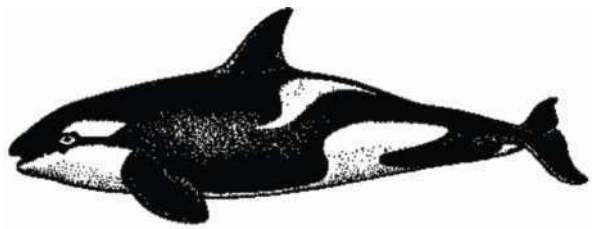
Canis familiaris	-	Domestic dog.
Felis domesticus	-	Domestic cat.
Panthera leo persica	-	Lion - Lions in India are found only in **Gir forests** of Kathiawar of Gujrat state.
Panthera pardus	-	Tendua - Panther.
Panthera tigris	-	Tiger - It is the **National animal** of India.
Acinonyx	-	Cheetah - It is the **extinct** animal of **India.**
Vulpes - bengalnensis	-	Fox.
Zalopus	-	Sea lion.
Phoca	-	Seal.
Odobenus	-	Walrus
Herpestes	-	Mangoose.
Ursus	-	Bear.
Canis lupus	-	Wolf

Order : Cetacea

– These animals are fish like marine mammals
– **Hind limbs** absent.
– **Hairs** & **Pinnae** are absent.
– Abdominal testes.
– Females have nipples.
– A thick heat resistance layer of adipose tissue is present just beneath the skin, that is called **blubber.**

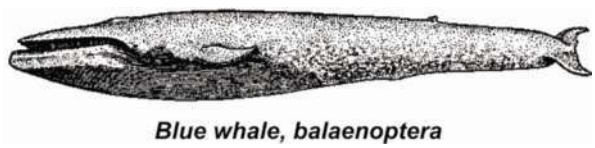


Pentanista gangeticus (Ganges Dolphin)



Killer, orctinus

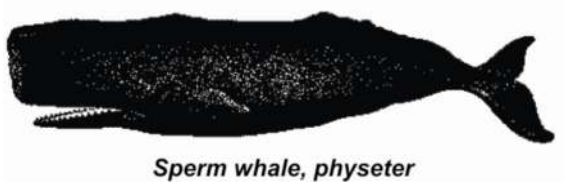
Balaenoptera musculus - Blue whale - Found in **Antarctic ocean.** A Horny sheet called **Baleen** Plate (for filtration) is found in upper jaw instead of teeth. Milk is squirited to through of baby by the muscle contraction of mother. **Retea mirabilis** is found in thoracic region which helps in **respiration** in under water.



Blue whale, balaenoptera

Phocaena porpoise	-	Small whale
Orcinus	-	Killer whale.
Caparea	-	Pigmy whale.
Physeter	-	Sperm whale

From its intestine **Ambergris** is secreted which is used in making perfumes.



Sperm whale, physeter

Platanista gangetica	-	Dolphin - It is found in Ganga river.
Delphinus	-	Common Dolfin

Order : Sirenia

– Herbivorous aquatic animals
– Hind limbs absent.
– Pinnae absent.
– A **transverse fin** on tail.
– Big **tusk** in male.

Rhytina - Sea cow.
Trichechus - Manatee
Halicore - Dugong

Order : Tubulidentata

– Tubular mouth, Tounge Slender & Protrusible.

Orycteropus - Aardvark - It is found in Africa

Order : Proboscidia

– Includes **largest** and **heaviest** modern **terrestrial** animals.
– **Upper incisors** long, tubular form **tusks.** Canine absent.
– Molar teeth are **lophodont** type.
– Hair less, Testis found in abdomen.

Elephas - Indian elephant
Loxodonta - African elephant, it is **largest living land animal.**

Order : Hyracoidea

– Small herbivore animals like rabbit
– **Plantigrade** animals

Hyrax - It is found in Asia and Africa.

Order : Artiodactyla

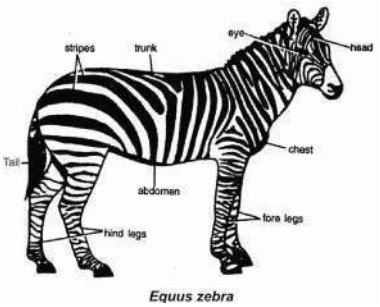
– Stomach is four chambered, (ruminant stomach) it helps these animals in **rumination** (Cud-chewing). All animals are Ruminant except pig and Hippopotamus (Nonruminant). **Eventoed ungulate** animals.

Bos indicus - Cow
Bubalus bubalus - Buffalow
Camelus - Camel [RBC nucleated]
Sus - Pig
Capra - Goat
Ovis - Sheep
Bos mutus/ - Yak
Cervus - Dear
Camelo paradelis - Girrafe
Moschus moschiferus - Musk dear (Smallest RBC)

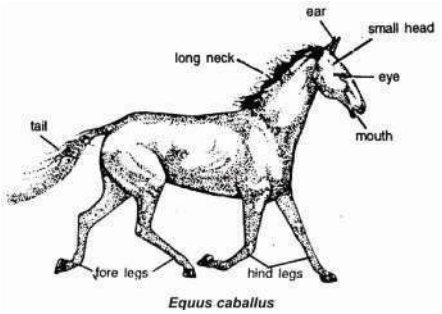
Order : Perissodactyla

– Limbs long, which have 1 or 3 digits with hooves. These are fast runners.
– Odd toed animals

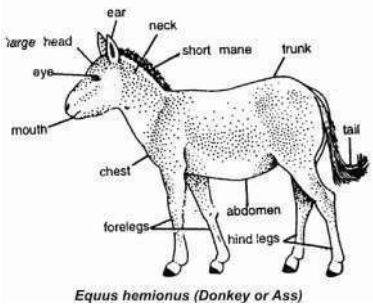
Equus caballus - Horse
Equus asinus - Donkey
Equus hemionus - Indian Donkey
Equus zebra - Zebra
Rhinoceros unicornis - Rhino - Single horn Genda. It is found in Kaziranga National Park Jorhat, Assam Rhino posses keratin hornoversnout.



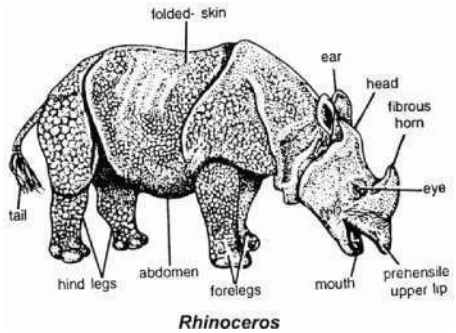
Equus zebra



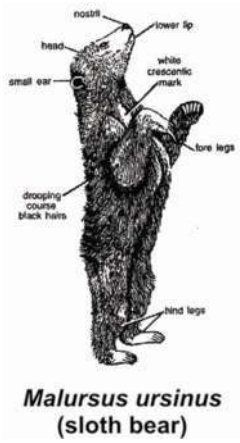
Equus caballus



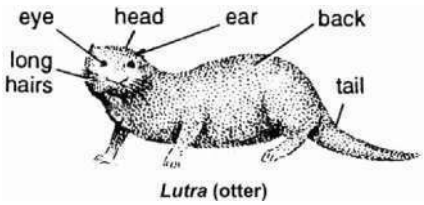
Equus hemionus (Donkey or Ass)



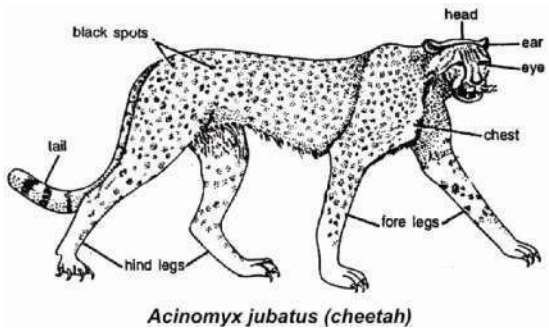
Rhinoceros



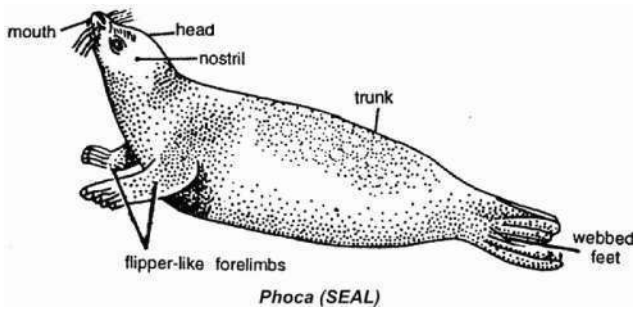
Malursus ursinus
(sloth bear)



Lutra (otter)



Acinomyx jubatus (cheetah)



Phoca (SEAL)

Order : Primates

– Most developed mammals. Plantigrade, large and highly convoluted cerebral hemispheres. It includes most intelligence animals e.g. man, monkeys, lemur, apes, gibbons, gorilla chimpangee.

(a) Prosimians

– **Nycticebus** - Lemur
– **Loris** - Loris (tail less)
– **Tarsius** - Tarsier

(b) Simians

– **Macaca mulalta** - Rhesus monkey
– **Semnopithecus** - Baboon

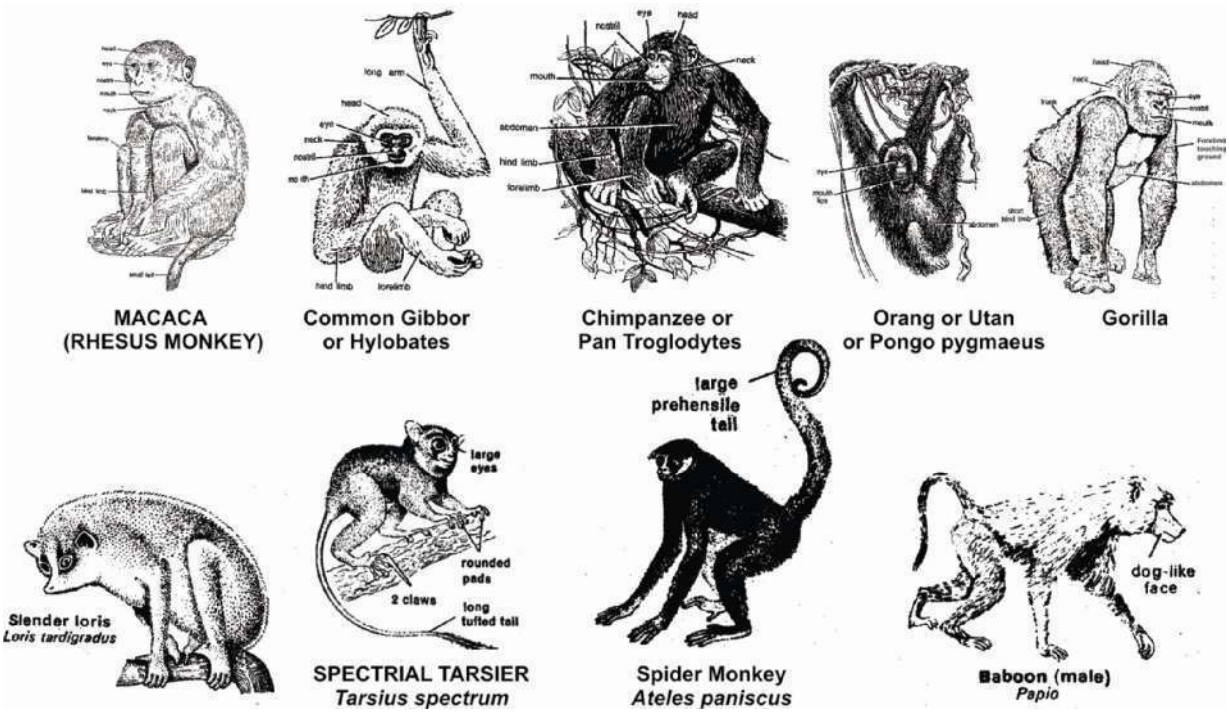
} (Monkey of old world catarrhini)

– **Atles** - Spider monkey (Prehensile tail) } Monkey of modern world. (Platrrhini)

– **Hylobates** - Gibbon - smallest ape. (found in India)
Only ape found india-Hoolock gibben

– **Gorila** - Largest ape.
– **Pan chimpanzee** - Most intelligent in apes
– **Oranguttan** - Man of forest (found in Indonesia)
– **Homo sapiens** - Man

} Ape



DIFFERENCE BETWEEN PROTOTHERIA, METATHERIA & EUTHERIA

S.No.	Prototheria	Metatheria	Eutheria
1	Most primitive and oviparous mammals.	Viviparous animals but young one born immature	Viviparous which give birth to mature younger one.
2	No care of egg but young ones are nourished by parents	Immature embryo young ones are carried in marsupium pouch	Young ones are looked after by mother but marsupium parents absent
3	Placenta is absent	Yolk sac placenta is present	True allantochorion placenta
4	Eggs are large; yolky and shelled	Eggs are small; yolkless Without shell	Eggs are small; yolkless and without shell
5	Meroblastic cleavage	Holoblastic cleavage	Holoblastic cleavage
6	Mammary glands without nipples	Mammary gland present in marsupium with teats	Mammary glands with well developed teats (nipples)
7	Pinna is absent	Pinna present	Pinna present
8	Teeth only in young ones i.e. Monophyodont.	Teeth only in adult stage i.e. monophyodont young ones	Teeth arises twice i.e. diphyodont.
9	Cloaca present	Cloacal aperture absent	Cloaca is absent
10	Testis abdominal	Testis extra abdominal lie in front of penis	Testis extra abdominal lie behind penis.
11	A mammalian penis absent	Penis is present sometimes bifid	Penis well developed
12	The two oviduct remain distinct and no differentiation in uteri and vagina	There are two uteri and two vagina but remain distinct/seperate	A single uterus & two vagina fuse to form single vagina
13	Uterus open into urinary bladder	Ureters open into the urinary bladder	Ureters open into urinary bladder

14	Corpus callosum absent	Corpus callosum absent/poor	Corpus callosum present
15	Cerebrum and cerebellum less developed	Poorly developed	Cerebrum and cerebellum are well develoed
16	Internal ear with less coiled	Cochelea is coiled	Cochelea is more coiled
18	Tympanic bulla absent	Tympanic bulla formed of alisphenoid	Tympanic bulla formed of periotec
19	Epiphysis absent	Epiphysis present between the vertebrae	Epiphysis present between the Vertebrae long bones
21	T. shaped interclavical	Inter clavical absent	Inter clavical absent

COMPARISON BETWEEN LEMUROIDEA, TARSIOIDEA AND ANTHROPOIDEA

S. No.	Characters	Suborder 1 Lemuroldea (Llemures, ghost)	Suborder 2 Tarsloldea (Gr., tarsus, first foot)	Suborder 3 Arthropoidea (Gr. anthropos man)
1	Status	Primitive or lowest	Slightly advanced	Most advanced,
2	Distribution	Madagascar, Africa, Southeastern Asia.	Philippines and adjacent islands.	World wide
3	Habits and habitat	Arboreal, mostly nocturnal omnivorous, solitary	mainly insectivorous.	Arboreal, nocturnal, solitary, Atboreal or tene gregarious,
4	Snout	Usually elongated	Shortened	Short-faced.
5	Eyes and vision	Usually lateral. Vision poor	Large protruding forward eyes. Vision good.	Forward with great power of vision (stereoscopic)
6	Tail	Long, nonprehensile, Sometimes lacking	Long, tufted, non-prehensile	Usually prehensile when present
7	Digits	Second toe with claw, others with flat nails.	2 toes with claws, 3 with nails. Tips of all digits bear rounded pads	All digits with nails
8	Dental formula	$\frac{2.1.3.3}{2.1.3.3} = 36$	$\frac{2.1.3.3}{1.1.3.3} = 34$	$\frac{2.1.2.3}{2.1.2.3} = 32$
9	Orbit	Confluent with temporal fossa.	Communicates by a wide fissure with temporal fossa.	Separated from temporal fossa by a bone
10	Cerebellum	Not covered by cerebrum	Not covered.	Covered by highly developed cerebrum.
11	Uterus	Duplex	Bicornuate	Simplex
12	Clitoris	Traversed by urethra.	Traversed by urethra	Not traversed
13	Placenta	Diffused and non deciduate	Metadiscoidal and deciduate	Metadiscoidal and haemochorial.
14	Examples	Tree shrew *(Tupaia) Aye-Aye (Cheiromys = Daubentonia), lemurs (Lemur), loris (Loris)*	Only single genus with 3 species Spectral tarsier (Tarsius spectrum).	New World and Old World Mookeys, apes and man

COMPARISON BETWEEN PLATYRRHINA AND CATARRHINA

S.N.	Characters	Infraorder Platyrrhlna (New world monkeys)	Infraorder'Catarrhlna (Old World monkeys, apes, man)
1	Distribution	Central and South America.	Africa and Asia.
2	Habitat	Mainly arboreal	Arboreal or terrestrial
3	Size	Relatively small	Relatively large
4	Nose	Nose flat. Internal septum broad, Nostrils widely separated and directed sideward	Nose raised, Internasal septum narrow. Nostrils close together and face downwards.
5	Cheek pouches	Absent	Present except in apes.
6	Tail	Long, usually prehensile	When present, not prehensile.
7	Ischial callosities	Ischial callosities on buttocks absent	Callosities on buttocks present
8	Bony auditory meatus	Poorly developed	Well developed
9	Tympanic bulla	Well developed	Poorly developed.
10	Dental formula	Premolors 3.	Premolars 2.
11	Sigmoid flexure	Poorly developed	Well developed
12	Placenta	Not secondary discoidal	Secondary discoidal
13	Offsprings	Usually more than one	Usually one
14	Examples	Spider monkey *(Ateles)*, howling mookey (Aloutta), capuchin (Cebus), mannoset (Callithrix).	Rhesus monkey *(Macaca)*, langur (Presbytis = Semnopithecus), gibbon (Hylobates), baboon (Papio), orang-utan, (Pango = Simia), chimpanzee (Pan = Anthropilhecus) , gorilla (Gorilla), Human (Homo sapiens).

SUMMARY OF ANIMAL CLASSIFICATION – CHORDATA

PHYLUM CHORDATA

Dignostic Characters

1. Notochord.
2. Dorsal Hollow Central Nervous System.
3. Pharyangeal Gill Slits.
4. Tail.

Sub-Phylum 1. Urochordata (Gr. Uros = tail + chordata = notochord). This sub-phylum is also called **Tunicata** because the adult body is enclosed within a leathery test of tunic formed of a cellulose-like organic substance termed **Tunicin.** The notochord is only present in the tail of the larva (hence named urochordata) and disappears in the adult. The dorsal tubular nerve cord is found in the larva. It is replaced by a dorsal ganglion in the adult. The larva (tadpole) undergoes **retrogressive metamorphosis,** i.e., chage from better devolped larva to less developed adult, e.g., Herdmania (Sea Squirt), Doliolum, Salpa, Botryllus (colonial urochordate). Molgula, pyrosoma-colonial urochorate. Pyrosoma is known for its powerful light with which is shines.

SUb-Phylum 2. Cephalochordata or Aeraniata. (Gr. cephalos = head + chordata = notochord) The notochord persists throughout life. The tail is present throughout life, e.g., Branchiostoma (= Amphioxus). Amphioxus has both ends pointede like hence it is commonly called **lancelet .**

SUb-Phylum 3. Vertebrata or Craniata- These are advance chordates that have cranium (Brain Box) around brain. Notochord is only present in the embryonic stae. it replaced by vertebral column (back bone) in the adult forms. **Paired appendages** are never more than two pairs. There is very high degree of cephalization (formation of head). The epidermis consists of may layers of cell. Epidermis may bear an exoskeleton of scales, feathers of hair. Heart is ventrally situated and there is present hepatic portal system. In many vertebrates renal portal system and pituitary portal system are also present. There is closed circulatory system consisting of blood corpuscles. Red blood corpuscles contain haemoglobin. Nervous system consists of central nervous system (brain and spinal cord), peripheral nerous system (cranial and spinal nerves) and autonomic nervous system(sympathetic and parasympathtic nervous systems). Subphylum vertebrata is divided into two sections : Agnatha and Gnathostomata.

Agnatha (The Jawless Vertebrates). They are most primitive of all craniates. The mouth does not possess jaws hence named agnatha. Notochord persists throughout life. Vertebral column is represented only by small imperfect neural archs over the notochord. They do not have exoskeleton and paired appendages. They have single nostril, Internal ear have one or two semi-circular canals. They are cold blooded. Agnatha has a single class named cyclostomata.

CLASS CYCLOSTOMATA – The Circular mouthed fishes (Gr. cyklos = circular ; stome = mouth)

General Characters – The mouth is circular is circular and Jawless. They are also called jawless fishes. Body is cell like but tail is compressed. Skin is soft and is without scales. Head and brain are poorly developed. Unpaired fins are present. Paired fins and associated girdles are absent. Endoskeleton is cartilaginous. Kindneys are mesonephric. Respiratiory organs are gills.

Heart is two chambered (one auricle and one ventricle) Lateral line sense organs are present. Fertilization is external. Life history may include a larval stage. They are mostly parasites on some fishes. Lamprey attaches itself to some fishes and sucks blood from them. In some places they aggect fish production e.g., petromyzon (lamprey), Myxine (Hag fish).

Gnathostomata (The Jawed Vertebrates). It includes advanced vertebrates. Embryonic notochord is usually replaced in adult by a vertebral column. Paired fins or limbs are present. Mouth has jaws hence it is named gnathostomata. Paired nostrils are present. Internal ear has three semicircular canals. ***Gnathostomata*** is divided into two super classes : **Pisces and Tetrapoda** .

Super class 1 Pisces. It includes true fishes. All are aquatic body bears fins. Repiration occurs typically by gills. They are cold blooded, Each eye has a well developed nictitating membrane. Super class Pisces is divided into three classes.

Class1.Placodermi. It includes the earliest fossil fishes which in lived fresh water. Body had an external protective armour of bony scales or plates. Primitive jaws with teeth were present. Skeleton was bony. Fins were mostly formed of large spines, e.g., *Climatius*.

Class 2. Chondrichthyes. This class includes cartilaginous fish, e.g., Scoliodon, Torpedo, Chimaera.

Class 3. Osteichthyes. It includes bony fish, e.g.m Labeo, Hippocampus, etc.

Tetrapoda is divided into four classes : **Amphibia, Reptillia, Aves and mammalia.**

Class Chondrichthyes- The Cartilaginous Fishes (Gk. chondros = cartilage; ichthys = fish)

General Characters-

The fishes of this class bear catilaginous endoskeleton. They are cold blooded (ectothermic). The exoskeleton consists of **placoid scales**, which are dermal in origin. Except in the Chimaeras, the gills are not covered by an operculum (gill cover). Jaws are well developed. Mouth is entrally placed. A spiral valve called scroll valve is usually present in the intestine. The digestive tract leads into the cloaca. External nares are present on the ventral side of the head. The internal nares are lacking. Paired fins are broad. The caudal fin is mostly **heterocercal.** Heart is two chambered (one auricle and one ventricle). Heart has a well developed sinus venosus and conus arteriosus. There is well developed renal portal system. Urea is chief nitrogenous waste. The brian bears large olfactory lobel and a large cerebellum. There are 10 pairs of cranial nerves. Laternal line system is well deveolped . Lung or air bladder is absent in these fishes. They haved cloaca. Male usually has claspers which are used in copulation. The fertilization is internal. They are oviparous or ovivivipparous (produce eggs which hatch out in mother's uterus).

Class Osteichthyes–The Bony Fishes (Gk. Osten = bone; ichthys = fish)

General Characters- The endoskelton is cartilaginous in the embryonic stage, but in he adult forms more or less it is replaced by bones. They are ectothermic (cold blooded). Caudal fin usually **homocercal.** The exoskeleton, if present comprises cycloid, ctenoid or gonoid scales. Scales are mesodermal in External nares lie on the dorsal surface of the snout. In lung fishes internal nares are also present. A swim bladder is usally present. It faciliatates floating and may function as a respiratory organ. Gills a covered by an operculum. The heart is 2-chambered and has sinus venosus and conus arteriosus. Lung fishes have three chambered heart. (Two auricles and one ventricle). They have well developed renal portal system. Kindneys are mesonepheric. Ammonia is chief nitrogenous waste. There are present 10 pairs of cranial nerves. The brain relatively small olfactory lobes and cerebellum. Lateral line system is well developed.

Common Food Fishes of India-Fresh Water Food Fishes- Labeo rohita (Rohu), Labeo calbasu (Calbasu, Catla catla (Catla), Cirrihina marigala (Mrigal), Mystus seenghala (Singhara), Wallago attu (Malhi), Notopterus chitala (Chital), Ophiocephalus striatus (Daula), Cyprinus carpio (Common Carp) **Marine Water Food Fishes-** Stromateus (Pomfret), Harpodon (Bombay Duck), Sardinella (Salmon), Hilsa (Hilsa), Anguilla (Eel)

CLASS AMPHIBIA – The Vertebrates with Dual - life (Gk. Amphi = Two or both; bois = life)

General Characters- They are the first cold blooded vertebrates from evolution point of view which came to the land. They are amphibious in nature, viz, they can live on and as well as in water. They are mostly found in warm countries. They are ectothermic (cold blooded). They are usually without scales, but if present they are hide beneath the skin (e.g., **Caecilians**)/ Paired fins are absent. Unpaired fins may be present. Two pairs of limbs are used for locomotion. The gills are present at least in the larval stage; some adult forms also carry also carry them in addition to lunge (e.g. Necturus). Skull is diccondylic, i.e., with two occipital condyles for articulation with vertebral column. The heart is three chambered, having two auricles and one ventricel. In the heart, there are present sinus venosus and truncus arteriosus. Both hepatic portal and renal portal systems are well developed. Kindneys are mesonephric.Urinary bladder is present in frog. Larvae and tailed amphibians (e.g., Salamanders) are ammonotelic. Frogs and toads are ureotelic. Ear consistrs of internal and middle ear. Tympanum (outer membrane) covers the middle ear. Ten pairs of cranial nerves are present. Lateral line system is found during their development. They return to water for breeding. Lacks copulatory organs. The metamorphosis is usually present. A Fish like stage, the tadpole is present. They occur only in fresh water and moist land. Amphibians are not found in sea water. Living amphibians are divided into three orders.

Order 1. Apoda (Gymnophiona or Caecilia)- Limbless, Scales present, e.g., Uraeoty- Phlus, Ichthyophis. They are called "blind worm'' or caecillians.

Order 2. Urodela (Caudata). Tail present, e.g., Necturus (Mud puppy), Amphiuma (Congo-eel), Salmandra (Salamander), Trilotriton (Indian Salamander) , Proteus (Blind Salamander), Siren (Mudeel) Ambystoma tigrinum (Tiger Salamander), Triturus (European large crested Newt).

Order 3. Anura (Salientia)- Without tail, e.g., Rana(Common frog), Rhacoporus (flying frog), Bufo (Common toad), Hyla (Tree frog), Alytes (Midwife frog), Xenopus (African toad), Pipa (Surinam toad).

Many frogs and toads show **parental care.** The female surinam toad (Pipa) carries the tadpoles in special pitas in its back till the tadpoles ae ready to hatch. Ichthyophis.

CLASS REPTILIA – The creeping vertebrates(L.Reptare = to creep)

General Characters- Resptiles are the creeping and burrowing cold blooded vertebrates bearing epidermal scales. They are ectothermic (cold-blooded) and are found mostly in the warmer parts of the world. They are few in colder parts. Skull is **monocondylic,** i.e., with single occipital condyle. Except in snakes, there are two pairs of pentadactyl limbs, each with 5 digits bearing claws-tetrapodus pentadactyl type. Heart consists of two auricles and a partyl system is less developed. Kindneys are **metanephric.**Urinary bladder may be present. Crocodiles are ammonotelic. Turtles and alligators are ureotelic. Lizards and snakes are uricotelic. Twelve pairs of cranial nerves are present. Snales do not possess ears. The laternal line system is altogether absent. Tortoises feed almost entirely on vegetation. Some turtles are flesh eaters. All other reptiles are carnivorous/insectivorous. A typical cloaca is present.

Living Reptiles are divide as follows; **Subclass1.Anapsida** : Skull has a soild bony roof; notemporal vacuities. It includes only single living **order chelonia** e.g., Chelone (turtle), Testudo (Tortoise), Trionyx (Terrapin)–soft shelled turtle of Indian rivers. **Sub class 2. Diapsida :** Skull has two temporal vacuities. It includes three living orders. **Order1 Rhynchocephalia e.g.,** Sphenodon (Tuatara)–a living fossil, **order 2 Squamata.** It includes two suborder: **suborder 1. Lacertillia (Sauria)** e.g., Lizards. Sub order 2. Ophidia e.g., snakes. **Order 3. Crocodilia** e.g., Crocodsiles, Alligators, Gavialis ("Gharial").

CLASS AVES- The Birds (L.Avis = Bird)

General Characters- Birds are bipedal feathere and warm blooded (endothermal, Sternothermal or homoiothermal) Animal. Their fore-limbs are modified into **wings.** The hind-limbs are adapted for perchin, walking or swimming, etc., and usually bear four, sometimes three and rarely two toes. Except **uropygial gland** (oil gland) , on the tail, no skin gland is present. Ostrich and parrot lack oil gland. The upper and lower jaws are modified into beak, which lacks teeth. Beaks are adapted to many ways of feeding; seed-crushiung, fruit-scooping, flesh-tearing, nector-spining, wood-chiselling and so on. The alimentary canal has additional chambers, the crop and gizzard. The crop stores and softens the food, however, the gizzard helps in crushing and churning the food. There is a **cloacal aperture.** Gall bladder is absent in some seed-eating birds (graminivorous) such as pigeons. The lungs are spongy and in elastic. Air sacs are connected with the lungs. The larynx does not act as a voice box. Voice is produced by a special organ, **the syrinx.** The heart is four-chambered Sinus venosus is absent. Renal protal system is very much reduced. ed blood corpuscles are nucleated, oval and biconvex. The kidneys are **metanephric** which drain the nitrogenous waste matter (chiefly uric acid) into cloaca through the uraters. Urinary bladder is absent except **Rhea americana** (American Rhea- also called "South American Ostrich". This is the only bird that has urinary bladder). Brain is better developed than that of reptiles, of which cerebrum, cerebellum and optic lobes are quite large. Birds has 12 pairs of cranial nerves. Birds have a keen, sense of sight. Sense of smell is usually poor developed. Ear openings are present. Each ear consists of three parts : external, middle and inernal.

The bones are **Pneumatic**, viz, they have air cavities to reduce weight. There is no bone marrow. The skull is **dylic** i.e., with one occipital condyle. Cervical (neck) vertebrae are from 11 to 25. Sternum is usually large and with a median keel for the attachment of flight muscles. Female has usually well developed single left ovary and oviduct are present. they are vestigial (nonfunctional). **Sexual dimorphism** is found in many birds. Fertilization is internal. All birds are oviparous. Eggs are large with much yolk and hard calcareous shell. Eggs are incubated at the body temperature by the parents. Four **embryonic membranes** (e.g., chorion, amnion, allantois and yolk sac) are formed. The birds are the most beautiful among the animals. They show courtship, nest building, parental care, migration and territorial behaviour. Class Aves is divided into two subclasses :

Subclass I Archaeornithes. Extinct, toothed beak, tail long lizard like e.g., Archaeopteryx.

SubclassII. Anas (Duck), Columba (Pigeon), Gallus (Fowl), Tyto (Owl), Milvus (Kite), Pavo(Peacock, House sparrow). Darwin Finchess–Dodo was pigeon-like bird which became extinct during 17th century in mauritius.

CLASS MAMMALIA–The Mammals(L. Mamma = Breast)

General Characters- these animals are warm blooded, hairy and have mammary or milk producing glands. They are the only animals which nourish their young ones with milk. Oil glands (sebaceous glands) and sweat glands (sudoriferous glands) are present in the skin. Teeth are of different types (beterodoot) and are embedded in the subjects of jaws (thecodont). These are developed twice during the life-time of the a Jumal (dipbyodoot), milk and permanent teeth. Teeth occur in both the jaws. Except a few, mammals possess seven cervical (neck) vertebrae. They possess a muscular diaphragm dividing trunk into thorax and abdomen. The heart is four chambered. sinus venosus is absent. The red blood corpuscles are without nucleus, Renal portal system is absent. The brain has large cerebrum and connects the two cerebral hemispheres internally. 12 pairs of cranial nerves are present.

Each ear consists of three parts external, middle and internal. Pinna is a part of external ear. Middle ear has 3 bony ear ossicles (malleous-hammer shaped, incus-anvil **shaped and stapes-** stirrup shaped). Internal ear has organ of *Corti-actual hearing organ. The kindneys are **metanephric** type, the cloaca is absent except in monotremes (egg laying mammals). Main excretory matter is urea. Ureters open into the urinary bladder. A copulating organ (penis) is always present. Fertilization is internal. Except egg laying mammals they are viviparous. There are [present four embryonic membranes : chorion, amnion, allantois and yolk sac. Except egg laying mammals a well developed is present.

Classification- Living mammals are divided into two sub-classes

1. **Sub-class Protoheria-** Prototherians are considered to be the most primitive mammals which are only restricted in Australia and its neighbouring islands (Tasmania, New Guinea). They lay eggs containing ample amount of yolk. They have cloaca. Subclass Prototheria includes **one order Monotremata** e.g., Orinithorhynchus (Duck billed paltypus), Echidna (spiny ant eater).
2. **Sub-class Theria-** They produce young ones. subclass theria is divided into two infraclasses; Metatheria and Eutheria.

I. Infra Class Metatheria- Now they are found mainly in Australia, New Guinea and South America. Females have a marsupium or brood-pouch for rearing the young ones. Infra-class metatheria includes in order Marsupialia. Mammals of this order are called marsupials or pouched mammals, e.g., Macropus (Kangaroo), Didelphis (Opossum) and Phascolarctos (Koala).

II. Infra-calss Eutheria- They are, provided with true placenta, hence called placental mammals. The embryos are retained in the uterus (womb) till an advanced stage. Some of the principal orders of placental mammals are briefly described here.

1. **Order Insectivora.** (L. insectum = insect, vorare = to eat). These are insect eating mammals and are most primitive palcental mammals. Testes are abdominal. The water shrew is the thiniest mammal which is large as a human thumb e.g., shrews, moles and hedgehogs.
2. **Order Dermoptera** (Gr. derm = skin, pteron-wing) A hairy skin fold called patagium extends like a parachute from neck to tail for gliding. All the four limbs are similar. These are nocturnal and arboreal (tree living) forms feeding upon leaves and fruits e.g., Flying foxes (larger than bats), vampire bats. These are small bats that suck blood of mammals such, as cattle and horses. They also attack man. These bats also spread certain diseases.
3. **Order Chiroptera.** (Gk. Cheiros = hand, potron = wing) They are aerial mammals. The forelimbs are modified into wings. The vampire bats feed on the blood, of man and mammals. Bats can echo-locate and capture flying insects in th dark e.g., Bats and Flying foxes (larger than bats), vampire bats. These are small bats that suck blood of mammals such, as cattle and horses. They also attack man. These bats also spread certain diseases.
4. **Order Edentata** (L. Edentaus = toothless). They are toothiess of with poorly developed molars. This order includes th armadillos and sloths of .South America.
5. **Order Pholidota.** (Gk. *Pholis* = a horny scale). The body of these mammals is covered with overlapping horny scales with sparse hair in between. Teeth are absent e.g., Mains (scalyant eater or pangolin).
6. **Order Promates** (L. *Primus* = of the first rank). Primates have highly developed brain. The living primates includs prosimians (meaning before monkeys) and simians. The prosimians include lemurs, lorises and tarsiers. The simians include monkeys, apes and man.
7. **Order Rodentia.** (L. *rodo = gnaw).* They have one pair if sharp chisel-like incisors in each jaw. The Canines are absent, leaving a toothless space, the diastema, in the jaw e.g., rats, mice, beavers, squirrels, guinea-pigs and procupines.
8. **Order Lagomorpha.** (L. *Logos* = hare , morphe = form). They have two pairs of incisors in the upper jaw and one pair of incisors in the lower jaw e.g., rabbits and hares.
9. **Order Cetacea.** (L. *Cetus* = whale). They have fish-like body, well adapted for aquatic life. They have fin-like fore limbs, but no hind limbs. Testes are abdiminal. the skin has thick layer of fat called blubber serving as reserve food, an insulator for reducing the specific gravity. Pinnae are reduced of absent. Hair are only on lips. They do not have sweat and oil glands e.g., Whales, Dolphins and porpoises. Blue whale is the largest living animal. Whales normally lack pelvic girdle and hind limbs. The Green land whales, however, possess vestiges of pelvic girdles and bones of hind limbs inside the body.
10. **Order Carnivora.** (L. Caro =Flesh, vorare = to eat.) They are flesh eating mammals. These animals have sharp pointed canines, strong jaws and well developed claws e.g., dog, cat, wolf, jackal, fox, cheetah, lion, tiger, hyaena, mongoose, bear, panda, otter, seal, walrus, sea lion. Cheetah is the fastest runner. It can cover a distance of 120 Km in one hour.
11. **Order Proboscidea.** (Gk. *Pro* = in front, boskein = They have a long muscular proboscis or trunk. The trunk is formed by nose and upper lip. They also have long tusks which are modified incisor. Canines are absent. They are tusks e.g., Manatee, Seacow.

12. **Order Proboscidea.** (Gk. Siren = sea nymph). They are herbivorous aquatic mammals with fin-like forelimbs and no hind limbs. They do not have hair and external ears. They have thick blubber. Testes are abdominal. The males have tusks e.g., Manatee, Seacws.

13. **Order Perissodactyla** (Gk. *Perissos* = odd, dactylos = toes). They are herbivorous odd toed hoofed mammals. It means they are unglates (L. ungula = hoof) or hoofed which have an odd number or toes **(lor3).** True horns with a bony core are never present. The stomach is of non-ruminating type (these are not cud chewing animals) e.g., horses, asses, mule, zebra, tapirs and rhinoceros.

14. **Order Artiodactyla** (Gk. artios = even, dactylos = digit). They are herbivorous even toed hoofed mammals. It means they are ungulates (hoofed) which have even number of toes (2 or 4). True horns of antlers are present in many animals of this order. Many even toed hoofed mammals like cow and camal are ruminants or cud-chewing. The four chambered stomach of cow is capable of digest ; 1g cellulose of plant materials by micro-organisms present in the rumen (first part of their stomach) e.g., cows, buffaloes, sheep, goats, deer, antelopes, camels, giraffes, pigs, and hippopotamus.

SPECIAL POINTS

FISHES- *Gambusia fish was introduced into several tropical regions to control malaria.

*** Hilsa** is the only India fish that migrates from the seas to the river for breeding. It migrates from the Bay of Bengal to the Ganges, Brahmaputra, Godavari and Krishna. Dr. Hora studied the migratio of Hilsa. *Copulartory organs of sharks are known as claspers.

***Largest Fish**- The whale shark, upto 18m long, weight over 40 tonnes. **Smallest fish-** Pygmy goby, up to 11 mm long, weight 4-5 mg. **Fastest fish-** Sail fish, about 109 km/h.

*** Ichthyology-** The study of fishes. ***pisiculture-** Cultivation of fishes. * **Devonian Period-** "Age of fishes"

Most** primitive fish (fossil) : Climatius.* Most beautiful fish in the sea : **Zebra fish Most poisonous fish : **Stone fish.**

Catadromous fishes live in fresh water and go down to sea for breeding e.g., Anguilla (European eel). When fishes migrate from the rivers to the sea. It is called catadromous **migration.**

Pomfret it the most widely eaten fishin India. It was introduced in India by foreigners.

***Types of Scales in Fishes: 1. Placoid Scales.** A placoid scale has a disc-like basia plate. In basic structure, a placoid structure resembles a tooth. These scales are found in cartilaginous fishes. e.g, Scolidon.2. **Ganoid Scales.** Ganoid scales are heavy and have an outer layer of hard inorganic enamel like material called **ganoine** . These scales are found in primitive bony fishes. e.g., Polypterus, Acipencer **3. Cycloid Scales.** These scales have circular ridges. The cycloid (smooth) scales are found in higher bony fishes. e.g., Carps, lung fisher. **4. Ctenoid Scales.** These scales also have circular ridger but have more of less serrated free edge. Thus they are comb-like. Ctenoid scales are found in higher bony fishes e.g. perch.

Stenohaline Fishes. They have only a narrow range of salinity tolerance and hence remain restricted to either fresh or salt water. ***Euryhaline Fishes.** They migrate between fresh water, estuarine and thus have a wide salinity tolerance.

***Dipnoi** (Gr. di = two, + pneoe = breathing (Gr. di = Two + pneoe = breathing)-means double breathers as they respire through gills as well as lungs. Dipnoi is a group of bony fishes which includes fungs fiehs.

***Weberian Ossicles.** These are named after the name of their discoverer **(Weber 1820,)**. In certain fishes (e.g., Labeo). A chain of four small bones (Claustrum, Scaphium, Intercalarium and tripus) connects the air bladder and internal on either side. They are considered helpful in the temperature e.g. Mashser (Tor Tor)

AMPHIBIANA-*Largest amphibians. Japanese Giant Salamander which grows to a length of 1.6 cm Smallest amphibian. One of the South American arrow poison frogs which meaures upto 1.3 cm.

***Axolotls** are larvae of a certain type of salamander. They are unsual in that many axolotls remain larveae all their lives but are still able to breed. When the larva develops gonads and reproduces as in axolotl) (larva). It is called **Neotony.**

***Blind worms** (limbless amphibians) are unusual amphibians as only one species lives in water. All the others burrow underground and are rarely seen on the surface. Many do not even need water to bread.

*Amphibians originated in **Devonian Period. *Carbonians Period-** "Age of Amphibians".

*The **Arrow Poison frogs** secrete a powerful poison from their skin which can cause death. These frogs are only found in central and South America.

*Poisonous forgs often **advertise the danger** with bright **yellow, orange, red and black patterns.** So that they can be easily avoided.

***Most poisonous Frog. Golden dart poison** frog from South America is the most poisonous frog. One adult frog contains enough poison to kill 2200 people.

*Salamanders are better adapted to life on land than newels. Salamander lives are similar to those of newts, except that they usually live in warmer areas and do not need to bibernate.

Necturus (Mud puppy), Proteus (Blind Salamander), Siren (Mud eel) and Axolotl larve have external gills.

REPTILES-* reptiles without urinary bladder -snakes, crocodiles, alligators.

* The oldest living animals in any Indian Zoo is the Aldabra giant tortoise. It has been living in the Alipore Zoo in Calcutta since. It is 1.3 metre long.

Herpetology** -Study of reptiles. ***Ophiology-** Study of sankes.Largest Lizard**. Komodo dragon.

***Saurology–** Study of lizards. ***Mesozoic Era**– Also called "Age of Retpiles. "*Rattle snake's tail emits a frightening sound which scares away the enemy. *The king cobra of India is the only snake in the world that builds a nest.* Forked tongue of snakes simple gives a "stereo" Senseof smell to them. They have an organ called **Jacobson's orgen** within their tht helps them to detct odours.

Most Poisonous Snake**- Hydrophis (Sea snake)* Longest Poisonous Snake-** King cobra*Fangs of a poisonous snake are maxillary teeth. ****Largest Snake.** Python/Anaconda, may grow upto 10 m in length. **Smallest Snake.**Thread snake, less than 12 cm inlength.****Largest Living Reptiles** (i) python, (ii) Crocodile(iii) Komodo dragon.

***Seymouria.** It was one such ancestral reptile which probably started laying eggs on land in the **Permian period.** It was a lizard like sluggish creatur. It was a "connecting link" between amphibians and reptiles. Its amphibian characters were short and stubby limbs, and lateral line system. The reptilian characters were-lizard like body, typical pentadactyle limb, modification of first two cervical vertebrae into atlas and axis. Dr. T.E. White made a detailed study of seymouria.

***Lycaenous.** It was a mammal -like reptile. This fossil was discovered from the late **Permian period.** In South Africa. It is considered a "connecting link" between reptiles and mammals.

Pterosauria (= Pterodactyl). They are extinct reptiles which were light built. Their fore limbs evolved into membranous wings. Rhamphorhynchus of late **Jurassic period** was primitive pterosaur with one metre wing span, a long balancing tail and toothed jaws.

*Anguish (European glass snake-limbless-lizard), Chameleon pumilus, vipera russelli-(the Russell's Viper), Hydrophis (Sec snake), -All are viviparous.

BIRDS-* Archaeopteryx (fossil) is one of the earliest birds. The first fossil of Archaeopteryx was found in Germany in 1861. It has the characters of both reptiles and birds. *The largest bird is **Ostrich.** *Dove is the emblem of the sign of peace. *The humming birds is the only bird which can fly backward as well as forward.***** Colombia has the world's richest diversity of birds. The bird Dodo became extinct because of its fearlessness.* **Ornithology-** study of birds. ***Nidology-** study of nests of birds. ****Oology-** study It eggs of birds.

* **MAMMALS-** The Indian one-horned Rhinoceros is the second largest land animal of-India. * Highest 1.Q in man- 210 in Korean boy 4 years.* Project Tiger was started, on April , 1973. Kailash Sankhala was the founding Director of project tiger.

* **Mammals : Largest -** Blue whale, up to 33 m in length and weighs 100-120 tones (heavies recorded about 180 tones). Smallest- Shrew, body length of less than 4.5 cm and weights about 2g. The hog-nosed bat of Thailand is about, the same weight. Longest Liver-Human being. Most primitive-spiny ant eater, Duck billed platypus.

* **Apes : Largest-** Gorilla, Smallest -Gibbon.

* **Monkeys : Largest-** Mandrill. Smallest-Pygmy marmosed.

* **Giant panda** is one of the rarest animals in the world. Pandas rarely breed in captivity. Giant pandas live only in high mountains of China.

Holocene Epoch-** "Age of Man". * Ancon Sheep-** short legged sheep which originated by mutations in a single generation. **Largest land animals.** African elephant. *Fastest growth-Blue whale.

* Aquatic mammals such as whale, Siberians and seals lack pinna. Platypus also does not have pinna.

* **Mammals without 7 cervical vertebrae.** 2-toed sloth (Choloepus) with 6 cervical vertebrae, 3-toed sloth (Bradypus) with 9, ant bear (Tamandua) with 8 and Manatee (Tiochechus) with 6. Manatea is like sea cow.

* **Koala Bear** lives without water on Eucalyptus leaves. The water in the leaves perhaps meets its requirement of water.

* The first living being sent into space was dog called **"Laika."** Kangaroo rat never drinks water in its entire life.

* Asiatic wild as is flowed in Rann of Kutch. Gujrat.* Origin of Mammals- **Triassic Period.*** Origin of manpiocene Epoch.

* **Pashmina woll** is obtained from the mountain goat. This animal is found in Ladakb and Tibet.

* **The white Tiger**. All white tigers in the world are the progeny of a white male tiger which was capturted in 1951 from the forest by the Maharaja of Rewa, Madhya Pradesh, and reared as, "Mohan" at Govindgarh Palace.

* Primate Population in Assam is falling. The study was carried out at Borajln Reserve Forest. There five Types of primates (except amn) in the state- the slow loris, the Assamese macaque (monkey) the Capped langur and the **Hoolock gibbon** (ape).*** Sambar stag** is the largest deer of India.

* **Hangul** (Kashmiri stag, red deer) is the world famous red deer. It is one of the endangered species red deer, found in Dachigam National Park situated about 25 km from Srinagar.*** Land of white Elephant -** Thailand.

DIFFERENCE BETWEEN THREE GROUPS OF MAMMALS

S.NO.	PROTOTHERIA	METATHERIA	EUTHERIA
1	Oviparous	Viviparous	Viviparous
2	No pinna	Pinna present	Pinna usually present
3	No nipples (mammae)	Nipples abdominal	Nipples abdominal thoracic
4	No marsupial pouch	Marsupial pouch often present.	No marsupial pouch
5	Digestive and urinogenital tracts open into a cloaca. Cloaca opens outside through cloacal aperture.	Anus and Urinogenital aperture open into a shallow cloaca surrounded by a common sphincter	Digestive and urinogenital tracts open out by separate apertures
6	Corpus callosum is feebly developed or absent	Corpus callosum is feebly developed or absent.	Cropus callosum is well developed. It connects two cerebral hemispheres of the brain internally.
7	Testes abdominal, No Scrotum.	Scrotum in front of penis.	Scrotum behind penis
8	No placenta.	Placenta is less developed	Placenta is well developed

* African Fish Eagle is called the Voice of Africa because of its familliar yelping call. * Shrews (mammals) have the highest metabolic rate. Humming birds rank along with them in having the highest metabolism of any warm-blooded vertebrate.

* Famous Inidan Orthinologist- Dr. Salim Ali.* **Certain humming** birds becomes cold blooded at night their Poikilothermal (warm blooded) behaviour is due to their very small size. The birds is so small and loses heat so quickly that it cannot maintain its temperature at a constant level over night. At night its metabolic rate falls. just before day break the humming birds' body spontaneously returns to its normal temperature and high consumption of oxygen certain humming birds also hibernate. The Kiwi of New Zealand has an usually acute sense of smell. The Kiwi has the most sensitive beak of any bird. It can detect worms in the ground, thus, Kiwi is the only bird known to use the sense of smell for smell for finding food on the ground.

* Origin of toothed birds - **Jurassic Period.* Origin of Reptiles** was in Carboniferous period.

* Kalka deo Ghana National Park, Bharatpur , Rajasthan and Chilka Lake Bird Sanctuary, Balagaon, Orissa are famous for birds.* A comb-like structure, the **pectin**, objects from the blind spot into the vitreous humour, The pecten is present in the eye of all the birds except Kiwi (Apteryx). **Pecten** is also found in some reptiles (e.g., Uromastix) but it is absent in mammals. The actua of pecten is not understood but possibily it aids in the nutrition of the eyeball or in accommodation.

Four Evolutionary Lines of Placental Mammals-

1. **Insectivorous Line-** It includes the primitive including placental mammals the groups arising from it such as bats and primates.
2. **Rodents and Rabbits-** Both group have no canines. The incisors are adpoted for gnawing.
3. **Whales, Dolphins and Porpoises-** They are aquatic placental mammals and have flipper like forelimbs and lack hind limbs.
4. **Elephants, Carnivores and Ungulates-** Elephants have padded-feet and no hooves. The elephant's trunk is an elongated nose and the tusks are modified incisors. Carnivores are flesh eating. The ungligate are hoofed herbivorous mammals.

COMPERISION AMONG VARIOUS CLASSES OF VERTEBRATA

Features	**Fishes**	**Amphibians**	**Reptiles**	**Aves**	**Mammals**
Habits	Aquatic, mainly carnivorous, cold blooded, active swimmers	Aquatic and terrestrial both, carnivorous, cold blooded	Terrestrial mainly, cold blooded, Mainly carnivorous	Terrestrial, warm blooded, carnivorous and herbivorous	Terrestrial, warm blooded, omnivorous carnivorous and herbivorous
Main habitat	Water	Water and land	Mainly land	Land	Land
Skin	Skin moist, with many mucous glands and embedded dermal scales. (Epidermal scales are absent)	Moist, soft, slippery, glandular and sticky. (Dermal and epidermal scales are absent)	Rough, dry with many epidermal scales. Skin is covered by dermal scutes and plates in snakes, crocodiles and tortoises.	Dry, covered by horny feathers. Epidermal scales are present on legs, feet and base of beak.	Rough, dry, cornified. Skin is the thickest. Skin bears dermal hairs
Occipital condyles in skull	Dicondylic	Dicondylic	Monocondylic	Monocondylic	Dicondylic
Vertebrae	Amphicoelous	Amphicoelous, Procoelous	Procoelous	Heterocoelous	Amphiplatyan (Acoelous)
Jaw' suspansorium	Amphistylic or hyostylic	Autostylic	Autostylic	Autostylic	Craniostylic
Teeth	Teeth are modified placoid scales in cartilaginous fishes.	Homodont, acrodont and polyphyodont	Homodont and pleurodont. Absent in tortoises	Absent	Heterodont, diphyodont and thecodont

Respiratory organs	Gills	Gills in larva but lungs and skin in adult	Lungs	Lungs	Lungs
Cloaca	Present	Present	Present	Present	Absent (Present in prototherians)
Heart	2 chambered	Three chambered	Three chambered (imperfectly four chambered in crocodiles)	Four chambered	Four chambered
Cranial nerves	10 pairs	10 pairs	12 pairs	12 pairs	12 pairs
Thermal nature	Poikilothermic	Poikilothermic	Poikilothermic	Homeothermic	Homeothermic
Kidneys	Mesonephric	Mesonephric	Metanephric	Metanephric	Metanephric
Scrotal sac in male	Absent	Absent	Absent	Absent	Present
Mammary glands	Absent	Absent	Absent	Absent	Present
Fertilisation	Usually internal	Usually external .	Internal	Internal	Internal
Development	Usually direct	Direct or indirect	Direct	Direct	Direct

Classification Chart

Class Mammalia

Subclasses

Prototheria (Egg-laying mammals)

- Primitive mammals which **lay eggs**.
- Digestive tract and urinogenital duct open to the exterior by single aperture.
- Newly hatched animals are nourished on mother's milk.
- External pinnae absent, Testes abdominal, cloacal opening present.
- Confined to Australia and its neighbouring islands.

Order

Monotremata

- **Cloacla** opening present.
- *E.gs.* Platypus (*Ornithorhyncus*), spiny ant eater (*Echidna*)

Theria (Viviparous)

- **Viviparous,** both extinct and living.
- Digestive tract and urinogenital duct open by separate aperture to the exterior.
- Their young develops in the uterus, extra abdominal testes, cloacal is usually absent.

Infraclasses

Metatheria
(Pouched mammals or marsupials)

- Placenta is simple and small
- Young ones are born prematurely
- Corpus callosum is absent
- The females have a pouch or marsupium for keeping and nourishing the young ones

Order

Marsupialia

- Vagina and uterus are double.
- *E.gs.*, Kangaroo, (*Macropus*), koala, opossum (*Didelphis*)

Eutheria

- **Placental mammals** with well developed placenta
- Cerebrum has corpus callosum
- Teeth thecodont, diphyodont and heterodont, cloaca absent but anus is present.

Order (16)

Insectivora

- Primitive placental mammals with abdominal testes.
- Sharp teeth, prolonged snout plantigrade feet with claws
- *E.gs.*, Mole (*Talpa murina*) Shrew (*Sorex*) Hedgehog (*Paraechinus*)

Chiroptera

- Patagium (skin fold) for flying
- Nocturnal arboreal
- Have ecoapparatus
- *E.gs.*, small bat (*Scot-ophillus*), large bat or flying fox (*Pteropus*), Vampire bat (*Desmodus*)

Dermoptera

- A hair skin fold patagium extended from neck to tail used for gliding,
- *E.gs.*, flying lemur (*Galaeopithecus*)

Edentata

- Teeth are few or absent.
- Testes are abdominal.
- Tongue is long and protrusible
- *E.gs.*, armadillo (*Dasypus*), sloth (*Bradypus tridoctylus*)

Primates

- Highly developed brain
- Long limbs
- Large convoluted cerebral hemispheres
- Forwardly directed eyes, binocular vision
- *E.gs.*, lemur, tarsiers, monkey, man

Lagomorpha

- Upper jaw contains two pairs of incisors while lower jaw has one pair of them.
- Pinnae are large
- Diatema occur
- *E.gs.*, Rabbit (*Oryctolagus*), hare (*Lepus*)

Rodentia

- Sharp chisel like incisors.
- Diastema occur.
- *E.gs.*, Rat (*Rattus*) Mouse, (*Mus musculus*) *Funambulus* (squirrel) Beaver (Castor *fiber*) Porcupine (*Hystrix indica*)

Pholidota

- Upper surface is covered with strong horny scales.
- Tongue is long worm-like, protrusible and sticky.
- *E.gs.*, manis (*Pangolin*)

Proboscidea

- Nose and upper lip are jointly prolonged to form prehensile proboscis.
- Canines and premolars are absent.
- Upper incisors enlarge to form **tusks** in elephants.
- Testes are abdominal
- They are the **largest land animals**
- *E.gs.*, Elephant (*Elephas maximus*)

Sirenia

- Herbivorous, aquatic mammals with fin like forelimbs and no hindlimbs.
- They do not have hair and external ears.
- Testes are abdominal
- The male have tusks
- 6 cervical vertebrae
- *E.gs.*, Dugong (*Halicore*), *Rhytina* (sea-cow), *Manthus* (Manatee)

Artiodactyla

- Even toed unguligrade mammals generally with hooves.
- Stomach may or may not be ruminant
- True horns occur in some forms.
- *E.gs.*, Hippopotamus, Spotted deer (*Carvus*), Camel (*Camelus*), Giraffe (*Giraffa*), Ox (*Bos indicus*), Buffalo (*Bos bubalus*), Sheep (*Ovis*), Goat (*Capra*), Pig (*Sus*), Musk deer (*Moschus*)

Perissodactyla

- Odd toed hoofed mammals
- Herbivorous
- Canines are reduced
- True horns are never present
- *E.gs.*, Horse (*Equus*) Africal Zebra (*Equus zebra*) *Tapirus* (Tapir) Ass (*Eqqus asinus*) *Rhinoceros unicornis*

Hyracoidea

- Cheek teeth lophodont
- *E.gs.*, conies (*Hyrax*)

Tubulidentata

- No incisors or canines
- *E.gs.*, Cape anteater (*Orycteropus*)

Cetacea

- Aquatic mammal
- Hair occur only in embryo and snout of the adult
- The skin does not bear any gland.
- Blubber is present
- *E.gs.*, Whale, Dolphin, Porpoise

Carnivora

- Large canines, powerful jaws and claws
- Mammae are abdominal
- Testes descend into scrotal sac
- *E.gs.*, Lion (*Panthera leo*), Tigre (*Panthera tigris*), Panther (*Panthera pardus*), Cat (*Felis domestica*), Wolf (*Canis lupus*), Dog (*Canis familiaris*), Hyaena (*Hyaena*), Jackal (*Canis aureus*), Fox (*Vulpes bengalensis*), Mongoose (*Herpestes edwardsi*), Walrus (*Odobenus*), Seal (*Phoca*)

EXERCISE – 1

PROTOCHODATA

Q.1 Tunicin is similar to
(1) Cellulose (2) Chitin
(3) Cuticle (4) Scleroprotein

Q.2 Retrogressive metamorphosis is found in
(1) Hemichordata (2) Urochordata
(3) Cephalochordata (4) cyclostomata

Q.3 Excretory organs of **Amphioxus** are
(1) Nephridia
(2) Pronephric kidney (Protonephridia)
(3) Mesonephric kidney
(4) metanephridic kidney

Q.4 In which one of the following group, brain box is absent
(1) Cyclostomata (2) Pisces
(3) Amphibia (4) Protochordata

Q.5 Which one of the following is a chordate but not a vertebrate
(1) Scoliodon (2) Salamender
(3) Amphioxus (4) Snake

Q.6 Why the Herdmania is considered as degenerated chordate
(1) Due to absence of kidney
(2) Due to absence of head
(3) Due to absence of brain box
(4) Due to all above character

Q.7 Excretory organ of **Herdmania** is
(1) Protonephridia (2) Supra neural gland
(3) Solenocytes (4) Metanephridia

Q.8 The larval form of Urochordates is called
(1) Tornaria (2) Tadpole
(3) Veliger (4) Pluteus

Q.9 Chordates possess
(1) Dorsal nerve cord placed below gut
(2) Single hollow nerve cord placed dorsal to gut
(3) Double ventral nerve cord
(4) Single solid & ventral nerve cord

Q.10 The distingushing feature of all chordates is
(1) A ventrally placed nerve cord
(2) A water vascular system
(3) A chitinous exoskeleton
(4) Notochord

Q.11 **Salpa** & **Doliolum** belong to : -
(1) Hemichordata (2) Cephalochordata
(3) Urochordata (4) Protochordata

Q.12 Chordates are distinguished from non chordates by the presence of : -
(1) Brain
(2) Dorsal tubular hollow nerve cord
(3) Ventral nerve cord
(4) Dorsal solid nerve cord

Q.13 Which of the following animal belongs to Urochordata : -
(1) Herdmania (2) Balanoglossus
(3) Amphioxus (4) Petromyzon

Q.14 Which of the following animal is devoid of notochord and nerve cord in its adult stage -
(1) Herdmania (Ascidian)
(2) Branchiostoma (amphioxus)
(3) Assymetron
(4) All of the above

Q.15 Which of the following character is shared by all chordates at some stage of life -
(1) Notochord
(2) Dorsdal tubular nerve cord
(3) Pharyngeal gill slits
(4) All of the above

Q.16 Prochordates lack : -
(1) Cranium & vertebral column
(2) Jaws & vertebral column
(3) Paired appendages
(4) All of the above

Q.17 Notochord is extended up to head and is retained thoughout life in : -
(1) Branchiostoma (2) Herdmania
(3) Balanoglossus (4) Frog

Q.18 The adult tunicates show : -
(1) All the chordate characters
(2) No chordate characters
(3) Some of the chordate characters
(4) Only dorsal nerve cord

Q.19 Which of the following urochordate animal is called indian "Sea squirt" : -
(1) Herdmania (2) Branchiostoma
(3) Balanoglossus (4) Saccoglossus

Q.20 Basically all chordates are metamerically segmented animals this statement is : -
(1) Completely false
(2) Applicable to some chordates only
(3) Applicable to all chordates, because at some stage of their development they show some sort of serial repetition of body parts
(4) True for all chordates, as they show this phenomenon throughout life

Q.21 Which of the following is not an essential chordate character : -
(1) Notochord
(2) Vertebral column
(3) Pharynegeal gill slits
(4) Dorsal hollow nerve cord

Q.22 The cephalochordates : -
(1) Are exclusively marine in habitat
(2) Retain the three primary chordate characters throughout the life
(3) Ciliary feeders
(4) All of the above

Q.23 The lateral line sensory system is best developed in : -
(1) **Scoliodon** only (2) **Labeo** only
(3) All elasmobranch and teleostei fishes
(4) Aquatic reptiles

Q.24 The gill – slits of chordates occur in : -
(1) Buccal cavity of aquatic animals
(2) Pharynx of all land vertebrates
(3) Pharynx of all chordates embryos and pharynx of aquatic adult chordates
(4) Pharynx of all aquatic and land vertebrates in adults as well as in their embryos

Q.25 Protochordates are : -
(1) Mucous feeders
(2) water current feeders
(3) Ciliary feeders
(4) Predators

Q.26 The Ascidian tadpole larva undergoes : -
(1) Progressive metamorphosis
(2) Retrogressive metamorphosis
(3) Partial metamorphosis
(4) Complete metamorphosis

Q.27 Find out main difference between urochordata and cephalochordates : -
(1) Position of endostyle & dorsal lamina
(2) Perforated pharynx
(3) Length of notochord
(4) All of the above

Q.28 Biolumnicent chordate is : -
(1) Pyrosoma (2) Doliolum
(3) Salpa (4) Botryllus

Q.29 Body of most of urochordates is covered by : -
(1) Mantle (2) Shell
(3) Dermal (4) Test or tunicine

Q.30 The other name of Notochord is : -
(1) Chorda dorsalis (2) Vertebral column
(3) Endostyle (4) Myotome

Q.31 Phylum chordata was established by : -
(1) Hyman (2) Huxley
(3) Balfour (4) Rommer

Q.32 Tunicine is the basic material of : -
(1) Skin of echinoderms
(2) Test of urochordates
(3) Shell of mollusca
(4) All the above

Q.33 Urochordates animals show : -
(1) Neoteny
(2) Retrogressive metamorphosis
(3) Paedogensis
(4) All the above

Q.34 Ascidians are commonly knows as : -
(1) Acoelomates (2) Tunicates
(3) Denticulates (4) None

Q.35 "Vanadium" is found in blood of : -
(1) Amphioxus
(2) Tunicates
(3) Myxine
(4) Tadpole larva of frog

Q.36 In **Amphioxus** excretion take place by : -
(1) Nephridia (2) Protonephridium
(3) Myotomes (4) Kidney

Q.37 Cranium is absent in : -
(1) Protochordata (2) Vertebrata
(3) Craniata (4) All the above

Q.38 Stomochord (Buccal diverticulum) is present in-
(1) Amphioxus (2) Herdmania
(3) Balanoglossus (4) None

Q.39 "Wheel organ" is found in : -
(1) Herdmania (2) Amphioxus
(3) Balanoglossus (4) All the above

Q.40 Ciliated organ of Muller is : -
(1) Velum (2) Wheel organ
(3) Branchial sac (4) None of these

Q.41 Hatscheck" nephridium is present in : -
(1) Herdmania (2) Amphiouxus
(3) Ciona (4) All of the above

Q.42 "Sea – squirt" is common name of : -
(1) Balanoglossus (2) Herdmania
(3) Amphioxus (4) None

Q.43 In **Amphioxus** notochord is present only in :
(1) In embryo (2) In adult
(3) Both (4) None of these

Q.44 Protochordates are not vertebrates as : -
(1) Notochord absent
(2) Vertebral column absent
(3) Nerve cord absent
(4) None of the above

Q.45 Mode of feeding in Cephalochordates is : -
(1) Ciliary (2) Tentacular
(3) Flagellar (4) None

Q.46 "Lancelet" is : -
(1) Amphioxus (2) Balanoglossus
(3) Herdmania (4) Salpa

Q.47 One of the following is bisexual : -
(1) Herdmania (2) Amphioxus
(3) Branchiostoma (4) Assymetron

Q.48 Which of the following animals is called "Typical chordate" : -
(1) Herdmania (2) Amphioxus
(3) Balanoglossus (4) Salpa

Q.49 Doliolum belongs to subphylum : -
(1) Hemichordata (2) Cephalochordata
(3) Urochordata (4) All of the above

Q.50 **Pyrosoma** is the member of class : -
(1) Thaliacea (2) Larvacea
(3) Ascidiacea (4) All the above

Q.51 Which of the following animal is sessile : -
(1) Balanoglossus (2) Herdmania
(3) Amphioxus (4) Petromyzon

Q.52 Notochord is restricted in tail of : -
(1) All chordates (2) Hemichordates
(3) Urochordates (4) Cephalochordates

Q.53 Which of the following animals are the members of Cephlochordata -
(1) Rhabdopleura and Amphioxus
(2) Branchiostoma & Assymetron
(3) Petromyzon & Myxine
(4) Ciona and Apendicularia

Q.54 Percentage of Chordates animal : -
(1) 3 - 5% (2) 20 - 35%
(3) 70 - 80% (4) 90 - 95%

Q.55 Kidneys of protochordates are : -
(1) Protonephric (2) Mesonephirc
(3) Metanephic (4) Holonephirc

Q.56 Excretory organs of Urochordates : -
(1) Neural gand (2) Pyloric gland
(3) Nephrocytes (4) All of the above

Q.57 Tunicin is secreted by : -
(1) Ectodermal cells
(2) Mesodermal cells
(3) Endodermal cells
(4) Cells of arterial cavity

PISCES

Q.58 By which structure origin of gills-slits is considered
(1) from pharynx (2) from intestine
(3) from duodenum (4) from Trachea

Q.59 Fishes found mainly in marine water are
(1) Placodermi (2) Chondrichthyes
(3) Dipnoi (4) Osteichthyes

Q.60 Example of living-fossil fish
(1) Latimeria (2) Lepidosteus
(3) Acipenser (4) Protopterus

Q.61 Operculum absent around gill-slits in
(1) Dipnoi (2) Osteichthyes
(3) Chondrichthyes (4) Holocaphali

Q.62 Kidney of pisces for excretion-
(1) Holonephric (2) Protonephric
(3) Mesonephric (4) Metanephric

Q.63 Hag fish is
(1) Entospherus (2) Myxine
(3) Ichthyomygon (4) Hippocampus

Q.64 Common name of chimaera
(1) Rat fish (2) Ghost fish
(3) King of herring (4) All of above

Q.65 Sucker fish found on a shark is example of-
(1) Symbiosis (2) Predation
(3) Parasitism (4) Commensalism

Q.66 Branch of science deals with study of shark & rays
(1) Tromatology (2) Saurology
(3) Torpedology (4) Ichthyology

Q.67 Pharyngeal gill slits are found in
(1) Cuttlefish (2) Crayfish
(3) Dogfish (4) Octopus

Q.68 Peculiarity of heart of fishes-
(1) It does no have blood
(2) It contains pue blood
(3) It contains impure and pure blood
(4) It contains only impure blood

Q.69 Lamprey belongs to-
(1) Osteichthyes (2) Chondrichthyes
(3) Cyclostomata (4) Chordates

Q.70 Study of fishes is called as -
(1) Ethology (2) Ethnology
(3) Ichthyology (4) Ichthinology

Q.71 Venous heart is found in -
(1) All fishes
(2) Only teleosts
(3) Fishes & Birds
(4) Reptiles & Amphibians.

Q.72 Cartilagenous fishes lack -
(1) Scales (2) Gill slits
(3) Pelvic girdle (4) Operculum

Q.73 Which fish is viviparous -
(1) Dog fish (2) Anabas
(3) Catla (4) Heteropneustis

Q.74 The fish which swims vertically & has tooth-less tubular mouth-
(1) Hippocampus (2) Latermaria
(3) Protopterus (4) Anguilla

Q.75 Which of the following is called as flying fish-
(1) Clarias (2) Exocoetus
(3) Anabas (4) All

Q.76 Other name of Anabas fish is -
(1) Sucker fish (2) Electric ray
(3) Climbing perch (4) Lizard

Q.77 Class of pisces with sexual dimorphism-
(1) Only shark (2) Elasmobranchii
(3) Teleosti (4) None

Q.78 Fish in which male is very reduced & remain permanently attached to the female-
(1) Amia (2) Acipensor
(3) Lophius (4) Hippocampus

Q.79 One of the following is a larva of petromyzon-
(1) Ascidian larva (2) Tadpole larva
(3) Axolotle larva (4) Ammocoet

Q.80 A fish which dies if kept submerged in water for long time-
(1) Clarias (2) Anguilla
(3) Flat fish (4) Anabas

Q.81 Migration of fishes from sea water to river is-
(1) Anadromous (2) Catadromous
(3) Migration (4) Locomotion

AMPHIBIA

Q.82 Diaphragm is not found in-
(1) Rabbit (2) Man
(3) Bat (4) Frog

Q.83 What is not found in the amphibian skin-
(1) Epidermis (2) Mucous glands
(3) Scales (4) Chromatophores

Q.84 During hibernation frog respires through-
(1) Gills and lungs (2) Gills
(3) Moist skin (4) Lungs

Q.85 Which exhibits permanent neoteny-
(1) Siren (2) Necturus
(3) Proteus (4) All

Q.86 One of the following is an arboreal amphibian-
(1) Rana (2) Bufo
(3) Rhacophorous (4) Pipa

Q.87 Group of limb-less amphibians is-
(1) Gymnophiona (2) Anura
(3) Urodela (4) None

Q.88 One of the following is not an amphibian -
(1) Cricket frog (2) Bell toad
(3) Horned toad (4) None

Q.89 Following is a true terrestrial animal -
(1) Frog (2) Tortoise
(3) Salamander (4) Toad

Q.90 Flying frog is a common name of-
(1) Rhacophorus (2) Hyla
(3) Alytese (4) Pipa

Q.91 Respiratory organ of tadpole -
(1) Gill (2) Skin
(3) Both 1 & 2 (4) None

Q.92 Amphibians are not found in/on -
(1) Land (2) Fresh water
(3) Land & water (4) Sea

Q.93 Except one of the following rest are amphibians
(1) Mud eel (2) Mud puppy
(3) Newt (4) Horned toad

Q.94 Internal fertilization is not found in -
(1) Amphibia (2) Osteichthyse
(3) Nereis (4) All

Q.95 Arboreal frog is -
(1) Pipa (2) Hyla
(3) Bufo (4) Alytes

Q.96 Toad without tongue is -
(1) Pipa (2) Lithodont
(3) Siren (4) Necturus

Q.97 Animal having length about 2 feet. exhibits neoteny & 3 pairs of external gills is -
(1) Ichthyophis (2) Siren
(3) Rana goliath (4) None

REPTILIA

Q.98 Which of the following group is example of non-poisonous snakes
(1) Dendrophis, Hydrophis, Dryofish, Eryx
(2) Naja, Dendrophis, Crotalus and Viper
(3) Eryx, Lycodon, Typhlops, Torpedonotus
(4) Crotalus, Bungarus, Eryx and Viper

Q.99 Lizard which resemble the snake
(1) Hydrophis (2) Ophiosaurus
(3) Iguana (4) Varanus

Q.100 Snakes devoid of limbs because
(1) Limbs lost during burrow formation
(2) Limbs were absent in ancestor of snakes
(3) Limbs lost or reduced during evolution
(4) Snakes never had limbs

Q.101 Number of cranial nerves in Reptiles
(1) 20 pair (2) 12 pair
(3) 10 pair (4) 8 pair

Q.102 Paddle like limbs are found in
(1) Sea-snake (2) Tortoise
(3) Magur (4) Turtle

Q.103 Autotomy found in some snakes it is
(1) Attack for bite
(2) Digest of its own body parts in starvation
(3) Voluntry separation of body parts for protection
(4) Anaerobic respiration

Q.104 Cause of death during snake bite-
(1) Failure of nerves
(2) Destruction of R.B.C.s
(3) Permanent contraction of muscles
(4) Both (1) and (2)

Q.105 Snake belongs to class-
(1) Lacertilia (2) Reptilia
(3) Amphibia (4) Annelida

Q.106 Which animal belongs to order Chelonia-
(1) Aligator (2) Turtle
(3) Snake (4) Lizard

Q.107 Only poisnous lizard is -
(1) Draco (2) Heloderma
(3) Varanus (4) Ophiosaurus

Q.108 Structure found in the middle ear of reptiles analogous to ear ossicles is -
(1) Columella auris (2) Stapes
(3) Incus (4) None

Q.109 Which snake is oviparous -
(1) Cobra (2) Viper
(3) Both (4) None

Q.110 Which of the following animal belong to chelonia -
(1) Trionyx (2) Chelone
(3) Testudo (4) All

Q.111 A reptile which has completely 4- chambered heart-
(1) Crocodile (2) Snakes & lizards
(3) Sphenodon (4) Turtal

Q.112 Fangs of poisnous snakes are modification of
(1) Canines (2) Incisors
(3) Maxillary teeth (4) Vomerine teeth

Q.113 Technical name of snake is -
(1) Serpent (2) Cobra
(3) Opalina (4) Ophidia

Q.114 Poison glands of snakes are modified -
(1) Mucous glands (2) Parotid glands
(3) Sub-lingual glands
(4) Infra-orbital glands

Q.115 Lizard with spiny tail is -
(1) Phrynosoma (2) Heloderma
(3) Uromastix (4) Chelone

Q.116 Snake venum is -
(1) Haemotoxic (2) Neurotoxic
(3) 1 & 2 (4) None

Q.117 One of the following is a marine chelone -
(1) Terrapins (2) Tortoise
(3) Terrapins & Tortoise
(4) Turtle

Q.118 Lizard-like & living fossil sphenodon belongs to-
(1) Rhyncocephalia (2) Squamata
(3) Chelonia (4) Crocodelia

AVES

Q.119 Flightless & fast running birds are included in
(1) Neoganathae (2) Palaeognathae
(3) Impennae (4) Odontognathae

Q.120 Centrum of birds vertebrae is
(1) Amphiplatyon (2) Procoelous
(3) Heterocoelous (4) Amphicoelous

Q.121 Wings of birds are modified from
(1) Fore limb (2) Hind limb
(3) Skin (4) Pectoral muscles

Q.122 Indian ornithologist known as" Bird men of India-
(1) Jakir Ali (2) Dr. Salim Ali
(3) Dr. Salim Ahmed (4) Mani Shanker

Q.123 In pigeon secretion of milk by both male & female by which of the following gland
(1) Salivary gland (2) Crop-gland
(3) Gizzard gland (4) Oesophageal gland

Q.124 Which of these birds builds its nest outside India
(1) Cuckoo (2) Wagtail
(3) Red-vented bulbul (4) Crow

Q.125 Air sacs of birds
(1) Keep body warm
(2) Reduce body weight
(3) Facilitate blood circulation
(4) Maintain body temperature

Q.126 Kiwi is found in-
(1) India (2) West Indies
(3) Newzealand (4) South America

Q.127 Ostrich is found in-
(1) Australia (2) Africa and Arabia
(3) North America (4) South America

Q.128 Which bird can not fly-
(1) Stork (2) Emu
(3) Duck (4) Peacock

Q.129 Birds have bones-
(1) Elastic (2) Solid and strong
(3) Pneumatic (4) Non-elastic

Q.130 Which animal has become extinct rather recently-
(1) Mammoth (2) Dodo
(3) Dinosaur (4) Pterodactyl

Q.131 Which bird makes nest outside India-
(1) Cuckoo (2) Wegtail
(3) Crow (4) Bulbul

Q.132 Which bird sucks nectar of flowers-
(1) Red crested Bulbul
(2) Sunbird
(3) Myna (4) Parrot

Q.133 Birds fly from place to place, this movement is termed-
(1) Cursorial (2) Scansorial
(3) Digitigrade (4) Volant

MAMMALIA

Q.134 Corpus collosum in Brain is absent in which of the following mammals
(1) Eutheria (2) Metatheria
(3) Prototheria (4) Both 2 and 3

Q.135 In India "Panther Leo found in"
(1) Corbet national park
(2) Kaziranga sanctuaries
(3) Gir – forest
(4) Kanha national park

Q.136 By which characteristics whale included in class Mammalia
(1) Gills wings & viviparity
(2) Viviparity, hairy skin, Diaphragm
(3) Vertebral column, Lungs, 4 chambered heart
(4) Lungs, 4 chambered heart & Metanephric kidney

Q.137 Which group of characters of whale justify its inclusion in the class mammalia
(1) Lungs, 4-chambered heart & kidneys
(2) Vertebral column, lungs and 4-chambered heart
(3) Hair skin, mammary glands and viviparity
(4) Gills, fins and viviparity

Q.138 Which one is a diagnostic feature of mammals-
(1) Dome-shaped diaphragm
(2) External ears
(3) Cervical vertebrae
(4) Coelom

Q.139 Marsupials are-
(1) Viviparous (2) Oviparous
(3) Ovo-viviparous (4) Omni-vorous

Q.140 Non-nucleated erythrocytes are found in-
(1) Fishes (2) Tadpole
(3) Birds (4) Mammals

Q.141 Which characters are found only in mammals-
(1) Pinna, teeth
(2) Hair, oviparous
(3) Mammary glands, teeth
(4) Hair, mammay glands

Q.142 In all mammals-
(1) Pinna are found
(2) Mother gives birth to young ones
(3) Seven cervical vertebral are found
(4) Four canine teeth are found

Q.143 Marsupials are found in-
(1) Asia (2) Australia
(3) America (4) Africa

Q.144 Mule is a product of-
(1) Male & female ass
(2) Male & female horse
(3) Male ass & mare (4) Cow & Ox

Q.145 Bat can fly in night because-
(1) It has strong sense of sight
(2) Strong sense of smell
(3) It can hear high velocity sound waves
(4) It can produce high velocity sound waves and perseive them

Q.146 Seal is-

(1) Fish

(2) Carnivorous mammal

(3) Herbivorous mammal

(4) Amphibian

Q.147 Ganges Dolphins are-

(1) Reptiles (2) Mammals

(3) Fishes (4) Invertebrates

Q.148 Respirotory organs of whale are-

(1) Book lungs (2) Lungs

(3) Gills (4) Skin

Q.149 Flying fox is-

(1) Fox (2) Bat

(3) Reptile (4) Bird

Q.150 Prototheria have evolved from-

(1) Metathiria (2) Reptiles

(3) Snakes (4) Birds

Q.151 Cloacal aperture is found in-

(1) Prototheria (2) Polychacta

(3) Primates (4) Protozoa

Q.152 Whale is a mammal because-

(1) Lungs, four chambered heart

(2) Vertebral column, lungs four chambered heart

(3) Hair, mammary glands, viviparous

(4) Viviparous, gills, fins

Q.153 External ear is found in-

(1) Reptiles (2) Mammals

(3) Amphibians (4) Fishes

Q.154 The purpose of warm bloodedness in mammals is-

(1) Maximum evaporation from body surface

(2) Increase metabolic rate

(3) Keep body temperature constant inspite of change in climatic temperature

(4) Continuous production of energy for physiology

Q.155 The class of vertebrate which includes bat-

(1) Eutheria (2) Chiroptera

(3) Metatheria (4) Mammalia

Q.156 In India lion these days is found in-

(1) The forests of Madhya Pradesh

(2) Gir forests of Gujarat

(3) Gim Corbet National Park

(4) Nilgiri forests

Q.157 Which animal has radar system to locate the objects in the darkness-

(1) Mammal (2) Bat

(3) Birds (4) Insects

Q.158 Whale is a mammal because-

(1) Lays eggs

(2) Heart has 4 chambers

(3) Aquatic

(4) Diaphragm is found between thorax and abdominal cavity

Q.159 Kangaroo is-

(1) Eutherian (2) Metatherian

(3) Prototherian (4) Primate

Q.160 Spinyant eater is-

(1) Indian bird (2) Australian mammal

(3) Australian bird (4) Australian reptile

Q.161 The high frequency sound waves produced by the bat, after striking the object are reflected to the animal, this fact proves that-

(1) Sound waves after being produced by bat are scattered in all the directions

(2) Scattered in all the directions after striking the object

(3) Object absorbs them

(4) They travel in straight line

Q.162 Monotremata group includes-

(1) Animals with cloacal aperture

(2) Protozoan with one flagellum

(3) Fishes with one gill

(4) Insect with on spiracle

Q.163 Centrum of mammalian vertebra is-

(1) Heterocoelous (2) Amphicoelous

(3) Acoelous (4) Platycoelous

GENERAL

Q.164 Body organization in Chordates-
(1) Tissue organ (2) organ system
(3) Cell tissue (4) Cellular

Q.165 In which of the following animal coelom is divided into three parts
(1) Saccoglossus (2) Balanoglossus
(3) Cephalodiscus (4) All of the above

Q.166 Which of of the animal remain in larval stage for 7 years
(1) Ammocoete larva (2) Bipinnaria larva
(3) Axolotl larva (4) Tornaria larva

Q.167 Foetal membrane around egg are found in
(1) Mammalia (2) Reptilia
(3) Aves (4) All of above

Q.168 Exoskeleton absent in which of the following animals
(1) Amphibian (2) Reptiles
(3) Aves (4) Mammals

Q.169 Urinary bladder absent in
(1) Prototheria (2) Snakes
(3) Aves (4) All of above

Q.170 Members included in cetacea
(1) Pteropus, Rhinolophus & Whale
(2) Whale, Dolphin & Porpoise
(3) Mink, Seal & Canis
(4) Galeopithecus & Lamur

Q.171 Common character among birds & mammals is
(1) Bipedal locomotion
(2) External ear
(3) Hair on body
(4) Four chambered heart

Q.172 Bat & Birds both are flying but by which character bat differ from birds
(1) Small brain
(2) Wings
(3) Diaphragm
(4) Four chambered heart

Q.173 Largest animal of world belongs to class-
(1) Reptile (2) Aves
(3) Mammalia (4) Mollusca

Q.174 Which of the following is a matching pair
(1) Stream lined body Aquatic Adaptation
(2) Excessive sweating - Desert Adaptation
(3) Parasitism - Inter specific relation
(4) Uricotelism - Aquatic adaptation

Q.175 Where the flamingo breeds
(1) Rann of Kutch (2) Chilka lake
(3) Sambhar lake (4) Mansarower lake

Q.176 Five kingdom classification was proposed by
(1) Linnaeus (2) Whittekar
(3) Aristotle (4) Hymen

Q.177 "Binomial nomenclature" means that every organism has
(1) Two names, one scientific and one popular
(2) One name proposed by two scientists
(3) One scientific name having first generic and a second specific name
(4) Two names, one denoting latinized name of the place and the other of the person who determined it

Q.178 Eumetazoa reproduce asexually by-
(1) Spore-formation (2) Pseudopodia
(3) Budding (4) Encystment

Q.179 Branch of Biology related to classification is
(1) Taxidermy (2) Anatomy
(3) Taxonomy (4) Phyllotaxy

Q.180 An endoskeleton is found in
(1) Earthworm (2) Cockroach
(3) Scorpion (4) Snake

Q.181 Alimentary canal is absent in animals of the class
(1) Apoda (2) Gastropoda
(3) Cestoda (4) Arachnida

Q.182 A common cloacal chamber is found in
(1) All mammals (2) Eutherians
(3) Marsupials (4) Prototherians

Q.183 Which of the following is most unmatching group
(1) Cockroach, king-crab, spider, silverfish
(2) Whale, bat, lizard, sea horse
(3) Starfish, sea urchin, sea cucumber
(4) Crayfish, cuttlefish, sawfish, hagfish

Q.184 A postanal tail is absent in
(1) Rabbit (2) Lizard
(3) Earthworm (4) Snake

Q.185 Animals floating passively at water surface are called
(1) Nektonic (2) Neritic
(3) Planktonic (4) pelagic

Q.186 Who propounded binomial system of nomenclature-
(1) Carolus Linnaeus (2) Gregor Mendel
(3) Pasteur (4) Darwin

Q.187 Radial sysmmetry is best seen in-
(1) Mollusca (2) Sponge
(3) Star fish (4) Fishes

Q.188 Inter-breeding animals are members of the same-
(1) Order (2) Species
(3) Genus (4) Family

Q.189 Moulting is not found in the development of-
(1) Polychaete (2) Snake
(3) Insect (4) All of them

Q.190 One celled animals and plants have been kept in-
(1) Monera (2) Protista
(3) Protozoa (4) Parazoa

Q.191 Animals living on the surface of sea water are called-
(1) Lotic (2) Pelagic
(3) Benthic (4) Lentic

Q.192 Which animal would not survive, if there were no ponds of water-
(1) Fasciola (2) Ascaris
(3) Entamoeba (4) Taenia

Q.193 Sometimes different scientists give different names of the same species, in such a situation-
(1) All these names are cancelled and a new name is put forward.
(2) People are free to choose any name.
(3) First name is considered right.
(4) Last name is considered right.

Q.194 Which is the matching set-
(1) Hydra, jellyfish, leech
(2) Whale, otter, cockroach
(3) Oyster, cuttle fish, octopus
(4) Ascaris, scorpion, spider

Q.195 Which is a species-
(1) Carnivora (2) Canis
(3) Canis femiliaris (4) Mammalia

Q.196 Which structures are found atleast in some stage of all chordates-
(1) Mammary glands, gill clefts, hair
(2) Notochord, scales, dorsal tubular nerve cord
(3) Notochord, vertebral column, gill slits
(4) Notochord, pharyngeal gill slits, dorsal tubular nerve cord

Q.197 Which set or animals are found together-
(1) Zebra and Giraffe (2) Lion and Zebra
(3) Kangaroo and Ostrich
(4) Camel and Elephant

Q.198 Shark, lizard and python are-
(1) Poisonous (2) Scaly
(3) Oviparous (4) Terrestrial

Q.199 Sessile (attached) animals are marine because-
(1) For protection from terrestrial animals
(2) Protection against bacteria
(3) They can produce water current to obtain food and oxygen
(4) Can enjoy water life

Q.200 Other than mammals which group is also warm blooded-
(1) Fishes (2) Amphibians
(3) Reptiles (4) Birds

Q.201 Exoskeleton is absent in-
(1) Frog (2) Mammals
(3) Reptiles (4) Fishes

Q.202 Scales are found in-
(1) Fishes (2) Reptiles
(3) Aves (4) All of these

Q.203 Endoskeleton is found in-
(1) Cockroach (2) Snake
(3) Scorpion (4) Earthworm

Q.204 The embryo is surrounded with amnion in-
(1) Toad (2) Fish
(3) Lizard (4) Cockroach

Q.205 A new species is formed when-
(1) Because of new genic populations organism with new traits are born
(2) Exchange of parts between homologous chromosomes takes place
(3) Changes in the genotype in population leads to sexual isolation
(4) The exchange of parts of chromosomes during gametogenesis leads to the formation of new genotype

Q.206 Body is unsegmental in-
(1) Earth-worm
(2) Glow-worm & scorpion
(3) Ascaris & hook-worm
(4) Tape-worm

Q.207 Which is viviparous-
(1) Turtle (2) Running birds
(3) Rabbit & whale (4) Bony fish

Q.208 Hair are not found in adult whale, its body temperature is regulated by-
(1) Sweat glands (2) Blubber
(3) Blood circulation (4) Water

Q.209 Thorax is not found in-
(1) Squirrel (2) Whale
(3) Centipede (4) Cockroach

Q.210 Metamorphosis does not occur in-
(1) Cnidaria (2) Polychaete
(3) Earth-worm (4) All of them

Q.211 Ventral nerve cord is found in-
(1) Cockroach (2) Hydra
(3) Frog (4) Amoeba

Q.212 Which is a cold blooded animal-
(1) Buffalo (2) Man
(3) Snake (4) Duck

Q.213 In which character vertebrates differ from invertebrates-
(1) Coelom (2) Tail
(3) Dorsal tubular nerve cord
(4) Brain

Q.214 Which set belongs to the same phylum-
(1) Scorpion, cockroach, earth-worm
(2) Cockroach, leech, prawn
(3) Prawn, earthworm, leech
(4) Scorpion, prawn, cockroach

Q.215 Insectivorous animals are-
(1) Some times harmful to prey
(2) Always harmful to prey
(3) Neither harmful nor useful to prey
(4) Useful to prey

Q.216 All worms are-
(1) Radially symmetrical
(2) Asymmetrical
(3) Triploblastic (4) Diploblastic

Q.217 Wasp, gilamonster, centepede, scorpion and honey bee are-
(1) Terrestrial (2) Viviparous
(3) Social (4) Poisonous

Q.218 Animals living at the bottom of the sea do not come on surface of water because-
(1) Water pressure is low on surface of water
(2) They have to swim against gravity of earth
(3) Larger animals will eat them up
(4) They do not have swimming organs

Q.219 Best aquarium is located at-
(1) Madras (2) Trivendrum
(3) Calcutta (4) Bombay

Q.220 Pigment metal found in animals with colourless blood-
(1) Copper (2) Iron
(3) Magnesium (4) Cobalt

Q.221 Animals which give birth to young ones are called-
(1) Viviparous (2) Coelomate
(3) Amphibian (4) Triploblastic

Q.222 Group Amniota includes-
(1) Birds and mammals
(2) Birds and reptiles
(3) Mammals and reptiles
(4) Reptiles, birds and mammals

Q.223 Which group includes monoecious animals-
(1) Leech, tape worm, Hydra
(2) Ascaris, Pheretima Hydra
(3) Leech, man, Hydra
(4) Star fish, toad, tapeworm

Q.224 Group of radially symmetrical animals-
(1) Echinodermata
(2) Cnidaria
(3) Cnidaria and echinodermata
(4) Sponges

Q.225 Animals active at day time are called-
(1) Nocturnal (2) Herbivore
(3) Diurnal (4) Insectivore

Q.226 Ambergis is the secretion from stomach and is used in the manufacture of perfume and other cosmetics, it is produced in-
(1) Techyglossus–Echidna
(2) Musk deer
(3) Physetter–sperm whale
(4) Kangaroo–Macropies

Q.227 Parthenogenesis is commonly found in-
(1) Ants, bees, wasps
(2) Ascaris, earthworm, liverfluke
(3) Frogs, fishes, foxes
(4) Starfish, jelly fish, cuttle fish

EXERCISE – 2

CHORDATA

Q.1 Which of the following animals is not a vertebrate
(1) Oryctolagus (2) Eurotyphlis
(3) Sparrow (4) Amphioxus

Q.2 Weberian ossicles are found in
(1) Frogs (2) Snakes
(3) Fishes (4) Birds

Q.3 The animal who possesses notochord throughout life is
(1) Fish (2) Amphioxus
(3) Bird (4) Snake

Q.4 In which of the following groups the members are exclusively marine
(1) Aquatic vertebrates
(2) Tetrapoda
(3) Pisces (4) Protochordata

Q.5 Branchiostoma belongs to
(1) Urochordata (2) Hemichordata
(3) Cephalochordata (4) Protochordata

Q.6 Which of the following group of characters is present in all chordates in some or other stage in their life
(1) Mammary glands, hair and gill slits
(2) Notochord, gill slits and dorsal tubular nervous system
(3) Notochord, scales and dorsal tubular nervous system
(4) Gill slits, vertebral column and notochord

Q.7 Agnatha includes
(1) Hag fishes (2) Fishes
(3) Jelly fishes (4) Flying fishes

Q.8 Notochord is restricted to tail region only in
(1) Hemichordata (2) Cephalochordata
(3) Tunicata (4) None of these

Q.9 Cyclostomes are
(1) Monoecious
(2) Dioecious
(3) Monoecious-and dioecious both
(4) Hermaphrodite

Q.10 Whose skin colour does not change
(1) Chameleon (2) Horse
(3) Garden lizard (4) Two of the above

Q.11 One character is given wrongly for phylum chordata mark it
(1) Presence of notochord
(2) Presence of vertebral column
(3) Paired gill slits connected with the exterior
(4) A central nervous system dorsal to digestive canal

Q.12 Which of the following are first Gnathostomes
(1) Fish (2) Amphibians
(3) Aves (4) Mammalians

Q.13 Characteristic features of cyclostomata are
(1) Elongated cylindrical body
(2) Round mouth
(3) Round mouth without jaws and paired appendages
(4) Round mouth with jaw and unpaired appendages

Q.14 Retrogressive metamorphosis is found in
(1) Balanoglossus (2) Branchiostoma
(3) Herdmania (4) All of these

Q.15 Correct Statement is
(1) Archaeopteryx is connecting link between aves and mammals
(2) Duck-billed platypus is connecting link between mammals and reptiles
(3) Sea horse is connecting link between horse and fish
(4) Hydra is connecting link between protozoa and metazoa

Q.16 Gnathostomata is divided into 2 super classes, these are
(1) Acrania and craniata
(2) Pisces and tetrapoda
(3) Amniota and bipedal
(4) Tetrapoda and gnathostomata

Q.17 The lamprey (Petromyzon) is included in the same taxonomic class as the
(1) Chamaeleon (Anolis)
(2) Hag fish (Myxine)
(3) Salamander (Ambystoma)
(4) Lung fish (Neoceratodus)

Q.18 The portal system seen in all vertebrates is
(1) Hepatic (2) Renal
(3) Both (1) and (2) (4) Pulmonary

Q.19 Chordates are distinguished from non-chordates by the presence of
(1) Ventral nerve cord
(2) Dorsal nerve cord
(3) Brain
(4) Dorsal tubular nerve cord

Q.20 Notochord is restricted to the anterior part of body proboscis in animals of which group
(1) Hemichordata (2) Urochordata
(3) Cephalochordata (4) Chordata

Q.21 Members of which group of the followings, have three ossicles in their internal ear
(1) Amphibia (2) Reptilia
(3) Aves (4) Mammalia

Q.22 Heterodont, thecodont and diphydont are the characteristics of
(1) Egg laying mammals
(2) Viviparous mammals
(3) Carnivorous mammals
(4) All of the above

Q.23 Only left aortic arches are present in
(1) Reptiles of order crocodilus
(2) Birds
(3) Mammals
(4) Both (1) and (3)

Q.24 Which is living fossil
(1) Coelacanth (2) Limulus
(3) Sphenodon (4) All of these

Q.25 The petromyzon belongs to
(1) Chondrichthyes (2) Osteichthyes
(3) Cyclostomata (4) Amphibia

Q.26 Which one of the following invertebrates is a deuterostome and enterocoelous coelomate
(1) Pila (2) Ascaris
(3) Aphrodite (4) Asterias

Q.27 Carpo-metacarpus and tarso-metatarsus are present in
(1) Reptilia (2) Mammalia
(3) Birds (4) Both (1) and (2)

Q.28 The group 'amniota' includes
(1) Birds and reptiles
(2) Birds and mammals
(3) Reptiles and mammals
(4) Reptiles, birds and mammals

Q.29 The animal group, where the adults are degenerated but larvae are well developed, is
(1) Agnatha (2) Tunicates
(3) Amphibians (4) Cephalo chordates

Q.30 Which one of the following sets of animals belongs to the same class of a phylum
(1) Hydra, jelly fish, cray fish
(2) Bat, pigeon, whale
(3) Spider, scorpion, centipede
(4) Whale, otter, kangaroo

Q.31 Which of the following is a matching set in taxonomy
(1) Man, chimpanzee, monkey
(2) Cuttle fish, jelly fish, silver fish
(3) Bat, pigeon, crow
(4) Oyster, octopus, star fish

Q.32 Constant body temperature is found in
(1) Earthworm (2) Snake
(3) Frog (4) Cow

Q.33 Which one of the following is a true terrestrial animal
(1) Frog (2) Tortoise
(3) Salamander (4) Toad

Q.34 The most important distinctive character of chordata is the presence of
(1) Vertebral column (2) Hairy skin
(3) Notochord (4) All the above

Q.35 Which one is different from others
(1) Whale (2) Porpoise
(3) Bat (4) Fish

Q.36 Heart pumps impure blood in case of
(1) Shark (2) Whale
(3) Frog (4) Lizard

Q.37 Which of the following groups has no member having gliding or flying appendages
(1) Arthropoda (2) Cyclostomata
(3) Mammals (4) Fishes

Q.38 Which one is a poikilothermic (cold blooded) animal
(1) Penguin (2) Whale
(3) Otter (4) Tortoise

Q.39 One of the primary character of chordates is
(1) Solid ventral nerve cord
(2) Dorsal tubular nerve cord
(3) Paired nerve cord
(4) Ganglionated nerve cord

Q.40 An animal having pentadactyl limbs without claws belongs to the class
(1) Amphibia (2) Reptilia
(3) Aves (4) Mammalia

PISCES

Q.41 Lateral line system is present in
(1) Fish (2) Frog
(3) Reptiles (4) Man

Q.42 Dolphins are
(1) Fishes (2) Amphibians
(3) Reptiles (4) Mammals

Q.43 Which one of the following is a cartilaginous fish
(1) Silver fish (2) Dog fish
(3) Cray fish (4) Star fish

Q.44 Scoliodon is called dogfish due to one of its following characteristics
(1) Mouth (2) Gait
(3) Carnivorous (4) Power of smell

Q.45 Sea horse is an example of
(1) Mammalia (2) Pisces
(3) Aves (4) Reptilia

Q.46 Which of the following has a cartilagenous endoskeleton
(1) Elasmobranch (2) Dipnoi
(3) Mollusca (4) Bony fishes

Q.47 Electric organs are found in
(1) Sharks (2) Porpoises
(3) Goldfish (4) Rays (Torpedo)

Q.48 A fish is characterised by the presence of
(1) Dermal scales (2) Paired fins
(3) Pharyngeal gills (4) All the above

Q.49 Which one of the following is exotic Indian fish
(1) Clarias (2) Labeo
(3) Cypris (4) Dephnia

Q.50 Which is a true fish
(1) Cat fish (2) Jelly fish
(3) Cuttle fish (4) Silver fish

Q.51 What would you call the study of fishes
(1) Ichthyology (2) Herpetology
(3) Saurology (4) Ornithology

Q.52 Petromyzon is a connecting link between
(1) Balanoglossus and Amphioxus
(2) Amphioxus and cyclostoma
(3) Cyclostoma and pisces
(4) Pisces and amphibians

Q.53 Elasmobranchs are exclusively
(1) Fresh water forms
(2) Marine water forms
(3) Brackish water forms
(4) None of these

Q.54 Jaws are absent in
(1) Protochordata
(2) Protochordata and cyclostomata
(3) Amphioxus and balanoglossus
(4) Herdmania and myxine

Q.55 Which of the following sets of animals belong to class cyclostomata
(1) Herdmania and petromyzon
(2) Petromyzone and myxine
(3) Amphioxus and balanoglossus
(4) Herdmania and myxine

Q.56 Swim bladder or air bladder is present only in
(1) Fish (2) Amphibia
(3) Aquatic reptilia (4) Aquatic mammals

Q.57 Lateral line system is not present in
(1) Sea horse
(2) Clarias
(3) Shark
(4) Aquatic amphibians

Q.58 Pristis belongs to the class
(1) Dipnoi (2) Telostomi
(3) Elasmobranchii (4) Holocephali

Q.59 Which of the following is not a fish
(1) Lung fish (2) Silver fish
(3) Cat fish (4) Dog fish

Q.60 The term 'protista' was given by
(1) Carolus Linnaeus (2) John Ray
(3) George Leapold Cuvier
(4) Ernst Haeckel

Q.61 Scales in chondrichthyes are
(1) Placoid (2) Ganoid
(3) Cycloid (4) Sesamoid

Q.62 Bony plates and scutes are found in addition to scales in
(1) Hag fish (2) Eel
(3) Flying fish (4) Sea horse

Q.63 Pharyngeal gill slits are found in
(1) Shark (2) Cray fish
(3) Cuttle fish (4) Star fish

Q.64 The fish Wallago is commonly called as 'fresh water shark', because it is
(1) Cartilaginous
(2) Dangerously predatory
(3) Lives in sea
(4) Resembles shark in body form

Q.65 Which fish gives birth to young ones
(1) Scoliodon (2) Anabas
(3) Heteropneustes (4) Catla

Q.66 True fishes possess gills and fins. Which of the following is not a true fish
(1) Silver fish (Lepisma)
(2) Gold fish (Carassius)
(3) Silver carp (Hythalamictyes)
(4) Sea horse (Hippocampus)

Q.67 In Icthyology, we study
(1) Aves (2) Reptiles
(3) Insects (4) Fishes

Q.68 Cartilaginous fishes are characterised by the presence of
(1) Terminal mouth (2) Ventral mouth
(3) A homocercal tail (4) A heterocercal tail

Q.69 Heart of fishes is
(1) One chambered (2) Two chambered
(3) Three chambered (4) Four chambered

Q.70 Placoid scales are found in
(1) Bony fishes (2) Cartilaginous fishes
(3) Lung fishes
(4) Palaeontogical fishes

Q.71 Fishes are
(1) Homoiothermic (2) Poikilothermic
(3) Both (1) and (2) (4) None of these

AMPHIBIA

Q.72 Tailless amphibians are the members of the group
(1) Salientia (Anura)
(2) Gymnophiona (Apoda)
(3) Urodela (Caudata) (4) Cyclostomata

Q.73 In amphibians the heart is
(1) Venous
(2) With double circulation
(3) With open circulation
(4) With arterial and venous circulation

Q.74 Which one of the following is not a true amphibian animal
(1) Frog (2) Tortoise
(3) Salamander (4) Toad

Q.75 The common name of necturus is
(1) Cave salamander (2) Congoeel
(3) Hell bender (4) Mud puppy

Q.76 The main difference between Gymnophiona (Apoda) and Urodela is that Urodela
(1) Have two auricles and one ventricle
(2) Have smooth moist skin
(3) Have a cloaca
(4) Respire by lungs in the adult stage

Q.77 Midwife toad is another name for
(1) Alytes (2) Hyla
(3) Rhacophorus (4) Pipa

Q.78 Which animal is surinam toad
(1) Pipa (2) Bufo
(3) Bombinator (4) Alytes

Q.79 Capacity of amphibians to change colour is called
(1) Metachrosis (2) Metachronous
(3) Synchronous (4) None of these

Q.80 Amphibians breed
(1) In crevices (2) In water
(3) On trees (4) In soil

Q.81 The name of flying frog is
(1) Rhacophorus (2) Bufo
(3) Phyllobates (4) Necturus

Q.82 Frog which lives on the trees
(1) Alytes (2) Bufo
(3) Hyla (4) Rana

REPTILIA

Q.83 Wall lizard can run efficiently on vertical surfaces because of
(1) Tetrapod condition
(2) Pentadactyle condition
(3) Lamellae present under digits
(4) Tip of digits are rounded

Q.84 Only poisonous lizard of the world is
(1) Draco (2) Heloderma
(3) Sphenodon (4) Varanus

Q.85 Classification of reptilia is based on
(1) Scales (2) Type of brain
(3) Vaccuties (4) None of these

Q.86 Limbless lizard is
(1) Draco (2) Ophisaurus
(3) Amblyrhynchus (4) Moloch

Q.87 Which of the following is a poisonous snake
(1) Eryx (2) Natrix
(3) Tree snake (4) Russel's viper

Q.88 The most highly advanced character in crocodile (reptilia) is the presence of
(1) Powerful jaws
(2) Shelled eggs
(3) Thecodont dentition
(4) Four chambered heart

Q.89 Which one of the following is a limbless lizard
(1) Hemidactylus (2) Chamelion
(3) Anguis (4) Phrynosoma

Q.90 Tortoise are
(1) Viviparous (2) Oviparous
(3) Bisexual (4) Parthenogenic

Q.91 A snake can be distinguished from a lizard by the absence of
(1) Limbs and tympanum
(2) Limbs and girdles
(3) Limbs, girdles and tympanum
(4) Limbs, girdles, tympanum and sternum

Q.92 Members of class Reptilia are
(1) Homoiothermic and amniotic
(2) Homoiothermic and anamniotic
(3) Poikilothermic and amniotic
(4) Poikilothermic and anamniotic

Q.93 Exclusively aquatic reptiles are included under the group
(1) Rhynchocephalia (2) Ophidia
(3) Lacertilia (4) Crocodilia

Q.94 Out of the following, reptiles and birds differ in only one, which is it
(1) The skin possesses scales
(2) They lay eggs
(3) Capacity of laying hard shelled eggs
(4) There is regulation of the body temperature

Q.95 Carapace is present in
(1) Toad (2) Bird
(3) Frog (4) Tortoise

Q.96 Which is a poisonous snake
(1) Enhydrina (2) Typhlops
(3) Python (4) Eryx

Q.97 In suborder ophidia, the vertebrae are
(1) Amphicoelus (2) Acoelus
(3) Heterocoelus (4) Procoelus

Q.98 Which of the following snake has hind legs
(1) Python (2) Bungarus
(3) Typhlops (4) King cobra

Q.99 Which is non-poisonous
(1) Spider (2) Scorpion
(3) Centipede (4) Crab

AVES

Q.100 Urinary bladder in birds is absent because
(1) Disturbs equilibrium of birds
(2) Urine is absent
(3) Solid excretory product
(4) All of them

Q.101 Quill feathers at the base of quill wings are called
(1) Remiges (2) Barbules
(3) Coverts (4) Down feathers

Q.102 The pelvic girdle of birds is attached to a complex structure formed by the fusion of last thoracic, all lumbar and first five caudal vertebra. This structure is called
(1) Synsacrum (2) Symphysis
(3) Synkaryon (4) Sympelvis

Q.103 Which of the following bird is viviparous
(1) Penguin (2) Humming bird
(3) Albatross (4) None of these

Q.104 Connecting link between reptiles and birds is
(1) Dimetrodon (2) Dodo
(3) Archaeopteryx (4) Sphenodon

Q.105 Birds are
(1) Cold blooded (2) Homoiothermal
(3) Poikilothermal (4) Homeopoiesis

Q.106 Flightless bird, cassowary is found in
(1) Australia (2) Newzealand
(3) Indonesia (4) Mauritious

Q.107 Which animals have a beak with jaws but no teeth
(1) Aves (2) Snakes
(3) Mammals (4) All the above

Q.108 Characteristic feature of aves is
(1) Presence of beak and features
(2) Ability to lay eggs
(3) Air spaces in lungs
(4) All the above

Q.109 Syrinx is present in
(1) Aves (2) Reptilia
(3) Mammals
(4) Aquatic amphibians

Q.110 Only right aortic arches are present in
(1) Reptilia (2) Mammals
(3) Birds (4) None of these

Q.111 Only one ovary is present in the
(1) Aquatic reptiles (2) Terrestrial reptiles
(3) Birds
(4) Egg laying mammals

Q.112 The study of migration of birds is known as
(1) Ecology (2) Nidology
(3) Phenology (4) Phrenology

Q.113 A pigeon in the absence of down feathers will not be able to
(1) Fly for long distance
(2) Protect against ectoparasites
(3) Exhibit secondary sexual dimorphism
(4) Keep the body warm

Q.114 Pneumatic bones of birds
(1) Increase the respiratory rate
(2) Increase the heart beat rate
(3) Increase the CO_2 output
(4) Increase the buoyancy

Q.115 Which one is characteristic for birds
(1) They are flying animals
(2) They are warm blooded
(3) They are Bipedal and have feathres
(4) They are quadruped and have scales

Q.116 The beak in birds is toothed in
(1) Ostrich (2) Kiwi
(3) Archaeopteryx (4) Pelican

Q.117 The most important characteristic of class aves is
(1) Homoiothermous animals
(2) Tetrapod vertebrates
(3) Bipedal vertebrates
(4) Exoskeleton of feathers

Q.118 The vertebrae of birds are characteristically
(1) Heterocoelous (2) Acoelous
(3) Opisthocoelous (4) Amphicoelous

Q.119 The members of class Aves are characterised by the presence of
(1) Hollow jaws and four chambered heart
(2) Bipedal locomotion and body covered with feathers
(3) Two chambered heart with ossified skeleton
(4) Homoiothermic condition and viviparity

Q.120 Which of the following is not found in birds
(1) Hind limb (2) Fore limb
(3) Pelvic girdle (4) Pectoral girdle

Q.121 Which of the following birds cannot fly
(1) Peacock (2) Duck
(3) Emu (4) Stork

MAMMAL

Q.122 Egg-laying mammals are grouped as
(1) Eutheria (2) Prototheria
(3) Rodentia (4) Metatheria

Q.123 'Bat' is classified as a mammal because
(1) It has hairs (2) It can fly
(3) It has pinna (4) It has testes

Q.124 Which of the following animals is an example of class mammalia?
(1) Manis (2) Planorbis
(3) Hydrophis (4) Psittacula

Q.125 External ears are characteristics of
(1) Birds (2) Mammals
(3) Birds and mammals
(4) Mammals and reptiles

Q.126 Eutherian mammals are
(1) Oviparous (2) Viviparous
(3) Ovoviviparous
(4) Both oviparous and ovoviviparous

Q.127 Marsupials are
(1) Oviparous (2) Viviparous
(3) Ovoviviparous (4) Omniparous

Q.128 Which one of the following is not a mammal?
(1) Ant eater (2) Echidna
(3) Heloderma (4) Dolphin

Q.129 Animals belonging to the order 'rodentia' have
(1) Long incisors (2) long canines
(3) short incisors (4) long molars

Q.130 Viviparous animal is
(1) Shark (2) Mud puppy
(3) Bony shark (4) Fish

Q.131 Corpora bigemina is not present in
(1) Frog (2) Snake
(3) Birds (4) Rabbit

Q.132 Which is the common character between all the mammals
(1) They are oviparous
(2) They are herbivorous
(3) They are carnivorous
(4) They have seven cervical vertebrae

Q.133 Why do mammals lack mucus glands in their skin
(1) The skin is not slippery
(2) The skin is tough
(3) The epidermis has many layers of cells
(4) The skin is not respiratory

Q.134 Corpus callosum is present only in
(1) Amphibia (2) Reptilia
(3) Birds (4) Mammalia

Q.135 Double circulatory heart is present in
(1) Birds only (2) Mammals only
(3) Reptilia only (4) (1) and (2) both

Q.136 The development of optic lobes is maximum in
(1) Birds (2) Reptilia
(3) Mammals (4) Amphibia

Q.137 Cerebellum of one of the following animals is provided with lateral lobes and arborvitae
(1) Reptilia (2) Mammals
(3) Birds (4) Amphibia

Q.138 12 pairs of cranial nerves are present in
(1) Reptilia (2) Birds only
(3) Mammals only (4) All the above

Q.139 In mammals, the name "Innominate" has been applied to
(1) A nerve and an artery
(2) A part of skeleton and an artery
(3) A bone and a nerve
(4) A vein and a kidney tubule

Q.140 Rabbit belongs to the order
(1) Rodentia (2) Lagomorpha
(3) Artiodactyla (4) Perissodactyla

Q.141 To which of the taxonomic group does whale belong
(1) Fishes (2) Reptilia
(3) Mammalia (4) Arthropoda

Q.142 Which one of the following is a metatherian
(1) Didelphis (2) Ornithorhynchus
(3) Tarsier (4) Hysterics

Q.143 The mammal which possesses both the characters of reptiles and mammals –
(1) Marsupials (2) Monotremes
(3) Equus (4) Oryctolagus

Q.144 Kangaroo is a member of which order
(1) Monotremata (2) Marsupialia
(3) Prototheria (4) Insectivora

Q.145 First flying animals are
(1) Mammals (2) Reptiles
(3) Insects (4) Aves

Q.146 Monotremata is a group of animals which includes
(1) Fishes with a single gill aperature
(2) Insects with a single pair of functional spiracles
(3) Mammals with a single common cloacal opening
(4) Protozoans with single flagellum

Q.147 Egg laying mammals are found in
(1) India (2) South Africa
(3) Africa (4) Australia

Q.148 Apart from mammals, other group of animals maintaining a high and constant body temperature is
(1) Insects (2) Fishes
(3) Worms (4) Birds

Q.149 Kangaroo is a native of
(1) Africa (2) Australia
(3) Austria (4) Mexico

Q.150 Chief distinguishing features of the mammals are
(1) Hairy skin and ovipary
(2) Hairy skin and mammary glands
(3) Mammary glands and teeth
(4) Pinna and teeth

Q.151 Milk glands are found in
(1) All vertebrates (2) All mammals
(3) All placental mammals
(4) All prototherians

Q.152 A rabbit shows resemblance with frog in
(1) Nucleated RBC (2) Oval RBC
(3) Renal portal system
(4) Dorsal tubular nerve cord

Q.153 Birds and bats are good fliers. The bat differs from bird in having
(1) Diaphragm
(2) Four chambered heart
(3) Wings (4) Small brain

Q.154 Largest animals belong to class
(1) Arthropoda (2) Pisces
(3) Mammalia (4) Reptilia

Q.155 The biological name of 'domestic cat' is
(1) Panthera domestica (2) Felis domestica
(3) Felis leo (4) Panthera indica

Q.156 Metanephros are present in
(1) Birds (2) Reptilia
(3) Mammals (4) All of the above

Q.157 Which of following group of mammals, the placenta is absent
(1) Prototheria (2) Metatheria
(3) Eutheria (4) Theria

Q.158 Which one of the following is a metatherian mammal
(1) Echidna (2) Kangaroo
(3) Shrew (4) Pangolin

Q.159 Most important characteristic of a mammal is
(1) Presence of thecodont dentition
(2) A four chambered heart
(3) Presence of corpus callosum in brain
(4) Presence of diaphragm

Q.160 Which pair of the animal groups, has oxygenated and de-oxygenated blood in the heart separately
(1) Amphibians and reptiles
(2) Birds and Mammals
(3) Reptiles and Birds
(4) Reptiles and Mammals

Q.161 Bats are included in the same taxonomial group as
(1) Birds (2) Butterflies
(3) Flying lizards (4) Whales

Q.162 The class of phylum chordata to which bat belongs
(1) Mammalia (2) Reptilia
(3) Aves (4) Amphibia

Q.163 External ears are characteristics of
(1) Mammals (2) Reptiles
(3) Amphibia (4) Pisces

Q.164 Which mammal lacks corpus callosum
(1) Ornithorhynchus (2) Balenoptera
(3) Macropus (4) Macaca

Q.165 The following mammal lays eggs
(1) Porcupine (2) Platypus
(3) Kangaroo (4) Koala

Q.166 Double Vagina are found in
(1) Monotremata (2) Eutheria
(3) Marsupials (4) All of the above

Q.167 Bat can travel with
(1) Eyes open
(2) Eyes plugged and ears open
(3) Ears plugged and eyes open
(4) Ears closed and eyes plugged

Q.168 The example of Marsupialia is
(1) Macropus (2) Elephant
(3) Horse (4) Rabbit

Q.169 Duck-billed platypus (ornithorhynchus) is
(1) A primitive egg laying reptile
(2) An advance egg laying reptile
(3) A primitive aquatic egg laying mammal
(4) An aquatic bird

Q.170 Members of which group of the following are egg laying
(1) Prototheria (2) Eutheria
(3) Metatheria (4) Theria

Q.171 The order Creatacea includes
(1) Monkey, gorilla and man
(2) Cat, dog, wolf and lion
(3) Whale, dolfin and porpoise
(4) Hippopotamus, pig and giraffe

Q.172 Whale is included among mammals because it has a
(1) Pair of lungs (2) Pair of nostrils
(3) Four chambered heart
(4) Diaphragm between thorax and abdomen

Q.173 Which of the following mammals have cloaca
(1) Prototheria (2) Metatheria
(3) Eutheria (4) Theria

Q.174 Which of the following mammals, has scrotal testes
(1) Prototherians
(2) All placental mammals
(3) Elephant (4) Man

Q.175 All the carnivores have
(1) Short incisors (2) Long incisors
(3) Short canines (4) Long canines

Q.176 The rodents are characterised by
(1) Long canines (2) Long incisors
(3) Hooves on feet (4) Claws on toes

Q.177 Which of the following is prototherian
(1) Platypus (2) Macropus
(3) Opposum (4) Bradypus

EXERCISE – 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Which one of the following animal is not Deuterostome **[RPMT 2000]**
(1) Ambystoma (2) Amphilina
(3) Anguilla (4) Amphiuma

Q.2 Which animal is called as "Roofed Terrapin" **[RPMT 2000]**
(1) Tryonix (2) Kachuga tectum
(3) Chrysemys (4) Chelone

Q.3 Which animal is surinum toad **[RPMT 2000]**
(1) Pipa americana (2) Bufo
(3) Bombinator (4) alytes

Q.4 National bird of India is **[RPMT 2000]**
(1) Flamingo (2) Pavo cristatus
(3) Columba levia (4) Psittacula

Q.5 in Urochordata notochord is found in **[RPMT 2001]**
(1) Head of adult (2) Tail of adult
(3) Tail of larva (4) Test of adult

Q.6 Microlecithal eggs are found in **[RPMT 2000]**
(1) Reptilia + Aves
(2) Amphibia + Aves + Reptilia
(3) Reptilia + Aves + Chiroptera
(4) Eutheria

Q.7 Which of the following shows the sexual dimorphism **[RPMT 2000]**
(1) Hydra & Ascaris
(2) Hydra & Oryctolagus
(3) Ascaris & Pheretima
(4) Ascaris & Oryctolagus

Q.8 Which is not aerial adaptation of Birds **[RPMT 2001]**
(1) Single ovary (2) Pneumatic bone
(3) Gizzard (4) keeled sternum

Q.9 How does the Reptilia differ from other vertebrates **[RPMT 2001]**
(1) Due to epidermal scale
(2) Due to cleidoic eggs
(3) Due to tetrapod limb
(4) None of them

Q.10 In which of the following notochord is absent **[RPMT 2001]**
(1) Adult Herdmania & Balanoglossus
(2) Adult Herdmania & adult Branchiostoma
(3) Larva of Herdmania & Branchiostoma
(4) Larva of Herdmania & Balanoglossus

Q.11 Which of the following are Anamniotes **[RPMT 2001]**
(1) Chondrichthyes,Ostiechthyes,Amphibia
(2) Reptilia, Aves, Amphibia
(3) Amphibia, Aves, Mammals
(4) Reptilia, Mammals, Aves

Q.12 How many cranial nerves found in the Amniota **[RPMT 2000]**
(1) 6 (2) 8
(3) 12 (4) 10

Q.13 Which have macrolecithal eggs **[RPMT 2000]**
(1) Aves, Reptilia
(2) Aves, Reptilia, Amphibia
(3) Aves, Reptilia, Chiroptera
(4) Aves, Eutheria

Q.14 Cleidoic egg is an adaptation for **[RPMT 2001]**
(1) Aquatic life (2) Marine life
(3) Terrestrial life (4) Aerial life

Q.15 Which type of scales are found on skin of cartilaginous fishes **[RPMT 2001]**
(1) Cycloid (2) Ctenoid
(3) Gonoid (4) Placoid

Q.16 In which pair both characters are found without exception in all mammals **[RPMT 2001]**
(1) Hair & vivipary
(2) Vivipary & internal fertilization
(3) Vivipary & mammary glands
(4) Mammary glands & internal fertilization

Q.17 Eggs of birds are **[RPMT 2001]**
(1) Microlecithal (2) Centrolecithal
(3) Megalectithal (4) Alecithal

Q.18 Which character is found only in mammales **[RPMT 2002]**
(1) Neck (2) Diaphragm
(3) Optic lobes of brain (4) Tail

Q.19 Heterocercal tail is found in **[RPMT 2002]**
(1) Cartilaginous fishes (2) Bony fishes
(3) Whale (4) Amphibians

Q.20 Which type of kidneys are found in amphibian **[RPMT 2002]**
(1) Holonephric (2) Mesonephric
(3) Pronephric (4) Meta nephric

Q.21 Which animal is Non-chordate- **[RPMT 2002]**
(1) Herdmania (2) Balanoglossus
(3) Branchiostoma (4) Botryllus

Q.22 In which of the following reptiles four chambered heart is present **[RPMT 2002]**
(1) Lizard (2) Snake
(3) Scorpion (4) Crocodile

Q.23 Which character is not same in aves and mammals **[RPMT 2002]**
(1) Single systemic arch
(2) Metanephric kidney
(3) Seven cervical vertebrae
(4) Homeotherms

Q.24 Odd-toed mammals is **[RPMT 2004]**
(1) Equus (2) Panthera
(3) Chiroptera (4) Oryctologus

Q.25 Icthyophis belongs to which class **[RPMT 2004]**
(1) Reptilia (2) Amphibia
(3) Aves (4) Pisces

Q.26 Which of the following is not a characteristic of birds **[RPMT 2004]**
(1) Lungs with air sacs (2) Pneumatic bone
(3) Exothermic (4) Amniotic eggs

Q.27 Which of the following is a reptile **[RPMT 2004]**
(1) Salamandra (2) Turtle
(3) Newts (4) Toad

Q.28 In snakes, which gland is modified into poison gland **[RPMT 2005]**
(1) Lingual (2) Sublingual
(3) Maxillary (4) Parotid

Q.29 What is common in Bat, Whale and Rat **[RPMT 2005]**
(1) Absence of neck
(2) Muscular diaphragm between thorax and abdomen
(3) Testes, outside abdominal cavity
(4) External earpinna

Q.30 A mammal in which milk is squirted down to the throat of the body by muscular contraction of mother is **[RPMT 2005]**
(1) Bear (2) Camel
(3) Whale (4) Rhinoceros

Q.31 Placoid scales are formed in **[RPMT 2005]**
(1) Cartilaginous fishes
(2) Bony fishes
(3) Paleontical fishes
(4) Lung fishes

Q.32 Hollow air filled bones (pneumatic bones) occur in **[AIPMT 1998]**
(1) Mammals (2) Reptiles
(3) Urodela (4) Aves

Q.33 What is true **[AIPMT 2000]**
(1) Platypus is oviparous
(2) Bats have feather
(3) Elephant is ovo viviparous
(4) Diaphragm is absent in them

Q.34 Which of the following character is not found in all the chordates **[AIPMT 2000]**
(1) Diaphragm
(2) Coelom
(3) Pharyngeal gill clifts
(4) Dorsal nerve cord

Q.35 Cleavage in mammals **[AIPMT 2000]**
(1) Holoblastic equal
(2) Holoblastic unequal
(3) Superficial
(4) Discoidal

Q.36 In which of the following animal post anal tail is found **[AIPMT 2001]**
(1) Earthworm (2) Lower invertebrate
(3) Scorpion (4) Snake

Q.37 Which of the following is closest relative of man **[AIPMT 2001]**
(1) Chimpanzee (2) Gorilla
(3) Orangutan (4) Gibbon

Q.38 In which era reptiles were dominated **[AIPMT 2002]**
(1) Coenozoic era (2) Mesozoic era
(3) Paleozoic era (4) Archaeozoic era

Q.39 In which of the following notochord is present in embryonic stage **[AIPMT 2002]**
(1) All chordates (2) Some chordates
(3) Vertebrates (4) Non chordates

Q.40 In which animal nerve cell is present but brain is absent **[AIPMT 2002]**
(1) Sponge (2) Earthworm
(3) Cockroach (4) Hydra

Q.41 Which group of vertebrates comprises the highest number of endangered species **[AIPMT 2003]**

(1) Mammals (2) Fishes
(3) Reptiles (4) Birds

Q.42 Uricotelism is found in **[AIPMT 2004]**

(1) Fishes and fresh water protozoans
(2) Birds, reptiles and insects
(3) Frogs and toads
(4) Mammals and birds

Q.43 One of the following is a very unique feature of the mammalian body **[AIPMT 2004]**

(1) Presence of diaphragm
(2) Four chambered heart
(3) Rib cage
(4) Homeothermy

Q.44 Presence of gills in the tadpole of frog indicates that **[AIPMT 2004]**

(1) Fishes evolved from frog like ancestors
(2) Frogs will have gills in future
(3) Frogs evolved from gilled ancestors
(4) Fishes were amphibious in the past

Q.45 Which one of the following charcters is not typical of the class Mammalia **[AIPMT 2005]**

(1) Alveolar lungs
(2) Ten pairs of cranial nerves
(3) Seven cervical vertebrae
(4) Thecodont dentition

Q.46 Annual migration does not occur in the case of **[AIPMT 2006]**

(1) Arctic tern (2) Salmon
(3) Siberian crane (4) Salamander

Q.47 Which one of the following is not a living fossil **[AIPMT 2006]**

(1) Peripatus (2) King crab
(3) Sphenodon (4) Archaeopteryx

Q.48 In which one of the following sets of animals give birth to young ones **[AIPMT 2006]**

(1) Kangaroo, Hedgehog, Dolphin, Loris
(2) Lion, Bat, Whale, Ostrich
(3) Platypus, Penguin, Bat, Hippopotamus
(4) Shrew, Bat, Cat, Kiwi

Q.49 Which one of the following statements is incorrect **[AIPMT 2006]**

(1) The principle of countercurrent flow facilitates efficient respiration in gills of fishes
(2) The residual air in lungs slightly decreases the efficiency of respiration in mammals.
(3) The presence of non-respiratory air sacs, increases the efficiency of respiration in birds
(4) In insects, circulating body fluids serves to distribute oxygen to tissues.

Q.50 Which of the following pairs are correctly matched **[AIPMT 2007]**

Animals	**Morphological features**
(A) Crocodile	4-chambered heart
(B) Sea Urchin	Parapodia
(C) Obelia	Metagenesis
(D) Lemur	Thecodont

(1) Only A and B (2) A, C and D
(3) B, C and D (4) Only A and D

Q.51 What is common between parrot, platypus and kangaroo **[AIPMT 2007]**

(1) Ovoaparity (2) Homoiothermy
(3) Toothless jaws
(4) Functional post-anal tail

Q.52 Which one of the following in birds, indicates their reptilian ancestry **[AIPMT 2008]**

(1) Scales on their hind limbs
(2) Four-chambered heart
(3) Eosinophils (4) Moncytes

Q.53 Axolotal larva is the name of larva of **[AIIMS 1996]**

(1) Amphioxns (2) Silkworm
(3) Ambyostoma (4) Round worm

Q.54 Gambusia is a **[AIIMS 1997]**

(1) Parasitic fish (2) Pest of fish
(3) Fish predator of mosquitos larva
(4) Mosquito spreading yellow fever

Q.55 Marsupials occur in **[AIIMS 1999]**

(1) Africa (2) America
(3) Asia (4) Australia

Q.56 An egg laying mammal is **[AIIMS 2001]**

(1) Kangaroo (2) Platypus
(3) Koala (4) Whale

Q.57 The early stage human embryo distinctly possesses **[AIIMS 2003]**
(1) Gills (2) Gill slits
(3) External ear (pinna)
(4) Eye brows

Q.58 Which one of the following groups of structures/organs have similar function : **[AIIMS 2005]**
(1) Typholosle in earthworm, intestinal villi in rat and contractile vacuole in Amoeba.
(2) Nephridia in earthworm, Malpighian tubules in cockroach and urinary tubules in rat.
(3) Antennae of cockroach, tympanum of frog and clitellum of earthworm.
(4) Incisors of rat, gizzard (proventriculus) of cockroach and tube feet of startish.

Q.59 Ornithorhynchus is a **[BHU 1986]**
(1) Duck (2) Dinosaur
(3) Monotreme mammal
(4) Fossil bird

Q.60 Vetebral column is derived from **[BHU 1987]**
(1) Dorsal nerve cord
(2) Ventral nerve cord
(3) Outgrowth of cranium
(4) Notochord

Q.61 Living fossil is **[BHU 1989]**
(1) Dog fish (2) Flying fish
(3) Dodo
(4) Coelacanth/Latimeria

Q.62 Most favourable land adaptation in reptiles is **[BHU 1989]**
(1) Lungs (2) Scales
(3) Moist skin (4) Pentadacty limbs

Q.63 Retention of larval characters even after sexual maturity is called **[BHU 1993]**
(1) Pathenogensis (2) Ontogenesis
(3) Phyllogenesis (4) Neoteny

Q.64 Which one is not excusively marine **[BHU 1996]**
(1) Seal (2) Warlus
(3) Whale (4) Dolphin

Q.65 Mammals giving rise to immature young ones and nursing them in a pouch are **[BHU 1996]**
(1) Monotremes (2) Marsupials
(3) Primates (4) Carnivores

Q.66 Lateral line system occurs in **[AIIMS 1996]**
(1) Star fish (2) jelly fish
(3) Dog fish (4) All the above

Q.67 Ichthyophis belongs to **[AIIMS 1997]**
(1) Amphibia (2) Mollusca
(3) Annelida (4) Reptilia

Q.68 Rumimants belong to order **[AIIMS 1997]**
(1) Proboscida (2) Artiodactyla
(3) Sirenia (4) Cetacea

Q.69 Carapace occurs in **[AIIMS 1997]**
(1) Toad (2) Frog
(3) Bird (4) Tortoise

Q.70 Bony fishes are **[AIIMS 1997]**
(1) Ammonotelic (2) Ureotelic
(3) Uricotelic (4) Both 2 and 3

Q.71 Vetrebrates have **[AFMC 1989]**
(1) Dorsal tubular nerve cord
(2) Ventrally situated heart
(3) Body cavity with alimentary canal
(4) All the above

Q.72 Larva of Balanoglossus is **[AFMC 1991]**
(1) Muller's larva (2) Tadpole
(3) Tornaria (4) Kentrogen larva

Q.73 In fishes the kidney is **[AFMC 1993]**
(1) Pronephric (2) Metanephric
(3) Mesonephric (4) Nephridial

Q.74 The glands present in the skin of frog are **[AFMC 1993]**
(1) Sweat and mammary glands
(2) Sweat and sebaceous glands
(3) Sweat and mucous glands
(4) Mucous and poisonous glands

Q.75 Which is the smallest taxonomic group having cranium, vertebral column, ventral heart, pulmonary respiration and two pairs of legs **[AFMC 1998]**
(1) Chordata (2) Gnathostomata
(3) Vertebrata (4) Tetrapoda

Q.76 Eggs of placental mammals are **[MP PMT 1999]**
(1) Homolecithal (2) Alecithal
(3) Microlecithal (4) Mesolecithal

Q.77 Corpus callosum is found in the brain of **[MP PMT 2000]**
(1) elephant (2) pigeon
(3) crocodile (4) frog

Q.78 The evidence for the origin of birds from reptiles is the presence in them of **[MP PMT 2000]**
(1) feathers (2) scales
(3) claws (4) hairs

Q.79 Scoliodon is called dogfish due to one of its following characteristics **[MP PMT 2000]**
(1) mouth (2) gait
(3) carnivorous (4) power of smell

Q.80 Which is a living fossil **[MP PMT 2000]**
(1) Coelacanth (2) Limulus
(3) Sphenodon (4) All of these

Q.81 Limbless lizard is **[MP PMT 2000]**
(1) Darco (2) Ophiosaurus
(3) Amblyrhynchus (4) Moloch

Q.82 The zoological name of lion is **[MP PMT 2000]**
(1) Panthera pardus (2) Panthera-leopersica
(3) Panthera leoperrca (4) Felis leo

Q.83 Urinary bladder is absent in **[MP PMT 2000]**
(1) Bird (2) Snakes
(3) Crocodiles (4) All the above

Q.84 The greatest evolutionary change that enabled the land vertebrates to be completely free from water, was the development of **[MP PMT 2000]**
(1) four appendages (2) lungs
(3) cleidoic eggs
(4) four chambered heart

Q.85 Which living connecting link is an evidence for organic evolution **[MP PMT 2000]**
(1) Archaeopteryx between reptiles and birds
(2) Lungs fishes between pisces and reptiles
(3) Coelacanth between pisces and amphibians
(4) Tachyglossus between reptiles and mammals

Q.86 Sonar system is found only **[MPPMT 2000]**
(1) Bats (2) Whales
(3) Bats & Whales (4) Otter

Q.87 Cleidoic eggs are characteristic of **[MPPMT 2002]**
(1) Mammals (2) Reptiles and Birds
(3) Insects (4) Fishes

Q.88 Microlecithal eggs with small amount of food reserve are found in **[MPPMT 2002]**
(1) Frog (2) Insects
(3) Man (4) Fish

Q.89 Jaw suspension characteristics of mammals is **[MPPMT 2002]**
(1) Amphistylic (2) Craniostylic
(3) Autodiastylic (4) Hyostylic

Q.90 In which of the following subclasses of reptiles the skull has a solid roof **[MPPMT 2002]**
(1) Anapsida (2) Diapsida
(3) Synapsida (4) Parapsida

Q.91 Icthyophis is **[MPPMT 2002]**
(1) a fish (2) an Amphibian
(3) a reptile (4) a mammal

Q.92 The type of dentition in Crocodile is **[MPPMT 2002]**
(1) Acrodont (2) Bunodont
(3) Pleurodont (4) Thecodont

Q.93 Ornithorhynchus is a **[MPPMT 2002]**
(1) Fossil bird (2) Flightless bird
(3) Connecting link between reptiles are birds
(4) Mammal

Q.94 Archeopetryx, a transitional fossil between birds and reptiles was discovered from the rocks of following period **[MPPMT 2002]**
(1) Jurassic (2) Archeozoic era
(3) Cretaceous (4) Triassic

Q.95 Stenohaline fishes are represented by **[MPPMT 2002]**
(1) Fresh water fishes only
(2) Marine fishes only
(3) Those which can tolerate a narrow range of salinity in water only
(4) Those which can tolerate a wide range of salinity in water

Q.96 Swim bladder is present in **[UTTARANCHAL-2004]**
(1) Star fishes (2) Bony fishes
(3) Carp fishes (4) All of these

Q.97 The Indian salamander is **[UTTARANCHAL-2004]**
(1) Siren (2) Trilotrition
(3) Ambystoma (4) Necturus

Q.98 The charater of birds, without exception, is **[UTTARANCHAL-2004]**
(1) Omnivorous
(2) Flying wings
(3) Beak without teeth
(4) Lay eggs with calcareous shell

Q.99 Which of the following is an exclusive character of class Mammalia **[UTTARANCHAL-2004]**

(1) Homoiothermy
(2) Internal fertilization
(3) Presence of a 4-chambered heart
(4) Presence of a muscular diaphragm

Q.100 Poisonous Sea-snake possess a **[UTTARANCHAL-2005]**

(1) Compressed tail (2) Printed tail
(3) Depressed tail (4) Conicl tail

Q.101 Echidna is found in **[UTTARANCHAL-2005]**

(1) India (2) Africa
(3) Malaya (4) Australia

Q.102 Cause of death during snake bite **[Bihar-2002]**

(1) Failure of nerves
(2) destruction R B Cs
(3) permanent contraction of muscles
(4) Both 'a' and ' b'

Q.103 Oviparous mammals are **[Bihar-2002]**

(1) Kangaroo (2) Duck bill platypus
(3) Whale (4) Rabbit

Q.104 Ophiosaurus belong to **[Bihar-2001]**

(1) Amphibia (2) Pisces
(3) Reptilia (4) Mammalia

Q.105 Torpedo is commonly **[Bihar-2006]**

(1) Sucherfish (2) Electric ray
(3) Globefish (4) Sea horse

Q.106 Formen of panizzae is found in the heart of **[Bihar-2006]**

(1) Rabbit (2) Pigeon
(3) Crocodile (4) Frog

Q.107 Which of the following is viviparous **[UTTARANCHAL-2006]**

(1) Running birds (2) Whales
(3) Bats (4) Both 2 and 3

Q.108 Which of the following snakes non-poisnous **[UPCPMT 2001]**

(1) Cobra (2) Krait
(3) Viper (4) Python

Q.109 Sea horse belongs to **[UPCPMT 2003]**

(1) Mammals (2) Amphibia
(3) Aves (4) Pisces

Q.110 Cranial nerves in frog are

(1) 12 pairs (2) 9 pairs + 1
(3) 10 pairs + 1 (4) 10 pairs

Q.111 Which of the following has exoskeleton of scales and paired copulatory organ or penis **[UPCPMT 2006]**

(1) Sharks (2) Lizards
(3) Urodela (4) Urochordata

Q.112 All chordates at one or the other stage have **[MPPMT 2004]**

(1) Pharyngeal gill-slits
(2) Vertebral column
(3) Two pairs of pentadactyte limbs
(4) A moveable jaw

Q.113 Sea cows are aquatic mammals include under **[MPPMT 2001]**

(1) Lagomorpha (2) Pinnipedia
(3) Cetacea (4) Sirenia

Q.114 Diapsid skull is found in the following **[MPPMT 2001]**

(1) Crocodile, Turtle and Seymauria
(2) Sphenodon, Crocodile and Viper
(3) Natrix, Draco and Turtle
(4) Calotes, Cobra and Varanosaurus

Q.115 A group of animals having marsupium **[MPPMT 2001]**

(1) Monotremata (2) Eutheria
(3) Metatheria (4) Pantotheria

Q.116 Which of the following belongs to Phylum Arthropoda **[MPPMT 2001]**

(1) Star fish (2) Gold fish
(3) Silver fish (4) Cuttle fish

Q.117 Which of the following does not belong to Phylum Coelentrata? **[MPPMT 2002]**

(1) Sea pen (2) Sea feather
(3) Sea cucumber (4) Sea fan

Q.118 Nematocysts are found in **[MPPMT 2002]**

(1) Porifera (2) Coelenterata
(3) Nematodes (4) Annelida

Q.119 In which of the following subclasses of reptiles, the skull has a solid roof **[MP PMT 2001]**

(1) Anapsida (2) Diapsida
(3) Synapsida (4) Parapsida

Q.120 Ichthyophis is **[MP PMT 2002]**
(1) A fish (2) An amphibian
(3) A reptile (4) A mammal

Q.121 The type of dentition in Crocodile is **[MP PMT 2002]**
(1) Acrodont (2) Bunodont
(3) Pleurodont (4) Thecodont

Q.122 The eggs of eutherian mammals are **[MP PMT 2003]**
(1) Mesolecithal type (2) Microlicithal type
(3) Telolecithal type (4) Megalecithal type

Q.123 Taxomically which of the following set is matched correctly? **[MP PMT 2001]**
(1) Cattle fish, Jelly fish, Silver fish
(2) Bat, Pigeon, Kite
(3) Lobsters, spider, shrimps
(4) Oyster, Otter, Octopus

Q.124 Sea horse is **[CG PMT 2009]**
(1) A bird (2) A Mammal
(3) An Amphibion (4) A fish

Q.125 Which one of the following lays eggs yet the female secretes milk? **[CG PMT 2009]**
(1) Bat (2) Kangaroo
(3) Platypus (4) Ostrich

Q.126 Archaeopteryx is **[CG PMT 2009]**
(1) A living fossil
(2) A mammal
(3) A connecting link between annelida and arthropoda
(4) A connecting ling between reptiles and birds

Q.127 The largest endangered bird in India **[CP PMT 2009]**
(1) Vulture
(2) Flamingo
(3) Great Indian Bustard
(4) Great Indian Hornbill

Q.128 Which of the following does not make a nest of its own? **[CG PMT 2009]**
(1) Crow (2) Parrot
(3) Cuckoo (4) Sparrow

Q.129 The sea snakes have **[CG PMT 2009]**
(1) Cylindrical tail
(2) Dry hrony scale at tail end
(3) Laterally compressed tail
(4) Dorsoventrally flattened tail

Q.130 Which one of the following is an example of ex-situ conservation? **[CPMT 2010]**
(1) Wild life sanctuary (2) Seed bank
(3) Sacred groves (4) National park

Q.131 Darwin's finches are a good example of - **[CPMT 2010]**
(1) Industrial melanism
(2) Connecting link
(3) Adaptive radiation
(4) Convergent evolution

Q.132 Which one of the following kinds of animals are triploblastic ? **[CPMT 2010]**
(1) Flat worms (2) Sponges
(3) Ctenophores (4) Corals

Q.133 Which one of the following animals is correctly matched with its particular named taxonomic category? **[AIPMT 2011]**
(1) Housefly – Musca, an order
(2) Tiger – tigris, the species
(3) Cuttlefish – Mollusca, a class
(4) Humans – Primata, the family

Q.134 Which one of the following groups of animals is correctly matched with its one characteristic feature without ieven a single exception? **[AIPMT 2011]**
(1) Mammalia : give birth to young ones.
(2) Reptilia : possess 3-chambered heat with one incompletely divided ventricle
(3) Chordata : possess a mouth provided with an upper and a lower jaw
(4) Chondrichthyes : possess catilaginous endoskeleton

Q.135 Mammals's heart is : **[RPMT 2011]**
(1) myogenic (2) neurogenic
(3) voluntary (4) sympathetic

Q.136 Which of the following snakes is nonpoisonous? **[RPMT 2011]**
(1) Cobra (2) Krait
(3) Viper (4) Python

Q.137 A group of animals having marsupium is : **[RPMT 2011]**
(1) monotremata (2) eutheria
(3) metatheria (4) panthotheria

Q.138 Which sound producing organ is found in birds? **[RPMT 2011]**

(1) Pharynx (2) Larynx

(3) Syrinx (4) Trachea

Q.139 What will you look for to indentify the sex of the following **[AIPMT 2011]**

(1) Male shark – Claspers borne on pelvic fins

(2) Female Ascaris – Sharply curved posterior end

(3) Male frog – A copulatory pad on the firts digit of the hind limb.

(4) Female cochroach – Anal cerci

Use the following options of the following questions for chose the correct answer.

(1) If both **Assertion** & **Reason** are true and the reason is the correct explanation of the assertion.

(2) If both **Assertion** & **Reason** are true but the reason is not the correct explanation of the assertion.

(3) If **Assertion** is true statement but **Reason** is false.

(4) If both **Assertion** and **Reason** are false statements.

Q.1 **A :** Amphibians have evolved from fishes.
R : Take the example of the fossil Archaeopteryx.

Q.2 **A :** Snakes exposed to gamma rays become non poisonous.
R : Poisonous snakes have poison glands and a pair of poison fangs. They are affected by gamma rays.

Q.3 **A :** Among the land animals, the Cheetah can run fastest over the ground.
R : The Cheetah uses its powerful forelimbs to push itself forward during running.

Q.4 **A :** Salamander, Sphenodon are classified as amphibian.
R : Their skin is naked, moist and glandular

Q.5 **A :** Lateral line system is found in fishes and aquatic larval amphibians.
R : Lateral line system has receptors which are the clusters of sensory cells derived from ectoderm

Q.6 **A :** Bats and whales are classified as mammals.
R : Bats and whales have four-chambered heart.

Q.7 **A :** All birds, except the ones like koel (cuckoo) build nests for retiring and taking rest during night time (day time for nocutrnal).
R : Koel lays its eggs in the nests of tailor bird.

Q.8 **A :** A bony fish can stay at a particular depth without expending energy in swimming contrary to the cartilaginous fishes.
R : In bony fishes swim bladder is present which helps in buoyancy.

Q.9 **A :** Lycaenops is mammal like reptile.
R : Mammal like reptiles originated in the permian period.

Q.10 **A :** Reptiles can be termed as first true land animals.
R : These are completely independent of water due to development of internal fertilization and the presence of a special membrane, amnion around the developing embryo.

Ques.	1	2	3	4	5	6	7	8	9	10
Ans.	3	1	1	4	2	2	3	1	1	2

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	**Good / Important questions**
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

Contents

Module - 4 (Structural Organisation in Plant)

Chapter Name	Page No.

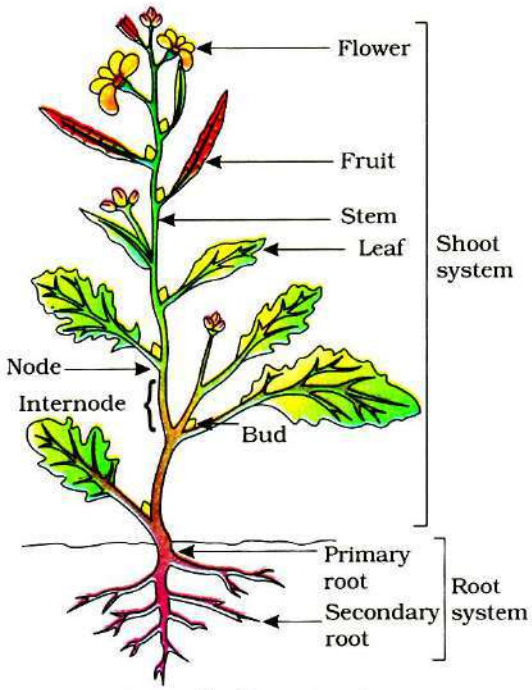
MORPHOLOGY OF FLOWERING PLANTS

INTRODUCTION



Parts of a flowering plant

- **Morphology –** (Morphe = form + logos = study). It deals with the **study of forms and features** of different plant organs like roots, stems, leaves, flowers, seeds, fruits etc.
- The body of a typical angiospermic plant is differentiated into :
  - an underground root system
  - an aerial shoot system.
  - The shoot system consists of stem (including branches), leaves, flowers and fruits.
- The roots, stems and leaves are **vegetative parts**, while flowers constitute the **reproductive part**.

CLASSIFICATION OF PLANTS (BASIS LIFE SPAN)

Depending upon their life span, plants are classified as –

- **Annuals –** Complete their life cycle in **one year** or **single growing season** or few weeks to a few months. They pass the unfavourable period in the form of **seeds** *e.g.*, Mustard, Pea.
- **Biennials –** Complete their life cycle in two years-**growing, vegetative** and storing food **in the first year, flowering and fruiting in the second year**. They die off after producing flowers and fruits *e.g.*, Radish, turnip, carrot are **biennial** in **colder** areas. They become **annual** in **warmer** places.
- **Perennials – Survives for several years**. These plants usually bears flowers and fruits every year and do not die after producing flowers. *e.g.*, Mango, Banana, Guava

CLASSIFICATION OF PLANTS (BASIS MODE OF NUTRITION)

1. **Autotrophs :** These are photosynthetic plants synthesizing their own food, *e.g.*, all green plants.
2. **Heterotrophs :** These plants cannot synthesize their own food. They are of following types-

(a) Parasitic plants : Depend on other plants for food and water. They have special structures for absorption of food and water. They may be of following types.

(i) Obligate or total parasite : Depend on other plants for both food and water.

- **Total stem parasite.** *e.g., Cuscuta, Cassytha* and *Arceuthobium* (smallest angiospermic parasite, only the flowers are visible externally, *A. minutissimum* is found on stem of *Pinus wallichiana*).
- **Total root parasite.** *e.g., Orobanchae* (Broom rape), *Balanophora, Rafflesia, Sapria, Cistanche*.

(ii) Partial or semi-parasites. Depend on other plants for water and minerals only.

- **Partial stem parasites.** *e.g., Viscum* (Mistletoe), *Loranthus*.
- **Partial root parasities.** *e.g., Santalum, Striga, Thesium.*

(b) Saprophytic plants. Grow on dead organic matter *e.g., Monotropa* (Indian pipe), *Neottia* (Bird's nest). They are mycotrophic plants.

(c) Symbiotic plants. Symbiosis or mutualism is obligatory beneficial partnership of two organisms *e.g.*, lichens (algae and fungi), *Rhizobium* (N_2 fixing bacteria and leguminous plants), mycorrhiza (fungi and roots of higher plants). Symboitic relationship between ants and some higher plants is another good example where the ants obtain food and shelter from the plant. They protect the plant from other animals *e.g., Acacia sphaerocephala* (Stipules are hollowed to function as ant shelter, leaflet tips and rachis possess feeding materials).

(d) Insectivorous or carnivorous plants. They grow in soil deficient in nitrogen. They trap insects and digest their protein. These are chlorophyllous plants thus can synthesize their own food. So all insectivorous plants are producers and secondary consumers.

(i) ***Utricularia*** **(Bladder wort).** It is a rootless aquatic plant with highly dissected leaves. some of the leaf segments are modified into small bladders which have trap valves for catching small animals like Cyclops and Daphnia.

(ii) ***Drosera*** **(Sundew).** It is a herbaceous plant growing in water logged places. The upper surface of its leaves possess club shaped tentacles. The tentacle heads secrete sticky purple juice that shines in the sun (hence called sundew). An insect touching a tentacle is stuck up and trapped by bending of tentacles. The trapped insect is then digested by enzymes secreted by digestive glads and amino acids are absorbed by the leaf.

(iii) ***Dionaea*** **(Venus fly trap).** It is a herbaceous plant bearing rosette leaves. Leaves have winged petiole and lamina modified into two toothed jaws (bilobed) normally open at an angle forming a trap. Each jaw contains several teeth. Upper surface of each jaw (lobe) bears sensitive hair, spines or bristles (three in number) and digestive glands.

Stimulation of a senstive spine or hair by an insect causes folding of leaf and secretion of digestive juices.

(iv) ***Nepenthes*** **(Pitcher plant).** It is a climber. The pitcher is formed from the lamina of leaf and the lid is the modified leaf tip. The flattened leaf like part below the petiole is the leaf base. Petiole is elongated and tendrillar. A large number of glands are situated on the upper half of the inner wall of pitcher which secrete proteolytic enzymes. The enzymes hydrolyse the protein of insects and amino acids so produced are absorbed by the plant. *Sarracenia, Darlingtonea* and *Cephalotus* are other insectivorous pitcher plants.

(v) ***Aldrovanda*** **(Water flea trap).** It has a thin rootless floating stem, which bear whorls of modified leaves. Each leaf has a spanthulate stalk and a folding two lobed lamina with teeth round the edges. The surface bears numerous sensitive joined hairs and digestive glands.

ROOT

Radicle comes out/arise from the seed coat in the form of soft structure and move toward the soil. It develops and forms primary root.

GENERAL CHARACTERS

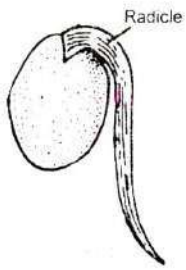
- Roots are **non green**, **underground**, (+) geotropic, (–) phototropic and (+) hydrotropic.
- Roots do not bear buds.
- Buds present for vegetative propagation in sweet potato (***Ipomea***) and Indian red wood (***Dalbergia***)
- Roots do not bear **nodes** and **internodes**.
- Roots have **unicellular** root hairs.

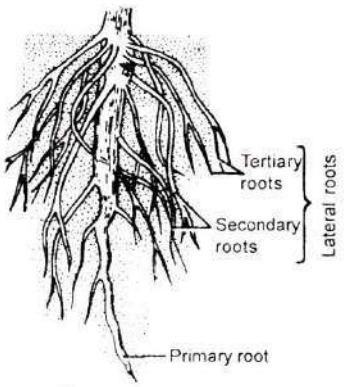
TYPES OF ROOTS :

Roots are of two types :

1. Tap root
2. Adventitious root

1. **Tap root :** It develops from radicle and made up of one main branch and other sub branches. The primary roots and its branches constitute tap root system. e.g. Dicot roots.
2. **Adventitious roots :** In some plants, after sometime of the growth of tap root which arises from radicle, stops and then roots, develop from other part of plant, which are branched or unbranched, fibrous or storage, are known as adventitious roots and constitute fibrous root system. *e.g.,* Monocot roots.





Tap root system

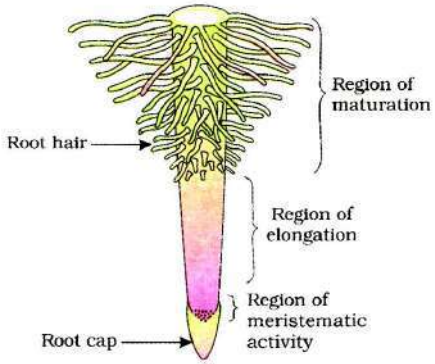
Adventitious root
Fibrous root system

REGIONS OF ROOTS :

Morphologically four distinct regions are present in roots.

- **Root cap :** It is terminal structure. It protects tender apex of root.

- **Meristematic zone :** Cells of this regions are very small and thin walled. They divide repeatedly and increase cell number
- **Elongation region :** The cells proximal to meristematic zone undergo rapid elongation and enlargement and are responsible for rapid growth of roots.
- **Maturation region :** Cells proximal to region of elongation gradually differentiate and mature. Root hairs are present in maturation zone.

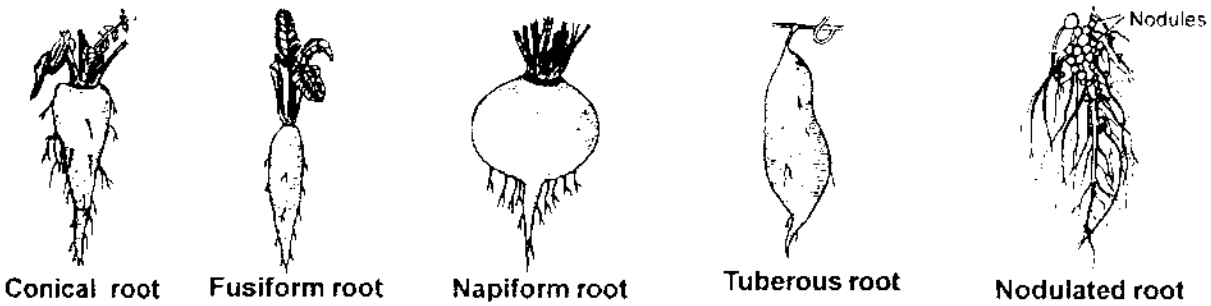


The regions of the root-tip

MODIFICATION OF ROOTS

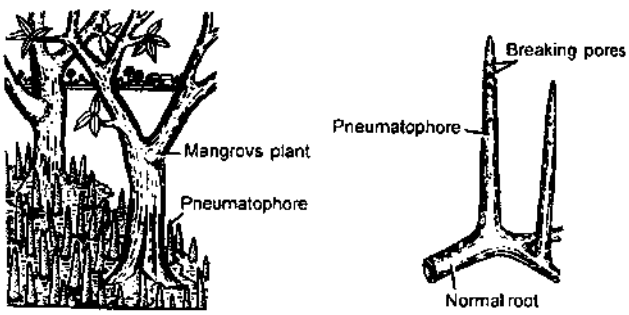
1. **Modified tap root for storage :**
   - **Fusiform roots :** These root are thicker in the middle and tappered on both ends. In this type of roots both hypocotyl and root help in storage of food. ***e.g.,*** **Radish**.
   - **Conical roots :** These roots are thicker at their upper side and tapering at basal end. ***e.g.,*** **Carrot.**
   - **Napiform :** These roots become swollen and spherical at upper end and tappered like a thread at their lower end. ***e.g.,*** **Turnip (*Brassica rapa*), Sugarbeet**
   - **Tuberous root :** Such roots do not have regular shape and get swollen & fleshy at any portion of roots. ***e.g.,*** **Mirabilis.**
2. **Nodulated root :**

   Nodules are formed on branches of roots by nitrogen fixing bacteria, (*Rhizobium*). *e.g.,* Plants of leguminosae family (Papilionatae) – **Pea.**



3. **Respiratory roots :**

   Halophyte or mangrove grow in oxygen deficient marshy area. Some branches of tap root in these plant grow vertically & comes out from soil. These roots are called pneumatophores through which air entered inside the plant. ***e.g., Rhizophora, Heritiera, Sonaratia*** **and other mangrove plant.**

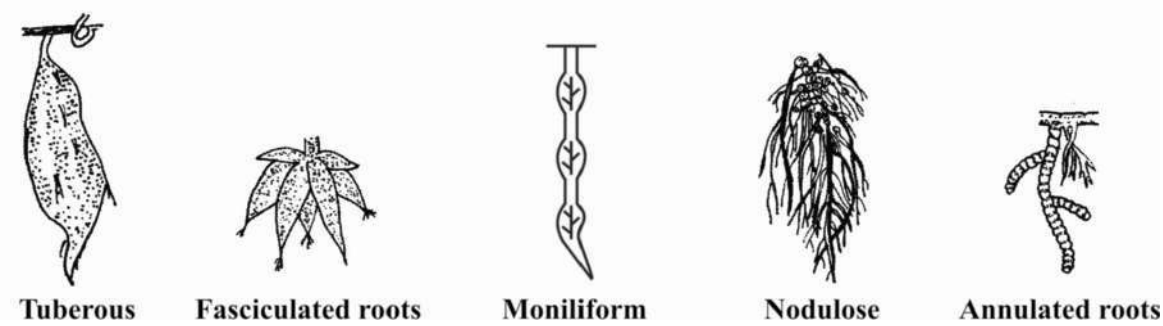


Respiratory roots (Pneumatophores) of Rhizophora

MODIFICATION OF ADVENTITIOUS ROOTS

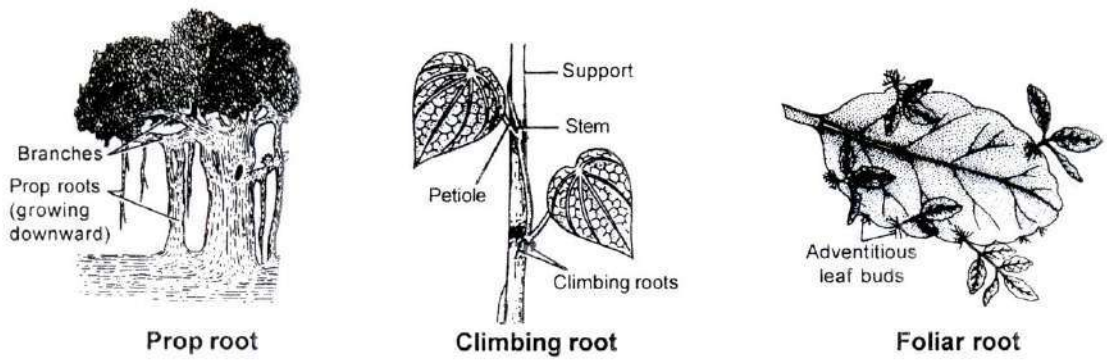
1. **Storage adventitious roots :**

- **Tuberous root :** When food is stored in these roots, they become swollen and form a bunch. *e.g.,* **Sweet potato (*Ipomea batata*)**
- **Fasciculated –** Roots arise in **bunch** (cluster) from lower node of the stem and become fleshy *e.g.*, ***Dahlia, Asparagus***.
- **Nodulose :** In this type, tips of roots swell up. ***e.g., Melilotus, Curcuma amoda.***
- **Beaded or moniliform :** When root swells up like a bead at different places after a regular interval. ***e.g., Vitis, Momordica*** **(Bitter gourd), Portulaca.**



- **Annulated :** Roots having series of ring like swellings ***e.g., Psychrotia***

2. **Stilt roots or brace roots :** When root arises from lower nodes and enter in soil obliquely, known as stilt roots ***e.g.*****, Maize, Sugarcane,** ***Pandanus*** **(screwpine)**
3. **Prop root or pillar roots :** when root arises from branches of plant and grows downward towards soil. It function as supporting stem for the plant. ***e.g.*****, Banyan**.
4. **Butteress root –** Such roots appear from the basal part of stem and spread in different directions in the soil. ***e.g., Ficus, Bombax , Terminalia.*** It is a characteristic feature of tropical rain forest.
5. **Climbing roots –** These roots arise from nodes and helps the plant in climbing. ***e.g.*****, Money plant (*Pothos*), Betel, Black pepper,** ***Techoma.***
6. **Foliar roots or Epiphyllous roots –** When roots arise from leaf they are called as foliar roots. ***e.g., Bryophyllum, Bignonia.***
7. **Sucking or haustorial roots or Parasitic roots :** In parasitic plant roots enter in the stem of host plant to absorbed nutrition from host. ***e.g., Dendrophthoe, Cuscuta, Viscum.***



8. **Assimilatory roots :** The aerial roots of ***Tinospora*** and submerged roots of ***Trapa*** (Water chestnut) become green and synthesize food. ***Podostemon*** also has green assimilatory roots.

9. **Hygroscopic roots :** These are found in epiphytes, specially in orchids and help in absorption of moisture from the atmosphere using special tissue called **velamen**. ***e.g., Orchids, Banda***
10. **Contractile roots :** They shrink 60 – 70% of the original length and bring underground organ at proper depth in the soil *e.g.,* corm of ***Crocus*** (saffron), ***Fresia***.
11. **Root thorns :** These are hard, thick and pointed thorns e.g. ***Pothos armatus***.

- **Reproductive roots :** These are fleshy, adventitious roots used for vegetative reproduction *e.g.,* sweet potato (*Ipomea batata*), Dahlia.
- **Leaf roots :** In Salvinia, one leaf of each node modifies into root like structure for balancing the plant in water.

FUNCTION OF ROOT

- Fixation (Primary function)
- Absorption of water and minerals
- Storage of food
- Conduction of water
- Photosynthesis and respiration

STEM

Stem is a part of plant which lies above from surface of soil i.e. it shows negative geotropic growth. It has nodes and internodes. Branches, leaf, flower bud and bracts are developed from nodes. Stem arises from plumule.

FORMS OF STEM

- **Caudex :** It is unbranched, erect, cylindrical stout stem and marked with scars of fallen leaves. Crown of leaves are present at the top of plant. *e.g.,*: Palm
- **Culm :** Stem is jointed with solid nodes & hollow internodes. *e.g.,* Bamboo (Graminae)
- **Excurrent :** The branches arise from the main stem in acropetal succession and the tree assumes a cone like appearance e.g. ***Pinus, Eucalyptus, Casuarina,*** etc.
- **Decurrent (Deliquescent) :** The lateral branches grow more vigorously and outcompetes the main trunk, giving a dome-shaped appearance, *e.g.,* mango (***Mangifera indica***), shishem (***Dalbergia sissoo***) and banyan (***Ficus bengalensis***).

TYPES & MODIFICATION OF STEM

1. AERIAL STEMS (EPITERRANEAN STEM) :

It may be reduced, erect and weak.

- **Reduced –** Stem reduced to a disc. *e.g.,*, Radish, Carrot, Turnip.
- **Erect stem -** It is strong and upright *e.g.,* maize, wheat, mango.
- **Weak stems –** These are thin, soft and weak and need support. They can be upright or prostrate.

– **Creepers –** The stem creeps on earth and the roots arise at the nodes, *e.g.,* Grasses, Strawberry, Oxalis.

– **Traliers –** The stem creeps on the ground, but the roots do not arise at the nodes. They may be of two types :

(i) Prostrate or procumbent – The stem creeps on ground totally, *e.g., Evolvulus, Tribulus*.

(ii) Decumbent – When prostrate stem projects its tip, *e.g., Portulaca, Linderbergia*.

– **Lianas (Stem climber).** Woody perennial climbers found in tropical rain forests are lianas. They twin themselves around tall trees to secure sunlight, *e.g.*, ***Hiptage***, ***Bauhinia vahlii*** (Phanera).

– **Climbers –** Plants are with long weak stem and have organs of attachment to climb the object. They may be of following type .

(i) Rootlet climbers – Roots produced at nodes help in climbing *e.g.*, ***Tecoma, Pothos, Piper betal*** (pan).

(ii) Hook climbers – In *Bougainvillea, Duranta* and *Carrisa*, the thron is modification of axillary vegetative bud which helps in climbing. In *Bignonia*, terminal leaflet is converted into hook.

(iii) Tendril climbers – Tendrils are thread like structure which help the plants in climbing. Tendrils are modifications of :

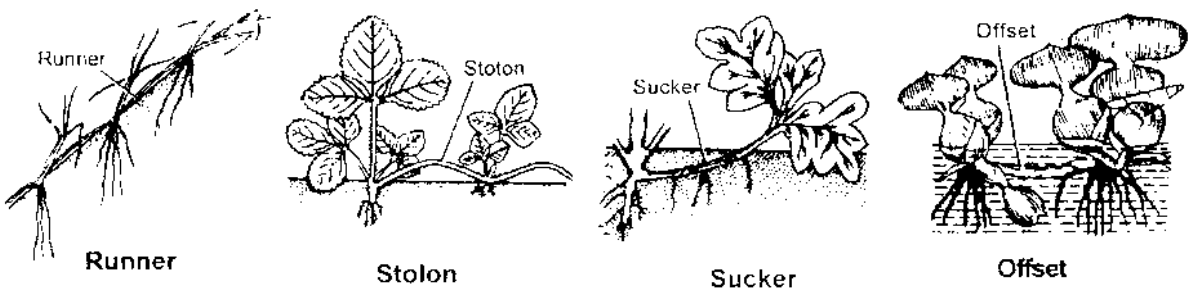
- Entire leaf e.g. ***Lathyrus sativus.***
- Leaflet e.g. ***Pisum sativum***
- Petiole e.g. ***Clematis, Nepenthes***.
- Stipule e.g. ***Smilex***.
- Leaf apex e.g. ***Gloriosa***
- Inflorescence e.g. ***Antigonon.***
- Stem *e.g.*, ***Vitis*** (grapevines), gourds, ***Passiflora*** (modified axillary bud).

– **Twiners –** The stem body twines around the support without any special organ of attachment. *e.g., Cuscuta, Dolichos*.

2. SUB-AERIAL MODIFICATION :

- **Runner –** When stem grows and spread on the surface of soil. Roots are developed at lower side and leaves from upper side from node *e.g.*, ***Cynodon dactylon*** **(Doob grass),** ***Oxalis*****.**
- **Stolon –** In it branches are small and stem condensed and grow in all direction. After sometime, of growing, their apical region comes out from the soil. *e.g.*, ***Fragaria*** **(Wild strawberry), Jasmine Peppermint.**
- **Sucker** – In it the main stem grow in the soil horizontally and branches develop obliquely from nodes above the soil, *e.g.*, **Mint, Pineapple,** ***Chrysanthemum*****.**
- **Offset** – A lateral branch with short internode and each node bearing a rossette of leaves and tuft of roots at base. *e.g.*, ***Pistia, Eichhornea.***

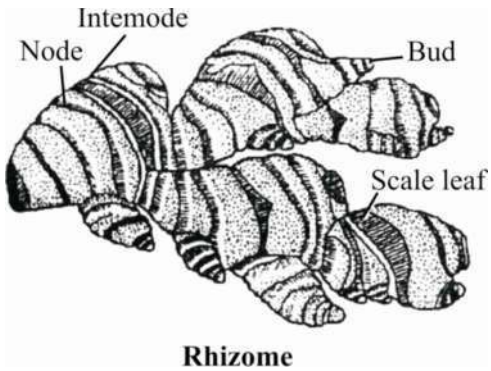
These modification are also involved in vegetative reproduction.



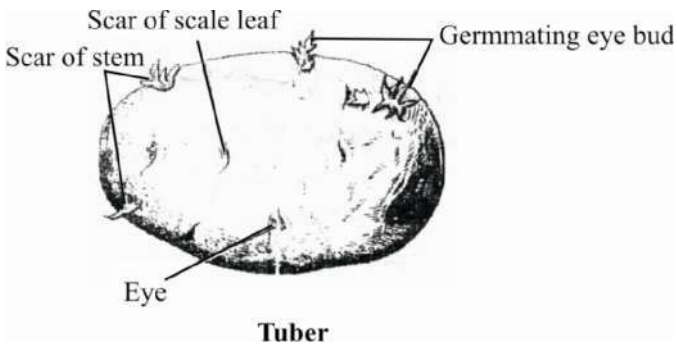
3. UNDERGROUND MODIFICATION

This type of modification occurs generally for food storage and vegetative propagation.

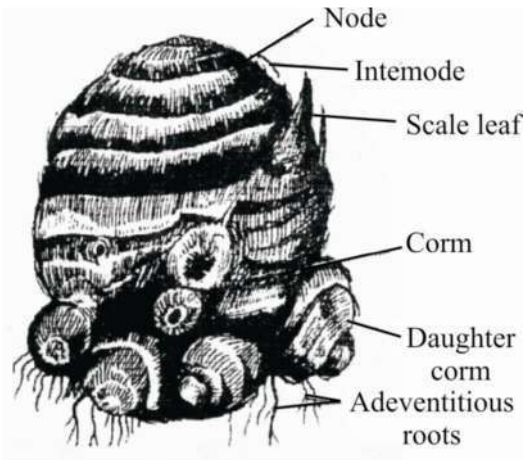
- **Tuber –** The tips of underground branches become swollen in the soil. Eyes are found on then which are axillary buds and covered with scaly leaves. *e.g.,* **Potato, *Helianthus tuberosus***
- **Rhizome –** It is fleshy and horizontally stem found below in soil. Small nodes and internodes are found which are covered by scaly leaves. *e.g.,* **Ginger, Turmeric, Canna, Water lily, Banana.**
- **Corm** – It is condensed structure which grow vertically under the soil surface. They are having spherical node and inter node *e.g.,* ***Colocasia, Alocasia,* Zaminkand, Saffron, *Gladiolus, Colchicum***
- **Bulb** – This stem is reduced and has disc like structure and surrounds with numerous fleshly scaly leaves. Many roots arise from its base. Food is stored in flashy leaves. They show apical growth *e.g.,* Onion, Garlic.



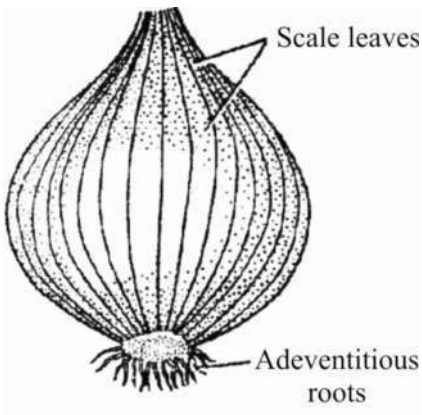
Rhizome



Tuber



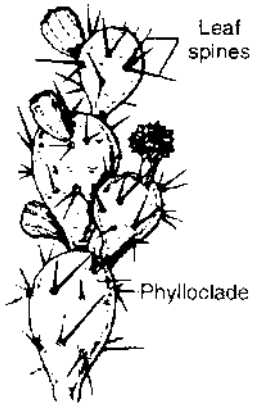
Corm



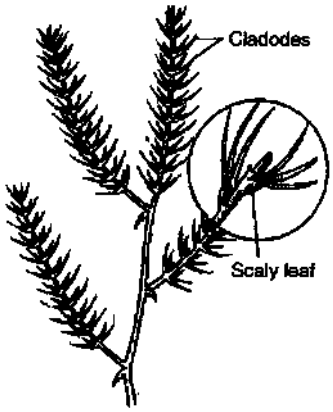
Bulb

4. Special stem modification :

- **Phylloclade –** It is green photosynthetic flattened or rounded succulent stem with leaves either feebly developed or modified into spines *e.g.,* ***Opuntia, Casuarina***, ***Euphorbia, Cactus***.
- **Thorn –** It is modification of axillary bud, *e.g.,* ***Bougainvillea, Duranta, Carissa.*** Thorns of ***Alhagi*** possess flowers, while thorns of ***Duranta*** bears leaves.
- **Cladode** – Phylloclade usually having one or two internode long & succulent is called cladode, *e.g.,* ***Asparagus***, ***Ruscus***.

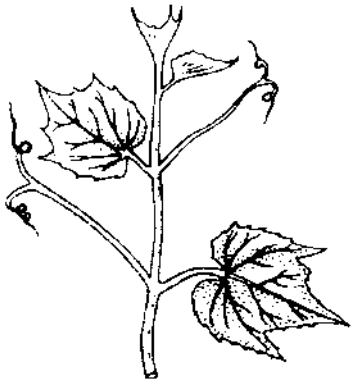


Phylloclade of *Opunita*

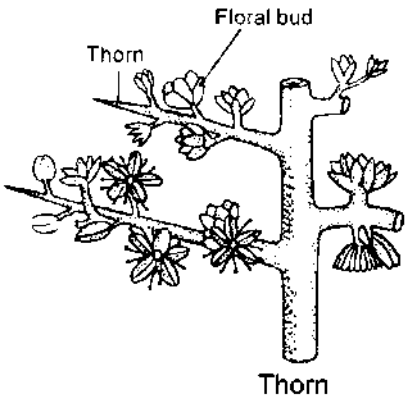


Cladode of *Asparagus*

- **Stem tendrill** – it is a leafless, spirally coiled structure found in climbers. It may be a modification of Axillary bud, e.g. ***Passiflora*** or terminal bud *e.g.*, ***Vitis***.



Stem tendril



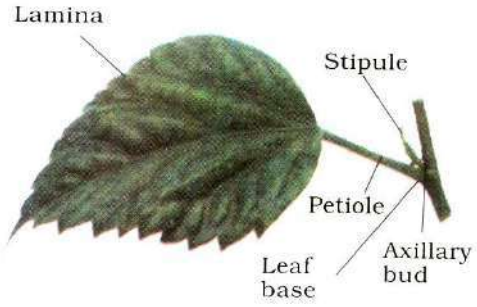
- **Bulbils** – A condensed , axillary fleshy bud is called ***bulbils***. It helps in vegetative reproduction. *e.g.,*, ***Dioscorea, Glabba, Agave, Oxalis***.

FUNCTION OF STEM

The main function of the stem is spreading out branches bearing leaves, flowers and fruits. It conducts water, minerals and photosynthates. Some stems perform the function of storage of food, support, Protection and of vegetative propagation.

LEAF (PHYLLOPODIUM)

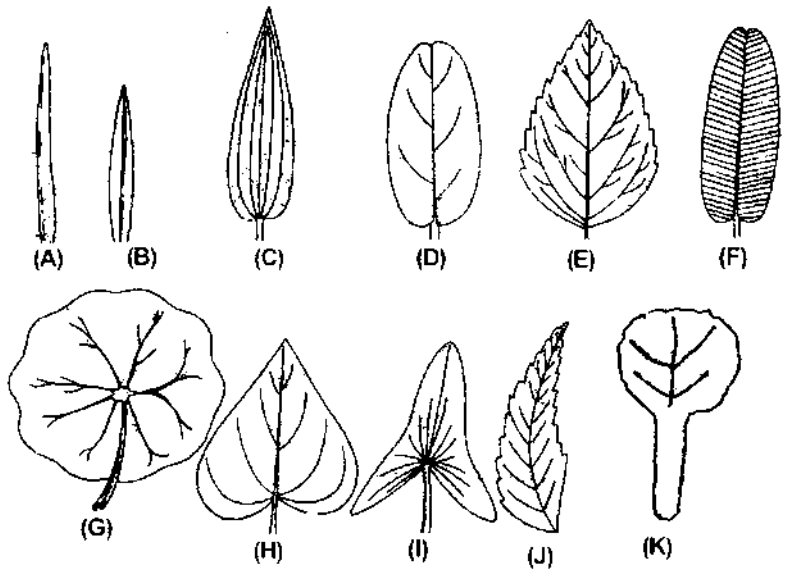
The leaf is a lateral generally flattened structure borne on the stem. The leaves develop from the nodes. Their main function is photosynthesis and food making, axillary buds are found in its axil. All the leaves of a plant is known as phyllome. Axillary bud later develops into a branch. Leaves originated from shoot apical meristem and are arranged in acropetal order.



- Leaf is divided into 3 main parts :

1. **Leaf base (Hypopodium) –**
   - Leaves are attached to stem by leaf base.
   - In some plants, leaf base becomes swollen and is called **pulvinus** which is responsible for sleep movement *e.g.,* Cassia, mimosa, bean.
   - In some plants, leaf base expands into **sheath** (**Sheathing leaf base**), *e.g.,* grasses and banana (monocots).
   - When the leaf base partially encloses the stem, it is called **semi amplexicaule** *e.g.,* Prickly poppy, ***Calotropis procera*** (Madar).
   - It completely encloses the stem, it is called **amplexicaule** *e.g.,* ***Sonchus, Polygonum***.
2. **Petiole (Mesopodium)** –
   - The part of leaf connecting the lamina with the branch of stem. Petiole help to hold the blade to light.
   - In ***Eichhornia*** petiole swell and in citrus it is winged.
   - Petiole is modified in tendrils in ***Nepenthes***.
   - In Australian acacia petiole is modified in phyllode.
   - Long thin flexible petiole allow leaf blade to flutter in air, thereby cooling the leaf and bringing fresh air to leaf.
3. **Lamina (Epipodium)** –

   It is a broad and flattened part of leaf. Its main functions are photosynthesis and transpiration.



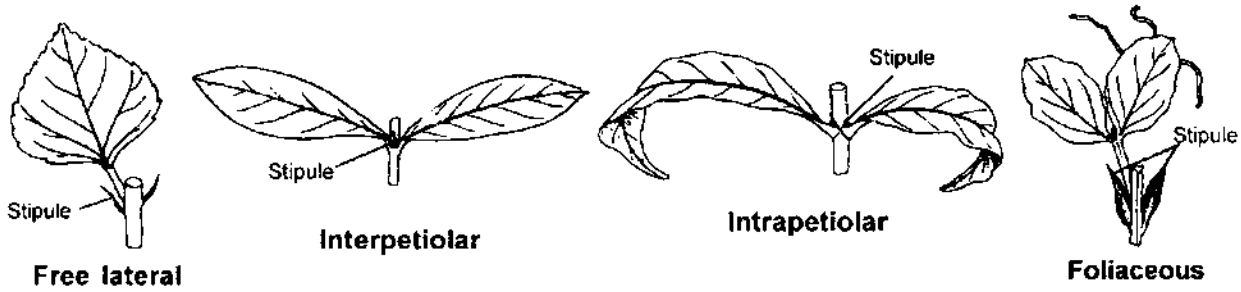
Shapes of lamina :
(A) Acicular, (B) Linear, (C) Lanceolate,
(D) Elliptical, (E) Ovate, (F) Oblong, (G) Rotund,
(H) Cordate, (I) Sagittate, (J) Oblique (K) Spathulate

STIPULES

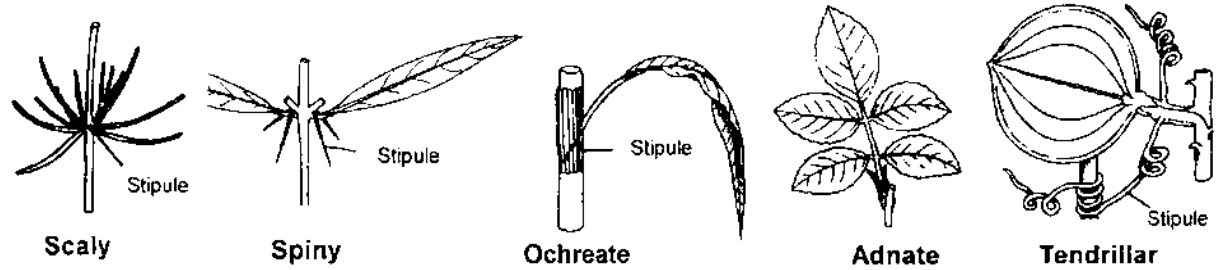
Leaves of some plants have lateral appendages on either side of leaf base, known as stipules. If stipules are present in leaf it is called stipulated leaf, if it is absent then leaf is called exstipulated.

- **Stipules are of various types –**
  - **Free lateral –** They are independently present on both sides of leaf base. *e.g.,* ***Hibiscus rosasinensis*** (China rose)

- **Interpetioler –** When two leaves are meet oppositely at the node then nearest stipules of each leaf join with each other. In this way only two stipules of two leaves are found in place of four. *e.g.,* ***Ixora, Anthocephalus.***
- **Intrapetioler –** In this type both stipules of a single leaf join with each other to form a single stipule. *e.g.,* ***Gardenia***
- **Foliaceous** – These type of stipules form a leaf like structure. *e.g.,* **Pea**



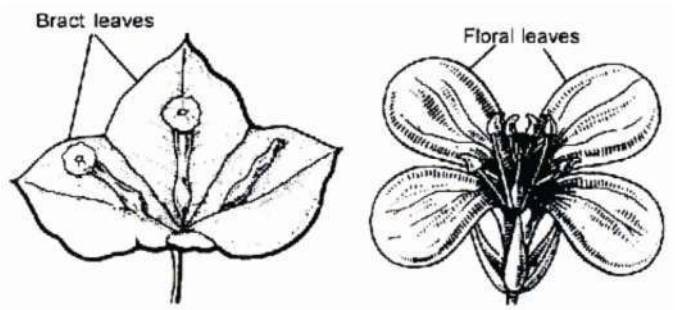
- **Scaly –** Stipules are dry, small and paper like. *e.g.,* ***Desmodium***
- **Spiny –** Stipules modified into spine. *e.g.,* ***Zizyphus*** (Beri), ***Acacia***.
- **Ochreate –** When both stipules of leaf combine together and form a tube like structure, It is called ochreate. *e.g.,* **Polygonum**
- **Adnate** – Both stipules are attached with petiole. *e.g.,* **Rose**
- **Tendrillar –** Stipules are modified into tendrils like structure. *e.g.,* ***Smilax***
- **Bud scale –** Protect the young Bud. e.g. **Ficus**



TYPES OF LEAVES

- **Foliage leaf –** They are usually green coloured and their main function is photosynthesis.
- **Cotyledonary leaf –** This leaf comes out during germination and helps in nutrition until the first leaf is not formed.
- **Scaly leaf (Cataphylls)** – Such leaves are usually dry membrane like and they can not perform photosynthesis

- **Bract (Hypsophyll)** – Bract are the leaves which is present in flower axis.
- **Bracteole** – These are leaf like structure found on pedicel.
- **Floral leaf** – Sepals, petals, stamen and carpel are found in flower which are included in this type of leaf.



- **Perianth –** In some flowers, Calyx and Corolla are not distinct and are termed as Perianth and unit of perianth is called tepal. *e.g.,* ***Lily***

Duration of leaf :

- **Persistent / Evergreen –** Leaves of such plants are found in all season and do not (fall) shed combindly. *e.g.,* ***Pinus, Saraca indica,*** **Datepalm.**
- **Deciduous –** All leaves of such plants shed at the same time *e.g.,* ***Azadirachta.***
- **Caducous –** Leaves fall soon just after appearance or after opening of bud. *e.g.,* **Rose**

Leaf insertion :

- **Cauline leaves –** When the leaves are found on node of stem, then these are called cauline leaves. *e.g.,* **Maize, Hollyhock.**
- **Ramal leaves** – When leaves are found on branches, then these are called ramal leaves. *e.g.,* ***Delbergia, Zizypus*****.**
- **Radical leaves –** During favourable season, leaves develop from the nodes of under ground stem and seem that they are developing from roots. This type of leaves are known as radical leaves. *e.g.,* **Radish, Turnip.**

VENATION OF LAMINA

The arrangement of veins and veinlets in leaves (Lamina) is known as venation. It is of two types :

1. **Reticulate :** It is found in dicots. Exception – ***Calophyllum***, ***Eryngium.*** It has parallel venation.
2. **Parallel :** It is found in monocots. Exception – ***Smilax***, ***Dioscorea, Alocasia, Colocasia***. It has reticulate venation.

1. Reticulate venation :

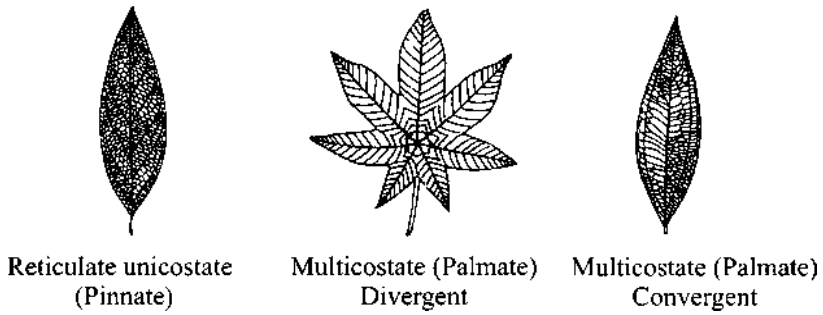
In it main vein divided into various branches (veinlets) and form a net like structure. Reticulate venation is of two types :

(i) Unicostate or pinnate – In this type of venation leaf have only one principal vein or midrib that give off many lateral veins which proceed toward margin and apex of lamina of the leaf and form a network. *e.g.,* **Mango, guava, Peepal.**

(ii) Multicostate or palmate – In this type of venation many principal veins arising from the tip of petiole and proceed towards tip of lamina. This is again two types –

(a) Multicostate divergent – Many principal veins arising from the tip of petiole, diverge from the another toward the margin of leaf blade *e.g.,* Cotton, Caster, Cucurbita, grape.

(b) Multicostate convergent – Many principal veins arising from the tip of petiole. At the base of leaf they are closely arranged but diverage from one another in middle part and converge towards the apex of leaf. *e.g.,* Camphor, ***Zizyphus***, Tejpat, Chinarose, plum.



Reticulate unicostate (Pinnate) | Multicostate (Palmate) Divergent | Multicostate (Palmate) Convergent

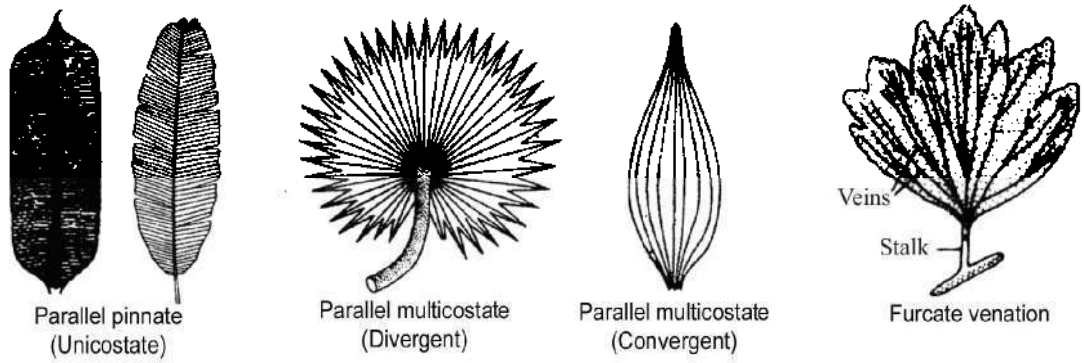
2. Parallel venation :

In this type of venation, all veins run parallel to each other and they do not from network. They are of two types :

(i) Unicostate or pinnate – This type of pattern having only one principal vein, that gives off many lateral veins, which proceed toward the margin of leaf blade in a parallel manner but they donot have veinlets. *e.g.,* **Banana, Ginger, Canna.**

(ii) Multicostate or palmate – Having many principal veins arising from the tip of the petiole and proceeding upwards.

- **Multicostate divergent –** Many principal veins arising from the tip of petiole and diverge toward the margin of leaf. They donot divide into veinlets and do not form network. *e.g.,* ***Coconut, Date palm***
- **Multicostate convergent –** Many principal veins arising from the tip of petiole run in a curved manner in lamina and converge towards the apex of leaf blades. *e.g.,* – Wheat, Sugar-cane, Bamboo.
- **Furcate venation –** The veins branch dichotomously but the reticulum is not formed by the finer branches. *e.g., **Adiantum*** (fern).



Parallel pinnate (Unicostate) | Parallel multicostate (Divergent) | Parallel multicostate (Convergent) | Furcate venation

TYPES OF LEAF

SIMPLE AND COMPOUND LEAF

- **Simple Leaf –** A leaf which may be incised to any depth, but not down to the midrib or petiole, then this type of leaf called **simple leaf**. *e.g.,* **Mango, Chinarose, Ficus**, etc.
- **Compound leaf –** A leaf in which the leaf blade is incised up to the midrib or petiole, thus dividing it into several small parts, known as **leaflets**. This type of leaf is known as **compound leaf**.

- **It is of two types** –

1. PINNATELY COMPOUND LEAF

In this type of leaf mid rib is known as **rachis**. Leaflets are arranged on both sides of rachis. *e.g.,* **Neem**.

- **It is of following types –**

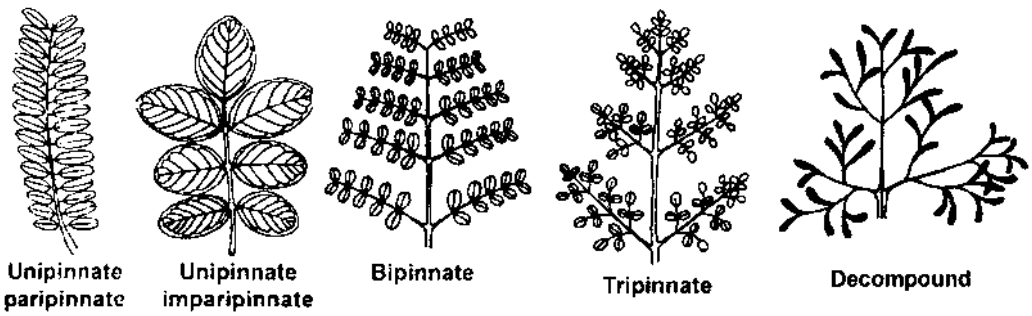
A. Unipinnate – In this type of leaf, division occurs only once and leaflets are directly attached on both sides of rachis.

- If the number of leaflet is even, then leaf is known as paripinnate. *e.g.,* ***Cassia fistula, Sesbania***
- If the number of leaflet is odd, it is known as imparipinnate. *e.g.,* **Rose, Neem.**

B. Bipinnate – A twice pinnate compound leaf *e.g.,* ***Acacia,*** **Gulmohar,** ***Mimosa*****.**

C. Tripinnate – A thrice pinnate compound leaf *e.g.,* ***Moringa.***

D. Decompound – A compound leaf, which is more than thrice pinnate. *e.g.,* **Carrot, Coriander.**



2. Palmate compound leaf –

In this type incision of leaf are directed from leaf margin to apex of petiole and all leaflets are attached on the upper end of petiole.

- **It is of following types –**

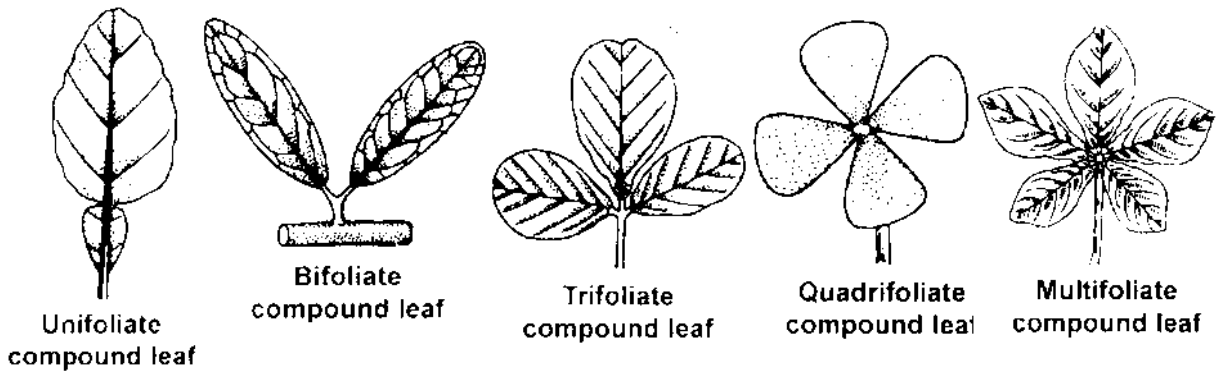
A. Unifoliate – When single leaflet is found. *e.g.,* **Lemon**

B. Bifoliate – When two leaflets are present. *e.g.,* ***Bauhinia, Regnelidium***, ***Bignonia***.

C. Trifoliate – When three leaflets are attached. *e.g.,* ***Oxalis, Aegle, Trifolium***

D. Tetrafoliate – When four leaflets are attached to the petiole. *e.g.,* ***Marsilea.***

E. Multifoliate – when more than four leaflet are found, then leaf is called multifoliate palmate compound leaf. *e.g.,* **Silkcotton.**



PHYLLOTAXY :

- It is of following type –

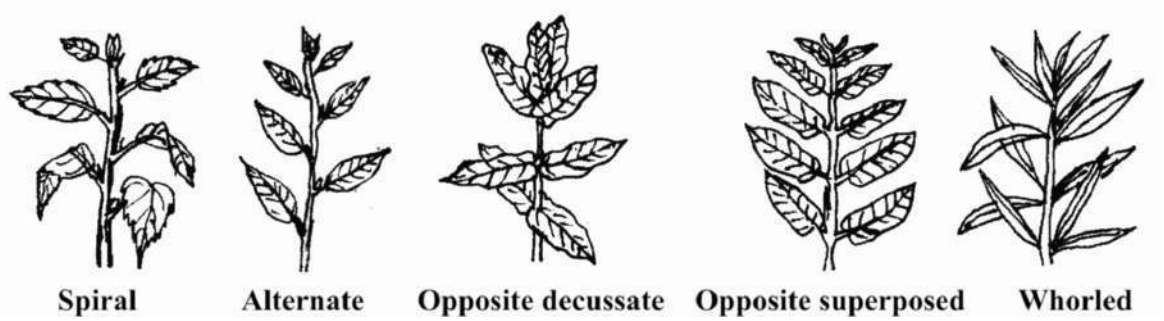
A. Alternate or spiral – Single leaf arising at each node. *e.g.,* ***Cyprus rotandus,*** Chinarose, mustard & Sunflower,.

B. Opposite – Leaves occuring in pairs at the node, they may be –

C. Decussate : Leaves that stands at right angle to next upper or lower pair *e.g.,* ***Calotropis, Mussaenda***.

D. Superposed : Successive pairs of leaves stand directly over a pair in the same plane *e.g.,* ***Psidium*** (guava), ***Ixora***.

E. Whorled – More than two leaves at each node *e.g.,* ***Nerium, Alstonia***.



HETEROPHYLLY –

- It is the occurrence of more than one type of leaves on the same plant. It is of three types –

A. Developmental Heterophylly : Leaves of different forms and shape occur at different period or places on the same plant *e.g.,* Mustard, Sonchus, Eucalyptus.

B. Environmental Heterophylly : It is aquatic adaptation which is commonly found in rooted emergent hydrophytes. In this, submerged leaves differ from the floating and aerial leaves. *e.g.,* ***Limnophila***, ***Heterophylla, Ranunculus aquatiles, Sagittaria***.

C. Habitual Heterophylly : Due to habit mature leaves differ in their shape and incissions *e.g., Artocarpus* (Jack fruit).

MODIFICATION OF LEAVES

(a) Leaf tendril – In it, whole leaf is modified into thin thread like structure which is called leaf tendril *e.g.,* ***Lathyrus aphaca*** **(wild pea).**

(b) Leaflet tendril – When leaflet is modified into tendril like structure than it is called leaflet tendril. *e.g.,* ***Pisum sativum*** (Garden pea), ***Lathyrus odoratus*** (sweet pea)

(c) Leaf spine – Leaves or any part of leaflet are modified into pointed spine. *e.g.,* ***Asparagus, Opuntia, Aloe, Argemone.***

(d) Leaf scale – In it, leaves become thin, dry and form a membrane or paper like structure and serve to protect axillary buds as in ***Ficus*** and ***Tamarix, Ruscus***, ***Casurina***.

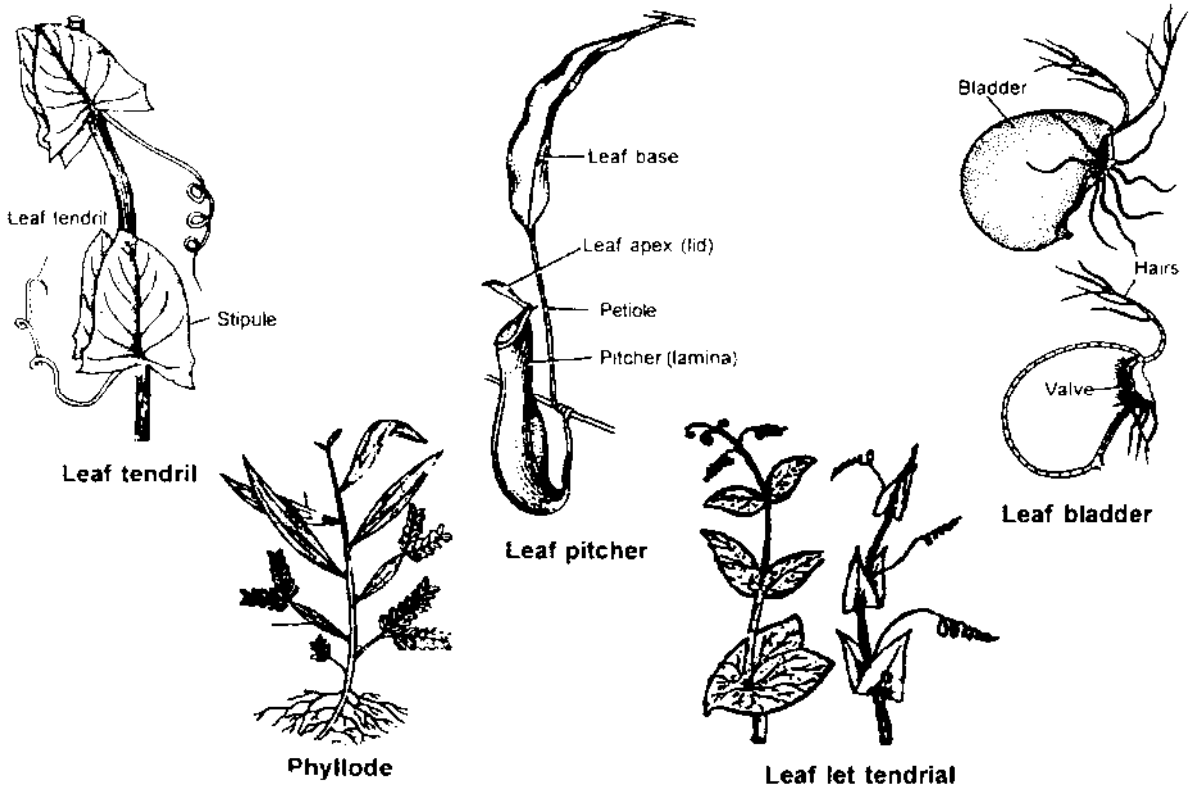
(e) Leaf pitcher – Leaves of some plants are modified to pitcher shape. *e.g.,* ***Nepenthes, Dischidia.***

(f) Leaf bladder – In some plant , leaves are modified into bladder like structure *e.g.,* ***Utricularia.***

(g) Leaf Hooks – In some plants terminal leaflets are modified into curved hooks for helping the plant in climbing. *e.g.,* ***Argemone, Opuntia, Aloe,*** **Cat's nail (*Bignonia unguis – cati*)**

(h) Phyllode – In its, petiole becomes flat structure and function as normal leaf. *e.g.*, ***Australian acacia*.**

(i) Flashy leaves – In onion and garlic food storing flashy leaves are present.



INFLORESCENCE

Arrangement of flower on floral axis is called inflorescence.

RACEMOSE

- In this type of inflorescence the main axis continues to grow and does not terminate in a flower and give off flower laterally in acropetal manner where old flowers are arranged toward base and young flowers are at tip. When peduncle is broad then flowers are centripetally arranged.
- This is of following different types :

(a) Raceme – When peduncle (main axis) is elongated and flowers are pedicellate.

e.g., **Radish,** characteristic feature of cruciferae family

When peduncle is branched and each branch bear pedicellated flowers like racemose and are arranged in acropetal manner known as compound raceme or panicle. *e.g.*, Gulmohar, Neem.

(b) Spike – In it peduncle is elongated but flowers are bisexual and sessile.

e.g., ***Achyranthes***

When peduncle is branched and each branch bear spike, like inflorescence then the small branch having flower is called spikelet and this arrangement is called as spike of spikelet. Characteristic inflorescence of family gramineae.

Catkin – In it peduncle is thin, long and weak, and flowers are sessile and unisexual. Peduncle is pendulus.

e.g., **mulberry, betula, oak.**

(c) Spadix – In it peduncle is thick, long and fleshy and have small sessile and unisexual male and female flowers covered with one or more green or colourfull bracts known as spathe.

e.g., **Colocasia, Maize, Aroids, Palms.**

(d) Corymb – In it peduncle is short and all flowers are present at same level because the lower flower has much long pedicel than the upper one *e.g.,* Candytuft **(*Iberis amara*)**.

- If in this type of inflorescene peduncle is branched, then each branch has flower cluster then this type of inflorescence is called compound corymb.

  e.g., **Cauliflower,**
- In mustard corymbose raceme type of inflorescence is present

(e) Umbel – An inflorescence in which the flower stalks of different flowers are of more or less equal length, arise from the same point. At the base of flowers stalks, there is whorl of bracts forming the involucre.

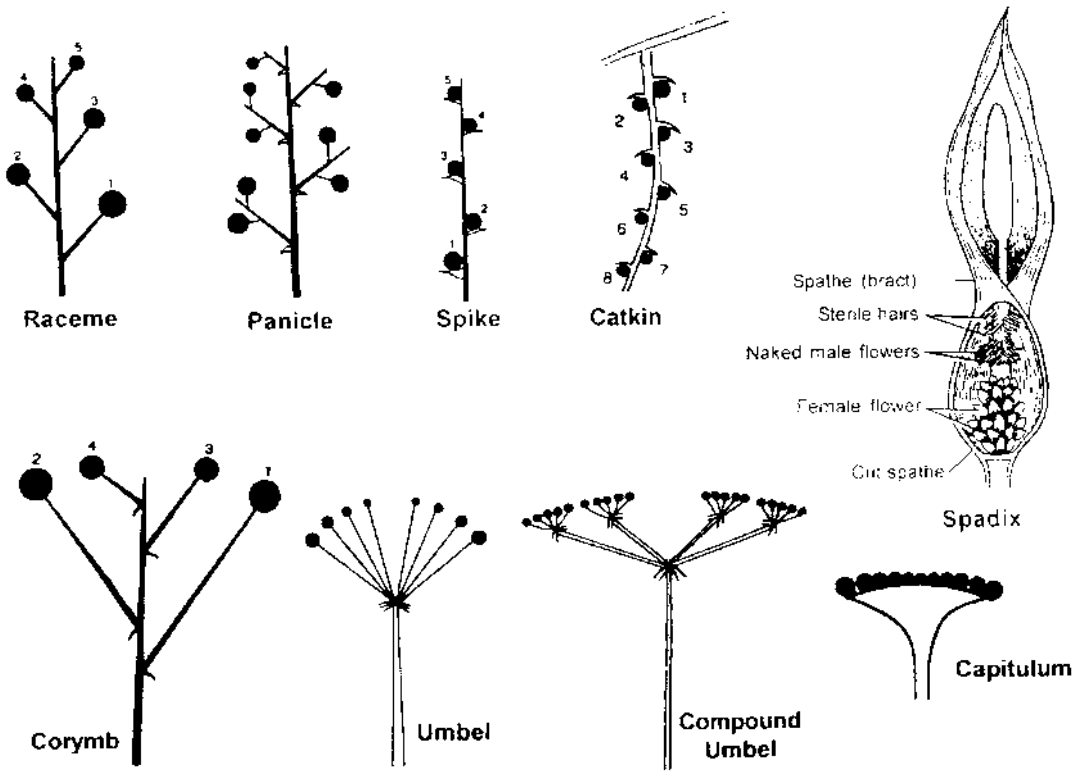
*e.g., **Centella***

- If in this type of inflorescence, peduncle is branched then each branch has flower cluster then this type of inflorescence is called compound umbel.

  *e.g., **Coriander, Foeniculum, Cuminum***.
- Characteristic feature of umbeliferae.
- **Scapigerous umbel is found in onion**

(f) Capitulum / Racemose head – In it the growth of peduncle is retarded and it become broad, flattened concave or convex. On it small flowers are found. These flowers are called floret. If all the flower of capitulum are same , then it is called homogamous. If two different type of floret, ray floret and disc floret are present in same inflorescence than it is known as heterogamous. In this type of inflorescence florets may be unisexual, bisexual and sterile. This inflorescence is surrounded by one or more involucre. It is most advanced type of inflorescence. *e.g.,* **Sunflower, Zinnia, Marigold**, **Cosmos**.

- Characteristic feature of asteraceae family.



CYMOSE

In this type of inflorescence, the peduncle terminate in a flower. In it the older flowers are present at tip and young buds are arranged towards base. This arrangement is called basipetal succession.

- It is of following types :

1. Uniparous cyme / Monochasial cyme –

- The peduncle ending in a flower producing lateral branch at a time of ending in flower.
- It is of two types –

(i) Helicoid cyme – When all lateral branches developed on the same side on peduncle then it is called helicoid cyme. *e.g.,* ***Heliotropium, Saraca, Atropa***, ***Datura.***

(ii) Scorpioid cyme – In it the lateral branch is alternately develop on left and right side. *e.g.,* ***Bignonia***,

2. Riphidium – In monochasial cyme all flowers are borne on same plane. *e.g.,* ***Solanum nigrum***

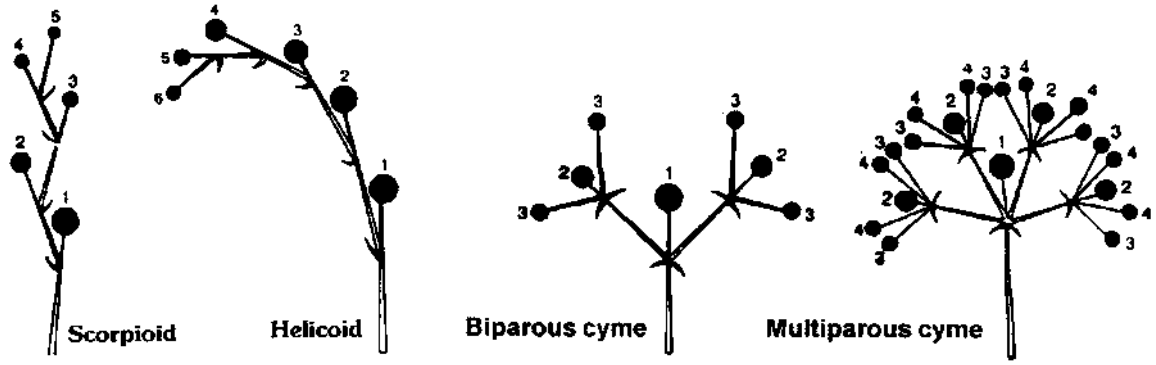
3. Dichasial or biparous cyme –

In it peduncle ends in a flower, from the basal part of peduncle two lateral branches arise, which also end in a flower, now this same arrangement occur on these lateral branches.

e.g., ***Bougainvillea,*** **Jasmine, Teak,** ***Mirabilis, Dianthus, Nyctanthes*****.**

4. Multiparous cyme / polychasial –

In it peduncle ends in a flower and from the base of it many lateral branches arise which also terminates in flower, this arrangement now also occur on these lateral branches. *e.g.,* ***Calotropis*** (Madar)**,** ***Nerium, Asclepias, Hamelia***



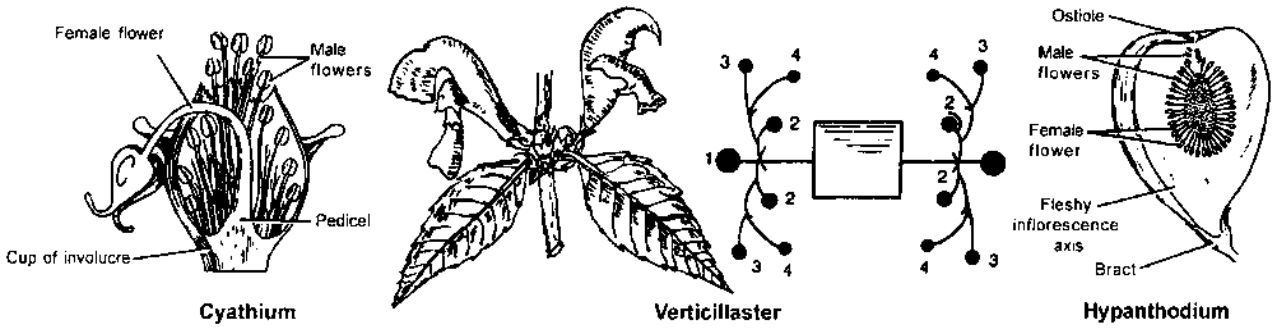
SPECIAL TYPE OF INFLORESCENCE

1. **Cyathium** – The bracts or the involucre become fused to form a cup shaped structure on the margin. In the central part of cup shaped structure a single female flowers is found, which mature earlier. Due to the growth of pedicel this come out from the cup shaped structure. Female flower are surrounded by large no. of small male flowers. The male flower, which lie toward centre mature earlier than the flower which are towards periphery. This inflorescence is found in Euphorbiaceae family like ***Euphorbia, Poinsettia, Pedilanthus***.

2. **Verticillaster -** A cluster of subsessile or sessile 3-9 flowers born on a dichasial cyme ending in monochasial cyme (scorpioid) in the form of condensed whorl on either side of the node. The opposite clusters give the appearance of whorl or verticel due to over crowding. The verticels are further arranged in a racemose manner *e.g.*, ***Ocimum*** (Tulsi), ***Salvia***. Characteristic inflorescence of labiateae family.

3. **Hypanthodium –** In it peduncle is modified in narrow cup like structure. At the base of cup female flowers develop while towards mouth male flower develops. All three types of flowers are present in this inflorescence. *e.g.,* **Banyan, Peepal, Ficus species**.

4. **Coenanthium :** In Dorsitenia, the receptacle becomes saucer shaped and its margins are slightly curved. Arrangement of florets are similar to hypanthodium.



5. **Mixed inflorescence –** Some times flowers are arranged in both racemose and cymose manner on same peduncle called mixed inflorescence.

- **Mixed spadix** – Banana
- **Cymose raceme or thyrsus** – Grapes.

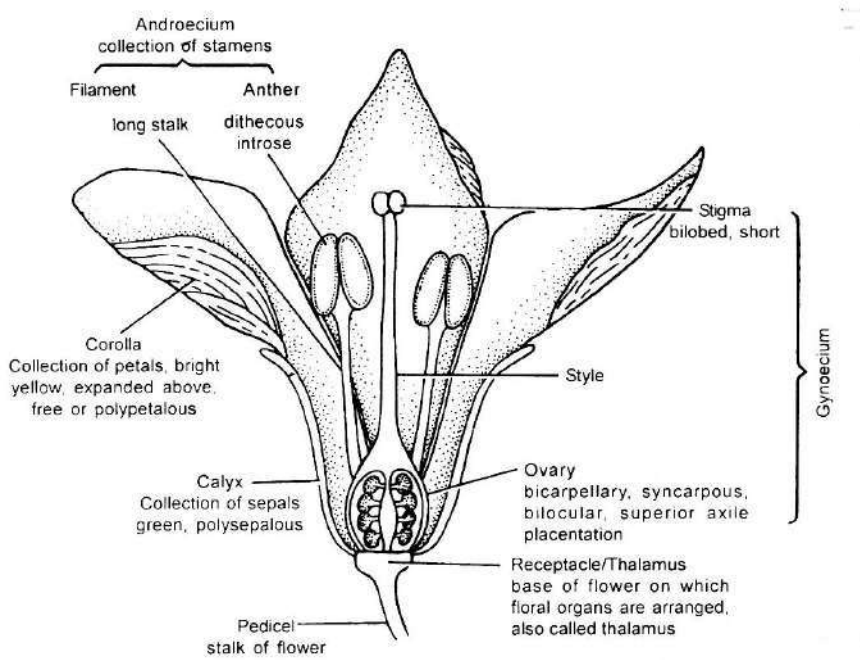
FLOWER

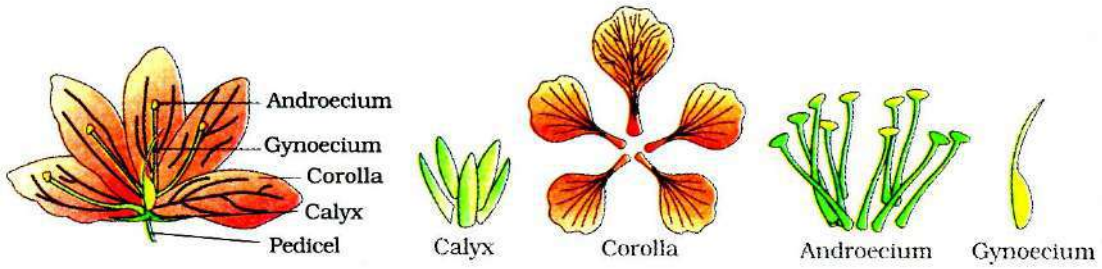
Flower is defined as highly condensed and modified reproductive shoot. The part from where flower arise is called **bract**. Flower has short or long flower stalk which is called pedicel. The upper part of pedicel is swollen, spherical shaped or conical which is called **thalamus / Receptacle**.

Floral leaves are present on it.

In a flower there are 4 type of floral leaves are found.

1. Sepal **2.** Petal **3.** Stamen **4.** Carpel





Parts of a flower

SOME WORDS RELATED TO FLOWER

- **Complete Flower –** When calyx, corolla, androecium and gynoecium are present.
- **Incomplete Flower –** Flower with one of the four whorl missing.
- **Bisexual Flower –** Both gynoecium and androecium present in the same flower.
- **Unisexual Flower –** Androecium (staminate flower) or gynoecium (Pistillate flower) any one of them are present in the flower.
- **Monoecious Plant –** When both male and female flowers are present on the same plant. *e.g.*, ***Cocos***, ***Ricinus, Colocasia, Zea, Acalypha***.
- **Dioecious Plant –** When male and female flowers are present on separate plant *e.g.*, Mulberry, Papaya.
- **Polygamous Plant –** When unisexual (male or female), bisexual and neuter flowers are present on the same plant *e.g.*, Mango, Polygonum.
- **Monocarpic Plant –** The plant which produces flowers and fruits only once in life *e.g.*, Pea, Mustard, Bamboo, Agave.
- **Polycarpic Plant –** The plants which produces flowers and fruits many times in life, *e.g.*, Pear, Mango,
- **Achlamydeous Flower –** Flowers are naked without sepals and petals *e.g.*, piperaceae.

– **Monochlamydeous Flower :** Only one accessory whorl is present (Perianth) *e.g.*, Polygonaceae, Liliaceae.

– **Dichlamydeous Flower :** Both accessory whorls present in flower.

- **Hemicyclic or Spirocyclic Flower :** Some of the floral parts are in circles and some are spirally arranged. *e.g.*, Ranunculaceae.
- **Cauliflory :**Production of flowers on old stem from dormant buds *e.g.*, ***Artrocarpus, Ficus***.
- **Symmetry of flower –** If the floral leaves are cyclic arranged in a flower, then it is called cyclic flower. If floral leaves are spirally arranged then it is called spiral flower. Floral symmetry is of three type –

(i) Actinomorphic / Radial / Regular – When flower is divided by any vertical plane into two equal halves, then it is called actinomorphic flower *e.g.*, Mustard, China rose, Datura, Chilli.

(ii) Zygomorphic / Bilateral – When the flower is divided into two equal halves only by one vertical plane, then it is called zygomorphic flower *e.g.*, Pea, Bean, Gulmohur, Cassia.

- If it is divided into two equal halves, from median plane, then it is called medianly zygomorphic, *e.g.*, **Ocimum** (Tulsi)
- But if it is divided into two equal halves, by lateral plane then it is called laterally zygomorphic

(iii) Asymmetrical / irregular – When the flower cannot be divided into two equal halves from any plane, then it is called asymmetrical flower. *e.g.*, Canna.

- **Internodal elongation in flower :**

– **Anthophore –** Internode between calyx and corolla is called anthophore. *e.g.*, ***Silane***

– **Androphore –** Internode between corolla and androecium is called androphore. *e.g.*, ***Passiflora***

– **Gynophore** – Internode between androecium and gynoecium is called gynophore. *e.g.*, ***Capparis*.**

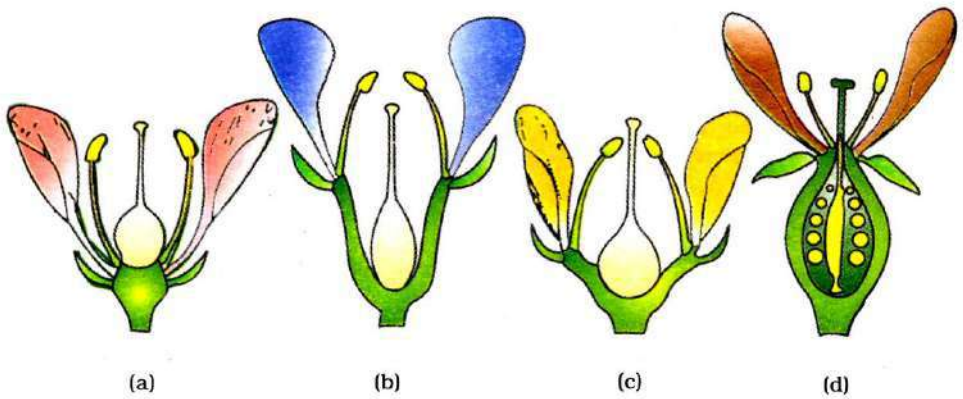
– **Gynandrophore or Androgynophore –** When both androphore and gynophore both conditions are found in same flower then this condition is called gynandrophore or androgynophore. *e.g.*, ***Cleome gynandra***.

– **Carpophore –** Elongation of thalamus beyond carpels. *e.g.*, **coriandrum**

Note : - Part of flower which lies near to mother axis is posterior part while the part which is far from mother axis is anterior part of flower.

INSERTION OF FLORAL LEAVES

1. **Hypogynous condition –** When petals, sepals and stamens are situated below the ovary, the flower is called hypogynous and in this condition ovary will be superior. *e.g.*, mustard, Chinarose, Brinjal.
2. **Perigynous condition –** In it thalamus grow upwardly and form a cup shaped structure. Gynoecium is situated in the centre and other parts of flower are located on the rim of the thalamus almost at the same level. It is called perigynous. The ovary here is said to be half inferior *e.g.*, plum, peach, rose.
3. **Epigynous condition –** The margin of thalamus grows upward enclosing the ovary completely and getting fused with it, the other parts of flower arises above the ovary, the ovary is said to be inferior and this condition is known as epigynous *e.g.*, Guava, Cucumber and ray florets of sun flower



Position of floral parts on thalamus
(a) Hypogynous (b) and (c) Perigynous (d) Epigynous

Notes :

- **Bracts :** Bracts are specialized leaves present in axis of flower.
- **Bracteate –** The flower which have bract is called bracteate flower.
- **Involucre –** The whorl of bract surrounding peduncle is called involucre.
- **Involucel –** Group of bracteole is called involucel.
- **Spathe –** In flowers when large bract completely encloses whole inflorescence, then it is called spathe. *e.g.*, Banana, Maize.
- **Petaloid bract –** When the size of bract of flower is greater than size of flower and these are of various coloured then it is called petaloid bract. *e.g.*, ***Bougainvillea.***
- **Glumes –** Small, dry, scaly bracts are called Glumes. *e.g.*, Wheat, Grass.

CALYX

- The outermost whorl of flower is called calyx. Each member of this whorl is called sepal when all the sepals are free from each other, then it is called poly-sepalous condition *e.g.*, Mustard, Radish. When the sepals are fused each other, then it is called gamosepalous condition *e.g.*, Cotton, Datura, Brinjal.
- In calyx of ***Mussaenda***, one of the sepal enlarge and form a leaf like structure. It may be white or brightly coloured. It attracts the insects and thus act as advertisement flag.
- In ***Trapa***, calyx is modified into spines and helps in protection of fruit.
- In ***Argemone*** spines are present on the surface of sepal which protect the flower bud.
- In larkspur and Balsum, the posterior part of sepal is modified into a narrow tube. This structure is called sepal spur. Nectar is stored in it for insect attraction.
- In asteraceae family, sepals are modified into hairy structure. It is called pappus. The pappus is a modified calyx and helps in dispersal of fruit.

DURATION OF SEPALS

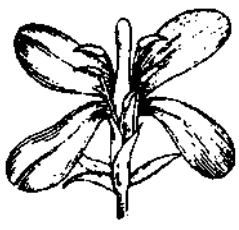
+ **Caducous** – Sepals fall just at the time of opening of flower bud. *e.g.*, Poppy.
+ **Deciduous** – Sepals fall after pollination *e.g.*, Mustard
+ **Persistant** – If sepals do not fall and remain attached to fruit. *e.g.*, Tomato, Capsicum, Brinjal, Cotton, Datura.
* Sometime below calyx, a whorl similar to sepals is found which is called epicalyx. *e.g.*, Malvaceae family

COROLLA

- The second whorl of flower is called corolla and each member of it is called Petals. When the shape and size of petals are similar then it is called symmetrical while when they are not similar then they are asymmetrical. When all the petals are free, then it is called polypetalous while when petals are fused, then it is called gamopetalous.
- **Forms of Corolla -**

1. Polypetalous :

- **Cruciform** – 4 petals are present in it. The lower narrow part of petal is called claw while the outer broad part is called limb. These petals are arranged crosswise. *e.g.*, **Radish, Mustard**.
- **Caryophyllaceous** – It consists of 5 petals the claw of petals are short and the limb of petals from right angle to the claw *e.g.*, **Dianthus.**
- **Rosaceous –** It consist of 5 or more petals. Claws are absent in it and limbs are spread regularly outwards. *e.g.*, Rose, Coconut.



Cruciform

Caryophyllaceous

Rosaceous

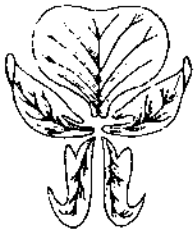
2. Gamopetalous :

- **Campanulate** – Five petals are arranged like bell. *e.g.*, **Tobacco, Raspberry, Campanula**.
- **Funnel shaped or infundibuliform** – Funnel like petals arrangement *e.g.*, **Datura, Railway creeper**.

- **Tubular –** Petals are like tube *e.g.,* **Disc florets of sunflower**.

3. Zygomorphic polypetalous corolla -

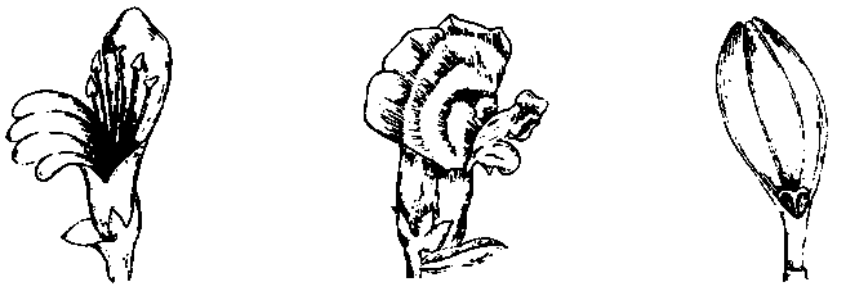
- **Papilionaceous –** Five petals are present. It's posterior petal is largest and is known as **standard** or **vexillum**. Vexillum covers two lateral petals which are called as wings and the innermost basal petals are united to form a keel or carina. Both lateral parts covers the keel. *e.g.*, **Pea, Gram, Arher**



Papilionaceous

4. Zygomorphic gamopetalous corolla –

- **Bilabiate –** The petal of gamopetalous corolla is divided into two lips. The place between two lips is called **corolla mouth**. *e.g.*, ***Ocimum, Salvia*.**
- **Personate –** In this case the corolla is bilabiate but the two lips are near to each other *e.g.*, ***Antirrhinum***
- **Ligulate –** The upper part of corolla is long, flattened which is attached with short narrow tube. *e.g.*, **Ray florets of sunflower**.



5. Aestivation -

- The mode of arrangement of sepals or petals in floral bud with respect to the other members of the seme whorl is known as aestivation. It is of following types –

(i) Valvate – When the petal of a whorl lie adjacent to each other petal and just touches it. *e.g.*, ***Calotropis*, Custard-apple, Mustard.**

(ii) Twisted – In it one part of a petal covers adjacent petals and the other part is covered by posterior petal. One margin of the petal overlaps that of the next one, and the other margin is overlapped by the third one. *e.g.*, Cotton, Ladyfinger, Chinarose

(iii) Imbricate –

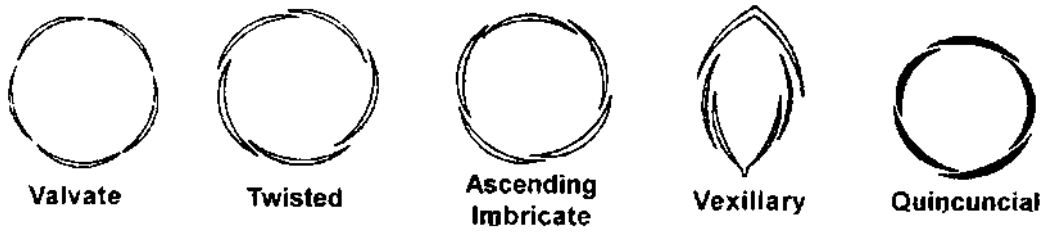
- When both margin of the one petal are covered by the others two petals and both margin of another one, covers other, Rest are arranged in twisted manner.
- It is of two types –

(a) Ascending imbricate – The posterior petal is innermost i.e., its both margins are overlapped. *e.g.*, ***Cassia*, *Bauhinia***, Gulmohur etc.

(b) Vexillary or Descending imbricate – The anterior petal is innermost and posterior petal is outermost & largest. *e.g.*, Pea, Bean.

(iv) Quincuncial –

It is a modification of imbricate type. Out of the five petals, two are completely internal, two completely external and in the remaining petal, one margin is internal and the other margin is external. *e.g.*, ***Murraya, Ranunculus***.



6. PERIANTH

- When there is no distinction between calyx and corolla the whorl is described as perianth.
- Individual perianth segments are called **Tepals**. Green tepals are called **sepaloid** and coloured tepals are called **petaloid**. Tepals are free (polytepalous) or fused (gamotepalous). *e.g.*, ***Liliaceae*** and ***Graminae*** family

ANDROECIUM

- It constitutes the third whorl of the flower and is made up of one or more stamens. Each stamen consist of filament, anther and connective. Each anther is usually bilobed and each lobe has two chambers the pollensac. The pollen grains are produced in pollensac.

A. Attachment of filament to anther lobe :

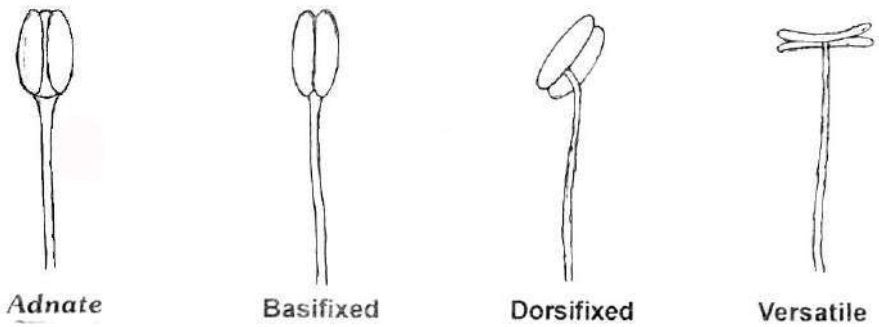
- The attachment of filament to another lobe is of 4 type –

(i) Adnate – Filament runs through the whole length of the anther from the base to the apex. *e.g.*, ***Michelia*** (Champa)**,** ***Magnolia***

(ii) Basifixed – Filament is attached to anther by its base. *e.g.*, **Datura, Radish, Mustard.**

(iii) Dorsifixed – The filament is attached at the centre to the back of the anther. *e.g.*, **Passion flower**

(iv) Versatile – Filament attached to the back of the anther at a point only, thus the anther can swing freely. *e.g.*, Wheat, grass, maize.



B. Cohesion of stamens :

When the floral parts of similar whorl are fused, then it is called **cohesion**. When the stamens of an androecium are free from one another, it is called **polyandrous condition**.

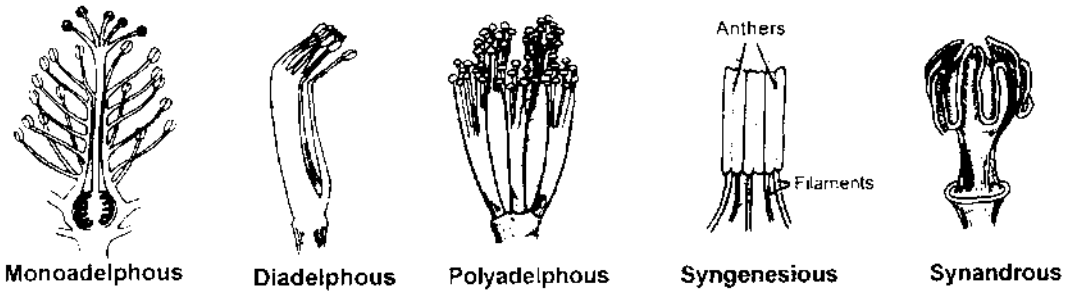
(i) Adelphous : when stamens are united by their filament only, it is called adelphous. It is of following types–

- **Monoadelphous** – When all the filaments are united into a single bundle but anthers are free from each other. In this type of cohesion a tube is formed around the gynoecium which is called staminal tube *e.g.*, Cotton, Hollyhock, Ladyfinger.
- **Diadelphous –** When the filaments are united in two bundles but the anther remains free *e.g.*, Gram, Pea, Bean

  In these plants from 10 stamens, 9 stamens are arranged in bundle while 1 remains free.
- **Polyadelphous –** When filaments are united into more then two bundles. *e.g.*, Citrus, Castor.

(ii) Synandrous – When anthers as well as filaments of stamens are united through their whole length. *e.g.*, ***Colocasia, Alocasia, Momordica,*** Cucurbitaceae family

(iii) Syngenesious – In it only anthers are united in bundle but filaments remain free *e.g.*, Compositae family



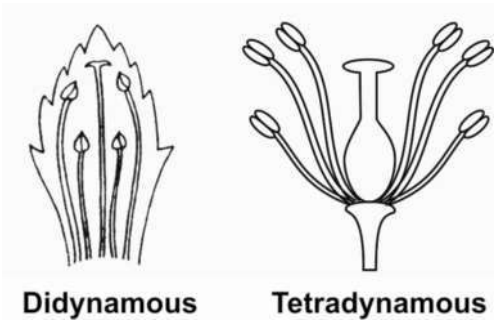
C. Adhesion of stamens :

When the stamens are attached to other parts of flower, then it is called adhesion of stamens.

- **Epipetalous –** When stamens are attached to petals. *e.g.*, Brinjal, Datura, Tobacco, Sunflower, Potato.
- **Epiphyllous –** When stamens are attached to tepals. *e.g.*, Onion, Lily.
- **Gynandrous** – When stamens are attached to gynonecium either throughout their whole length or by their anther *e.g.*, ***Calotropis***.

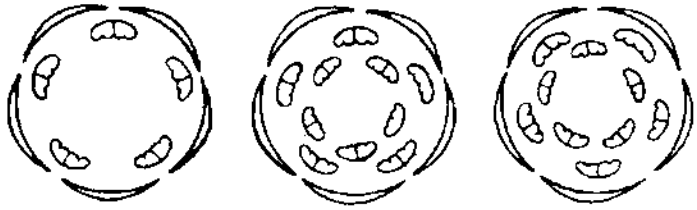
D. Length of stamens :

- **Didynamous –** When four stamens are present, out of them two are long and two are short, then it is called didynamous. *e.g.*, Labiatae family.
- **Tetradynamous –** When there are six stamens and they are arranged in two whorls. In outer whorl, there are two short stamens while in inner whorl, there are four long stamens, this condition is called tetradynamous. *e.g.*, Cruciferae family.



Note –

- **Inserted –** When the stamens are smaller than corolla. *e.g.*, Datura
- **Exserted –** Stamens are longer than corolla and are radially outward. *e.g.*, Gulmohar.
- **Diplostemonous –** The stamens are double the number of petals and present in two whorls. The outer whorl of stamens is alternating with petals (alternipetalous), while inner whorl is opposite to petals (antipetalous). *e.g.*, **Liliaceae family.**
- **Obdiplostemonous –** It is reverse of diplostemonous. The outer whorl of stamen is opposite to petals, while inner whorl of stamen is alternating with petals. *e.g.*, **Caryophyllaceae.**



- **Isostemonous or Haplostemonous –** In such type of condition stamens are present in single whorls. No. of stamens is equal to no. of sepals and petals and generally whorl of stamens is alternating with petals.
- **Heterostemonous –** Stamens are of different length in some flowers.
- **Staminodes –** When stamens are without pollen grains & remain sterile through out life are called staminodes e.g. ***Salvia verbascum***.

GYNOECIUM (PISTIL)

- It is the fourth and second essential whorl of the flower. It is female part of the flower comprising of the inner whorl of megasporophylls in the form of carpels bearing ovules. It consists of ovary, style and stigma. Ovary is the enlarged basal part, on which lies the elongated tube the style, the style connects the ovary to the stigma. The stigma is usually at the tip of the style and is receptive surface for pollen grains. The gynoecium may be monocarpellary or multicarpellary.
- If only one carpel is present in gynoecium this condition is called monocarpellary.
- If more than one carpel is present in gynoecium this condition is called polycarpellary.
- If all the carpels in polycarpellary / multicarpellary condition are free, then condition is called apocarpous.
- If all the carpels are fused together, then condition is called syncarpous.

COHESION OF CARPEL

- In syncarpous gynoecium four types of cohesion are found :

(a) When ovaries are fused, but stigma and style are separated with each other, *e.g.*, **Dianthus, Plumbag**

(b) Ovary and style are fused, but stigma are not fused. Malvaceae family. ***Hibiscus rosasinensis,*** cotton.

(c) When stigma are fused but the ovary and style are free. *e.g.*, ***Calotropis, Cassia fistula, Nerium*****.**

(d) Carpels are completely fused. This condition is found in max. flowers, *e.g.*, **Mustard, Radish, Tomato**.

PLACENTATION

- The ovules are attached on ovary walls on one or more cushion called placenta. The arrangement of ovule within ovary wall is known as placentation. It is of following types –

(i) Marginal : Marginal placentation is found in unilocular ovary. The placenta forms a ridge along the ventral suture of the ovary and the ovules are borne on this ridge forming two rows. *e.g.*, Leguminosae.

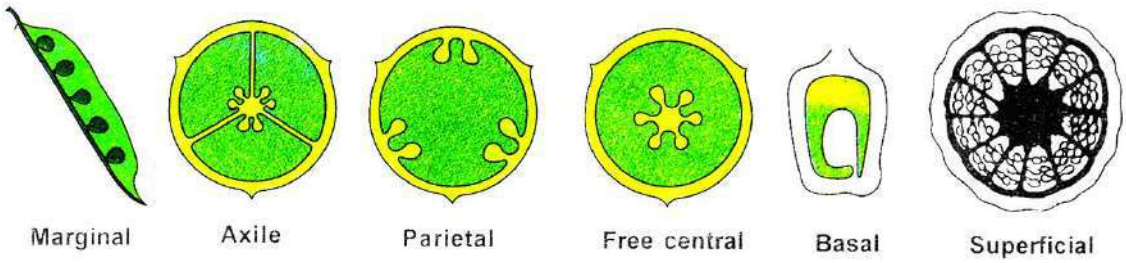
(ii) Parietal : This type of placentation is found in unilocular syncarpus ovary. In it the ovule develops on the innerwall of the ovary or on peripheral part. Ovary become bi or multilocular due to formation a false septum *e.g.*, ***Cucurbita, Argemone,*** and Cruciferae family (Mustard)

(iii) Axile : It is found in multicarpellary syncarpous gynoecium. The fusion margin of carpels grown inward and meet in the centre of the ovary. Thus an axis forms in the centre of ovary, thus ovary becomes multichambered. The ovules are born at the central axis. Number of these chambers are equal to the number of carpel ***e.g.*****, Potato, China rose, Onion, Lemon, Orange, Tomato**.

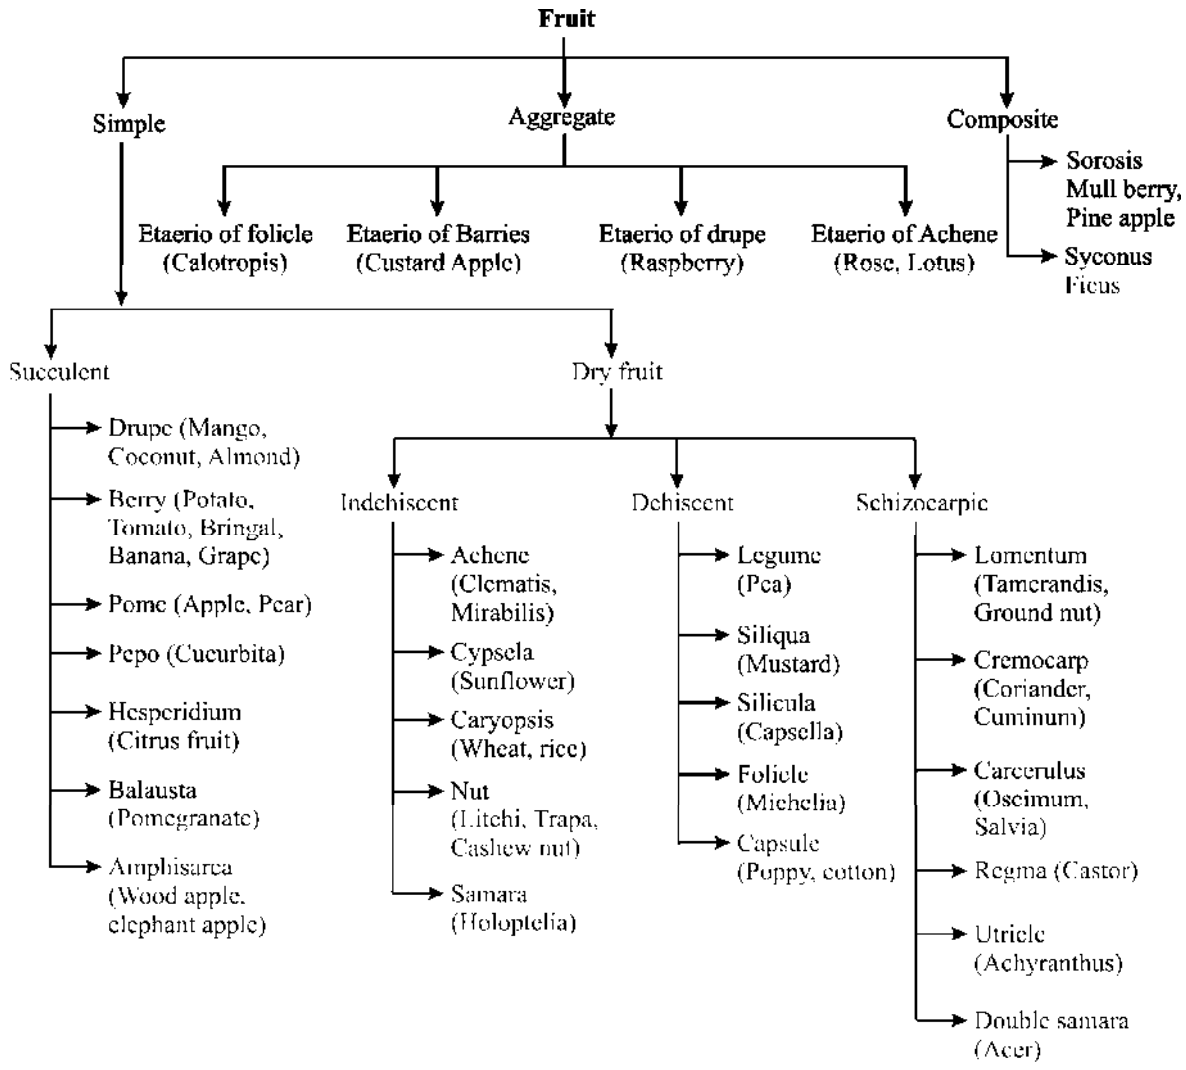
(iv) Free central : This type of placentation is found in syncarpous gynoecium. In it, the ovary is unilocular and the ovules are borne on the axis in the centre of the ovary. septum are absent in ovary. Placentation is axile in beginning. After sometimes walls of chamber destroy and only ovulated central axis left. *e.g.*, **Primrose, Dianthus (Caryophyllaceae)**

(v) Superficial – This type of placentation is found in multicarpellary syncarpous gynoecium. The ovules are attached on the walls of locule *e.g.*, **Nymphea** (Water lily)

(vi) Basal : The ovary is unilocular and a single ovule is borne at the base of ovary. *e.g.*, Marigold, Sunflower (Asteraceae family).



FRUIT



- Fertilized and ripened ovary is fruit. A Fruit consist of (i) Pericarp (fruit wall), (ii) seed.
- The seeds are protected inside fruit. But in some fruits, seeds are not found like in grapes, banana and such type of fruits are seedless fruit.
- If a fruit is formed without fertilization of the ovary it is known as **parthenocarpic fruit**.

PERICARP

- After ripening, the ovary wall change into pericarp. This pericarp may by thick and fleshy or thick and hard or thin and soft.
- Pericarp is differentiated in 3 layers

(i) Epicarp :- It is the outermost layer, which is also called rind

(ii) Mesocarp :- It is the middle layer.

(iii) Endocarp : It forms the innermost layer.

TRUE FRUIT :

When the fruit is developed only from the ovary, the fruit is called as **true fruit**. *e.g.*, Mango, Coconut, ***Zizyphus***

FALSE FRUIT OR PSEUDOCARP :

- In some fruits, in place of ovary, some other parts of flower like thalamus, inflorescence, calyx are modified to form a part of fruit. These types of fruit are called **false fruits**. *e.g.*, Apple, Strawberry, Pear.

CLASSIFICATON OF FRUIT

- Fruits are divided in three groups :

1. Simple **2.** Aggregate **3.** Composite

1. SIMPLE FRUIT :-

- These fruit develop from monocarpellary ovary or multicarpellary syncarpous ovary. Only one fruit is formed by the gynoecium. Simple fruits are of two types –

(A) Fleshy fruit **(B)** Dry fruit

A. Fleshy Fruit:- These fruit develop from superior or inferior syncarpous gynoecium. These may be unilocular or multilocular. These fruits are indehiscent. Dispersal of seeds occur after pericarp is destroyed.

- Fleshy fruits are of following types :

(i) Drupe fruit :- These fruit develops from mono or multicarpellary, syncarpous, superior ovary. In these fruits endocarp is hard and stony so these fruits are also called stony fruits. *e.g.*, Mango, coconut almond, Peach walnut, plum. Brachysclereids are present in endocarp.

In mango edible fleshy part is mesocarp and the part where seed is protected is called as **endocarp**.

In ber, epicarp and mesocarp both are edible part.

The rind of Almond and walnut are endocarp and their edible part is seed.

In coconut epicarp is hard and thin while mesocarp is thick and consist of hard fibers The endocarp is hard and seed is protected in it. Endosperm is edible in coconut.

(ii) Berry : These fruits develop from mono or multicarpellary syncarpous ovary. Ovary may be superior or inferior, Placentation is axile or parietal. In these epicarp is thin and seeds are embedded in fleshy part.

Initially seeds are attached with placenta of fruit but after maturation these seeds are deteched with placenta and are spread randomly in fleshy part.

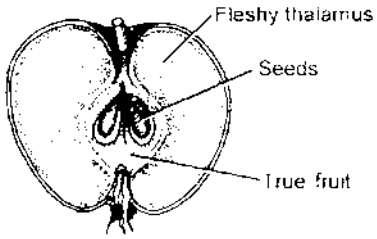
- Plants with superior ovary = Tomato, Grapes, Brinjal.
- Plants with inferior ovary = Guava, Banana

Date palm is one seeded berry. In it pericarp is divided into epicarp, mesocarp and endocarp. Epicarp is thin and soft while mesocarp is thick and fleshy and endocarp is thin like a membrane. Which is attached with seed.

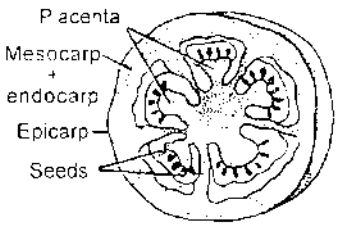
Arecanut is one seeded fibrous fruit berry. When its thick fibrous layer is removed then seed comes out which is hard.

(iii) Pepo - These fruit develops from tricarpellary, syncarpous and inferior ovary. This fruit is unilocular and have parietal placentation. These fruits are fleshy and spongy. sometime fruits are bitter in taste due to presence of tetracyclic triterpine in flashy pulp. *e.g.,* fruits of cucurbitaceae family.

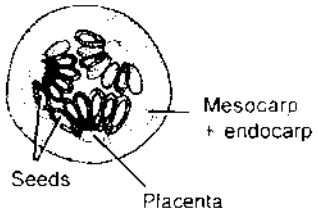
(iv) Pome - This fruit develops from bi or multicarpellary syncarpous inferior ovary. The rind and fleshy pulp are made up of thalamus. The main part of ovary is hard and dry and remain inside the fruit. Seeds are present in it. *e.g.,* Apple, Pear.



L.s. of Apple

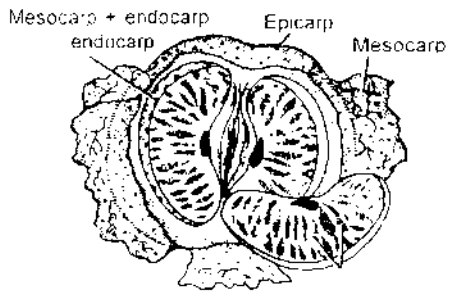


L.s. of Tomato

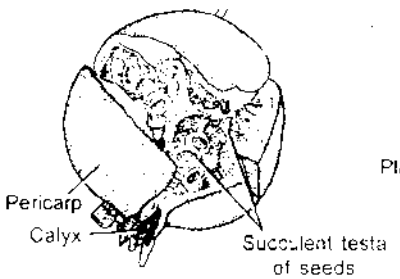


T.s. of Cucumber

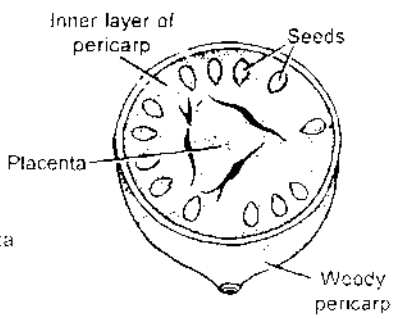
- **Hesperidium :** This fruit develops from multicarpellary, syncarpous, superior ovary. This fruit is specialy found in plants of Rutaceae family. *e.g.,* Orange, Lemon, Citrus fruit.
  Epicarp of these is made up of thick rind which is leathery and many oil glands are found in it. Mesocarp is white fibrous structure which is attached with epicarp. Membranous endocarp projects inward and form many chambers. Many glandular hairs are present on the inner side of endocarp. These glandular hairs are only edible parts.
- **Balausta :** It is a multilocular multiseeded fruit, which develops from inferior ovary. Its pericarp is hard. Persistent calyx is arranged in the form of crown. Seeds are irregularly arranged on placenta. Endocarp is hard. Testa is fleshy. This is the edible part of fruit. *e.g.,* Pomegranate **(*Punica granatum*).**
- **Amphisarca :** This fruit is multicarpellary and multichambered which develops from superior ovary. Pericarp is hard and fleshy placenta is found in them. The inner part of pericarp and placenta is edible part of fruit. Testa of seed is mucilegenous *e.g.,* wood apple **(*Aegle marmelos*),** elephant apple.



Hesperidium of orange



Balausta of pomegranate



Amphisarca of wood apple

B. Simple Dry Fruit - Pericarp of simple dry fruit is hard and dry and not differentiated into epicarp, mesocarp and endocarp. Such fruits are called **dry fruit**.

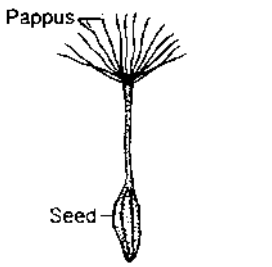
- Simple dry fruits can be divided into following three groups :

  (i) Indehiscent **(ii)** Dehiscent **(iii)** Schizocarpic

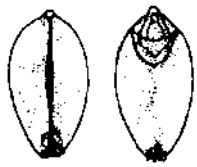
(i) Indehiscent fruits : These simple dry fruits are generally of small size and single seeded pericarp does not rupture even after maturity.

- **Cypsela :** It is a small, single seeded dry fruit which develops from bicarpellary, syncarpous inferior ovary. Pericarp and seed coat are free from each other. In these fruits a bunch of hair is attached with the fruit which is known as Pappus. Pappus helps in fruit dispersal. *e.g.,* Compositae family Plants.
- **Caryopsis :** These are small, single seeded dry fruits. It develop from monocarpellary, superior ovary. Pericarp of these fruits is fused with the seed coat and form a joint surface. These fruits are present in family gramineae. Wheat grain or rice grain is a fruit.
- **Achene :** These are single seeded fruit which develops from monocarpellary superior ovary. In it, pericarp is free from the seed coat *e.g.,* ***Clematis, Mirabilis, Boerhaavia***
- **Nut :** This is a single seeded fruit which develop from monocarpellary syncarpous superior ovary. In it pericarp is hard *e.g.,* ***Quercus*** (oak), ***Anacardium occidentale*** (Cashewnut) ***Trapa***, (Water chest-nut), Litchi.

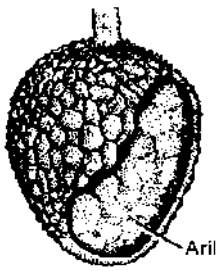
  In Litchi epicarp and mesocarp is fused and give leathery apperence. Endocarp is membrane like thin. Outer seed coat grows forward and forms an additional coat around the seed which is called as aril. In mature fruit, this aril is fleshy and is only edible part.
- **Samara :** These are dry indehiscent one seeded feathery fruit. It develops from bi or tri carpellary, syncarpous and superior ovary. The main character of these fruits is wing like structure develops from its pericarp which helps in dispersal. *e.g.,* ***Holoptelia***.



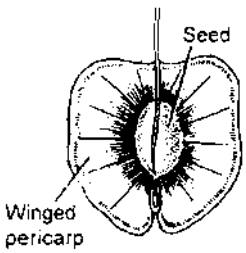
Cypsela of sunflower



Caryopsis of wheat



Nut of Litchi



Samara of Holoptelia

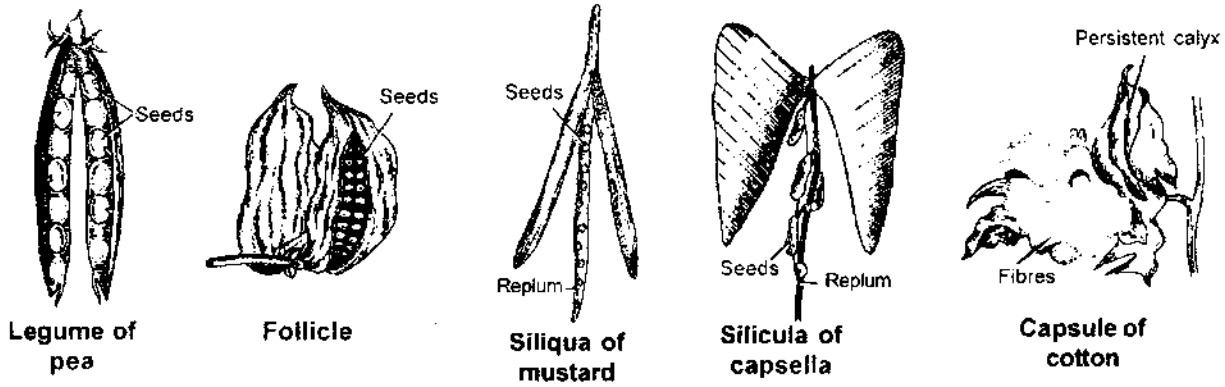
In ***Shorea robusta*** wing develops from calyx instead pericarp and these fruit are called **samaroid**.

(ii) Dehiscent Fruits : After ripening pericarp are ruptured and seeds are dispersed outside.

- **Legume or pods :** These fruits develop from monocarpellary, unilocular, superior ovary. It is generally long and multiseeded fruit. Dehiscense of fruit occurs at both sutures i.e. Dorsal and ventral side. Dehiscence start from apex and reaches to basal part. *e.g.,* Pea, Beans.

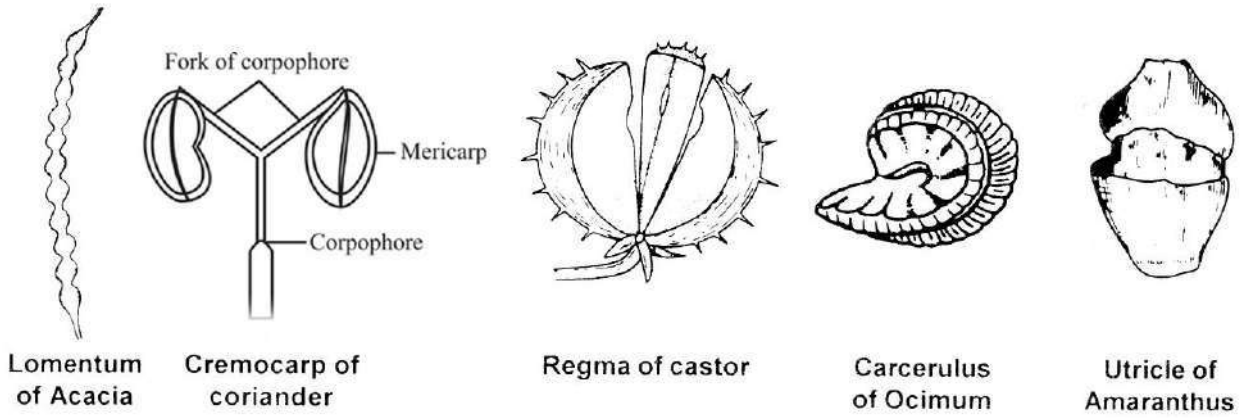
  When only one or two seeds are present in fruit, then it is also called as pod.
- **Follicle :** It is also multiseeded fruit which develops from superior unilocular, monocarpellary ovary but the dehiscence of it occur only at ventral suture. *e.g.,* ***Asclepias, Rauwolfia, Vinca, Michelia*** (Champa), ***Delphinium***.

- **Siliqua :** This fruit develops from bicarpellary, syncarpous superior ovary with parietal placentation. Dehiscence occurs at both dorsal and ventral suture and starts from lower part and proceeds upward. Due to formation of false septum ovary become bilocular. On false septum, seeds are attached, This type of fruit is found in Cruciferae family. *e.g.,* Mustard.
- **Silicula :** A short broad siliqua is known as Silicula. It is also found in Cruciferae family. *e.g.,* Candytuft (***Iberis amara***), Capsella,
- **Capsule :** This is dry multichambered and multiseeded fruit and develop from multicarpellary syncarpus, superior ovary. In it, Axile placentation is found and dehiscence occurs by various methods. Poricidal (Poppy), loculicidal (cotton), septifragal (Datura), septicidal (Lineseed).



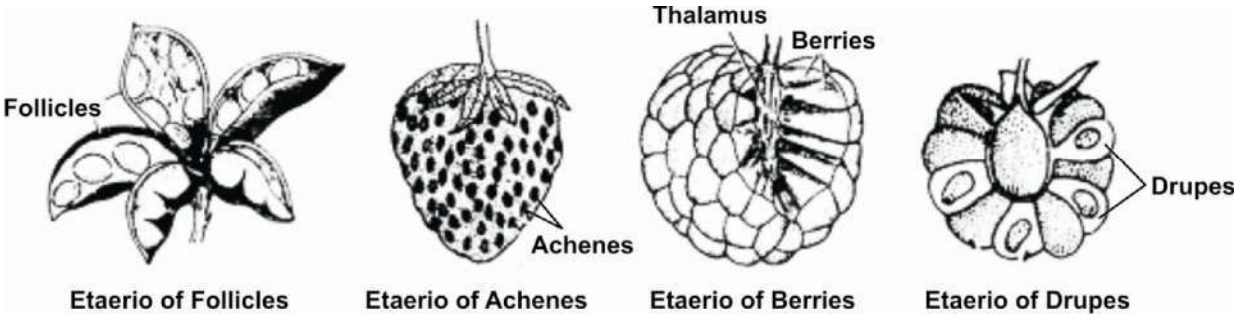
(iii) Schizocarpic fruit : It is a multiseeded fruit. After ripening, it is devided into mericarp and seeds come out after destruction of pericarp. The fruits develop from mono or bi or multicarpellary superior or inferior ovary. The mericarp contains one or two seeds.

- **Lomentum :** It develops like legume. Fruits are constricted or divided in one seeded mericarp, after maturity these are separated with each other. Eg ***Tamarind, Cassia fistula, Mimosa pudica, Archis hypogea, Desmodium***.
- **Cremocarp :** It is a double seeded fruit and develops from bicarpellary, syncarpous, inferior ovary. On maturation, it dehisces from apex to base in such a way that two mericarp forms and each contain one seed. These mericarp are attached with carpophore. Carpophore is the extended part of receptacle. *e.g.,* **Coriander, Cuminum, Foeniculum.**
- **Regma :** This fruit develops from tri to pentacarpellary, syncarpous superior ovary. In it three locules are present and its fruit is breaks into three one seeded part. Each part is known as coccus. At the outer end of pericarp, spines are found. *e.g.,* Euphorbiaceae family, Castor has three cocci Geranium has 5 cocci.
- **Carcerulus :** It is a dry fruit which develops from multi carpellary or bicarpellary, syncarpous, superior ovary. Number of mericarp is more than locules because of formation of false septum. It divides into four one seeded locules. *e.g.*, ***Ocimum*** (Basil), ***Salvia.***
  In hollyhock and abutilon (family malvaceae), the no. of locules is more than four.
- **Utricle :** It is a single seeded fruit which has thin membrane. It dehiscence generally from cap. It develops from bicarpellary, unilocular, syncarpous, superior ovary. *e.g.*, ***Achyranthes, Amaranthus.***
- **Double Samara :** It develop from bicarpellary syncarpous superior ovary. Pericarp develops into two wings. On maturation it divides in two single seeded mericarp eg . samara , acer.



AGGREGATE FRUIT

- These fruits develop from multicarpellary apocarpous ovary. Because in apocarpous ovary, each carpel is separated from one another, therefore it forms a fruitlet. These fruits are made up of bunch of fruitlets which is known as **etaerio**.
- **Etaerio of follicles :** Each fruitlet is a follicle. *e.g.,* ***Calotropis, Catharanthus, Magnolia*.**
- **Etaerio of achenes :** In this aggregate fruit, each fruitlet is an achene. *e.g.,* ***Rananculus***, Strawberry, Rose, Lotus
- **Etaerio of berries :** It is an aggregate of small berries. *e.g.,* ***polyalthia, Annona squamosa*** (Custard-apple). In etaerio of Anona all the berries are arranged densly on thalamus.
- **Etaerio of drupes :** In this type of fruit, many small drupes develop from different carpels. *e.g.,* Raspberry



COMPOSITE FRUIT

- All composite fruits are false fruits.
- This type of fruit differ from aggregate fruit that in place of single ovary many ovaries and other floral parts combine together to form fruit. In composite fruits, generally whole inflorescence is modified into fruit. These are of two types.

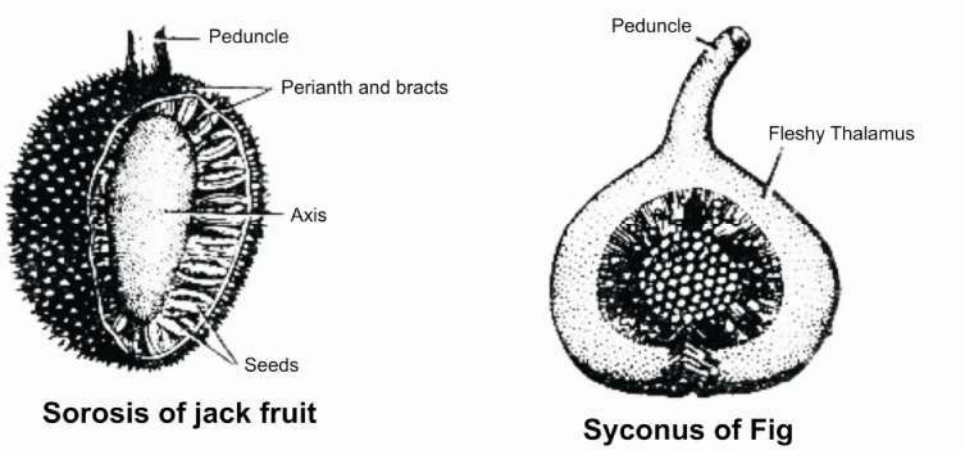
(i) Sorosis : This fruit develops from spike, spadix or cartkin inflorescence. Peduncle become thick spongy and woody. *e.g.*, Jack fruit, ***Pandanus*** **(screwpine)**, Pineapple

In jack fruit (Kathal) pistillate flowers are developed around the peduncle. In fruit formation pericarp become spongy and fused.

In Pine apple peduncle bracts and perianth become fleshy. Due to the fusion of perianths of flower a composite fruit is formed.

In mulberry perianth become fleshy and calyx of every flower becomes thick, sweet and fleshy and are edible.

(ii) Syconus : This fruit develops from hypanthodium inflorescence. *e.g.*, **Ficus** species like fig, Peepal



Geocarpic fruit : When fruit development occurs inside soil e.g. **ground nut**

DISPERSAL OF FRUIT AND SEED

- The seeds falling directly under the mother plant have to germinate and develop under limited food supply and space. To overcome this problem, the fruits and seeds have developed several special devices for wide dispersal.
- The natural agents like wind, water, animals and even mechanism of dehiscence in some fruits, help the seeds and fruits to disperse from one place to another, and to long distances from the parent plant.

1. WIND (Anemochory) :

- In the species where the seeds are light in weight or have some accessory part to help dissemination, are dispersed by the air current.
- The seeds of Drum-stick and Cinchona, and fruits of yam, maple and sal tree, are having appendages in the form of thin, flat and membranous wings, which help them to float in the air and be carried away to long distances.
- In the members of Asteraceae, the calyx is modified into hair like structures called pappus. They persist in fruit and open out like umbrella, helping the seeds to float in the air.
- In poppy and prickly poppy (Argemone), the fruit dehisces and seeds are thorwn out to a distances away from the parent plant. (Censor mechanism)
- The seeds of Calotropis, Alstonia and cotton are provided with hair and cover sufficient distances alongwith the wind.
- The seeds of orchids and some grasses are very small and light in weight and may be easily carried away by wind to far off places.
- In fruits of physalis swollen persistant calyx is present and fruit can easily be carried out by air.
- Some plant like chenopodium, amaranthus etc. are uprooted after drying and carried away by wind and seeds are dispersed distantly. These plants are known as tumbler weed.

2. WATER (Hydrochory) :

- The fruit and seeds with specialised devices which may be in the form of spongy and fibrous outer walls as in coconut and spongy thalamus as in lotus, and small seeds with airy aril as in water lily, float very easily in water and are carried away to long distances with the water current.

3. ANIMAL (Zoochory) :

- The fruit and seeds with hooks, spines, bristles, stiff hair, etc., get attached to the body of animals and are carried away by them to distant places.
- Fruits of ***Xanthium*** and ***Urena*** bear curved hooks.
- Spear grass has a bunch of stiff hair.
- ***Tribulus*** has sharp and rigid spines.
- ***Boerhaavia*** has sticky hair, which help their dispersal by animals. In *Martynia* two curved hooks are present.
- The edible fruits like guava, grape, fig and plum are dispersed by birds and even human beings by feeding on them and passing out undigested seeds with faeces or by carrying them to other places for later feeding.

4. DEFENSE MECHANISM IN PLANTS :

- These specialized structures, organs, substances and adaptations which protect the plants from destroying by animals, insects and disease carriers are called as defence mechanism in plants. Some of these are as follows:
- Epidermis, periderm, cork and bark.
- Trichomes, hairs and spines.
- Laticiferous glands or ducts.
- Secretory glands.
- Taste of different plant parts.
- Underground plant parts.
- Myrmecophily
- Colour, shape and structure of plants.

5. Epidermis, Periderm, Cork and Bark :

- Epidermis acts as a protective layer which saves internal tissues from being damages by high temperature, microbes, acidic rain and high wind velocity etc.
- In ***Vanda*** (orchid), ***Nerium, Peperomia*** etc. it is multilayed. In ***Peperomia,*** it consists of 14 to 15 layers of cells.
- All parts of a plant except root, have a layer of wax-like substance or cutin on the outer surface of the epidermis. This layer is known as cuticle.
- In ***Cycas*** and ***Pinus*** the cuticle is lignified.
- On aerial parts of ***Equisetum*** and members of grass family silica or silicon oxide is found which protect them from grazing animal.
- On epidermis of some plants wax, oil, resin crystallized salts, silica, lignified substances etc. are deposited.
- In woody plants periderm is present which is a secondary epidermal tissue and is formed by activity of the phellogen. Here the cork is a protective layer.
- Bark is the tertiary epidermal tissue found in woody plants. Its main function is to protect the internal tissues from mechanical injury.

6. Trichomes, Hairs and spines :

- Leafy epidermal hairs regulate atmospheric humidity,
- Covering hairs protect plants from disease causing insects
- Glandular epidermal hairs secrete some chemical substances to protect them from animals.
- Stinging hairs pierce the skin of animals and secrete poisonous substances which cause irritation and protect the plants from animals. *e.g.,* ***Urtica diocea.***
- Spiny stipules and spines found in xerophytes protect these plants from grazing animals. *e.g.*, ***Zizypus, Acacia***.
- Spines of ***Euphrbia*** act as defensive devices against grazing animals.
- Prickles of ***Capparis, Bombax*** and rose and needle like hairs of cacti save these plants from animals.

7. Laticiferous glands or Ducts :

- Woody plants of arid and semi arid areas secrete a white milky fluid which is called **latex**.
- It is a viscous fluid which contains various substances like water, hydrocarbons, resins, oils, proteins, acids, salts, sugars and rubber in suspended form. It is found in members of family Moraceae, Euphorbiaceae, Apocyanaceae etc. Latex help in protection of these plants from animals. The latex secreted by plants of ***Calotropis*** is poisonous.

8. Secretory glands or cells :

- They are filled with different types of excretory or secretory substances such as oils, tannins, gums, mucilage and different type crystals.
- Smell of oily substances secreted by oil glands present in the leaves and bark of **Eucalyptus** and pericarp of lemon fruit protect these plants from animals.

9. Taste of different plant parts :

- Aerial parts like fruits, seeds leaves, branches and bark of some plants contain different type of alkaloids or excretory substances which are repulsive or bitter in taste and are disliked by animals e.g. ***Azadirachta indica, Momordica charantia, Trigonella, Ocimum sanctum, Datura stramonium, Papaver somniferum, Mentha arvensis, Nicotiana tabacum, Carica papaya, Cinchona officinalie*** etc.

10. Underground plants :

- In some plants, plant parts remain under the soil i.e. out of reach of grazing animals e.g. underground modified roots of radish **(*Raphanus sativus*),** carrot **(*Daucus carota*), turnip (*Brassica rapa*), chukandar (*Beta vulgaris*), heeng (*Ferula asafoetida*)** etc. underground modified stems of potato **(*Solanum tuberosum*),** arbi **(*Colocasia antiquoru*m),** onion **(*Allium cepa*),** garlic **(*Allium sativum*).** ginger **(*Zingiber officinale*),** turmeric **(*Cucrcuma domestica*)** etc. and underground fruits of ground nut **(*Arachis hypogea*).**

11. Myrmecophily :

- Gauva **(*Psidium guajava*),** mango **(*Mangifera indica*),** litchi **(*Litchi chinensis*),** mulberry **(Morus alba)** etc. secrete some substances which attracts some ants. These ants take their abode on these plants and act as bodyguards against any animal attack. This relationship is called myrmecophily.

12. Colour, shape and structure of plants :

- Certain plants strickingly resemble some dreaded animals so that they are carefully avoided by other animals. This is known as mimicry e.g. plants of ***Caladium*** and ***Sensviria*** resemble spotted serpents.

SOME FRUIT & THEIR EDIBLE PART

S.No.	Fruit	Type of fruit	Edible part
1.	***Abelmoschus esculentus*** / Lady's Finger	Capsule	Whole fruit (vegetable)
2.	***Achrus sapota***/Cheeku	Berry	Mesocarp and endocarp
3.	***Aegle marmelos***/Wood Apple	Amphisarca	Pulpy endocarp (inner pericarp) and placentae.
4.	***Anacardium occidentale***/Cashewnut	Nut	Cotyledons and Peduncle
5.	***Ananas comosus*** = Pineapple	Sorosis	Outer fleshy axis, bracts fused perianth & Pericarp
6.	***Annona squamosa***/Custard Apple	Etaerio of Berries	Mesocarp (Pericarp)
7.	***Arachis hypogea***/Ground nut/Peanut	Lomentum	Seeds/Cotyledons
8.	***Areca catechu***/Betel or Areca Nut	Berry	Seed/Endosperm
9.	***Artocarpus integrifolia***/Jack Fruit	Sorosis	Bracts, perianth and seeds
10.	***Carica papaya***/Papaya	Berry	Mesocarp and Endocarp
11.	Cereals, ***Avena sterilis*** (Oat), ***Oryza sativa*** (Rice), ***Hordeum vulgare*** (Barley), ***Triticum duram*** (Durum Wheat), ***Triticum aestivum*** (Bread Wheat), ***Zea mays*** (Maize)	Caryopsis	Whole fruit
12.	***Citrus reticulate***/Orange, ***Citrus sinensis***/Sweet Orange, ***Citrus aurantifolia***/Lime	Hesperidium	Glandular hair
13.	***Cocos nucifera***/Coconut	Drupe	Endosperm
14.	***Cucumis melo***/Musk Melon	Pepo	Mesocarp, Endocarp & seeds
15.	***Cucumis vulgaris***/Water melon	Pepo	Mesocarp, Endocarp & seeds
16.	***Cucumis sativus***/Cucumber	Pepo	Mesocarp, Endocarp and Young seed
17.	***Ficus carica***/Fig/Anjeer	Syconus	Fleshy receptacle
18.	***Fragaria vesca***/Strawberry	Etaerio of achenes	Fleshy thalamus
19.	***Grewia asiatica***/Dhamin/Phalsa	Drupe	Mesocarp
20.	***Juglans regia***/Walnut	Drupe	Lobed cotyledons
21.	***Litchi chinensis***/Litchi	Nut	Aril
22.	***Lycopersicon esculentum***/Tomato	Berry	Pericarp and placenta
23.	***Pyrus malus*** (M. sylvestris)/Apple	Pome	Thalamus
24.	***Mangifera indica***/Mango	Drupe	Mesocarp
25.	***Morus alba, M. nigra***/Mulberry	Sorosis	Fleshy perianth, Fleshy axis

26.	***Phoenix dactylifera***/Date	Berry	Pericarp
27.	***Prunus amygdalus***/Almond	Drupe	Seed (Cotyledons and embryo)
28.	***Musa paradisiaca***/Banana	Berry	Less developed Mesocarp and well developed endocarp
29.	***Psidium guajava***/Guava	Berry	Thalamus, pericarp and placenta
30.	Pulses	Pod/Legume	Seed
31.	***Punica granatum,*** Pomegranate/Anar	Balausta	Testa
32.	***Pyrus comunis***/Pear	Pome	Fleshy thalamus
33.	***Solanum melongena***/Brinjal	Berry	Pericarp & Placenta
34.	***Tamarindus indica***/Tamarind	Lomentum	Pericarp (Mesocarp)
35.	***Trapa bispinosa***/Water Chestnut/Singhara	Nut	Seed
36.	***Vitis vinifera***/Grape	Berry	Pericarp and placenta
37.	***Zizyphus mauritiana***/Jujube/ Chinese Dates/Ber	Drupe	Epicarp and mesocarp

MORPHOLOGY OF ANGIOSPERM (Point to be remembered always)

- Arrangement of flowers on peduncle and study of flowers is called **Anthology.**
- **National flower** of India is **Lotus** (***Nelumbo nucifera***)
- **Longest styles** are found in **maize.**
- **Longest inflorescence** is in **Agave** (12m),
- In **Mussanda**, One (odd) sepal is enlarged to form a leafy structure called **Advertisement Flag.**
- **National fruit** of India is **Mango** (***Mangifera Indica***)
- **Largest fruit** and **largest seed** is of ***Lodoicea maldivica*** (double coconut, weight is 18 Kgs.)
- **False nuts** are **Coconut** (drupe), **Areca nut** (Berry), **Pea nut or Ground nut** (Lomentum), **Walnut** (drupe) and **Chilgoza** (seed)
- Dispersal of fruits and seeds by ants is called **myrmechory** *e.g.*, ***Ulex*** and ***Trillium*** (seeds).
- ***Monophyllea*** is a plant with **single leaf**.
- ***Welwitschia*** (a gymnosperm) is a plant with **two leaves** throughout the life.
- ***Victoria regia*** has **broadest** leaves each with a diameter of 1.5–1.8m.
- Leaves are **longest** in ***Raphia vinifera*** (10–15m)
- Small protein rich glands called ***Belt's corpuscles*** are present at the tip of leaflets in ***Acacia sphaerocephola.***
- In ***Musca*** the suckers are called **sword suckers**.
- In **knol-khol** (Ganth Gobhi) the entire stem becomes tuberous.
- **Largest bud** is cabbage.
- **Pseudostem** is a trunk formed by leaf bases in Banana.

- A plant with reduced stem is called as **Acaulescent**.
- ***Ulex*** possesses both **stem thorns** as well as **leaf spines**.
- Shruby climbers which climb with the help of hooks are called **Stragglers** *e.g.,* ***Bougainvillea, Artobotrys.***
- **Marine** angiosperm is ***Zostera***.
- **Pseudobulb** is swollen part of stem in orchids for storing water and food reserve.
- Annuals and biennials are **monocarpic**. The perennials are **polycarpic** as they bear fruits every year. Some perennial plants such as ***Agave***, Bamboo are **monocarpic** as they flower and fruit only once in their **life** after a long period of vegetative growth.
- **Smallest** angiosperm is ***Wolffia*** (less than 0.1 mm) and **largest** or **tallest** angiosperm is ***Eucalyptus regnans*** (height more that 114 m or 375 ft)
- Plants with **roots only** are ***podostemon***, ***Arceuthobium***, ***Rafflesia*** and ***Sapria***.
- Hypocotyl develops into a large tuber in ***Myrmecodia enchinata*** family Rubiaceae. In the cavities of tuber many ant live. So it is an example of **myrmecophily**.
- Gynostagium : It is formed due to the fusion of crowned stamens with the carpels. It forms a protective covering around the carpels, thus protects the gynoecium. Presence of Gynostagium is the characteristic feature of family Asclepediaceae.
- Maize (***Zea mays***) has largest stigma and style.
- The sterile pistil is called **pistalloide**.
- State tree of Rajasthan → ***Prosopis cineraria***.
- State flower of Rajasthan → Rohira (***Tecomela undulate***)

EXERCISE - 1

Q.1 Plant lives for many years and bears fruits every year. These platns are known as
(1) Annual and polycarpic
(2) Biennials and polycarpic
(3) Perennial and polycarpic
(4) Perennial and monocarpic

Q.2 If flowering occurs only once in life time. That plant is called
(1) Annual (2) Monoecieus
(3) Monocarpic (4) Monocot

Q.3 Pinus and Casuarina plants are
(1) Caudex (2) Excurrent
(3) Deliquescent (4) Clum

Q.4 Root pocket is present in Pistia, Lemma and Eichhornia. It is the substitute of
(1) Root hair (2) Root cap
(3) Tap root (4) Roots

Q.5 'Zone of cell maturation' is an important part of root. because
(1) It helps in the absorbtion of water
(2) It bears unicellular root hairs
(3) A and B both are correct
(4) In hydrophyte root hairs are absent in the zone of cell maturation

Q.6 Find out the incorrect match.
Type of Root – Plants
(1) Fusiform – *Rhaphanus sativus*
(2) Conical – *Brassica rapa*
(3) Napiform – *Beta vulgaris*
(4) Tuberous – *Mirabilis*

Q.7 *Ipomoea batata* (Sweet Potato) is a tuberous root for storage of food. It is a
(1) Tap root
(2) Adventitious root
(3) Modified stem
(4) Either tap root or adventitious root

Q.8 Prop and Stilt roots both are for extra support. Which is/are present in maize ?
(1) Prop root (2) Stilt root
(3) Both A and B (4) Climbing root

Q.9 Cladode and phylloclade are modified stem, the only difference is
(1) Cladode is the modification of entire stem but phylloclade is the modification of only single internode
(2) Phylloclade is the modification of entire stem but cladode is the modification of only single internode
(3) Cladode is common in Casuarina
(4) Phylloclade is common in Asparagus

Q.10 Which is the most reduced modification of stem and look like disc shaped
(1) Rhizome (2) Tuber
(3) Corm (4) Bulb

Q.11 Rhizome is modified stem. Which is correct for it ?
(1) It grow vertical to the soil surface
(2) It is reported in Banana
(3) They are swollen at the terminal end due to storge of food
(4) Rhizome is not found in fern

Q.12 Which pair is the correct combination of sub aerial modification of stem
(1) Sucker and Offset
(2) Sucker and Rhizome
(3) Offset and Rhizome (4) Rhizome and Bulb

Q.13 Find out the incorrect example of Sucker
(1) Mentha (2) Chrysanthemum
(3) Rosa (4) Oxalis

Q.14 What is incorrect for stem
a. Leaf bearing part of stem is called bud
b. Shoot is leafless part of stem
c. Stem are negatively phototropic
d. Stem are positively geotropic
(1) Only a (2) Only b
(3) only c and d (4) All a, b, c, d

Q.15 Woody perennial climber found in tropical rain forest are modified stem. They are called

(1) Climber (2) Lianas

(3) Twiners (4) Trailers

Q.16 Fertilized and ripened ovary is

(1) Seed (2) Fruit

(3) Fruit and Seed both (4) Bud

Q.17 Seedless fruits develop without fertilzation called

(1) Parthenocarpic fruit (2) Apocarpic fruit

(3) Pseudocarpic fruit (4) False fruit

Q.18 Pericarp is

(1) Seed wall (2) Fruit wall

(3) Cell wall (4) China wall

Q.19 What is correct match.

a. Pod – Gram, Pea

b. Siliqua – Mustured, Radish

c. Silicula – Iberish, Capsella

d. Capsule – Cotton, Datura

(1) Only a is correct

(2) Only b and c are correct

(3) All are correct (4) All are incorrect

Q.20 Caryopsis type of fruit is

(1) Characteristic fo cypreceae family

(2) Not split or brust for discharge of seed

(3) Fruit wall and seed coat do not completly fused

(4) Not present in wheat

Q.21 The fruit of litchi and tomato is

(1) Nut and Berry (2) Berry and Nut

(3) Pepo and Pome (4) Pome and Pepo

Q.22 Sorosis type of fruit is common in

(1) Jack fruit (2) Pine Apple

(3) Mulberry (4) All of these

Q.23 Sorosis and syconus are

(1) Simple dry fruit (2) Simple fleshy fruit

(3) Aggregate fruit (4) composite fruit

Q.24 Which one of the following is incoreect w.r.t obligate stem parasite.

(1) Cuscuta (2) Cassytha

(3) Arceuthobium (4) Sapria

Q.25 Which of the following is incorrect match

(1) Orobanchae – Broom rape

(2) Monotropa – Indian Pipe

(3) Neottia – (Bird's nest fungus)

(4) Viscum – Mistletoe

Q.26 Match the Column I & Column II.

Column I	Column II
(i) Utricularia	(1) Water flea trap
(ii) Drosera	(2) Venus fly trap
(iii) Dionaea	(3) Sundew
(iv) Aldrovanda	(4) Bladderwort

(1) i – a, ii – b, iii – c, iv – d

(2) i – d, ii – c, iii – b, iv – a

(3) i – c, ii – d, iii – b, iv – a

(4) i – d, ii – c, iii – a, iv – b

Q.27 Which of the following is not true for epiphytes

(1) They are usually found in tropical rain forest.

(2) They contain velamen tissues

(3) The roots are hygroscopic

(4) They have tentacles over leaves

Q.28 Choose the false statement.

(1) Phylloclades are photosynthetic in function

(2) Pitcher of Nepenthes is a modification of stem

(3) bulb of garlic and onion have disc shaped stem.

(4) Cladode is found in Asparagus

Q.29 Identify the incorrectly matched pair.

(1) Hygroscopic roots – Orchids

(2) Assimilatory roots – Tinospora

(3) Leaf roots – Bryophyllum.

(4) Lianas – Tropical rain forest.

Q.30 Which of the following statement is incorrect
(1) Prop roots are found in Ficus benghalensis
(2) Stilt roots provide extra support to Pandanus
(3) Scape is leafless flower bearing branch of mustard
(4) Cluster root is fonud in Dahlia

Q.31 Which of the following is not true w.r.t halophytes
(1) They are found in salty soil
(2) They bear pneumatophores
(3) They shows viviparity
(4) The leaves are amphistomatic and parallel veined

Q.32 In Amorphophalus and Crocus vegetative propagation takes place by means of :
(1) Corm (2) Rhizome
(3) Offset (4) Both 1 & 3

Q.33 a-A fleshy vegatative bud is called bulbil.
b-Multiple root cap is found in Screwpine
c-Root cap is absent in hydrophytes
d-Phylloclade is found in opuntia.
(1) All are correct except b
(2) All are correct
(3) a & b are correct
(4) b & c are corret

Q.34 Sheathing leaf base is characteristic feature of
(1) Legumes (2) Poppy
(3) Grasses (4) Touch me not

Q.35 A plant which possesses a single leaf is
(1) Welwitschia (2) Platanus
(3) Monophyllea (4) Ulex

Q.36 The most common type of compound leaf found in nature are
(1) Bipinnate (2) Tripinnate
(3) Trifoliate (4) Decompound

Q.37 Cauliflory is the formation of flowers
(1) On the young branches from new buds
(2) On old branches from new buds
(3) From epiphyllous buds
(4) In bunch

Q.38 Tendrils modified from leaf lets are not found in
(1) Lathyrus aphaca (2) Lathyrus odoratus
(3) Pisum sativum (4) Both 2 & 3

Q.39 Heterophylly of Limnophila is
(1) Adaptive (2) Developmental
(3) Habitual (4) Environmental

Q.40 In Gloriosa, the tendril is the modified from of
(1) Axillary bud (2) Leaf
(3) Leaf apex (4) Stipule

Q.41 Which of the following is odd one out w.r.t reticulate venation?
(1) Dioscorea (2) Colocasia
(3) Smilax
(4) More than one option

Q.42 Which of the following is not a modified stem?
(1) Ginger (2) Turnip
(3) Colocasia (4) Potato

Q.43 Uni – internodal phylloclade is called
(1) Cladophyll (2) Sporophyll
(3) bulbil (4) Brachyplast

Q.44 The stem of which of the following is not a rhizome:
(1) Nelumbo (2) Curcuma
(3) Crocus (4) Zingiber

Q.45 Sucking roots are characteristic of
(1) Cuscuta (2) Tinospora
(3) Piper betel (4) Orchid

Q.46 Pneumathodes are morphologically similar to
(1) Stomata (2) Lenticels
(3) Hydathodes (4) Wounds

Q.47 The feature that distinguish a stem from a root is
(1) Ascending part of axis bearing, branches, leaves, flowers and fruits.
(2) Develops plumule of the embryo of a germinating seed
(3) Bears nodes and internodes.
(4) All of the above.

Q.48 Which of the following is not correct.

(1) Leaf develops at the node.

(2) Axillary bud develops into a branch

(3) Leaves originate from Shoot apical meristem

(4) Leaf is not important due to lack of photosynthesis

Q.49 Identify the incorrectly matched pair

(1) Lianas – Tropical rain forests

(2) Scape – Leafless Stem of onion bearing flowers

(3) Pitcher of Nepenthes – Modification of Stem

(4) Cocoloba – Phylloclade

Q.50 The pattern of arrangement of leaves on the Stem or branch is called :

(1) Reticulate venation

(2) Parallel venation

(3) Phyllotaxy

(4) Vernation

EXERCISE - 2

Q.1 In root, branches (secondary roots) are-
(1) Stellar in origin
(2) Cortical in origin
(3) Stellar and endogenous
(4) Cortical and exogenous

Q.2 In Pandanus (Screw Pine) root cap is-
(1) Simple, multicellular
(2) Multiple, multicellular
(3) Absent
(4) Replaced by root pocket

Q.3 A plant called plantless root is-
(1) Arceuthorbium (2) Podostemon
(3) Rafflesia & Sapria (4) All of these

Q.4 Root bears-
(1) Nodes only (2) Internodes only
(3) Both nodes and internode
(4) None of the above

Q.5 Root pockets act as balancers and found in-
(1) Hygrophytes
(2) Free floating hydrophytes
(3) Fixed floating hydrophytes
(4) Submerged hydrophytes

Q.6 The geotropic response of root is due to starch grains (statoliths) in-
(1) Cells of root cap
(2) Cells of root hair
(3) Cells in root apex
(4) Cells in growing point

Q.7 Root cap is absent in-
(1) Hydrophytes (2) Xerophytes
(3) Lithophytes (4) All of these

Q.8 Root hair lost during transplantation but reappear within a week. These root hairs are found in-
(1) Zone of division (2) Zone of elongation
(3) Zone of maturation (4) All zones

Q.9 Root hairs are found on-
(1) Secondary roots (2) Tertiary roots
(3) (1) and (2) both (4) Adventitious roots

Q.10 Tap (primary) root develops from-
(1) Radicle (2) Hypocotyl
(3) Epicotyl (4) None

Q.11 Root hairs are absent in aquatic plants as-
(1) They do not absorb salts and water
(2) Absorption occurs by leaves
(3) Roots are profusely branched and have more surface area
(4) None

Q.12 Monocot plants are characterised by the presence of
(1) Moniliform roots (2) Fibrous roots
(3) Stilt roots (4) Annulated roots

Q.13 Root nodules (tubercles) are found on -
(1) Primary root (2) Branch
(3) Secondary roots
(4) Primary and secondary roots

Q.14 Rhizobium lives symbiotically with root nodules and fixes atmospheric nitrogen. It gives nitrogenous compound to host and inturn takes food from host. This food taken by bacterium is-
(1) Fats (2) proteins
(3) Carbohydrates (4) Any of these

Q.15 The factors which initiate development of respiratory roots in Avicenia and other mangroves are-
(1) Saline marshes
(2) Poor oxygen supply
(3) Soil is physiologically dry
(4) All the above are correct

Q.16 The lenticles in respiratory roots are called-
(1) Pneumatophores (2) Pneumathodes
(3) Stomata (4) Hydathodes

Q.17 Buttrus or Plank roots in Bombax, Ficus are metamorphosed tap roots for support. They arise from-
(1) Base of tap root
(2) Mid part
(3) Base of tap root and mid part both
(4) Base of adventititous roots

Q.18 Roots store food in-
(1) Cell elongation region
(2) Cell differentiation region
(3) Root cap (4) Meristemtic ozone

Q.19 Reproductive roots taking part in reproduction are found in-
(1) Dalbergia (shisham)
(2) Dahlia
(3) Sweet Potato (Ipomoea)
(4) All correct

Q.20 Assimilatory (Photosynthetic) roots are characteristic of-
(1) Trapa and Tinospora
(2) Taeniophyllum and Podostemon
(3) Trapa
(4) All of the above

Q.21 Prop roots are-
(1) Primary roots (2) Adventitious roots
(3) Branch roots (4) Tap roots

STEM

Q.22 Ginger is not a root but a stem, because-
(1) It stores the food material
(2) It has a pungent taste
(3) It has nodes and internodes
(4) It is not green in colour

Q.23 Potato tuber is a modified-
(1) Stem (2) Root
(3) Bulb (4) Stolon

Q.24 Buds typically are found-
(1) At the tips of branches and roots
(2) At the tips of branches and at the bases of leaves
(3) Along roots and at the bases of leaves
(4) Only on the bases of leaves

Q.25 Stem modified to perform the function of leaf and having many internodes is called-
(1) Phylloclade (2) Cladode
(3) Offset (4) Phyllode

Q.26 In which of the following stem is most reduced-
(1) Rhizome (2) Corn
(3) Phylloclode (4) Bulb

Q.27 Photosynthetic organ of Asparagus are-
(1) Leaf (2) Leaf stipule
(3) Phyllode (4) Cladode

Q.28 Cladode are common among-
(1) Liliaceae (2) Malvaceae
(3) Mimosoideae (4) Solanaceae

Q.29 Photosynthetic organs of opuntia are-
(1) Phyllode (2) Phylloclode
(3) Leaves (4) Leaflets

Q.30 Which of the following is a caudex plant-
(1) Cycas (2) Pinus
(3) Ficus (4) Mango

LEAF

Q.31 In opuntia the leaves are modified into-
(1) Scales (2) Spines
(3) Thorns (4) Phylloclades

Q.32 The stipules are modified into tendrils in-
(1) Smilax (2) Asphodelus
(3) Gloriossa (4) Asparagus

Q.33 The first few leaves after the cotyledons in the seedling of an Acacia are pinnately compound but the petioles of upper compound leaves are flattened and they bear fewer pinnae. The adult plant only has parallel veined leaves like the flattened petioles but without any pinnae. These observations lead us to the conclusion that-
(1) The leaves in the adult plant are reduced to phyllodes while seedling leaves are unreduced
(2) The green, parallel-veined structures in the adult plant are phylloclades
(3) The exhibits heterophilly bearing simple leaves in the adult plant and compound leaves in the seedling
(4) The adult plant leaves are a case of reversion where they become simple like the cotyledons

Q.34 The cladode among the following is-
(1) Parkinsonia (2) Acacia
(3) Opuntia (4) Asparagus

Q.35 The mode of arrangement of leaves on the stem and branch is knwon as-
(1) Vernalization (2) Vernation
(3) Venation (4) Phyllotaxy

Q.36 Which of the following plant has parallel venation-
(1) Castor (2) Grass
(3) Moss (4) Fern

Q.37 In Nepenthes, the pitcher is formed of-
(1) Peptide and stipules
(2) Lamina
(3) Leaf apex (4) Leaf base

Q.38 Main photosynthetic organs of lathyrus sativus plant-
(1) Leaves (2) Leaflets
(3) Stipules (4) Phyllodes

Q.39 An abnormal dicot leaf showing parallel venation is of-
(1) Smilex (2) Rananculus
(3) Calophyllum (4) Dioscorea

Q.40 An abnormal monocot with reticulate venation and tendrilar stipule is-
(1) Gloriosa (2) Pethos
(3) Smilax (4) Dracaena

Q.41 Tongue like out growth in the leaf base is the characteristic feature of-
(1) Fern leaf (2) Cycas leaf
(3) Grass leaf (4) Banana leaf

INFLORESCENCE

Q.42 The main axis of the inflorescence is elongated in a-
(1) Corymb (2) Capitulum
(3) Cyanthium (4) Catkin

Q.43 Cyathium is a type of-
(1) Fruit (2) Inflorescence
(3) Bacterium (4) Algae

Q.44 Verticillaster is a type of-
(1) Phyllotaxis (2) Placentation
(3) Inflorescence (4) Venation

Q.45 When inflorescence axis is branched, it is called-
(1) Panicle (2) Head
(3) Umbel (4) Cymose

Q.46 The axis of inflorescence is known as-
(1) Thalamus (2) Peduncle
(3) Pedicel (4) Petiole

Q.47 The inflorescence with acropetally arranged sessile flower is-
(1) Raceme (2) Spike
(3) Carymb (4) Panicle

Q.48 In onion the inflorescence is-
(1) Raceme (2) Corymb
(3) Umbel (4) Spike

Q.49 Inflorescence of Lycopersicon is-
(1) Raceme (2) Helicoid cyme
(3) Scorpoid cyme (4) Spike

Q.50 The name compositae is based on-
(1) Inflorescence (2) Corolla
(3) Gynoecium (4) Fruit

Q.51 Inflorescence of banana is-
(1) Raceme (2) Spike
(3) Spadix (4) Catkin

EXERCISE - 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Pneumatophores occur in plants of **[CBSE PMT 2000]**

(1) Sandy soil
(2) Saline marshy soil
(3) Marshy soil (4) Water

Q.2 Assimilatory (Photosynthetic) roots a characteristic of **[Kerala 2000]**

(1) Trapa and Tinospora
(2) Taeniophyllum and Podostemon
(3) Both correct
(4) None of these

Q.3 Bacteria found in root nodules of legumes are **[DPMT 2002]**

(1) Nitrobacter (2) Nitrosomonas
(3) Rhizobium (4) Azotobacter

Q.4 In Ipomoea batatas/Sweet potato the food is stored in [**JKCMEE 2002]**

(1) Root tuber (2) Stem tuber
(3) Bud (4) Leaves

Q.5 Pneumatophores are characteristics of family **[Bih. PMT 2001**]

(1) Loranthaceae (2) Hydrocharitaceae
(3) Rhizophoraceae (4) Orchidaceae

Q.6 Root cap is absent in **[BHU 1994, 2000]**

(1) Hydrophytes (2) Lithophytes
(3) Xerophytes (4) Mesophytes

Q.7 Food is stored in one of the following **[Kerala 2001]**

(1) Respiratory root (2) Fibrous root
(3) Fasciculated root (4) Nodulated root

Q.8 Velamen is present in **[CPMT 2001]**

(1) Tuberous roots
(2) Epiphytic roots of orchids
(3) Breathing roots (4) Parasitic roots

Q.9 Epiphytes like Vanda develop special layer of absorptive tissue velamen consiting of 4 or 5 layers of long polygonal cells. Velamen is formed by **[AIIMS 2001]**

(1) Absorbing roots (2) Stem
(3) Clinging roots (4) Hanging roots

Q.10 Regions of root from base to root tip are **[AMU 2001]**

(1) Maturation zone - Cell division zone - Elongation zone
(2) Maturation zone - Elongation zone - Cell division zone
(3) Cell division zone - Elongation zone - Maturation zone
(4) Elongation zone - Cell division zone - Maturation zone

Q.11 A plant with epidermis specialised to absorb moisture from air is **[APMEE 2002]**

(1) Avicennia (2) Vanda
(3) Rhizophora (4) Jussiaea

Q.12 Hygroscopic roots occur in **[AMU 2002]**

(1) Vanda (2) Rhizophora
(3) Bryophyllum (4) All the above

Q.13 A root is adventitious when it is **[CPMT 2002]**

(1) Swollen
(2) Growing in marshy places
(3) Formed from plumule
(4) Modified for storage

Q.14 A fleshy root tapering at both ends is **[AMU 2001]**

(1) Fusiform (2) Conical
(3) Napiform (4) Tuberous

Q.15 A fibrous root system is better adapted than tap root system for **[BHU 2001; AMU 2001]**

(1) Storage of food
(2) Anchorage of plant to soil
(3) Absorption of water and minerals
(4) Transport of water and organic food

Q.16 An underground specialised shoot with reduced disc like stem covered by fleshy leaves is **[JKCMEE 2000]**

(1) Bulb (2) Bulbil
(3) Rhizome (4) Rhizophore

Q.17 Potato and sweet potato **[AIIMS 2004]**
(1) Have edible parts which are homologous organs
(2) Have edible parts which are analogous organs
(3) Have been introduced in India from the same place
(4) Are two species of the same genus

Q.18 Phylloclade is a modification of **[JKCMEE 2002]**
(1) Leaf (2) Root
(3) Flower (4) Stem

Q.19 Ginger plant has an underground stem which is **[MP PMT 2004]**
(1) Rhizome (2) Bulb
(3) Tuber (4) Corm

Q.20 Phylloclade is found in **[AMU 2001]**
(1) Chrysanthemum (2) Asparagus
(3) Ruscus (4) Opuntia

Q.21 Thorns with leaves and flowers are found in **[APMEE 2002]**
(1) Bougainvillea (2) Carissa
(3) Duranta (4) Artabotrys

Q.22 Thick underground stem growing parallel to soil surface is **[Tamil Nadu 2001]**
(1) Stolon (2) Rhizome
(3) Sucker (4) Offset

Q.23 Underground stem is rhizome in plant **[APMEE 2002]**
(1) Allium (2) Scilla
(3) Lilium (4) Gloriosa

Q.24 Green leaf-like one internode long stem branches are called **[KCET 2003]**
(1) Phylloclades (2) Phyllodes
(3) Bulbils (4) Cladodes

Q.25 Stem tendrils occur in **[Orissa 2000]**
(1) Smilax (2) Gloriosa
(3) Vitis (4) Lathyrus

Q.26 Which of the following is not related to corm **[Kerala 2001]**
(1) Tunic (2) Lateral buds
(3) Nodes (4) Scale leaves

Q.27 Eye of potato is **[CPMT 2001]**
(1) Apical bud (2) Axillary bud
(3) Accessory bud (4) Adventitious bud

Q.28 Swollen lower end of leaf stalk is **[Wardha 2000]**
(1) Petiole (2) Pulvinus
(3) Thalamus (4) Disc

Q.29 Phyllotaxis is **Kerala 2002]**
(1) Mode of leaf arrangement on stem
(2) Types of roots
(3) Arrangement of sepals and petals in a flower
(4) Type of ovary

Q.30 Petiole is modified into tendril in : **[Orissa 2000]**
(1) Passiflora (2) Gloriosa
(3) Pisum (4) Clematis

Q.31 On the margins of leaves of a plant called Bryophyllum tiny plants grow complete with roots. These tiny plants fall of and continue to grow. This is a form of **[AIEEE 2004]**
(1) Hermophroditism
(2) Vegetative reproduction
(3) Sexual reproduction
(4) Reproduction by fission

Q.32 Pinnately parallel venation is found in **[Tamil Nadu 2001]**
(1) Canna (2) Grass
(3) Zizyphus (4) Castor

Q.33 Ochreate stipules occur in leafy vegetable **[APMEE 2002]**
(1) Amaranthus (2) Mentha
(3) Platanus (4) Rumex

Q.34 Spiral phyllotaxy in which sixth leaf lies above the first one after completing two circles is **[APMEE 2002]**
(1) Distichous (2) Tristichous
(3) Pentastichous (4) Octastichous

Q.35 Match the columns **[AMU 2002]**

(i) Acicular	(1) Grass
(ii) Linear	(2) Nerium
(iii) Lanceolate	(3) Banana

(iv) Oblong (4) Pine

(1) (i) 4 (ii) 1 (iii) 2 (iv) 3

(2) (i) 4 (ii) 1 (iii) 3 (iv) 2

(3) (i) 4 (ii) 2 (iii) 3 (iv) 1

(4) (i) 4 (ii) 3 (iii) 2 (iv) 1

Q.36 Leaves develop from **[AFMC 2003]**

(1) Nodes (2) Internodes

(3) Epidermis (4) Endodermis

Q.37 Phyllode is found in **[CET Chd. 2003]**

(1) Clematis (2) Gloriosa

(3) Acacia (4) Dischidia

Q.38 Parallel venation occurs in **[BVP 2000; Tamil Nadu 2001]**

(1) Monocots (2) Dicots

(3) All angiosperms (4) Ferns

Q.39 Bombax leaf is **[Tamil Nadu 2001]**

(1) Tripinnate (2) Unipinnate

(3) Multifoliate (4) Quadrifoliate

(5) Trifoliate

Q.40 Name the plant having reticulate venation **[Wardha 2001; Tamil Nadu 2001]**

(1) Musa (2) Mangifera

(3) Oryza (4) Canna

Q.41 In Nepenthes the pitcher is modified **[Kerala 2001; CET Chd. 2003]**

(1) Whole leaf (2) Leaf apex

(3) Lamina (4) Petiole

Q.42 Santalum album/Sandal-wood Tree is **[Orissa 2007]**

(1) Partial root parasite

(2) Partial stem parasite

(3) Total stem parasite (4) Total root parasite

Q.43 Biggest flower belongs to a plant which is **[C.B.S.E. 1999, Manipur 2006]**

(1) Partial root parasite

(2) Partial stem parasite

(3) Total stem parasite (4) Total root parasite

Q.44 A plant growing on another plant without drawing any nourishment is **[A.F.M.C. 1986, 2005]**

(1) Ectoparasite (2) Epiphyte

(3) Symbiont (4) Saprophyte

Q.45 A rootless aquatic plant in which a portion of leaf is modified to form a blade for catching small aquatic animals is **[DPMT 2009]**

(1) Dionaea (2) Drosera

(3) Utricularia (4) Nepenthes

Q.46 Total root parasite is **[MPPMT 2009]**

(1) Rafflesia (2) Cassytha

(3) Viscum (4) Loranthus

Q.47 Insectivorous plants usually grow in soils which are deficient in **[CPMT2009]**

(1) Nitrogen/nitrate (2) Cassytha

(3) Organic matter (4) Ca/Mg

Q.48 Balanophora/Orobanche is a **[CPMT1990, 1992, Bih.PMT1994]**

(1) Total root parasite

(2) Partial root parasite

(3) Partial stem parasite

(4) Total stem parasite

Q.49 The tallest plant belongs to **[A.F.M.C. 2004, H.P.PMT2005]**

(1) Cedrus deodara (2) Eucalyptus ragnans

(3) Sequoia sempervirens

(4) Pinus roxburghii.

Q.50 Smallest flowering plant/flower is **[CPMT2009]**

(1) Polyalthia (2) Rafflesia

(3) Azadirachta (4) Wolffia

Q.51 One of the follwing is a saprophyte **[B.H.U. 1999, Manipur 2009]**

(1) Monotropa/Neottia (2) Utricularia

(3) Dionaea (4) Nepenthes

Q.52 Botanical name of Venus Fly Trap is **[B.H.U 1989, C.E.T. Chd. 2002]**

(1) Aldrovanda (2) Dionaea

(3) Utricularia (4) Napenthes

Q.53 Insects captured by carnivorous plants partially meet their requirement of **[B.H.U 2008]**

(1) Organic matter (2) Enzymes

(3) Water (4) Nitrogen

Q.54 Which one of the following is a partial root parasite **[D.PMT2002]**

(1) Balanophora (2) Santalum

(3) Viscum (4) Cuscuta

Q.55 Which one of the following is a total root parasite **[Bih. PMT 2002]**

(1) Balanophora/Orobanche

(2) Viscum

(3) Cassytha (4) Drosera

Q.56 The association between ants and members of family rubiaceae is **[A.M.U. 1997]**

(1) Ornithophily (2) Entomophily

(3) Myrmecophily (4) Anemophily

Q.57 Which is not an insectivorous plant **[Manipur 2009]**

(1) Dionaea

(2) Dischidia/Monotropa

(3) Sarracenia (4) Pinguicula

Q.58 Monocarpic plant is the one which **[Orissa 2009, MPPMT2009]**

(1) Flowers twice in a year

(2) Produces only one fruit

(3) Flowers once in life and then dies

(4) Bears only one type of flowers

Q.59 Which one is an insectivorous plant? **[Orissa 2009]**

(1) Vallisneria (2) Rafflesia

(3) Santalum (4) Nepenthes

Q.60 Which of the following is/are angiospermic hydrophyte? **[CPMT 2009]**

(1) Hydrilla (2) Vallisneria

(3) Zizyphus (4) Both 1 and 2

Q.61 Which one of the following is not insectivorous plant? **[JKCMEE 2010]**

(1) Monotropa (2) Drosera

(3) Utricularia (4) Nepenthes

ROOT

Q.62 Radish has **[JKCMEE 2005]**

(1) Napifom root (2) Conical root

(3) Fusiform root (4) Tuberous root

Q.63 Prop or pillar roots are **[Manipur 2010]**

(1) Fasciculated roots (2) Tap roots

(3) Adventitions roots (4) Secondary roots

Q.64 In Ipomoea batatas/Sweet Potato the food is stroed in **[JKCMEE 2008]**

(1) Root tuber (2) Stem tuber

(3) Bud (4) Leaves

Q.65 Haustoria or sucking roots occur in **[JKCMEE 2003, Kerala 2006]**

(1) Betel (2) Orchids

(3) Cuscuta (4) Tinospora

Q.66 Velamen is present in **[Bihar PMT2001, Manipur 2007]**

(1) Tuberous roots (2) Epiphytic roots

(3) Breathing roots (4) Parasitic roots

Q.67 Roots that hold horizontal branches of Banyan tree in the air are **[Bih. PMT1991, Orissa 2005]**

(1) Thumb roots (2) Prop roots

(3) Stilt roots (4) All the above

Q.68 Root cap is absent in **[B.H.U. 1993, R.PMT2005]**

(1) Hydrophytes (2) Lithophytes

(3) Xerophytes (4) Mesophytes

Q.69 Clinging roots occur in **[C.B.S.E. 1999, A.M.U.P.M.D.C. 2006]**

(1) Trapa (2) Orchid

(3) Screwpine (4) Podostemon

Q.70 Roots originating from parts other than radicle are **[C.M.C. 2003, Har. PMT2005]**

(1) Stilt roots (2) Adventitious roots

(3) Tap roots (4) Fibrous roots

Q.71 Outer covring of epiphytic root is **[Orissa 2005]**

(1) Osmophore (2) Rhizophore

(3) Pneumatophore (4) Velamen

Q.72 Identify the correct order **[EAMCET 2005]**

1. Mineral absorption zone.
2. Meristematic zone.
3. Maturation Zone
4. Water absorption zone

(1) 2, 1, 4, 3 (2) 4, 3, 2, 1

(3) 2, 4, 1, 3 (4) 1, 2, 3, 4

Q.73 Which of the following has succulent root? **[Pb. PMT20005]**

(1) Opuntia (2) Agave

(3) Aloe (4) Asparagus

Q.74 Pneumatophores are found **[B.V. 2006]**

(1) In deserts (2) Near river mouths

(3) On mountains (4) In grasslands

Q.75 Match the columns

	Column I	Column II
1.	Tubercular storage roots	a. Tinospora
2.	Pneumatophores	b. Heritiera
3.	Haustoria	c. Asparagus
4.	Prop roots	d. Viscum
5.	Assimilatory roots	e. Screwpine

[Kerala 2007]

(1) 1 – c, 2 – b, 3 – d, 4 – e, 5 – a

(2) 1 – b, 2 – c, 3 – d, 4 – e, 5 – a

(3) 1 – c, 2 – d, 3 – e, 4 – a, 5 – b

(4) 1 – c, 2 – a, 3 – b, 4 – e, 5 – d

(5) 1 – e, 2 – d, 3 – e, 4 – b, 5 – a

Q.76 Root modification is **[JKCMEE 2007]**

(1) Permanent internal changes in roots

(2) Temporary internal changes in roots

(3) Permanent structural changes in roots

(4) Temporary structural changes in roots

Q.77 Asafoetide is obtained from Ferula asafoetida from **[Ph. PMT2007]**

(1) Stem (2) Root

(3) Leaf (4) Flower

Q.78 Velamen occurs in **[B.H.U. 2008]**

(1) Epiphytes (2) Mesophytes

(3) Hydrophytes (4) Xerophytes

Q.79 Select the correct code

Primary root is -

1. Positively geotropic
2. Positivily hydrotropic
3. Negatively geotropic
4. Negatively hydrotropic **[BHU 2008]**

(1) 1, 2, 3 correct (2) 1, 2 correct

(3) 2, 4 correct (4) 1, 3 correct

Q.80 A fibrous root system is efficient in **[DPMT2009]**

(1) Food storage

(2) Nitrogen fixation

(3) Good anchorage

(4) Absorption from deep soil layers

Q.81 Primary root continues to grow and form root system called **[DPMT2009]**

(1) Tap (2) Stilt

(3) Secondary (4) Fibrous

Q.82 Pneumatophores are found in **[Orissa 2009]**

(1) Mesophytes (2) Sciophytes

(3) Halophytes (4) Helophytes

Q.83 Rhizophora possesses **[AMU 2009]**

(1) Pneumatophores (2) Prop roots

(3) Stilt roots (4) Modified roots

Q.84 Tall trees of what range of height have strong buttresses at their base **[Guj.CET 2009]**

(1) 15 m and above (2) 5 – 7 m

(3) 3 – 5 m (4) 7 – 10 m

Q.85 Root cap is absent in **[Guj. CET 2009]**

(1) Xerophytes (2) Mesophytes

(3) Epiphytes (4) hydrophytes

Q.86 Which is incorrect match? **[AMU 2010]**

(1) Tap root – Carrot

(2) Prop root – Banyan Tree

(3) Adventitious root – Sweet potato

(4) Stilt root – Turnip

Q.87 The stem of Maize and Sugarcane have support roots coming out of the lower nodes of stem. They are called **[HPPMT 2010]**

(1) Stilt roots (2) Prop roots

(3) pneumatophores (4) Adventitious roots

STEM

Q.88 Cladodes occur in **[JKCMEE 2008]**

(1) Parkinsonia (2) Asparagus

(3) Opuntia

(4) Euphorbia royleana

Q.89 In Amorphophallus, vegetative multiplication occurs through **[Pb. PMT 2005]**
(1) Bulbils (2) Rhizome
(3) Corm (4) Offset

Q.90 In passiflora, the tendrils are modified **[JKCMEE 2007]**
(1) Axillary buds (2) Upper leaflets
(3) Whole leaves (4) Stipules

Q.91 Potato tuber is modified/Edible part of Potato is **[Har, PMT 2005]**
(1) Stem (2) Bulb
(3) Stolon (4) Root

Q.92 Ginger is a stem which can be differentiated from root becaue it **[Bih. PMT 2002, MPPMT 2007]**
(1) Grows parallel to ground
(2) Stores food
(3) Lacks chlorophyll
(4) Has nodes and internodes

Q.93 In opuntia, the stem is modified into **[Orissa 2000]**
(1) Cladode (2) Phylloclade
(3) Phyllode (4) Staminode

Q.94 Ginger plant has an underground stem which is **[MPPMT2004, JKCMEE 2005]**
(1) Rhizome (2) Bulb
(3) Tuber (4) Corm

Q.95 Stem tendrils occur in **[Orissa 2000]**
(1) Smilax (2) Gloriosa
(3) Vitis (4) Lathyrus

Q.96 Thick undergound stem growing parallel to soil surface is **[DPMT2009]**
(1) Stolon (2) Rhizome
(3) Sucker (4) Offset

Q.97 A rhizome which grows vertically upwards is **[AFMC 2005]**
(1) Corm (2) Stolon
(3) Bulbil (4) Rootstock

Q.98 Underground stem that has contractile roots is **[EAMCET 2005]**
(1) Rhizome (2) Corm
(3) Stem tuber (4) Bulb

Q.99 Bamboo is **[RPMT2005]**
(1) Culm (2) Bulb
(3) Runner (4) Twiner

Q.100 Turmeric powder is obtained from **[RPMT2006]**
(1) Curuma longa (2) Curcuma amada
(3) Cucurbita sativa (4) Cassia tora

Q.101 Corm is modified **[Orissa 2006]**
(1) Root (2) Stem
(3) Leaf (4) Bud

Q.102 Which one is found only in aquatic plant **[Orissa 2006]**
(1) Runner (2) Stolon
(3) Tuber (4) Offset

Q.103 Uniparous, biparous and multiparous system of branching are found respectively in **[Kerala 2005]**
(1) Mirabilis, Datura and Vine
(2) Saraca, Mirabilis and Euphorbia
(3) Vine, Polyalthia and Saraca
(4) Casuarina, Saraca and Croton
(5) Euphorbia, Croton and Polyalthia

Q.104 Scaly bulb occurs in **[JKCMEE 2007]**
(1) Lilium (2) Allium
(3) Scilla (4) Ginger

Q.105 Black Pepper is **[MPPMT2007]**
(1) Herb (2) Shrub
(3) Tree (4) Climber

Q.106 Which statements are true
(a) Stem with joined solid nodes and hollow internodes is called caudex
(b) In Tridax, the stem is decumbent
(c) Corm is condensed form of rhizome growing more or less in vertical direction
(d) Sucker is an underground modification of stem
(e) Biparous type of cymose branching seen in Saraca. **[Kerala 2008]**
(1) a, d, e (2) b and c only
(3) c and d only (4) b, c, e only
(5) d, e only

Q.107 Identify plants which show modification of axillary buds into tendrils and hooks respectively

(a) Hugonia (b) Duranta

(c) Passiflora (d) Dioscorea

[EAMCET 2008]

(1) a and b (2) c and a

(3) b and c (4) d and a

Q.108 Stem may function in **[AMU 2008]**

(1) Protection

(2) Spread of branches

(3) Storage, support and vegetative propagation

(4) All of these

Q.109 Which one is example of sub aerial modification of stem **[Kerala 2009]**

(1) Asparagus (2) Polyalthia

(3) Tridax (4) Oxalis

(5) Agave

Q.110 Potato is

(1) Root (2) Rhizome

(3) Leaf (4) Stem

Q.111 In Duranta, vasculated defensive structure represent

(1) Axillary bud as in Bougainvillea

(2) Stipules as in Acacia

(3) Terminal bud as in Carissa

(4) Apical bud as in Artobotrys

Q.112 Suculent stem occurs in **[EAMCET 2009]**

(1) Pisum (2) Casuarina

(3) Euphorbia (4) Oxalis

Q.113 Stem modification having vascular bundle is

(1) Prickle (2) Thorn

(3) Bristle (4) All the above

LEAF

Q.114 Petiole is modified into green leafy structure called **[CET Chd. 2009]**

(1) Phyllode (2) Phylloclade

(3) Cladode

(4) Foliaceous petiole

Q.115 Occurrence of more than one type of leaves on the same plant is **[Kerala 2008]**

(1) Heterophylly (2) Phyllotaxy

(3) Venation (4) Vernation

Q.116 Spiny leaf margins are found in **[Manipal 2005]**

(1) Opuntia (2) Papaver

(3) Argemone (4) Polyalthia

Q.117 The largest leaf belongs to **[CPMT 1995, WB 2007]**

(1) Nerium (2) Tobacco

(3) Victoria/musa (4) Rafflesia

Q.118 In Nepenthes the pitcher is modified **[DPMT 2005, Orissa 2010]**

(1) Whole leaf (2) Leaf apex

(3) Lamina (4) Petiole

(5) Leaf base

Q.119 Identify the order where plants show alternate, opposite and whorled phyllotaxy. **Kerala 2005]**

(1) China Rose, Calotropis and Nerium

(2) China Rose, Nerium and Calotropis

(3) Nerium, China Rose and Calotropis

(4) Nerium, Calotropis and China Rose

(5) Calotropis, Nerium and China Rose

Q.120 Pulvinus is found in **[Kerala 2005]**

(1) Calotropis (2) Ocimum

(3) Legume plants (4) Alstonia

(5) Ficus

Q.121 Venation is generally reticulate in **[JKCMEE 2005]**

(1) Monocot plants (2) Bryophytes

(3) Thallophytes (4) Dicot plants

Q.122 Venation in monocots is **[Orissa 2005, AMU 2005]**

(1) Pinnate reticulate (2) Palmate reticulate

(3) Pinnate parallel (4) Parallel

Q.123 Stipules are modified into spines in **[EAMCET 2005]**

(1) Citrus and Euphorbia

(2) Euphorbia and Zizyphus

(3) Ziziphus and Bougainvillea

(4) Citrus and Bougainvillea

Q.124 A compound leaf which appears simple due to supression of 1 – 2 lateral leaflets is found in **[EAMCET 2005]**

(1) Hardwickia (2) Parkinsonia
(3) Citrus (4) Coriandrum

Q.125 In Utriularia, the leaves are modification to form **[JKCMEE 2005]**

(1) Bladders (2) Tendrils
(3) Hooks (4) Pitchers

Q.126 In Opunita, spines are modification of **[JKCMEE 2005]**

(1) Epidermal hair (2) Stem
(3) Flowers
(4) Leaves of axillary bud

Q.127 Leaves are modified into tendrils, hooks, pitchers and bladders in **[Kerala 2006]**

(1) Sweet Pea, Cat's Nail, Nepenthes, Utricularia
(2) Sweet Pea, Cat's Nail, Utricularia, Nepenthes
(3) Nepenthes, Sweet Pea, Cat's Nail, Utricularia
(4) Utricularia, Nepenthes, Cat's Nail, Sweet Pea
(5) Nepenthes, Cat's Nail, Sweet Pea, Utricularia

Q.128 In distichous condition **[Manipur 2005]**

(1) First leaf stands over the second
(2) Second leaf stands over the first
(3) Third leaf stands over the first
(4) Fourth leaf stands over the first

Q.129 Leaves of Nelumbo plant are **[WB 2007]**

(1) Epistomatic (2) Hypostomatic
(3) Amphistomatic (4) None of these

Q.130 Phyllotaxy is decussate in **[COMED-K's 2008]**

(1) Nerium indicum
(2) Pisum sativum
(3) Hibiscus rosa–sinensis
(4) Catharanthus roseus

Q.131 Which ones show stipular modifications

(a) Spines of Zizyphus
(b) Tendrils in Smilax
(c) Tendirls in Nepenthes
(d) Spines in Argemone
(e) Thorn in bougainvillea. **[EAMCET 2005]**

(1) a and b (2) a and c
(3) b and e (4) c and e

Q.132 Phyllotaxy in Calotropis is **[AMU 2005]**

(1) Alternate (2) Opposite
(3) Whorled (4) None of these

Q.133 Multicostate parallel venation occurs in **[Kerala 2009]**

(1) Banana and Canna
(2) Mango and Peepal
(3) Grasses and Palms
(4) Castor and Tapioca
(5) Castor and China Rose

Q.134 Leaves are modified into spines in **[Kerala 2009]**

(1) Nepenthes (2) Australian Acscia
(3) Opuntia (4) Utricularia
(5) Tamarix

Q.135 Find the correct match **[AMU 2010]**

(1) Mustard – Leaves opposite
(2) Mustard – Leaves alternate
(3) Guava – Leaves alternate
(4) Guava – Leaves whorled

Q.136 Whorled phyllotaxy occurs in **[Kerala 2010]**

(1) Alstonia (2) Guava
(3) Calotropis (4) Mustard
(5) China Rose

Q.137 Bladderwort is **[MPPMT 2010]**

(1) Drosera (2) Nepenthes
(3) Dionaea (4) Utricularia

INFLORESCENCE

Q.138 In cyathium, the ratio between female to male flowers is **[EAMCET 2002, Orissa 2010]**

(1) One : One (2) One : Many
(3) Many : One (4) Many : Many

Q.139 The flowers of a raceme are arranged **[Pb.PMT 2010]**

(1) Acropetally (2) Basipetally

(3) Centripetally (4) Centrifugally

Q.140 The inflorescence of Rice/family gramineae is **[Orissa 2010]**

(1) Spike (2) Thyrsus

(3) Spikelet (4) Pedicel

Q.141 Axis of the inflorescence is called **[Har PMT 2007]**

(1) Peduncle (2) Thalamus

(3) Petiole (4) Pedicel

Q.142 The inflorescence present in Euphorbia is **[KECT, 2000, Tamil Nadu 2001]**

(1) Cyathium (2) Capitulum

(3) Helicoid cyme (4) Verticillaster

Q.143 Inflorescence having a flattend axis, sessile flowers and a whorl of involucral bracts is **[Kerala 2010]**

(1) Umbel (2) Head

(3) Corymb (4) Raceme

Q.144 A biparous cyme ending in uniparous cymes constitutes **[JIPMER 2000]**

(1) Verticillaster (2) Panicle

(3) Thyrus (4)Paniculate cyme

Q.145 Spadix inflorescence occurs in **[Orissa 2007, JKCMEE 2010]**

(1) Mulberry (2) Banana

(3) Coriander (4) Delonix

Q.146 Number of female flowers in a cyathium is : **[Kerala 2005, CPMT 2007]**

(1) 1 (2) 2

(3) 3 (4) Several

Q.147 Edible part of Cauliflower is **[AFMC 1996, AIIMS 2000]**

(1) Bud (2) Bract

(3) Inflorescence (4) Leaves

Q.148 Capitulum inflorescence is found in **[MPPMT 2010, CET Chd. 2010]**

(1) Malvance (2) Papilionaceae

(3) Liliaceae (4) Compositae

Q.149 Whorl of small green structures present around Sunflower is **[Pb. PMT 2000]**

(1) Epicalyx (2) Calyx

(3) Leaves (4) Involucre

Q.150 Inflorescence of Jowar is **[Wardha 2010]**

(1) Spike of spikelets (2) Panicle of spikelts

(3) capitulum (4) Verticillaster

Q.151 The ratio of female to male flowers is $1 : \infty$. It is found in **[CMPT 2001]**

(1) Hypanthodium (2) Cyathium

(3) Catkin (4) verticillaster

Q.152 Vertiillaster inflorescence occurs in **[Har. PMT 2001]**

(1) Lamiaceae/Labiatae

(2) Brassicacaea/Cruciferae

(3) Compositae/Asteraceae

(4) Solanaceae

Q.153 All the florets are disc florets in **[Tamil Nadu 2001]**

(1) Launea (2) Vernonia

(3) Sunflower (4) Tridax

Q.154 Inflorescence having unisexual sessile flowers is **[JKCMEE 2002]**

(1) Spike (2) Spikelet

(3) Catkin (4) Spadix

Q.155 Inflorescence having unisexual sessile flowers is **[RPMT 2002]**

(1) Umbel Cyathium (2) Cyathium

(3) Hypanthodium (4) Capitulum

Q.156 Which is true

(1) Umbel is racemose inflorescence where stalked flowers aggregate on a flat receptacle

(2) In raceme the main axis is shortened and flowers are born acropetally

(3) Spadix is a pendulous spike with main axis much flattened

(4) Spike is a racemose inflorescence having sessile flowers.

Q.157 Select the correct combination of inflorescence

(1) Simple raceme, corymb, umbel, simple cyme

(2) Simple raceme, spadix, spike, catkin

(3) Cyathium, verticillaster, hypanthodium, catkin

(4) Capitulum, globose head, verticillaster, catkin

Q.158 Raceme inflorescence occurs in **[JIPMER 2003]**

(1) Cucurbita (2) Delonix

(3) Euphorbia (4) Begonia

Q.159 Which is nearest to corymb **[CMC 2003]**

(1) Umbel (2) Capitulum

(3) Cyathium (4) Hypanthodium

Q.160 Elongated peduncle bearing pedicellate flowers continuously in acropetal order is **[KJCMEE 2001]**

(1) Corymb (2) Umbel

(3) Raceme (4) Head

Q.161 Which is not a correct match **[JKCMEE 2003]**

(1) Catkin — Mulberry

(2) Capitulum — Sunflower

(3) Corymb — Candytuft

(4) Raceme — Candytuft

Q.162 Edible part of Cauliflower is **[CPMT 2004, AFMC 2005]**

(1) Cotyledons (2) Mesocarp

(3) Endocarp (4) Inflorescense

Q.163 Capitulum inflorescence occur in **[JKCMEE 2005]**

(1) Salvia (2) Euphorbia

(3) Marigold (4) Jasmine

Q.164 Compare the column and find out the correct combinatiion

Column I	**Column II**
(1) Gall flowers	(i) Spikelet
(2) Involucre	(ii) Hypanthodium
(3) Spathe	(iii) Cyathium
(4) Lemma	(iv) Umbel
	(v) Spadix

[EAMCET 2005]

(1) (1) – (ii), (2) – (iv), (3) – (v), (4) – (iii)

(2) (1) – (ii), (2) – (iii), (3) – (v), (4) – (i)

(3) (1) – (iii), (2) – (iv), (3) – (ii), (4) – (v)

(4) (1) – (iii), (2) – (iv), (3) – (ii), (4) – (i)

Q.165 Characteristic bracts associated with spikelet inflorescence of grasses are **[Manipur 2006]**

(1) Involucral bracts (2) Glumes

(3) Pappus (4) Spathes

Q.166 Spadix inflorescence is characteristic feature of **[CET Chd. 2006]**

(1) Colocasia (2) Palm

(3) Banana (4) All the above

Q.167 Scorpioid cyme occurs in **[JKCMEE 2007]**

(1) Hamelia (2) Nerium

(3) Heliotropium (4) Clerodendron

Q.168 Capitulum inflorescence does not occur in **[Manipur 2007]**

(1) Dahlia (2) Sunflower

(3) Marigold (4) China Rose

Q.169 Match the column and select the correct options

Column I	**Column II**
(a) Spike	(1) Bougainvillea
(b) Capitulum	(2) Coleus
(c) Dichasial cyme	(3) Adhatoda
(d) Multiparous cyme	(4) Zinnia
(e) Verticillaster	(5) Asclepias

[Kerala 2008]

(1) a – 3, b – 4, c – 1, d – 5, e – 2

(2) a – 3, b – 1, c – 4, d – 5, e – 2

(3) a – 2, b – 4, c – 1, d – 5, e – 3

(4) a – 4, b – 2, c – 5, d – 1, e – 3

(5) a – 5, b – 4, c – 1, d – 3, e – 2

Q.170 Study the following table and find the correct pair **[EAMCET 2008]**

(a) False whorl like inflorescence – many sessile bisexual flowers – Leonotis

(b) Single flower like inflorescence – Many stalked stminate and pistillate flowers – Poinsettia

(c) Fruit–like inflorescence – Many sessile, staminate flowers on top, pistillate flowers at base and sterile flower in between – Ficus

(d) Fleshy axis of inflorescence – Many stalked, staminate flowers at base, pistillate flowers on top and sterile flowers in between – Colocasia.

(1) a, c (2) a, d

(3) b, c (4) b, d

Q.171 Find the correct match

Column I	Column II
(a) Gall flowers	(1) Theobroma
(b) Sympodial axis	(2) Bougainvillea
(c) Achlamydeous	(3) Ficus
(d) Cauliflory	(4) Euphorbia
	(5) Hamelia

[EAMCET 2008]

(1) a – 3, b – 5, c – 1, d – 2
(2) a – 3, b – 4, c – 2, d – 1
(3) a – 3, b – 4, c – 1, d – 2
(4) a – 3, b – 5, c – 4, d – 1

Q.172 In an inflorescence two types of centripetally arranged sessile flowers with hair like sepals occurs. Which one is not associated with them
(a) Nectar glands at base of corolla
(b) Axile placentation
(c) Superior ovary
(d) Scaly bracts **[EAMCET 2008]**
(1) b and c (2) c and d
(3) a and b (4) a and d

Q.173 Verticillaster type of inflorescence occurs in **[JKCMEE 2008]**
(1) Cotton (2) Datura
(3) Leucas (4) Ocimum

Q.174 Glumes represent **[CPMT 2009]**
(1) Petals (2) Bracts
(3) Sepals (4) Stamens

Q.175 A student observed 34 inflorescence in Bougainvillea and 42 inflorescence in Poinsettia. Find out the number of flowers in Bougainvillea and the number of female of flowers in poinsettia respectively. **[EAMCET 2009]**
(1) 34, 126 (2) 204, 164
(3) 102, 42 (4) 68, indefinite

Q.176 Largest flower is that of **[BHU 1987, 1991]**
(1) Sunflower (2) Rafflesia
(3) Nelumbo (4) Drosera

Q.177 Arrangment of sepals and petals with respect to each other is **[COMED–K's 2006]**
(1) Venation (2) Vernation
(3) Aestivation (4) Phyllotaxy

Q.178 A flowers which can be divided into two exactly equal halves by any vertical division passing through centre is **[Har. PMT 2003, JKCMEE 2004]**
(1) Zygomorphic (2) Hypogynous
(3) Actinomorphic (4) Epigynous

Q.179 A typical flower with superior ovary and other floral parts inferior is **[JKCMEE 2005]**
(1) Polygamous (2) Hypogynous
(3) Periynous (4) Epigynous

Q.180 An apocarpous flower is found in **[BHU 1999, JIPMER 2000]**
(1) Caesalpinnia (2) Ranunculus
(3) Brassica (4) Datura

Q.181 Part of pistil which receives pollen is **[MPPMT 2000]**
(1) Ovary (2) Style
(3) Stigma (4) Ovule

Q.182 Gynobasic sytle is found in **[Har. PMT 2007]**
(1) Labiatae/Lamiaceae (2) Liliaceae
(3) Gramineae/Poaceae
(4) Composite/Asteracceae

Q.183 A plant with both male and female flowers/sex organs borne over it is **[DPMT 2009]**
(1) Monoecious (2) Dioecious
(3) Unisexual (4) Bisexual

Q.184 Marginal placentation is found in **[RPMT 2000]**
(1) Solanaceae (2) Cruciferae
(3) Fabaceae/Leguminosae
(4) Asteraceae/Compositae

Q.185 Pappus is modification of **[BHU 2005]**
(1) Bracts (2) Bracteoles
(3) Corolla (4) Sunflower

Q.186 Diadelphous (9) + 1 stamens occur in **[Manipal 2001, AIIMS 2001]**
(1) Gramineae (2) Cucurbitaceae
(3) Papilionate (4) Malvaceae

Q.187 Filament attachd along the whole length of anther is the condition called **[EAMCET 1996, AIIMS 2002]**
(1) Adnate (2) Dorsifixed
(3) Basifixed (4) Versatile

Q.188 Tetradynamous condition is characteristic of family **[Bihar PMT 2001, CBSC 2001]**

(1) Papilionaceae/Pea

(2) Cruciferae/Mustard

(3) Solanaceae/Tamato

(4) Malvaceae/Cotton

Q.189 Vexillary type of petal arrangement occurs in **[KCET 1998, 2001]**

(1) Maize (2) Cucurbita

(3) Mustard (4) Pea/Crotolaria

Q.190 Placentation type of petal arrangement in a syncarpous unilocular ovary where ovules occur on sutures is **[CPMT 2010]**

(1) Apical placentation

(2) Parietal placentation

(3) Marginal placentation

(4) Superficial placentation

Q.191 Monothecous anthers occur in **[RPMT 2000, Bih. PMT 2002]**

(1) Hibiscus rosa-sinensis/Malvaceae

(2) Allium cepa/Liliaceae

(3) Brassica oleracea/Cruiferae

(4) Solanum nigrum/Solanaceae

Q.192 Hair present on the cob of corn are **[CBSE 2000, 2006]**

(1) See hairs

(2) Modified hairs of bracts

(3) Styles

(4) Stigmas

Q.193 Pappus is characteristic of family **[JKCMEE 2000]**

(1) Asteraceae/Compositae

(2) Papaveraceae

(3) Papolionaceae/Fabaceae

(4) Malvaceae

Q.194 In many cultivated ornamental flowers, number of petal whorls is higher than the one in wild type. Extra petals are generally modified. **[JKMEE 2000]**

(1) Sepals (2) Petals

(3) Stamens (4) Pistils

Q.195 Ligulate corolla found in compositae is **[JIPMER 2000]**

(1) Wheel – shaped (2) Strap – shaped

(3) Masked (4) Two – lipped

Q.196 Butterfly shaped flower with one standard, two wing-like and two keeled petals belong to **[AIIMS 2000]**

(1) Compositae (2) Rubiaceae

(3) Malvaceae (4) Papilionaceae

Q.197 Transversely placed syncarpous ovary occurs in **[Pb. PMT 2000]**

(1) Compositae (2) Cruciferae

(3) Malvaceae (4) Cucurbitaceae

Q.198 When stamens are fused by their anthers and the filaments are free, the condition is called **[JIPMER 2000, Har. PMT 2003]**

(1) Monadelphous (2) Synandrous

(3) Syngenesious (4) Epipetalous

Q.199 Papilionaceous corolla occurs in **[Wardha 2001]**

(1) Brassicaceae (2) Asteraceae

(3) Fabaceae (4) Poaceae

Q.200 Stamens of Jower/Grass are **[Wardha 2001]**

(1) Dorsifixed (2) Versatile

(3) Basifixed (4) Adnate

Q.201 A flower without nonessential whorls is **[Kerala 2001]**

(1) Monoecious (2) Trioecious

(3) Dioecious (4) Achlamydeous

(5) Hermaphrodite

Q.202 The condition of free petals is called **[Kerala 2001]**

(1) Polypetalous (2) Gamopetalous

(3) Polyphyllous (4) Gamophyllous

(5) Apocarpous

Q.203 Anthers represents **[BHU 2001]**

(1) Male gametophytes (2) Male sporophylls

(3) Spermatogonia

(4) Female gametophytes

Q.204 Bicarpellary gynoecium with oblique ovary occurs in **[CBSE 2001]**

(1) Banana (2) Brinjal

(3) Pisum (4) Mustard

Q.205 Inividual flowers are attached to inflorescence axis by **[Tamil Nadu 2001]**

(1) Peduncle (2) Petiole

(3) Pedicel (4) Bract

Q.206 Trimerous flowers occur in **[Har. PMT 2001]**

(1) Monocots (2) Dicots

(3) Gymnosperms (4) All the above

Q.207 Which of the following is asymetrical flower **[Tamil Nadu 2001]**

(1) Clitroria (2) Canna

(3) Crotalaria (4) Hibiscus

Q.208 In obdiplostemonous androecium, stamens are arranged in **[EAMCET 2002]**

(1) One whorl alternating with petals

(2) Two whorls with outer whorl opposite the petals

(3) Two whorls with outer whorl alternating with petals

(4) One whorl opposite the petals

Q.209 In Bentham and Hooker's system of classification the arrangement of three series of polypetalae reflects evolution from **[EAMCET 2002]**

(1) Bisexuality to unisexuality

(2) Dichlamydeous to monochlamydeous condition

(3) Hypogyny to epigyny

(4) Apocarpy to syncarpy

Q.210 Petals of a flower are arranged in such a way that each overlaps a petal on one side and is overlapped by other petal on the other side. The aestivation is **[RPMT 2002]**

(1) Valvate (2) Quincuncial

(3) Imbricate (4) Twisted

Q.211 Out of 5 petals of a flower, two are completly internal, two completely external and remaining one is internal at one margin and external at the other margin. Aestivation is **[Orissa 2002]**

(1) Ascending imbricate

(2) Vaxillary

(3) Quincuncial (4) Valvate

Q.212 A flower which can be divided into two equal halves by only one plane is **[JKCMEE 2002, HPPMT 2007]**

(1) Zygomorphic (2) Actinomorphic

(3) Perfect (4) Regular

Q.213 Individual components of perianth are called **[Har. PMT 2003]**

(1) Sepals (2) Petals

(3) Tepals (4) Bracts

Q.214 Union of stamens with carpels from a complex called **[CMC 2003]**

(1) Gynandrous (2) Syngenesious

(3) Gynandrium (4) Synandrous

Q.215 The condition of fusion of filaments as well as anthers is **[Orissa 2004]**

(1) Gyandrous (2) Synandrous

(3) Syngenesious (4) Protandrous

Q.216 An ovule bent to come at right angles to funicle is **[CBSE 2004]**

(1) Anatropous (2) Orthotropous

(3) Campylotropous (4) Hemitropous

Q.217 Anthesis is **[CBSE 2004, CET Chd. 2010]**

(1) Opening of floral bud

(2) Development of anthers

(3) Maturation of anthers

(4) Reception of pollen by stigma

Q.218 Tetradynamous condition occurs in **[AFMC/CPMT 2004, RPMT 2005]**

(1) Petunia hybrida

(2) Helianthus annuus

(3) Brassica campestris

(4) Hibiscus rosa sinensis

Q.219 Flowers having only one set of essential organ are **[Kerala 2004]**

(1) Monoecious (2) Dioecious

(3) Bisexual (4) Unisexual

(5) Polygamous

Q.220 Trimerous unisexual flowers occur in **[KCET 2004]**

(1) Tamarind (2) Cocos

(3) Pea (4) Hibiscus

Q.221 Saffron is **[MPPMT 2004, Har. PMT 2007]**

(1) Stamens of Hibiscus

(2) Style and stigma of Crocus plant

(3) Roots of Indigofera

(4) Petals of Musa

Q.222 Gynoecium having three fused carpels with a single ovule containing chamber is **[JIPMER 2004]**

(1) Tricarpellary, syncarpous, unilocular

(2) Tricarpellary, polycarpellary unilocular

(3) Tricarpellary, syncarpous, trilocular

(4) Tricarpellary, polycarpellary, trilocular

Q.223 Clove used as spice represents **[Kerala 2005]**

(1) Seed (2) Leaves

(3) Flower buds (4) Stem tip

(5) Terminal bud

Q.224 Arrangement of ovules on the placentae developed from central axis of ovary is **[JKCMEE 2005]**

(1) Parietal placentation

(2) Basal placentation

(3) Marginal placentation

(4) Axile placentation

Q.225 The position of ovary is below sepals, petals and stamens. The flower is **[Orissa 2005]**

(1) Epigynous (2) Perigynous

(3) Mesogynous (4) Metagynous

Q.226 Indentify the wrong statement **[EAMCET 2005]**

(1) A plant that bears male, female and bisexual flowers is polygamous

(2) Actinomorphic flowers can be dissected into two equal halves from any plane

(3) Superior ovary is found in hypogynous flowers

(4) Side of the flower towards the bract is called posterior side.

Q.227 Compare the column and find out the correct combination **[EAMCET 2005]**

Column I	**Column II**
(1) Tridax	(i) Synandrous
(2) Dolichos	(ii) Monadelphous
(3) Ceiba	(iii) Syngenesious
(4) Cucurbita	(iv) Polyadephous
	(v) Diadelphous

(1) (1) – (iv), (2) – (v), (3) – (ii), (4) – (i)

(2) (1) – (iii), (2) – (v), (3) – (iv), (4) – (i)

(3) (1) – (iii), (2) – (v), (3) – (i), (4) – (iv)

(4) (1) – (v), (2) – (iii), (3) – (iv), (4) – (ii)

Q.228 A flower with five unequal petals has largest posterior petal, two lateral slighly small petals and two anterior petals partially fused to form a boat – shaped structure. Which is not correct for such a flower? **[EAMCET 2005]**

(1) Descending imbricate aestivation

(2) Odd sepal anterior

(3) Piston mechanism of pollination

(4) Many carpels.

Q.229 Staminal tube comes out of flower in **[RPMT 2005]**

(1) Pisum sativum (2) Cassia fistula

(3) Hibiscus (4) Iberis

Q.230 Colour of Bougainvillea flower is due to colour of its **[RPMT 2005]**

(1) Corolla (2) Bracts

(3) Calyx (4) Androrcium

Q.231 When pistillate and bisexual flowers develop on different plants. The condition is **[BV 2006]**

(1) Gynodioecious (2) Gymnomonoecius

(3) Polygamodiecius (4) Polygamonoecius

Q.232 Non-essential floral organs without differentiation of calyx and corolla are called **[MHTCET 2007]**

(1) Thalamus (2) Pedicel

(3) Perianth (4) Lodicules

Q.233 Epicalyx occurs in **[MHTCET 2007]**

(1) Cycas (2) Jower

(3) Nephrolepis (4) China Rose

Q.234 In Guava and Cucurbits the flowers are

(1) Hypogynous (2) Epigynous

(3) Perigynous (4) Both A and B

Q.235 Synandrous condition is found in **[WB 2008]**

(1) Sunflower (2) Gourd

(3) Pea (4) Lemon

Q.236 Floral bud is covered by **[Orissa 2008]**
(1) Petals (2) Anthers
(3) Sepals (4) Stigmas

Q.237 Ovarian parts are fused, styles and stigmas free but ovary part is unilocular with free central placentation. The plant is **[EAMCET 2008]**
(1) Michelia (2) Nymphaea
(3) Abutilon (4) Dianthus

Q.238 Replum occurs in the ovary of **[CBSE 2008]**
(1) Mustard (2) Pea
(3) Sunflower (4) Lemon

Q.239 In a plant, androecium has monadelphous stamens, monothecous reniform anthers and contorted corolla. It is **[KCET 2009]**
(1) Nerium (2) Rauwolfia
(3) Hibiscus (4) Lathyrus

Q.240 Pollinia occur in **[Orissa 2009]**
(1) Cruciferae (2) Asteraceae
(3) Poaceae (4) Asclepiadaceae

Q.241 Ochreate stipules occurs in **[Orissa 2009]**
(1) Leguminosae (2) Polygonaceae
(3) Acanthaceae (4) Malvaceae

Q.242 Ovules occur along the ventral suture over a ridge in two rows in placentation **[AMU 2009]**
(1) Marginal (2) Parietal
(3) Axile (4) Free central

Q.243 Placentation found in caryophyllaceae is **[Kerala 2009]**
(1) Axile (2) Basal
(3) Parietal (4) Free central
(5) Marginal

Q.244 Other florals develop below the base of ovary in a flower called **[WB 2009]**
(1) Epigynous (2) Hypogynous
(3) Agynous (4) Perigynous

Q.245 An example of axile placentation is **[CBSE 2009]**
(1) Marigold (2) Dianthus
(3) Lemon (4) Argemone

Q.246 Which one is monoecious **[CBSE 2009]**
(1) Marchantia (2) Pinus
(3) Cycas (4) Papaya

Q.247 Consider the following statements **[Kerala 2010]**
(a) In recemose inflorescence the flowers are borne in a basipetal order
(b) Epigynous floweers are seen in Rose plants
(c) In Brinjal the ovary is superior. Of these statements
(1) a and b are true but c is false
(2) a and c are true but b is false
(3) a and b are false but c is true
(4) b and c are true but a is false
(5) a and c are false but b is true

Q.248 The ovary in hypogynous flowers is said to be **[HPPMT 2010]**
(1) Half inferior (2) Inferior
(3) Superior (4) None of these

Q.249 Aestivation found in Pea flowers is **[HPPMT 2010]**
(1) Twisted (2) Valvate
(3) Imbricate (4) Vexillary

Q.250 In which of the following kinds of ovules, the emboryo sac is horse – shoe shaped **[MPPMT 2010]**
(1) Orthotropous ovule
(2) Hemitorpous ovule
(3) Amphitropous ovule
(4) Circinotropous ovule

Q.251 Which of these is an example for zygomorphic flower with inbricate aestivation **[Kerala 2010]**
(1) Canna (2) Cassia
(3) Cucumber (4) Catotropis
(5) Mustard

Q.252 Gynandrous condition means **[Orissa 2010]**
(1) Adhesion of stamens and carpels
(2) Cohesion of stamens
(3) Stamens united by filaments
(4) Free stamens

Q.253 Feathery stigma is called **[Orissa 2010]**
(1) Plumose (2) Spur
(3) Stylopodium (4) Calyculus

Q.254 The expression 'gynoecium is apocarpous' implies that **[DPMT 2010]**

(1) Gynoecium compries only one pistil which is fused with the stamens

(2) Gynoecium compries more than one carpel which are free

(3) Gynoecium compries more than one carpel which are fused

(4) Gynocium compries only one carpel which is free

Q.255 In unilocular ovary with a single ovule the placentation is **[CBSE 2010]**

(1) Basal (2) Free central

(3) Axile (4) Marginal

Q.256 The technical term used for the androecium in a flower of China Rose (Hibiscus rosa - sinensis) is **[CBSE 2010]**

(1) Diadelphous (2) Polyandrous

(3) Polyadelphous (4) Monadelphous

FRUIT

Q.257 Maize/Wheat/Rice grain is **[RPMT 2005, AFMC 2005]**

(1) Fruit (2) Seed

(3) Embryo (4) Dried bud

Q.258 Edible part in the fruit of Litchi is **[CBSE 2005, Wardha 2005]**

(1) Mesocarp (2) Aril

(3) Fleshy thalamus (4) Cotyledons

Q.259 In Asteraceae/Sunflower, the fruit is **[CPMT 2001]**

(1) Drupe (2) Cypsela

(3) Berry (4) Carcerules

Q.260 Wheat/Rice grain is a fruit of the type **[AMUPMDC 2006, AFMC 2009]**

(1) Cypsela (2) Samara

(3) Achene (4) Caryopsis

Q.261 Which one of the following is a nut **[Kerala 2003, BHU 2005, 2008]**

(1) Walnut (2) Cashewnut

(3) Groundnut/Areca (4) Both 1 and 2

Q.262 Which one of the following does not have a polycarpellary ovary **[CPMT 1989, JKCMEE 2009]**

(1) Guava (2) Coconut

(3) Apple (4) Fig.

Q.263 A simple one – seeded dry, indehiscent fruit in which pericarp and testa are fused is **[JKCMEE 2008, CET Chd. 2010]**

(1) nut (2) Achene

(3) Cypsela (4) Caryopsis

Q.264 Coir of commerce is obtained from **[AIIMS 2001, AMU 2005, CPMT 2009]**

(1) Endocarp of Coconut

(2) Mesocarp of Coconut

(3) Stem of Jute

(4) Leaves of Coconut

Q.265 Fruit of Calotropis is **[CPMT 1986, Pb. PMT 2000]**

(1) Nut (2) Follicle

(3) Berry (4) Siliqua

Q.266 Fruit growing from hypanthodium/fruit of Fig is **[CPMT 2001, CBSE 2009]**

(1) Sorosis (2) Siliqua

(3) Syconus (4) Samara

Q.267 Caryopsis is the fruit of **[AFMC 1986, MHTCET 2007]**

(1) Coconut (2) Brinjal

(3) Tomato (4) Maize/Sorghum

Q.268 A false fruit is that of **[CPMT 1988, 2009, AFMC 2010]**

(1) Mango (2) Cashewnut

(3) Apple (4) Brinjal

Q.269 The fruit of Annona squamosa (Custard Apple) is **[AFMC 2004]**

(1) Etaerio of berries (2) Etaerio of drupes

(3) Hypanthodium (4) Etaerio of achenes

Q.270 The edible part of Apple/Pear is **[BHU 2008, AMU 2005, Manipur 2007]**

(1) Cotyledons

(2) Thalamus/Receptacle

(3) Mesocarp

(4) Endocarp

Q.271 Endocarp is stony in the fruit of **[JKCEE 2005, KCET 2009]**

(1) Berry (2) Pome
(3) Drupe (4) Pepo

Q.272 Edible part of Mango is **[AFMC 2010, CBSE 2004]**

(1) Pericarp (2) Mesocarp
(3) Pome (4) Epicarp

Q.273 Edible part of Coconut is **[Bih. PMT 1991]**

(1) Endocarp (2) Mesocarp
(3) Aril (4)Seed/Endosperm

Q.274 Dry indehiscent single seeded fruit formed from bicarpellary syncarpous inferior ovary is **[CBSE 2008]**

(1) Cremocarp (2) Caryopsis
(3) Cypsela (4) Berry

Q.275 Pepo is a fruit of **[AMUPMDC 2006]**

(1) Crouciferae (2) Leguminosae
(3) Cucurbitaceae (4) Liliaceae

Q.276 Formation of fruit without fertilization is **[AFMC 2001, CPMT 2003, 2009]**

(1) Apogamy (2) Apospory
(3) Syngenesious (4) Parthenocarpy

Q.277 Edible part of Guava is **[Orissa 1995, AFMC 2002]**

(1) Thalamus and pericarp
(2) Entire fruit
(3) Endocarp (4) None of the above

Q.278 Aril represents edible part in **[CBSE 2006, AFMC 2009]**

(1) Litchi (2) Apple
(3) Mango (4) Banana

Q.279 Science and practice of fruit culture is **[Orissa 2010]**

(1) Spermology (2) Pomology
(3) Anthology (4) Dendrology

Q.280 Syconus fruit develops from **[AMUPMDC 2006]**

(1) Catkin (2) Varticillaster
(3) Hypanthodium (4) Cyathium

Q.281 Syconus is the name of **[Har. PMT 2010]**

(1) Inflorescence (2) Fruit
(3) Thalamus (4) Ovary

Q.282 Geocarpic fruit is **[CBSE 2000]**

(1) Mango (2) Orange
(3) Wtare Melon (4) Pea Nut

Q.283 Jack fruit is **[CET Chd. 2000]**

(1) Sorosis (2) Syconus
(3) Siliqua (4) Lomentum

Q.284 Fruit of Candytuft is **[Wardha 2000]**

(1) Capsule (2) Follicle
(3) Silicula (4) Pome

Q.285 Pome is false fruit as **[CPMT 2000]**

(1) Endocarp is cartilaginous
(2) Pericarp is inconspicuous
(3) Fruit is surrounded by fleshy thalamus
(4) All the above

Q.286 Schizocarpic fruit has **[JIPMER 2000]**

(1) Fleshy pericarp
(2) Origin from inflorescence
(3) Origin from apocarpous pistil
(4) Trait of breaking up into single seeded parts

Q.287 Select the correct combination of edible part **[Manipal 2000]**

(1) Coconut – Mesocarp
(2) Apple – Mesocarp
(3) Mango – Endocarp
(4) Banana – Mesocarp Endocarp

Q.288 Which one of the following is true match **[Manipal 2001]**

(1) Composite fruit – Pineapple
(2) Aggregate fruit – Pineapple
(3) True fruit – apple
(4) False fruit – Mango

Q.289 Single seeded fruit develops from **[CPMT 2001]**

(1) Tricarpellary ovary
(2) Bicarpellary syncarpous ovary
(3) Multicarpellary syncarpous ovary
(4) Pistil having single ovule

Q.290 Fruit of coconut is **[CPMT 2010]**

(1) Berry (2) Cypsela
(3) Drupe (4) Cremocarp

Q.291 A composite/sorosis fruit is **[HPPMT 2007]**

(1) Banana (2) Pineapple

(3) Pear (4) Coconut

Q.292 Which is correct match for edible part **[CBSC 2001]**

(1) Tomato – Thalamus

(2) Maize – Cotyledons

(3) Guava – Mesocarp

(4) Date – Mesocarp

Q.293 Edible part of Banana is **[CBSE 2001]**

(1) Epicarp

(2) Epicarp and mesocarp

(3) Mesocarp and less developed endocarp

(4) Endocarp and less developed mesocarp

Q.294 Coir is obtained from **[Har. PMT 2001]**

(1) Fruit of Cocos nucifera

(2) Seed of Cocos nucifera

(3) Stem of Cocos nucifera

(4) Leaves of Cocos nucifera

Q.295 Edible part of Mulberry is **[Uttarakhand 2001]**

(1) Thalamus (2) Perianth

(3) Rachis (4) Ripened ovary

Q.296 Spines on the rind of Jack – Fruit represent **[Tamil Nadu 2001]**

(1) Styles (2) Carpels

(3) Stigmas (4) Bracts

Q.297 Which one is a composite fruit **[DPMT 2002]**

(1) Pea (2) Strawberry

(3) Calotropis (4) Jack Fruit

Q.298 Fruit developed from bicarpelley syncarpous ovary having a false septum is **[DPMT 2002]**

(1) Achene (2) Siliqua

(3) Capsule (4) Berry

Q.299 Berries, drupes and pomes are **[JKCMEE 2002]**

(1) Aggregate fruits

(2) Composite fruits

(3) Simple dry fruits

(4) Simple succulent fruits

Q.300 Aril is **[JIPMER 2002]**

(1) Outgrowth of integument

(2) Persistent nucellus

(3) Outgrowth of funicle which grows around the ovule

(4) Outgrowth from micropyle

Q.301 Nature of fruit developing from a flower depends upon the type of **[KCET 2002]**

(1) Gynoecium (2) Androecium

(3) Pollination (4) Fertilisation

Q.302 Juicy hair like structures observed in lemon fruit develop from **[CBSE 2003]**

(1) Exocarp

(2) Mesocarp

(3) Endocarp

(4) Mesocarp and endocarp

Q.303 Fruit formed from an inflorescence is **[Wardha 2003]**

(1) Simple fruit (2) Pseudocarp

(3) Composite fruit (4) Aggregate fruit

Q.304 Most important edible plant food is **[AMU 2003]**

(1) Roots (2) Stems

(3) Leaves (4) Fruits

Q.305 Fruits have fructose for **[AMU 2003]**

(1) Attracting animals for seed dispersal

(2) Fruit ripening

(3) Maturation of seeds

(4) Nourishment of embryo

Q.306 Fruit of Elepkat Apple (Dillenia indica) **[AMU 2003]**

(1) Balausta (2) Pepo

(3) Amphisarca (4) Berry

Q.307 A dry indehiscent fruit is **[Kerala 2004]**

(1) Caryopsis (2) Follicle

(3) Capsule (4) Pod

Q.308 In sorosis type of composite fruits, the edible part is **[BHU 2005]**

(1) Cotyledons

(2) Fleshy thalamus

(3) Perianth and peduncle

(4) Endosperm

Q.309 The fruit developed from single ovary is **[JKCMEE 2005]**

(1) Composite (2) Simple fruit

(3) Aggregate fruit (4) None of the above

Q.310 Drupes are called stony fruits as they have **[Kerala 2005]**

(1) Hard endocarp

(2) Hard mesocarp

(3) Hard epicarp

(4) Hard epicarp and hard mesocarp

(5) Hard mesocarp and hard endocarp

Q.311 Dorsiventral dehiscence occurs in fruits **[EAMCET 2005]**

1. Legume 2. Follicle

3. Siliqua 4. Capsule

(1) 1 and 2 (2) 2 and 3

(3) 2 and 4 (4) 1 and 3

Q.312 Edible part of fleshy fruit is **[Manipur 2005]**

(1) Parenchymatous pulp

(2) Soft seeds

(3) Collenchymatous rind

(4) Sclerenchymatous endocarp

Q.313 Which is correct for Anacardium occidentale? **[Manipur 2005]**

(1) Upper part is edible

(2) Upper part is false fruit

(3) Seed is edible part of fruit

(4) Upper part is true fruit

Q.314 Which one is a true fruit? **[AMU 2005]**

(1) Walnut (2) Areca nut

(3) Cashew nut (4) Ground nut

Q.315 Edible part in sorosis fruit is **[AMU 2005]**

(1) Perianth (2) Parianth + sepals

(3) Placenta (4) Perianth + Placenta

Q.316 Pineapple (Ananas) fruit develops from **[CBSE 2006, DPMT 2009]**

(1) Cluster of flowers borne compactly on a common axis

(2) Multilocular monocarpellary flower

(3) Unilocular polycarpelley flower

(4) Mulitpistillate syncarpous flower

Q.317 Seedless fruit in Banana is produced by **[Bih. PMT 2006]**

(1) Parthenogenesis

(2) Asexual reproduction

(3) Triploidy

(4) Cross pollination

Q.318 Banana is **[COMED – K's 2006]**

(1) Cremocarp

(2) Parthenocarpic berry

(3) Drupe (4) Capsule

Q.319 A fruit that has fleshy mesocarp and stony endocarp is **[Manipur 2006]**

(1) Pome (2) Berry

(3) Pepo (4) Drupe

Q.320 Match the column **[Kerale 2006]**

Column I	**Column II**
(a) Apple	(1) Outer portion of receptacte
(b) Coconut	(2) Fleshy thalamus
(c) JAckfruit	(3) Thalamus and pericarp
(d) Guava	(4) Endosperm
(e) Pineapple	(5) Bract, perianth and seeds

(1) a – 5, b – 3, c – 1, d – 4, e – 2

(2) a – 2, b – 3, c – 1, d – 5, e – 4

(3) a – 2, b – 4, c – 5, d – 3, e – 1

(4) a – 2, b – 3, c – 4, d – 5, e – 1

(5) a – 5, b – 4, c – 3, d – 2, e – 1

Q.321 Lomentum is **[BHU 2007]**

(1) Achenial fruit (2) Schizocarpic fruit

(3) Composite fruit (4) Syconus fruit

Q.322 Pericarp and placenta are edible parts of simple fleshy berry fruit **[KCET 2007]**

(1) Tomato (2) Jack fruit

(3) Banana (4) Date Palm

Q.323 Edible part in the fruit of Hesperidium is **[JKMEE 2007]**

(1) Endocarp (2) Mesocarp

(3) Juicy hairs (4) Pericarp

Q.324 Dried fruit used in making a musical instrument is **[Har. PMT 2007]**
(1) Snake Gourd (2) Bitter Gourd
(3) Bottle Gourd (4) All the above

Q.325 Geocarpic fruits are formed in **[AMFC 2007]**
(1) Watermelon (2) Onion
(3) Carrot (4) Groundnut

Q.326 A single flower with multiple ovaries produces **[Orissa 2008]**
(1) Simple fruit (2) Aggregate fruit
(3) Composite fruit (4) False fruit

Q.327 Arrange the fruits in descending order of the chambers of the ovary they develop **[EAMCET 2008]**
(a) Carcerulus (b) Schizocarp
(c) Cremocarp (d) Regma
(1) b, a, d, c (2) a, d, c, b
(3) b, d, c, a (4) b, c, a, d

Q.328 The fruit is chambered, developed from inferior ovary and has seeds with succculent testa is **[CBSE 2008]**
(1) Orange (2) Cucumber
(3) Pomegranate (4) Guava

Q.329 Fleshy receptacle of syconus of Fig encloses a number of **[CBSE 2008]**
(1) Berries (2) Achenes
(3) Mericarps (4) Samras

Q.330 Find out the correct statements **[BHU 2008]**
(1) Seeds of Pea are exalbuminous
(2) Fruit of Peach is drupe
(3) Seeds of Tamoto are albuminous
(4) Fruit of Coconut is berry
(1) 1, 2, 3, correct (2) 1, 2 correct
(3) 2, 4 correct (4) 1, 3 correct

Q.331 In which plant the fruit is a drupe, seed coat is thin, embryo is inconspicuos and endosperm is edible? **[DPMT 2009]**
(1) Groundnut (2) Apple
(3) Wheat (4) Coconut

Q.332 In drupe of Coconut, mesocarp is **[AMU 2009]**
(1) Stony (2) Fleshy
(3) Fibrous (4) Watery

Q.333 Which statements are correct **[Kerala 2009]**
(a) A fruit developing from inflorescence composite fruit
(b) Mesocarp is edible in Apple
(c) Gynobasic style occurs in Ocimum
(d) hypanthodium occurs in Euphorbia species
(1) a, d correct (2) a, c correct
(3) a, b correct (4) b,d correct
(5) b, c, d corrct

Q.334 Cotyledons and testa are respectively edible in **[CBSE 2009]**
(1) Walnut and Tamarind
(2) French Bean and Coconut
(3) Cashew Nut and Litchi
(4) Groudnut and Pomegranate

Q.335 What is correct answer to assertion (1) and reason (r). Assertion a. In syconus type fruit, the achenes formed are fewer the total number of flowers in the inflorescence. Reason r. Upper and middle flowers do not develop into fruits **[EAMCET 2009]**
(1) Both a and r are correct with r being correct explanation of a
(2) Both a and r are correct with r is not correct explanation of a
(3) a is true but r is false
(4) a is false but r is true

Q.336 Which of the following fruit is parthenocarpic **[CET Chd. 2010]**
(1) Mango (2) Lemon
(3) Banana (4) Apple

Q.337 Which is multicellular and splits longitudinally along dorsal sutures **[Orissa 2010]**
(1) Septicidal (2) Capsular
(3) Loculicidal (4) Septifragal

Q.338 Bracts, perianth and seeds are edible parts of **[MPPMT 2010]**
(1) Cocos nucifera
(2) Mangifera indica
(3) Argemone maxicana
(4) Artocarpus heterophyllus

Q.339 In Coconut fruit, the hard shell is **[MPPMT 2010]**

(1) Endocarp
(2) Fused structure of mesocarp and endocarp
(3) Fused structure of epicarp anb mesocarp
(4) Epicarp

Q.340 Which one is not a false fruit **[HPPMT 2010]**

(1) Apple (2) Mango
(3) Strawberry (4) Cashewnut

Q.341 Scientific name of Banana is **[AFMC 2010]**

(1) Musa paradisica (2) Musa superba
(3) Musa textilis (4) Hibiscus mutabilis

SEEDS

Q.342 Mechanical injuring of seed coat to break dormancy is called **[DPMT 1999, 2003]**

(1) Scarification (2) Stratification
(3) Impaction (4) Compaction

Q.343 A seed which does not require oxygen for germination is **[BHU 2008]**

(1) Pea (2) Rice
(3) Typha (4) Both B and C

Q.344 Outermost layer of endosperm of Maize grain is **[Uttarakhand 2001, Har. PMT 2007]**

(1) Epidermis (2) Pericarp
(3) Tunica (4) Aleurone

Q.345 Oil is stored in the endosperm of **[WB 2007]**

(1) Groundnut (2) Soybean
(3) Coconut (4) Cashewnut

Q.346 Micropyle occurs in **[BHU 2008]**

(1) Ovary (2) Seeds
(3) Ovule (4) Both B and C

Q.347 Shield – shaped cotyledon/scutellum occurs in **[BHU 2008]**

(1) Maize/Sorghum (2) Gram
(3) Pea (4) Cucumber

Q.348 A method of breaking dormancy and allowing ample absorption of water is **[CBSE 2000]**

(1) Stratification (2) Scarification
(3) Vernalisation (4) Devernalisation

Q.349 During seed germination, seed coatrupture due to **[Har. PMT 2000]**

(1) Differentiation of cotyledons
(2) Massive glycolysis in endosperm cotyledons
(3) Maasive imbibition of water
(4) Sudden increase in cell division

Q.350 Hormone group responsible for breaking seed dormancy **[Manipur 2001]**

1. ABA 2. Cytokinin
3. Auxin 4. Gibberellin

(1) 1, 3 (2) 1, 2, 4
(3) 2, 3, 4 (4) 1, 2, 4

Q.351 In some halophytes, seeds germinate with fruits while attached to parent plant. **[Kerala 2001, Orissa 2009]**

(1) Vivipary (2) Halophytosis
(3) Monocarpic (4) Vernalisation
(5) Seismonasty

Q.352 Mitochondria produce more energy during **[AFMC 2001]**

(1) Formation of seed (2) Seed maturation
(3) Dormant seed (4) Seed germination

Q.353 Which one is endospermous **[Tamil Nadu 2001]**

(1) Cajanus cajan
(2) Helianthus annus
(3) Ricinus communis
(4) Ravenala madagascariensis

Q.354 Embryo of Sunflower has **[BHU 2002]**

(1) One cotyledon (2) Two cotyledon
(3) Many cotyledons (4) No cotyledon

Q.355 Nonalbuminuos seeds occur in **[DPMT 2002]**

(1) Maize (2) Wheat
(3) Rice (4) Vallisneria

Q.356 In pulses protein is stored in **[EAMCET 2002]**

(1) Cotyledons (2) Endosperm
(3) Pericarp (4) Seed coat

Q.357 Aleurone layer of maize grain is specially rich in **[CBSE 2003]**

(1) Proteins (2) Starch
(3) Lipid (4) Auxins

Q.358 Which of the following is an oil seed plant? **[AFMC 2003]**

(1) Sunflower (2) Hibiscus
(3) Marigold (4) Rose

Q.359 Which one is monocot albuminous seed **[Har. PMT 2003]**

(1) Maize (2) Wheat
(3) Rice (4) All the above

Q.360 In Groundnut, oil is stored in **[CPMT 2003]**

(1) Embryo axis (2) Endosperm
(3) Cotyledons (4) None of the above

Q.361 Assign the seeds to their respective categories **[JKCMEE 2003]**

(a) Maize (b) Mustard
(c) Pea (d) Endospermic
(e) Nonendospermic

(1) a – d, b – d, c – e (2) a – d, b – e, c – e
(3) a – e, b – e, c – d (4) a – e, b – d, c – e

Q.362 In Pea, Castor and Maize, the number of cotyledons are respectively **[JKCMEE 2004]**

(1) One, two and two (2) Two, two and one
(3) Two, one and two (4) One, two and one

Q.363 Which one does not exhibit seed dormancy? **[CPMT 2004]**

(1) Phaseolus (2) Rhizophora
(3) Cassia (4) Xanthium

Q.364 Which one yields castor oil? **[MPPMT 2004]**

(1) Sesamum indicum (2) Cocos nucifera
(3) Ricinus communis
(4) Brassica campesteris

Q.365 Dry fruit 'Chilgoza' is **[BHU 2005]**

(1) Fruit of Cycas
(2) Seed of Cycas
(3) Fruit of Pinus gerardiana
(4) Seed of Pinus gerardiana

Q.366 Why is vivipary an undesirable character for annual crop plants? **[CBSE 2005]**

(1) It reduces vigour of the plant
(2) It adversely affects the fertility of the plant
(3) The seeds exhibit long dormancy
(4) The seeds cannot be stored under normal conditions for next season.

Q.367 A dicot plant lacking cotyledons is **[AMU 2005]**

(1) Cuscuta (2) Santalum
(3) Lodoicea (4) None of the above

Q.368 Seed of Castor is **[AMU 2005]**

(1) Nonendospermic exalbuminous
(2) Endospermic ablbuminous
(3) Endospermic exalbuminous
(4) Nonendospermic ablbuminous

Q.369 In cereal grain, single cotyledon is represented by **[CBSE 2006]**

(1) Coleoptile (2) Coleorhiza
(3) Scutellum (4) Prophyll

Q.370 Edible part of Paddy is **[Orissas 2006]**

(1) Endosperm (2) Cotylendons
(3) Fruit
(4) Endosperm and embryo

Q.371 The point of attachment of the stalk with the seed is **[HPPMT 2007]**

(1) Hilum (2) Micropyle
(3) Tegmen (4) Plumule

Q.372 In Maiza grain, plumule is covered by protective sheath called **[HPPMT 2007]**

(1) Scutellum (2) Coleorrhiza
(3) Coleoptile (4) Tegmen

Q.373 Match the columns **[Kerala 2007]**

	Column I	**Column II**
(1)	Coleorrhiza	(1) Grapes
(2)	Food storing tissue	(2) Mango
(3)	Parthenocarpic fruit	(3) Maize
(4)	Single seeded fruit from monocarpellary superior ovary	(4) Radicle
(5)	Membranous seed coat	(5) Endosperm

(1) a – 1, b – 3, c – 2, d – 5, e – 4
(2) a – 4, b – 5, c – 1, d – 2, e – 3
(3) a – 3, b – 1, c – 4, d – 2, e – 5
(4) a – 4, b – 2, c – 5, d – 1, e – 3
(5) a – 5, b – 1, c – 3, d – 4, e – 2

Q.374 In monocotyledonous seeds, endosperm is separated from embryo by a distinct layer of **[Kerala 2008]**

(1) Testa (2) Tegmen
(3) Aleurone layer (4) Scutellum
(5) Coleoptile

Q.375 Scutellum of Maize is **[COMED–K's 2008, CBSE 2010]**

(1) Cotyledon (2) Endosperm
(3) Tegmen (4) Testa

Q.376 Identify the characters of plant where 8–nucleate embryo sac was first studied by Strasburger **[EAMCET 2007]**

(a) Micropyle, chalaza and funiculus in same vertical line
(b) Both unisexual and bisexual flowers on same plant
(c) Filiform apparatus conducts food from endosperm to egg apparatus
(d) Long funiculus coils like watch spring around the ovule.

(1) a, b and c (2) a and b
(3) b and d (4) a and c

Q.377 Find the correct answers : Seeds have separate endosperm **[BHU 2008]**

(a) Mazie (b) Onion
(c) Rice (d) Bean
(1) a, b and c (2) a and b
(3) b and d (4) a and c

Q.378 Find the correct answer : For germination of angiospermic seeds **[BHU 2008]**

(a) On hydraytion the seed germinates showing increased enzyme activily
(b) Respiration rate of germinating seed increases alongwith increase enzymatic activity
(c) Increase in respiratory rate continue still senescence
(d) Rate of enzymatic activity increases

(1) 1, 2, 3 (2) 1 and 2
(3) 2, 4 (4) 1 and 3

Q.379 Prechilling treatment to break seed dormancy is **[JKCMEE 2008]**

(1) Scarification (2) Vernalisation
(3) Impaction (4) Stratification

Q.380 Endosperm is consumed by the developing embryo in **[CBSE 2008]**

(1) Coconut (2) Pea
(3) Maize (4) Castor

Q.381 Embryo axis above the cotyledon is known as **[Orissa 2009]**

(1) Hypocotyl (2) Funicle
(3) Epicotyl (4) Raphe

Q.382 Scutellum is seed leaf of **[CET Chd 2009]**

(1) Gymnosperms (2) Dicots
(3) Pteridophytes (4) Monocots

Q.383 An example of a seed with endosperm, perisperm and caruncle is **[CBSE 2009]**

(1) Castor (2) Coffee
(3) Lily (4) Cotton

Q.384 Match the follwing **[EAMCET 2009]**

	Column I		**Column II**
a	Coleorhiza	i	Development of sporophyte directly from gametophyte without intervention of gametes
b	Apogamy	ii	Development of gametophyte directly from sporophyte without the
c	Indusium	iii	An unbranched columnar stem with a crown of leaves
d	Caudex	iv	Protective covering of radicle
		v	Protective structure of a sorus

(1) a – v, b – ii, c – iv, d – i
(2) a – iii, b – v, c – ii, d – iv
(3) a – iv, b – i, c – v, d – iii
(4) a – ii, b – iii, c – i, d – v

Q.385 Residual perisistent nucellus is known as **[AMU 2010]**

(1) Perisperm (2) Integument
(3) Pericarp (4) None of the above

Q.386 Non – endospermic seeds are found in **[Orissa 2010]**

(1) Barley (2) Castor
(3) Bean (4) Wheat

Q.387 In hypogeal germination plumule comes out of ground due to elongation of **[Orissa 2010]**

(1) Hypocotyl (2) Epicotyl
(3) Cotyledons (4) Both A and B

Q.388 A large shield – shaped cotyledon found in some moncotyledonous seeds is **[MPPMT 2010]**

(1) Aleurone layer (2) Coleorhiza
(3) Scutellum (4) Hilum
(5) Coleoptile

Q.389 Seed develops from **[MPPMT 2010]**

(1) Embryo (2) Ovule
(3) Embyo sac (4) Ovary

Q.390 Keel is characteristic of the flower of **[CBSC 2010]**

(1) Cassia (2) Calotropis
(3) Bean (4) Gulmohur

FRUIT & SEED DISPERSAL

Q.391 Seeds of Ruellia tuberosa are disseminated by **[Har. PMT 2007]**

(1) Censer mechanism
(2) Parachute mechanism
(3) Jaculator mechanism
(4) Explosive mechanism

Q.392 Clematis and Narvelia are dispersed by air with the help of **[BHU 2008]**

(1) Persistent inflated calyx
(2) Perisistent hairy styles
(3) Hair (4) Wings

Q.393 Censer mechanism of seed dispersal is found in **[CPMT 2000, BHU 2007]**

(1) Papaveraceae (2) Liliaceae
(3) Leguminosae (4) Rosaceae

Q.394 In which plant only two curved hooks are formed on seeds **[EAMCET 2002]**

(1) Xanthium (2) Martynia
(3) Tribulus (4) Ricinus

Q.395 Birds disseminate seeds by **[AMU 2003]**

(1) Eating fruit and passing the seeds unharmed through excreta at places
(2) Their feathers
(3) Carrying seeds in their beaks
(4) Eating fruits and digesting fruit contents in their alimentary canal.

Q.396 Pappus occurs in compositae for **[CPMT 2007]**

(1) Air pollination (2) Air dispersal
(3) Insect pollination (4) Animal dispersal

Q.397 Bright coloured fleshy fruits are dispersed by **[Orissa 2007]**

(1) Air (2) Insects
(3) Water (4) Birds

Q.398 Which one of the following statements is correct? **[CPMT 2011]**

(1) In tomato, fruit is a capsule
(2) Seeds of orchids have oil-rich endosperm
(3) Placentation in primose is basal
(4) Flower of tulip is a modified shoot

Q.399 The correct floral formula of chilli is **[CPMT 2011]**

(1) $\oplus \, ♀ ♂ \, K_{(5)}C_5A_5\underline{G_{(2)}}$ (2) $\oplus \, ♀ ♂ \, K_{(5)}C_{(5)}A_5\underline{G_{(2)}}$

(3) $\oplus \, ♀ ♂ \, K_{(5)}C_{(5)}A_{(5)}\underline{G_2}$ (4) $\oplus \, ♀ ♂ \, K_{(5)}C_5A_{(5)}\underline{G_2}$

Q.400 Flowers are zygomorphic in **[CPMT 2011]**

(1) Mustard (2) Gulmohur
(3) Tomato (4) Darura

Q.401 The ovary is half inferior in flower of **[CPMT 2011]**

(1) Peach (2) Cucumber
(3) Cotton (4) Guava

Q.402 A drupe develops in **[CPMT 2011]**

(1) Mango (2) Wheat
(3) Pea (4) Tomato

Q.403 Placentation in tomato and lemon is : **[AIPMT Pre 2012]**

(1) Free central (2) Marginal
(3) Axile (4) Parietal

Q.404 How many plants in the list given below have composite fruits that develop form an inflorescence ? **[AIPMT Pre 2012]**

(1) Five (2) Two

(3) Three (4) Four

Q.405 Phyllode is present in : **[AIPMT Pre 2012]**

(1) *Euphorbia* (2) Australian Acacia

(3) *Opuntia* (4) *Asparagus*

Q.406 The coconut water and the edible part of coconut are equivalent to : **[AIPMT Pre 2012]**

(1) Endocarp (2) Mesocarp

(3) Embryo (4) Endosperm

Q.407 Cymose inflorescence is present in : **[AIPMT Pre 2012]**

(1) *Sesbania* (2) *Trifolium*

(3) *Brassica* (4) *Solanum*

Q.408 Vixillary aestivation is characteristic of the family: **[AIPMT Pre 2012]**

(1) Asteraceae (2) Solanaceae

(3) Brassicaceae (4) Fabaceae

Q.409 The gynoecium consists of many free pistils in flowers of : **[AIPMT Pre 2012]**

(1) Tomato (2) *Papaver*

(3) *Michelia* (4) *Aloe*

Q.410 How many plants in the list given below have marginal placentation ?

Mustard, Gram, Tulip, Asparagus, Arhar, Sun hemp, Chilli, Colchicine, Onion, Moong, Pea, Tobacco, Lupin

[AIPMT Mains 2012]

(1) Four (2) Five

(3) Six (4) Three

Q.411 *Cuscuta* is an example of : **[AIPMT Mains 2012]**

(1) Ectoparasitism (2) Brood parasitism

(3) Predation (4) Endoparasitism

Q.407 4	**Q.408 4**	**Q.409 3**	**Q.410 3**	**Q.411 1**		

These questions consist of two statements each, printed as Assertion and Reason. While answering to choose any one of the following four responses.

(1) **If both Assertion & Reason are True & the reason is correct explanation of the Assertion.**

(2) **If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.**

(3) **If Assertion is True but the Reason is False.**

(4) **If both Assertion & Reason are false.**

Q.1 **A :** In angiosperms, seeds are present inside fruit.

R : The ripended ovary forms fruit and ripened ovules form seeds.

Q.2 **A :** Binnials complete their life cycle in two growing seasons.

R : They complete their vegetative phase in first season and reproductive phase in second season.

Q.3 **A :** The plants producing flowers and fruits single time in life are called monocarpic.

R : Agave americana and Bambusa are monocarpic plants.

Q.4 **A :** Onion is a tunicated bulb.

R : characteristic smell of onion is due to presence of allyl sulphide.

Q.5 **A :** Banana plant is a herb.

R : Herbaceous pseudostem is found in banana.

Q.6 **A :** Arrangement of main vein and its branches in leaf is called vernation.

R : Parallel venation is characteristic of dicotyledons.

Q.7 **A :** A specific outgrowth present over hilum in castor seed is called strophiole.

R : Strophiole helps in gaseous exchange.

Q.8 **A :** Censer mechanism of seed dispersal occurs in Papaver (poppy)

R : Seeds of poppy are scattered after dehiscence of fruit when shaken by wind.

Q.9 **A :** Roots of trapa are photosynthetic.

R : Trapa consist of spiny calyx.

Q.10 **A :** Seeds should be heavy and smooth so that they can travel large distances for dispersal.

R : For dispersal by wind fruits and seeds should be light.

Q.11 **A :** Flower are arranged in acropetal Manner in cymose inflorescence.

R : All flower are at same level is cymose inflorescence.

Q.12 **A :** Fruit is caryopsis in poaceae.

R : Placentation is parietal type in poaceae.

Q.13 **A :** Ovary is unilocular in parietal placentation.

R : Number of placenta is equal to number of ovaries.

Q.14 **A :** Reticulate venation is found in dicots.

R : Veinlets are absent in reticulate venation.

Q.15 **A :** Parietal placentation is found in cruciferae.

R : Ovary is bilocular in cruciferae.

Q.16 **A :** Pentamerous condition is found in cruciferae.

R : 5 sepals and 5 petals are found in cruciferae.

Q.17 **A :** Ovary of Brassicaceae is unilocular in the beginning but becomes bilocular.

R : Ovary of Brassicaceae become bilocular due to formations of a false septum.

Q.18 **A :** Custard apple is a aggregate fruit.

R : It is formed by many flowers.

Q.19 **A :** Ovules are situated at central axis in parietal placentation.

R : Ovary in bilocular in parietal placentation.

Q.20 **A :** The banyan trees are able to extand over large areas.

R : Banyan trees have prop roots.

Q.21 **A :** Stem is exogenous in origin.

R : Stem originates from cortex.

Q.22 **A :** It is possible to identify nodes on a stem.

R : Leaves arise from the nodes of a stem.

Q.23 **A :** Carrot is a root.

R : It occurs underground and have unicellular root hairs.

Q.24 **A :** Radish is a fusiform fleshy root.

R : Base at radish root is hypocotyl.

Q.25 **A :** Root are geotropic.

R : Root are more hydrotropic than geotropic.

Q.26 **A :** Cladodes are stems of unlimited growth.

R : Only the main stems is modified as cladodes.

Q.27 **A :** Mangroves show breathing root.

R : Soil air is almost negligible in swamps.

Q.28 **A :** Onion leaves are centric and green.

R : Aerial leaves of anion store food.

Q.29 **A :** Scale leaves are small and non-green.

R : They do not photosynthesis.

Q.30 **A :** Lithci is an aril.

R : It is dry fruit.

Bansal Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	**Good / Important questions**
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

FAMILIES OF ANGIOSPERM PLANTS

SEMI-TECHNICAL DESCRIPTION

Bracteate	=	Br
Ebracteate	=	Ebr
Actinomorphic	=	⊕
Zygomorphic	=	% or ↿
Bisexual	=	☿
Unisexual male (staminate)	=	♂
Unisexual female (Pistillate)	=	♀
Epicalyx	=	Epi
Calyx	=	K or if joined = $K_{( )}$
Corolla	=	C or if joined = $C_{( )}$
Perianth	=	P or if joined = $P_{( )}$
Androecium	=	A or if joined = $A_{( )}$
Gynoecium	=	G or if joined = $G_{( )}$
Superior ovary / Hypogynous flower	=	$\underline{G}$
Inferior ovary / Epigynous flower	=	$\overline{G}$
Ovary half inferior or half superior / Perigynous flower	=	G –

- **Adhesion**

Epiphyllous	=	$\overset{\frown}{P\ A}$
Epipetalous	=	$\overset{\frown}{C\ A}$

CRUCIFERAE (BRASSICACEAE)

- **Systematic Position -**

Class	=	Dicotyledonae	
Sub-Class	=	Polypetalae	Petals - Free
Series	=	Thalamiflorae	Flower - Hypogynous
Order	=	Parietales	Placentation - Parietal

- **Distinguishing Features of Cruciferae -**
  - The plant organs have pungent odour. This odour is due to presence of sulphur containing glucosides compound. Myrosin enzyme (present in secondary cells) hydrolyse then into glucose & different isothiocyanates (Various oils).
  - Inflorescence – Typical raceme.

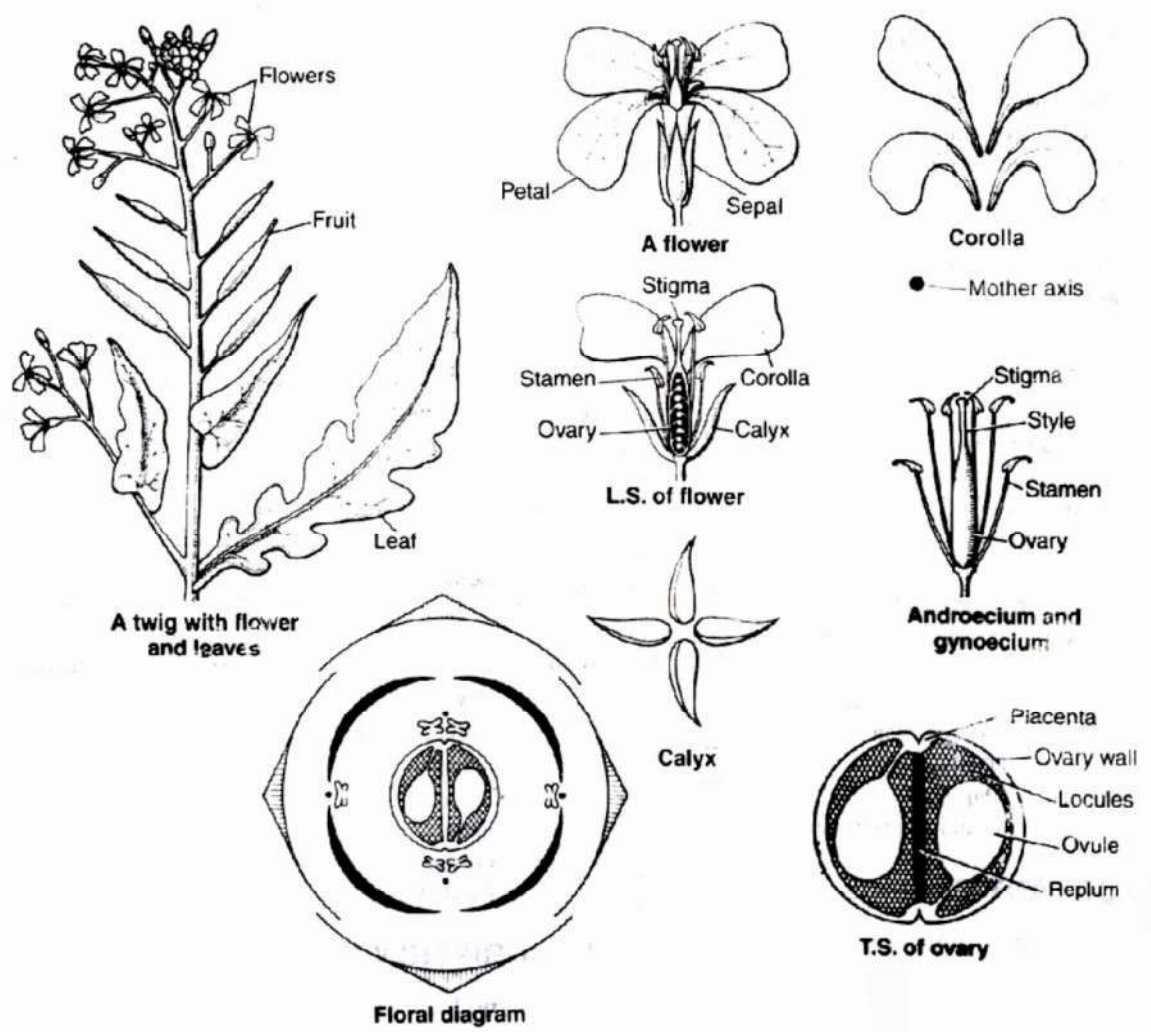
  Exception :-
  - ***Iberis amara*** = Candytuft (chandni) has corymb type of inflorescence.
  - The compound corymb inflorescence is present in cauliflower.
  - Corymbose raceme inflorescence is present in mustard.
- **The common Characteristics of flower -**
  - **Flower** Ebracteate
  - Bisexual or hermaphrodite
  - Actinomorphic but some time zygomorphic e.g. ***Iberis amara***
  - Hypogynous and tetramerous,
  - **Calyx-** Sepals 4, polysepalous, sepals arranged in two whorls 2 outer and 2 inner. Imbricate or valvate or quincuncial aestivation.
  - Out of their four sepals two lower sepals are small and upper two are big in size
  - **Corolla-** Petals 4, polypetalous, valvate aestivation and cruciform.
  - The each petal in cruciferae is divided into two parts-long **claw** and broader lamina-**limb.**
  - The corolla is absent in ***Lepidium*** and ***Coronopus.***
  - The corolla is transformed into stamens in **Capsella.**
  - **Androecium :-** Stamens 6 (2 + 4), arranged in two whorls in which two outer small stamens antisepalous and inner four stamens are long and anti petalous. This condition is known as **tetradynamous.** Nactaries are present at the base of the anthers
  - Anther is dithecous
  - Stamens introse and basifixed.

  Exception :- 2 stamens in *Coronopus*, 4 stamens in *Lepidium* and *Cardamine*, and 16 stamens in *Megacarpea.*
  - **Gynoecium :-** Bicarpellary, syncarpous.
  - The ovary is unilocular in the beginning but it becomes bilocular due to the formation of a false septum (replum),
    - Placentation is parietal.
    - Both the carpels arranged transversely.
    - Ovule is campylotropous.
    - •• Gynoecium is tricarpellary in ***Lepidium***, and tetracarpellary gynoecium in ***Nasturtium***
  - **Fruit -** Usually siliqua which is solitary dry and dehiscent.

    Silicula fruit is found in ***Capsella, Iberis, Lepidium*** and ***Alyssum*.**
  - **Seed -** Non endospermic
- **Floral Formula -**

Ebr ⊕ ♀♂ $K_{2+2}\ C_{4x}\ A_{2+4}\ \underline{G}_{(2)}$

- **Diagram –**



Flowering twig, parts of a flower and floral diagram of ***Brassica comprestris*** (Yellow mustard)

- **Economic Importance -**
  - **Food Stuff**

Radish	=	***Raphanus sativus***-fusiform root and unripe fruit
Turnip	=	***Brassica rapa***-Napiform root
Cauliflower	=	***Brassica oleracea*** var. botrytis inflorescence
Cabbage	=	***Brassica oleracea*** var. capitata-Fleshy leaves./condensed bud
Knol-Khol	=	***Brassica oleracea*** var. caulorapa/gongilodes-thickened stem.
Mustard	=	***Brassica campestris*** (yellow).
Black Mustard	=	***Brassica napus***
Black Rai	=	***Brassica nigra***
Local Rai	=	***Brassica juncea***
Taramira	=	***Eruca sativa***
White Rai	=	***Brassica Alba***
Armoracia lapathifolia	=	obtains sweet materials form roots.

- **Medicinal uses :-**

Halima	=	***Lepidium sativum* –** garden cress-its seeds are used in liver diseases, asthma, cough and bleeding piles
Khoob Kalan	=	***Sisymbrium irio* -** Its leaves are used in scurvy disease
Wall flower	=	***Cheiranthus cheiri*-**Its seeds are used in fever, cough, paralysis, bronchits.
Tarha	=	***Nasturtium indica* –** Its seed are very useful in asthma disease.
Chandni (Candy tuft)	=	***Iberis amara* –** It is used in rheumatism.

- **Ornamental :-**

Chandni (Candy tuft)	=	***Iberis amara***
Wall Flower	=	***Cheiranthus cheiri***
Shepherd's purse	=	***Capsella bursa-pestoris***
Basket of gold	=	***Alyssum sexatile***
Honesty	=	***Luneria annue***
Stock	=	***Mathiola incana***

MALVACEAE

Systematic position :-

Class	=	Dicotyledonae
Sub class	=	Polypetalae
Series	=	Thalamiflorae
Order	=	Malvales
Family	=	Malvaceae

Diagnostic feature of malvaceae :-

- The mucilage is present in various plant organs like flower, fruit etc. in this family. Stellate (star shaped) hairs present on the shoot.
- **Inflorescence :-** Cymose or solitary axillary (***Hibiscus, Gossypium***) or solitary terminal (***Abutilon***).
- **Exception :-** The raceme inflorescence is present in ***Althaea*** (holly hock). Penicle inflorescence is present in **kydia**

General characters of flower :-

- **Flower :-** Bracteate-Bracts are big and green in colour. Flowers are bisexual, actinomorphic, hypogynous and pentamerous.
  Polygamous flower are present in ***Kydia*** and unisexual flower is present in ***Napaea***.
- **Epicalyx :-** Epicalyx are 3-7; free and green in colour. Valvate aestivation.
  Epicalyx is absent in some genera of the malvaceae such as ***Abutilon, sida*** and ***Bombax***.
- **Calyx :-** sepals-5 gamosepalous valvate aestivation but in some of the plants **persistant** calyx are present, it means present on fruit also as in ***Abelmoschus*** and ***Gossypium*.**
  The odd sepal is posterior in malvaceae.
  * odd sepal in **Malvastrum** are anterior
- **Corolla :-** Petal 5, polypetalous twisted aestivation mucilaginous and attractive.
- **Andorecium :-** Stamens indefinite, monoadelphous The filament are united together to form a long **staminal canal** or tube around styles, epipetalous.

– The stamens are monothecous, kidney shaped, anther dorsifixed.
– The stamens are **extrose.**

– **Exception :** ***Julostylis*** contains 10 stamens in which 5 stamens are sterile and remaining 5 are normal.

- **Gynoecium :-** Penta carpellary or poly carpellary syncarpus.

  The number of locules are equal to the number of carpels so ovary is penta locular or multilcular.

  The ovary and style are enclosed by staminal tube but stigma remains out side. Axile placentation

  Exception :- Three carpels are present in the flower of ***kydia.***

- **Fruit :-** Loculicidal capsule, which is solitary, dry dehiscent multilocular and multi seeded fruit each locules breaks from the wall of the locule during the dehiscence eg. Lady's finger, cotton

  Exception :- The carcerulus fruit is found in ***Althaea***, ***Abutilon, Sida***. Hooked-schizocarpic in ***Urena*** & ***Pavonia***

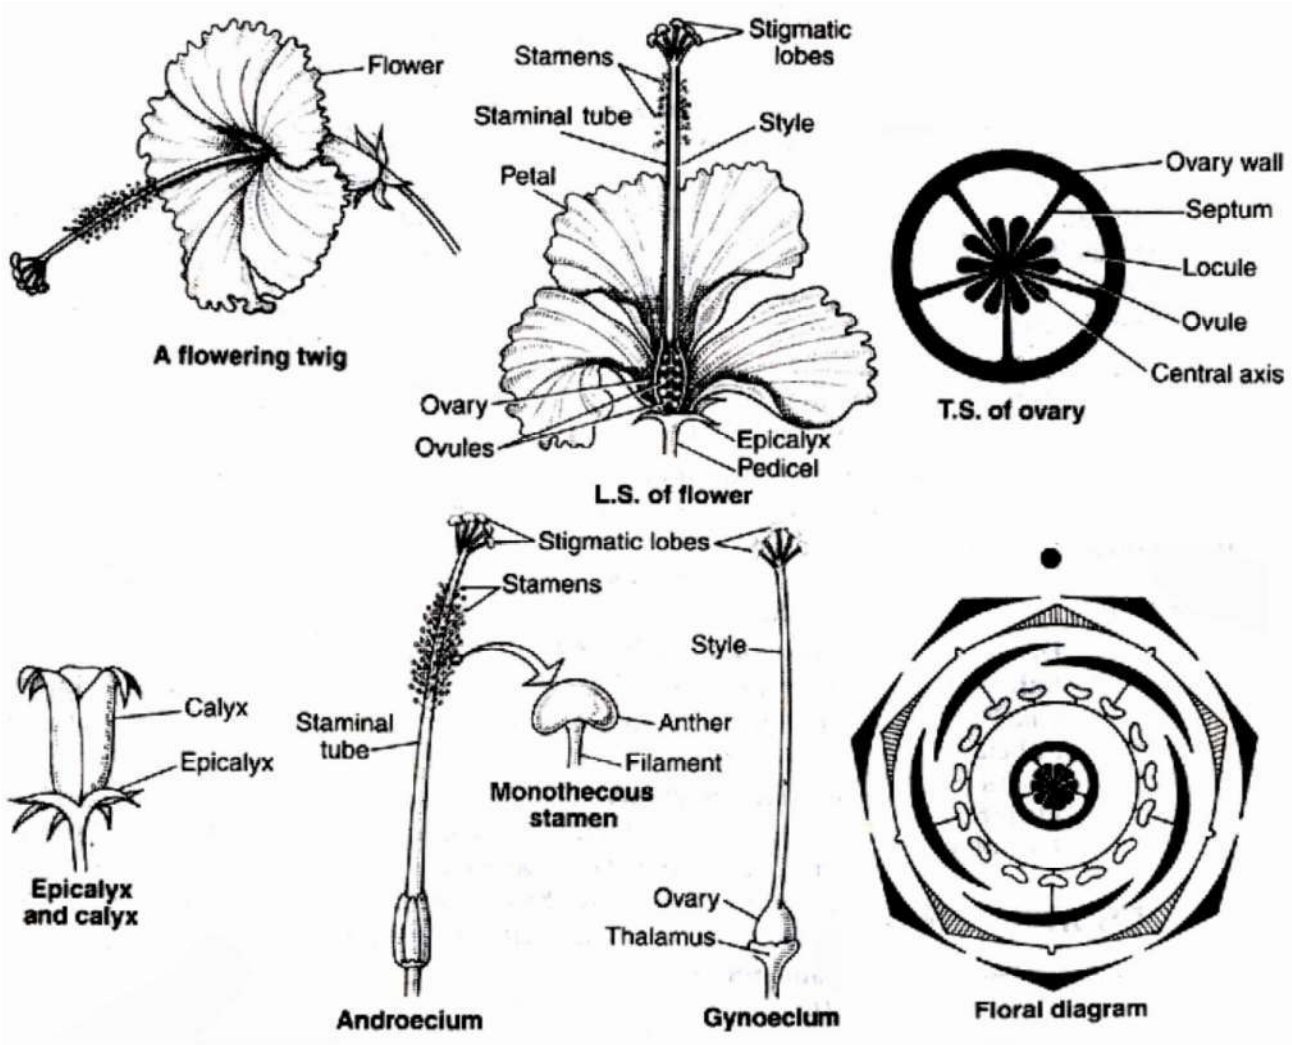
  Some times berry is present e.g. ***Malva Viscus.***

- **Seed :-** Non endospermic. A dense hairy seed coat is present on cotton seed **[*Gossypium*]**

- **Floral formula -**

$$\boxed{\text{Br} \oplus \male\!\!\female \; \text{Epi}_{3-7}\text{K}_{(5)}\,\overset{\frown}{\text{C}_5\,\text{A}_{(\infty)}}\underline{\text{G}}_{(5-\infty)}}$$

- **Diagram –**



Flowering twig, parts of a flower and floral diagram of *Hibiscus rosa-sinensis* (Gurhal)

- **Economic importance -**
  - **Food** - Okra (Lady's finger) = ***Abelmoschus esculentus*** or ***Hibiscus esculentus*** used as vegetable.
  - **Oils**- Cotton seeds – ***Gossypium*** genera. The seed of ***Gossypium*** are used for obtaining oils which is hydrogenated to prepare vegetable ghee.
  - Volatile oil known as Musk seed oil used in perfumery is obtained from ***Hibiscus abelmoschus*** seeds.
  - **Fibres -**
  - **Cotton = *Gossypium*.**

    The seeds of ***Gossypium*** are used for obtaining cotton fibres -

    Gossypium arboreum and ***G.herbaceum*** are known as old world cotton while ***Gossypium hirsutum*** and ***G.barbedense*** is called as new world cotton.

    Gossypium hirsutum = Upland cotton

    G. arboreum = Egyptian cotton

    G. herbaceum = Asiatic cotton

    G. barbedense = Long fibre

    Salmalia malabaricum = Red Silk cotton

    Eriodendron or ***Ceiba*** = White Silk cotton [Kapok]
  - **Soft fibre or Bast fibers :-**

    Hibiscus sabdariffa = Patua/Roma (Rosella hemp)

    Sida rhombifolia = Queen's land hemp

    Abutilon asiaticum = China Jute **(**Indian mallow)

    Hibiscus cannabinus = Pastsan [Deccan hemp]

    Hibiscus elatus = Cuba bast

    Urena lobata = Vilayati Sunn/Foreign hemp
  - **Timber :-**

    Ochroma lagopus = Balsa wood, lightest wood

    Malva sylvestrils = Mallow wood

    Hibiscus elatus =
  - **Medicine :-**

    Urena repanda = These roots are useful in hydrophobia

    Adansonia digitata = Monkey bread tree-Quinine like medicine is obtained from its **roots.**

    Abelmoschus moschatus = Musk mallow- Its root is used for abdominal pain.

    Abutilon indicum = Luxative seed – Their seeds are used in constipation and root are used for fever.

    Thespesia populnea = It is used as purgative.

    Sida acuta = Its roots are used in neural and urinal diseases.

    Sida rhombifolia = It is used in rheumatism diseases.
  - **Ornamental : -**

    China rose [Shoeflower] = ***Hibiscus rosasinensis*** **–** Red shoes polish is obtained form the petals of this flower.

    Holly hock [Gul-e-khera] = ***Althaea rosea*** (Blue colour is obtained from its leaves)

Pula = ***Kydia calycina***

Cotton rose = ***Hibiscus mutabilis*** (Changeable rose - It change its colour)

Mallow [Khatmi] = ***Malva sylvestris***

Umbrella tree = ***Thespesia populnea***

Pavonia odorata **-** from roots hina perfume is manufactured.

- **Vitamins:-*Gossypium*** seeds are rich in vitamin A,D,E and B- complex.

SOLANACEAE

- **Systematic position :-**

Class - Dicotyledonae

Subclass - Gamopetalae

Series - Bicarpellatae

Order - Polymoniales

Family - Solanaceae

- Many ovules are present in the ovary so many seed are formed as in tomato, Brinjal etc.
- Most of plants of this family are herbs, some of them are shrubs, rarely trees.
- The tap root system is present in these plants.
- Leaves are simple and exstipulate. Bicollateral vascular bundles are present in stem

Inflorescence :- Solitary axillary or cymose inflorescence.

Monochasical cyme is of two types :-

- **Helicoid cyme : *Solanum*.**
- **Scorpioid Cyme : *Atropa***

Exception :- Solitary terminal inflorescence is found in **Datura,** Rhipidium inflorescence is present in ***Solanum nigrum***

- **Flower :-** Flowers are bracteate or ebracteate, bisexual, complete, hypogynous, pentamerous and actinomorphic but in few of them is zygomorphic such as in Henbane (***Hyoscyamus***) and ***Salpiglossis***, ***Schizanthus***.
- **Calyx -** Sepals 5, gamosepalous, valvate aestivation and persistent.
  - The sepals in some of the plants changed into membranous balloon like structure which help in dispersal of fruits. e.g. **Physalis** (Raspberry). The sepal grows with the growth of the fruit and becomes thickened and elongated. They are known as **accrescent** such as in Brinjal.
  - The odd sepal in solanaceae is in posterior condition.
- **Corolla -** Petals-5 gamopetalous, aestivation valvate or imbricate with various shapes of corolla.
- **Androecium** - Stamens-5, polyandrous, epipetalous, intorse, filaments basifixed and anthers dithecous.
  - The dehiscence of anther is longitudinal but in ***Solanum*** dehiscence through the apical pores.
  - **Exceptions:-** 4-Stamens are present in ***Salpiglossis*** in which two are elongated means didynamous in condition. 2-Stamens are present in ***Schizanthus*.**
- **Gynoecium :-** Bicarpellary, syncarpous, bilocular and axile placentation, superior.
  - **Special features :-** Swollen placenta is present. Ovaries arranged obliquely on thalamus carpels move at ∠45° in clock wise direction. posterior carpal turns on right side and anterior carpal turns on left side.
  - Multilocular ovary is formed in tomato and Datura due to formation of false septum.

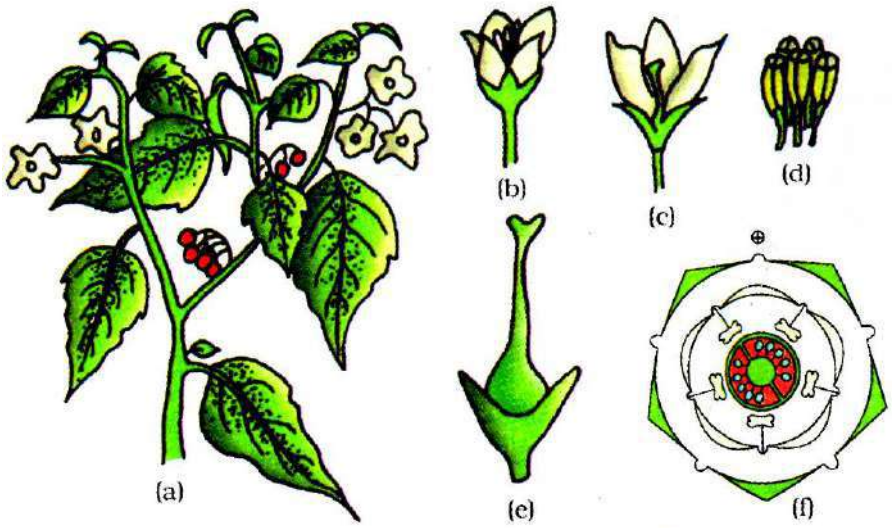
  * Unilocular is present in ***Henoonia***.

* The ovary is bilocular at the base and unilocular on the upper side in ***Capsicum*** (chilli)

- **Fruit :-** Fleshy fruits – berry such as Tomato, Brinjal, chilli, Physalis etc.
  The fruit of the Datura is septifragal capsule in which dehiscence takes place through the septa.
- **Seed :-** Endospermic
- **Floral formula :**

  Br or Ebr ⊕ ♀ $K_{(5)}\ \overset{\frown}{C_{(5)}}\ A_5\ \underline{G}_{(2)}$

- **Diagram :**



Solanum nigrum (makoi) plant : (a) Flowering twig (b) Flower (c) L.S. of flower (d) Stamens (e) Carpel (f) Floral diagram

- **Economic Importance :-**
  - **Food (Vegetable) :-**

Potato	=	***Solanum tuberosum*** – edible part = under ground stem-**tuber**
Tomato	=	**(loveapple)** ***Lycopersicon esculentum / Solanum lycoperscium***
Brinjal (Egg plant)	=	***Solanum melongena***
Makoi	=	***Solanum nigrum***
Chilli	=	***Capsicum annuum***
Shimala Mirch	=	***Capsicum frutescence***
Raspberry (Goose berry)	=	***Physalis peruviana*** (fruit are eaten)
Physalis ixocarpa		
Cyphomandra betacea [tree tomato]		

  - **Medicines :-**

– ***Atropa belladona*** (Deadly night shade) The roots are used in the manufacture of belladonna. Atropine alkaloids is obtained from the roots. Atropine is used to dialate the pupil of the eye.
– ***Withania somnifera*** = Asvagandh/Ashwagandha-Its root used as nerve tonic, leaves used in fever
– **Stramonium** is obtained form the seeds of Datura (Thorn apple) in which **Scopolamine alkaloid** is present. It is pain reliever and sedative.
– **Henbane** medicine (containing hyoscyamine alkaloid) obtained from the leaves of ***Hyscyamus niger.*** It is used in the treatment of asthama and whooping cough.

– **Nicotine** & anabasin alkaloid obtain from the leaves of ***Nicotiana tabacum*** **(Tobacco)** & ***N. rustica*** It is nerve stimulant and are also used as insecticide. Its leaves are used as fumigatory.
– ***Solanum xanthocarpum*** **=** (Nelee Kanteli) the juice of its used in rheumatism and cough.
– ***Solanum nigrum*** = (Makoi) = The fruit are laxative.

• **Ornamental Plants –** Many plants of the family are cultivated for their beautiful flower and fragrance as follows-

– ***Petunia alba*** and ***petunia hybrida.***

Cestrum nocturnum	=	Rat-Ki-Rani
Cestrum diurnum	=	Din-ka-Raja
Schizanthus	=	Poor man's orchids
Brunfelsia hopeana	=	Kal-Aaj-Kal
Salpiglossis sinvata		
Solanum dulcamara	**=**	**Jangli-lata**
Solanum grandiflorum		
Nicandra physaloides		

LEGUMINOSAE OR FABACEAE

• **Systematic position**

Class	-	Dicotyledonae
Sub class	-	Polypetalae
Series	-	Calyciflorae
Order	-	Rosales
Family	-	Leguminosae [Fabaceae]

• **Main characteristics**

Flower	-	Perigynous G-/Hypogynous G
Gynoecium	-	Monocarpellary
Ovary	-	Unilocular
Placentation	-	Marginal

Dissimilarities are found in the remaining characters. On the basis of dissimilarities, (inflorescence and floral characters) Leguminosae family is divided into **3 subfamilies**

(i) Papilionatae (ii) Caesalpinoideae (iii) Mimosoideae

PAPILIONATAE/LOTOIDEAE (SUB FAMILY)

• **Important features**

Sleeping movements commonly occurs in this family.

• **Roots :-** Roots are branched and tap root system is present. Root nodules are present. In root nodules N_2 fixing becterium ***Rhizobium leguminosarum*** is present.

• **Leaves :-** Stipulate, unipinnate, imparipinnate.

Many modification are found in leaves as follows -

– Some of the leaflets of compound leaves of Pea are modified into tendrils for climbing.
– All the leaflets of ***Lathyrus odoratus*** are transformed into the tendrils.
– The stipules of leaves in both Pea and ***Lathyrus odoratus*** become foliaceous.

• **Inflorescence :-** Typical raceme or sometimes solitary axillary as-***Lathyrus aphaca***

- **General features of Flower :-** Bracteate, bisexual, Perigynous/hypogynous, penta merous and Zygomorphic symmetry. The zygomorphic symmetry is due to presence of different (odd) petals (dissimilar petals & androecium) - **Cleistogamous flower**
- **Calyx :-** Sepals 5, gamosepalous, aestivation valvate or imbricate and anterior sepals is odd.
- **Corolla :-** Petals 5, papilionaceous (main feature) polypetalous, one petal is odd out of 5-petals.

  Exception

  Petals are absent in *Lespedeza*.
- **Androecium**

  Stamens – 10; diadelphous-1 + (9) ;

  Exception →

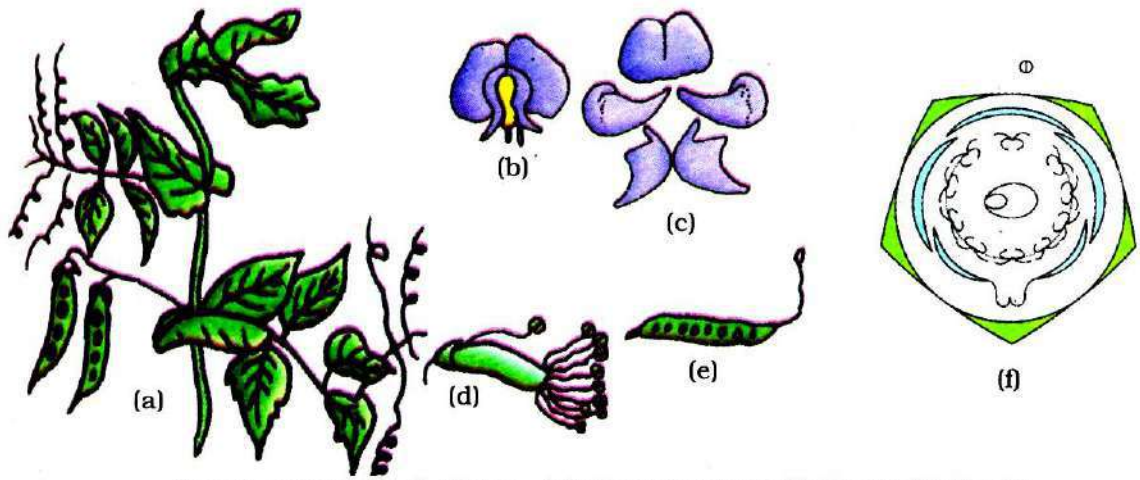
  10 – stamens are free in ***Sophora***

  10 – stamens are monoadelphous in ***Pongamia, Crotalaria, Lupinus cymopsis***. (10)

  The posterior stamen is absent in ***Arachis, Dalbergia*** and ***Abrus***. 9-stamens are present in them in monoadelphous condition. (9)
- **Gynoecium :-** Gynoecium is monocarpellary, unilocular, Half inferior/superior and marginal placentation.
- **Fruit -** Legume or pod, dry, dehiscent, one chambered fruit.

  Sometimes lomentum is also found as in ***Arachis***
- **Seed -** Nonendospermic
- **Floral formula -**

  $$\text{Br}\ \%\ \female\ K_{(5)}\ C_{1+2+(2)}\ A_{(9)+1}\ \underline{G}_{1}$$
- **Diagram -**



Pisum sativum (pea) plant : (a) Flowering twig (b) Flower (c) Petals (d) Reproductive parts (e) L.S.carpel (f) Floral diagram

- **Economic importance**
  - **Food plant**

    Arhar (Pigeon pea) = ***Cajanus cajan* (Indicus)**

    Chana (Gram) = ***Cicer arietinum***

    Mattar (Pea) = ***Pisum sativum***

    Urad (Black gram) = ***Phaseolus mungo* or *vigna mungo***

    Mung (green gram) = ***Pheseolus radiatus* or *vigna radiatus***

Masoor = ***Lens esculenta* or L. culinaris**

French been = ***Vigna/Phaseolus vulgaris***
or kidney bean (Rajma)

Soyabean = ***Glycine max (G. soja)***

Gwar (cluster bean) = ***Cymopsis tetragonoloba***

Methi = ***Trigonella foenum graecum***

Mungphali (Ground nut) = ***Arachis hypogea*.**

Sem = ***Dolichos lablab***

Horse gram = ***Dolichos bifolras***

Agast tree = ***Sesbania grandiflora* (**Flower are edible)

Kasoori Methi = ***Medicago flacata***

Moth = ***Phaseolus aconitifolia* or *vigna aconitifolia***

Cowpea (chowla) = ***Vigna sinensis***

Asparagous bean = ***Vigna catiang***

Khaseri dal = ***Lathyrus sativus***
The lathyrism disease is occurred by the use of this dal.

Lima beam (Lobia) = ***Phaseolus lunatus***

- **Fooder**

Alfalfa = ***Medicago sativa***

Van Methi (Sweet colver) = ***Meliolotus indicus***

Sanji (Indian colver) = ***Meliolotus alba***

Berseem = ***Trifolium alexandrium*.** Used as green mannure

Bankla = ***Vicia faba***

- **Fibres**

Sunnhemp = ***Crotalaria juncea***

Dhaincha = ***Sesbania cannabinus*** used as green mannure **Hard** fibres

Ratti = ***Abrus precatorius*** Hard fibre

Ougenia dalbergiodes

Erythrina suberosa

- **Timber**

Shisham = ***Dalbergia sissoo* (Indian Red Wood)**

Kala shisham = ***Dalbergia latifolia*** = Indian rose wood

African black wood = ***Dalbergia melanoxylon***

Red sandal wood = ***Pterocarpus santalinus***

Indian kino tree = ***Pterocarpus marsupium***

Hard sola = ***Aeschynoment aspara***

- **Dyes**

Red colour = ***Pterocarpus santalinus***

Neel (Blue dye) = ***Indigofera tinctoria*** (dye is obtained from leaves)

Yellow dye = ***Butea monosperma*** orange, yellow dye is obtained from the flower

Black dye = ***Crotalaria striata***

Yellow dye = ***Psoralia plicata***

- **Medicinal plants**

  Glycyrrhiza glabra = Mulathi (Liquoric)
  Its roots are used in coughs & cold.

  Krameria traindra = The medicine for diarrhoea → **"krameria"** is obtained.

  Pongamia pinnata = Oil of the seed is used for rheumatism.

  Abrus precatoris = Ointment made from leaves is used for Treatment of leucoderma
- **Ornamental**

  Clitoria ternatea = Butterfly pea

  Cannavalia gladiata = Sword bean

  Erythrina indica = Indian coral tree

  Desmodium gyrans = Indian telegraph plant

  Clianthus = Glory pea

  Lathyrus odoratus = Phool matar (sweet pea)

  Sophora japonica = Japanese pagoda tree

  Lupinus albus

  Pongamia pinnata

  Butea monosperma
- **Insecticides**

  Derris elliptica = Rotenone insecticide
- **Gum**

  Bengal kino = It is obtained from the **butea** (dhak).

  Balsam of Peru = ***Myroxylon balsemum***

  Gwar Gum = Edible gum obtained from the Gwar (***cyamopsis tetragonoloba***)

  Indian gum = ***Pterocarpous marsupium*.**
- **Other uses :-**

  Abrus precatorius = Ratti = Jeweller's weight – jeweller's use it's seeds as weight

  Aeschynomeni indica **"Omfosm pith Plant"** ➡ Its wood is spongy. Toys are made from this.

  Dalbergia latifolia – Its bark is used in tanning.

  Aschynomeni aspara = Indian cork plant. It's wood used as cork.

  Silk worm lives on the stem of Butea.

  Alhagi pseudoalhagi = Camel's fodder. From its twigs screens (chiks) are manufactured

CAESALPINOIDEAE (SUB FAMILY)

- **Root -** Tap root system.
- **Leaves -**

  Usually compound, unipinnate, paripinnate. Palvinus leaf base present

  Bipinnate in ***Delonix*** Phyllode is found in ***Parkinsonia***.
- **Inflorescence –** Panicle or raceme of racemes or compound raceme

  * In *Bauhinia* cymose inflorescence is present
- **General character of flower -**

  Bracteate, bisexual, perigynous/ hypogynous, pentamerous and zygomorphic symmetry of the flower is due to the presence of sterile stamens.

- **Calyx -**
  Sepals 5, polysepalous imbricate aestivation, odd sepal is anterior one.
- **Corolla -**
  Petals 5, all alike, polypetalous, ascending imbricate aestivation (posterior petal is the innermost.)

***Exception➡**

Petals are absent in Ashok (***Saraca***)

Only 3-petals are present in Imli (***Tamarindus***), two petals are modified scales

- **Androecium -**
  Stamens 10, free, arranged in two whorls/(Circles) 5 + 5, some of them are sterile called as staminodes. Most of the genera have 3 staminodes.

– 7 Stamens are present in ***Tamarindus,*** monoadelphous, out of them 4 are staminodes.
– 5-8 normal stamens are present in ***Saraca*** (Ashok)
– 5- normal stamens are found in ***Bauhinia variegata*** (Kachnar).
All 10 stamens are fertile in parkinsonia,

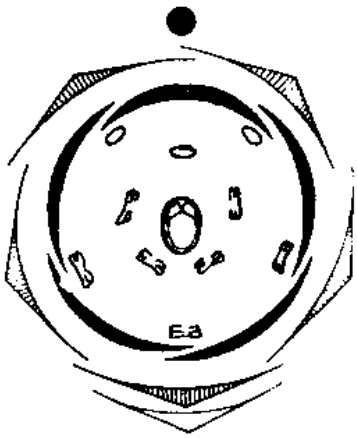
- **Gynoecium -**
  Monocarpellary, ovary half inferior/superior, unilocular, style long, stigma is simple and marginal placentation.
- **Fruit-**
  Legume or pod is present.

– Lomentum is present in ***Tamarindus.***

- **Seed** :- Nonendospermic
- **Floral formula**

$$\text{Br} \oplus \overset{\male}{\underset{+}{\bigcirc}} \; K_5\, C_5\, A_{5+5} \text{ or } A_{7+3} \text{ (Staminodes) } \underline{G}_1$$

- **Floral diagram**



- **Economic importance**
  - **Food**

Tamarindus indica	=	Imli
Bauhinia variegata	=	Kachnar (Camel's foot tree)
Bauhinia purpurea	=	Rawal
Ceratonia siliqua	=	Seeds are rich in protein

- **Ornamental**

Cassia fistula	=	Amaltas
Delonix regia	=	Gulmohar
Bauhinia anguinia	=	Nagput (Snake climber)
Saraca indica	=	Ashok
Caesalpinia pulcherima	=	Peacock flower
Parkinsonia aculeata	=	Vilayti kikar (Jeruselam Thorn)
Bauhinia variegata	=	Kachnar
Ambrestia nobilis		

- **Timber**

Caesalpinia sappan	**=**	**Brazil wood**
Haematoxylon compechianum	**=**	**Log wood**
		It yields a dye haematoxylin.
Copaifera pubiflora	**=**	**Purple heart wood**
Hymaenia-carbaryl	**=**	**West Indian locust wood**
Hardwickia binata	**=**	Hardest wood
Tamarindus indica	=	Imli
Kingiodendron pinnatum	**=**	It is used in agricultural implements.
Acroscarpus fraxinifolia	=	It produces primitive type of wood.

- **Medicines**

– The raw fruits of amaltas **(*Cassia fistula*)** are used as luxative.
– **Ashokarist** is obtained from the bark of ashok tree (ayurvedic medicine)
– The leaves and seed *Cassia occidentails* and *Cassia obtusifolia* (also purgative) are used in **skin diseases.**
– The bark and leaves of *Cassia glauca* are used in **diabetes** and **gonorrhoea.**
– A tonic is prepared from the bark ***Bauhinia variegata***.

- **Other uses**

– ***Phanera vahlii*** – It yields a commercial gum and bark fibres are used for making **ropes** and **baskets.**
– ***Caesalpinia sappan* – 'Gulal'** is obtained from its heart wood.
– ***Bauhinia purpurea*** and ***Ceratonia silqua*** are used as fodder.
– The oil of ***Kingiodendron pinnatum*** is used for making **soap** and **paints.**

- **Tanning :**

– **Bark of *Bauhinia purpurea***
– ***Bauhinia malabarica***
– ***Caesalpinia digyna***

MIMOSOIDEAE (SUB FAMILY)

- **Root -**

  Tap root system and branched.

- **Leaves -**

  Usually bipinnate paripinnate-pulvinus leaf base

  The stipule is modified into thorn as in ***Acacia.***

  Phyllode is found in Australian **Acacia**

- **Inflorescence -**

  Two types of inflorescences are found in Mimosoidae family -

(i) Capitate (Cymose Capitulum) - Acacia.

(ii) Spike – *Prosopis*

- **General floral character -**

  Bracteate, bisexual, Actinomorphic symmetry, perigynous/hypogynous, tetramerous or pentamerous

- **Calyx -**

  Sepals 4 or 5, gamosepalous, valvate aestivation

- **Corolla -**

  Petals 4 or 5, polypetalous

  gamopetalous corolla is present in ***Acacia*** & ***Albizzia***.

- **Androecium -**

  Many stamens, free, polyandrous

– Monoadelphous stamens are present in ***Albizzia.***

– 4 stamens which are free-found in ***Mimosa.***

– In prosopis 10 stamens are free

- **Gynoecium -**

  Monocarpellary, unilocular, half inferior/superior, marginal placentation

- **Fruit -**

  Lomentum

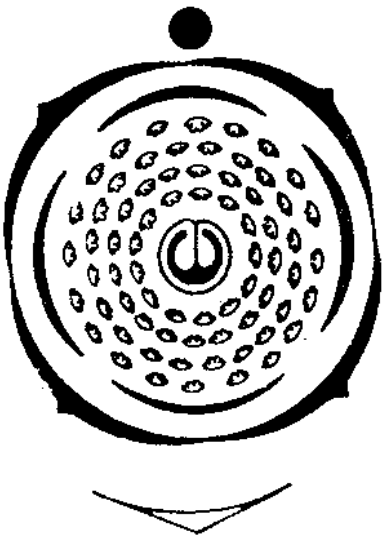
- **Seed** –

  Non endospermic

- **Floral formula -**

$$\text{Br} \oplus \male\!\!\female \; K_{(4-5)} \; C_{4-5} \; A_{\infty} \; \underline{G}_{1}$$

- **Floral diagram -**



- **Economic importance**
  - **Timber & fuel : -**

Acacia arabica	=	Desi Babool. (Black wood)
Prosopis juliflora	=	**Australian Babool**
Xylia dolabini formis	=	**Iron wood** (Jamboo)
Prosopis cineraria	=	Khejari (state tree of Rajasthan)
Albizzia lebbek	=	Siris
Acacia sundra	=	Heaviest wood in India
Xylia xylocarpa	=	Indian ironwood. Wood is used for making sleepers
Acacia julibrissin	=	Mimosa tree

  - **Food & fodder**

Pithecolobium dulce	=	**Jungle Jalebi (Aril)**
Albizzia lebbek	=	**Siris –** Pods are edible and used as fodder.
Neptunia oleracea	=	**Lajalu** – Fruits are edible
Parkia roxburghii	=	**Khurail**
Entada phaseliodes		

  - **Ornamental**

Mimosa pudica	=	Sensitive plant = "Touch me not"
Neptunia oleracea	=	Lajwanti "Kiss me quick"
Pithecolobium dulce	=	Hedge plant
Leucaena leucopholea		

  - **Other uses :-**

Adenanthera pavonia	=	seed-"Glodsmith's weight"
Acacia fornesiana	=	Cassie perfume is obtained from the flowers.
Acacia concinna	=	Shikakai-Its pods are used for head bath.
Acacia catechu	=	**Kattha** is obtained from its heart wood.
Prosopis spicigera	=	It is grown in Rajasthan as wind breaker.

    Many species of ***Acacia*** yield gum.
    Albizzia (Siris) produces special type of gum called **''Sresh''**
    The pods of shikakai are also used as insecticides.
    Gum arabic is obtained from the ***Acacia senegal*.**

CUCURBITACEAE

- **Systematic position**

Class	-	Dicotyledonae
Subclass	-	Polypetalae (but most of plants are gamopetalous, it is an exception)
Series	-	Calyciflorae
Order	-	Passiflorales
Family	-	Cucurbitaceae

- **Special character -**

– Stem Pentangular, branched, usually fistular, with bicollateral vascular bundle. They are arranged in two circles

– Inflorescence-Solitary axillary, most of the plants of this family are monoecious.

- Flowers are ebracteate, pedicellate, incomplete, unisexual, Actinomorphic symmetry, pentamerous and epigynous.
- 5 Sepals, gamosepalous, valvate aestivation.
- Petals 5, gamopetalous, valvate or imbricate aestivation.
- Tricarpellary, syncarpous, inferior ovary, unilocular, parietal placentation but it looks like axile placentation due to swelling of placenta, style one, stigma three and branched.
- 5 Stamens, usually cohesion in three groups (2) + (2) + 1. It means four stamens present in two pairs and fifth one is free, synandrous condition,
- Fruit is pepo
- The **bitter taste** of the fruit is due to presence of tetracyclic triterpenes.

- **Floral formula -**

Male flower – $\text{Ebr} \oplus \male\ K_{(5)}\, C_{(5)}\, A_{(2)+(2)+1} G_0$

Female flower - $\text{Ebr} \oplus \female\ K_{(5)}\, C_{(5)}\, A_0\, \underline{G}_{(3)}$

- **Floral diagram -**

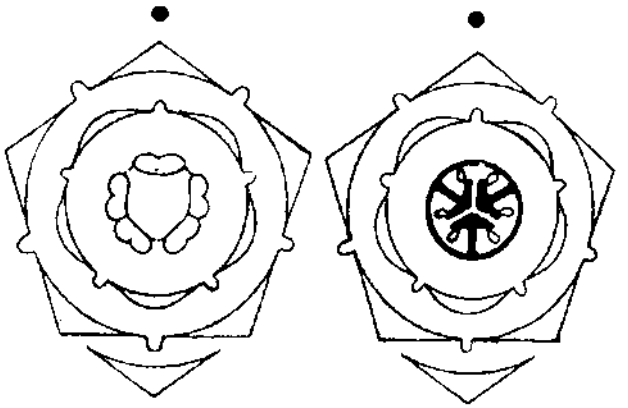


FIG. MALE FLOWER FEMALE FLOWER

- **Economic importance :**
- **Vegetables and Fruits**

Cucurbita pepo or ***Cucurbita maxima***	=	**Kadoo**
Lagenaria vulgaris	=	**Lauki**
Luffa acutangula	=	**Ridge Gourd**
Cucumis melo	=	**Muskmelon (Kharbooza)**
Luffa cylindrica	=	**Ghia tore**
***Cucumis melo* var. utilissimus**	=	**Kakari**
Citrullus vulgaris	=	Tarbooj (water melon)
Cucumis sativas	=	Kheera
Momordica charantia	=	Karela
Citrullus vulgaris *var.* ***fistulosus***	=	Tinda
Benincasa hispida	=	**Ash Gourd** or White Gourd
Trichosanthes dioeca	=	Parval (pointed gourd)
Trichosanthes anguina	=	Snake gourd

T. cucumeriana.	=	Ram bel
Cucumis momordica	=	Kachari
Coccinia cordifolia	=	Kundru (lvygourd)
Sechium edule	=	Lanku

- **Medicinal plants :**
  - ***Ecballium eleterium* = Eleterium** medicine is obtained, which is very useful in malaria and hydrophobia.
  - ***Bryonia rostrata* –** It is used in asthama and piles
  - ***Coccinia indica* –** extract of root leaf and fruit are used in treatment of diabetes
- **Other uses :**
  - ***Careya arborea* :-** Used in bidi

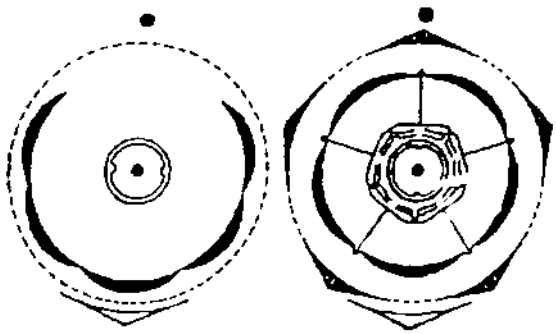
ASTERACEAE OR COMPOSITAE

- **Systematic position -**

Class	-	Dicotyledonae
Sub class	-	Gamopetalae
Series	-	Inferae
Order	-	Asterales
Family	-	Compositae or Asteraceae

Special character : Inflorescence mostly head or capitulum.

- Calyx usually represented by hairy structure called **pappus** or represented by minute **scales.** It is persistant & attached on fruit & helps in its dispersal.
- Petals 5, gamopetalous, valvate aestivation.
- Stamens-5 epipetalous, syngenesious.
- Bicarpellary, syncarpous, inferior ovary, unilocular basal placentation, one style and two stigma or bifurcated stigma
- Fruit is **cypsela** with hairy pappus.
- In Dehlia fasciculated roots are present.
- **Floral formula -**
  - Ray florets → Br % $\underset{+}{\bigcirc}$ $K_P\, C_{(5)}\, A_0\, \overline{G}_{(2)}$
  - Disc florets → Br ⊕ $\underset{+}{\bigcirc\!\!\!\!\bigcirc}$ $K_P\, \overset{\frown}{C_{(5)}\, A_{(5)}}\, \overline{G}_{(2)}$
  - Sterile florets → Br ⓘ $K_P\, C_{(5)}\, A_0\, G_0$
- **Floral diagram –**



- **Economic importance -**
  - **Food -**

    ***Lactuca sativa* =** Salad (Garden lettuce).

Cichorium intybus* (Kasni) = *Cichorium – chicory powder is prepared from roots which mixed in coffee powder.

Helianthus tuberosus – Their tubers are eaten which contain inulin.

Helianthus annus = Sunflower (Suraj mukhi) – The seeds of this yields valuable oil which is used for cooking purposes.

Carthamus thinctorius = Kusum (Safflower) – Oil obtaining from seeds reduced the level of cholesterol.

- **Medicinal plants -**

***Artemisia obsinthium* –** Santonin medicine obtains from *Artemisia* which is useful for removal of worms.

***Arnica montana* –** Arnica medicine is obtained which is used in healing of wound and as hair oil.

***Eclipta alba* –** (Bhring Raj) – Juice is used as hair tonic.

***Anthemis nobilis* –** Camomile named medicine is obtained from the inflorescence.

Species of blumea produce **''Kapoor''** which is a useful medicine.

***Taraxacum officinale* –** "Taraxacum" medicine is obtained which is purgative and diuretic.

- **Ornamental -**

Helianthus annus = Surajmukhi

Chrysanthemum = Gul-Daudi

***Tagetes* =** Genda (marigold)

***Calendula officinalis* =** (Pot marigold)

- **Other Values -**

Ambrosia artemissifolia = **Ring weed** – Hay fever is due to its pollen grains.

Parthenium hysterophorus = Congress grass-skin allergy develops from its pollen grains.

***Chrysanthemum cinerariefolium* =** Guldaudi-Pyrethrum named insecticide is obtained.

LILIACEAE

- **Systematic position**

Class - Monocotyledonae

Series - Coronarieae

Family - Liliaceae

* Perianth is present in this family,

- **Diagnostic features**
  - **Habit -**

Mostly Herbs some climbers

sometimes abnormal secondary growth is found in trees such as – ***Dracaena, Yucca*.**

  - **Root -**

Usually adventitous/fibrous. Fasciculated root is found in ***Asparagus*** (satawar)

  - **Stem**

The aerial stem is present in few plants.

Majority of the plants have underground stem. It is of two type-

(i) **Bulbs**

Example – **Onion, Garlic.**

(ii) **Corm**

Example – **Colchicum**

Modification of aerial stem -

Cladode – in ***Asparagus, Ruscus***

- **Leaves -**

  Some of the plants bear cauline leaves (present on aerial stem.)

  Radical leaves are present in few plants such as in ***Asphodelus*****.**

  The leaves are sessile with sheathing leaf bases i.e. clasping round the stem.

  *In ***Allium*** three different type of leaves are found scale, Foliar and Fleshy.

- **Venation-**

  Perallel venation

  *Reticulate venation is found in ***Smilax, Paris***

  The stipule of ***Smilax*** and leaf tip of ***Gloriosa*** are modified into tendrils.

- **Inflorescence -**

  It is of many types as follows :-

  Panicle *:-* Compound raceme e.g. ***Yucca*** and ***Dracaena***

  Scorpioid cyme – e.g. ***Haemorcoalis***

  Spadix – e.g. ***Aloe***

  Scapigerous umbel or Cymose umbel – e.g. **Onion** and **Garlic**

  Solitory terminal → ***Tulipa***

  Solitary axiliary – ***Gloriosa***

- **General characters of flower -**

  Bracteate, bisexual, complete, actinomorphic symmetry, Hypogynous and Trimerous, epiphyllous and in some plants may be epipetalous

  *The flowers in ***Ruscus*** and ***Smilax*** are unisexual and incomplete.

  *Zygomorphic flower present in ***Lilium***

  ****Aspidiastra***, ***Paris*** and ***Mianthimum*** contain tetramerous flowers.

- **Perianth-**

  Tapals 6 (perianth), polyphyllous, arranged in two whorls 3 + 3, Valvate or imbricate aestivation, tepal of outer whorl-anterior. May be polytepalous. Gamotepalous flower → ***Aloe, Asparagous***

  *Eight (8) tepals are present in ***Paris*** and ***Mianthimum*** and arranged in two whorls 4 + 4.

- **Andoroecium -**

  6 stamens, arranged in two whorls 3 + 3, free polyandrous, basifixed or versatile & introrse.

  *Only 3 stamens are found in ruscus. 8 stemens are found in Paris arranged in 4 + 4.

- **Gynoecium -**

  Tricarpellary, syncarpous, trilocular, stigma trifid, axile placentation, superior ovary.

- **Fruit -**

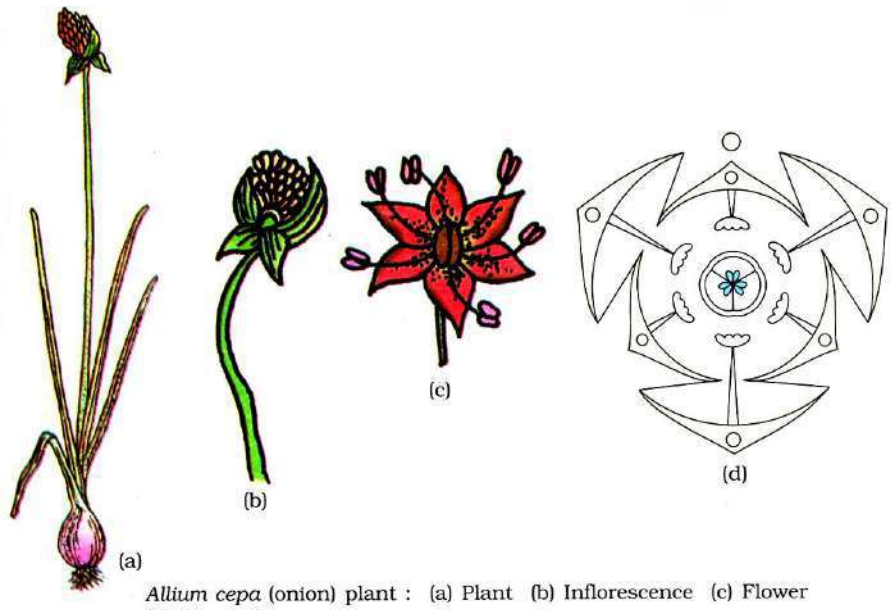
  Some have berry as in **Lily and** normally capsule as in **onion.**

- **Seed -** Endospermic

- **Floral formula -**

$$\text{Br} \oplus \; \overset{+}{\circlearrowleft} \; P_{3+3 \text{ or } (3+3)} \, A_{3+3} \, \underline{G}_{(3)} \quad \text{or} \quad \text{Br} \oplus \; \overset{+}{\circlearrowleft} \; \overset{\frown}{P_{3+3 \text{ or } (3+3)}} \, A_{3+3} \, \underline{G}_{(3)}$$

- **Diagram -**



Allium cepa (onion) plant : (a) Plant (b) Inflorescence (c) Flower (d) Floral diagram

- **Economic importance -**
  - **Food -**

    Allium cepa = Onion

    ***A. sativum* =** Garlic

    Asparagus = Satawar - Fasciculated roots

    Leprogeria rosea – Fruits are eaten.
  - **Ornamental plants -**

    ***Lilium bulbiferum* =** Lily

    ***Gloriosa superba* =** Glory lily

    Tulipa = **Tulip**

    ***Convalaria majlis* =** Lily of the valley

    Sensiviera trifasiata – "Mother in Law's tongue"

    Ruscus aculeatus – Butcher's boom"

    Fritillaria tenella* ; *F. melagris = snakes head

    Agapanthus americans = African lily
  - **Medicinal uses -**

    Sarasprilla = *Smilax zeylamicum* – roots yield sarasaprilla which is used in veneral disease dysentery and skin disease

    Sudarshan = ***Crinum asiaticum***

    The juice of leaves is used in rheumatism and ear pain.

    Gvar patha = ***Aloe vera*** – the juice of the leaves is used as skin tonic and increase the eye sight.

    Asphodelus tennuifolius – Its seeds are used in peptic ulcer.

    Urginea (wild onion) and Scilla rat killer medicine is prepared from their bulb.

    Lahasun = ***Allium sativum* =** It is very useful in heart disease, rheumatism & diabetes.

    ***Gloriosa superba* –** It is used in leprosy and piles, it is also very useful in biting of snake or scorpion.

- **Other uses :-**

– Dragon plant = ***Dracenena draca*** **–** Red colour resin is obtained from the stem, Thus it is known as "Dragon's blood"

– **Dragger plant =** ***Yucca alolifolia, Y. filamentosa*****-** Fibres are ontained from the stem.

– ***Colchicum automnale*****-**Colchicine is obtained from this plant which is used to induce polyploids in plants.

– ***C. luteum*** = corm is laxative

– ***lphigenia indica*** **–** Red colour is obtained from the flowers.

– ***Phormium tenax*** – It is used for preparing oil paints and varnishes.

– ***Sansevieria roxburghiana*** **=** "Indian Bowstring hemp" Bowstring hemp" and ***Sansevieria trifasciana*** = "African Bowstring hemp" – fibers are obtained which are used for making ropes and nets.

– ***Veratrum album*** = moth killer is prepared

POACEAE OR GRAMINEAE

- **Systematic position -**

  Class = Monocotyledonae

  Series = Glumaceae

  Family = Gramineae or Poaceae

- **Special character :**

– This is the largest family of the Indian flora.

– Inflorescence spike of spikelets. Main axis is called rachilla.

– Flowers sessile, bracteate, bracteolate. Two sterile or empty scales called glumes occur at the base of the main axis. A series of florets are present above the glumes with superieor and inferior palea. Inferior palea is fertile bract which is also known as fertile glume lemma. They can produce hair or awn. Superior palea is morphologically act as a bracteole.

– Flowers zygomorphic, bisexual, but in Zea and coix flowers are unisexual. Flowers are hypogynous and trimerous.

– Tepals 2, free polytapelous, membranous and situated in antereo lateral position. They are called lodicules.

– Stamens 3, polyandrous,

– Monocarpellary or Tricarpellary, syncarpous, superior ovary, unilocular, placentation is basal, two style are present and stigma is **feathery**

– Fruit is **caryopsis.**

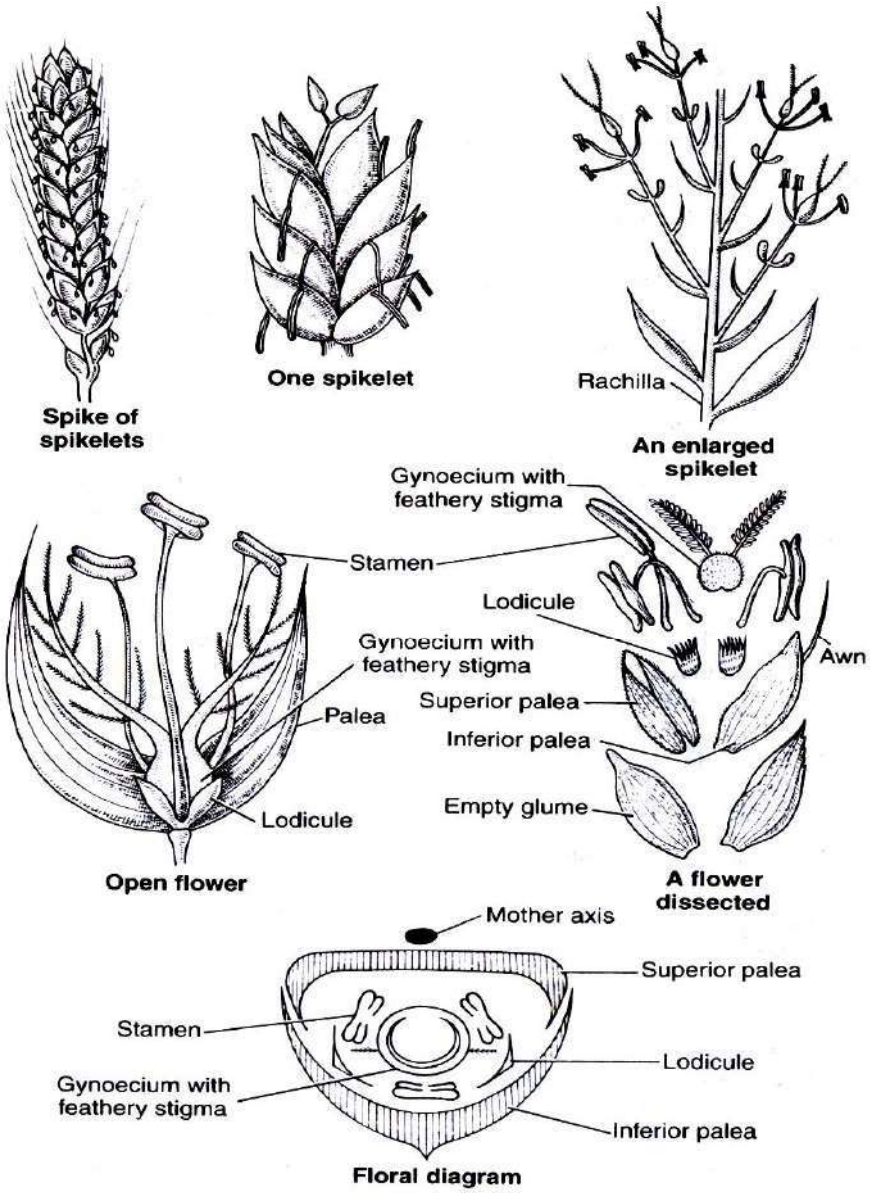
– Culm stem is present.

– Seed → Endospermic

- **Floral formula -**

$$Br \oplus \delta\!\!\!

- **Diagram -**



Triticum aestivum **(Wheat) : A spike of spikelets, one spikelet, an enlarged spikelet, an open flower, a dissected flower and floral diagram**

- **Economic importance -**
  - **Ornamental Plants :-**

    ***Cynodon dactylon* = Doob**
  - **Cereals :-**

Avena sativa	=	Jai/oat
Eleusine coracena	=	Ragi
Hordeum vulgare	=	Barely/jau – It is the oldest ancient crop.
Oryza sativa	=	Rice
Pennisetum typhoides	=	Bajra
Secale cereale	=	Europen rye
Sorghum vulgare	=	Jawar

Triticum aestivum = Wheat

Zea mays = Maize

- **Sugar :-**

Saccharum officinarum = Sugar cane

- **Oil Yielding Plants :-**

Cymbopogon caesius = ginger grass oil is obtained from their leaves & is used in soap industry.

C.flexnosus = Lemon grass oil is obtained from their leaves & is used for making scented materials.

Vetiveria zizanoides = Khus
Oil obtained from their root which is used in perfumery.

- **Fibre Yielding Plants :-**

– ***Erianthus arundinaceus*** = Sarkanda is used in making ropes.

– ***E.munja*** = Moonj–Fibres obtained from stem is used for making ropes, mats and baskets etc.

- **Timber Yielding Plants :-**

– ***Bambusa balcooa*** = Bamboo

– ***Dendrocalamus giganteus*****.**

- **Other uses :-**

– ***Hordeum vulgare*** is used for making **beer.**

– ***Thysanolaena mexima*** – It is used from making brooms

– ***Zea mays*** is used in alcohol industry.

– ***Vetiveria zizanoides* –** (Khus) – It is used for preparation of on alcoholic drinks. Its root are also used in perfumery.

– ***Arundinaria falcata*** **(Bansi) :** Used for making fishing rod.

SPECIAL POINTS

- Fabaceae is the alternative name of the **Leguminosae.**
- Compositae = **Asteraceae** is the largest family of angiosperms.
- ***Desmodium latifolium*** the member of papilionateae family which is halophyte.
- J.C. Bose conducted experiment of plant movement on ***Desmodium gyrans***.
- Pollen grains in Mimosoidae are usually present in the form of packets.
- Soyabean contains more protein than meat.
- Aloin alkaloides are obtained from ***Aloe*** plant of Liliaceae.
- ***Smilax*** is a monocot, having, reticulate venation.
- The flowers enter into the soil after fertilization in ground nut (Geocarpic fruit).
- Pulses are rich source of proteins.

EXERCISE - 1

Q.1 Edible part of coconut is-
(1) Endocarp (2) Embryo
(3) Endosperm (4) Mesocarp

Q.2 The characteristic fruit of family cruciferae is-
(1) legume (2) Capsule
(3) Berry (4) Siliqua

Q.3 The morphological nature of edible part of apple is-
(1) Mesocarp (2) Fleshy thalamus
(3) Endocarp (4) Cotyledons

Q.4 A caryopsis is a fruit-
(1) That does not have fruit wall
(2) Fruit wall, which is fleshy and contains many seeds
(3) In which fruit wall and seed coat are fused
(4) That dehiscence to expose seeds

Q.5 The fruit of coconut is a-
(1) Capsule (2) Drupe
(3) Nut (4) Berry

Q.6 The edible part of ripe mango is morphologically-
(1) Epicarp (2) Mesocarp
(3) Endocarp (4) Pericarp

Q.7 The fruit of apple (pome) is said to be false fruit because-
(1) Its pericarp is inconspicuous
(2) Its endocarp is cartilagenous
(3) Its actual fruit is located within an edible fleshy thalamus
(4) It develops from an inferior ovary

Q.8 Which of the following is not fruit-
(1) Tomato (2) Cucumber
(3) Mango (4) Potato

Q.9 The pair which is not correctly matched-
(1) Mango-drupe (2) Sunflower-cypsela
(3) Tomato-berry (4) fig-sorosis

Q.10 Drupe is one seeded succulent fruit with a three layered pericap, which of the following is not that fruit-
(1) Plum (2) Peach
(3) Lemon (4) Cherry

Q.11 Type of fruit in groundnut (Arachis hypogea) is-
(1) Nut (2) Legume
(3) Lomentum (4) Caryopsis

Q.12 The type of dehiscence in the capsule of cotton is-
(1) Loculicidal (2) Septifragal
(3) Septicidal (4) Poricidal

Q.13 Rice grains are fruits known as-
(1) Caryopsis (2) Achene
(3) Cypsela (4) Samara

Q.14 A true fruit develops from-
(1) Ovary (2) Thalamus
(3) Petals (4) Receptacle

Q.15 A cypsela is a fruit-
(1) That does not have a fruit wall
(2) In which fruit wall is fused with seed coat
(3) Which develops from a syncarpous, inferior single seeded ovary
(4) In which the pericarp is fleshy

Q.16 Which one of the following is a fruit-
(1) Potato (2) Radish
(3) Ginger (4) Lady's finger

Q.17 The fruit developing from an apocarpous condition of a gynoecium in a flower is known as-
(1) Multiple (2) Simple
(3) Aggregate (4) Composite

Q.18 The edible part of litchi is-
(1) Mesocarp (2) Fleshy thalamus
(3) Succulent testa (4) Fleshy aril

Q.19 Mulberry is a-
(1) Simple fruit (2) Composite fruit
(3) Aggregate fruit (4) None of these

Q.20 Parthenocarpic fruit develops from-
(1) Unpolinated ovary
(2) Unfertilized ovary
(3) Thalamus and ovary
(4) Unfertilized ovule

Q.21 The fruit that develops from hypanthodium inflorescence is called-
(1) Syconus (2) Siliqua
(3) Samara (4) Sorosis

Q.22 Siliqua fruit develops from-
(1) Bicarpellary ovary
(2) Polycarpellary unilocular ovary
(3) Monocarpellary ovary
(4) Polycarpellary and multilocular ovary

Q.23 Stony endocarp is found in-
(1) Berry (2) Nut
(3) Drupe (4) Amphisaraca

Q.24 Betel nut is a-
(1) Drupe (2) Berry
(3) Nut (4) Sorosis

Q.25 The plant which buries its own seeds in the soil is-
(1) Sweet potato (2) Arachis hypogea
(3) Potato (4) Onion

Q.26 When the pericarp is fused with testa and the fruit contains a single seed, it is called-
(1) Caryopsis (2) Achene
(3) Utricle (4) Nut

Q.27 Coir is obtained from which part of coconut-
(1) Epicarp (2) Mesocarp
(3) Endocarp (4) Seed

Q.28 Tomato is a-
(1) Pome (2) Berry
(3) Drupe (4) Nut

Q.29 The most important foods are derived from-
(1) Roots (2) Fruits
(3) Stems (4) Leaves

Q.30 The unilocular, single seeded fruit developing from a bicarpellary, inferior ovary, often with persistent pappus is called-
(1) Caryopsis (2) Achene
(3) Cypsela (4) Capsule

Q.31 Pine apple is an example of-
(1) An etaerio of berries
(2) A sorosis
(3) An aggregate of drupes
(4) A simple fleshy fruit

Q.32 Anona squamosa is-
(1) Etaerio of achenes (2) Etaerio of drupes
(3) Etaerio of berries (4) Hypanthodiuim

Q.33 Berry is a fruit which is commonly-
(1) Dry and multiseeded
(2) Fleshy and single seeded
(3) Flehsy and multiseeded
(4) Fleshy and single or multiseeded

Q.34 Immature gular fruit is a-
(1) Berry fruit (2) Pome fruit
(3) Hypanthodium inflorescence
(4) Swollen tip of a twig

Q.35 A fruit that has a fleshy mesocarp and stony endocarp is called-
(1) Pome (2) Drupe
(3) Berry (4) pepo

Q.36 The survival of the flowering plants can best be attributed to-
(1) Absence of vascular system
(2) Development of fruit
(3) Development of an extensive root system
(4) Ability to carry on vegetative propogation

Q.37 The dry dehiscent (schizocarpic) fruit which develops from tricarpellary, synacarpous, superior ovary with axile placentation is-
(1) Regma (2) Carcerulus
(3) Septicedal capsule (4) Septifragal capsule

Q.38 The fleshy indehiscent fruit which develops from tricarpellary synacarpous gynoecium, inferior ovary with parietal placentation is-
(1) Hesperidium (2) Pome
(3) Pepo (4) Syconus

Q.39 The fruits of which plants are dispersed by grazing animals such as goats and cows-
(1) Sunflower (2) Xanthium
(3) Mustard (4) Cucurbita

Q.40 Which of the following plants are likely to have wider range of distribution-
(1) Those distributed by seeds
(2) Those distributed by spores
(3) Those distributed by vegetative means
(4) Those distributed by fruits

Q.41 Dispersal of coconut fruit takes place by-
(1) Air (2) Water
(3) Animals (4) Splitting

Q.42 Parachute mechanism of fruit and seed dispersal is due to the structure called-
(1) Pappus (2) Thorns
(3) Corolla (4) Bracts

Q.43 Orchid seeds are-
(1) Very large and heavy
(2) Light and dry
(3) Small and sticky
(4) None of the above

Q.44 The following bear winged fruits-
(1) Oroxylon (2) Cinchona
(3) Dioscorea (4) Moringa

Q.45 Among the following whose seeds are dispersed by wind-
(1) Calotropis (2) Cycas
(3) Petunia (4) Rice

Q.46 The dispersal of seeds in opium takes place by-
(1) Parachute mechanism
(2) Censor mechanism
(3) Explosive mechanism
(4) None of the above

Q.47 Winged seeds are present in-
(1) Moringa (2) Shorea
(3) Hiptage (4) Calotropis

Q.48 Fruits dispersed by persistent styles in-
(1) Clematis (2) Solanum
(3) Papaver (4) Phyasalis

Q.49 Parachute mechanism of fruit and seed dispersal is due to structure called-
(1) Pappus (2) Thorns
(3) Corolla (4) Bracts

Q.50 The ovary showing ovules borne on three parietal placenta is-
(1) Bilocular (2) Trilocular
(3) Pentalocular (4) Unilocular

ANSWER KEY

EXERCISE – 1

Q.1	3	Q.2	4	Q.3	2	Q.4	3	Q.5	2	Q.6	2	Q.7	3
Q.8	4	Q.9	43	Q.10	3	Q.11	3	Q.12	1	Q.13	1	Q.14	1

Q.43	2	Q.44	3	Q.45	1	Q.46	2	Q.47	1	Q.48	1	Q.49	1
Q.50	4												

EXERCISE - 2

Q.1 For higher plant flowers are chiefly used as a basis of classification, because-
(1) These show a great variety in colour
(2) It can be preserved easily
(3) Reproductive parts are more conservative than vegetative
(4) None of these

Q.2 The part of cauliflower which is eaten is-
(1) Bud (2) Inflorescence
(3) Flower (4) Fruit

Q.3 Tetradynamous androecium is characterized by-
(1) Outer two long and inner two short stamens
(2) Outer two short and inner four long stamens
(3) Outer four long and inner two short stamens
(4) Outer four short and inner two long stamens

Q.4 Cruciform corolla is present in-
(1) Sunflower (2) China rose
(3) Raddish (4) Pea

Q.5 The aestivation of corolla of pea flower is called-
(1) Valvate (2) Twisted
(3) Imbricate (4) Vexillary

Q.6 Ochreate stipules occur in-
(1) Cotton (2) Rose
(3) Polygonum (4) Pea

Q.7 Maturation of stamens and pistils at different times in the same flower is called-
(1) Heterospory (2) Heterostyly
(3) Dichogamy (4) Dichotomy

Q.8 Monoadelphous stamens are formed by the fusion of
(1) Anther lobes of all the stamens
(2) Anther lobes of two stamens
(3) Filaments of all stamens
(4) Filaments of two stamens

Q.9 In bisexual flowers when the gynoecium matures earlier than the androecium it is called-
(1) Protandry (2) Protogyny
(3) Heterogamy (4) Autogamy

Q.10 A bisexual flower which never opens in its life span is called-
(1) Homogamous (2) Heterogamous
(3) Dichogamy (4) Cleistogamy

Q.11 Hydrophily is best demonstrated by-
(1) Nelumbium (2) Vallisneria
(3) Eichornia (4) Nymphaea

Q.12 A modification of a bud that can bear leaves, flowers and fruits and may also become branched is called-
(1) Prickle (2) Spine
(3) Thorn (4) Trichome

Q.13 The placentation in a multilocular ovary where the ovules are borne over the entire inner surface is called
(1) Pendulous (2) Marginal
(3) Superficial (4) Parietal

Q.14 When the filaments are united into a number of bundles, but the anthers are free, the conditions is called-
(1) Diadelphous (2) Monoadelphou
(3) Syngenesius (4) Polyadelphous

Q.15 Gynobasic style is found in-
(1) Labiatae (2) Gramineae
(3) Liliaceae (4) Compositae

Q.16 Perianth is-
(1) Outer part of flower in which calyx and corolla are not always distinguishable
(2) When stamens and gynoecium are not distinguishable
(3) When only calyx is present
(4) None of the above

Q.17 Arrangement of sepals or petals with respect to each other in floral bud is called-
(1) Vernation (2) Venation
(3) Aestivation (4) Phyllotaxy

Q.18 Ligulate/strap-shaped corolla occurs in sunflower in-
(1) Disc florets
(2) Immature florets
(3) Ray florets
(4) Both ray and disc florets

Q.19 The long silky hair coming out of cob of maize are-
(1) Meant for fruit dispersal
(2) Meant for attracting insects
(3) Meant for protecting seeds
(4) Long styles and stigmas

Q.20 Stamens with free anthers but filaments fused into a number of groups are-
(1) Polyadelphous (2) Diadelphous
(3) Monadelphous (4) Syngenesious

Q.21 Structure equivalent to perianth is-
(1) Superior palea (2) Inferior palea
(3) Glumes (4) Lodicules

Q.22 Which is not correctly matched in respect to edible part-
(1) Mango-mesocarp
(2) Litchi-fleshy aril
(3) Groundnut-embryo and cotyledons
(4) Coconut-endocarp

Q.23 An albuminous seed showing hypogeal germination is-
(1) Castor (2) Bean
(3) Gram (4) Maize

Q.24 Oil is stored in the endosperm of-
(1) Groundnut (2) Soyabean
(3) Coconut (4) Cashewnut

Q.25 Germination of seed within fruit is-
(1) Ovipary (2) Vivipary
(3) Hypogeal (4) Epigeal

Q.26 Dispersal of seed in opium Poppy/Argemone occurs by-
(1) Explosive mechanism
(2) Parachute mechanism
(3) Censer mechanism
(4) Jaculator mechanism

Q.27 Seeds are beset with tiger's claw in-
(1) Martynia (2) Xanthium
(3) Spear grass (4) Puncture vine

Q.28 Tetradynamous condition is related to-
(1) Androecium (2) Inflorescence
(3) Perianth (4) Gynaecium

Q.29 In the fruit of pomegranate, the edible part is-
(1) Mesocarp (2) Pericarp
(3) Seed coat (4) Endocarp

Q.30 Which is not correctly matched-
(1) Fig – Sorosis (2) Sunflower – Cypsela
(3) Mango – Drupe (4) Tomato – Berry

Q.31 Perisperm is-
(1) Remnant of endosperm
(2) Persistent nucellus
(3) Peripheral part of endosperm
(4) Disintegrated secondary nucleus

Q.32 Outermost layer of endosperm of maize grain is-
(1) Epidermis (2) Pericarp
(3) Tunica (4) Aleurone

Q.33 Fruit bearing plants are-
(1) Gymnosperms (2) Dicotyledons
(3) Angiosperms (4) Spermatophytes

Q.34 Tetradynamous condition has-
(1) Six stamens, two short and four long
(2) Six stamens, two long and four short
(3) Six stamens, two short in outer whorl and four long in inner whorl
(4) Four stamens, two short and two long in outer and inner whorls respectively

Q.35 Synandrous condition is fusion of-
(1) Filaments only
(2) Both filaments and anthers
(3) Anthers only
(4) Petals

Q.36 Maize/Wheat/Rice grain is-
(1) Fruit (2) Seed
(3) Embryo (4) Dried bud

Q.37 In pineapple, the edible part is-
(1) Pericarp and thalamus
(2) Rachis/penducle, bracts, perianth and pericarps
(3) Mesocarp and endocarp
(4) Pericarp and placenta

Q.38 Aleurone layer helps in-
(1) Storage of food in endosperm
(2) Protection of embryo
(3) Utilization of stored food
(4) All the above

Q.39 In the legume seed, food is stored in-
(1) Cotyledons (2) Endosperm
(3) Perisperm (4) Seed coats

Q.40 Epithelial layer of maize scutellum secretes the hormone-
(1) Auxin (2) Cytokinin
(3) Gibberellin (4) Ethylene

Q.41 Fruit of Cruciferae is-
(1) Legume/pod (2) Siliqua
(3) Berry (4) Cypsela

Q.42 Edible part of groundnut buried is soil is morphologically-
(1) Root (2) Stem
(3) Fruit (4) Leaf

Q.43 Fruit of Ficus is-
(1) Sorosis (2) Syconium
(3) Aggregate (4) Dry

Q.44 Aggregate fruit occurs in-
(1) Artocarpus (2)Annona squamosa
(3) Ananas (4) Both (2) and (3)

Q.45 Shield-shaped cotyledon/scutellum occurs in-
(1) Maize (2) Gram
(3) Pea (4) Cucumber

Q.46 Parachute type dispersal occurs in-
(1) Tomato (2) Mustard
(3) Pea (4) Cotton

Q.47 A characteristic of drupe is-
(1) Fleshy seed coat (2) Stony pericarp
(3) Stony mesocarp (4) Stony endocarp

Q.48 Which is active in maize-
(1) Maltase (2) Zymase
(3) Diastase (4) Urease

Q.49 Winged seeds are-
(1) Rough and sticky (2) Smooth and sticky
(3) Dry and spinning (4) None of the above

EXERCISE – 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Pappus is characteristic of family **[JKCMEE 2000]**

(1) Asteraceae/Compositae
(2) Papaveraceae
(3) Papilionaceae/Fabaceae
(4) Malvaceae

Q.2 An apocarpous flower is found in **[JIPMER 2000]**

(1) *Caesalpinnia* (2) *Ranunculus*
(3) *Brassica* (4) *Datura*

Q.3 Ligulate corolla found in compositae is **[JIPMER 2000]**

(1) Wheel-shaped (2) Strap-shaped
(3) Masked (4) Two-lipped

Q.4 Butterfly shaped flower with one stranded, two wing-like and two keeled petal belong to **[AIIMS 2000]**

(1) Compositae (2) Rubiaceae
(3) Malvaceae (4) Papilionaceae

Q.5 Hair present on the cob of corn are **[CBSE PMT 2000]**

(1) Seed hairs
(2) Modified hairs of bracts
(3) Styles
(4) Stigmas and styles

Q.6 Transversely placed syncarpous ovary occurs in **[Pb. PMT 2000]**

(1) Compositae (2) Cruciferae
(3) Malvaceae (4) Cucurbitaceae

Q.7 Part of pistil which receives pollen is **[MP PMT 2004]**

(1) Ovary (2) Style
(3) Stigma (4) Ovule

Q.8 Tetradynamous condition is characteristics of [**CPMT 2001; Bih. PMT 2001]**

(1) *Liliaceae/Allium/Asphodelus*
(2) Cruciferae/Mustard/Iberis
(3) Malvaceae/*Althea/Hibiscus*
(4) Solanaceae/*Nicotiana/Petunia*

Q.9 The term Anthesis is used for **[AIEEE 2004]**

(1) Cluster of anthers
(2) Opening of flowers
(3) Dehiscence of anthers
(4) Falling of flowers

Q.10 Bilocular oblique ovary with numerous shining ovule on swollen axile placenta is the characteristics of **[AMU 2002]**

(1) Cruciferae (2) Solanaceae
(3) Liliaceae (4) Malvaceae

Q.11 In many cultivated ornamental flowers, number of petal whorls is higher than the one in wild type. Extra petals are generally modified **[JKCMEE 2000]**

(1) Sepals (2) Petals
(3) Stamens (4) Pistils

Q.12 Name the plant from seeds of which oil is obtained **[MP PMT 2001]**

(1) *Cicer arietinum*
(2) *Saccharum officinarum*
(3) *Saccharum munja*
(4) *Arachis hypogea*

Q.13 Chief features of family Brassicaceae/ Cruciferae is presence of **[BHU 2002]**

(1) Latex (2) Pectin
(3) Alkaloids (4) Myrosin enzyme

Q.14 Flower of Fabaceae is **[JIPMER 2002]**

(1) Complete, zygomorphic, pentamerous
(2) Complete, actinomorphic, trimerous
(3) Incomplete, zygomorphic, trimerous
(4) Incomplete, actinomorphic, pentamerous

Q.15 Ovary having basal placentation is **[JIPMER 2002]**

(1) Monocarpellary bilocular
(2) Bicarpellary, syncarpous and unilocular
(3) Multicarpellary, syncarpous and unilocular
(4) Syncarpous with two or more carpels

Q.16 Most important character of Brassica campesteris is **[RPMT 2002]**

(1) False septum (2) Parietal placentation
(3) Ebracteate (4) Imbricate aestivation

Q.17 In fabaceae, one of the following immediately encloses the essential organs **[APMEE 2002]**
(1) Anterior petals (2) Posterior petal
(3) Lateral petals (4) Sepals

Q.18 Choose the correct description depicted by floral diagram **[KCET 2002]**
(1) United valvate sepals, free twisted petals, free stamens, unilocular ovary with marginal placenta
(2) United valvate sepale, free imbricate petals, free stamens, unilocular ovary with axile placenta
(3) United valvate sepals, free imbricate petals, epipetalous stamens, unilocular ovary with marginal placenta
(4) United valvate sepals, free imbricate petals, free stamens, unilocular ovary with marginal placentation

Q.19 Compositae is also known as **[DPMT 2001]**
(1) Fabaceae (2) Asteraceae
(3) Liliaceae (4) Poaceae

Q.20 Four sepals arranged in two whorls is characteristic of family **[Manipal 2001, BHU 2002]**
(1) Solanaceae (2) Fabaceae
(3) Brassicaceae (4) Liliaceae

Q.21 Name the family having (9)+1 arrangement of stamens **[AIIMS 2001]**
(1) Solanaceae (2) Asteraceae
(3) Liliaceae (4) Fabaceae

Q.22 Largest family of flowering plants is **[Tamil Nadu 2001]**
(1) Fabaceae (2) Liliaceae
(3) Poaceae (4) Asteraceae

Q.23 Russian Millet, Digitaria, is grown in **[Har PMT 2000]**
(1) Bihar (2) Karnataka
(3) Rajasthan (4) Meghalaya

Q.24 Bicarpellary, syncarpous, unilocular ovary with basal placentation occurs in **[Tamil Nadu 2001]**
(1) Liliaceae (2) Solanaceae
(3) Asteraceae (4) Fabaceae

Q.25 Pulses are obtained from **[MPPMT 2002]**
(1) Fabaceae (2) Asteraceae
(3) Poaceae (4) Solanaceae

FAMILIES OF FLOWERING PLANTS

Q.26 Edible oil is obtined from seeds of **[BHU 2008]**
(1) Helianthus tuberosus
(2) Helianthus annus
(3) Carthamus tinctorius
(4) Both B and C

Q.27 Raticide poisons are obtained from **[BHU 2008, JKCMEE 2010]**
(1) Scilla (2) Urginea
(3) Both A and B (4) Gloriosa

Q.28 Botanical names of Jower and Rice are respectively **[JIPMER 2004]**
(1) Oryza sativa and Pennisetum typhoides
(2) Sorghum vulgare and Oryza sativa
(3) Triticum aestivum and Pennisetum typhoides
(4) Oryza sativa and Sorghum vugare

Q.29 Floral formula of Brassicaceae (Mustard) is **[Kerala 2010]**
(1) $\oplus\ K_{2+2}\ C_{X\ 4}\ A_{2+4}\ \underline{G_{(2)}}$
(2) $K_5C_5\ A_{5+5}\underline{G_1}$
(3) $\oplus\ \underline{G_{(3)}}$
(4) $\oplus\ K_5\ \underline{G_{(2)}}$ .....

Q.30 Scientific name of Sunflower is **[WB 2009]**
(1) Brassica campestris
(2) Pisum sativum
(3) Helianthus annuus
(4) Gossypium herbaceum

Q.31 Pulses are obtained from **[MPPMT 2002]**
(1) Fabaceae (2) Asteraceae
(3) Poaceae (4) Solanaceae

Q.32 Indian Mustard or Rai is **[CPMT 2010]**
(1) Brassica juncea (2) Brassica nigra
(3) Brassica rapa (4) Brassica campestris

Q.33 $\oplus\ \underline{G_{(3)}}$ is floral formula of **[RPMT 2006]**
(1) Liliaceae (2) Brassicaceae
(3) Asteraceae (4) Poaceae

Q.34 Floral formula of family solanaceae is **[Bih. PMT 2006]**

(1) Br Ebral $\oplus$ K_5 $G_{(\underline{2})}$

(2) Br Ebrl $\oplus$ $K_{(5)}$ $C_{1+2+(2)}$ A_{5+5} $G_{\underline{1}}$

(3) Ebe Ebrl $\oplus$ K_4 $C_{X\ 4}$ A_{2+4} $G_{(\underline{2})}$

(4) None of the above

Q.35 Russian Millet, Digitaria, is grown in **[PMT 2000]**

(1) Bihar (2) Kerala

(3) Rajasthan (4) Meghalaya

Q.36 An oil seed crop is **[MPPMT 2004]**

(1) Paddy (2) Sunflower

(3) Chrysanthemum (4) Gram

Q.37 Lycopersicum esculentum belongs to family **[Pb. PMT 2000]**

(1) Brassicaceae (2) Solanaceae

(3) Liliaceae (4) Poaceae

Q.38 Red dye for dyeing silk is got from petals of **[JIPMER 2000]**

(1) Tagetes erecta

(2) Zinnia elegans

(3) Carthamus tinctorius

(4) Eclipta prostrata

Q.39 Scientific name of Ragi is **[HPPMT 2001]**

(1) Avena sativa

(2) Sorghum vulgare

(3) Eleusine coracana

(4) Pennisetum typhoides

Q.40 Belladona is obtained from **[MPPMT 2001]**

(1) Atropa (2) Hyoscyamus

(3) Calendula (4) Aconitum

Q.41 Name the plant from seeds of which oil is obtained **[MPPMT 2001]**

(1) Cicer arietinum

(2) Saccharum officinarum

(3) Saccharum munja

(4) Arachis hypogea

Q.42 Replum is characteristic of family **[Manipal 2001, BHU 2008]**

(1) Brassicaceae (2) Asteraceae

(3) Liliaceae (4) Solanaceae

Q.43 Tetradynamous condition occurs in family **[CBSE 2001]**

(1) Asteraceae (2) Solanaceae

(3) Brassicaceae (4) Liliaceae

Q.44 Gram belongs to family **[MPPMT 2001]**

(1) Papilionaceae (2) Asteraceae

(3) Poaceae (4) Solanaceae

Q.45 Compositee is also known as **[DPMT 2001]**

(1) Fabaceae (2) Asteraceae

(3) Poaceae (4) Solanaceae

Q.46 Four sepals arranged in two whorls is characteristic of family **[Manipal 2001, BHU 2002]**

(1) Solanaceae (2) Fabaceae

(3) Brassicaceae (4) Liliaceae

Q.47 Name the family having (9) + 1 arrangement of stamens **[AIIMS 2001]**

(1) Solanaceae (2) Asteraceae

(3) Liliaceae (4) Fabaceae

Q.48 The number of ovules present in ovary of Asteraceae is **[Tamil Nadu 2001]**

(1) 1 (2) 2

(3) 4 (4) Many

Q.49 Largest family of flowering plants is **[Tamil Nadu 2001]**

(1) Fabaceae (2) Liliaceae

(3) Poaceae (4) Asteraceae

Q.50 Diadelphous condition cocurs in **[CPMT 2004]**

(1) Solanaceae (2) Fabaceae

(3) Asteraceae (4) Liliaceae

Q.51 Chief features of family Brassicaceae / Cruciferae is presence of **[BHU 2002]**

(1) Latex (2) Pectin

(3) Alkaloids (4) Myrosin enzyme

Q.52 Oblique ovary is found in **[DPMT 2002]**

(1) Liliaceae (2) Solanaceae

(3) Asteraceae (4) Poaceae

Q.53 Flower of Fabaceae is **[JIPMER 2002]**

(1) Complete, zygomorphic, pentamerous

(2) Complete, actinomorphic, trimerous

(3) Inomplete, zygomorphic, trimerous

(4) Incomplete, actinomorphic, pentamerous

Q.54 Ovary having basal placentation is **[JIPMER 2002]**

(1) Monocarpellary bilocular
(2) Bicarpellary, syncarpous and unilocular
(3) Multicarpellary, syncarpous and unilocular
(4) Syncarpous with two or more carpels

Q.55 Most important character of Brassica compestris is **[RPMT 2002]**

(1) False septum
(2) Parietal placentation
(3) Ebracteate
(4) Imbricate aestivation

Q.56 Swollen placentae, oblique septum and conniving anthers are characteristics of family **[AMU 2002]**

(1) Brassicaceae (2) Asteraceae
(3) Poaceae (4) Solanaceae

Q.57 In fabaceae, one of the following immediately encloses the essential organs **[EAMCET 2002]**

(1) Anterrior petals (2) Posterior petal
(3) lateral petals (4) Sepals

Q.58 Which one of the following is oil seed **[AFMC 2003]**

(1) Marigold (2) Sunflower
(3) Rose (4) Hibiscus

Q.59 Plants which are used as green manure in crop fields and in sandy soil **[CBSE 2003]**

(1) Crotalaria juncea and Alhagi camelorum
(2) Calotropis procera and Phyllanthus niruri
(3) Saccharum munja and Lantana camara
(4) Dichanthium annulatum and Azolla nilotica

Q.60 Which of the following is correct with reference to flowers of family Solanaceae **[KCET 2003]**

(1) Pentamerous, actinomorphic, unisexual, hypogynous
(2) Pentamerous, zygomorphic, bisexual, epigynous
(3) Pentamerous, bisexual, actinomorphic, hypogynous
(4) Trimerous, actinomorphic, bisexual, hypogynous

Q.61 Bract of jower flower is called **[Wardha 2003]**

(1) Palea (2) Lemma
(3) Lodicule (4) Spikelet

Q.62 Flowers are exclusively bisexual in **[CMC 2003]**

(1) Cucurbits (2) Euphorbias
(3) Malvaceae (4) Asteraceae

Q.63 In Gramineae / Poaceae, the inflorescence is **[Orissa 2003]**

(1) Spikelet (2) Spadix
(3) Cyathium (4) Corymb

Q.64 Inflorescence of Compositae / Asteraceae is **[Orissa 2004]**

(1) Capitulum (2) Hypanthodium
(3) Umbel (4) Corymb

Q.65 Most diversified monocot family is **[Orissa 2004]**

(1) Liliaceae (2) Poaceae
(3) Orchidaceae (4) Palmae

Q.66 Green Gram is **[Orissa 2004]**

(1) Vigna radiata (2) Vigna mungo
(3) Phaseolus vulgaris (4) Phaseolus coccineus

Q.67 Oil found in Groundnut accumulates in **[JIPMER 2004]**

(1) Embryo (2) Cotyledons
(3) Endosperm (4) None of the above

Q.68 Trimerrous flower, superior ovary with axile placentation are characteristic of **[BHU 2005, 2008]**

(1) Liliaceae (2) Cucurbitaceae
(3) Solanaceae (4) Asteraceae

Q.69 Which of the following members of family solanaceae is rich in vitamin C? **[AFMC 2005]**

(1) Guava (2) Gooseberry
(3) Strawberry (4) Tomato

Q.70 Identify the family containing mustard and its main characteristics **[AIIMS 2005]**

(1) Brassicaceae – Pentamerous flowers, many stamens, pentacarpellary gynoecium, capsule fruit
(2) Solanaceae – Pentamerous flowers, five stamens, bicarpellary gynoecium, berry fruit
(3) Brassicaceae – Tetramerous flowers, six stamens, bicarpellary gynoecium, siliqua fruit
(4) Poaceae – Trimerous flowers, three stamens, monocarpellary gynoecium, caryopsis fruit

Q.71 Three crops that contribute maximum to global food production are **[CBSE 2005]**
(1) Wheat, Rice and Maize
(2) Wheat, Rice and Barley
(3) Wheat, Maize and Sorghum
(4) Rice, Maize and Sorghum

Q.72 Which is not the characteristic feature of fabaceae? **[Kerala 2005]**
(1) Taproot system, compound leaves, raceme inflorescence
(2) Flowers actinomorphic, aestivation twisted and gamopetalous
(3) Stamens 10, introrse, basifixed, bithecous
(4) Monocarpellary, ovary superior and bent stigma
(5) Fruit is legume

Q.73 Match the columns and find out correct combination **[Kerala 2005]**

Column I	**Column II**
(A) Hibiscus rosa – sinensis	(p) Poaceae
(B) Oryza sativa	(q) Malvaceae
(C) Tridax procumbans	(r) Fabaceae
(D) Crotalaria juncea	(s) Liliaceae
(E) Gloriosa superba	(t)Asteraceae

(1) (A)–(q),(B)–(t),(C)–(p),(D)–(s),(E)–(r)
(2) (A)–(t),(B)–(p),(C)–(s),(D)–(q),(E)–(r)
(3) (A)–(r),(B)–(s),(C)–(p),(D)–(t),(E)–(q)
(4) (A)–(s),(B)–(p),(C)–(q),(D)–(t),(E)–(r)

Q.74 Which is absent in Asteraceae? **[Kerala 2005]**
(1) Cypsela fruit
(2) Capitulum inflorescence
(3) Hypogynous flowers
(4) Syngenecious anthers
(5) Pappus calyx

Q.75 Match the columns : **[EAMCET 2005]**

Column I	**Column II**
(1) Solanaceae	(i) Launaea
(2) Malvaceae	(ii) Pongamia
(3) Fabaceae	(iii) Petunia
(4) Asteraceae	(iv) Withania
	(v) Thespepsia

(1) (1)–(iii),(2)–(iv),(3)–(i),(4)–(ii)
(2) (1)–(ii),(2)–(v),(3)–(i),(4)–(iv)
(3) (1)–(iv),(2)–(v),(3)–(ii),(4)–(i)
(4) (1)–(v),(2)–(ii),(3)–(iii),(4)–(iv)

Q.76 In solanaceae the fruit is **[CPMT 2005]**
(1) Drupe (2) Berry or Capsule
(3) Siliqua (4) Pod or achene

Q.77 Perianth occurs in family **[RPMT 2005]**
(1) Solanaceae (2) Fabaceae
(3) Brassicaceae (4) Liliaceae

Q.78 Plant used both as packing material as well excellent fodder is **[AMU 2005]**
(1) Medicago (2) Crotalaria
(3) Pongamia (4) All the above

Q.79 What type of placentation is seen in Sweeet Pea? **[CBSE 2006]**
(1) Marginal (2) Basal
(3) Axile (4) Free central

Q.80 Pentamerous actinomorphic flowers, bicarpellary ovary with oblique septum and a fruit of capsule or berry, belong to family [**CBSE 2006]**
(1) Liliaceae (2) Asteraceae
(3) Brassicaceae (4) Solanaceae

Q.81 Aloe used in medicine belongs to family **[Bih. PMT 2006]**
(1) Solanaceae (2) Liliaceae
(3) Asteraceae (4) Malvaceae

Q.82 Soyabeen belongs to **[Orissa 2006]**
(1) Fabaceae (2) Poaceae
(3) Solanaceae (4) Asteraceae

Q.83 Name the most advanced family of monocots **[Orissa 2006]**
(1) Arecaceae (2) Orchidaceae
(3) Poaceae (4) None of the above

Q.84 Leguminous plant used for prevention of Parkinson's syndrome is **[Orissa 2006]**
(1) Acacia catechu (2) Acacia arabica
(3) Abrus precatorius (4) Arabidopsis

Q.85 Which is not a feature of fabaceae **[Kerala 2007]**
(1) Corolla 5, polypetalous, anteriorlarge and outermost
(2) Descending imbricate, 10 stamens, diadelphous, ovary superior
(3) Sepals 5, gamosopalous, imbricate aestivation, placentation marginal
(4) Monocarpelley, ovary sperior, style long, slightly bent at the apex
(5) Zygomorphic flowers, diadelphous stamens, many ovules

Q.86 Select the wrong statement **[Kerala 2007]**
(1) Persistent calyx in Solanaceae
(2) Flowers are hypogynous in Asteraceae
(3) Santonin are obtained from Artemesia
(4) In Poaceae, perianth is represented by lodicules
(5) Parietal placentation occurs in Brassicaceae

Q.87 Most of economically important fibre yielding plants belong to family **[CPMT 2007]**
(1) Cruciferae (2) Poacece
(3) Solanaceae (4) Malvaceae

Q.88 The floral characters of liliaceae are **[Kerala 2008]**
(1) Six tepals, zygomorphic, six stamens, bilocular ovary, axile placentation
(2) Tetramerous, actinomorphic, polyphyllous, unilocular ovary, axile placentation
(3) Trimerous, actinomorphic, polyandrous, superior ovary, axile placentation
(4) Bisexual, zygomorphic, gamophyllous, inferior ovary, marginal placentation
(5) Unisexual, actinomorphic, trilocular, inferior ovary, axile placentation

Q.89 Which one is not characteristic feature of Asteraceae **[Kerala 2008]**
(a) Cypsela fruit
(b) Syngenesious stamens
(c) Ovary bicarpellary superior
(d) Plancentation marginal
(e) Head type inflorescence
(1) a, b only (2) c and e only
(3) e only (4) c and d only
(5) b, c and d only

Q.90 Match the columns **[Kerala 2008]**

Column I	**Column II**
(a) Artemesia species	(1) Insecticide
(b) Solidago species	(2) Santonin
(c) Eclipta alba	(3) Dropsy
(d) Chrysanthermum roseus	(4) Tonic in spleen enlargement

(1) a – 2, b – 3, c – 4, d – 1
(2) a – 1, b – 2, c – 3, d – 4
(3) a – 3, b – 4, c – 2, d – 1
(4) a – 4, b – 3, c – 2, d – 1
(5) a – 3, b – 1, c – 4, d – 2

Q.91 In floral formula, (K) denotes **[WB 2008]**
(1) Polysepalous (2) Gamosepalous
(3) Polypetalous (4) Gamopetalous

Q.92 Sorghum and Cotton are respectively useful for **[EAMCET 2008]**
(a) Blood purification and organic fertillzer
(b) Animal food and paper industry
(c) B vitamin and cosmetics
(d) Explosives and organic fertilizer
(1) a, b (2) c, d
(3) b, c (4) b, d

Q.93 Match the column **[EAMCET 2008]**

Colunm I	**Colunm II**
(a) Arachis	(1) Swollen placenta
(b) Cihorium	(2) Epicalyx
(c) Lilium tuberous root	(3) Fasciculate
(d) Physatis	(4) Geocarpy
	(5) Bulbils

(1) a – 4, b – 3, c – 2, d – 5
(2) a – 4, b – 1, c – 2, d – 3
(3) a – 5, b – 4, c – 3, d – 1
(4) a – 4, b – 3, c – 5, d – 1

Q.94 Major crop of Asia is **[BHU 2008]**
(1) Jower (2) Millet
(3) Rice (4) Sugarcane

Q.95 Bicarpelley syncarpous ovary with axile placentation is found in **[JKCMEE 2008]**
(1) Solanaceae (2) Asteraceae
(3) Malvaceae (4) Caesalpiniaceae

Q.96 Sunflower belongs to family **[DPMT 2009]**
(1) Liliaceae (2) Cruciferae
(3) Fabaceae (4) Asteraceae

Q.97 Brinjal, Potato, Tomato, Onion, Ginger belong to **[Orissa 2009]**
(1) A single family (2) Four genera
(3) Five genera (4) Same genus

Q.98 A member of lilaceae is **[AMU 2009]**
(1) Lupin (2) Petunia
(3) Tulip (4) Soyabean

Q.99 The characteristics of Poaceae are **[Kerala 2009]**

(1) Pedicellate, bracteate, bisexual, tetramerous, actinomorphic, complete and superior ovary

(2) Pedicellate, bracteate, bisexual, pentamerous, zygomorphic, complete and superior ovary

(3) Sessile, bracteate, bracteolate, incomplete uni- or bisexual, perianth modified into lodicules, stamens three, syncarpous, superior ovary and feathery stigma

(4) Bracteate, bracteolate, bisexual, pentamerous, actinomorphic, complete and superior ovary

(5) Bracteate, unisexual, actinomorphic, stamens five, inferior ovary.

Q.100 Which ones are not applicable to family solanaceae **[Kerala 2009]**

(a) Epipetalous and syngenesious

(b) Bicarpellary and syncarpous ovary

(c) Oblique ovary with axile placentation

(d) Stamens six, arranged in two whorls

(e) Bicarpelley, syncarpous and inferior ovary

(1) b and c only (2) a, d, e only

(3) a and c only (4) b, d, e only

(5) c, d, e only

Q.101 Scientific name of Sunn Hemp is **[Kerala 2009]**

(1) Crotalaria juncea (2) Erythrina indica

(3) Arachis hypogea (4) Glycine max

(5) Dalbergia sisso

Q.102 Match the column **[Kerala 2009]**

Column I	**Column II**
1. Artemesia	(a) Fibre
2. Astragalus	(b) Insecticide
3. Phormium	(c) Rat poison
4. Chrysanthemum	(d) Medicine
5. Withania	(e) Vermifuge
	(f) Gum

(1) 1 – d, 2 – c, 3 – f, 4 – b, 5 – e

(2) 1 – b, 2 – e, 3 – d, 4 – c, 5 – a

(3) 1 – c, 2 – e, 3 – a, 4 – f, 5 – d

(4) 1 – e, 2 – f, 3 – a, 4 – b, 5 – d

(5) 1 – f, 2 – e, 3 – a, 4 – b, 5 – d

Q.103 Floral formula $\oplus$ $K_{(5)}$ $\underline{G}_{(2)}$ is that of **[CBSE 2009]**

(1) Soyabean (2) Tobacco

(3) Tulip (4) Sunn Hemp

Q.104 A plant with actinomorphic and hypogynous flowers, heterochlamydeous perianth dorsified and extrose anthers dehiscing transversely belongs to **[EAMCET 2009]**

(1) Coronariae (2) Thalamiflorae

(3) Bicarpellatae (4) Calyciflorae.

Q.105 Zygomorphic condition is represented as **[CPMT 2009]**

(1) $\oplus$ (2) %

(3) P (4) G

Q.106 Lady's Finger / Okra belongs to family **[CPMT 2009]**

(1) Malvaceae (2) Liliaceae

(3) Brassicaceae (4) Cucurbitaceae

Q.107 Cotton fibre is obtained from **[CPMT 2010]**

(1) Seed coat (2) Stem

(3) Leaves (4) Root

Q.108 Colchicine is obtained from Colchicum autumanle. It belongs to family **[CPMT 2010]**

(1) Liliaceae (2) Solanaceae

(3) Leguminoceae (4) Poaceae

Q.109 Petunia, Datura and Nicotiana belong to family **[CPMT 2010]**

(1) Leguminoceae (2) Poaceae

(3) Solanaceae (4) Liliaceae

Q.110 Which of the following is not correctly paired **[AMU 2010)]**

(1) Fabaceae – Legume family

(2) Liliaceae – Sunflower family

(3) Solanaceae – Potato family

(4) Brassicaeae – Mustard family

Q.111 Select the correct match from the following **[Orissa 2010]**

(1) Malvaceae – Legume family

(2) Liliaceae – Sunflower family

(3) Caesalpiniaceae – Catechu

(4) Solanaceae – Potato family

Q.112 Which family is characteristic representative of monocotyledonous plants? **[HPPMT 2010]**

(1) Liliaceae (2) Solanaceae

(3) Fabaceae (4) Brassicaceae

Q.113 Consider the following four statements a, b, c and d and select the right option for two correct statements. **[CBSE Main 2010]**

(a) In vexillary aestivation, the large posterior petal is called standard, two lateral wings and two samll anterior keel.

(b) Floral formula of liliaceae is $\oplus\ P_{3+3}\ A_{3}\ +3\ \underline{G_{(3)}}$

(c) In Pea flower the stanens are monadelphous

(d) Floral formula of solanaceae is $\oplus\ K_{(5)}\ C_{(3)}\ A_{(4)}\ \underline{G_{(2)}}$

Correct statements are.

(1) a and c (2) a and b

(3) b and c (4) c and d

Q.113	**2**												

Q.1 'Genera Plantarum' was written by
(1) Hutchinson (2) Bessey
(3) Bentham and Hooker
(4) Eichler

Q.2 In phylogenetic classification, the groups are arranged
(1) Following the evolutionary trends
(2) According to floral similarities
(3) According to their morphological characters
(4) According to their complexities

Q.3 "Ordines Anomali" of Bentham and Hooker includes
(1) Seed plants showing abnormal forms of growth and development
(2) Plants described only in fossil state
(3) Plants described in the literature but which Bentham and Hooker did not see in original
(4) A few orders which could not be placed satisfactorily in the classification

Q.4 Megasporophyll of Cyeas has the same nature as
(1) Stamen (2) Petal
(3) Sepal (4) Carpel

Q.5 Parkinsonia is a good example of
(1) Winged fruit (2) Phyllode
(3) Parachute mechanism
(4) Phylloclade

Q.6 Inflorescence, which begins as a dichasial cyme and ends in a monochasial cyme, is called
(1) Cyathium (2) Biparous
(3) Verticillaster (4) Thyrsus

Q.7 Velamen is found in
(1) Viseum (2) Vanda
(3) Santalum (4) Rosa

Q.8 The 3 sub-families of leguminosae are distinguished mainly on the basis of
(1) Nature and habit of the plants
(2) Nature of gynoecium
(3) Nature of fruit and its germination
(4) Inflorescence and flower characters

Q.9 In Gloriosa, the tendrillar part is formed by
(1) Leaf petiole (2) Stipule
(3) Axillary bud (4) Leaf apex

Q.10 When ovules are developed from the inner wall of the unilocular ovary, the placentation is called
(1) Marginal (2) Parietal
(3) Superficial (4) Basal

Q.11 Which of the following is the largest and edible bud?
(1) Cabbage (2) Onion
(3) Cauliflower (4) Agave

Q.12 An insectivorous plant having glandular structures on its leaf, secreting stickly fluid is
(1) Sundew plant (2) Aldrovanda
(3) Venus fly trap (4) All of these

Q.13 The plants in desert, in order to tolerate water stress, have
(1) Stipular spines
(2) No stomata
(3) Stems which are converted into leaf type
(4) Long root system reach the water level

Q.14 Potato is included in Solanaceae family because
(1) It is epipetalous
(2) It is pentamerous
(3) Ovary is slightly diverted from its position
(4) All of these

Q.15 The part of cauliflower that we eat is
(1) Stem (2) Leaf
(3) Flower (4) Inflorescence

Q.16 A plant has a butterfly shaped flower with one standard, two wing like and two keel petals. The plant belongs to the family
(1) Papilionaceae (2) Compositae
(3) Malvaceae (4) Rubiaceae

Q.17 Velamen is a specialtzed tissue found in
(1) Aerial roots of Orchids
(2) Succulent leaves
(3) Pneumatophores (4) Stilt roots

Q.18 Which floral family has (9) + 1 arrangement of anthers in the androecium?
(1) Malvaceae (2) Rutaceae
(3) Fabaceae (4) Caesalpiniaceae

Q.19 Clove is a part of
(1) Flower (2) Thalamus of a flower
(3) Axillary bud (4) Seed

Q.20 Coconut's Husk fibre i.e. coir of commerce is extracted from
(1) Epicarp (2) Mesocarp
(3) Endocarp (4) Seed coat

Q.21 When the filament runs along the back of anther, it is called
(1) Adnate (2) Longitudinal
(3) Versatile (4) Syngenesious

Q.22 The family containing mustard is and its main characters are
(1) Brassicaceae - Tetramerous flowers, six stamens, bicarpellary gynoecium, siliqua type fruit
(2) Brassicaceae - Pentamerous flowers, many stamens, pentacarpellary gynoecium, capsule type fruit
(3) Solanaceae - Pentamerous flowers, five stamens, bicarpellary gynoecium, berry type fruit
(4) Poaceae - Trimerous flowers, three stamens, monocarpellary gynoecium, caryopsis type of fruit

Instructions : In the following questions (23 to 25), a statement of assertion (A) is followed by a statement of reason (R).

(1) If both Assertion & Reason are true and the reason is the correct explanation of the assertion, then mark (1).

(2) If both Assertion & Reason are true but the reason is not the correct explanation of the assertion, then mark (2).

(3) If Assertion is true statement bblt Reason is false, then mark (3).

(4) If both Assertion and Reason are false statements, then mark (4).

Q.23 **A :** Systematics is the branch of biology that deals with classificatio,n of living organism.
R : The aim of classification is to group the organisms in an orderly manner.

Q.24 **A :** The two cotyledons in the seed are the embryonic leaves.
R : The embryo contains radicle and plumule.

Q.25 **A :** Ginger has a prostrate rhizome.
R : Shoot growth is not effected by gravity.

Q.26 **A :** Compositae is the largest family of angiosperm.
R : The fruit of this family is cypsella.

Q.27 **A :** The fruit of cucurbitaceae are bitter in teste.
R : It is due to presence of tetracyclic triterpens Cucerbitacine.

Q.28 **A :** Colchicine is known as mitotic poision.
R : Colchicine is obtained from liliaceae.

Q.29 **A :** Glumes are found in the infloroscence of graminae.
R : Glumes are the modification of bracts.

Q.30 **A :** Ringing experiment can not be performed in members of cucurbitaceae.
R : The vascular bundles are bicolateral.

Q.31 **A :** Synandrous stamens are found in cucurbitanceae.
R : Stamens are fused through out their length.

Q.32 **A :** Tetradynamous stamens are found in cruciferae.
R : The outer four stamens are longers and inner two are smaller.

Q.33 **A :** Ratti is known as jweller's weight.
R : It is related with leguminoceae.

Q.34 **A :** Epicalyx are related to cruciferae.
R : These are the modification of stamens.

Q.35 **A :** Sterile stamens are found in mimosoidae.
R : Amaltas is the member of mimosoidae.

Q.36 **A :** Cruciferae is named on the basis of there corolla.
R : 4 petals are arranged in cruciferae manner.

Q.37 **A :** Versatile stamens are the characterstic feature of graminae.
R : In grases, versatile anther is the characterstic of anemophilous flowers.

Q.38 **A :** Axile placentation is found in liliaceae.
R : Incomplete flowers are found in liliaceae.

Q.39 **A :** Leguminoceae is classified into three sub familes on th basis of corolla and androdcium.
R : Monoadelphous stamens are found in paplionatae.

Q.40 **A :** Butea monosperma is known as 'flame of the forest'.
R : Dark red colour fruits are found in Butea monosperma.

Q.41 **A :** Allium sativum (Garlic) is beneficial edible material for heart patient.
R : The essential oil of Garlic reduces the amount of cholestrol in blood.

Q.42 **A :** Caryopsis is the characterstic fruit of graminae.
R : Legumes are the chief source of food in the world.

Q.43 **A :** Oblique ovary is found in solanaceae.
R : Oblique ovary in solanaceae is due to rotation of posterior towards right side and antirial carpal towares left side.

Q.44 **A :** Pulses are the goods source of protein.
R : It is due to presence of root nodules in pulses.

Q.45 **A :** Graminae is the largest family of Indian flora.
R : Most of the food is obtained from the members of graminae.

Q.46 **A :** Coriender is the member of Umbelliferae.
R : Umbel infloroscence is found in.

Q.47 **A :** The flower of candytuft is zygomorphic.
R : The anterior petal of candytuft are unequal.

Q.48 **A :** The flower of paplionatae are zygomorphic.
R : The petals are butterfly shaped and unequal.

Q.49 **A :** Syngenecious stamens are found in compositae.
R : Filament are free but anthers are united.

Q.50 **A :** Trimerous flowers are found in solaneceae.
R : All the floral parts are arranged in three whorals.

Q.51 **A :** Persistant style is the characterstic feature of anemophilous flower.
R : Persistant style is found in family graminae.

Q.52 **A :** The bracts of graminae are represented by awm shaped lemma.
R : Bractoles of graminae are represented by palea.

Q.53 **A :** The ovary of cruciferae is bilocular.
R : A true septum divides the ovary into two locules.

Q.54 **A :** Reduced parienth are known as lodecules.
R : Lodecules are found in member of graminae.

Q.55 **A :** The ovary of cucurbitaceae is unilocular but appear as trilocular.
R : Placenta are embedded into ovary appearing it as trilocular.

Q.56 **A :** The classification of Bentham and hooker is not phyolgenetic.
R : Bentham and Hooker could not explain the evolution theory of darvin.

Q.57 **A :** The generic and specific epithet are similar in tautonyms.
R : Tautonyms are not accepted in botanical nomenclature.

Q.58 **A :** Angiosperms are classified on the basic of floral characters.
R : Floral characters are more conservative than vegetative character.

Q.59 **A :** The venation of leaves the basis of the classification of angiosperms.
R : Reticulate venation is the characterstic feature of dicots.

Q.60 **A :** According to Bentham & Hooker, superior ovary is more advanced in polypetalae.
R : Inferior ovary is found in gamopetalae.

Q.61 **A :** Touch me not is the menber of mimosoidae.
R : Four stames are found in Touch me.

Q.62 **A :** Most of the plants of cucurbitaceae are monoecious.
R : Cucurbitaceae is the family of dicot.

Q.63 **A :** In didynamous the outer two stamens are large and inner to are small.
R : Six stamens are found in didynamous condition.

Q.64 **A :** The members of malvaceae and compositae are fiber and oil yielding.
R : The members of malvaceae and compositae are herbs.

Q.65 **A :** Head infloroscence is found in compositae.
R : Compositae is the family of dicot.

Q.66 **A :** Head is the most advanced infloroscence.
R : All the flowrs are so compact to each other that can be easily pollinated.

Q.67 **A :** Bentham and Hooker kept the gymnosperm in between monocot and dicot.
R : Gymnosperm is the most advaced family of dicot.

Q.68 **A :** Linnaeus classification is also known as sexual classification.
R : Linnaeus classification is based on the character of stamen.

Q.69 **A :** Royal Botanical Garden is the largest herbarium of the world.
R : It is classified on the basis of Bentham-Hooker system.

Q.70 **A :** Systematics involves classification of living organism.
R : The aim of classification is the systematics arrangement of organism.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	**Good / Important questions**
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

ANATOMY OF FLOWERING PLANTS

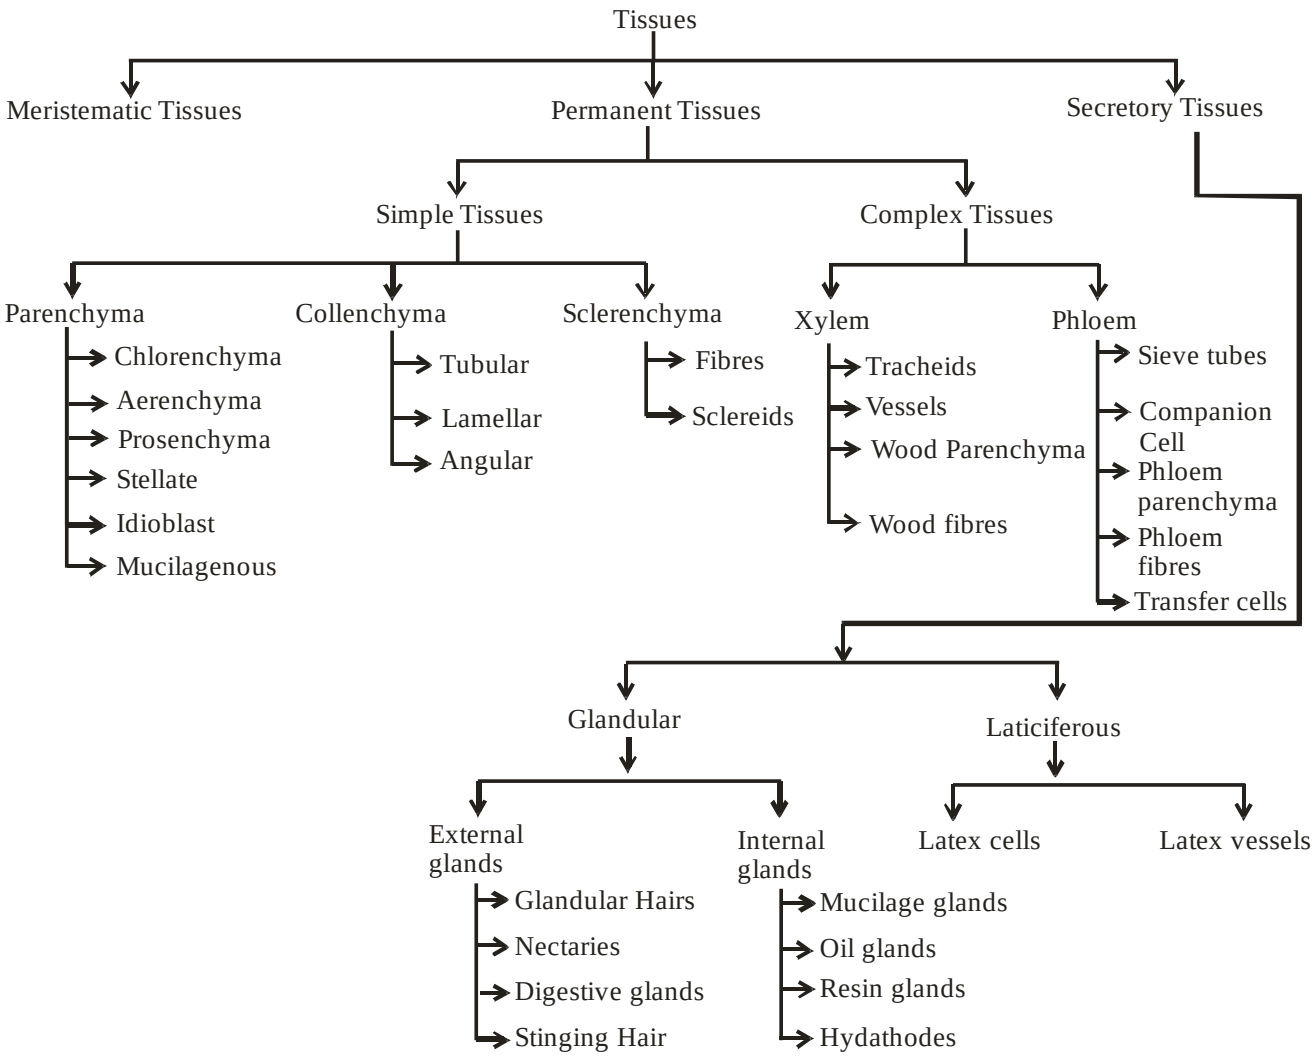
PRIMARY STRUCTURE OF PLANTS

PLANT ANATOMY

- It is the branch of Botany which deals with study of internal structures and organization of plants by the section cutting is called **Plant anatomy.**
- Anatomy is a Greek Word. Ana → asunder & temnein → to cut. Plant anatomy is also called as **Internal Morphology**.
- **N.Grew** is known as father of plant anatomy.
- **K.A. Chaudhary** is known as father of Indian plant Anatomy.
-

PLANT TISSUE

- An organized group of cells which is having similar or dissimilar in shape, having a common origin and usually performing a common function is called **tissue.**
- The term tissue was coined by **Nehemiah Grew.**



1. MERISTEMATIC TISSUE –

- Term given by Nageli.
- **Meristem :** Growth in plants is largely restricted to specialised regions of active cell division called meristerm./A meristem is a localized region in which actual cell division occurs.

A. Characteristics of meristematic tissues –

- It is an **undifferentiated tissue.**
- Cell cycle of meristem is in **continuous** state of division. It means they have the capacity to divide. So meristematic tissue is composed of **immature cells.**
- Meristematic cells have only primary cell wall which is thin and flexible (elastic) and made up of cellulose. Secondary cell wall is absent.
- Cells of meristem are small and isodiametric.
- They have **dense cytoplasm.**
- **Normally vacuoles are absent in meristematic cells but if present then small.**
- They have **prominent** and large nucleus.
- Meristematic cells are **metabolically** highly active so lack of reserve food occur in these cells.
- **Plastids** are **absent** in meristems. If they are present, then only in the **proplastid stage** ER is poorly developed.
- They do not have **intercellular** spaces. Cells are closely fitted (Packed) together. So it is a **compact tissue**.

B. Classification of meristematic tissue –

- **Meristematic tissue based on origin and development –**

  On the basis of origin and development meristems can be divided into following three types :

(i) Promeristem/Embryonic Meristem/Primordial Meristem :

- This meristem develops in begining during embryonic stage.
- They divide and give rise to primary meristem.

(ii) Primary meristem :

- Meristematic cell developed from promeristem are known as **primary meristem.**
- These cells are always in division phase and form primary permanent tissue.
- They are present below the promeristem at shoot and root apices, at the apex of leaves and in intercalary parts.

(iii) Secondary meristem :

- These are the meristems developed from primary permanent tissues. They are not present in the embryonic stage of the plant. These are present in mature region of root and stem of many plants particularly those that produce woody axis.
- Some of the cells of primary permanent tissues become meristematic and constitute secondary meristem.
- By the activity of secondary meristems, **secondary growth** takes place.
- Cork cambium, Interfascicular cambium & root cambium are excellent examples of secondary meristems.

  Note : Formation of meristem from any permanent tissue is called **dedifferentiation.**

  or

  Formation of undifferentiated tissue from differentiated tissues is called **dedifferentiation.**

- Promeristem $\longrightarrow$ Primary meristem $\longrightarrow$ Permanent tissue

  $\downarrow$

  Secondary meristem

- **Meristematic tissues based on location (position) in plant body –**
  On the basis of position, meristematic tissues are divided into three types :

(i) Apical Meristem :

- The meristems which occur at the tips of roots and shoots and produce primary tissues are called apical meristems. They are responsible for increase in the length of plant organs. Example : **Root apex, Shoot apex.** They are responsible for primary growth.

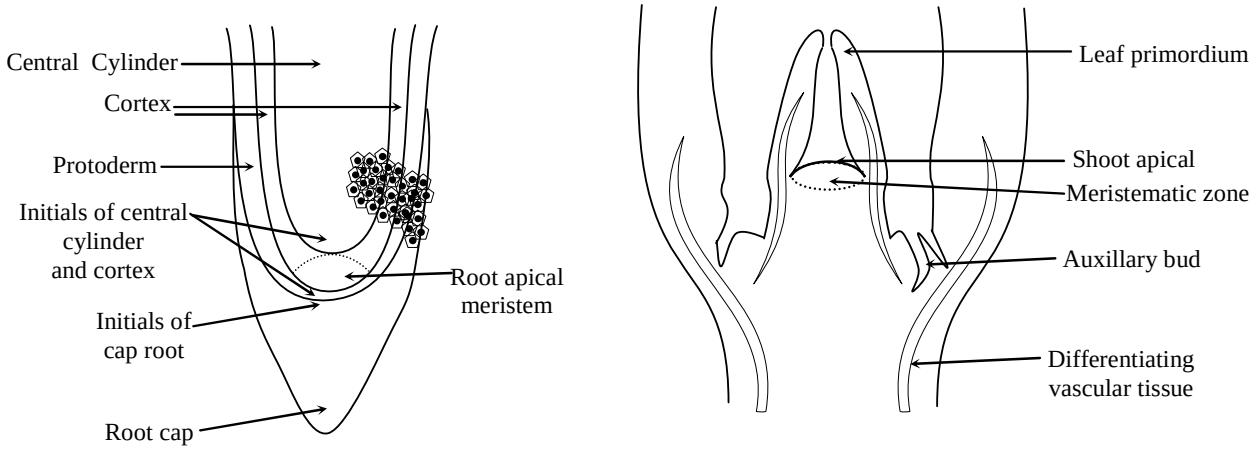


Fig.: Apical Meristem : (A) Root (B) Shoot

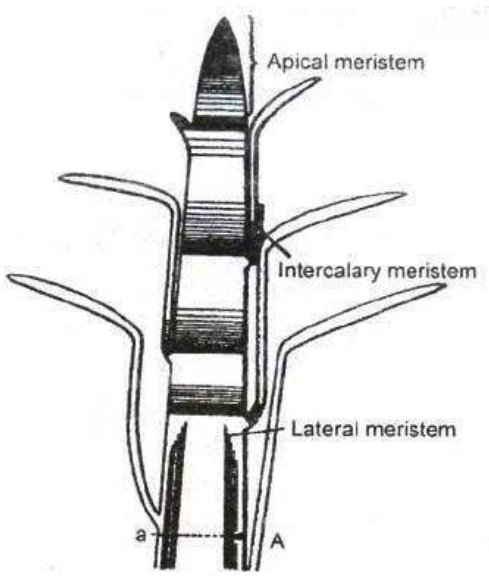
- Apical meristem has two regions at embryonic stage :
- **First – Promeristem** or **Primordial Meristem –** Which develops in embryonic stage.
  Second – Eumeristem – It is formed from the division of primordial meristem.

- During elongation of leaves and elongation of stem, some cells left behind, they form auxillary bud and from new branches.

(ii) Intercalary Meristem :

- The meristem which occurs between mature tissues.
- This is the separated region of apical meristem. This meristem is found between plant organs.
- By the activity of this meristem length of the plant organs increases.
- They are present in some plants stem.
- They may be present either at the base of internode e.g., grasses, bamboo and Equisetum etc. or at the base of node e.g., **Mint.** They are also present at the base of leaves e.g., **Pinus.** By the activity of this meristem, **length** of leaves increases. They are responsible for regeneration of parts removed by grazing herbivores in grasses.



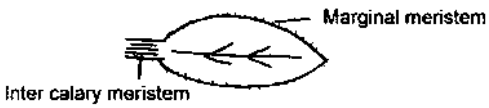
Note : They are short lived and convert into permanent tissue.

Both apical meristem & intercalary meristems are primary meristem because they appear early in the life of a plant and contribute to the formation of primary plant body.

(iii) Lateral Meristem :

- Lateral meristem occurs in **lateral side** of plant organs or parallel to the **longitudinal axis** (Tangential plane) of plant organs.
- Activity of lateral meristem increases the **girth of plant** organ, so it is **responsible** for **secondary growth.**
- Lateral meristems are both primary and secondary in origin **(mostly secondary in origin).** There are two examples of **primary lateral meristem.**

1. **Marginal meristem :-** It occurs at the margin of leaf. Its activity increases the **width** of leaf so total growth of leaf is called **intercalary marginal growth.**



2. **Intra fascicular cambium or fascicular cambium :-** This cambium occurs inside the vascular bundle of the stem. Except intra fascicular cambium all cambia are secondary in origin.

C. Classification based on plane of division –

(i) Rib-Meristem/File Meristem :

- Meristem in which anticlinal division occurs in **one plane**. For example, **tunica** is a type of rib-meristem. Formation of some cells of **cortex** and **pith** takes place by this meristem.

(ii) Plate-Meristem :

- Meristem which divides anticlinally into **two plane** at right angle to each other. By this division a plate like structure is formed. Formation of leaf blade takes place by the activity of this meristem.

(iii) Mass-Meristem :

- Meristem which divides in **all possible planes** resulting in the increase in the volume of plant body (organ). **Example :** The formation of embryo and endosperm takes place by this kind of meristem.

On the basis of function –

(i) On the basis of function, **Haberlandt** divided meristem into three group.

(a) Protoderm :- It is the outer most layer of eumeristem. By the activity of protoderm **epidermal tissue system** is formed. It includes Epidermis, Root hair, Stem hair etc.

(b) Procambium : These cells are long and it gives rise to the **vascular tissue system.** It includes Xylem and phloem.

(c) Ground Meristem : The cells of this region are large, thin walled and **isodiametric. Ground tissue system** is formed by the acitivity of these cells. It includes hypodermis, cortex, endodermis, pericycle, pith-rays and pith.

(ii) Apical shoot meristem is terminal in position while root apical meristem is sub terminal in position.

D. Composition of apical meristem in different plants –

- **Apical meristem** is **absent** in lower **Algae** and **Fungi.** All the cells of these plants are divisible, So they do not show apical growth. Thus such type of growth in these plants is called diffused growth.
- Apical meristem in higher algae (eg., *Fucus, Dictyota & Sargassum*), Bryophytes and Some Pteridophytes (eg., *Selaginella*) is consist of **single cell.** This cell is known as **apical cell.**
- Apical meristem in **Ferns, Gymnosperms** and **Angiosperms** consist of **many cells.**

2. THEORIES RELATED TO SHOOT AND ROOT APEX ORGANISATION –

A. Apical cell theory –

- This theory proposed by **Karl Nageli** and **Hofmeister** and supported by **wolff.**
- According to Nageli and Hofmeister, the apical meristem is composed of single apical cell. This view is only applicable on Bryophytes and some Pteridophytes and some higher algae (*Fucus, Dictyota* & *Sargassum*).

Fig.: Apical Cell

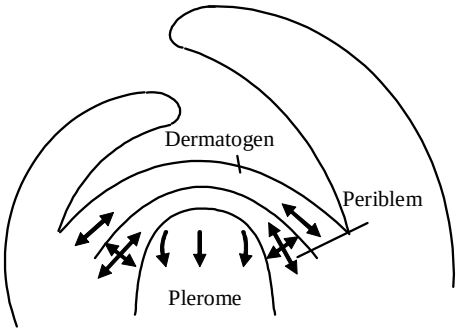
B. Histogen theory –

- It was proposed by **Hanstein (1870).** According to him, the root and shoot apices are distinguished into three meristematic regions or three layers of histogen cells. These are as follows-

(a) Dermatogen : This is the outermost single layer of cells. These cells form **uniseriate epidermis** by anticlinal division.

(b) Periblem : This region is situated just below the dermatogen. It forms cortex **(Hypodermis, General cortex** and **endodermis).**

(c) Plerome : This is the innermost region. Stele formation takes place by division of these cells. It means formation of **pericycle, vascular bundles, pith rays or medullary rays** and **pith.**



Organization of shoot apex proposed by Hanstein

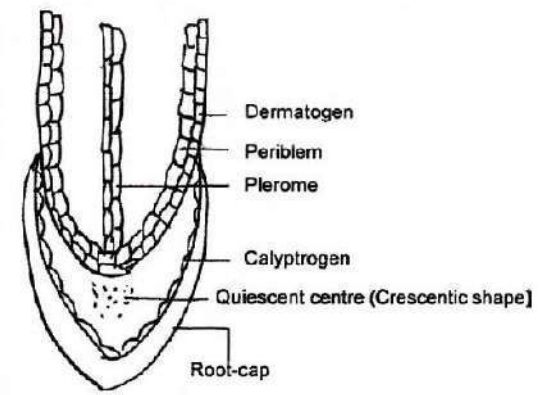
- This theory is only true for root apex. It is not applicable for shoot apex of higher plants because in most of the gymnosperms and angiosperms, shoot apex does not have distinct differentiation of three layers.
- Except above described three histogens, a fourth type of histogen is also present in **monocotyledon root apex.** This is known as **Calyptrogen.** Root cap is produced by Calyptrogen in monocots. Root cap is produced by dermatogen in dicotyledons.
  Exception : There is only **one histogen** present in **Ranunculus. Two** histogens occurs in **Casuarina.**
- Due to presence of root cap position of **root apex is sub terminal.** So maximum growth in root takes place **behind the apex.**

Note :

1. In hydrophytes root cap is absent.
2. Generally root cap is single layered but in ***Pandanus*** (Screw pine) root cap is multilayered.
3. Root cap contains large number of Golgibody which secrete mucilage which make the root slimy.

QUIESCENT CENTRE

- A group of inactive or less active cells present **between the dermatogen** and **calyptrogen** is called **quiescent centre.** These cells contain **less amount of DNA, light cytoplasm, small nuclei** and **synthesis of protein is also less.** Quiescent centre name coined by **"Clowes ".** Quiescent centre was discovered in **Maize root** with the help of **autoradiography.**
- If calyptrogen get damaged, this zone becomes active to form new cells of calyptrogen.
  Note : The quiescent centre in the root meristem serves as a reserve for replenishment of damaged cells of the meristem.



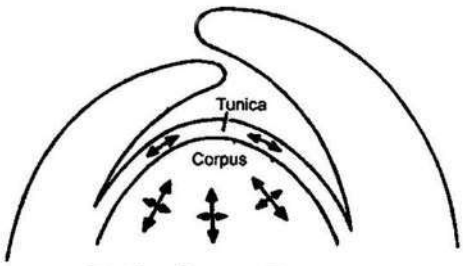
Histogen theory - Organization of root apex

C. Tunica corpus theory –

This theory was proposed by **Schmidt (1924).** This theory is **applicable on shoot apex.** According to this theory **two** types of layeres are found in the shoot apex.

(a) Tunica :

- This is peripheral layer, **epidermis** is formed by this layer. In tunica cells, **anticlinal division** takes place only in one plane.
- Anticlinal division occurs at right angle to longitudinal axis (tangential plane) of cell.
- When division occurs in single anticlinal plane they do not increase the number of layers.
- Generally, tunica is **single** layered, but some times it is multilayered, then the outer most layer forms the epidermis and remaining layers form rest types of the tissue system with the association of corpus.



Tunica Corpus Theory
Organisation of shoot apex

(b) Corpus : The mass of cells present below the tunica is called **Corpus.** The cells of this zone divide in all direction (many planes) due to which, **volume** increases. The cell of corpus usually larger than the cells of tunica. It forms rest of the tissue system.

D. Korper-kappe theory –

- It was proposed by **Schuepp (1917).** According to this theory, the cells of central and peripheral part of the root apex exhibit differences in planes of cell divisions.
- In peripheral region each cell first divides transversely and there after the lower daughter cell divides longitudinally thus forming the shape of 'T'. Such divisions are called the Kappe divisions. In the central region T is inverted (⊥) as the second division takes place in the upper daughter cell. Such divisions are called the Korper divisions. As a result of these 'T' or '⊥' divisions, the cells in root apex remain arranged in rows.
- Korper form the body of organism while Kappe form the covering or cap.
- By Kappe divisions, the number of row increases downwardly and by Korper divisions upwardly.

3. PERMANENT TISSUES

- Permanent tissues are composed of cells which have lost the power of division temporarily or permanently. They are formed by division and differentiation of meristematic tissues.
- They are present either in permanent G_0 stage or in arrested G_1 stage.
- Their cells may be **living** or **dead.**

4. SIMPLE TISSUES

- These tissues are **made up of similar type of cells** that perform a common function and have common origin. Simple tissues are of three types :-

  (A) Parenchyma (B) Collenchyma (C) Sclerenchyma

(A) Parenchyma :

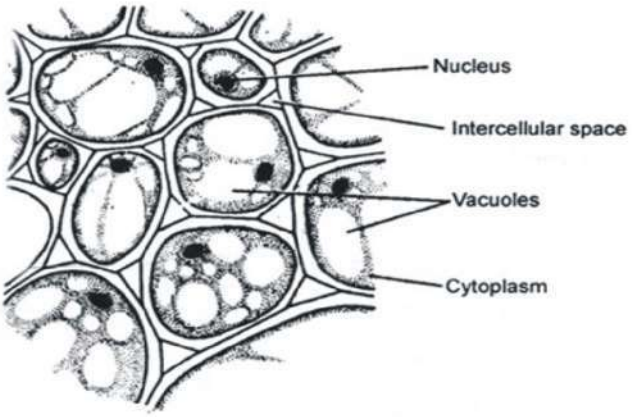
It is very primitive type of tissue. It is first evolved tissue. Remaining all different type of tissues are derived from this tissue. So it is also called as fundamental tissue.

Parenchyma name coined by **Grew.**

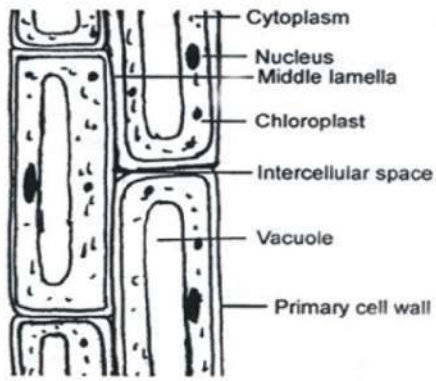
- **Characteristic Features :**

– It is a living tissue.

- Tissue first to be differentiated from meristem is parenchyma.
- It is a universal tissue and a major component of internal plant organs.
- Body of Bryophyte is mainly composed of parenchyma.
- All the cells of parenchyma are thin walled. Cell wall is made up of pectocellulose. **(Mainly cellulose).** So parenchyma is a soft tissue.
- Each cell containing large central vacuole.
- Inter cellular spaces are present between cells of this tissue, it is a loose tissue. Intercellular spaces are **schizogenous** in origin.
- The cells are **isodiametric.** Flesh of a fruit is mainly composed of parenchyma.



T.S. of Parenchyma



L.S. of Parenchyma

- **Shape :**

  The cells of parenchyma are spherical, oval or polygonal in shape. Each parenchymatous cell contains 14 planes of lateral line, which are maximum possible plane in a cell. These are known as **tetrakaidecahedron.**

- **Modification of Parenchyma :**

  (a) Prosenchyma : The cells of this parenchyma are long with pointed ends. This parenchyma forms the **Pericycle of roots.**

  (b) Aerenchyma : This parenchyma is made up of **rounded** cells. These cells surround the large **air chambers.** Air chambers are lysigenous in origin. It is found in cortex region. It provides **buoyancy** to **hydrophyte** plants.

  (c) Stellate parenchyma : The cells of this tissue are stellate and branched. Air spaces are also present but they are less developed. Main function of this parenchyma is to provide **mechanical support.**
  It is found in the leaf bases of **banana** and **canna.** It provides strength to leaf bases.

  (d) Chlorenchyma : Such type of parenchyma in which abundant quantity of chloroplasts are found. Two types of chlorenchyma are present in dorsiventral leaves :-

  (i) Palisade tissues :- Inter cellular spaces are absent. Their cells are tightly fitted together. They are present towards adaxial/ventral/upper side of leaf. Numbers of chloroplasts are more in palisade tissue as compare to spongy tissue. So upper surface of a leaf appears more green as compared to lower surface.

  (ii) Spongy tissues :- Large intercellular spaces are present. So they facilitate transpiration and gaseous exchange. They are present towards abaxial/dorsal/lower side of leaf.

  (e) Mucilage Parenchyma : In the mucilage parenchyma **large vacuoles** and Mucilage will be found. eg., Succulent xerophytic plants. e.g., ***Aloe.*** Function –storage of water.

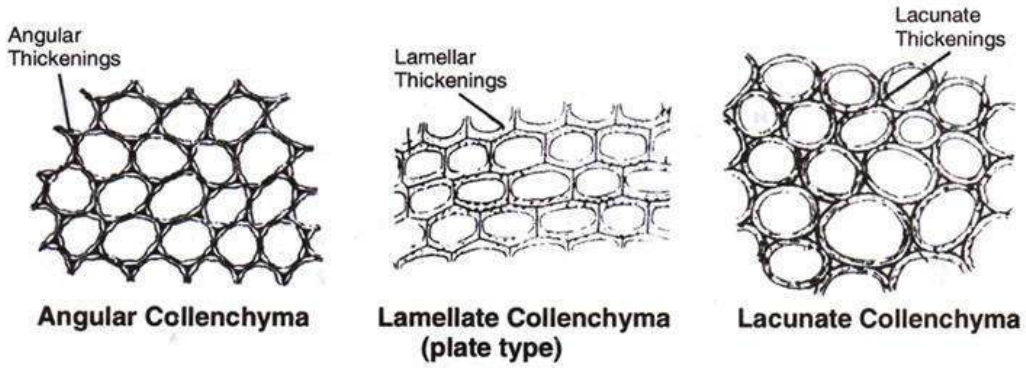
  (f) Idioblast : In this type of parenchyma non-living ergastic substances like tannins, oils, crystals etc. are present.

- **Functions of parenchyma :**
  The main function of this tissue is **storage of food.**

(B) Collenchyma : Term coined by **Schleiden.**

Main characteristics :

- Collenchyma is a **living mechanical tissue. Lignin is absent,** but simple pit **may be present**.
- It is made up of **elongated (oval, spherical or polygonal** shape in section) cells.
- **Localized** deposition of pectocellulose (mainly **pectin**) & hemi cellulose is the characteristics feature of collenchyma.
- **Vacuolated** cytoplasm is found in the cells of collenchyma. Intercellular spaces are not present.



- **Origin of collenchyma :-** Collenchyma originates from **ground meristem.**

Occurance :

- Collenchyma is **not a universal tissue.** It is found in the stems of **herbaceous dicotyledons.**
- Collenchyma is absent in parts of woody plant parts, root and monocotyledons.
- Collenchyma forms the **hypodermis** of **dicotyledon** stems.
- Collenchyma is absent in plants after the secondary growth because plant becomes woody.
- Chloroplast may be found in the cells of collenchyma.
- **Lamina margins** of leaves also bear collenchyma. This protects the cracking of lamina margin due to the action of wind.

- **Type of Collenchyma :**
  - On the basis of **place of deposition,** it is classify into three types by Majumdar :

  (1) Lamellar / plate collenchyma : The cells of collenchyma arranged in lamellar forms. The cell have thickening on the **tangential walls.** Due to such type of deposition, cell looks like a lamellar or plates. Ex. **Sunflower stem.**

  (2) Angular collenchyma : This type of collenchyma abundantly found in plants. The cells of this tissue are angular. The deposition of pectocellulose at the angle of cell. **eg.,** Stem of *Datura, Solanum* and Tomato.

  (3) Lacunar collenchyma/tubular collenchyma : Large intercellular spaces are present in the cells of this tissue. Deposition of pectocellulose on the wall of intercellular spaces. Intercellular spaces of collenchyma are thickened. e.g., *Cucurbita* stem and aerial roots of *Monstera*.

  Functions :

  - **Mechanical** as well as **Physiological.** They provide mechanical support to growing parts of plant such as young stem and petiole of leaf.
  - Due to the presence of chloroplast, it is also participates in the process of **photosynthesis.**

(C) Sclerenchyma : Name coined by **Mattenius.**

Main features :

- Sclerenchyma is the **main mechanical tissue.**
- These cells are long, narrow, thick walled and dead.

- Cell wall is **thick** and **lignified.**

Function : It provide mechanical support/mechanical strength to plants.

- Various types of pits are formed due to the deposition of **lignin on hard wall.**

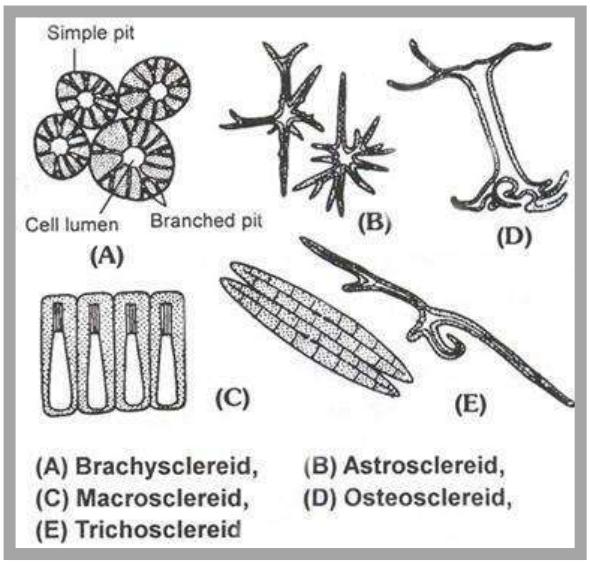
- **Type of sclerenchyma :**
  - On the basis of cells and quantity of deposition of wall materials, sclerenchyma cells are of **two types.**
    (i) Sclereids **(ii) Sclerenchymatous fibres**

(i) Sclereids : These cells are small, extremely thick walled and their ends are not pointed. Sclereids are isodiametric or **irregular** in shape. Sclereids cells have **more pits** and **lumen** is almost **very small.** There pit cavity is **branched.**

- Sclereids are classsify by **Tschierch,** on the basis of their shapes :

(a) Stone cells or Brachysclereids or Grit cells : These cells are spherical or oval in shape. They are found in endocarp of drupe fruits, so endocarp becomes hard.

- They are present in endocarp of **Coconut, Mango, Almond, and Walnut** etc.
- Brachysclereids are also present in **fleshy (edible) part of pear (*Pyrus*).**
- Brachysclereids are also found in pulp of guava and sapota.



(b) Trichosclereids : These are also known as **internal hairs.** They are spines like, bifurcated cells. These are found in **floating leaves.** Also present in aerial roots of monstera.

(c) Astro Sclereids or **Stellate sclerenchyma :** These cells are stellate (star) shaped. They are found in floating leaves.

Example : Both Astro and Tricho sclereids are present in floating leaves.

Victoria, *Nelumbo* (Lotus) and *Nymphaea* petiole.

Note : Astrosclereids are also found in tea leaves.

(d) Macro-sclereids or Rod cells or Malpighi cells :

- They are small and rod like cells. They are present in **seed coats.**

Example :

- They form part of seed coat in legume plants. Due to their presence seed coat becomes hard and dormancy is present in legume seeds.
- In **leguminous plants** hardest seed coat is found in **French bean.**
- In plant kingdom, hardest **Seed coat** is found in lotus.

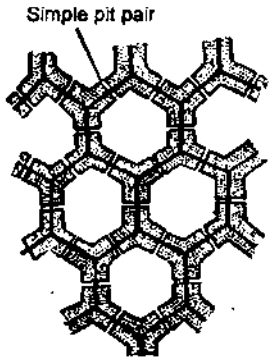
(e) Osteo-Sclereids or Bone cell :

- These are known as prop-cells. These are pillar like cells. Both end of pillar like cells spreads to form bone like structure.

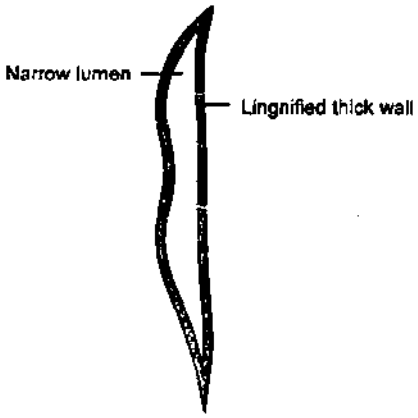
  Example : These cells are found in leaves of *Hakea* and *Osmanthus*.

(ii) Sclerenchymatous Fibres :

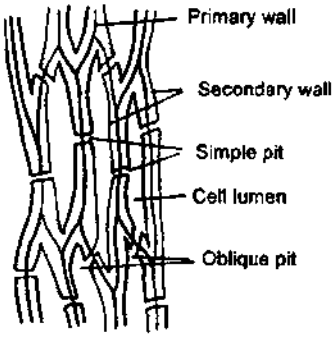
- These cells are fibrous. They are longest cells in plant body.Their both ends are pointed (tapering). Due to thick wall, lumen is reduced.
- Their cell wall contains simple and bordered pits.



T.S. of Sclerenchyma fibre



L.S. of Single Sc. fibre



L.S. of Sclerenchyma fibre

- On the basis of structure fibres are classified into two groups :

(a) Libriform fibres : They are highly thickened long fibres. They posses **simple pits** and narrow lumen. Libriform fibres are found in phloem, xylem, pericycle and hypodermis **(Maximum in phloem).**

(b) Fibre Tracheids : They are also highly thickened. **Bordered pits** are present in these fibres and lumen is broad. They are only found in **xylem.**

- On the basis of position, fibres are divided into three types :

A. Surface fibres : They are present on the surface of plant. These fibres also called as filling fibres.

(i) Seed surface fibres –

Example 1 : Cotton fibres : Cotton fibres are formed by the **out growth of seed coat.** They are not any type of tissue or cell.

Cotton fibres are composed of **cellulose** these fibres are **non-lignified.** So cotton fibres are **not true fibres.** Two types of fibres are found in cotton. Long fibres are called **'lint'** and small fibres are known as **'fuzz'.** Lint fibres are used in cloth industry. Fuzz are filling fibre. Cotton fibres are most pure form of cellulose in nature.

Cotton fibres are not an example of any type of cell because these fibres are formed by out growth of testa.

Example 2 : Red silk cotton (Semal fibre)- Obtained from ***Salmalia malabaricum.***

Example 3 : White silk cotton (Kapok) – Obtained from ***Ceiba pentendra.***

(Both red and white silk cotton fibres are not true fibres and they are also an example of seed surface fibre.)

(ii) Coir of coconut is also a type of surface fibre. They are derived from the **mesocarp.** These are **true fibres.**

B. Xylary or wood fibres : These are hard fibres. These fibres are not flexible. They can not be knitted (weaved) easily so they are not useful. These are found in xylem. Ex. Munj fibre (*Saccharum munja*)

C. Bast fibres / Extra xylary fibres / Phloem fibre : These are known as **commercial fibres.** These fibres are flexible and can be **knitted (weaved)** easily. They have great economic value.

- These fibres are obtained from the phloem and pericycle of plants.
- The bast fibres of *Corchorus capsularis* (Jute), *Crotalaria juncea* (Sunn hemp) and *Hibiscus sabdariffa* (patua) are obtained from the secondary phloem of stem.
- The bast fibres of hemp (*Cannabis sativa*) and *Linum usitatissimum* (flax) are obtained from the pericycle. Fibres which are obtained from pericycle are called perivascular fibres.

Leaf fibres ➡ Manila hemp (*Musa textilis*) and agave hemp (*Agave sislana*) : These are obtained from sclerenchymatous bundle sheath.

Special Points :

- Fibres are longest plant cell. Longest fibres occur in *Boehmeria nivea* (Ramie fibre) length -55 cm.
- In plant kingdom hardest seed coat is found in *Nelumbo* (Lotus).

- In plant kingdom largest leaves are found in *Victoria regia.*
- Longest leaves are found in *Raphia vinifera*. Length 10-15 m.
- Longest commercial fibres – Jute fibres.
- Living sclerenchymatous fibres are present in *Tamarix.*

5. COMPLEX PERMANENT TISSUES

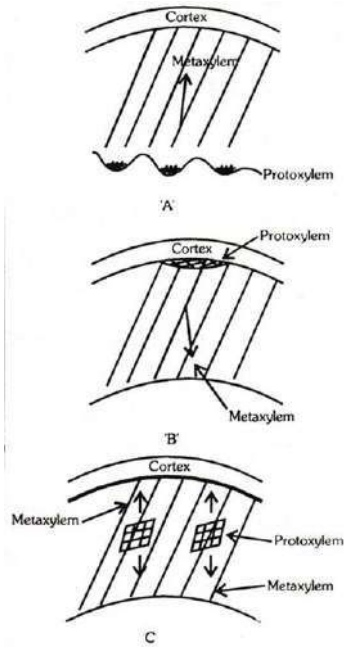
- The complex tissues are made up of more than one type of cells and these work as a unit. Complex tissue are heterogenous.
- Complex tissues are absent in gametophytes.
- During vascularisation in plants differentiation of procambium followed by the formation of primary phloem and primary xylem simultaneously.

- Complex tissues are of two types :

(A) Xylem **(B) Phloem**

A. Xylem :

- The term 'Xylem' is coined by **Nageli.** (Greek xyles–wood.)
- The function of xylem is to conduct water and mineral salts upwards form the root to stem and leaves and to give mechanical strength to the plant body.
- For conduction of water, death of protoplasm is must. Dead tissues are more develop in water scares condition.
- On the basis of **origin,** xylem is divided into **primary xylem** and **secondary xylem.**



I. Primary xylem : Originates form **procambium.**

- On the basis of development primary xylem divided into two parts :
  (a) Protoxylem **(b) Metaxylem**
- Cells of protoxylem are small as compare to metaxylem. Metaxylem is more mature than protoxylem.
- **Development of water conducting elements of Xylem :**
  It is of three types –

(i) Centrifugal : In this type of development, the protoxylem formed near the central axis and metaxylem is formed away from the centre it means towards the periphery. This condition is known as **endarch. Ex.-** Stem of Angiosperm and Gymnosperm.

(ii) Centripetal : In which protoxylem is formed away from the centre it means near the pericycle and metaxylem is formed toward the centre. This condition is called **exarch.** Ex. Roots.

(iii) Centrifugal and Centripetal : In which elements of metaxylem is formed from both side of the elements of protoxylem. In this type of development protoxylem is surrounded by metaxylem. This condition is known as **Mesarch.** Ex.-Fern rhizome.

II. Secondary xylem : Originates from vascular cambium.

- The elements of xylem are :

(a) Tracheids, (b) Vessels or tracheae, (c) Xylem fibres — Dead elements

&

(d) Xylem parenchyma — Living elements

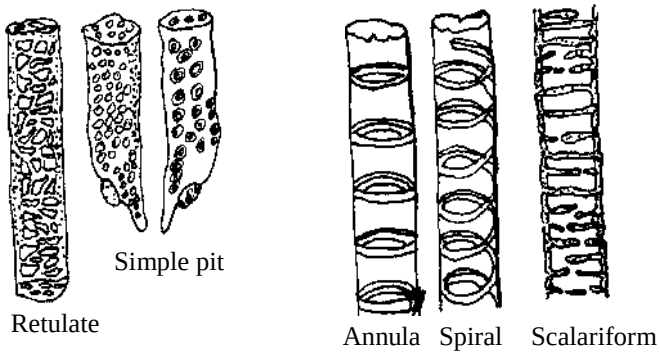
(a) Tracheids : Term was coined by **Sanio**.

- **Tracheids** are primitive **conducting elements** of xylem. They are present in all tracheophytes.
- **Tracheids** having a **narrow lumen**.

- Tracheids join together from **their ends** to form a **long row.** These rows extending form the root to leaves via stem.
- A **transverse septum** lies between each two tracheids. It bears **pits.** Water moves from one tracheid to another Tracheids through pits.
- Due to presence of transeverse septum lumen is discontinuous in tracheids.
- Tracheids are **dead** and **lignified** cells. The deposition of lignin on cell wall is responsible to form different type of thickenings. (Pits are nonlignified areas on lignified wall)

Note :

1. Usually broadered pits are present at end wall of tracheids.
2. The maximum bordered pits are found in the tracheids of Gymnosperm plants.
3. Maximum deposition of lignin is found in pitted type of thickening.
4. Annular and Spiral type of thickening of lignin is found in protoxylem.
5. Reticulate and Pitted (mainly) type of thickening of lignin is found in metaxylem.
6. In metaxylem tracheids of pteridophytes scalariform type of thickening is found.



Different lignified thickening in xylem (tracheids and vessels)

(b) Vessels :

- It is advance water conducting element of xylem. The basic structure of vessels is same as tracheids.
- The **lumen of vessels** is **wider** than tracheids and end wall is perforated **(Transverse septum** is absent between two vessel elements. If present then **porous.)** Thus vessles are more capable for conduction of water than tracheids. Due to presence of perforated end wall, vessels **work as a pipe line** during conduction of water.
- Vessels contain usually simple pits at their lateral wall. Thickening type of wall is the same as tracheids.

Note :

1. Vessels are only found in xylem of angiosperm but exceptionally it is also present in some Gymnosperms like *Ephedra, Gnetum* and *Welwitschia*.
2. Vessels are absent in some Angiospermic plants such as *Dracaena, Yucca, Dazinaria, Drimys.* There are some angiosperms families in which vesselless angiosperms are include. eg., Winteraceae, Tetracentronaceae and Trochodendronaceae.
3. Vessels are example of dead syncyte.
4. Tracheids are unicellular whereas vessels are multicellular.

➡ **Syncyte :** Cell which is formed by fusion of cells, called as syncyte.

(c) Xylem fibres :

- Xylem fibres **provides strength** to the tracheids and vessels. Mainly these fibres provide strength to the vessels.
- They are present **more abundant** in **secondary xylem.**

(d) Xylem Parenchyma :

- It's cell wall is made up of cellulose. It store starch, fats and tannin etc.

- The **radial conduction of water** is the function of xylem parenchyma. (It conducts water to peripheral part of plant organs).
- Their wall possesses pits.

Hadrom :

Tracheids and **Vessels** are **collectively** known as **water conducting elements** or **"Hadrom".** Hadrom term was proposed by **Haberlandt.**

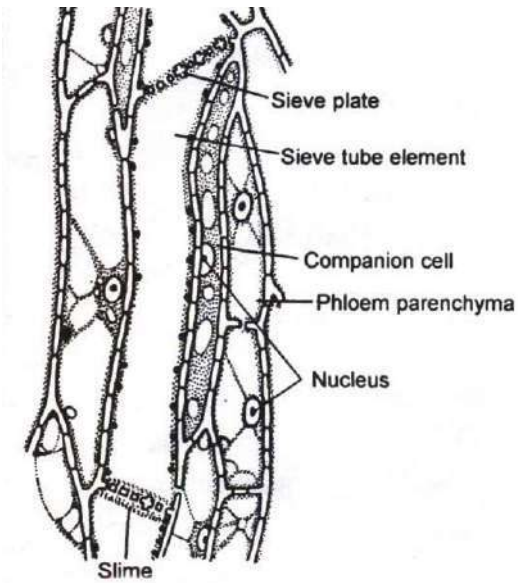
B. <u>Phloem</u> :

- The term **'Phloem'** is coined by **Nageli.**
- The main function of the phloem is to conduct food materials, usually from the leaf to other plant parts (eg., storage organ and growing regions.)
- On the basis of origin, phloem is classified into two categories primary and secondary phloem.
- Primary phloem originates from procambium and secondary phloem originates from vascular cambium.
- On the basis of development primary phloem categorised into protophloem and metaphloem.
- The protophloem has narrow sieve tubes whereas metaphloem has bigger sieve tubes.
- Phloem remains active for less duration as compared to xylem.
- Phloem consist of **4 types** of cells.

(a) Sieve cell (In Gymnosperms**)**

Or Sieve tube (In Angiosperms and pteridophytes**)**

- Sieve elements was discovered by **Hartig.**
- Sieve cell/sieve tube element are living and thin **walled.**
- Mature sieve tube elements are **enucleated** living cells.
- **Central vacuole** is present in each sieve cells/sieve tube element. Cytoplasm of sieve cells/sieve tube element show **cyclosis** in the form of thin layer around the vacuole.
- **In Angiosperm plants** sieve tube elements are arranged with their ends and form **sieve tube.**
- Sieve plate (oblique transverse perforated septa) is present between the two sieve tube elements. Materials are transported through these pores.
- **Callose** deposited on the radius of pores during **dropping season** (autumn) of leaves, to form a thick layer. This is called **Callus pad.**
- Sieve plate is protected by callus pad. It is also prevented from **bacterial infection** and drought.
- Callose dissolves during spring season by callase enzyme. Callose is a β-1-3 glucan.
- In Gymnosperms and pteridophytes sieve cells are arranged irregularly. Sieve cell have sieve plates on their lateral walls. Thus conduction of food takes place in zig-zag manner.
- In Angiosperms food conduction is erect and efficient.
- Sieve elements contain special type of protein **P-protein** (p-phloem)



L.S. of Phloem Tissue

Note :

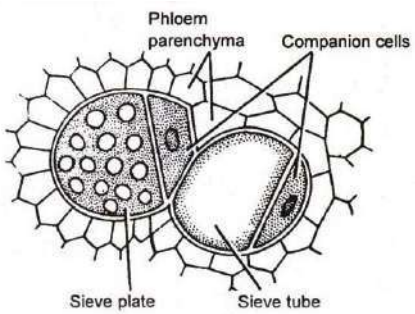
1. Food conduction is **bidirectional** in sieve tube.
2. Sieve tube is an example of living enucleated syncyte.
3. Most likely function of p-protein is sealing mechanism on wounding and it is also related with conduction of food.

(b) Companion cell :

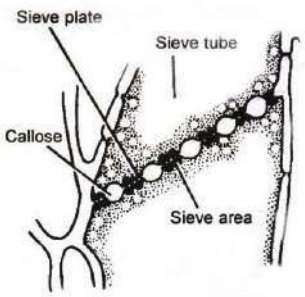
- These are **thin walled living cells.** The sieve tube elements and companion cells are connected by pits present in their longitudinal wall, which is common wall for both and with the death of one, other cell also dies.
- A companion cell is laterally associated with each sieve tube element in Angiospermic plant. (In carrot more than one)
- Sieve tube element and companion cell originates together. Both of them originates from **a single mother cell**. So called as **sister cells.**
- The companion cell and sieve tube elements maintain close **cytoplasmic connections** with each other. Companion cell maintain pressure gradient in sieve tube.
- Companion cells are only found in Angiosperms. (Exception – *Austrobaileya* is angiosperm plant but companion cell are absent).
- Special type of cells attached with the sieve cells in gymnosperm and pteridophytes in place of companion cells. These cells are called as albuminous cells/strassburger cell.

Note :

1. Albuminous cells in conifers are analogus to companion cells of angiosperms. They are modified phloem parenchyma cells.
2. The companion cells play an important role in the maintenance of a pressure gradient in the sieve tube.
3. In phloem of pteridophytes and gymnosperms, Sieve cells are present which are comparable to the tracheids.



T.S. of Phloem Tissue



L.S. of Sieve plate

(c) Phloem fibres :

- Fibres which are present in **phloem** are called bast fibres. These fibres are generally not found in primary phloem.
- These fibres provide mechanical support to the **conducting elements** (sieve cells and sieve tube.)

(d) Phloem Parenchyma :

- It is also known as bast parenchyma.
- It's cells are living and thin walled. It store various **material. eg.,** Resin, Latex, Mucilage etc.
- The main function of phloem parenchyma is **conduction of food in radial direction** and **storage of food.** The food conducting element of phloem is called **Leptom.**

Leptom includes < Sieve cell, Sieve tubes

- **Leptom** term was proposed by **Haberlandt.**

Note :

1. Phloem parenchyma is absent in the stems of monocotyledon plants.
2. Phloem parenchyma is absent in the stems of Ranunculaceae plants. (dicot family).
   e.g., *Thalictrum*.

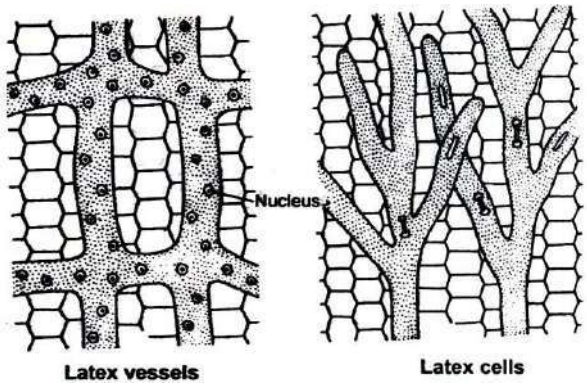
6. SPECIAL TISSUES OR SECRETORY TISSUE

- The cells of this tissue have secretory function. The substances get isolated from cytoplasm and get deposited or aggregated in vacuole of living cells, in dead cells or cavities and canals.
- These tissues are of two main types -

(A) Laticiferous tissues **(B) Glandular tissues**

A. Laticiferous tissue :

- These are made up of long, highly branched and thin walled cells. These cells are filled with milky juice, called as **Latex.**
- Latex is the mixture of saccharides, starch granules, alkaloids, minerals and waste materials.
- Starch granules present in latex are **dumble shaped.**



Function :

- Latex provide **protection** to the plant.
- It prevents the plants from infection of bacteria and fungus. In laticiferous tissue there are two types of cells-

(I) Latex vessels **(II) Latex cells**

(I) Latex vessels : These are **articulated** vassels. Latex vessels are formed due to dissolve of cell walls of meristematic cells. Thus these are syncyte, coenocytic cell (multinucleated).

Example : Latex vessels are present in *Hevea, Ficus, Papaver, Papaya, Argemone* and *Sonchus.*

⇒ Highly developed latex vessels are found in the fruit wall of unripe fruit (capsule) of Poppy.

- Opium is obtained from the latex of ***Papaver somniferum*.** It contains an alkaloid named as morphine.
- An enzyme **papain** is obtained from the latex of papaya **(*Carica papaya*).**
- Indian rubber is obtained from ***Ficus elastica*** and para rubber is obtain from ***Hevea brasiliensis.***
- Chewing gum is obtained from Latex of *Achras sapota.*

Mostly latex is white in colour but in some plants latex is coloured.

Ex. Papaver – Dark brown.

Argemone, Sonchus] Yellow colour

In some plants latex is colourless. **Ex. Banana.**

(II) Latex cells : These are **non articulated** latex ducts/tubes. These are long, branched and multinucleated cells **(coenocytic cells).**

Example – Latex cells are found in ***Calotropis, Euphorbia*** and ***Nerium*. M.Calvin** coined petroplant term for Latex producing plants.

Note : Latex vessels and latex cells are found in cortex.

B. Glandular tissue :

- As the name indicates that this tissue is made up of **glands.** These glands contain secretory or excretory materials.
- Glandular tissues have **two types** of glands :

(a) Unicellular. *Urtica-dioica.* These cell are present on the **surface of the leaves.** These are spiny glands in which **formic acid** is filled. It protects the plants from **grazing animals.** It is commonly known as **Bichchuvati.**

(b) Multicellular : Multicellular glands are of two types.

(i) External Glands : These are located **on the surface of the plants** and arising as an outgrowth from the epidermis. These glands are of various types :-

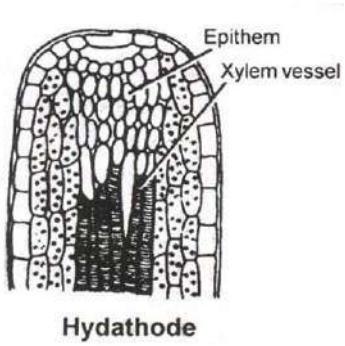
- **Glandular hairs :** They secrete gum-like sticky substance in **tobacco** and **Plumbago,** digestive juicy substance in **Drosera.**
- **Nectar Glands :** These glands secrete **sugar solution.** These are found in floral parts mainly in **thalamus.** Exeption → In **passiflora,** nectar glands are found in leaves.

(ii) Internal Glands : These glands are embedded in the tissues. Internal glands are of following types.

- **Digestive glands :** Digestive glands are found in **insectivorous plants.** These are found in ***Utricularia, Drosera, Dionea*** etc. They secrete proteolytic juice.
- **Mucous secreting glands :** These glands secretes mucous.These are found in the **leaves of betel.**
- **Oil glands :** These secretes **Volatile oil.** It acts as **antiseptic.** These glands are found in fruits and leaves of **lemon and orange.**

  Mostly , Oil glands are **lysigenous** but in sunflower these glands are **schizogenous.**

  Note : Oil glands which secrete volatile oil are called **osmophores.** Osmophores develop fragrance in flowers. Oils which are obtained from **Eucalyptus** leaves are used in medicines.



Hydathode

- Tennin, resin, gum secretory glands are also internal glands. Maximum resin glands are found in **Pinus.**

  Resin ducts are schizogenous. Gum glands are found in ***Acacia*.**
- **Water glands / Hydathode :** These glands are related with **guttation.** Hydathodes are present in **Tomato, Pistia** and **Eichhornia etc.**

TISSUE SYSTEM

In higher plants several tissues work together in form of a unit to perform a particular function. These tissues have the same origin. Such tissues form a system which is called **tissue system.** On the basis of **division of labour** tissue categorized by **Sachs** into three different system. Each system usually consist of an association of tissues which perform specific function-

1. Epidermal tissue system :

The epidermal tissue system forms the outermost covering of the plant body. It is made up of elongated compactly arranged cells which form a continuous layer. Epidermal cells are Parenchymatous cells.This system includes epidermis and its related structures. eg., Root hairs, trichomes, stomata and bulliform cells etc. It is developed from **protoderm.**

- The epidermis (Greek, Epi = upon ; Derma = skin) of most of plant organs is uniseriate, i.e. composed of single layer of epidermal cells but in some cases it may be multilayered e.g., *Ficus , Nerium, Peperomia.*
- Each cell has a large central vacuole & peripheral thin cytoplasm. They may contain chloroplasts, anthocyanin pigments, tannins, oils and crystals etc.
- Some members of gramineae and cyperaceae possess two types of epidermal cells - the long cells and the short cells. The short cell may be cork cell or silica cells.

Stomata :

Stomata are minute apertures in the epidermis. Each aperture is bounded by two kidney/bean shaped cells, called as **guard cells**. Dumbell shaped guard cell are present in grasses.

- Guard cell contains chloroplasts. Inner wall of guard cell is thickened.
- There are different numbers of cells of variable size in the epidermis around the guard cells. These are called as subsidiary cells.
- Stomata are absent in roots, underground parts and submerged hydrophytes.

- The function of stomata is exchange of gases and control of transpiration.

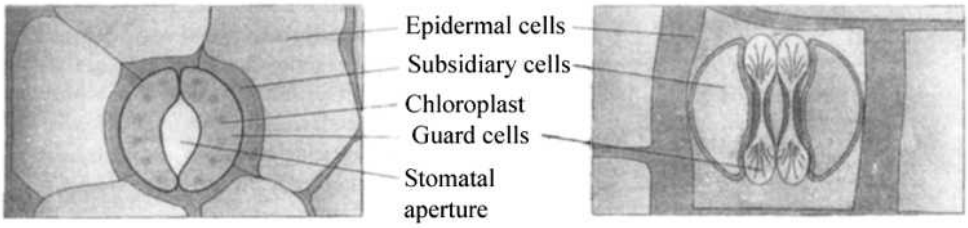


Fig.: Diagrammatic representation : (a) Stomata with bean-shaped guard cells. (b) Stomata with dumb-bell shaped guard cell.

Trichomes :

The cells of the epidermis give rise to a number of protuberances which vary markedly in their shape, structure and function. These are known as **trichomes.** These appendages can be unicellular or multicellular. The unicellular trichomes are usually simple, unbranched (sometimes also branched) and elongated structures. On the other hand, the multicellular trichomes and glands are made up of several layers of cells.

Note : In shoot system, **trichomes are usually multicellular.** Stem hair are not present on monocot stem.

Function : The trichomes help in protection, dispersal of seeds and fruits and reduction of water loss.

Root hair :

The root hairs are formed due to the elongation of the epidermal cells and are not protuberances or appendages. These have vacuolated protoplasm and the nucleus moves towards the apical part of the cell. The thin wall is made up of cellulose and pectic materials.

Root hairs are always **unicellular.** Root hairs are endogenous in origin.

Function : Root hairs play an important role in anchoring the plant body in the soil besides absorbing water and mineral solution from it.

2. Ground tissue system :

It is the largest tissue system. It includes hypodermis, general cortex, endodermis, pericycle pith and medullary rays (pith rays). It is also called as **fundamental tissue system.**

Hypodermis :

- In stem, below the epidermis hypodermis is present. It can be collenchymatous or sclerenchymatous.
- In monocots hypodermis is usually **sclerenchymatous**.

Cortex :

- The cells have prominent intercellular spaces. Starch grain, oil, tannin, and crystals of various types are present in cortical cells. It is loosely packed multi layered structure.

Endodermis :

Inner most layer of cortex is known as endodermis.

- Endodermal cells get elongated to becomes barrel shaped & have **casparian bands**.
- Casparian bands are characteristics feature of endodermis. These bands have **lignosuberin** deposition mainly suberin.
- In roots, the endodermal cells opposite to protoxylem are thin walled. They are called as **passage cells**.
- In young stem of angiosperms, endodermis is also called as **starch sheath** due to abundant starch granules present in them.
- There are several functions of endodermis, e.g., it act as a **water tight jacket** between vascular & nonvascular region, it stores starch, it may serve as protective layer and maintain root pressure.

Pericycle :

- In roots, the pericycle is made up of thin-walled parenchymatous cells which later on give rise to lateral roots.
- In dicot root the cork cambium originates in pericycle. It also give rise to a part of vascular cambium.

Medullary ray :

- In dicot stem the part outside the pith but in between the vascular bundles is called **medullary ray**.
- They serve the function of **lateral transport**.

Function of ground tissue :

- Manufacture and storage of food material.
- Mechanical support (additional work).

3. VASCULAR BUNDLES / VASCULAR TISSUE SYSTEM

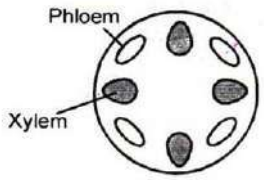
- This tissue system originates from **pro-cambium.**
- Xylem and phloem are collectively termed as **Vascular bundles** or **Vascular tissues system**.

Type of Vascular Bundles :

On the basis of arrangement of different parts, vascular bundles are divided into three categories :

I. Radial vascular bundles :

- When the xylem and phloem are present separately on different radii in alternate manner. Such vascular bundles are called **radial vascular bundle.**
- The order of development of xylem in these vascular bundles is **centripetal.** Thus, these vascular bundles are called exarch. Example : Most of the roots.
- **Exception :-** In Radish, Carrot, Turnip, Sugarbeet Conjoint-callateral, Vascular bundle are present.



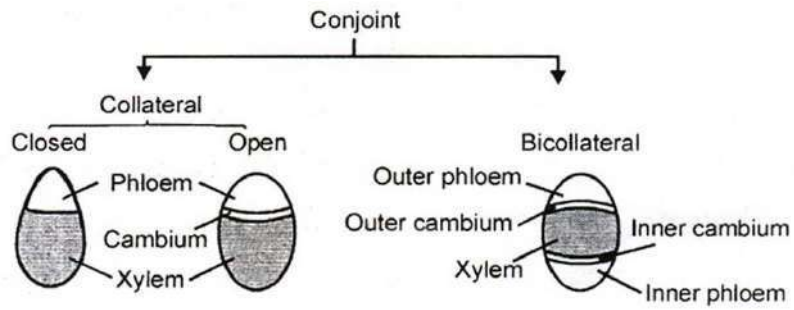
Radial vascular bundle

II. Conjoint vascular bundles :

- In this type of vascular bundle xylem and phloem are present on the same radius. These are of two types -

(1) Conjoint collateral :

In this type of vascular bundle xylem and phloem are present on the same radius and phloem present towards the periphery. These are two types:



(i) Open – If the cambium is present between the xylem and phloem, It is known as **open** vascular bundle. Ex. Open vascular bundle is found in stem of **dicotyledons** and **gymnosperm.**

(ii) Close – When cambium is absent between the xylem and phloem, in conjoint vascular bundle, it is called as **closed vascular bundle.** Ex.- Closed vascular bundles are found in **monocotyledons stem.**

- In this type of vascular bundle, order of development of xylem is **centrifugal.** So **endarch** condition is found in xylem.

(2) Conjoint bicollateral and Open Vascular bundle –

There are two patches of phloem, one on each side of xylem, are found. There are two strips of cambium (outer and inner), one on each side of xylem, are found. Such types of vascular bundles are known as conjoint, bicollateral and open vascular bundle.

- Order of development of xylem is centrifugal so endarch condition is found.

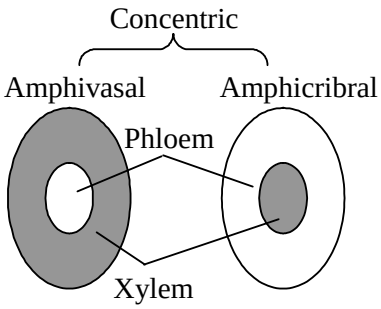
  Ex.- Stem of family Cucurbitaceae, Apocynaceae and Solanaceae.

III. Concentric vascular bundles :

- In this type of vascular bundle either xylem surrounds the phloem or phloem surrounds the xylem. Concentric vascular bundles are always closed. They are of two types -

(a) Amphicribral or Hadrocentric :

- In this type of vascular bundle xylem is completely surrounded by phloem. It means xylem is present in the centre of vascular bundle. Such type of vascular bundle is termed as **amphicribral.**
- The order of development of xylem in these vascular bundles both centripetal and centrifugal manner. In this type of vascular bundle protoxylem surrounded by metaxylem. These are known as mesarch vascular bundle.
- Such types of vascular bundles are found ferns rhizomes.



Amphivasal or Leptocentric :

- In this type of vascular bundle phloem is completely surrounded by xylem. It means phloem is present in the centre of the vascular bundle.
- In this type of vascular bundle, xylem is endarch. Eg., Stem of *Dracaena, Yucca* etc.

STELE –

- The stele is the whole central mass of vascular tissue (vascular cylinder) with or withouth pith surrounded by endodermis. **Van Tieghem** and **Douliot** put forward the hypothesis about stele. Stele surrounded by endodermis but endodermis is originally the part of cortex. It is not a part of stele. All the tissues inside endodermis is known as stele.
- According to him stele is the central part or core of the axis of the plant which includes the vascular system and its related structures.
- The tissues which lies inside the stele is called **intrastelar tissues** and the tissues which lies out side the stele is known as **extra stellar tissues.**
- Steler system started from **pteridophytes.**

INTERNAL STRUCTURE OF STEMS, ROOTS & LEAVES

1. INTERNAL STRUCTURE OF DICOT STEM

Internal structure of a typical dicot stem show following features :

I. Epidermis :

Epidermis is the outermost layer of the stem. It is single layered and lack of chloroplast. Multicellular hair (trichomes) and stomata are found on epidermis. Outer side of epidermis, a layer is present which is made up of cutin is called cuticle.

- Epidermis plays a significant role in protection.

II. Cortex :

In dicotyledon stem cortex divided into three parts :

(a) Hypodermis (b) General cortex (c) Endodermis

(a) Hypodermis : It is present just below the epidermis. It provides additional support to epidermis. It is thick multicellular layer. This layer is composed of **collenchyma** and their cells contain **chloroplast.**
So, hypodermis is **green** and **photosynthetic.**

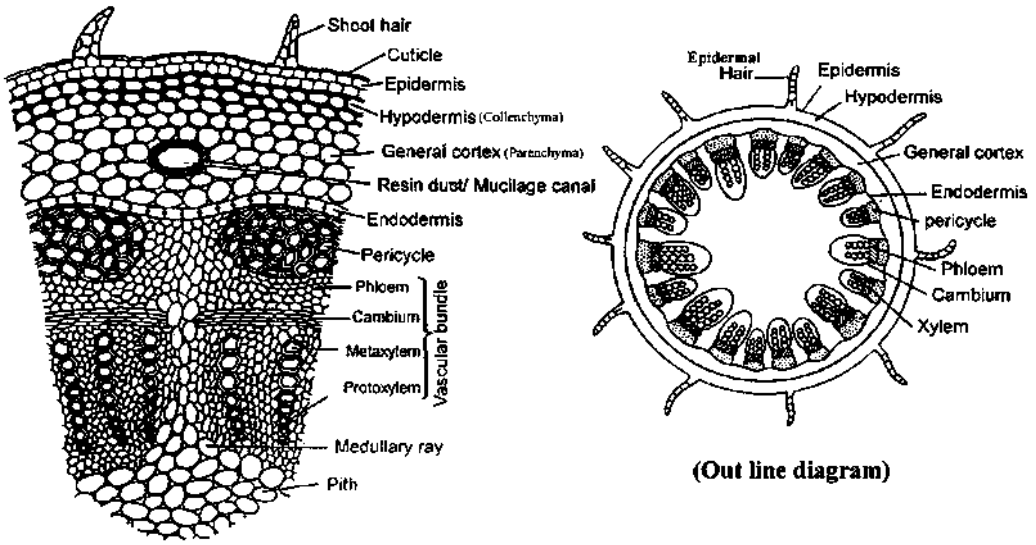
(b) General cortex : This part is composed of **parenchyma.** Storage of food is the main function of the cortex. Resin canal/mucilage canal are present in it. These are **schizogenous** in origin.

(c) Endodermis : It is single celled thick layer. The cells of **endodermis are barrel shaped.** These cells accumulate **starch** in stem of dicot. Thus, it is known as **"starch sheath".**

III. Pericycle :

This layer situated in between the endodermis and vascular bundle. The pericycle of stem is multilayered and made up of **sclerenchyma.** Sclerenchymatous pericycle is also known as **Hard bast.**

Note : In **sunflower** stem, pericycle is made of alternate bands of **parenchymatous** and **sclerenchymatous** cells. In which pericycle which is present in front of the vascular bundle is made up of sclerenchyma and remaining is composed of **parenchyma.** Part of pericycle which is situated in front of vascular bundle is known as **Bundle cap.** Pericycle is **heterogenous** in sunflower stem.



(Out line diagram)

T.S. OF SUNFLOWER STEM - [A part of Cellular]

IV. Vascular Bundle :

The vascular bundles **(wedge shaped)** are arranged in a ring. Each vascular bundle is **conjoint, collateral** and **open.** Each vascular bundle is made of phloem, cambium and xylem. **Eustele** is present in dicotyledon stems.

V. Pith :

This is well developed region, spreading from ring of vascular bundle to the centre. The cells of this region mainly made up of **parenchyma.**

Function of pith – Storage of water and food.

Note : The part of pith which is radially arranged between the vascular bundles, called **pith rays or medullary rays.** The main function of pith rays is radial conduction of food and water.

2. INTERNAL STRUCTURE OF MONOCOTYLEDON STEM

I. Epidermis :

Epidermis is the outer most single celled thick layer. It is covered with thick cuticle. Multicellular hair are absent and stomata are also less.

II. Hypodermis :

Hypodermis of monocotyledon is made up of **sclerenchyma.** It is 2-3 layered. It provides **mechanical** support to plant.

III. Ground tissue :

The entire mass of parenchyma cells next to hypodermis and extending to the centre is called ground tissue. There is **no differentiation** of ground tissue in monocotyledon stem. It means ground tissue is not differentiated into endodermis, cortex, pericycle etc.

Note : Sometimes in some grasses, wheat etc. the central position of ground tissue becomes hollow and is called pith cavity.

IV. Vascular Bundle :

Many vascular bundle are scattered in the ground tissue and V.B. are generally oval shape.

- Vascular bundles lies towards the centre are large in size and less in number.
- Vascular bundles situated towards the periphery are smell in size but more in number.
- Each vascular bundle is conjoint collateral and closed. Vascular bundle surrounded by the layer of sclerenchymatous fibre is known as **bundle sheath**.

(a) Xylem : In xylem number of **vessels** is less. In metaxylem there are **two** large vessels while in protoxylem there are **one** or **two** small vessels. Vessels are arranged in **V** or **Y** shape. Just beneath protoxylem vessels, there are a **water cavity** which is schizolysigenous in origin but major part of water cavity is **lysigenous.** This cavity is formed by disintegration of the element present below the protoxylem and neighbouring parenchyma.

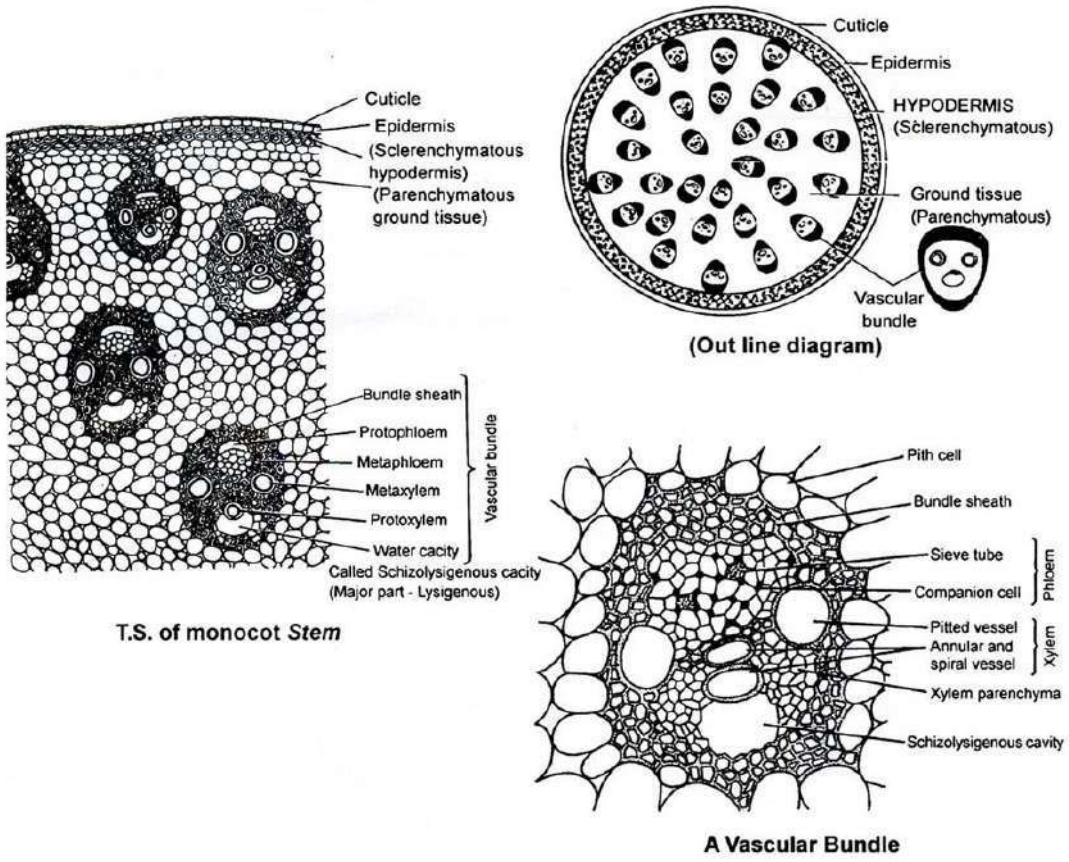
Exception : In *Asparagus* water cavity and bundle sheath are absent.

(b) Phloem : It consist of sieve tube elements and companion cells. **Phloem parenchyma** is absent.

V. Pith :

Pith is undifferentiated in monocotyledon stems.

Stele : Atactostele is found in monocotyledon. This is the most **developed stele.**



S. No.	Monocot stem	Dicot stem
1.	Epidermis with generally comparatively **smaller** cells.	Epidermis is made of comparatively **larger** cells.
2.	Hairs are generally **absent**.	Multicellular hairs are **present**.
3.	Hypodermis is **sclerenchymatous**.	Hypodermis is **collenchymatous**.
4.	Cortex is generally absent, but from hypodermis to centre of stem there is **ground tissue** present.	Cortex is made of many layered parenchymatous cells.
5.	Endodermis is absent.	Endodermis is **present** but usually poorly developed.
6.	Pericycle is **absent**.	Pericycle is made of one or many layers of cells.
7.	Medullary rays are **absent**.	Medullary rays are **present** between vascular bundles.
8.	Pith is **absent**.	Pith is **present**.
9.	Vascular bundles :	Vascular bundles :
	(a) Scattered V.B.	(a) V.B. are arranged in a ring.
	(b) V.B. are conjoint, collateral and **closed**.	(b) V.B. are conjoint, collateral and **open**
	(c) There is differences in the size of V.B. in the centre and at periphery, i.e., V.B. in centre are larger in size and towards periphery are smaller.	(c) V.B. are of same size.
	(d) Bundle sheath is **present** around vascular bundle in monocot stem	(d) Bundle sheath is **absent**.
	(e) **Oval** vascular bundles.	(e) **Wedge shaped** vascular bundles.
	(f) Phloem parenchyma is **absent**.	(f) Phloem parenchyma is **present**.
	(g) Xylem vessels are 'Y' or 'V' shaped.	(g) Xylem vessels are radial.

3. INTERNAL STRUCTURE OF TYPICAL DICOTYLEDON - ROOT

Internal structure of a typical dicotyledon root shows following features : -

I. Epiblema : -

It is **uniseriate** outermost layer. It comprising tubular living components. Cuticle and stomata are absent. Unicellular root hairs are formed due to elongation of some cells of epiblema. Epiblema also known as Rhizodermis or Piliferous layer. Root hairs are present in maturation zone of root.

II. Cortex : -

It is made up of parenchymatous cells.

Chloroplast is absent so they are non-photosynthetic but chloroplast is present in roots of **Tinospora** and **Trapa** so they are photosynthetic.

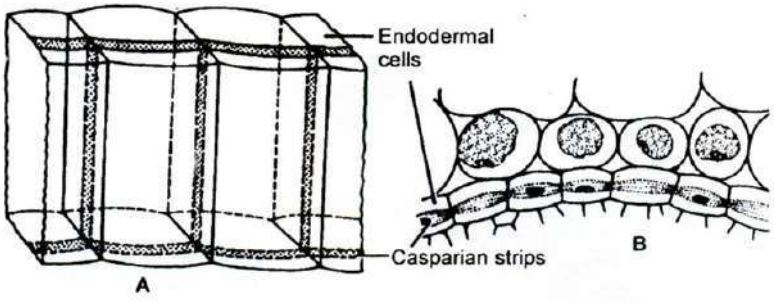
Note : The cells of outer part of cortex are suberized in old root. It is called **exodermis.**

Exodermis found in some dicotyledon roots and most of the monocotyledon roots.

III. Endodermis : -

This layer is situated between the pericycle and cortex. **Casparain strips** are present on radial and tangential wall of endodermis. These strips are made up of **ligno suberin (mainly suberin)**. Casparian strips are discovered by **Caspari**.

- The cells of endodermis which are situated in front of protoxylem cells lack of casparain strips.
  These are called **passage cells.**
  The number of **passage cells** is equivalent to the **protoxylem cells** and number of rows of root hair equivalent to protoylem cells.



Endodermal cells : Casparian strips in tangential and radial walls

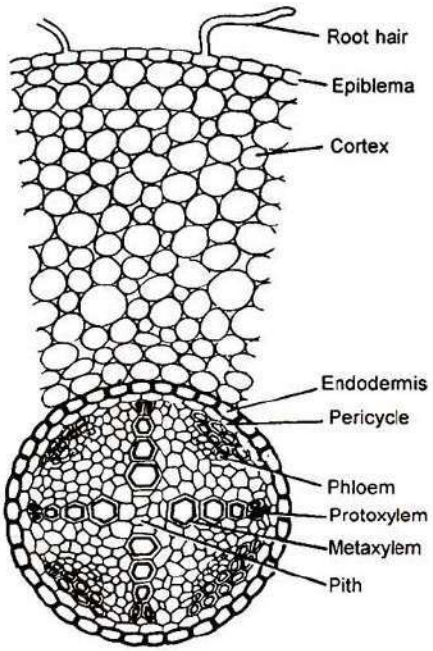
- Passage cells provide path to absorbed water from cortex to pericycle.

Note :

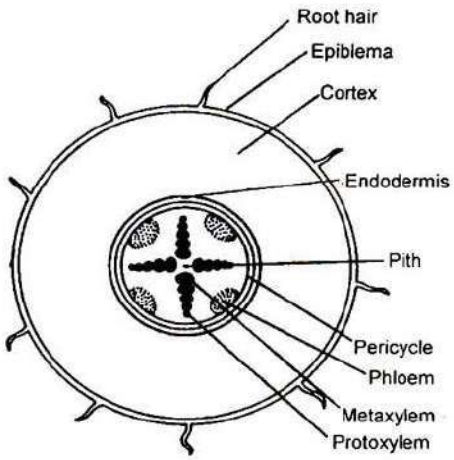
(a) Root hairs are linearly arranged on root apex.

(b) Casparian bands and passage cells are well developed in monocot root.

(c) Endodermis acts as a **water tight jacket** and prevents radial conduction of water



T. S. OF TYPICAL DICOTYLEDON ROOT



(Out line diagram)

IV. Pericycle :

It is single layered. It is composed of **prosenchyma**.

- **Lateral** roots are originated from the part of **pericycle** which is lying opposite to protoxylem. Thus lateral root are **endogenous** in origin. A few mature cells of pericycle usually opposite to protoxylem, become meristematic. these cells divide by periclinal divisions and form some layers of cells. these divisions are followed by anticlinal divisions forming a primordium which grows to form a lateral root.

Note :

(i) The branches of stems are **exogenous** in origin because these are originated from extra stelar region.

(ii) Adventitious root are also **endogenous.** Because these are originated from stellar region.

- Some part of vascular cambium in root is originated from pericycle.

V. Vascular Bundles : -

Vascular bundles are **radial** and **exarch**. Xylem and phloems are separate and equal in number. The numbers of xylem bundles are two to six (**diarch** to **hexarch**).

- But exceptionally, **Ficus** (Bayan tree) root is **polyarch.**
- Parenchyma which is found between xylem and phloem, called **Conjunctive tissue.**

VI. Pith :

In dicot root pith is **less developed** or **absent.**

4. INTERNAL STRUCTURE OF MONOCOTYLEDON - ROOT

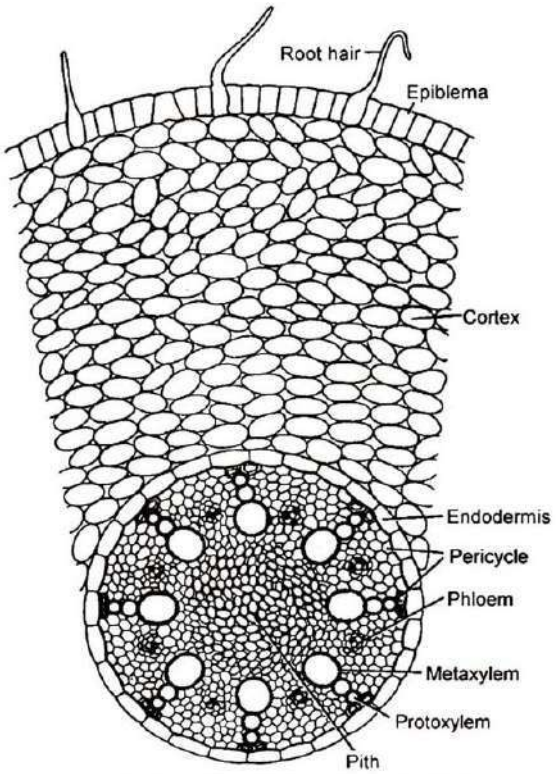
- The internal structure of a typical monocotyledon root is similar to dicotyledon root.

But

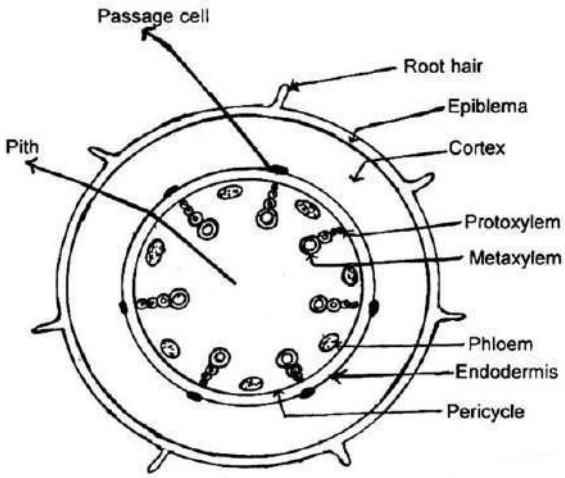
(a) Number of xylem bundles are **more than six** (Polyarch) in monocotyledon root (**exceptionally** the number of xylem bundles are two to **six** in **onion**).

(b) Pith is **well developed** in monocotyledon root

(c) Only lateral roots are originated from pericycle.



T.S. OF MONOCOTYLEDON ROOT



(Out line diagram)

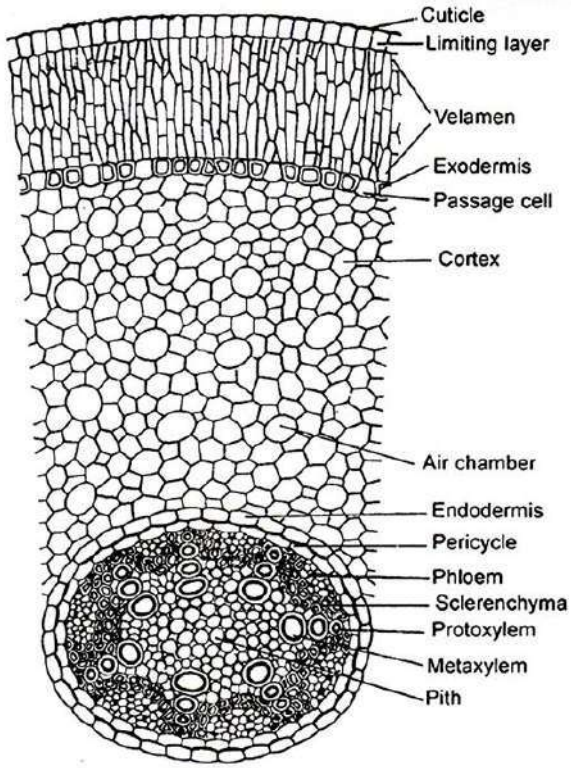
Difference between dicot root and monocot root

S.No.	Character	Dicot root	Monocot root
1.	Pericycle	Gives rise to secondary roots and lateral meristem	Gives rise to lateral roots only.
2.	Vascular bundles	Diarch to hexarch	Polyarch
3.	Cambium	Develops at the time of secondary growth	Absent
4.	Pith	Absent or poorly developed	Fully developed

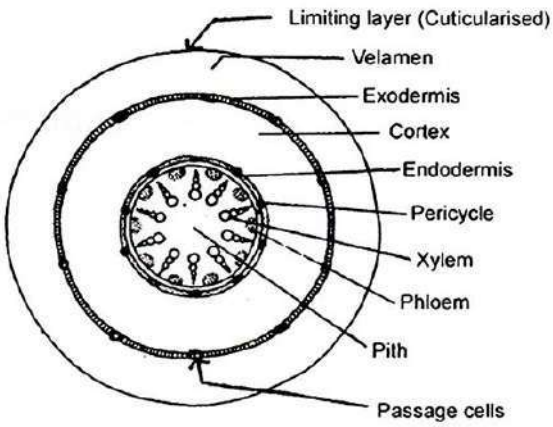
5. INTERNAL STRUCTURE OF ORCHID ROOT –

Velamen : - These are found in aerial or hanging roots of some epiphytes (eg. **orchid**)

- These are examples of multilayered epidermis.
- These are present outside the exodermis.
- These are made up of **protoderm** and are dead.
- Spiral thickening of **colloids** is found in **velamen cells**.
- Passage cells are found in both exodermis and endodermis in hanging roots of orchids.



T.S. of Orchid Root (A part of cellular)



(Out line diagram)

6. INTERNAL STRUCTURE OF LEAF

Generally leaves divided into two categories – Dorsiventral leaves and isobilateral leaves. The differences in between them as follows :

Dorsiventral or Bi-facial	Iso-bilateral or Equifacial
1. Present at right angle to stem	**1.** Arranged parallel to stem.
2. Upper surface of leaf receive more sun light as compared to lower surface, so there are difference between internal structure of upper and lower surface of leaf.	**2.** Both surface of leaf receive equal amount of sun light so there are no difference between internal structure of upper & lower surfaces.
Examples : - Dicots	Example : - Monocots
Exception – *Eucalyptus, Neruim.*	Exception – *Lilium longiflorum*

DIFFERENCE BETWEEN DICOT LEAF (DORSIVENTRAL) & MONOCOT (ISOBILATERAL)

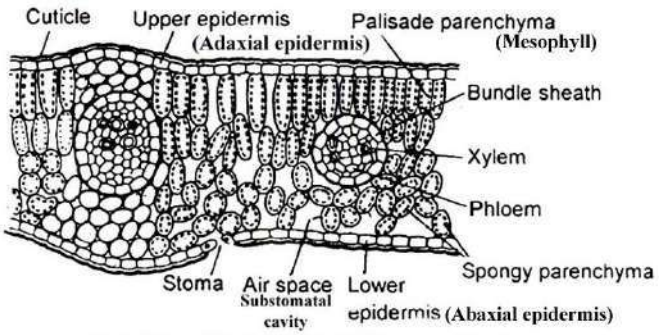
	Character	Dicot leaf	Monocot leaf
(i)	Leaf	Dorsiventral	Isobilateral
(ii)	Stomata	Usually more on lower epidermis (Hypostomatic)	Equal on lower and upper epidermis (Amphistomatic)
(iii)	Mesophyll	Made up of two types of tissues (A) Palisade parenchyma (B) Spongy Parenchyma with large intercellular spaces	Only spongy parenchyma is present which has very small spaces.
(iv)	Bundle sheath	Made up of parenchyma just above and below vascular bundle. Some parenchyma cells or collenchymatous cells are present upto epidermis	Just above and below the vascular bundles sclerenchymatous cells (up to epidermis) are found.
(v)	Bulliform Cells	Absent	Present

7. INTERNAL STRUCTURE OF DORSIVENTRAL LEAVES

- Cuticle is present on both surfaces but cuticle of upper surface is thicker.
- Dorsiventral leaves are mostly **hypostomatic** i.e. stomata present on lower surface.

Note : In amphistomatic dorsiventral leaves stomata are more on lower surface.

- Mesophyll of these leaves is divided into two regions – Palisade tissue and spongy tissue.



V.S./T.S OF DORSIVENTRAL LEAF

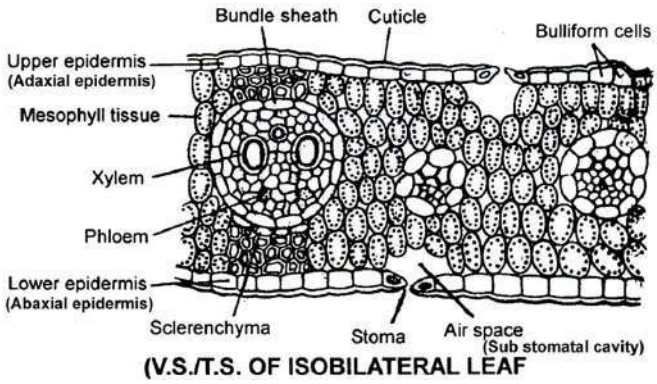
- Palisade tissue is found towards upper surface. These cells have more chloroplasts. Spongy tissues is found towards lower surface and have large intercellular space.

8. INTERNAL STRUCTURE OF ISOBILATERAL LEAVES

- The thickness of cuticle on the both surface is equal.
- Distribution of stomata on both surface's are **equal**.

Note : Isobilateral leaves are **Amphistomatic** i.e. stomata present on both sides.

- Mesophyll of isobilateral leaves is not differentiated into palisade and spongy tissues. It is completely made up of spongy tissues. **Palisade tissues are absent.**

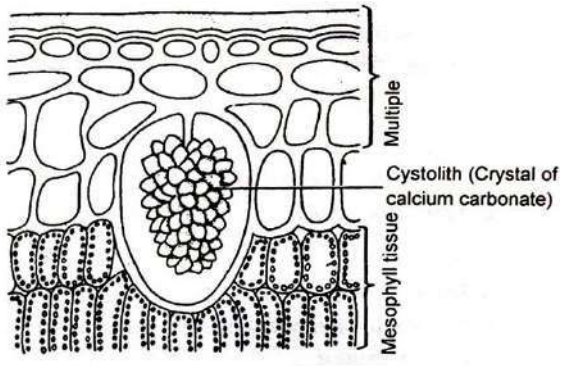


(V.S./T.S. OF ISOBILATERAL LEAF

9. VASCULAR BUNDLES OF LEAVES

- Similar types of vascular bundles are found in both dorsiventral and isobilateral leaves. Vascular bundles of leaves are **conjoint, collateral** and **closed.**

- Protoxylem is situated towards the adaxial surface and protophloem towards the abaxial surface in the vascular bundle. Leaves are devoid of endodermis and pericycle.
- Vascular bundles are surrounded by a **bundle sheath**. Bundle sheath is **chlorenchymatous** in C-4 plants.
- **Bulliform cells : -** Large cells are found in the epidermis of psammophytic (desert) grasses which are filled by liquid or empty (mostly) and colourless are called bulliform cells or motor cells. Folding of leaves during the sunny day takes place due to the presence of these specific cells. This is an adaptation to **reduce transpiration**.
  Example : - Ammophila, Poa, Empectra and **Agropyron** etc. are Psammophytic grasses.
- Epidermis of **Nerium** (both upper & lower) and **Ficus** (only upper epidermis) becomes **multilayered**. This is an adaptation to reduce transpiration.



T.S. of Ficus leaf
Druses → Crystal of calcium oxalate

SPECIAL POINTS –

1. Xerophytes with isobilateral leaves contain palisade on both sides of leaf.
   Examples : - Eucalyptus & Nerium.
2. Desert grasses contain palisade like spongy tissue
3. **Unifacial or cylindrical leaf : -** In these leaves there are no differentitation of upper surface and lower surface. Example : - Onion, Garlic
4. **Albascent leaf : -** Palisade tissue is restricted in half part of leaf so half part appears more green and other half appears less green. Example : Abutilon

ANOMALOUS PRIMARY STRUCTURE

1. ANOMALOUS STRUCTURE IN DICOTYLEDON STEM

I. Scattered Vascular Bundles : -

In some of dicotyledon stem, vascular bundles are not arranged in a ring, they are **Scattered** in the cortex.
Example : - *Thalictrum, Nymphaea, Papaver orientale* & *Peperomia.*

II. Phloem on innermost radius : -

Generally phloem is situated in the ring of vascular bundles towards peripheral (outer) radius and xylem towards the inner radius. But **anomalously** in some plants, the position of phloem is towards the inner side of xylem. Such type of phloem is called **Internal or intraxylary phloem**. Because, this phloem lies towards the pith, so it is also known as **medullary phloem**.
This anomalous condition is found in **Calotropis, Capsicum, Leptadaenia,** etc. plants.

III. Medullary vascular Bundle : -

In some plants vascular bundles are present in pith. These are found in addition to normal ring of vascular bundles. These are called **medulllary vascular bundles**.
Example : *Amaranthus, Boerhaavia, Chenopodium, Mirabilis, Achyranthes, Bougainvillea, Raphanus sativus.*

IV. Cortical Vascular Bundles : -

Some of the vascular bundles are also present in the cortex of plants except the ordinary ring of vascular bundles. They are known as **cortical vascular bundles**.
Example : *Casuarina, Nyctanthes* and *Lathyrus* etc.

V. Polystelic condition : -

Each vascular bundle is surrounded by a separate endodermis and pericycle in some plants. Hence, each vascular bundle is a **stele**. It is the normal situation in pteriodphytes but in some dicotyledons it is present abnormally.

Example : - *Primula, Dianthera*

VI. Exclusively xylem vascular Bundle : -

Abnormally, some vascular bundles are only formed by xylem except the normal vascular bundles. Phloem is not present in these vascular bundles.

Example : - Paonia

VII. Exclusively phloem vascular Bundle : -

Abnormally, some vascular bundles are only formed by phloem except normal vascular bundles in some plants. Xylem is not present in these vascular bundle.

Examples : - Cuscuta & *Ricinus communis*

2. ANOMALOUS STRUCUTE IN MONOCOT STEM

I. Vascular bundle situated in Ring : -

Normally vascular bundles are found in monocotyledon stem in scattered form but in the stem of some monocotyledon plants vascular bundles are arranged in ring. Such as *Triticum, Secale, Hordeum, Avena, Oryza* etc. Members of family Gramineae.

II. Eustele : -

Instead of atactostele, **eustele** is found abnormally in some monocotyledon stems. Presence of **eustele** is the basic feature of **dicotyledons**.

Examples : - *Tamus communis*.

SPECIAL POINT :

1. Cricket bat → from ***Salix*** (Willow)
2. Hockey → From ***Morus*** (Mulberry)
3. Monarch condition → in **Trapa root**
4. Triarch condition → in **Pisum root**
5. Tetracrch condition → in ***Helianthus annus*** *and* ***Cicer arietenum*** **root**
6. **Waiting meristem concept :** This concept was given by **Buvat.** According to this, there is an inactive centre in the shoot apex which is known as waiting meristem and it acts as reservoir of active initials and on induction it give rise to reproductive apex.
7. **Tannin** is found in latex of **banana.** When it comes in contact with air it gets oxidized and becomes reddish brown in colour.
8. **Chewing gum** is made up by latex of ***Achras sapota.***
9. Tannin glands are found in **Camellia.** These glands are **schizogenous** in origin.
10. Salt glands are found in ***Tamarix*** which secretes **sodium chloride.**
11. **Chalk glands** are found in plants of **plumbaginaceae** family which secretes **calcium carbonate.**
12. Maltilayered (14 to 15 layers) epidermis is found in **Peperomia leaves.**
13. Cystolith containing cells are found in the upper epidermis of **Ficus** leaf, called **lithocytes.**
14. The most durable wood is ***Tectona grandis.***
15. Tracheids are the chief water transporting elements in gymnosperms.
16. Phloem is embedded into the secondary xylem in some plants. Such phloem is called **included phloem** or **interxylary phloem.** This is secondary anomalous structure.
    Example. : ***Leptadaenia, Salvadora*** etc. dicot stem.
17. Pericycle is absent in roots and stem of some aquatic plants.

18. In some monocotyledonae roots, pith is **sclerenchymatous.** Ex. **Canna.**
19. A nectar secreting glands cell contains granular cytoplasm and a large conspicuous nucleus.

ANATOMY – SECONDARY GROWTH

Primary Growth :

- Cells of apical meristems divide, differentiate and develop to form primary tissues, As a result the plant grows in length. This is called **primary growth**.

Secondary Growth :

- By the activity of lateral meristems, increase in the **circumference/girth** of the plant organs due to the formation of secondary tissues in stelar & extra stelar regions called secondary growth.
- Normally secondary growth takes place in roots and stem of **dicotyledons & Gymnosperms**.
- Due to lack of cambium in monocotyledons, secondary growth is absent. But exceptionally secondary growth takes place in some monocotyledons. Such as- ***Palm, Yucca, Dracaena, Smilax, Agave, Coconut*** etc.
- Pteridophytes and monocots have only primary structure but gymnosperm and dicots soon start undergoing secondary growth.

SECONDARY GROWTH IN DICOT STEM

A. Secondary growth in stelar region or secondary growth in vascular region :

Secondary growth in stelar region begins earlier than the extra stelar region.

Formation of ring of vascular cambium : -

A cambium which is present inside the vascular bundle is called **intrafascicular – cambium**. This is a type of primary meristem.

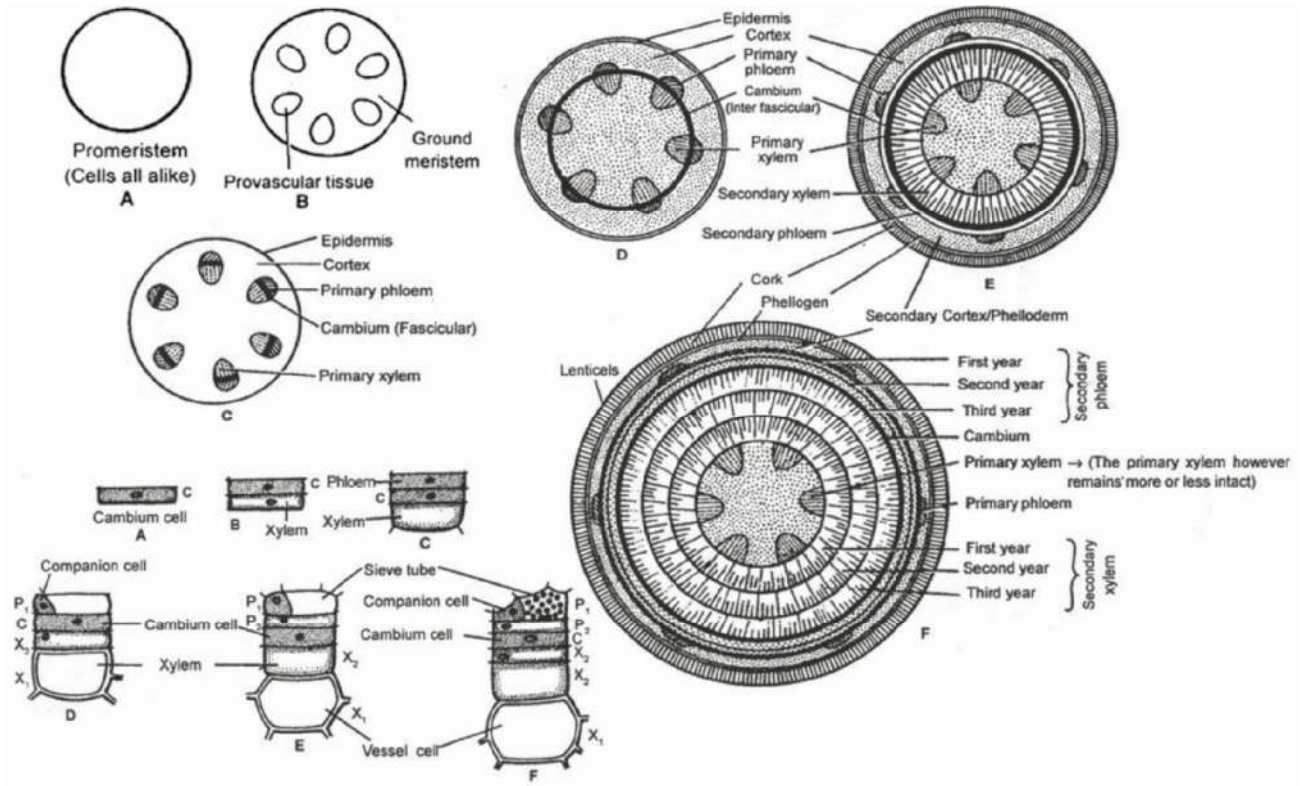
- First of all, cells of medullary rays become meristematic to form interfascicular cambium which is secondary lateral meristem.
- Intrafascicular and interfascicular cambium are collectively known as **vascular cambium**. Vascular cambium is formed in the form of a complete ring which is made up of single layer of cells.
- In dicot stem some part of vascular cambium is primary and some part is secondary.
- Two types of cells are found in the ring of this vascular cambium.
  (I) Fusiform initials (II) Ray initials.
- Fusiform initials are long with **pointed ends**, while ray initials are **spherical** (oval).
- **Amount of fusiform initials** is more in **vascular cambium**.

I. Activity of vascular fusiform initials :

Activity of fusiform initials :

- Continuous **periclinal** divisions or **tangential** division takes place in fusiform initials .
- This type of activity few cells are formed towards the periphery and these cells differentiate into secondary phloem or bast and some of the cells are formed towards the central axis and these cells are differentiated into secondary xylem or wood.
- Normally more secondary xylem is formed as compared to secondary phloem due to unequal distribution of hormones.
  (Secondary xylem is formed 8-10 times more as compared to sec. phloem).
- By the pressure of secondary phloem, primary phloem is pushed towards the outside and gets crushed.
- By the pressure of secondary xylem, all the primary tissues-such as primary xylem, pith etc and old secondary xylem degenerates in the centre of the stem. Due to this, central part of the stem becomes woody. These activities are going on continuously in plants throughout the life.

- Secondary xylem forms in plant regularly and primary tissues degenerate continuously. This new secondary xylem also degenerate the old secondary xylem. Waste materials are formed in the stem such as **lignin, suberin, tannin, resin, gums** etc. due to degeneration of the cells. All these waste materials are filled in the **lumen** (cavity) of **tracheids** and **vessels of secondary xylem**. Because of this, wood in the central region of the stem becomes dark coloured (Black brown). It is called **Heart wood or Duramen**. The peripheral or outer wood which looks light in colour is known as **Sap wood or Alburnum**. As a result of growth of secondary xylem, the **diameter** of **heart wood increases**.



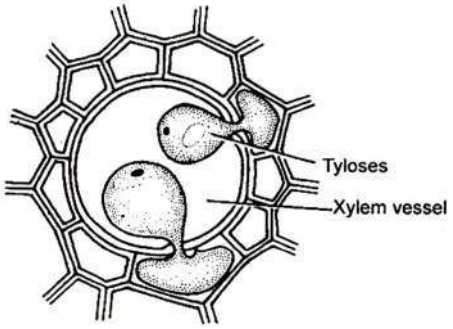
Different Stage of Secondary Growth in Dicotyledon Stem

Physiologically active wood is sapwood. The main function of sap wood is water conduction. Heart wood provides maximum mechanical strength to stem.

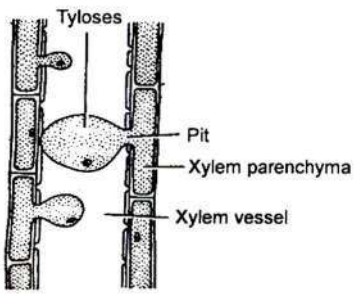
Note : Conduction of water is not carried out by heart wood because : -

1. Cavities of tracheids and vessels are progressively filled by waste materials.
2. The bladder like ingrowth of parenchyma cells, which enter the lumen of vessels (mainly) & tracheids through the pits in their wall. Such bladders like ingrowth are called as **tyloses**. Tyloses blocks the **conduction** of water.

Note: In gymnosperms **tylosoids** are formed in place of tyloses.



T.S. of Sec. xylem vessels showing tyloses



L.S. of Sec. xylem vessels showing tyloses

SPECIAL POINT :

1. If the heart wood is destroyed in any stem, then there will be no effect on plants (any vital function is not effected), but if the sap wood is destroyed, then the plant will die because conduction of water will be blocked.
2. Heart wood provides stiffness to the stem. The waste materials of heart wood are **antiseptic** in nature. Heart wood is resistant to bacteria and fungus. Heart wood has a power of **repelling** insects. So it is resistant to the **termites** and in rainy season it does not imbibe water. Thus it is the best quality of wood.
3. Study of wood is known as **Xylotomy**.
4. If a wood is exposed freely in air then **decomposition** of **sap wood** takes place **rapidly**.
5. Position of youngest layer of secondary phloem is just outside the vascular cambium.
6. Position of oldest layer of secondary phloem is just inside the primary phloem.
7. Position of youngest layer of secondary xylem is just inside the vascular cambium.
8. Position of oldest layer of secondary xylem is just outside the primary xylem.
9. If xylem is blocked then shoot will die first.

TYPES OF WOOD

I. On the basis of amount of parenchyma wood is classified into **two** groups.

1. Manoxylic wood : - Such type of wood contains more living parenchyma. It is soft and loose wood. eg. **Cycas**.

2. Pycnoxylic wood : - Such wood contains less amount of living parenchyma. It is hard wood. Such type of wood are found in most of the dicot plant.
Example : - *Pinus* (Chir), Mango, *Acacia* (Babool), *Tectona* (Teak), *Dalbergia* (Shisham).

II. On the basis of distribution of parenchyma wood is classified into three groups : -

1. Apotracheal : - In this type of wood **parenchyma is in scattered** form.
Example : Gymnosperm

2. Paratracheal wood : - In this wood parenchyma is arranged or distributed in the form of masses or groups.
Example : Dicotyledon plants.

3. Syntracheal wood : - In this wood **parenchyma is arranged around** the **vessels**.
Example : *Terminalia arjuna*.

III. Classification based on vessels : - On the basis of presence or absence of vessles, wood is classified in two categories –

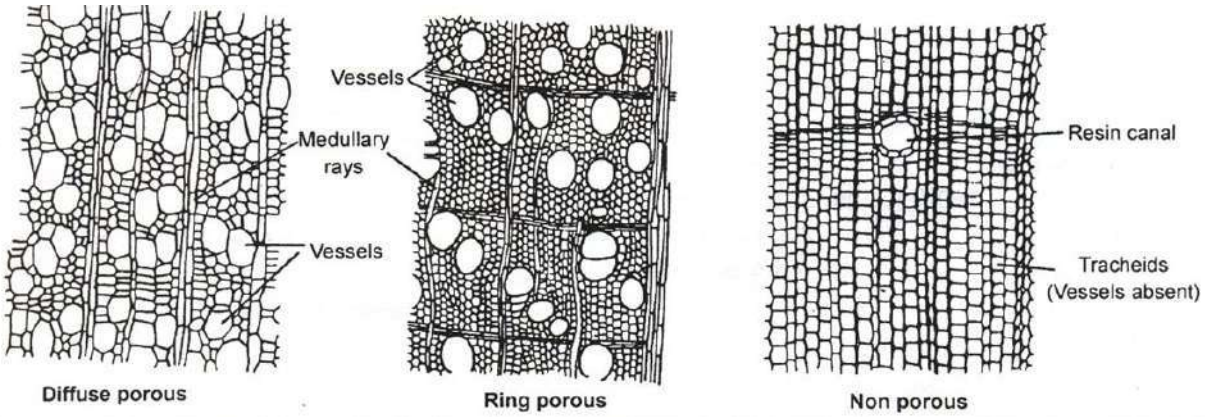
1. Non-porous wood : - Vessels are absent in such type of wood. **Example :** Gymnosperm

2. Porous wood : Vessels are present in such type of wood. On the basis of **arrangement** of **vessels** porous wood is divided into two groups.

(a) Ring porous wood : - Vessels are arranged in the form of a ring. Such wood conducts water more efficiently. Example : *Dalbergia*

(b) Diffused porous wood : Vessels are irregularly arranged in wood. Example : *Azadirachta*.

Non-porous wood is also called as **homoxylous wood** and porous wood is also called as **hetero xylous wood**.



Activity of Ray initial : - Periclinal divisions are also going on continuously in ray intials of vascular cambium. Some of the cells are formed towards inside and some of the cells are formed towards outside through these divisions and these cells are made up of parenchyma. Radial lines of cells of parenchyma are formed in the stem. These are called **Vascular rays or Sec. medullary rays.** They conduct **water** and **food** in **radial direction**. Order of development of vascular rays is both centripetal and centrifugal manner.

(c) Formation of Annual Rings : Annual rings are formed due to unequal activity of vascular cambium.

- The activity of cambium does not remain same, it is **changeable** through out whole year. Activity of vascular cambium is affected by physiological and environmental factors.
- In **winter** or **autumn** season the activity of the cambium is less and forms fewer xylary elements. Cells formed during this period, are small, thick walled darker with higher density and have narrow lumens. This is called **autumn wood** or **late wood**.
- The vascular cambium is highly active in **spring** or **summer** season and produce a large number of xylary element and cells of secondary xylem are larger, thin walled lighter in colour with a lower density and have wider lumen. This wood is known as **spring wood** or **early wood**.

Note :

1. The **autumn** and spring wood are formed in the form of rings. The ring of any type of wood is called **growth ring**. Thus **two growth** rings are formed in one year.
2. A ring of **autumn wood** and a **ring of spring** wood are collectively known as **Annual ring**. Thus an annual ring consists of two growth rings. The numbers of annual rings, formed in a tree give the idea of the age of the tree. The study of determination of age of the plant by this technique is called **Dendrochronology**.
3. The annual rings are counted from the base of the stem because basal part has maximum annual rings and upper part has less. Therefore counting from the basal region can give the correct idea.

- The width of annual ring is less in unfavorable conditions and more in favorable conditions. Thus the annual rings are also indicative of environment period, the tree has encountered perviously.

4. A piece is taken from the stem from the base of stem with the help of **increment borer** instrument. The annual rings are counted from that piece and again inserted (fitted) into the same stem at the same place.
5. More **distinct** annual rings are formed in that region where climatic variations are sharp.
6. More distinct annual rings are formed in **temperate** plants.
7. Distinct annual rings are not formed in tropical plants.
8. Distinct annual rings are not formed in India except **Himalayan** regions.
9. Least distinct annual rings are formed in **seashore** regions because the climate remains same through out the year.

10. More clear annual rings are formed in **deciduous** plants as compared to **evergreen** plants. (In temperate region)
11. In deserts annual rings are less distinct.

Secondary Growth in Extra Stelar Region :

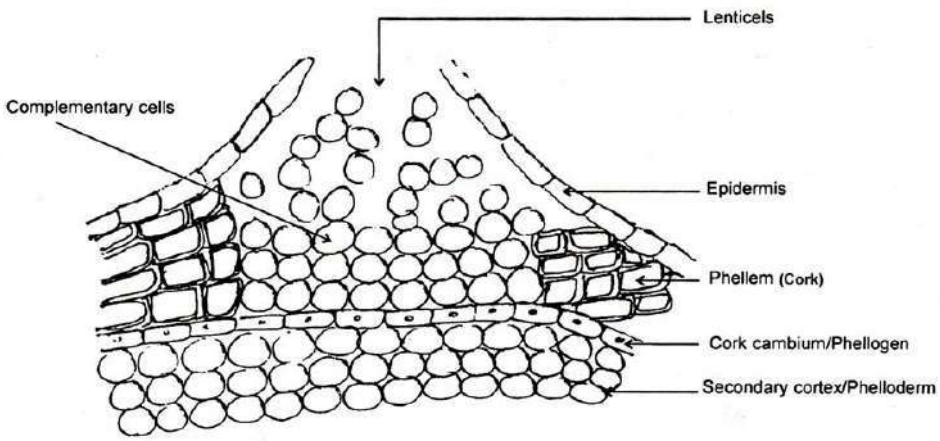
- Secondary growth takes place in extra stelar region due to the activity of cork cambium. Cork cambium is also known as Phellogen or Extrastelar cambium.
- Cork cambium arises from the hypodermis or from the outer layer of cortex because they become meristematic. Cork cambium is also formed in the form of a single layered ring. It forms secondary tissue in extra stelar region.
- Cork cambium forms some cells towards the outside (epidermis) and some cells towards the inside (cortex). Those cells formed towards outside, their middle lamella is suberized. Due to this, these cells become dead. These cells are known as Cork or Phellem. Those cells formed towards the inside, are differentiated into parenchyma and may contain chloroplasts. These are called secondary cortex or Phelloderm.

Phellem (cork) + Phellogen (cork cambium) + Phelloderm (secondary cortex) = Periderm

- Cork is formed in more quantity and secondary cortex is in less quantity because activity of Cork cambium is more towards outside. The maximum activity of cork cambium is in **winter** (Autumn) season.
- Ring of cork cambium remains living only for one year. Each year, a new cambium is formed below the previous cambium. This new cambium is derived from the secondary cortex.
- Commercial cork is obtained from *Quercus suber*.

  Rhytidome : All the tissues which occur outside the cork cambium are collectively termed as **rhytidome**. Rhytidome includes cork and tissues which become dead due to the pressure of cork.

  Lenticels: Most of the cells of phellem are dead. But at some places living cells are also found. Suberin is not deposited in these places. These places are known as **Lenticels**. Lenticels apprears on the outer surface of the plant either in small point or in the form of areas of protruberance. Lenticels are made up of scattered group of living cells. Usually they are formed below the stomata. These cells are known as **complementary cells/complementary tissue.**



Function :

1. The main function of lenticels is exchange of gases between plant and atmosphere.
2. Transpiration also takes place through the lenticles, is known as **Lenticular transpiration**.
3. Adventitious roots on cutting originate from the living cells of lenticels in vegetative reproduction.

Note :

- Lenticels are found in most of the **woody trees** but absent in woody climbers.
- Lenticles are present all over the plant body. They are also present on **fruits**.They are never found on leaves.

Bark :

- All the tissues situated out side the vascular cambium is called **Bark**. According to modern view bark includes both living and dead tissues. **Bark** has two parts.

  Outer layer of bark is called **Rhytidome** and inner layer of bark is **secondary** phloem.
- Bark that is formed early in the season is called early or soft Bark. Towards the end of season late or hard bark is formed.

KINDS OF BARK :

1. **Ring Bark : -** Continuous bark of equal thickening is called ring bark. It is formed around the stem in the form of a complete ring. In ring bark cork cambium is continuous.

   Example : - Bhojpatra **(Betula)** – A complete distinct ring bark is formed in this plant. Its bark was used as a **writing material**/as a paper in **ancient period**. Ring bark is also formed in **Eucalyptus**.
2. **Scaly Bark : -** Discontinuous bark of unequal thickening is called scaly bark. This bark is formed around the stem in the form of pieces or fragments. Highly obvious scaly bark is formed in *Psidium guajava*. Except this scaly bark is also formed in Neem (*Azadirachta*), Mango (*Mangifera indica*) and *Tamarindus* etc plants.

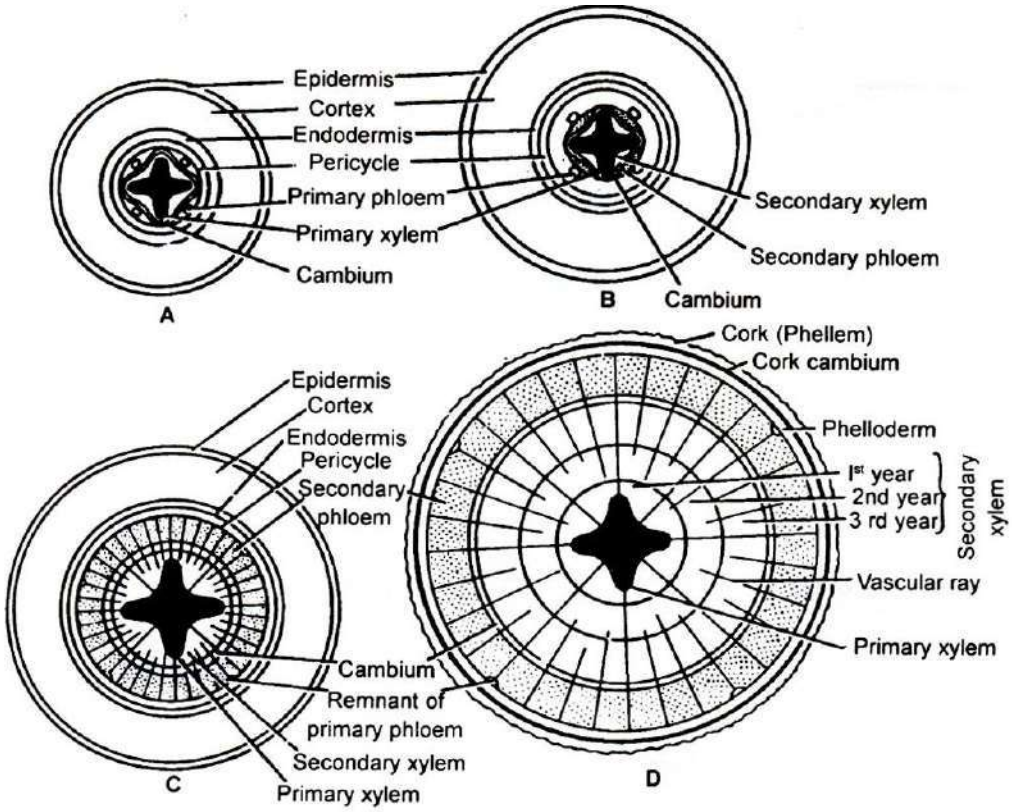
- If complete bark of tree is removed then plant becomes dead due to excessive water loss.
- If bark is removed in the form of ring at the base of main stem then root will die first due to lack of food.

SECONDARY GROWTH IN DICOT ROOT

- First of all, conjunctive tissue becomes meristematic during the secondary growth in a dicotyledon root and form separate **curved strips** of vasular cambium below phloem bundles. Then after, the cells of pericycle lying opposite to protoxylem also become meristematic to form additional strips of cambium. In this way a complete ring of vascular cambium is formed.

  The portion of vascular cambium formed by pericycle is less. The main portion of vascular cambium is formed by conjunctive tissue. Vascular cambiums in roots are secondary in origin.
- The activity of vascular cambium of root is the same as the activity of vascular cambium of stem. Secondary xylem is formed towards the inner side and secondary phloem is formed towards the outer side by vascular cambium. The portion of vascular cambium which is formed by pericycle is responsible for the formation of **pith rays.** These are made up of parenchyma. These pith rays are known as **primary medullary rays** (Multiseriate). A few medullary or pith rays are also formed from remaining vascular cambium. These are called **secondary medullary rays** (uniseriate). Thus two types of medullary rays are found in the secondary structure of roots.

Note : The presence of two types of medullary rays is basic characteristic feature of roots. Only secondary medullary rays are found in stem after the secondary growth. Both of them conduct **water** and **food in radial direction.**



DIFFERENT STAGES IN SECONDARY GROWTH OF DICOT ROOT

- Cork cambium is developed from the **pericycle** in roots. Cork is formed towards the outside and secondary cortex is formed towards the inner side by the cork cambium. Lenticles are also found in roots but less in number as compared to stem. Cortex completely degenerate in roots after the secondary growth of one or two years. This falls down due to the pressure of cork, whereas in stem, it degenerates after the long duration.

(i) Secondary growth is essential in roots to provide strength to the growing aerial parts of the plants and fulfill the requirement of water and minerals.

(ii) Annual rings are not formed in roots because these are not effected by the changes of environment.

(iii) Secondary growth is not found in monocot roots. Secondary growth present in *Yucca* and *Dracnea*.

(iv) In roots, all cambia are secondary in origin.

Wound Healing :

- When any plant part gets injured wound is formed there. Boundary of the wound is raised outside and composed of similar type of living cells (Parenchyma) called callus. Living cells of wound are responsible to form a cambium. This is called **wound Cambium**. It is also called **inducible cambium**. This newly formed cambium forms cork towards the outside. This cork covers the wound entirely. Wound cambium is a secondary lateral meristem.

Abscission : -

- Falling of any plant organ without harming plant is called as abscission.
- Abscission takes place due to formation of abscission layer at the base of plant organ and it is composed of parenchyma.
- ABA induces the formation of abscission layer.

- Middle lamella is dissolved and form abscission layer during abscission and primary walls also dissolve partially or completely. Sign of leaf fall on stem is called **leaf scar**. It is a type of wound. The living cells of leaf scar are responsible to form **cork cambium**. At the site of abscission **protective layer** is found which is **suberized.**

  Knots : Knot is formed when branches are embedded inside the main stem.

  Grafting : - Grafting is not possible in monocots because **cambium is absent** there.

ANOMALOUS SECONDARY GROWTH IN DICOT STEM

1. **Anomalus/abnormal position of vascular cambium : -**

   Normally vascular cambium is circular, but it is folded in stem of some plants later on these folds break and separate from each other. Each fold is responsible to form a complete vascular bundle. Many vascular bundles are formed in stem.

   Example : - *Thinouia, Serjania, Bauhinia*.

2. **Abnormal Activity of vascular cambium : -**

   Generally xylem and phloem is formed from the maximum part of the vascular cambium and medullary rays are formed from the few parts of vascular cambium. But in some plants parenchyma is formed from the maximum part of the vascular Cambium and rarely at some places xylem and phloem are formed.

   Example : - *Aristolochia, Vitis vinifera* (Grape).

3. **Sequential or successive ring of vascular cambium : -**

   In some of the plants, a new ring of vascular cambium is formed each year. This is formed out side the previous ring.

   Example : - *Mirabilis, Boerhaavia, Bougainvillea Cycas* etc.

4. **Formation of vascular cambium from pericycle : -**

   Vascular cambium is formed from the pericycle in plants of Amaranthaceae and Chinopodiaceae family. A complete ring of vascular cambium is formed from pericycle.

5. **Interxylary Cork : -**

   A cork layer that develops between the two growth rings of secondary xylem is called interxylary cork.

   Example : - *Artemesia tridentata.*

6. **Formation of cork cambium from Epidermis**

   Example : *Malus pumila, Solanum dulcamara, Quercus suber* (oak).

   The commerical cork is obtained from the plant *Quercus suber***.**

7. **Formation of cork cambium from pericycle : -** Example – *Clematis* &*Thuja*
8. **Formation of cork cambium from phloem : -** *Vitis* and *Berberis*

ANOMALOUS SECONDARY GROWTH IN MONOCOT STEM

- In some members of plants such as *Dracaena, Yucca, Agave, Aloe arboresence, Lomandra, Kingia, Sanseviera,* etc. vascular cambium is formed from the outer region of the ground tissues. Parenchyma is formed towards the outside by the vascular cambium and secondary vascular bundles are formed towards the inner side.
- In some plants, the **girth** of the stem increases without cambium. Such as – **Palm, Musa, Tulipa** etc. The apical meristem of these plants is of special type. This is known as **primary thickening meristem**. This apical meristem is repsonsible for the growth in both length and girth (thickness) of the plant.
- In Cycas and *Gnetum ula* successive ring of vascular cambium is found.
- In Thuja stem cork cambium is derived from pericycle.

Special Points :

Billiards's ball ⟶ ***Phytelophus*** *(Ivory Palm)*
Violin ⟶ Picea (Spruce)
Hardest wood ⟶ *Hardwickia binata*
Heaviest wood ⟶ *Guaiacum officinale*
Lightest wood ⟶ *Ochroma pyramidale* or *Ochroma lagopus*
Heaviest wood of India ⟶ *Acacia sundra*
Most durable soft wood ⟶ *Cedrus deodar*

IMPORTANT COMPARISON TABLES

Porous wood (Hard wood)	Non porous wood (Soft wood)
(i) This wood is found in angiosperms	It is found in Gymnosperms.
(ii) Vessels are present.	Vessels do not present.
(iii) This wood is hard.	It is soft.
(iv) Xylem fibres are present.	Xylem fibres are rarely present.
(v) Vessels are more in porous wood.	Xylem tracheids are dense.
(vi) It is also called heteroxylous wood	It is called homoxylous wood.

Duramen (Heart wood)	Alburnum (Sap wood)
(i) Duramen wood dark in colour.	Alburnum wood light in colour.
(ii) This wood does not conduct water.	Alburnum wood conduct the entire water.
(iii) In this wood, Tyloses are present.	In this wood tyloses are not present.
(iv) It gives the mechanical support to the plant.	It does not gives mechanical support.
(v) It is present in the central part of the tree stem.	It is found in outer part of stem.

Spring wood	Autumn wood
(i) Spring wood are generally light brown in colour.	Autumn wood are dark brown in colour.
(ii) In plant, its quantity is more.	In plant, its quantity is less.
(iii) Its vessel are broad and with large cavity.	Its vessels are small and with narrow cavity.
(iv) It is made up in favourable conditions.	It is made up in unfavourable conditions.
(v) It is produce from more activity of cambium.	It is produce from less activity of cambium.
(vi) In wood, the fibre are less present.	In wood, the fibre are more present.

EXERCISE – 1

MERISTEMATIC TISSUE

Q.1 Maximum absorption of water by the roots takes place through the region of.....
(1) Root cap (2) Meristematic zone
(3) Root hair (4) Mature cells

Q.2 Plastochron occurs in-
(1) Shoot apex (2) Root apex
(3) Shoot apex and root apex both
(4) Root cap

Q.3 Position of shoot apex and root apex is respectively-
(1) Sub terminal and terminal
(2) Terminal and sub terminal
(3) Both sub terminal
(4) Lateral and intercalary

Q.4 Which of the following is the example of sec. meristem-
(1) Procambium
(2) Intra fascicular cambium
(3) Accessory cambium
(4) Plerome

Q.5 Which of the following is the character of meristem-
(1) Well developed inter cellular spaces
(2) Thick cell walls
(3) Absence of vacuoles and prominent nucleus
(4) Presence of sec. cell wall

Q.6 Tunica-corpus theory proposed by-
(1) Foster (2) Hanstein
(3) Schmidt (4) Karl nageli

Q.7 How many histogens are found in monocot root apex-
(1) One (2) Two
(3) Three (4) Four

Q.8 Which of the following structure is to protect the shoot apex-
(1) Root - cap (2) Calyptra
(3) Primordial leaves (4) Dermatogen

Q.9 Which of the following factor induce the changes of vegetative shoot apex into reproductive shoot apex-
(1) Florigen (2) Light
(3) Florigen and light both
(4) None

Q.10 Which of the following is not a sec. lateral meristem-
(1) Vascular cambium of root
(2) Cork cambium
(3) Wound cambium
(4) Intra-fascicular cambium

Q.11 Which of the following is incorrect for reproductive shoot apex-
(1) It is formed at the time of flowering
(2) Little activity on flank and more activity on summit zone
(3) It is consumed in the formation of floral parts
(4) Cyclic plastochromic changes are present

Q.12 Leaf primordia grows into adult lamina by the activity of-
(1) Apical meristem (2) Marginal meristem
(3) First apical and then marginal meristem
(4) Lateral meristem

Q.13 Dividing tissue present in between xylem and phloem of primary stem in plants is-
(1) Secondary cambium
(2) Apical meristem
(3) Intrafascicular cambium
(4) Interfascicular cambium

PERMANENT TISSUE

Q.14 In stem vascular cambium & cork cambium form sec. tissues respectively in which region-
(1) Cortical region & vascular region
(2) Intrastelar region & extrastelar region
(3) Both in stelar region
(4) Both in extra region

Q.15 A secondary xylem is called porous wood when it posses -

(1) Pores (2) Vessels

(3) Only tracheids (4) Parenchyma cells

Q.16 Sieve tube & companion cell occur in the phloem of-

(1) Gymnosperm & monocots

(2) Gymnosperm and angiosperm

(3) Gymnosperm and dicots

(4) Dicots and monocots

Q.17 Position of sieve plates in Angiosperm and Gymnosperm respectively-

(1) Lateral wall and end wall

(2) Lateral wall and lateral wall

(3) End wall and lateral wall

(4) End wall & end wall

Q.18 Which of the following is a well differentiated plant tissues-

(1) Promeristem

(2) Vascular cambium

(3) Parenchyma

(4) Lateral meristem

Q.19 Position of stomata in bifacial & equifacial leaves is respectively-

(1) Astomatic and amphistomatic

(2) Amphistomatic and hypostomatic

(3) Hypostomatic and amphistomatic

(4) Hypostomatic and hypostomatic

Q.20 Seat of the origin of lateral roots or secondary root is-

(1) Endodermal cells against phloem

(2) Pericycle against protoxylem

(3) Cortical cells below roots hairs

(4) Piliferous layer

Q.21 Vessels differ from tracheids in-

(1) Presence of pitted end wall

(2) Presence of thick wall

(3) Absence of bordered pits

(4) Being syncytes

Q.22 Chloroplasts may occur in which of the following tissue-

(1) Parenchyma and sclerenchyma

(2) Parenchyma and sclereids

(3) Parenchyma and collenchyma

(4) Collenchyma and sclerenchyma

Q.23 Which of the following statement is true-

(1) Epidermis is always single layered

(2) Flank zone is more active in reproductive shoot apex

(3) Parenchyma and collenchyma tissues act as potential meristem

(4) Well developed vacuoles are found in sclerenchyma

Q.24 Fibre tracheids are-

(1) Libriform fiber (2) Phloem fiber

(3) Xylem fiber (4) Sclereids

Q.25 Bordered pits occurs in-

(1) Tracheids of monocots

(2) Sieve tube of monocots

(3) Sieve cell of dicot

(4) Companian cell of dicot

Q.26 Which of the following is not the character of stem-

(1) Conjoint, collateral V.B.

(2) Endarch condition

(3) Exarch condition

(4) Presence of cuticle

Q.27 The chief function of parenchymatous tissue is to-

(1) Synthesize food

(2) Storage of food

(3) Absorb water and minerales

(4) All the above

Q.28 A mature sieve tube is different from a vessel in-

(1) Absence of functional nucleus

(2) Being dead

(3) Absence of cytoplasm

(4) Absence of lignified wall

Q.29 Ectophloic siphonostele means-
(1) A condition in which xylem and phloem absent
(2) A condition when phloem ring present outside the xylem
(3) A condition when pericycle is not present in plant
(4) When phloem ring is present both the side of xylem

Q.30 When stelar system is composed of meristele it is called-
(1) Protostele (2) Siphonostele
(3) Atactostele (4) Dictyostele

Q.31 Which of the following is the example of living syncyte-
(1) Vessels
(2) Sieve tube
(3) Latex vessel
(4) Sieve tube & latex vessel

Q.32 External protective tissues are-
(1) Cortex and epidermis
(2) Cork and pericycle
(3) Cortex and pericycle
(4) Cork and epidermis

Q.33 The Cambium is made up of -
(1) Fusiform initials and Ray initials
(2) Secondary xylem and secondary phloem
(3) Hard bast and soft bast
(4) Bulliform cells and Periderm

Q.34 Para - rubber is obtained from latex of -
(1) *Calotropis*
(2) *Euphorbia*
(3) *Hevea brasiliensis*
(4) None of these

Q.35 Conjunctive tissue present-
(1) Between xylem and phloem strands of root
(2) Between metaxylem and protoxylem of stem
(3) Between protoxylem and metaxylem of root
(4) Between xylem and phloem of stem

Q.36 Identifying features in T.S. of stem and root-
(1) Presence of cortex and position of protoxylem
(2) Type of V.B. and presence of cambium
(3) Types of V.B. and position of protoxylem
(4) Presence and absence of epidermis

Q.37 Origin of vegetative branches and adventitious root is respectively-
(1) Endogenous and exogenous
(2) Exogenous and endogenous
(3) Both are exogenous
(4) Both are endogenous

Q.38 Formation of sec. xylem and sec. phloem in which order (respectively)-
(1) Centripetal and centrifugal
(2) Centrifugal and centripetal
(3) Both centrifugal
(4) Both centripetal

Q.39 Which tissues form wood-
(1) Secondary xylem
(2) Secondary xylem + sec. phloem
(3) Secondary xylem + sec. phloem + cambium
(4) Sec. xylem + primary phloem + primary xylem

Q.40 Grafting is not possible in monocot due to-
(1) Scattered V.B.
(2) Absence of cambium
(3) Presence of phloem
(4) Presence of xylem

Q.41 Bulliform cells are found in the leaves of-
(1) *Solanum tuberosum*
(2) *Tinospora cordiflolia*
(3) *Triticum aestivum*
(4) *Helianthus annus*

Q.42 Dermatogen, periblem, and plerome are-
(1) Intermediate tissue
(2) Meristematic tissue
(3) Permanent tissue
(4) Secondary tissue

Q.43 Which type of vascular bundle is found in the stem of *Pinus*-
(1) Conjoint, collateral and exarch
(2) Conjoint, collateral and endarch
(3) Radial and diarch
(4) Conjoint, bicollateral and endarch

Q.44 True statement for inter fascicular cambium is-
(1) Primary meristem
(2) Found in plant from embryonal stage
(3) Formed by dedifferentiation
(4) Present inside the V.B.

Q.45 Sugar transporting element in Gymnosperm and angiosperm are respectively-
(1) Sieve tube & sieve cell
(2) Tracheid and sieve tube
(3) Sieve cell & vessels
(4) Sieve cell and sieve tube

Q.46 Which of the following tissues does not contain chloroplast and vacuole-
(1) Palisad tissue (2) Spongy tissue
(3) Chlorenchyma (4) Vessel and tracheid

Q.47 Incorrect statement about vessels-
(1) Vessels are example of syncyte
(2) Lumen is continuous
(3) Multicellular with wide lumen
(4) It contain nucleus at maturity

Q.48 A tissue with spiral thickening in the cell wall capable of absorbing water from air is known as-
(1) Cork (2) Velamen
(3) Epidermis (4) Hypodermis

Q.49 Pericycle in root is for-
(1) Formation of lateral root
(2) Providing mechanical support
(3) Formation of vascular bundles
(4) Separating vascular bundles from cortex

Q.50 The correct situation of mesophyll in isobilateral grass leaf is-
(1) Palisade towards adaxial surface
(2) Palisade towards abaxial surface
(3) Undifferentiated mesophyll
(4) Palisade along both the surface

Q.51 Occurrence of vessels in xylem is the-
(1) Primitive character
(2) Advance character
(3) Character of ancestors
(4) Character of pteridophytes

Q.52 Which statement is wrong-
(1) Eustele is found in stem of dicot & Gymnosperms
(2) Protostele is most primitive type of stele
(3) Dictyostele is the most advance type of stele
(4) Bicollateral V.B. are found in stem of family cucurbitaceae

EXERCISE – 2

PRIMARY STRUCTURE

Q.1 In dicot root vascular cambium derived from conjuctive tissue form -
(1) Sec. xylem and sec. medullary rays
(2) Sec. phloem & sec. xylem
(3) Sec. xylem, sec. phloem, primary and sec. medullary rays
(4) Sec. xylem, sec. phloem and sec. medullary rays

Q.2 Mesophyll is differentiated in to palisade and spongy tissues in -
(1) Some dicot deaves
(2) All dorsiventral leaves
(3) All monocot leaves
(4) All the isobilateral leaves

Q.3 Shape of guard cells in monocot plants is-
(1) Kidney shape
(2) Bean seeds shape
(3) Dumb-bell shape or bone shape
(4) Oval

Q.4 In monocots and dicots the number of cotyledons are normally 1 and 2 respectively in gymnosperm the number of cotyledons are -
(1) 1 or 2 (2) 3 – 18
(3) 2 - 3 (4) Zero

Q.5 Which of the following pair is correctly matched-
(1) Bicollatered V.B. - maize root
(2) Collateral & closed V.B. - *Cucurbita* stem
(3) Collateral & open V.B. - sunflower root
(4) Radial V.B. - orchid root

Q.6 Pericycle and endodermis is absent in-
(1) Maize stem & sunflower stem
(2) Maize stem & root
(3) Maize stem (4) All of the above

Q.7 Which statement is correct-
(1) Collateral V.B. are always open
(2) Bicollateral V.B. are always open
(3) Bulliform cells are present in bifacial leaf
(4) Concentric V.B. are always open

Q.8 Which statement is correct-
(1) Roots of all plants are photosyntheti
(2) In dicot root pith well developed
(3) In monocot root and dicot stem pith is well developed
(4) Passage cells are found in pericycle

Q.9 Eustele is found in -
(1) All dicot and monocot stem
(2) All dicot root and monocot stem
(3) Dicot stem
(4) Stem of dicot & gymnosperm

Q.10 In vertical section of a typical dicot leaf phloem in mid vein is situated -
(1) Facing the upper epidermis
(2) Facing the lower epidermis
(3) Facing sideway
(4) All round the xylem

Q.11 In which Y-shaped primary xylem is found-
(1) Dicot leaf (2) Monocot stem
(3) Monocot root (4) Dicot stem

Q.12 Monocot leaves are characterised by-
(1) Bulliform cells are absent
(2) Phloem on abaxial side
(3) Permanently open stomata
(4) Lack of differentiation between palisade and spongy tissue

Q.13 A transverse section of material shows many alternate patches of xylem and phloem almost in ring with a prominent pith, this will be-
(1) Dicot root (2) Dicot stem
(3) Monocot stem (4) Monocot root

Q.14 Which of the following set of characters are found in dicot stem but not in monocot stem-
(1) Phloem parenchyma, endodermis and vessels
(2) Cortex, pith and companian cell
(3) Endodermis, pericycle and phloem parenchyma
(4) Conjoint, collateral V.B.

Q.15 Characteristic feature of quiescent centre is-
(1) Cells have low amount of DNA, RNA and protein
(2) Cells are normally inactive
(3) Cells have small nuclei
(4) All are correct

Q.16 Most primitive and most advance stele in pteridophyta respectively-
(1) Protostele and atactostele
(2) Protostele and dictyostele
(3) Protostele and eustele
(4) Eustele and atactostele

Q.17 Hypodermis of dicot stem and monocot stem respectively composed of-
(1) Sclerenchyma and collenchyma
(2) Collenchyma and sclerenchyma
(3) Only collenchyma
(4) Only sclerenchyma

SECONDARY GROWTH

Q.18 Function of phellogen is to form the -
(1) Secondary xylem and phloem
(2) Secondary cortex and phloem
(3) Cork and secondary cortex
(4) Cork and wood

Q.19 Distinct annual rings occurs in plants growing in-
(1) Tropical region
(2) Arctic region
(3) Regions with seasonal changes
(4) Regions where no seasonal changes

Q.20 The cells forming phellogen are-
(1) Collenchymatous
(2) Parenchymatous
(3) Parenchymatous or collenchymatous
(4) Sclerenchymatous

Q.21 The function of heart wood in plants-
(1) Mechanical support
(2) Conduction of food
(3) Conduction of water
(4) Storage of food

Q.22 The youngest layer of secondary xylem in a 5 yrs. old dicot stem lies-
(1) Just outside the cambium
(2) Just inside the cambium
(3) Adjacent the pith
(4) Adjacent to cortex

Q.23 Which part of wood is light coloured, young and functionally active-
(1) Heart wood (2) Sap wood
(3) Soft wood (4) None

Q.24 Sap wood is-
(1) Outer part of secondary xylem
(2) Inner part of secondary xylem
(3) Outer part of secondary phloem
(4) Inner part of secondary phloem

Q.25 Ballon like in growth of xylem parenchyma into the lumen of vessels is known as-
(1) Tunica (2) Tyloses
(3) Phellogen (4) Phelloderm

Q.26 Where young secondary xylem cell may be found in a seven year old dicot stem -
(1) Just outside cambium
(2) Just inside cambium
(3) Just outside cork cambium
(4) Just inside cork cambium

Q.27 Living mechanical tissue devoid of lignin is-
(1) Parenchyma (2) Collenchyma
(3) Sclerenchyma (4) All the above

Q.28 The cells of xylem of early wood formed during early spring have-
(1) Wide lumen, thick walls
(2) Wide lumen, thin walls
(3) Narrow lumen and thin walls
(4) Narrow lumen and thick walls

Q.29 Which of the following is not the character of stem-
(1) Conjoint, collateral V.B.
(2) Endarch condition
(3) Exarch condition
(4) Presence of cuticle

Q.30 Which of these exhibits secondary growth-
(1) Gametophytes of pteridium
(2) Gymnosperm's stem and monocot stem
(3) Root and stem of gymnosperm and dicot
(4) Stem and leaf of gymnosperm and monocot

Q.31 Tyloses occur in-
(1) Primary xylem only
(2) Secondary xylem only
(3) Secondary and primary xylem
(4) Secondary xylem and secondary phloem

Q.32 In a woody dicot stem which wood is physiologically most active-
(1) Duramen
(2) Albernum & duramen
(3) Sap wood & heart wood
(4) Albernum or sap wood

Q.33 The youngest layer of sec. phloem in a woody dicot stem is located-
(1) Just outside pith
(2) Just outside the cambium
(3) Just inner side of primary xylem
(4) Just outside the primary xylem

Q.34 Fascicular cambium is the example of-
(1) Primary meristem
(2) Secondary meristem
(3) Primary and secondary meristem both
(4) Dedifferentiation

Q.35 Which statement is true-
(1) Albernum is central portion of wood
(2) Duramen is meant for ascent of sap
(3) Tyloses mainly occur in duramen
(4) In woody plant cambium functions for few years

Q.36 Duramen or heart wood is-
(1) Physiologically inactive part of wood
(2) Dark in colour
(3) Non conducting part of xylem in old stem
(4) All the above

Q.37 Secondary growth is due to-
(1) Ground meristem (2) Procambium
(3) Intercalary cambium
(4) Vascular cambium

Q.38 With increasing secondary growth in trees-
(1) Sap wood increases
(2) Heart wood increases
(3) Both (1) and (2)
(4) Both increases in equal quantities

Q.39 In dicot stem cork cambium derived from-
(1) Outer layer of cortex
(2) Pericycle
(3) Endodermis (4) Epidermis

Q.40 Which factor most affects the activity of cambium-
(1) Humidity (2) Temperature
(3) Winter (4) Availability of water

Q.41 The formation of distinct annual rings in stem mainly depends upon-
(1) Formation of cork cambium
(2) Unequal activity of cork cambium
(3) Contrasting seasonal variation
(4) Formation of unequal amount of phloem & xylem

Q.42 Annual rings are formed due to activity of-
(1) Extra stelar cambium
(2) Intrastelar cambium
(3) Sec. xylem and sec. phloem
(4) Extra stelar & intrastelar cambium

Q.43 In dicot root a part of vascular cambium is derived from-
(1) Endodermis opposite to protoxylem
(2) Pericycle opposite to phloem
(3) Pericycle opposite to protoxylem
(4) Endodermis opposite to phloem

Q.44 In dicot root and stem ring of cork cambium is respectively-
(1) Primary & secondary
(2) Secondary & primary
(3) Secondary meristem
(4) None of these

Q.45 The initial cambium arch in root arise from cells located just-
(1) Outer to phloem (2) Outer to xylem
(3) Inner to phloem
(4) Outer to xylem & inner to phloem

Q.46 Interxylary or included cork is formed in wood of-

(1) *Chenopodium* (2) *Epibolium*

(3) *Amaranthus* (4) *Dracena*

Q.47 Wood of which plant contain only tracheids-

(1) *Tectona* (2) *Ephedra*

(3) *Cycas* (4) *Gnetum*

Q.48 In dicot root pericycle form-

(1) Secondary roots

(2) Cork cambium

(3) Vascular cambium

(4) Lateral roots, phellogen and some part of V.C.

Q.49 In one year how many growth rings are formed in root-

(1) Two (2) One

(3) Many (4) None

Q.50 Youngest layer of sec. xylem is adjacent to-

(1) Pericycle (2) Vascular cambium

(3) Cortex (3) Pith

Q.51 Which of the following statement is correct about phellogen of stem-

(1) Phellogen is primary in origin

(2) Phellogen is secondary in origin

(3) Phellogen is example of apical meristem

(4) Phellogen is composed of parenchymatous & sclerenchymatous tissue

EXERCISE – 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Fibres are obtained from **[JIPMER 2002]**

(1) Xylem, phloem and sclerenchyma

(2) Xylem, phloem, sclerenchyma and epidermis

(3) Xylem, parenchyma, epidermis

(4) Xylem, parenchyma, endodermis

Q.2 The quiescent centre in root meristem serves as a **[AIIMS 2003]**

(1) Site for storage of food which is utilized during maturation

(2) Reservoir of growth hormones

(3) Reserve for replenishment of damaged cells of the meristem

(4) Region for absorption of water

Q.3 The outermost primary meristem gives rise to **[CPMT 2001]**

(1) Epidermis (2) Procambium

(3) Ground meristem (4) All of the above

Q.4 Root cap regenerates or produced from **[MP PMT 2003]**

(1) Calyptrogen

(2) Pleurome

(3) Periblem and histogen

(4) Dermatogen

Q.5 Tunica corpus theory was proposed by **[MP PMT 2001]**

(1) Schmidt (2) Strasburger

(3) Nageli (4) Hofmeister

Q.6 Vascular cambium of the root is an example of **[BHU 2000; AIIMS 2000]**

(1) Apical meristem

(2) Intercalary meristem

(3) Secondary meristem

(4) Root apical meristem

Q.7 Vascular cambium and cork cambium are examples of **[J&K CET (Med.) 2002]**

(1) Lateral meristem

(2) Apical meristem

(3) Elements of xylem and phloem

(4) Intercalary meristem

Q.8 Quiescent centre is found in **[CPMT 1993, 2002]**

(1) Stem (2) Root

(3) Leaves (4) None of these

Q.9 Grass stem elongates by the activity of **[APMEE 2002; KCET 2003]**

(1) Primary meristem

(2) Secondary meristem

(3) Intercalary meristem

(4) Apical meristem

Q.10 The calyptrogen of the root apex forms **[MP PMT 2003]**

(1) Rhizoids (2) Root nodule

(3) Root hairs (4) Root cap

Q.11 Aerenchyma is found in **[JIPMER 2001; CPMT 2002]**

(1) Lithophytes (2) Hydrophytes

(3) Sciophytes (4) Xerophytes

Q.12 Parenchymatous tissue is characterised by the **[JIPMER 2002]**

(1) Presence of uniform thickening

(2) Presence of thickening in the corners

(3) Presence of intercellular spaces

(4) Presence of lignified walls

Q.13 The difference in phloem of gymnosperms and angiosperms is due to **[RPMT 2002]**

(1) Parenchyma (2) Sieve cell

(3) Companion cell (4) Fibres

Q.14 Cork cambium is a **[CET Chd. 2001; J&K CET 2002]**

(1) Secondary meristem

(2) Apical meristem

(3) Intercalary meristem

(4) Primary meristem

Q.15 The complex tissues include **[BVP 2003]**

(1) Scleroids (2) Sclerenchyma

(3) Secretory tissues (4) Collenchyma

Q.16 The cell wall of xylem cells is rich in **[MPPMT 2002]**

(1) Lipid (2) Protein

(3) Lignin (4) Starch

Q.17 Root cap is absent in **[RPMT 2002]**

(1) Lithophytes (2) Hydrophytes

(3) Xerophytes (4) Mesophytes

Q.18 Which meristem helps in increasing girth **[RPMT 2002]**

(1) Lateral meristem (2) Intercalary meristem
(3) Primary meristem (4) Apical meristem

Q.19 Vessels are the major conducting element mainly found in **[J&K CET (Med.) 2002; KCET 2003]**

(1)Xylem of angiosperms
(2) Xylem of gymnosperms
(3) Both (1) and (2) (4) None of these

Q.20 Trachieds and vessels related to **[CPMT 2003]**

(1) Xylem (2) Phloem
(3) Both (4) None of these

Q.21 Passage cells are found in **[AIIMS 2002]**

(1) Dicot stem (2) Aerial root
(3) Monocot root (4) Monocot stem

Q.22 Vessels are found in **[CBSE PMT 2002]**

(1) All pteridophyta (2) All angiosperms
(3) Some gymnosperm
(4) Both (2) and (3)

Q.23 Axillary bud and terminal bud are derived from the activity of **[CBSE PMT 2002]**

(1) Parenchyma (2) Lateral meristem
(3) Apical meristem (4) Intercalary meristem

Q.24 Cells of quiescent centre are characterised by **[CPMT 2003]**

(1) Dense cytoplasm and prominent nuclei
(2) Light cytoplasm and small nuclei
(3) Dividing regularly to add to the corpus
(4) Dividing regularly to add to tunica

Q.25 Apical meristem of root is present **[CPMT 2003]**

(1) Only in radicles
(2) Only in tap roots
(3) Only in adventitious roots
(4) In all the roots

Q.26 Vessels occur in **[CPMT 2002]**

(1) All angiosperms, all gymnosperms and some pteridophytes
(2) All angiosperms, and some gymnosperms
(3) Most angiosperms, a few gymnosperms and pteridophytes
(4) All pteridophytes

Q.27 Which is correct **[CBSE 2002]**

(1) Tracheids are unicellular with wide lumen
(2) Vessels are multicellular with wide lumen
(3) Tracheids are multicellular with narrow lumen
(4) Vessels are unicellular with narrow lumen

Q.28 Which of the following are simple tissues **[CPMT 2000]**

(1) Parenchyma, xylem and phloem
(2) Parenchyma, collenchyma and sclerenchyma
(3) Parenchyma, xylem and collenchyma
(4) Parenchyma, xylem and sclerenchyma

Q.29 Diffuse porous woods are characteristics of plants growing in **[CBSE PMT 2003]**

(1) Alpine regions (2) Cold winter regions
(3)Temperate regions (4) Tropical regions

Q.30 Porous wood contains mainly **[AIIMS 2001]**

(1) Fibres (2) Vessels
(3) Trachieds (4) Solid secretions

Q.31 Bordered pits are very common in **[Wardha 2002]**

(1) Monocotyledons (2) Gymnosperms
(3) Dicotyledons (4) Pteridophytes

Q.32 Which of the following is known as wood **[AFMC 2003]**

(1) Primary xylem (2) Secondary xylem
(3) Secondary phloem (4) Cambium

Q.33 Conducting part of phloem according to Haberlandt (1914) is **[J & K CET (Med.) 2002]**

(1) Hadrom (2) Leptom
(3) Sterom (4) Bark

Q.34 Epidermis in stem is produced from **[BHU 2002]**

(1) Protoderm (2) Procambium
(3) Ground meristem (4) Calyptrogen

Q.35 Trabaculae is the transformation of **[MP PMT 2003]**

(1) Pericycle (2) Endodermis
(3) Xylem (4) Phloem

Q.36 Which of the following is absent in the primary and secondary structure of stem of Pinus **[AIIMS 2000]**

(1) Seive tubes (2) Mucilage duct
(3) Companion cells (4) Phloem parenchyma

Q.37 Epiblema in roots is derived from **[BHU 2002]**
(1) Protoderm (2) Procambium
(3) Ground meristem (4) Calyptrogen

Q.38 Procambium forms **[DPMT 2001]**
(1) Only primary vascular bundles
(2) Only vascular cambium
(3) Only cork cambium
(4) Primary vascular bundles and vascular cambium

Q.39 Periblem produces **[MP PMT 2001]**
(1) Cortex (2) Pericycle
(3) Vascular strand (4) Both (2) and (3)

Q.40 Cells taking part in conduction of sap are **[Kerala 2000]**
(1) Sieve tubes (2) Tracheae
(3) Sieve cells (4) Stone cells

Q.41 Function of vessels is **[BHU 2000]**
(1) Conduction of water and mineral
(2) Conduction of food
(3) Mechanical strength
(4) All of the above

Q.42 Why cambium is considered as lateral meristem **[RPMT 2002]**
(1) Because it gives rise to lateral branches
(2) Because it increases the girth of a plant
(3) Because it increases the length of a plant
(4) None of these

Q.43 Aerenchyma is helpful in plants by **[BVP 2003]**
(1) Providing buoyancy in hydrophytes
(2) Promoting photosynthesis
(3) Giving mechanical strength to plants
(4) Giving flexibility to plants

Q.44 The chief function of sieve tubes is **[MPPMT 2003]**
(1) To translocate the organic materials manufactured in the leaves
(2) To conduct minerals
(3) To transport water from root to leaves
(4) To help the plant in forming wood

Q.45 At maturity, which of the following is non-nucleated **[RPMT 2002; Wardha 2002]**
(1) Sieve cell (2) Companion cells
(3) Palisade cell (4) Cortical cell

Q.46 Which combination of tissues acts together to provide the support to the hypocotyl of a seedling **[BVP 2003]**
(1) Xylem and phloem fibres
(2) Epidermis and parenchyma
(3) Xylem and parenchyma
(4) Epidermis and collenchyma

Q.47 Senescence and death are essential in the functioning of **[Pb. PMT 2000]**
(1) Sieve tubes
(2) Companion cells
(3) Both (1) and (2)
(4) Xylem and Sclerenchyma cells

Q.48 The layer of cells outside the phloem meant for giving rise to the root branches is called **[Kerala CET (Med.) 2003]**
(1) Cambium (2) Corpus
(3) Endodermis (4) Pericycle

Q.49 The lateral roots generally originate in **[DPMT 2003]**
(1) Endodermal cells lying against phloem
(2) Cortex
(3) Pericycle cells lying against protoxylem
(4) Cork cambium

Q.50 In free floating plant, the stomata are **[AFMC 2000]**
(1) Absent
(2) Present on upper surface
(3) Present on both the surface
(4) Present on lower surface

Q.51 Cuticle is secreted by **[CPMT 2002]**
(1) Epidermis (2) Endodermis
(3) Both (1) and (2) (4) Hypodermis

Q.52 Which of the following do not have stomata **[AIIMS 2000]**
(1) Xerophytes
(2) Mesophytes
(3) Hydrophytes
(4) Submerged hydrophytes

Q.53 Passage cells are present in **[KCET (Med.) 2000]**
(1) Epidermis (2) Endodermis
(3) Xylem
(4) Lenticels and hydathodes

Q.54 Velamen tissue in orchids is found in **[RPMT 2002]**

(1) Shoot (2) Root

(3) Leaves (4) Flowers

Q.55 Which of the following have sunken stomata **[RPMT 2002]**

(1) Nerium (2) Mangifera

(3) Hydrilla (4) Zea mays

Q.56 Vascular bundles in the stem of Cucurbita or Lagenaria are **[BHU 2001]**

(1) Collateral (2) Bicollateral

(3) Radial (4) Inverted

Q.57 The bicollatoral vascular bundle is the characteristic feature of plants belonging to the family **[BHU 2001]**

(1) Cruciferae (2) Liliaceae

(3) Cucurbitaceae (4) Malvaceae

Q.58 Passage cells occur in **[AIIMS 2002]**

(1) Monocot root (2) Dicot root

(3) Monocot stem (4) Both (1) and (2)

Q.59 Stomata in Water Lily and Podostemon occur respectively **[BHU 2002]**

(1) Lower leaf surface and absent

(2) Upper leaf surface and absent

(3) Both leaf surface and upper part

(4) Absent in both

Q.60 Root hairs are found **[Kerala CET (Med.) 2003]**

(1) In the zone of maturation

(2) Adventitious roots

(3) On the root cap

(4) Apical meristem

Q.61 A concentric amphivasal (leptocentric) vascular bundle is one in which **[MPPMT 2001]**

(1) Centrally located phloem is surrounded by the xylem or xylem surrounds phloem

(2) Centrally located xylem is surrounded by phloem

(3) Xylem is flanked by phloem on the interior and exterior side only

(4) Phloem is flanked by the xylem on interior side only

Q.62 Vascular bundles in which phloem is found on both sides of xylem are called (in which of the following phloem occurs on two patches) **[BVP 2003]**

(1) Collateral

(2) Bicollateral (Amphiphloic)

(3) Radial

(4) Amphicribral

Q.63 Pericycle in roots is responsible for **[KCET (Med.) 2000]**

(1) Formation of lateral roots

(2) Providing mechanical support

(3) Formation of vascular bundle from cortex

(4) Formation of vascular bundle from endodermis

Q.64 Monocot stem has **[RPMT 2002; BHU 2002]**

(1) Bicollateral closed vascular bundles

(2) Bicollateral open vascular bundles

(3) Collateral open vascular bundles

(4) Collateral closed vascular bundles

Q.65 In monocot roots which types of vascular bundles are found **[BHU 2003]**

(1) Collateral, conjoint and closed

(2) Radial V.B. with exarch xylem

(3) Bicollateral, conjoint and closed

(4) Radial V.B. with endarch xylem

Q.66 Exarch and polyarch vascular bundles occur in **[MP PMT 2000]**

(1) Monocot stem (2) Monocot root

(3) Dicot stem (4) Dicot root

Q.67 Vascular bundles are scattered in **[Kerala CET (Med.) 2002]**

(1) Bryophytes (2) Dicot root

(3) Dicot stem (4) Monocot stem

Q.68 Dorsiventral leaf has **[Kerala CET (Med.) 2002]**

(1) Stomata on both side

(2) Stomata on lower surface

(3) Stomata on upper surface

(4) No stomata

Q.69 In the leaf vascular bundles are found in the **[Kerala CET (Med.) 2003]**

(1) Veins (2) Palisade tissue

(3) Lower epidermis (4) Upper epidermis

Q.70 In a dicotyledonous stem, the sequence of tissues from the outside to the inside is **[AIIMS 2003]**

(1) Phellem - Pericycle - Endodermis - Phloem
(2) Phellem - Phloem - Endodermis - Pericycle
(3) Phellem - Endodermis - Pericycle- Phloem
(4) Pericycle - Phellem - Endodermis - Phloem

Q.71 Hypodermis in monocotyledonous stem is **[Pb. PMT 2000]**

(1) Parenchymatous (2) Chlorenchymatous
(3) Collenchymatous (4) Sclerenchymatous

Q.72 In a dorsiventral leaf, protoxylem and metaxylem are located respectively **[RPMT 2002]**

(1) Abaxial and adaxial sides
(2) Adaxial and abaxial sides
(3) Adaxial and adaxial sides
(4) Abaxial and adaxial sides

Q.73 In a longitudinal section of a root, starting from the tip upward, the four zones occur in the following order **[CPMT 2004]**

(1) Cell division, cell enlargement, cell maturation, root cap
(2) Cell division, cell maturation, cell enlargement, root cap
(3) Root cap, cell division, cell enlargement, cell maturation
(4) Root cap, cell division, cell maturation, cell enlargement

Q.74 Intrafascicular cambium is situated in **[BVP 2003]**

(1) Out side the vascular bundles
(2) In medullary rays
(3) Inside the vascular bundles
(4) In between the vascular bundles

Q.75 The waxy substance associated with cell walls of cork cells is or cork cells are impervious to water because of the presence or what is deposited on cork cells **[MP PMT 2000]**

(1) Cutin (2) Suberin
(3) Lignin (4) Hemicellulose

Q.76 If four radial vascular bundles are present, then the structure will be **[CPMT 2002]**

(1) Monocot stem (2) Monocot root
(3) Dicot stem (4) Dicot root

Q.77 The functional xylem of dicot tree is **[AFMC 2001]**

(1) Sap wood (2) Hard wood
(3) Heart wood (4) Autumn wood

Q.78 Tyloses thickenings are seen in **[CPMT 2001]**

(1) Phloem cells
(2) Ray parenchyma only
(3) Collenchyma
(4) Ray parenchyma and xylem cells

Q.79 Main function of lenticel is **[CBSE PMT 2002]**

(1) Transpiration (2) Guttation
(3) Bleeding (4) Gaseous exchange

Q.80 Heart wood or duramen is **[KCET (Med.) 2001]**

(1) Outer region of secondary xylem
(2) Inner region of secondary xylem
(3) Outer region of secondary phloem
(4) Inner region of secondary phloem

Q.81 Wood is a common name of **[J & KCET (Med.) 2002]**

(1) Phloem (2) Secondary xylem
(3) Cambium (4) Vascular bundles

Q.82 Cambium is most active in **[AFMC 2003]**

(1) Summer (2) Winter
(3) All seasons (4) Snow areas

Q.83 Sap-wood is **[AFMC 2001]**

(1) Outer functional part of secondary xylem
(2) Inner nonfunctional part of secondary xylem
(3) Outer as well as inner part of secondary xylem
(4) None of the above

Q.84 Exchange of gases in old stems takes place from **[CPMT 2001]**

(1) Stomata (2) Hydathodes
(3) Lenticels (4) Passage cells

Q.85 Vascularisation in plants occurs through **[CPMT 2000]**

(1) Differentiation of procambium followed by primary phloem and then primary xylem
(2) Differentiation of procambium followed by development of xylem and phloem
(3) Simultaneous differentiation of procambium, xylem and phloem
(4) Differentiation of procambium is immediately followed by development of secondary xylem and secondary phloem

Q.86 Tyloses are **[BHU 2000]**

(1) Wound healing secretions

(2) Responsible for plugging the lumen of vessels

(3) Special epidermal hairs covering stomata in xerophytes

(4) Callus secretion on sieve plates

Q.87 Removal of ring wood of tissue outside the vascular cambium from the tree trunk kill it because **[CPMT 2002]**

(1) Water can not move up

(2) Food does not travel down and root become starved

(3) Shoot become starved

(4) Annual ring are not produced

Q.88 Leaves are situated on **[AFMC 2003]**

(1) Nodes (2) Internodes

(3) Tip (4) None of these

Q.89 Which of the following cell is totipotent **[KCET (Med.) 2000; AFMC 2000]**

(1) Meristem (2) Sieve tube

(3) Collenchyma (4) Xylem vessel

Q.90 Raphides are needle-like crystals of calcium oxalate which are specially found in **[CPMT 2000]**

(1) Pistia (2) Rose

(3) Asparagus (4) Dahlia

Q.91 Commercial cork is obtained from **[BHU 2003]**

(1) Mango (2) Oak (Quercus suber)

(3) Ficus religiosa (4) Pinus

Q.92 Wound healing is due to **[CPMT 2000]**

(1) Primary meristem (2) Secondary meristem

(3) Ventral meristem (4) All of the above

Q.93 Which of the following tissues is present in the leaves of Pinus to conduct water and food **[AFMC 2002]**

(1) Xylem

(2) Phloem

(3) Transfussion tissue

(4) Conducting tissue

Q.94 Protosteles are found in **[MPPMT 2002]**

(1) Bryophyta (2) Gymnosperms

(3) Pteridophyta (4) Angiosperms

Q.95 The most primitive type of stele is **[CPMT 2001]**

(1) Eustele (2) Solenostele

(3) Protostele (4) Siphonostele

Q.96 Stele consists of **[JIPMER 2000]**

(1) Phloem (2) Xylem

(3) Pericycle (4) All the above

Q.97 Lightest wood is **[JIPMER 2002]**

(1) Cereus giganteus (2) Ochroma lagopus

(3) Hardwickia binata (4) Cycas

Q.98 Inulin and raphide crystals are which type of plant products **[CPMT 2001]**

(1) Excretory (2) Inorganic

(3) Respiratory (4) Reserve material

Q.99 Which one of the following shows origin and evolution of steles **[CPMT 2001]**

(1) Bryophytes (2) Pteridophytes

(3) Gymnosperms (4) Angiosperms

Q.100 The stems of hydrophytic plants are soft and weak because of the poor development of **[JIPMER (Med,) 2002]**

(1) Pith and supporting parenchyma

(2) Phloem and companion cells

(3) Xylem and supporting tissue

(4) Cortex and endodermis

INTERNAL STRUCTURE OF ANGIOSPERMOUS PLANTS

MERISTEMS

Q.101 Tunica corpus theory was proposed by [**MPPMT 2001 ,Orissa 2007]**

(1) Schmidt (2) Nageli

(3) Hanstein (4) Wolf

Q.102 Crok cambium represents **[CETChd. 2001]**

(1) Secondary meristem

(2) Primary meristem

(3) Intercalary meristem

(4) Apical meristem

Q.103 Cambium produces growth in **[RPMT 2005]**

(1) Branches (2) Girth

(3) Pith (4) Cortex

Q.104 Vascular bundles grow from **[WB 2009]**
(1) Protoderm (2) Periderm
(3) Ground meristem (4) Procambium

Q.105 Tunica coropus theory is connected with **[Orissa 2009]**
(1) Root apex (2) Root cap
(3) Shoot apex (4) Secondary growth

Q.106 Which meristem helps in increasing girth? **[CET Chd. 2006]**
(1) Lateral meristem / cambium
(2) Intercalary meristem
(3) Primary meristem
(4) Apical meristem

Q.107 Procambium forms **[WB 2007]**
(1) Only primary vasular bundles
(2) Only vascular cambiu
(3) Only cork cambium
(4) Primary vascular bundles and vascular cambium

Q.108 Quiescent centre occurs in **[CPMT 2002, 2005, WB 2010]**
(1) Shoot apex (2) Root apex
(3) Both A and B (4) Meristematic tissue

Q.109 Intercalary meristem produces **[Kerala 2004, Har. PMT 2007]**
(1) Secondary growth
(2) Primary growth
(3) Apical growth
(4) Secondary thickeing
(5) Secondary overgrowth

Q.110 Histogen tissues are classified on the basis of **[Manipal 2005]**
(1) Plane of division
(2) Type of cells they form
(3) Position
(4) Origin

Q.111 Meristematic cells are characterised by **[Manipal 2005]**
(1) Thin cell walls and large intercellular spaces
(2) Thin cell walls and no intercellular spaces
(3) Thick cell walls and large intercellular spaces
(4) Thick cell walls and small intercellular spaces

Q.112 Quiescent centre is region of root apex which is
(1) Actively dividing
(2) Water absorption area
(3) Inactive cells
(4) Root hair cells

Q.113 Which one is not formed from procambium? **[Wardha 2005]**
(1) Xylem
(2) Phloem
(3) Intrafascicular cambium
(4) Interfascicular cambium

Q.114 ..... is an exmple of secondary meristem **[COMED- K's 2006]**
(1) Xylem (2) Phloem
(3) Phloem (4) Cork cambium

Q.115 Outermost primary meristem forms **[AMUPMDC 2006]**
(1) Epidermis (2) Procambium
(3) Ground meristem (4) All the above

Q.116 Vascullar cambium of dicot stem is **[Manipur 2006]**
(1) Apical meristem (2) Intercalary meristem
(3) Local meristem (4) Secondary meristem

Q.117 Cells of quiescent centre have lower concentration of **[CET Chd. 2006]**
(1) DNA (2) Proteins
(3) RNA (4) All the above

Q.118 Length of petiole increases by the activity of **[CPMT 2007]**
(1) Apical meristem (2) Lateral meristem
(3) Intercalary meristem
(4) All the above

Q.119 Intercalary meristem is derivative of **[KCET 2008]**
(1) Promeristem (2) Primary meristem
(3) Lateral meristem (4) Secondary meristem

Q.120 Dividing cells not yet committed to become specific cell type are **[CPMED- K's 2008]**
(1) Epidermal cells (2) Ground cells
(3) Periderm cells (4) Meristem cells

Q.121 Shoot apical meristem occurs over the tip of **[Orissa 2008]**

(1) Root (2) Radicle
(3) Plumule (4) Mesocotyl

Q.122 In dicot stems, vascular cambium is formed from **[Orissa 2008]**

(1) Procambium (2) Cambium
(3) Promeristem (4) Protoderm

Q.123 Cambium is lateral meristem that takes part in **[MHTCET 2008]**

(1) Internodal growth
(2) Axial growth
(3) Growth of Branches
(4) Increasing girth of stem and root

Q.124 Vascular tissues of flowering plant develp from **[CBSE 2008]**

(1) Dermatogen (2) Periblem
(3) Plerome (4) Phellogen

Q.125 Length of different internodes in culm of sugarcane is variable due to **[CBSE 2008]**

(1)Shoot apical meristem
(2) Position of axillary buds
(3) Intercalary meristem
(4) Size of leaf lamina at the node below each internode

Q.126 Lateral meristems are **[KCET 2009, 2010]**

(1) Phellogen and procambium
(2) Procambium and dermatogen
(3) Fascicular cambium and procambium
(4) Fascicular cambium and cork combium

Q.127 Interfascicular cambium is **[COMED- K's 2009]**

(1) Intercalary meristem
(2) Secondary meristem
(3) Apical meristem
(4) Noncalary meristem

Q.128 What is correct answer of **Assertion (A)** and **Reason (R)** **[EAMCET 2009]**

A.: Apical and intercalary meristem contribute to the growth in length while the lateral meristems bring increase in girth in Mazie.

R.: Apical and intercalary meristems always increase the height of plants

(1) Both **A** and **R** are true with **R** being correct eplanation of **A**
(2) Both **A** and **R** are true but **R** is not the correct eplanation of **A**
(3) **A** is true but **R** is false
(4) **A** is false but **R** is trye

Q.129 Histogens are components of **[COMED - K's 2010]**

(1) Secondary phellogen
(2) Apical meristem
(3) Lateral meristem
(4) Intercalary meristem

Q.130 Which one of the following is not a lateral meristem **[CBSE 2010]**

(1) Interfascicular cambium
(2) Phellogen
(3) Intercalary meristem
(4) Intrafascicular cambium

Q.131 Meristem that is parallel to the longitudinal axis of the plant is **[JKCMEE 2010]**

(1) Procambium
(2) Intercalary meristem
(3) Phellogen
(4) Apical meristem

PERMANENT TISSUES

Q.132 The tissue which has dead cells in the functional state is **[CET Chd. 2009]**

(1) Collenchyma (2) Sclerenchyma
(3) Parenchyma (4) Phloem

Q.133 Albuminous cells occurs in **[COMED- K's 2008]**

(1) Xylem (2) Phloem
(3) Cortex
(4) Conjunctive parenchyma

Q.134 Which group possesses vessels in its xylem **[Har. PMT 2005]**

(1) Pteridophytes (2) Angiosperms
(3) Gymnosperms (4) Both B and C

Q.135 The only plant cells without nucleus among the following are **[CET Chd. 2009]**

(1) Cambium
(2) Xylem vessels elements
(3) Root hairs (4) Companion cells

Q.136 Epidermal fibres of economic importance belong to **[MPPMT 2009]**

(1) Cotton (2) Flax
(3) Hemp (4) Coir

Q.137 Sieve tubes are constituent of **[WB 2008]**

(1) Wood (2) Vascular cambium
(3) Phellem (4) Bast

Q.138 A closed collateral bundle is one where **[Orissa 2008, AFMC 2010]**

(1) Xylem and phloem occur on different radii
(2) Collateral bundle without cambium
(3) Xylem and phloem are separated by cambium
(4) Collateral bundle with cambium

Q.139 Anatomically Jute fibres are **[MPPMT 2004, COMED-K's 2008]**

(1) Xylem fibers (2) Cortial fibers
(3) Pith fibers (4) Phloem fibers

Q.140 Jute of commerce is got from **[MPPMT 2001, DPMT 2009]**

(1) Primary phloem (2) Secondary pholem
(3) Secondary xylem (4) Primary xylem

Q.141 Which is correct

(1) Tracheids are unicellular with wide lumen
(2) Vessels are multicellular with wide lumen
(3) Tracheids are unicellular with narrow lumen
(4) Vessels are multicellular with narrow lumen

Q.142 Which one of the following statements pertaining to plant structure is correct? **[AIIMS 2005]**

(1) Cork lacks stomata but lenticels carry out transpiration
(2) Passage cells help in transfer of food from cortex to phloem
(3) Sieve tube elements possess cytoplasm but no nuclei
(4) The shoot apical meristem has a quiescent centre.

Q.143 Identify the plant tissue in which lignin is absent **[KCET 2005]**

(1) Collenchyma (2) Sclerenchyma fibres
(3) Sclereids (4) Xylem tracheids

Q.144 Pith or central part of ground tissue is made of **[JKCMEE 2005]**

(1) Collenchyma (2) Parenchyma
(3) Chlorenchyma (4) Sclerenchyma

Q.145 Vascular bundles having phloem on the periphery of both outer and inner cambium are **[DPMT 2005]**

(1) Bicollateral closed (2) Bicollateral open
(3) Radial (4) Biradial

Q.146 Find out the correct ones in the following table: **[EAMCET 2005]**

	Tissue Structure	**Features**	**Function**
1.	Collenchyma	Cell wall with water content	Photosynthesis in young stems
2.	Parenchyma	Suberised cell walls	Storage of food
3.	Sclerenchyma	Lignified cell walls	Mechanical strength
4.	Digestive glands	Dense cytoplasm without water	Breaking substrate

(1) 1 and 2 (2) 2 and 3
(3) 1 and 4 (4) 1 and 3

Q.147 Living part of xylem is **[RPMT 205]**

(1) Xylem tracheids (2) Xylem vessels
(3) Parenchyma (4) None of the above

Q.148 Which is least differentiated? **[Manipal 2005]**

(1) Simple tissues
(2) Parenchyma
(3) Circulatory tissues
(4) Complex tissues

Q.149 The term parenchyma was coined by **[Manipal 2005]**

(1) Hooke (2) Schleiden
(3) Grew (4) Mettenius

Q.150 P-protein occurs in **[CPMT 2005]**

(1) Sieve tube elements
(2) Tracheids
(3) Vessels
(4) Phloem parenchyma

Q.151 Companion cells are fiound in **[Manipur 2005, MPPMT 2010]**

(1) Epidermis (2) Cambium
(3) Xylem (4) Phloem

Q.152 Common feature in vessel elements and sieve tube elements is **[CBSE 2006]**

(1) Enucleate condition

(2) Presence of p-protein

(3) Thick secondary wall

(4) Pores on lateral walls

Q.153 In sieve elements, the possible functionof P-proteins is **[AIIMS 2006]**

(1) Autolytic enzymes

(2) Sealing mechanism on wounding

(3) Providing energy for active translocation

(4) Deposition of callose on sieve plates

Q.154 Bicollateral conjoint vascular bundle possess **[Kerala 2006]**

(1) Xylem and phloem on alternate radii

(2) Phloem surrounds xylem

(3) Xylem surrounds phloem

(4) Xylem and phloem on same radius with two groups of phloem, on the two side of xylem

(5) Xylem and phloem on same radius with one group of phloem outside xylem

Q.155 Match the columns **[Kerala 2006]**

Column I	**Column II**
(a) Xylem vessels	1. Store food material
(b) Xylemtracheids	2. Obliterated lumen
(c) Xylem fibre	3. Perforated plates
(d) Xylem parenchyma	4. Chisel–like ends

(1) a – 3, b – 4, c – 2, d – 1

(2) a – 4, b – 3, c – 2, d – 1

(3) a – 3, b – 2, c – 1, d – 4

(4) a – 2, b – 1, c – 4, d – 3

(5) a – 1, b – 2, c – 3, d – 4

Q.156 Bordered pits are elongated transversely and arranged in vertical series. The pattern is known as **[CET Chd. 2006]**

(1) Scalariform pitting

(2) Intervascular pitting

(3) Reticulate thickening

(4) Oblique pitting

Q.157 Trichomes take part in **[JKCMEE 2007]**

(1) Transpiration and exchange of gases

(2) Protection and reduction of transpiration

(3) Exudation of water drops

(4) Desiccation

Q.158 Simple sieve plate occurs in **[JKCMEE 2007]**

(1) Cucurbita (2) Vitis

(3) Pyrus (4) Prunus

Q.159 Lacunate collenchyma is found in the stem of **[JKCMEE 2007]**

(1) Leucas (2) Monstera

(3) Cucurbita (4) Sambucus

Q.160 Angiosperm lacking vessels is **[JKCMEE 2007]**

(1) Mangifera (2) Dillenia

(3) Magnolia (4) Drimys

Q.161 Sclereids found in seed coat of pulses are **[COMED-K's 2007]**

(1) Marcrosclereids (2) Brachysclereids

(3) Osteosclreids (4) Asterosclereids

Q.162 Xylem produced through centrifugal differentiation is **[COMED - K's 2007]**

(1) Exarch (2) Endarch

(3) Measarch (4) Centrarch

Q.163 Which is wrong about sieve tube elements **[Kerala 2007]**

(1) Peripheral cytoplasm and large vacuole

(2) Perforated end wall becomes impregnated with lignin

(3) P-proteins occurs evenly distributed throughout lumen

(4) Absence of nucleus at maturity

(5) Tube – like structures present in longitudnal series

Q.164 Collenchyma is **[CPMT 2007]**

(1) Living with no reserve food

(2) Living with protoplasm

(3) Dead and hollow

(4) Dead with reserve food

Q.165 Vessels and companion cells occur in **[MPPMT 2007]**

(1) Thallophytes (2) Bryophytes

(3) Pteridophytes (4) Angiosperms

Q.166 Which ones are correct **[Kerala 2008]**

(a) Uneven thickeing of cell wall is characteristic of sclerenchyma

(b) Periblem forms cortex of stem and root

(c) Tracheids are chief water conducting elements in gymnosperms

(d) Commercial cell is devoid of nucleus at maturity

(e) Commercial cork is obtained from Quercus suber

(1) b, c, e (2) a, d

(3) b, e (4) c, d

(5) a, b, c

Q.167 In a vascular bundle, xylem shows centripetal develpment. It is **[KCET 2008]**

(1) Centrarch (2) Mesarch

(3) Endarch (4) Exarch

Q.168 Which pair has lignin in both **[WB 2008]**

(1) Tracheid and collenchyma

(2) Sclerenchyma and sieve tube

(3) Sclerenchyma and tracheids

(4) Parenchyma and endodermis

Q.169 Parenchymatous cells filling the space between dermal and vascular tissue is **[Orissa 2008]**

(1) Ground tissue

(2) Epidermal tissue

(3) Pith (4) Vascular bundles

Q.170 Match the column

Column I	**Column II**
(a) Extrafoliar nectaries	1. Acharas
(b) Schizogenous cavities	2. Tropaelum
(c) Laticiferous ducts	3. Passiflora
(d) Hydathodes	4. Eucalyptus
	5. Pinus

(1) a – 3, b – 1, c – 2, d – 4

(2) a – 3, b – 5, c – 1, d – 2

(3) a – 2, b – 1, c – 3, d – 4

(4) a – 5, b – 2, c – 1, d – 3

Q.171 Senescence is an active developmental cellular processes in the growth and functioning of a flowering plant, is indicated in **[CBSE 2008]**

(1) Annual plants (2) Floral parts

(3) Leaf abscission

(4) Vessels and tracheids

Q.172 Tissue cells commonly found in friut walls of nuts and pulp of some fruits like guava are called **[AMU 2009]**

(1) Fibres (2) Sclereids

(3) Tracheids (4) Vessels

Q.173 At maturity sieve plates become impregnated with **[Kerala 2009]**

(1) Cellulose (2) Suberin

(3) Callose (4) Lignin

(5) Pectin

Q.174 Choose the correct options **[Kerala 2009]**

(a) Thread like cytoplasmic strands, running from one cell to other are known as plasmodesmata

(b) Xylem and phloem constitute the vascular bundle of the stem

(c) First formed xylem elements are described as metaxylem

(d) Radial bundles are mainly found in leaves

(1) a, b true c, d wrong

(2) d true a, b, c wrong

(3) d true a, b, d wrong

(4) b true a, c, d wrong

(5) a true b, c, d wrong

Q.175 Which one consists of living cells **[MPPMT 2009]**

(1) Vessels (2) Tracheids

(3) Companion cells (4) Sclerenchyma

Q.176 Annular and spirally thickened conducting element generally develop in protoxylem when root or stem is **[CBSE 2009]**

(1) Widening (2) Differentiating

(3) Maturing (4) Elongating

Q.177 Which one is enucleated **[CPMT 2009]**

(1) Companion cell (2) Sieve cell

(3) Tracheid (4) Vessel

Q.178 Which of the following is a complex tissue **[CPMT 2010]**

(1) Parenchyma (2) Collenchyma

(3) Xylem (4) Sclerenchyma

Q.179 Compare the statements A and B

A : Sclerenchyma cells do not have plasmodesmata

B : Cell walls of some permanent tissue are heavilly lignified.

(1) Statement a is correct and b is wrong

(2) Both the statements a and b are wrong

(3) Both the statements a and b are correct

(4) Statement a is wrong and b is correct

Q.180 The activity of sieve tubes is remotely controlled by the protoplasm of **[COMED - K's 2010]**

(1) Phloem parenchyma

(2) Companion cells

(3) Phloem fibres

(4) Both phloem parenchyma and phloem fidres

Q.181 Find the incorrect statement **[AMU 2010]**

(1) Root hairs are unicellular elongations

(2) Trichomes are unicellular elongations

(3) Trichomes are mutlicellular elongations

(4) Root hairs absorb water and minerals

Q.182 The arrangement of xylem in stem is **[Orissa 2010]**

(1) Endarch (2) Mesarch

(3) Exarch (4) Both A and B

Q.183 Which of the following is not part of epidermal tissue system **[Keerala 2010]**

(1) Trichomes (2) Companion cells

(3) Guard cells (4) Subsidiary cells

(5) Root hairs

Q.184 Which of the following statements is true **[Kerala 2010]**

(1) Collenchyma occurs in layers below epidermis

(2) Xylem parenchyma cells are living, thin walled and lignified

(3) Sclerenchyma cells are usually dead and without protoplasts

(4) Companion cells are specialised sclerenchyma cells

(5) Phloem fibres are generally present in primary phloem

Q.185 Transport of food material in higher plants takes place through **[CBSE Main 2010]**

(1) Companion cells (2) Sieve elements

(3) Tracheids (4) Transfusion tissue

Q.186 Cotton fibre is basically a type of **[WB 2010]**

(1) Trichome (2) Scale

(3) Dried seed coat (4) Nonglandular hair

ANATOMY OF PLANT PARTS

Q.187 Heart wood is **[HPPMT 2010]**

(1) Outer part of secondary xylem

(2) Inner part of secondary xylem

(3) Outer part of secondary phloem

(4) Inner part of secondary phloem

Q.188 As the secondary growth takes place (proceeds) in a tree, thickness of **[KCET 2006]**

(1) Heart wood increases

(2) Sap – wood increases

(3) Both increases

(4) Both remain the same

Q.189 The bark of tree commonly comprises **[CET Chd. 2006]**

(1) All the tissue outside the vascular cambium

(2) All the tissue outside the cork cambium

(3) Only the cork

(4) The cork and secondary cortex

Q.190 Well developed pith is found in **[KCET 2008]**

(1) Monocot root and monocot stem

(2) Monocot stem and dicot root

(3) Monocot root and dicot stem

(4) Dicot root and dicot stem

Q.191 Cork is formed from **[AFMC 2005]**

(1) Cork cambium (phellogen)

(2) Vascular cambium

(3) Phloem (4) Xylem

Q.192 Function of cork cambium is to producce **[Orissa 2010]**

(1) Secondary xylem and secondary phloem

(2) Cork and secondary cortex

(3) Secondary cortex and phloem

(4) Cork

Q.193 Monocot root differs from dicot root in having **[RPMT 2005]**

(1) Open vascular bundles

(2) Scattered vascular bundles

(3) Well developed pith

(4) radially arranged vascular bundles

Q.194 Where do the casparian bands occur **[Orissa 2005, RPMT 2006]**

(1) Epidermis (2) Endodermis

(3) Pericyle (4) Phloem

Q.195 Growth / annual rings are formed by the actively of **[Manipur 20007]**

(1) Cambium (2) Xylem

(3) Phloem

(4) Both xylem and phloem

Q.196 Tyloses occur in **[KCET 2010]**

(1) Secondary xylem (2) Secondary phloem

(3) Callus tissue (4) Cork cells

Q.197 Exchange of gases between air and internal tissue of older corky stem takes place through **[HPPMT 2007, Kerala 2010]**

(1) Sieve tube (2) Pits

(3) Stomata (4) Lenticels

Q.198 In roots, lateral branches grow from **[DPMT 2003, KCET 2007]**

(1) Epiblema (2) Pericycle

(3) Cortex (4) Endodermis

Q.199 Sunken stomata occur in **[Orissa 2008]**

(1) Mesophytes (2) Xerophytes

(3) Hygrophytes (4) Hydrophytes

Q.200 Mesophyll is differentiated into palisade and spongy tissues in **[Orissa 2008]**

(1) Extermely xerophytic leaves

(2) Hydrophytic leaves

(3) Monocot leaves

(4) Dicot leaves

Q.201 Bulliform or motor cells occur in **[Har. PMT 2007]**

(1) Upper epidermis of dicot leaves

(2) Upper epidermis of monocot leaves

(3) Lower epidermis of monocot leaves

(4) Lower epidermis of dicot leaves

Q.202 Poyarch and exarch condition is found in **[MPPMT 2000, CPMT 2007]**

(1) Monocot stem (2) Monocot root

(3) Dicot stem (4) Dicot root

Q.203 Meristem present in a vascular bundle is **[MPPMT 2007]**

(1) Fascicular / Intrafascicular cambium

(2) Intrafascicular cambium

(3) Phellogen

(4) Procambium

Q.204 Fusiform intials produce **[MPPMT 2007]**

(1) Vascular rays

(2) Primary phloem

(3) Tracheary elements

(4) Ray parenchyma

Q.205 Outer lighter colured / alburnum region of wood is **[JKCMEE 2008, Kerala 2009]**

(1) Autumn wood (2) Spring wood

(3) Heart wood (4) Sapwood

Q.206 In monocots **[CPMT 2010]**

(1) Leaves have reticulate venation

(2) Stems annual rings

(3) Seeds have two storage organs

(4) Stems have scattered conducting starnds

Q.207 Cork cambium is also called **[Har. PMT 2005, BV 2006]**

(1) Phelloderm (2) Phellem

(3) Periderm (4) Phellogen

Q.208 Periderm is produced by **[JKCMEE 2007]**

(1) Vascular cambium

(2) Fascicular cambium

(3) Phellogen

(4) Intrafascicular cambium

Q.209 Common features between lenticles and hydathodes are **[AMUPMDC 2006]**

(1) Allow exchange of gases

(2) Always remain closed

(3) There is no regulation of their opening and closing

(4) They occur on the same organ of the plant

Q.210 Endodermis of dicot stem is also called **[AMU 2009]**

(1) Bundle sheath (2) Starch sheath

(3) Mesophyll (4) Water channel

Q.211 Endodermis is part of **[BV 2006]**

(1) Medulla (2) Stele

(3) Cortex (4) Exodermis

Q.212 Functional xylem of dicot tree is **[COMED K's 2009]**

(1) Sap wood (2) Autumn wood

(3) Heart wood (4) Hard wood

Q.213 Tyloses are thickenings seen in **[AMUPMDC 2006, BHU 2008]**

(1) Ray parenchyma (2) Collenchyma

(3) Phloem cells

(4) Ray parenchyma and xylem cells

Q.214 Casparian strips contain **[HPPMT 2005]**

(1) Cutin (2) Pectin

(3) Suberin (4) Wax

Q.215 A monocot showing secondary growth is **[CET Chd. 2010]**

(1) Coconut (2) Sugarcane

(3) Mazie (4) Yucca

Q.216 Scattered vascular bundles occur in **[Kerala 2002, Orissa 2007]**

(1) Pteridophytes (2) Gymnosperms

(3) Monocots (4) Dicots

(5) Bryophytes

Q.217 Vascular cambium of stem is **[JKCMEE 2004, Kerala 2008]**

(1) Primary meristem

(2) Partly primary and partly secondary

(3) Secondary meristem

(4) Intercalary meristem

Q.218 Growth rings are formed by the activity of **[CPMT 2004, Pb. PMT 2007]**

(1) Extrastelar cambium

(2) Intrastelar cambium

(3) Interstelar cambium

(4) Both B and C

Q.219 Inner darker, harder portion of secondary xylem that cannot conduct water in older dicot stem is called **[KCET 2005, BHU 2006]**

(1) Alburnum (2) Bast

(3) Duramen (4) Wood

Q.220 Epiblema is the name of **[DPMT 2005]**

(1) Epidermis of leaf

(2) Epidermis of stem

(3) Epidermis of dicot root

(4) Epidermis of both dicot and monocot roots

Q.221 Choose the correct combination of labelling of the lenticel **[Kerala 2005]**

(1) a – pore, b – complementary cells, c – cork, d – cork cambium, e – secondary cortex

(2) a – pore, b – secondary cortex, c – cork, d – cork cambium, e – complementary cells

(3) a – pore, b – cork cambium, c – secondary cortex, d – cork, e – complementary cells

(4) a – pore, b – cork , c – complementary cells, d – cork cambium, e – secondary cortex

(5) a – pore, b – cork , c – cork cambium, d – secondary cortex, e – complementary cells

Q.222 Correct sequnce of layers from outside to inside of a typical monocot root is **[CPMT 2005]**

(1) Epiblema, endodermis, cortex, pericycle

(2) Pericycle, cortex, endodermis, epiblema

(3) Epiblema, cortex, endodermis, pericycle

(4) Epiblema, pericycle, cortex, endodermis

Q.223 **(A) :** All the endodermal cells of the root do not contain casparian thickenings on their radial walls and transverse walls.

(R) : Passage cells are found in endodermis. **[EAMCET 2005]**

(1) Both (A) and (R) are true. (R) is correct explanation of (A)

(2) Both (A) and (R) are true. (R) is not correct explanation of (A)

(3) (A) is true but (R) is false

(4) (A) is false but (R) is true

Q.224 Identify correct order of components with reference to their arrangement from outside to inner side in a woody dicot stem **[EAMCET 2005]**

1. Secondary cortex 2. Autumn wood

3. Secondary phloem 4. Phellum

(1) 2, 3, 1, 4 (2) 4, 1, 3, 2

(3) 1, 2, 4, 3 (4) 3, 4, 2, 1

Q.225 Palisade parenchyma is present on both sides in **[RPMT 2005]**

(1) Nerium (2) Eucalyptus

(3) Wheat (4) Both A and B

Q.226 Tyloses are baloon-like ingrowths in vessels developing from adjoining **[Pb. PMT 2005]**

(1) Parenchyma through pits in vessel wall

(2) Parenchyma through general surface of vessel wall

(3) Fibers through general surface of vessel wall

(4) Fibers through pits in vessel wall

Q.227 Casparian thicknings ocur in the cells of **[KCET 2006]**

(1) Pericycle of stem (2) Endodermis of stem

(3) Pericycle of root (4) Endodermis of root

Q.228 Large nearly empty, colourless cells present on upper surface of grass leaf are **[Kerala 2006]**

(1) Accessory cells (2) Bulliform cells

(3) Palisade parenchyma

(4) Spongy parenchyma

(5) Passage cells

Q.229 Which of the following is/are not true? **[Kerala 2006]**

(a) Cork cambium is otherwise called phellogen

(b) Cork is otherwise called phellem

(c) Secondary cortx is otherwise called periderm

(d) Cork cambium, cork and secondary cortex are collectively called phelloderm

(1) b and d only (2) b and c only

(3) c and b only (4) a and b only

(5) a and d only

Q.230 Collateral open vascular bundles and eustele are found in **[RPMT 2006]**

(1) Dicot root (2) Dicot stem

(3) Monocot stem (4) Monocot root

Q.231 Radial vascular bundles occur in **[RPMT 2006]**

(1) Dicot root (2) Monocot root

(3) All roots (4) Dicot stem

Q.232 Vascular cabium produces **[RPMT 2006]**

(1) Secondary xylem and secondary phloem

(2) Secondary xylem only

(3) Secondary Phloem only

(4) Primary xylem and primary phloem

Q.233 Phellogen is also known as **[BHU 2007]**

(1) Vascular cambium (2) Periderm

(3) Cork cambium (4) Apical cambium

Q.234 Which one is/are not true **[Kerala 2007]**

(a) Crok cambium is called phellogen

(b) Crok is called phellogen

(c) Secondary cortex is called periderm

(d) Secondary cambium, cork and secondary cortex are collectively called phelloderm

(1) a and d only (2) a and b only

(3) b and c only (4) b and d only

(5) a and d only

Q.235 Cambium ring consists of **[COMED - K's 2007]**

(1) Interfascicular cambium

(2) Intrafascicular cambium

(3) Both A and B (4) Phelloderm

Q.236 Endodermis takes part in **[CPMT 2007]**

(1) Providing protection

(2) Preventing water loss from stele

(3) Maintaining rigidity

(4) All the above

Q.237 In autumn and winter, cambium produces **[Orissa 2007]**

(1) Sap wood (2) Heart wood

(3) Early wood (4) Late wood

Q.238 Cells of grass leaves which help in minimising cuticular transpiration are **[Orissa 2007]**

(1) Bulliform cells (2) Guard cells

(3) Subsidiary cells (4) Endodermal cells

Q.239 Cork cambium is **[Orissa 2007]**

(1) Primary meristem (2) Apical meristem

(3) Secondary meristem

(4) Intercalary meristem

Q.240 Secondary growth is best observed in **[CBSE 2007]**

(1) Teak and Pine (2) Deodar and Fren

(3) Wheat and Maiden Hair Fern

(4) Sugarcane and Sunflower.

Q.241 Passage cells are thin walled cells found in **[CBSE 2007]**

(1) Phloem elements to serve as entry points
(2) Testa of seeds for emergence of embryonal axis
(3) Central area of style for passage of pollen tube
(4) Endodermis of roots to facilitate rapid transport of water from cortex to pericycle

Q.242 Find out the correct and incorrect statements **[Kerala 2008]**

(a) In dicot root, the vascular bundles are collateral and endarch
(b) Innermost layer of cortex in a dicot root is endodermis
(c) In dicot root, phloem and xylem bundles are separated by conjunctive tissue

(1) a true, b, c false (2) b true, a, c false
(3) a false, b, c true (4) b false, a, c true
(5) c true, a, b false

Q.243 Closing layers of lenticels show deposition of **[COMED - K's 2008]**

(1) Cutin (2) Lignin
(3) Pectin (4) Suberin

Q.244 What differentiates a dicot leaf from monocot leaf **[BHU 2008]**

(1) Stomata only on upper side
(2) Differentiation of palisade and spongy parenchyma
(3) Parallel venation
(4) Stomata on upper and lower sides

Q.245 Cellular layers from outside to inside in old dicot stem are **[KCET 2008]**

(1) Epidermis, phellem, phellogen, phelloderm
(2) Epidermis, hypodermis, cortex,endodermis
(3) Epidermis, phellogen, phellem,endodermis
(4) Epidermis, hypodermis, phellogen, phelloderm

Q.246 Older resin–clogged central secondary xylem and younger outer secondary xylem are respectively known as **[COMED - K's 2008]**

(1) Alburnum and duramen
(2) Duramen and alburnum
(3) Autumn wood and springwood
(4) Springwood and autumn wood

Q.247 Which character is not associated with plant where Shull studied inbreeding depression while Miller and Letham extracted a hormone from its seeds **[EAMCET 2008]**

(1) Atactostele in stem
(2) Bundle sheath in leaf
(3) Chromosome number 30 in endosperm
(4) Medulla absent in root

Q.248 Condition found in roots of a plant having assimilatory submerged roots and spongy petioles **[EAMCET 2008]**

(1) Tetrarch (2) Triarch
(3) Monarch (4) Mature stem

Q.249 Cuticle is absent in **[DPMT 2009]**

(1) Mesophytes (2) Young roots
(3) Leaves (4) Mature stem

Q.250 In an annual ring, the light coloured part is **[DPMT 2009]**

(1) Heart wood (2) Sapwood
(3) Early wood (4) Late wood

Q.251 What is true about heartwood **[KCET 2009]**

(a) It does not help in water conduction
(b) It is also called alburnum
(c) It is dark in colour but is very soft
(d) It has tracheary elements which are filled with tannins, resins, etc

(1) b, c, d (2) a, b, c
(3) b, d (4) a, d

Q.252 Pith parenchyma generally lacks **[COMED-K's 2009]**

(1) Vacuole (2) Chloroplasts
(3) Mitochondria (4) Nucleus

Q.253 Tetrarch bundles occur in **[COMED-K's 2009]**

(1) Leaf of Cicer arietinum
(2) Leaf of Pisum sativum
(3) Root of Cicer arietinum
(4) Root of Zea mays

Q.254 Which is not part of periderm **[COMED-K's 2009]**

(1) Phellogen (2) Cork
(3) Secondary cortex (4) Wood

Q.255 Lenticels are patches of **[Orissa 2009]**

(1) Loose cells in leaves
(2) Loose cells on bark for aeration
(3) Subsidiary cells of stomata
(4) Cells for respiration of epiphytes

Q.256 Conjoint and closed vascular bundles with no phloem paranchyma are observed in
(1) Monocot stem (2) Dicot stem
(3) Monocot root (4) Dicot root

Q.257 Match the column and choose the correct combination **[Kerala 2009]**

Column I	Column II
(a) Endodermis	1. Companion cell
(b) Stomata	2. Lenticel
(c) Sieve tube	3. Palisade cell
(d) Periderm	4. Passage cell
(e) Mesophyll	5. Accessory cell

(1) a – 4, b – 5, c – 2, d – 1, e – 3
(2) a – 5, b – 3, c – 1, d – 2, e – 4
(3) a – 2, b – 5, c – 3, d – 4, e – 1
(4) a – 4, b – 5, c – 1, d – 2, e – 3
(5) a – 4, b – 2, c – 5, d – 3, e – 1

Q.258 In Barley stem, vascular bundles are **[CBSE 2009]**
(1) Open and scattered
(2) Closed and scattered
(3) Closed and radial (4) Open and in a ring

Q.259 Palisade parenchyma is absent in leaves of **[CBSE 2009]**
(1) Gram (2) Soyabean
(3) Sorghum (4) Mustard

Q.260 Anatomically fairly old dicotyledonous root is distinguised from dicotyedonous stem by **[CBSE 2009]**
(1) Position of protoxylem
(2) Absence of secondary xylem
(3) Absence of secondary pholem
(4) Presence of cortex

Q.261 Arrange the following in the order of their location from periphery to centre in the entire dicotyledonous plant body **[EAMCET 2009]**
(a) Fusiform cells (b) Trichoblasts
(c) Collocytes (d) Tylosis
(1) b, c, a, d (2) a, b, c, d
(3) d, a, b, c (4) c, b, a, d

Q.262 Vascular bundle of monocot is **[CPMT 2010]**
(1) Scattered (2) Closed
(3) Endarch (4) All the above

Q.263 A structure absent in monocot is **[AFMC 2010]**
(1) Sieve tubes (2) Pith
(3) Cambium (4) Vessels

Q.264 Which of the following is not correct **[AMU 2010]**
(1) Early wood is characterised by a large number of xylary elements
(2) Late wood is characterised by a large number of xylary elements
(3) Early wood is characterised by vessels with narrower cavities
(4) Late wood is characterised by vessels with narrower cavities

Q.265 Medullary rays are made up of **[AMU 2010]**
(1) Fibres
(2) Tracheids
(3) Sclerencyma cells
(4) Parenchymatous cells

Q.266 Heart wood differs from sapwood in **[CBSE 2010]**
(1) Absence of vessels and parenchyma
(2) Having dead and non-conducting elements
(3) Being susceptible to pests and pathogens
(4) Presence of rays and fibres

Q.267 Ground tissue includes **[CPMT 2011]**
(1) All tissues external to endodermis
(2) All tissues except epidermis and vascular bundles
(3) Epidermis and cortex
(4) All tissues internal to endodermis

Q.268 The cork cambium, cork and secondary cortex are collectivelty called **[CPMT 2011]**
(1) Phelloderm (2) Phellogen
(3) Periderm (4) Phellem

Q.269 The common bottle cork is a product of : **[AIPMT Pre 2012]**
(1) Phellogen (2) Xylem
(3) Vascular Cambium (4) Dermatogen

Q.270 Closed vascular bundles lack : **[AIPMT Pre 2012]**
(1) Conjunctive tissue (2) Cambium
(3) Pith (4) Ground tissue

Q.271 Water containing cavities in vascular bundles are found in : **[AIPMT Pre 2012]**

(1) Maize (2) Cycas

(3) Pinus (4) Sunflower

Q.272 Companion cells are closely associated with : **[AIPMT Pre 2012]**

(1) Vessel elements (2) Trichomes

(3) Guard cells (4) Sieve elements

Q.273 As compared to a dicot root, a monocot root has : **[AIPMT Mains 2012]**

(1) More abundant secondary xylem

(2) Many xylem bundles

(3) Inconspicuous annual rings

(4) Relatively thicker periderm

Q.1 Bullifonn cells are present in
(1) Bundle sheath (2) Mesophyll
(3) Vascular bundles (4) Epidermis

Q.2 Black wood is obtained from
(1) Dalbergia (2) Albizzia
(3) Manihot (4) Salvia

Q.3 Kranz anatomy is seen in
(1) Euphorbia hirta (2) Citrus indica
(3) Mangifera indica (4) Zeamays

Q.4 The chief function of pholem is the conduction of
(1) Food (2) Mineral
(3) Water (4) Air

Q.5 Secondary phloem remains functional generally
(1) Less than 1 year
(2) More than 1 year
(3) For 1 year
(4) As long as plant lives

Q.6 Casparian strips are the characteristics of
(1) Cortex (2) Endodermis
(3) Pericycle (4) Pith

Q.7 The vascular cambium and cork cambium are the examples of
(1) Apical meristem (2) Lateral meristem
(3) Intercalary meristem
(4) Elements of xylem and phloem

Q.8 Transverse section of a plant is stained with safranin and fast green. What is the colour of the phloem?
(1) Red (2) Green
(3) Pink (4) Orange

Q.9 Root cap in monocots is formed by
(1) Dermatogen (2) Calyptrogen
(3) Vascular cambium
(4) Wound cambium

Q.10 Porous wood contains
(1) Vessels (2) Fibres only
(3) Tracheids (4) Sieve tubes

Q.11 Passage cells are found in
(1) Dicot stem (2) Monocot leaf
(3) Aerial root (4) Monocot stem

Q.12 In a dicotyledonous stem, the sequence of tissues from the outside to the inside is
(1) Phellem - pericycle. - endodermis - phloem
(2) Phellem - phloem - endoderm is - pericycle
(3) Phellem - endodermis - pericycle – phloem
(4) Pericycle - phellem - endodermis - phloem

Q.13 The quiescent centre in root meristem serves as a :
(1) Site for storage of food which is utilized during maturation
(2) Reservoir of growth hormones
(3) Reserve for replenishment of damaged cells of the meristem
(4) Region for absorption of water

Q.14 In a plant organ which is covered by periderm and in which the stomata are absent, some gaseous exchange still takes place through
(1) Aerenchyma (2) Trichomes
(3) Pneumatophores (4) Lenticels

Q.15 Companion cells in plants are associated with
(1) Vessels (2) Sperms
(3) Sieve elements (4) Guard cells

Q.16 Cork cambium results in the formation of cork which becomes impermeable to water due to the accumulation of
(1) Resin (2) Suberin
(3) Lignin (4) Tannin

Q.17 Which one of the following statements pertaining to plants primary structure is correct?
(1) Cork lacks stomata, but lenticels carry out transpi ration
(2) Passage cells help in transfer of food from cortex to phloem
(3) Sieve tube elements possess cytoplasm but no nuclei
(4) The shoot apical meristem has a quiescent centre

Q.18 In the sieve elements, which one of the following is the most likely function of P-proteins?
(1) Deposition of callose on sieve plates
(2) Providing energy for active translocation
(3) Autolytic enzymes
(4) Sealing mechanism on wounding

INSTRUCTIONS FOR Q.NO.11 TO 14

In the following questions, a statement of **assertion (A)** is followed by a statement of **reason (R).**

(1) If both Assertion & Reason are true and the reason is the correct explanation of the assertion, then mark (A).

(2) If both Assertion & Reason are true but the reason is not the correct explanation of the assertion, then mark (2).

(3) If Assertion is true statement but Reason is false, then mark (3).

(4) If both Assertion and Reason are false statements, then mark (4).

Q.19 **A :** In woody stems, the amount of heart wood continues to increase year after year.
R : The activity of the cambial ring continues uninterrupted.

Q.20 **A :** Thick cuticle is mostly present in disease resistant plants.
R : Disease causing agents cannot grow on cuticle and cannot invade the cuticle.

Q.21 **A :** Vascular cambium is considered as lateral meristem.
R : It gives rise to lateral shoots.

Q.22 **A :** Monocot stem bear collateral open vascular bundles.
R : If cambium is absent, such vascular bundles are called open type.

Q.23 **A :** The collenchyma is thick walled living tissue.
R : The collenchyma is thickened due to the depositioft of pectin.

Q.24 **A :** Water and mineral uptake by root hairs from the soil occurs through apoplast until it reaches endoderm is.
R : Casparian strips in endodermis are suberized.

Q.25 **A :** Long distance flow of photoassimilates in plants occur through sieve tubes.
R : Mature sieve tubes have parietal cytoplasm and perforated sieve plates.

Q.26 **A :** In angiosperms, the conduction of water is more efficient because their xylem has vessels.
R : Conduction of water by vessel elements is an active process with energy supplied by xylem parenchyma rich in mitochondria.

Q.27 **A :** Apical meristem of root is subterminal.
R : At the terminal end of root, root cap is present.

Q.28 **A :** In stem, pericycle take active part in secondary growth.
R : In root, pericycle take active part in secondary growth.

Q.29 **A :** Annual ring do not occur in dicot trees growing on sea shore.
R : There is little climate variation.

Q.30 **A :** Tyloses are more abundant in Duramen.
R : They provide rigidity & strength to heart wood.

Q.31 **A :** Radial vascular bundles are found in roots.
R : Xylem & phloem occur in separate bundles and lie on different radii alternating with each other.

Q.32 **A :** Open vascular bundles are found in dicot stem & gymnosperm.
R : Cambium is absent in between xylem & phloem.

Q.33 **A :** Amphivasal vascular bundles are found in some monocots.
R : Xylem lie in centre surrounded by phloem.

Q.34 **A :** Histogen theory is not applicable to shoot apex.
R : The shoot apex is not clearly divided into three layers.

Q.35 **A :** Aerenchyma help in buoyancy to hydrophyte plants.
R : The large air chambers are present in aerenchyma.

Q.36 **A :** Collenchyma forms the hypodermis of dicotyledon stems.
R : This the reason for flexibility of dicotyledon stems.

Q.37 **A :** Various types of pits are formed in sclerenchyma.
R : The deposition of lignin in sclerenchyma.

Q.38 **A :** Annual ring are absent in monocot plants.
R : Absence of cambium in monocot plants.

Q.39 **A :** The seed coat of legume plants becomes hard.
R : The presence of macrosclerids in seed coat of legume plants.

Q.40 **A :** Primary meristem present in plants from embryonic.
R : Primary meristem is responsible only for primary growth.

Q.41 **A :** Xylem is more developed in xerophytes.
R : Major part of xylem is living in xerophytes

Q.42 **A :** Epidermis has meristematic potentialities.
R : The epidermis can resume active cell division and helps in the healing of wounds.

Q.43 **A :** Vascular supply to leaf is called leaf trace.
R : The leaf trace extends between the leaf base and point where it merges with stem.

Q.44 **A :** Protosteles have always pith in the centre.
R : Protosteles are of two types called haplosteles and actinosteles.

Q.45 **A :** Parenchyma is a collection of similar cells that perform a common function.
R : Parenchyma is a simple tissue.

Q.46 **A :** In the hydrophytes the xylem is not differentiate into different types of cells.
R : Xylem provides support and helps in the conduction of water which is not very important in hydrophytes.

Q.47 **A :** Phloem transports prepared food material from leaves to all parts of the plants.
R : In phloem there are some values which stop the flow from down wards to upwards.

Q.48 **A :** Oil glands are mostly schizogamous.
R : Oil glands are formed by dissolution of cells.

Q.49 **A :** Tunica is a type of rib meristem.
R : It's cells divide only in one plane.

Q.50 **A :** Corpus of shoot apex is the example of mass meristem.
R : Cell of corpus divide in two planes.

Q.51 **A :** Intra fascicular cambium is primary in origin.
R : Intra fascicular cambium located in between vascular bundle.

Q.52 **A :** In monocot grafting is not possible.
R : In monocots vascular bundle are closed.

Q.53 **A :** In true xerophytes major part of xylem is dead.
R : True xerophytes grows in water stress condition and dead tissues more developed in water stress condition.

Q.54 **A :** Collenchyma is living mechanical tissue.
R : Collenchyma is non lignified tissue with localised thickening.

Q.55 **A :** Ground tissue system is the largest tissue system of plants.
R : Cortex is a part of ground tissue system.

Q.56 **A :** Vessels are made up of row of cells placed one above the another with their intervening walls (septa) absent due to dissolution.
R : Sieve tubes are tubular channels. In tracheids walls are thick.

Q.57 **A :** There is large deposition of lignin in the lumen of tracheids.
R : The lumen of tracheids is narrow.

Q.58 **A :** In bark all the cells are dead.
R : Bark constitutes secondary cortex, epidermis, cork etc.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	**Good / Important questions**
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

ANIMAL TISSUE

INTRODUCTION

- **Tissue :** A group of cells similar in structure, function and origin.

  In a tissue cells my be dissimilar in structure and function but they are always similar in origin.

  – Word animal tissue was coined by – **Bichat**
  – N. Grew coined the term for Plant Anatomy.
  – Study of tissue – **Histology**
  – Histology word was given by – **Mayar**
  – Father of Histology – **Bichat**
  – Study of tissue is also called **Microscopic anatomy.**
  – Founder of microscopic anatomy – **Marcello Malpighi**

  Based on **functions & location** tissues are classified into four types :

Type	Origin	Function
1. Epithelial tissue	Ectoderm, endoderm, mesoderm	Protection, secretion, absorption etc.
2. Connective tissue	Mesoderm	Support, binding, storage, protection, circulation.
3. Muscular tissue	Mesoderm	Contraction and movement
4. Nervous tissue	Ectoderm.	Conduction and control

EPITHELIAL TISSUE

Word epithelium is composed of two words
Epi – Upon
Thelio – grows
A tissue which grows upon another tissue is called **Epithelium.**

– Cells are either single layered or multilayered.
– Cells are compactly arranged and there is no intercellular matrix.
– Cells of lowermost layer always rest on a non living basement membrane.
– Cells are capable of division and regeneration throughout the life.
– Free surface of the cells may have fine hair **cilia** or **microvilli** or may be smooth.
– Epithelial tissue is non-vascularised.

Due to absence/less of intercellular spaces blood vessels, lymph vessels are unable to pierce this tissue so blood circulation is absent in epithelium. Hence cells depend for their nutrients on underlying connective tissue.

Between epithelium & connective tissue, a thin non living acellular basement membrane is present which is highly permeable.

Basement membrane consist of 2 layers.

(a) **Basal lamina :** made up of glycoprotein, and secreted by epithelium cells.

(b) **Fibrous lamina :** Formed of collagen and reticular fibres suspended in mucopoly-saccharide which is matrix of connective tissue.

– So basement membrance is secreted by both epithelium and connective tissue.
Mucopolysaccharide is present in the form of Hyaluronic acid which is composed of 2 components–N acetyl glucosamine & glucuronic acid. Both these components are found in alternate form.

– NAG – GA – NAG –

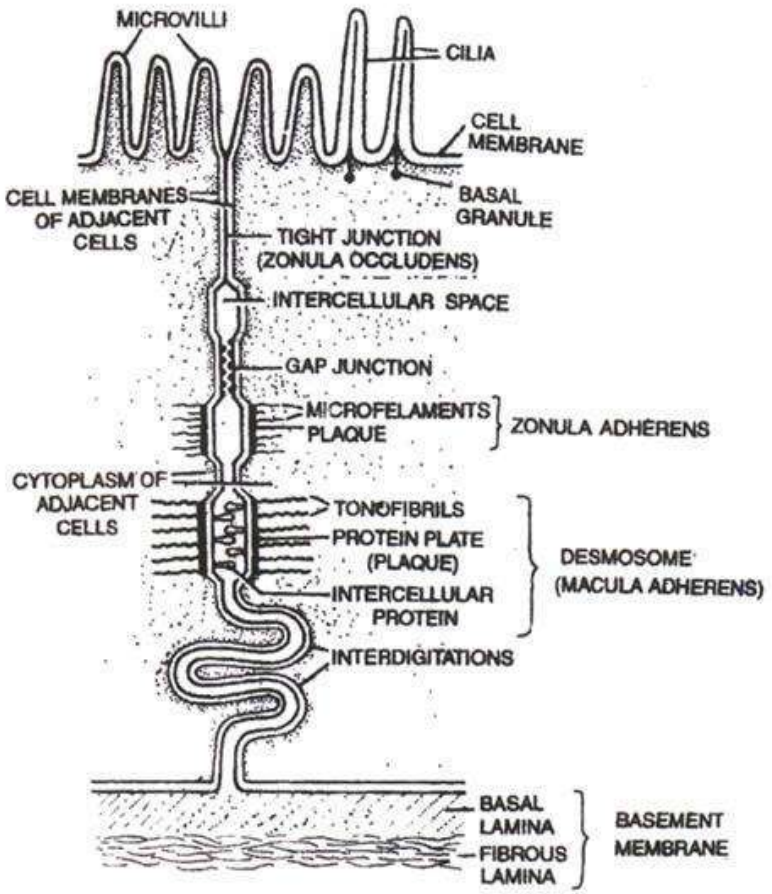
– **Specialized junctions between epithelial cells : -**

– To provide mechanical support for the tissue plasma membrane of adjacent epithelial cells modified to form following structures called as Intercellular Junctions.

→ **Tight junctions (Zonula occludens) :** help to prevent substances from leaking across the tissue. Plasma membranes in the apical parts become tightly packed together or are even fused.

→ **Interdigitations :** These are interfitting, finger like processes of the cell membranes of the adjacent cells.

→ **Intercellular Bridges :** These are minute projections that arise from adjacent cell membrances. They make contact with one anther.



Showing microvilli, cilia, cell junctions and basement membrane

→ **Gap Junctions :** Facilitate the cells to communicate with each other by connecting the cytoplasm of adjoining cells, for rapid transfer of ions, small molecules and sometimes big molecules.

→ **Intermediate Junctions (= Zonula adherens) :** These usually occur just below tight junctions. The intercellular space at these places contains a clear, low electron density fluid. There is a dense plaque like structure on cytoplasmic side of each plasma membrane from which fine microfilaments of actin (protein) extend into the cytoplasm. There is no intercellular filaments between the adjacent cell membranes. There is an adhesive material at this point. They probably serve anchoring functions.

→ **Desmosomes (=Macula adherens) :** Perform cementing to keep the neighbouring cells together. These are like zonula adherens but are thicker and stronger and are disc like junctions. They have intercellular protein. The plaque-like structures (= protein plate) are much thicker. The microfilaments which extend from microfilaments are called **tonofibrils.** Desmosomes serve anchoring function. **Hemidesmosomes** (single sided desmosomes) are similar to desmosomes, but the thickening of cell membrane is seen only on one side. Hemidesmosomes join epithelial cells to basal lamina (outer layer of basement membrane).

– **Specialised functional structures shown by Epthelial Cells : -**

Plasma membrane of free end get modified to form 3 types of functional structures.

- **Microvilli :**
  - Minute protoplasmic process which are not non motile, non contractile.
  - Help in absorption, secretion, excretion
  - Increase surface more than 20 times.

  Present in the wall of Intestine, Gall bladder, Proximal convoluted tubule etc.
- **Cillia or Kinocilia**
  - Long cylindrical protoplasmic process.
  - Motile and contractile
  - Movement of cilia is always in uniform direction.
  - Originated from basal granule or kinetosome.
  - Diameter of cilia is same from base to apex.
  - In internal structure of cilia 9 + 2 arrangement of microtubules is present.
  - They helps in conduction

  e.g. – Fallopian tube.
  - Trachea.
  - Uterus.
  - Uterus.
  - Ependymal epithelium : (Inner lining of ventricles of brain & central canal of spinal cord. Function of cilia is to conduct substances in CSF.)
- **Steriocilia**
  - Long cytoplasmic process
  - Non motile, non contractile
  - Basal granule is absent
  - Plasma membrane is thick & rigid.
  - Base of stereocilia is broad & apical part is narrow so they are conical in shape.
  - They increase surface area .

  eg. Epididymis

  Vasadeferens
- **Origin of Epithelial Tissue**

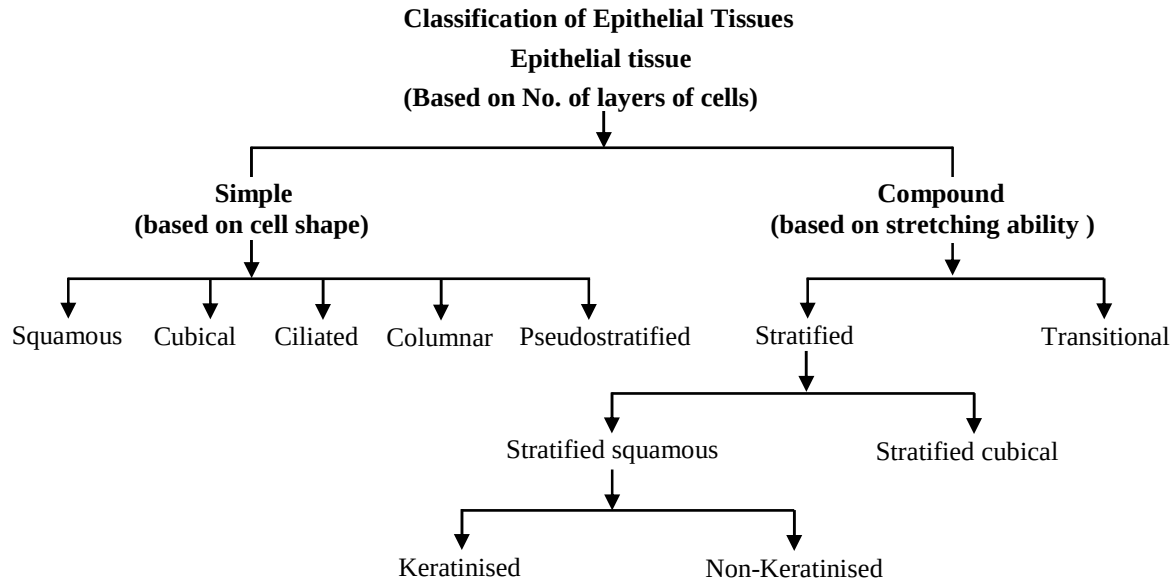
  It is the only tissue which originated from all the three primordial germinal layers.

  eg. (i) Ectodermal – Epidermis (stratified squamous epitheliium)

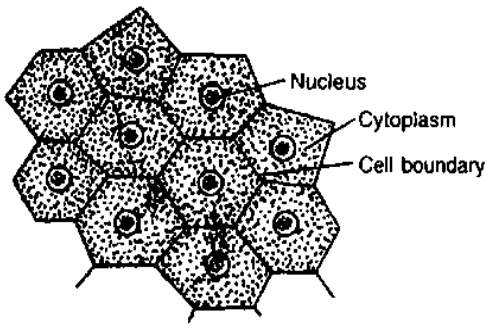
  (ii) Mesodermal – Mesothelium (simple squamous Epithelium)

  (iii) Endodermal – Endothelium (simple squamous Epithelium)

Types of Epithelial Tissue

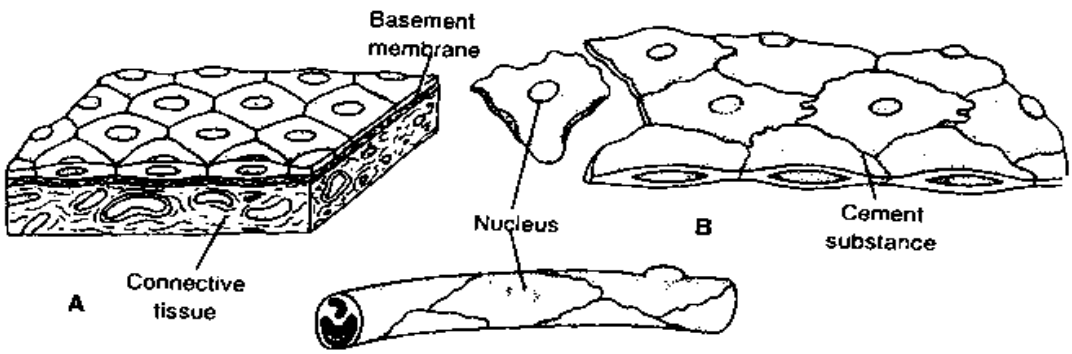


- **SIMPLE SQUAMOUS EPITHELIUM**



(Simple squamous epithelium)

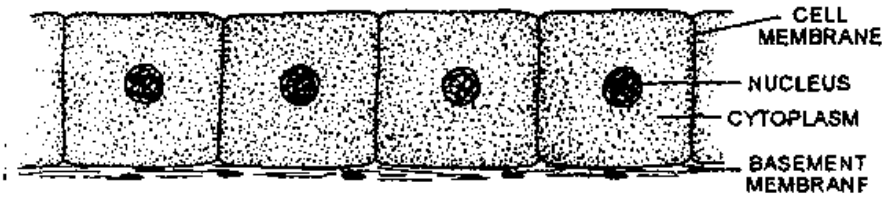
- Unilayered.
- Cells are flat or scale like in shape
- A flattened/rounded nucleus present.
- Cells are more in width and less in length so in verticle section they appear rectangular in shape.
- It is also called **pavement epithelium** due to its tile like appearance.
- Also called **Tesselated epithelium** due to its wavy appearance.
- This epithelium is associated with **filtration & diffusion**



e.g. – Bowman's capsule (Podocyte)

– Descending limb & thin part of ascending limb of loop of Henle.
– Rete Testis
– Alveoli of lungs (Pneumocytes)
– Small bronchioles
– Mesothelium – Covering of coelom is called as mesothelium. (Tesselated)
– Visceral & Parietal peritoneum. Visceral and parietal pleura, Visceral and Parietal pericardium.
– Endothelium – Inner lining of blood vessels and lymph vessels. (Tesselated)
– Inner lining of heart wall (Tesselated).

- **SIMPLE CUBOIDAL EPITHELIUM**
  – Basement membrane is present.
  – Cells are cube like in shape
  – A rounded nucleus is present in the centre of cell.
  – Cells are same in length & width so they appear square shaped in vertical section.

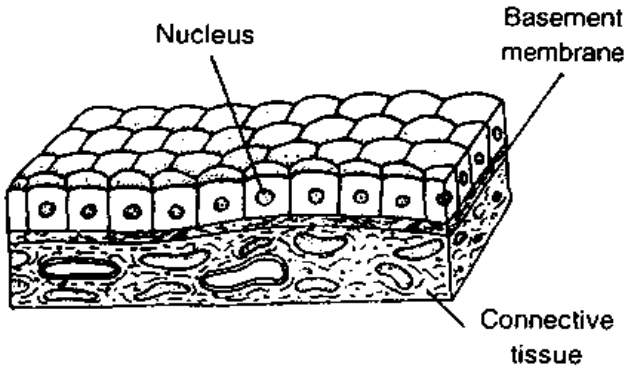


(Simple cuboidal epithelium)

– This epithelium helps in absorption, secretion & excertion.

It also form gametes in gonads.

Mostly cuboidal cells are found in glands.



eg. – Vesicles of Thyroid gland
– Acini of Pancreas
– Pancreatic duct
– Secretory unit of sweat glands

Sweat glands are coiled tubular glands in structure. Coiled part of this gland has secretory unit in the form of simple cuboidal epithelium is present while in secretory duct of this gland **stratified cuboidal epithelium** is present.

– Secretory duct of salivary glands
(secretory unit of salivary glands is composed is **stratified cuboidal epithelium.**)
– Iris

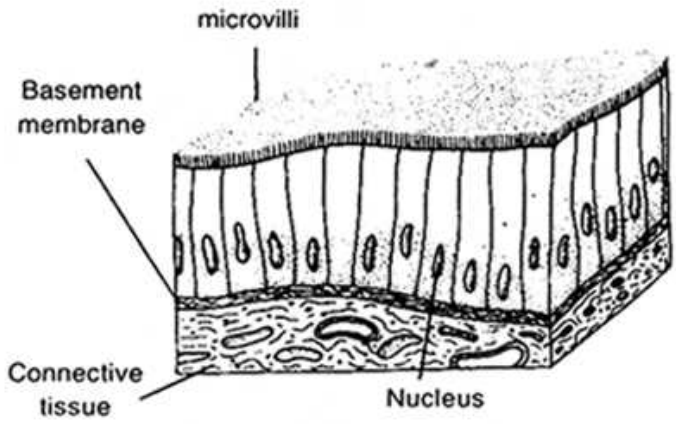
– **Choroid**
– **Ciliary body of eye**
– **Thick part of ascending limb of loop of henle**
– **DCT**

– In gonads this epithelium is also called as **Germinal epithelium** (testis & ovaries) where cuboidal cells divide to form egg & sperm.
– It is found in peripheral region of ovary & seminiferous tubules in Testis.

Modifications :

Brush bordered cuboidal epithelium where microvilli are present on free and cuboidal cells
eg. – Found in PCT of nephron.
Ciliated cuboidal epithelium when cilia present on free end of cuboidal cells then
Found in certain part of nephron and in collecting duct.

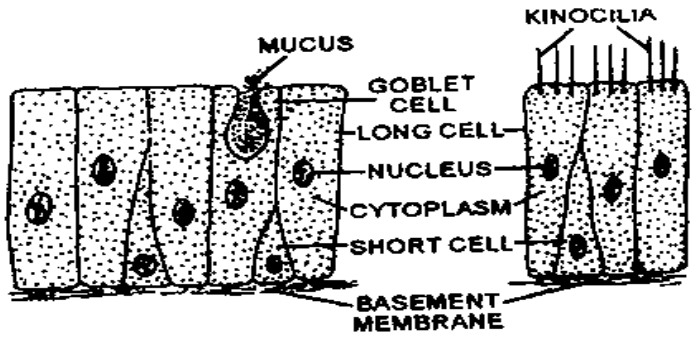
- **SIMPLE COLUMNAR EPITHELIUM**
  – Basement membrane is present.
  – Cells are pillar or column like in shape.
  – Elongated nucleus is present at the base of cell.
  – It helps in absorption and secretion.
  e.g., **Bile Duct, Liver**



Modifications :

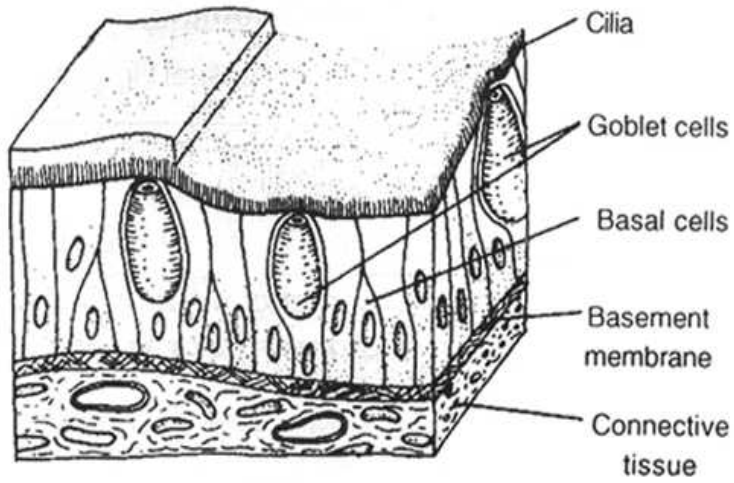
- **Brush Bordered Columnar epithelium :**
  Microvilli are present at free end of epithelium.
  e.g. Gall bladder
- **Gladndular columnar epithelium :**
  Unicellular mucous secreting **goblet cells** are also present in between columnar cells.
  eg. Stomach, Colon, Rectum
- **Glandular Brush bordered columnar epithelium :**
  Microvilli present on free end of columnar cells & in between these cells goblet cells are also present.
  e.g., Duodenum, IIeum, Caecum.
- **Ciliated Columnar epithelium :**
  Cilia are present on free end of columnar cells.
  e.g. Fallopian Tube, Ependymal epithelium
- **Steriociliated columnar epithelium :** Steriocilia present on free end of columnar cells.
  e.g. Epididymis, Vasa Deferens

- **PSEUDOSTRATIFIED EPITHELIUM**
  – It appears billayered as two types of cells are present
  i.e. Long cells
  Short cells.
  – But all the cells are present on single basement membrane so its unilayered.



(Pseudostratified columnar & ciliated columnar)

– All these cells are pillar like in shape so it is also modification of columnar epithelum.
– In long cells, elongated nucleus is present at the base of cell & are ciliated Short cells have rounded nucleus present in the centre of cell, lack cilla and secrete mucus.



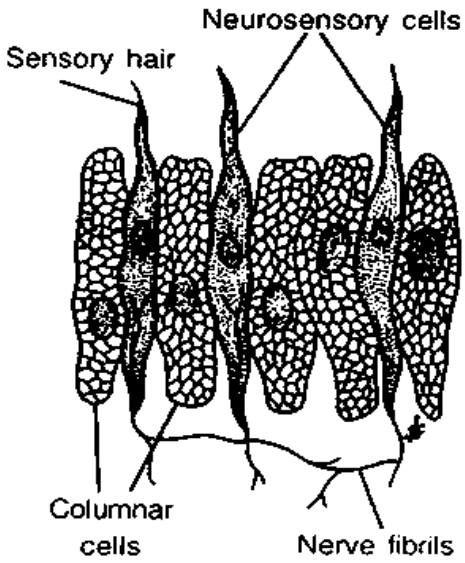
Modification

- **Pseudostratified Non-ciliated Epithelium** eg, Parotid Salivary gland middle part of male urethra.
- **Pseudostratified ciliated glandular epithelium :**
  In this epithelium cillia are present at free end of long cells and goblet cells are also present in this epithelium.
  e.g. Trachea, Bronchi
  Respiratory epithelium of nasal chambers.

Special Types of Epithelium

(a) Neuro sensory epithelium :
In between piller shaped supporting cells modified sensory cells are present. On the free end sensory hair is present. Base of these cells is attached with sensory nerve.

e.g. – Gustatory Epithelium – Cover taste bud of tongue and receive taste sensation.
– Olfactory epithelium – Schneidarian membrane receive smell sensation.
– Stato – acoustic – Lining of internal ear.
– In retina of eye receive optic sensation.



(b) Myoepithelium : Around mammary and sweat gland
(c) Pigmented epithelium (Cuboidal) : In Retina of eye

COMPUND EPITHEliUM

(1) Transitional epithelium – Stretcheable.
(also called Plastic epithelium)

(2) Stratified epithelium – Non-stretcheable.

- **TRANSITIONAL EPITHELIUM (UROTHELIUM)**
  - It is only tissue in which basement membrane is absent. So innermost layer directly rest upon underlaying connective tissue.

  - In this epithelium 4-6 layer of cells are present.
  - Inner most layer of cells is composed of **cube like cells.**
  - Middle 2-4 layers are composed of pear shaped or umbrella shaped cells.
  - Outermost 1 or 2 layers are of oval shaped cells.
  - These different shape of cells appears only in resting stage. When this tissue is stretched, all the cell become flattened.
  - At outermost layer a thin cuticle is present which makes this tissue water proof.
  - Cells are interconnected by interdigitation.

  e.g. – Renal Pelvis, Ureter, Urinary Bladder, Proximal part of male urethra.

- **STRATIFIED EPITHELIUM**
  - Stratified epithelium possess many layer of epithelial cells, the deepest layers is made up of **cuboidal** cells. On the basis of shape of the cells of outermost layer it is of four types.

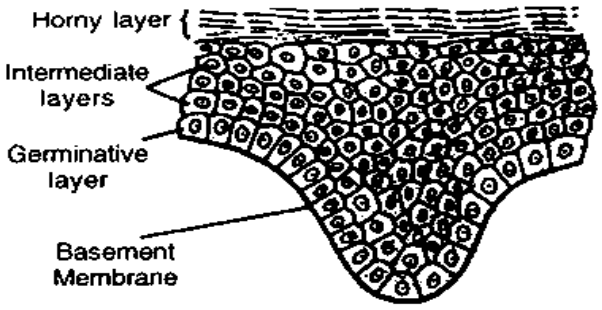
  (1) **Stratified squamous epithelium**
  (2) **Stratified cubical epithelium**
  (3) **Stratified columnar epithelium**
  (4) **Stratified ciliated columnar epithelium**

- **STRATIFIED SQUAMOUS EPITHELIUM**
  - Innermost layer of cells are of cuboidal or columnar shaped.
  - These cells have high Mitotic index
  - They divide to form layer of Stratified epithelium so this layer is called as **Germinativum** layer. Middle layers are made up of polygonal cells.
  - These cells are interconnected with Desmosomes which provide rigidity or mechanical support.

– Cells of outermost layer are scale like flat cells. On the basis of presence or absence of Keratin protein in the outer most cells this epithelium is of two types :

(a) Keratinized Stratified squamous epithelium .

Hard water proof keratin protein is present in scaly cells and cells become non nucleated dead cells.



(Stratified squamous)

e.g. – Epidermis of skin, Scale, Horn, Nails, Feathers

(b) Non Keratinized Stratified squamous epithelium .

Keratin protein is absent. Cells are nucleated & Living.

e.g., Buccal cavity or oral cavity of mammals, Inner lining of cheeks, Inner lining of lips, Lining of hard palate, Lining of Tonsils, Lower part of soft palate, Pharynx, Oesophagus, Anal canal, Lining of vagina, Cornea of eye

- **STRATIFIED CUBICAL EPITHELIUM**

– Outermost layer of cells are cube like & cells are nucleated & living.

– Middle layer – polygonal shaped cells.

e.g. – Secretory duct of seat glands, mammary glands and sebaceous gland.
– Secretory unit of salivary glands, sebaceous gland.
– Female Urethra ; part of anal canal.
– Conjunctiva of eye.

- **STRATIFIED COLUMNAR EPITHELIUM**

It consists of columnar cells in both superficial basal layers. Cells are nucleated. Cilia absent on free end.

e.g., – Distal part of male urethra, Epiglottis

FUNCTIONAL CLASSIFICATION OF EPITHELIAL TISSUE

Functionally epithelial tissues can be classified as follows :

(a) Germinal epithelium : It is present in testis and ovaries. Its cells produce **Sperms** and **Ova**.

(b) Pigmented epithelium : It is present in retina of eye. It possess pigment which give colour to the retina.

(c) Sensory epithelium : It is found in retina of eye, internal ear, nasal chamber and tongue. It perceives stimuli and conducts impulses.

(d) Glandular epithelium : It is present in glands and secrete fluid (Secretion)

(e) Absorptive epithelium : It is found in nephron of kidneys, stomach, intestine, It helps in absorption of food in stomach and intestine and liquid materials in nephron.

GLANDS OF EPITHELIUM

- A cell or group of cells which secrete chemical substances are called glands.
- All glands are composed of Epithelium tissue.
- Glands originate from all three germinal layers.
- The cells are generally columnar or cuboidal.

- **TYPES OF GLANDS**

(A) On the basis of number of cells

icellular gland consist of isolated glandular cells. Life an of 2-3 days
;., Mucosa of stomach, Intestine, Trachea, Nasal amber (Goblet cells), Paneth cells (Intestine)

(b) Multicellular glands Consist of cluters of cells.
Formed by invagination of Epithelial cells. e.g. Rest glands

(B) On the basis of Shape of secretory units

(1) Tubular glands
- (A) Simple gland
  - (i) S. Tubular glands
    eg. Intestine glands
    (Crypts of leiberkuhn)
  - (ii) S. coiled tubular
    - Sweat glands
  - (iii) S. branched tubular
    - Sweat glands of armpit
    - Gastric glands
- (B) Compound tubular glands
  Eg. - Brunner's gland
  - Mammary glands of Prototheria.
  - Inactive mammary glands of eutheria

(2) Saccular/Alveolar glands
- (A) Simple Glands
  - (i) Simple Alveolar
    eg. Cutaneous glands of frog
    - Poison glands
    - Mucous glands
  - (ii) Simple branched alveolar
    eg. Most sebaceous glands
- (B) Compound Sacccular glands
  eg. - Sublingual gland
  - Submandibular gland
  - Few sebaceous glands

(3) Compound tubulo Alveolar
- Active mammary glands
- Parotid gland
- Cowper's gland
- Pancreas

(C) On the basis of presence of secretory duct glands are of 3 types

(a) **Endocrine glands –** Secretory duct absent
(b) **Exocrine gland –** Secretory duct present.
(c) **Heterocrine/mixed gland** – Both endocrine & exocrine parts are present.

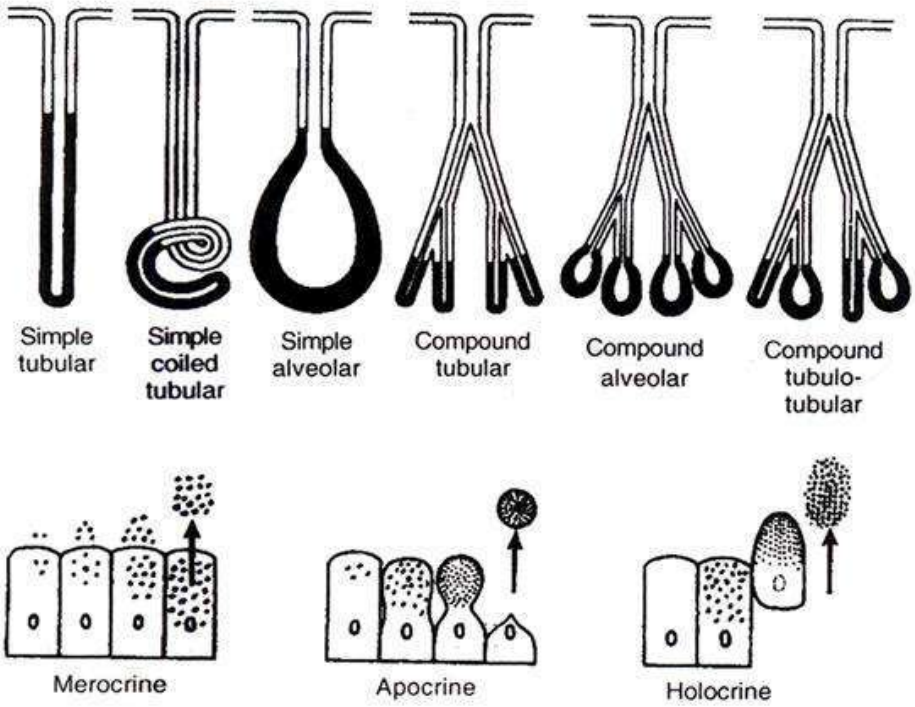
(D) On the basis of nature of secretion – 3 types of glands are there.

(a) **Eccrine/Acrine/Merocrine gland** –
In these glands secretory cells secrete substances by simple diffusion (Exocytosis). No part of cytoplasm is destroyed in secretion.

e.g. Maximum sweat glands of humans, Paws of rabbit, Goblet cells, Salivary gland, Tear gland, Intestinal gland, Mucous gland.

(b) **Apocrine gland** – In this type of glands secretory products are collected in apical part of secretory cell Apical portion is also shed along with secretory matter.
Secretory cells gain their lost part of cytoplasm by process of regeneration.

– Mammary glands.
Sweat gland of Arm pit, pubic region, skin around anus, lips, nipples etc.
Largest sweat gland of body are found around nipples. – Areola mamme.



In Rabbit seat glands of this type are found on lips and skin around lips.

(c) **Holocrine glands –**
The production or secretion is shed with whole cell leading to its destruction. i.e
e.g. Sebaceous, meibomian & Zeis gland.

(E) On the basis of secretory matter

(i) Serous glands	(ii) Mixed glands	(iii) Mixed glands
Secretion-Watery fluid	Secretion : Mucous/gelatinous	Secretion : Watery + Mucous
Eg. Sweat glands	Eg. Goblet cell	Eg. Pancreas, gastric glands

CONNECTIVE TISSUE

– All connective Tissue in the body are developed from Mesoderm.
– O. Hartwig called them **Mesenchyme** because they originated from embryonic mesoderm.
– Only connective Tissue consititute **30%** of total body weight.
(Muscle – 50%, Epithelium – 10% Nervous – 10%)
– On the basis of **matrix** connective tissue is of 3 types

1. Connective Tissue Proper – Matrix soft and fibrous

2. **Connective Tissue Skeleton** – Dense and mineralized matrix. Due to deposition of minerals it becomes hard.
3. **Connective tissue Vascular –** Liquid and fibres free matrix

1. CONNECTIVE TISSUE PROPER

Connective Tissue Proper is composed of three components (A) Different types of cells, (B) Fibres, (C) Matrix.

(A) CELLS OF CONNECTIVE TISSUE PROPER

- **FIBROBLAST CELLS**

– Largest cell of connective tissue proper.
– Maximum in number.
– Cell body and nucleus both are oval shaped.
– Branched cytoplasmic process arise from these cells so they appear irregular in shape.
– Rich in rough ER because main or primary function is to produces fibres. Fibres are composed of protein.
– Chief matrix producing cells.
– Old fibroblast cells (fibrocyte) are inactive cells.
– These are also considered as undifferentiated cells of conn. Tissue because they can be modified into **Osteoblast** & **Chondrioblast** cells to produce bone & cartilage.

Function : (1) To produce fibres (2) To secrete matrix.

- **PLASMA CELL - CART WHEEL CELL**

– Less in number
– Amoeboid in shape
– Chromatin material is arranged like spokes in wheel so they are also called as **Cart wheel cells.**
– According to research these cells are formed by the division of lymphocytes. So they are also called as **clone of lymphocytes.**

Function : Produce, Secrete & transport antibody.

- **MAST CELLS/MASTOCYTES**

– Numerous , amoeboid and small in size.
– Structurally and functionally similar to basophils.
– 2-3 lobed S-shaped nucleus
– Cytoplasm contains basophilic granules which can be stained with basic dye Methylene Blue.
– It is important cell of connective tissue proper as they perform important functions.

(a) Histamine – Histamine is a protein, a vasodilator

– Increase permeability of blood capillaries.
– Take part in allergy and inflammatory reactions.

(b) Secotonin -

– Also called as 5-Hydroxy tryptamine
– It is a protein, a vasoconstrictor & decrease blood circulation but increases blood pressure.
– A the site of cut or injury serotonin decrease blood loss.

(c) Heparin –

A mucopolysaccharide, a natural anti-coagulant, prevents clotting of blood in blood vessels by preventing the conversion of prothrombin into thrombin.

- **ADIPOSE CELLS/FAT CELLS**

– Oval shaped stores fat.
– Fat is collected in the form of fat globule formed by the fusion of small oil droplets.
– On the basis of number of fat globules adipocytes are of two types.

(a) Monolocular adipocytes/ White fat tissue-cell

– In these cells single large and central fat globule is present.
– nucleus & Cytoplasm is peripheral and Cytoplasm is less in amount.
– Due to compression of fat globule, nucleus become flattened in shape . These adipocytes form **White Fat.**

(b) Multilocular adipocytes/Brown fat tissue cell

– In these cell 2-3 fat globules are distributed in the cytoplasm around nucleus
– Cytoplasm is more in quantity.
– Nucleus is rounded & found in the centre
– These adipocytes form **Brown Fat.**

- **MESENCHYMAL CELLS**

– Less in numbers . Small sized with cytoplasmic process having irregular shape.
– Oval shaped nucleus
– These are undifferentiated cells of connective tissue because they can transform into any cell of connective Tissue proper. (Totipotent in nature)
Function : To form other cells of connective tissue.

- **MACROPHAGES/HISTEOCYTE/CLASMATOCYTES.**

– It is 2nd largest in size and in number.
– Amoeboid in shape with bean or kidney shaped nucleus.
– Cytoplasm quantity is more agranular but due to presence of more number of lysosome it appears granular.
– Phagocytic in nature, destroy bacteria & viruses by phagocytosis. They arises by the fusion of monocytes
– Also called as **scavenger cells** of connective tissue because they destroy dead or damaged cells to clean connective tissue.

Macrophages are named differently in different organs.

Lung	–	Dust cells
Liver	–	Kupffer cells
Blood	–	Monocytes
Brain	–	Microgleal cells
Thymus gland	–	Hessels granules
Spleen	–	Reticular cells

- **LYMPHOCYTES**

– Less in number and small in size having amoeboid shape.
– A large nucleus is present cytoplasm is present as peripheral layer. Cytoplasm quantity is less.
– Produce, transport & secretes antibodies.
– They divide to form plasma cells of connective tissue proper.

(B) FIBRES

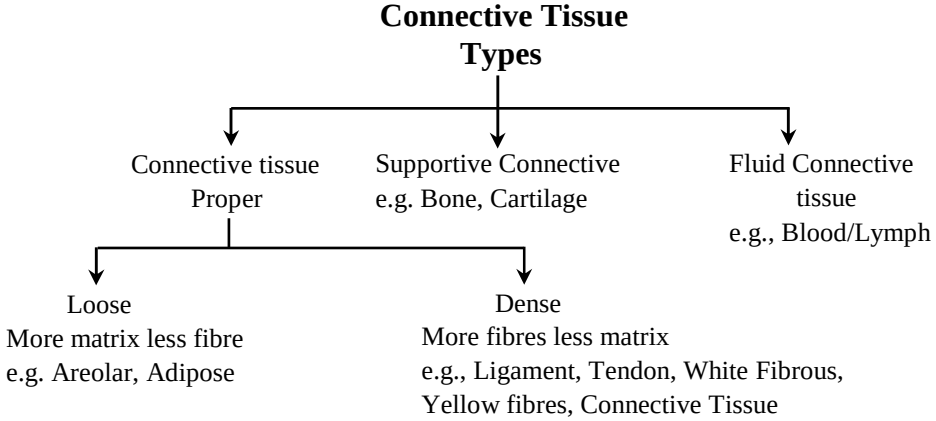
- **Collagen fibres (White fibres)**
  - They are shining white fibres composed of collagen protein (Tropocollagen).
  - It is present in maximum quantity in vertebrates, (only collagen fibres constituted one third part of connective tissue fibres in human beings.)
  - They are wavy & tough fibres always arranged in bundle called fascia.
  - On boiling they convert into gelatin.
  - They can be digested by Pepsin enzyme.
- **Elastic fibres – (Yellow fibres)**
  - Precursor in colour and composed of elastin protein.
  - They are branched fibres but always arranged singly. Branches of these form network.
  - In these fibres maximum elasticity is present.
  - They are highly resistant to chemicals.
  - When boiled they do not dissolve.
  - They can be digested by **trypsin** enzyme.
- **Reticular Fibres : -**
  - Precursor of Collagen fibres, delicate with no elasticity
  - Also known as Arzyrophil fibre since they can be stained with silver salts.
  - They are composed of recticulin protein highly branched fibres which always form dense network.
  - These are mainly distributed in lymphoid organs like spleen or lymph nodes.

(i) Collagen fibers or white fibres	(ii) Elastic Fibres or Yellow fibres	(iii) Reticular fibres
Bright white, madeup collagenprotein Unbranched and wavy Not elastic	Yellow, Made up of Elastin protein. Single and branched. Maximum elastic. Ex-Ligament that connect bone to bone	Made up of reticulin Protein Freely branched Non-elastic fibres

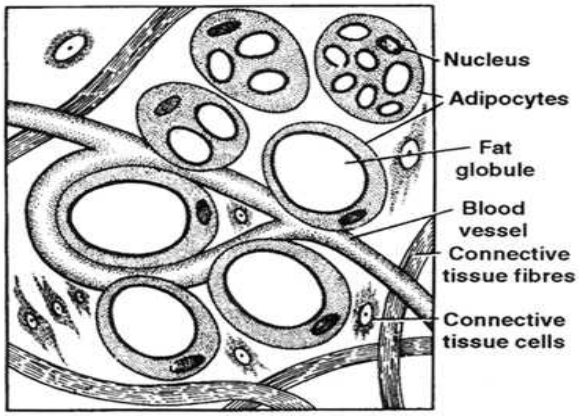
(C) MATRIX

Matrix is composed of Mucopolysaccharide which is present in the form of Hyaluronic acid.

TYPE OF CONNECTIVE TISSUE PROPER



Connective Tissue Proper



Adipose connective tissue

Loose Connective Tissue : It consists of cells scattered within an amorphous mass of proteins that forms a ground substance. The gelatinous material is strengthened by a loose scattering of protein fibres such as collagen, elastin, which makes tissue elastic and reticulin which supports the tissue by forming a collagenous meshwork.

- **AREOLAR CONNECTIVE TISSUE**
  - Also known **spongy** tissue.
  - It is most widely distributed tissue in the body.
  - In this tissue maximum intercellular space or substances/matrix is present.
  - Due to irregular arrangement of bundle of collagen fibres many gaps are present. These spaces called **Areolae.**
  - In areolae other components of connective tissue are distributed like fibres, cell & matrix.
  - Few elastic fibres are present but reticular fibres are completely absent.
  - Mast cells, Macrophage & Fibroblast contain mone amount.
  - It occurs beneath the epithelia of many visceral organs skin and in the walls of blood vessels.
  - Fibroblast is the main cell.

  e.g., Tela Subcutanea – A thin continuous layer which connect skin with underlying skeletal muscles (Pannicules carnosus). In mammals skin is tightly attached with muscles.

  While in frog it is present in the form of septum so skin is loosely attached with muscles.

  Endomysium – Around single muscles fibre.

  Perimysium – Around bundle of muscle fibre.

  Outside of semniferous Tubules.

  Medulla of ovary

  Sub mucosa of trachea, Bronchi, Intestine

  ➡ **The areolar tissue joins different tissues and forms the packing between them and helps to keep the organs in place and in normal shape.**

- **ADIPOSE CONNECTIVE. TISSUE**
  - Modification of Areolar connective tissue. But in areolae major component is adipocytes which store fats.
  - Blood vascular system is also present in this tissue.

– If this tissue is treated with alcohol (organic solvent) Fat will be dissolved completely and adipocytes will become vacuolated.
– This tissue can be stained with sudan solution.
– On the basis of adipocytes 2 type of fats are found in animals.
(A) White fat (B) Brown fat

(A) White fat – It is composed of monolocular adipocytes in which single large fat globule & peripheral cytoplasm is present. Due to less amount of cytoplasm, Mitochondria are also less in number, so they produce less energy.

- **e.g. Panniculas adiposus –** A thin continuous layer of white fat under the dermis of skin which is also called **hypodermis** of skin.
  Panniculas adiposus is absent in rabbit. Fat collected in form of adipose connective tissue is a discontinuous layer.
- **Blubber –** Thick layer of white fat found under dermis of skin. Found in whale, seal, elephants. Maximum thickness of this layer is found in Blue whale (80 cm)
- **Hump of camel**
- **Tail of marino sheep**
- **Yellow Bone marrow.**

(B) Brown fat – It is composed of multilocular adipocytes in which many fat globules are present. Cytoplasm is more in amount. Due to more number of mitochondria, it produces 20 times more heat than white fat. Brown colour of fat is due to Cytochrome Pigment.

– Cold resistance device in new born baby is due to presence of brown fat. It accounts for 5-6 percent of body wt.
– It cannot be substituted for food.
– In hibernating animals during hibernation they obtain energy from stored brown fat.
– When fat is oxidized it produce water & energy.

Dense Connective Tissue – Fibres and fibroblasts are compactly packed in the dense connective tissues. Orientation of fibres show a regular or irregular pattern and are called dense regular and dense irregular tissues.

In the dense regular connective tissues, the collagen fibres are present in rows between many parallel bundles of fibres e.g. tendons and ligaments.

Dense irregular connective tissue has fibroblasts and many fibres (mostly collagen) that are oriented in different directions. This tissue is present in the skin, in perimysium, perineurium and bones as periosteum.

- **WHITE FIBROUS CONNECTIVE TISSUE**

– Bundle of collagen fibres are more in quantity & other components of connective tissue proper are less in quantity. It has great tensile strength.
– Yellow fibres & reticular fibres are completely absent.
– Its presence at joints between skull bones makes them immovable.
– On the basis of arrangement of fibres and matrix this tissue occurs in two forms –

Cord

1. Bundle of collagen fibres & matrix are distributed in regular parttern (alternate pattern).
2. Fibroblast cells are arranged in a series. Mast cells are scattered in matrix.

eg. Tendon connects muscles & bones.

Strongest tendon of the body is **Tendocalcaneus Tendon.** This tendon connects Gastrocnemius muscles of shank with calcaneum bone of ankle.

Sheath – In this form there is no regular pattern of fibres & matrix. Cells and fibres are criss – crossed arranged.

eg. – Pericardium

Periosteum – Outer covering of bone.

Perichondrium – Outer covering of cartilage.

Perichondrium – Covering of muscle.

Epimysium – Around Kidney.

Renal capsule – Covering of spleen.

Tunica Albugenia – Covering of Testis.

Splenic capsule – Covering of spleen.

Duramater – Otermost covering of brain.

Cornea of eye

Trachea

Bronchi

Oesophagus.

Glison's capsule – Around lobe of liver.

- **YELLOW FIBROUS CONNECTIVE TISSUE**
  - Yellow fibres are more in quantity but collagen fibres are also present.
  - Reticular fibres are absent.
  - On the basis of distribution of fibres & matrix they are of two types.

Cord : - Bundle of collagen fibres & matrix distributed in a regular pattern & in matrix yellow fibres form network.

eg. Ligaments – A structure which connects Bones.

- Strongest Ligament of body is **IIio-fermoral ligament** connects IIium bone of pelvic girdle with femur bone of Hind limb.
- In quardrupeds like cow & buffalo strongest ligament is **ligamentum nuchea** present in the between two cervical vertebrae.

Sheath – Irregular distribution of fibres and matrix with Elastic fibre.

eg. **– Wall of Alveoli of lungs**

Wall of small bronchioles

Wall of lymph vessels & Blood vessels

True vocal cords

Difference between Tendon and Ligament

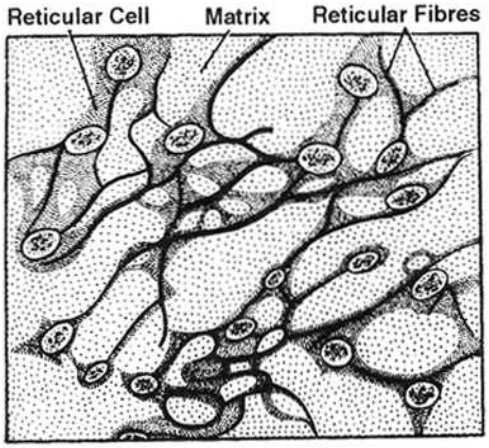
S.No.	Tendon	Ligament
1.	It is composed of white fibrous tissue	It is composed of yellow elastic tissue
2.	Fibroblasts lie in almost continous rows.	Fibroblasts lie scattered
3.	It joins a skeleton muscle to a bone	It joins a bone to another bone
4.	It is tough and inelastic	It is strong but elastic

- **RETICUlAR FIBROUS /LYMPHOID TISSUE**
  - It is mostly found in lymphoid organs.
  - Matrix of this tissue is like lymph.

– Reticular fibres are more in amount & form dense network around star shaped reticular cells. (Phagocytic in function)
– Lymphocyte cells are also more in number.
– Provide support and strength and form the stroma (Frame work) of soft organs.

e.g. **– Spleen**

– **Lymph nodes (Tonsils, Peyer's Patches).**
– **Cortex of ovary.**
– **Endosteum (covering of bone marrow cavity)**



Reticular tissue

– **Lamina Propria, Trachea, Bronchi , Intestine**

- **MUCOID CONNECTIVE TISSUE**

Also called **Embryonic** Tissue because it is mainly found during embryonic life.

– Matrix is in abundance.
– Few collagen fibres & fibroblast cell may be present.
– Matrix is composed of jelly like material called **Wharton's Jelly.**

eg. **– Umbilical cord (connect Placenta with foetus), Viterous humor – In vitreous body of eye, Comb of cock.**

- **PIGMENTED CONNECTIVE TISSUE**

It is a modification of areolar connective tissue but in areolae pigmented cells are more in number known as **Chromatophores** with provide colouration.

Melanophore – Melanin – Black
Guanophore – Guanine – White
Xanthophore – Xanthophil –Yellow

eg. – **Dermis of frog skin**
– Iris & choroids of eye.

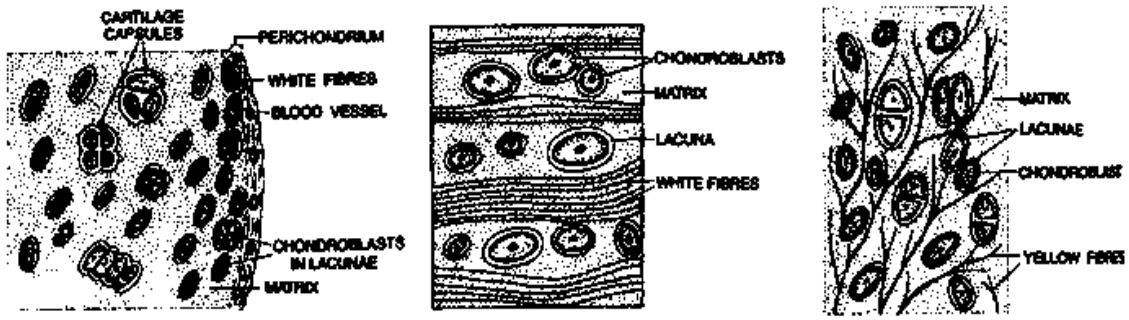
SUPPORTIVE CONNECTIVE TISSUE

– Matrix is dense mineralized. Due to deposition of minerals it becomes hard.
– Also known as **Skeletal Tissue** from skeleton of body.
– It is of 2 types

(1) Cartilage – Solid, semi-rigid, flexible conn. tissue.
(2) Bone – Solid, rigid conn. tissue.

CARTILAGE

- Outer most covering of cartilage is called **Perichondrium** which is composed of white fibres connective tissue.
- Cartilage producing cells are arranged on periphery known as **Chondrioblast.**
- These are active cell & divide to form chondriocytes, and synthesize the matrix of cartilage.
- Mature cells of cartilage are called **Chondriocytes.**
- They are found in vacuole like space in matrix called Lacuna. In which 2-3 Chondrocytes are present.
- **Chondrioclast** are cartilage destrolying cells.
- Maxtrix of cartilage is called **Chondrin** composed of Chondromucoprotein having Chondroitin-6-sulphate and Mucopolysaccharide (Hyaluronic acid)
- Matrix of cartilage provides rigidity & elasticity to cartilage.
- Blood circulation is absent in the matrix of cartilage.



Hyaline cartilage **White fibrous cartilage** **Yellow elastic fibrocartilage**

Type of Cartilage – There are following types of cartilage.

(A) Hyaline Cartilage.

(B) Fibrous Cartilage – (a) Elastic cartilage (b) white fibrous cartilage

(C) Calcified Cartilage.

(A) Hyaline cartilage

- Most of the part of embryonic skeleton is composed of this cartilage. Therefore, maximum bones of body are cartilaginous bones because they are developed from cartilage.
- Outermost covering **Perichondirum** is present.
- Matrix of this cartilage is **glass like** clear or hyaline matrix. Fibres are completely absent in the matrix of this cartilage. Only few collagen fibres may be present.
- Colour of matrix is bluish and it is transluscent.
  eg. – **Nasal septum.**
- **'C' shaped rings of trachea and Bronchi.** (Incomplete in dorsal surface)
- **Sternal part of ribs**. (Costal cartilage)
- **Larynx : Thyroid, Cricoid, Arytenoid.** Maximum part of Larynx is composed of hyaline cartilage.
- **Articular cartilage –** At the junction of two long bones on articular surface. At the end of long bone periosteum is absent and Hyaline cartilage is present known as Articular cartilage.

(B) Fibrous cartilage

(a) Elastic cartilage

- Perichondrium is present.
- In the matrix yellow fibres form network so it is highly flexible cartilage of body
- Colour of matrix is pale yellow.
  e.g. – **Tip of Nose**
  – **Ear Pinna**

- **Epiglottis**
- **Larynx –** Cartilage of santorini of larynx
- **Wall of Eustachian tube**

(b) White fibrous cartilage

- Perichondrium is absent because complete white fibrous connective tissue is converted into cartilage.
- In matrix bundle of collagen fibres are more in quantity so it is **strongest cartilage.**

  e.g. **Pubic symphysis**

  Pubis bone (Half part of pelvic girdle osinnomineta) are interconnected by pubic symphysis.

  Intervertebral disc

  A pad of cushion like structure which absorb mechanical shock and jerks and protect vertebral column. Central part of this disc is soft called as Nucleus pulposus. (remnant of embryonic Notochord)

  Slight elongation of body after death or in sleeping posture is due to relaxation of this disc.

(c) Calcified cartilage

- It is modified hyaline cartilage but due to deposition of calcium salts its matrix becomes hard like bones.
- It is **hardest cartilage** of the body
- Ca salt deposits in the form of Hydroxy apatite $Ca_{10}(PO_4)_6(OH)_2$.

  Eg. – Pubis of frog's pelvic girdle.
- Supra scapula of pectoral girdle
- Head of Femur & Humerus

Differences between Bone and Cartilage

Bone	Cartilage
1. Matrix is composed of a tough, inflexible material, the ossein.	**1.** Matrix is composed of a firm, but flexible material, the chondrin.
2. Matrix is always impregnated with calcium salts.	**2.** Matrix may be free or impregenated with calcium salts.
3. Bone cells lie in lucunae singly.	**3.** Cartilage cells lie in lacunae singly or in groups of two or four.
4. Osteocytes are irregular and give off branching processes in the developing bone.	**4.** Chondroblasts are oval and devoid of processes.
5. Lacunae give off canaliculi.	**5.** Lacunae lack canaliculi.
6. There are outer and inner layers of special bone forming cells, the osteoblasts, that produce new osteocytes, which secrete new lamellae of matrix.	**6.** There are no special cartilage-forming cells. Cartilage grows by division of all chondroblasts.
7. Matrix occurs largely in concentric lamellae.	**7.** Matrix occurs in a homogenous mass.
8. Bone is highly vascular.	**8.** Cartilage in nonvascular.
9. Bone may have bone marrow at the centre.	**9.** No such tissue is present.

BONE

- Study of Bone – **Osteology**
- Process of bone formation – **Ossification**
- Hardest Tissue – Bones
- (Softest Tissue – Blood.)
- Hardest substance – Enamel. (It is not a group of cell but it is formed by the secretion of ameloblast cells of teeth.)
- Outermost covering of bone is **Periosteum** composed of white fibrous connective tissue.

– Bone producing cell called **Osteoblast.** They divide to form **Osteocyte** & synthesize organic part of matrix.
– Mature cell of bone is called **Osteocyte** which is found in Lacuna. Only one osteocyte is found in lacuna.
– Bone destroying cells are **Osteoclast** cells.

Matrix

It consist of two parts.

Inorganic Part – 65 – 68%

$Ca_3(PO_4)_2$ – 80% max. rest 20% $CaCO_3$, $Mg_3(PO_4)_2$, Flourides.

Organic part – 32-35%

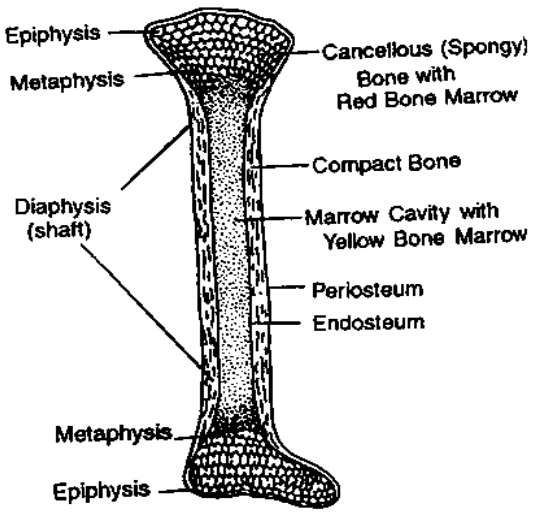
Ossein in which bundle of collagen fibres suspended in sulphated mucopolysaccharide.

Sharpey's fibre – extra bundle of collagen fibres which are present in the outermost layer of matrix called Sharpey fibres. They are also found in the cement of teeth which provide extra mechanical support to bone & teeth.

Structure of long bone :

Long bone has three region :

(a) Epiphysis (b) Diaphysis (c) Metaphysis



(Long Bone)

(a) Epiphysis

– Ends of long bone is called **Epiphysis.** This pat is composed of spongy bone. If this part is present at the joint then on articular surface **Periosteum** is absent & Articular cartilage (Hyaline cartilage) is present.
– Cavity is present in the form of **Trabeculae** filled with red bone marrow.
– It is composed of myeloid Tissue which produce blood corpuscles so epiphysis act as a **Haemopoietic** organ.

(b) Diaphysis

– Middle part of shaft of long bone is diaphysis which is composed of **compact bone.**
– In this region hollow cavity is present called bone marrow cavity filled with yellow bone marrow composed of white fat. Function is storage of fat.
– If required in anaemic condition YBM is replaced by RBM.
– A the time of birth RBM is 70 ml while in adult it is 4000 ml.

(c) Metaphysis

- It form little part between epiphysis & Diaphysis.
- In this region **epiphyseal plate** is present which is made up of osteoblast cells. They divide to form osteocyte and also synthesize matrix of bone, so epiphysial plate is responsible for elongation of bone.
- After complete development of long bone this plate is destroyed. So a complete developed bone shows 2 regions while in a developing bone 3 regions are found.

SPECIAL POINTS

Spongy Bones

- Haversian system is absent. Marrow cavity is present in the form of Trabeculae filled with RBM. So all spongy bones of body are haemopoietic
  e.g. Ribs, Pubis, Sternum, Vertebrae, Clavicle, End of long Bones, Scapula

Compact Bone

Haversian system is present.
e.g. Diaphysis of long bone.

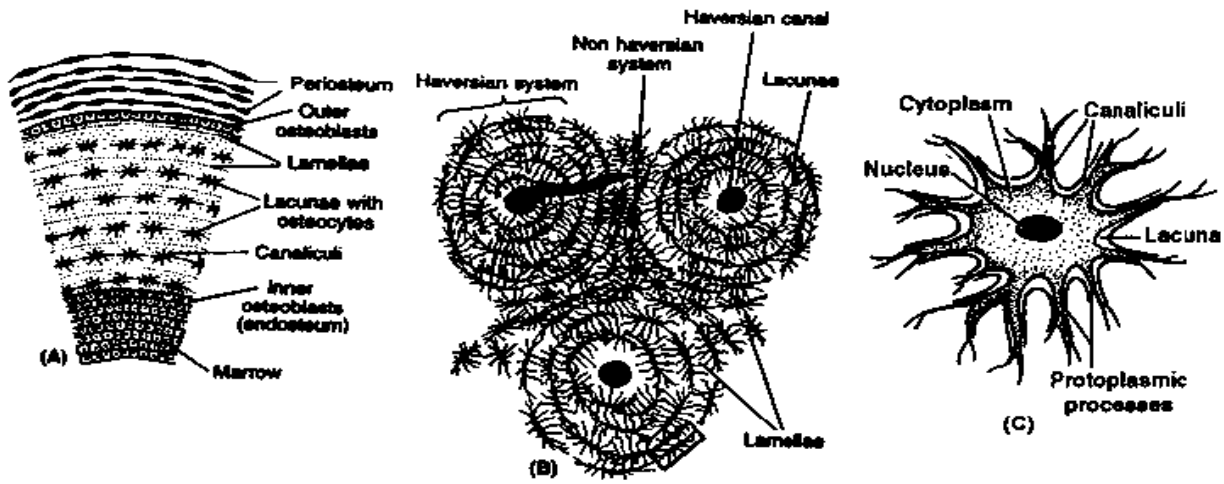
Dipolic/Heterotypic

- Middle part of bone is composed of spongy bone, in which Trabeculae is filled with RBM. This bone is covered by compact bone on upper & lower surface.
  e.g. All flat bones of skull.

Pneumatic Bone

- In the matrix air filled spaces are present so bone become light in weight.
  e.g. Bones of birds.

INTERNAl STRUCTURE OF MAMMALS BONE



(A) T.S. of amphibian bone, (B) T.S. of mammalian bone, (C) An osteocyte

It has following major structures.

1. Periosteum 2. Matrix 3. Endosteum 4. Bone marrow cavity

(1) PERIOSTEUM

- Outermost covering consists of two layers.
- Outer layer consist of WFCT in which blood circulation is present.

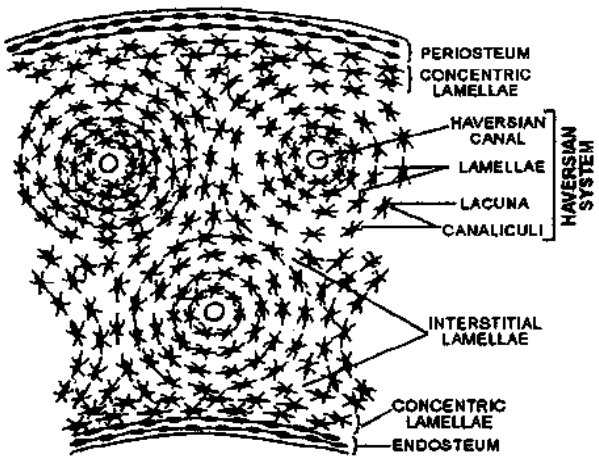
– Inner layer – consists of single layer of osteoblast cells. These cells are cube like in shape in which oval shaped nucleus & basophilic granules are present in cytoplasm.
– They divide to form osteocyte and secrete layer of matrix.

(2) Matrix

It is composed of inorganic & organic compounds.

– In the matrix of bone 2 types of canals are present.

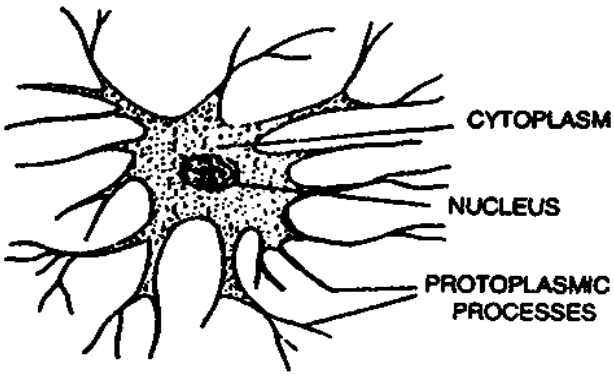
(a) Haversian canal **(b) Volkmann's canal**



(T.S. of Mammalian long bone)

Haversian canals are central Longitudenal canals which are arranged parallel to long axis of bone. In this canals 1 or 2 blood capillaries and nerve fibres are present.

– Volkman canals are transverse/horizontal or oblique canals.
– Haversian canals are interconnected by means of volkmann's canal.
– Matrix of bone is synthesized in the form of layer called **Lamellae.** On the basis of arrangement 3 types of lamellae are present in the matrix.
  (i) Haversian lamellae
  (ii) Interstitial lamellae
  (iii) Circumferential lamellae.
– Haversian lamellae are Concentric layers of matrix which are present around Haversian Canal.
– Between these lamellae layer of Osteocyte cells are also present.
– Haversian canal, Haversian lamellae & Osteocyte form **Haversian** system or **Osteon.**



Bone Cell

– Presence of Haversian system is a typical feature of **mammalian** compact bones.
– Osteocyte are present in the lacuna.Each Osteocyte is inter connected with adjacent Osteocyete by their cytoplasmic process.
– Cytoplasmic process of Osteocyte are present in the canals of lacuna called as **canaliculi.**

– Interstitial lamellae are present in the space between 2 haversian systems

Circumferential lamellae are of 2 types.

(i) Outer circumferential lamellae :

– These are present around all haversian system.

– These are peripheral layers of matrix.

(ii) Inner circumferential lamellae

– Present around bone marrow cavity.

(3) ENDOSTEUM

Endosteum consist of 2 layers.

(a) Towards bone marrow cavity lined with layer of reticular fibrous connective tissue.

(b) Towards matrix of bone line with layer of Osteoblast cell. They divide to form osteocyte & synthesize matrix. So growth of bone is bidirectional (Periphery and central region). While Growth of cartilage is unidirectional.

(4) BONE MARROW CAVITY

– In the central region hollow cavity is present which is filled with YBM. It is composed of white fat & its function is collection of fats or storage of fats.

• **TYPE OF BONES**

On the basis of development or location of ossification bones are four types :

1. Cartilagenous bones/Replacing /Endochondral bone

– These bones are developed from cartilage or they are formed by the ossification of cartilage.

– In the formation of these bones 2 types of cells are required.

A. Chondrioclast – Which reabsorb cartilaginous matter.

B. Osteoblast – Which deposit bony matter into cartilage so cartilage is replaced by bone. Hence these bone are also called as replacing bones.

e.g. Maximum bones of our body like limb bones (Fore & Hindi), Ribs ; vertebrae; Girdle bones except clavicle.

2. Membranous bones/Dermal bones/Investing bones

– These bones are developed from the connective tissue of dermis or formed by ossification in the connective tissue of dermis.

e.g. Sternum, Nasal Bone, Clavicle, Vomer Bone, Skull bones.

Flat bones of skull – Parietal Bone, Frontal, Larymal, Temporal

Bones of upper Jaw – Maxilla, Palatine

Bones of lower Jaw – Mandible (Human)/Dentary (other mammals)

3. Sesamoid Bones

– These bones are developed by the ossification of tendons at the joints.

e.g., Pisciform (wrist bone) of man and rabbit. (One out of 8 carpals in man and 1 out of 9 carpals in Rabbit).

– Patella (knee bone) Largest sesamoid bone. (Patella and two fabillae in rabbit)

– Fibulla (of Tibia – Fibulla)

4. Visceral Bones

– If ossification take place in the visceral organs then visceral bones are formed. These are rare bones, found in few animals. In rabbit & man these bones are absent.

e.g. **Os Cardis** **:** Present in inter ventricular septum of Deer's heart
Os Palpebrae **:** In the eyelid of crocodile
Os Penis (Baculum) : In the Penis of rodents, rat, shrew, Bat, Whale, Tiger.
Os rostralis **:** In the snout of pig.
Os falciparum **:** Palm of mole

Differences between Cartilaginous, Dermal, Sesamoid and Visceral bones

Cartilaginous (Endochondrial) bone	Dermal (Intramembranous) bone	Sesamoid bone	Visceral bone
These are formed by ossification directly on the cartilages and formation involves deposition of body matter by osteoblasts and resorption by osteoclast.	These are formed by ossification in the dermis of the skin.	These are formed by ossification at the joints of the bones or on the tendon and ligament.	They are formed in the soft organs.
These are elongated and hard bones Examples : Vertebrae, humerus, femur and fibula.	These are membrane-like bones. Examples : skull bones, phalanges, clavicles.	These are small sized disc like bones. Example : patella bone (knee cap).	Examples : oscordis, ospenis, osclitoris.

Differences between Spongy bone and Compact bone

Characters	Spongy bone	Compact bone
Arrangement of lamellae	There is no regular Haversian system so have spongy texture.	Have regular Haversian system
Occurrence	In skull bones, ribs, centrum of vertebrae and epiphyses of long bones	In the shaft (diaphysis) of long bones
Marrow cavity	Broad	Narrow
Type of bone marrow	Red marrow in the spaces between lamellae	Yellow marrow in marrow cavity
Function	Marrow forms RBCs and Granular WBCs	Marrow stores fats

Table : Difference between a Dried bone and a Decalcified bone

Dried bone	Decalcified bone
(i) It is a bone that has been dried by subjecting to a high temperature	(i) It is a bone that has been treated with dilution HCl.
(ii) It does not have the bone marrow. Bone marrow cavity is empty.	(ii) It has the bone marrow.
(iii) It contains mineral matter.	(iii) It contains only the organic matter.
(iv) Living structures are absent.	(iv) Living structures are present.

FLUID CONNECTIVE TISSUE

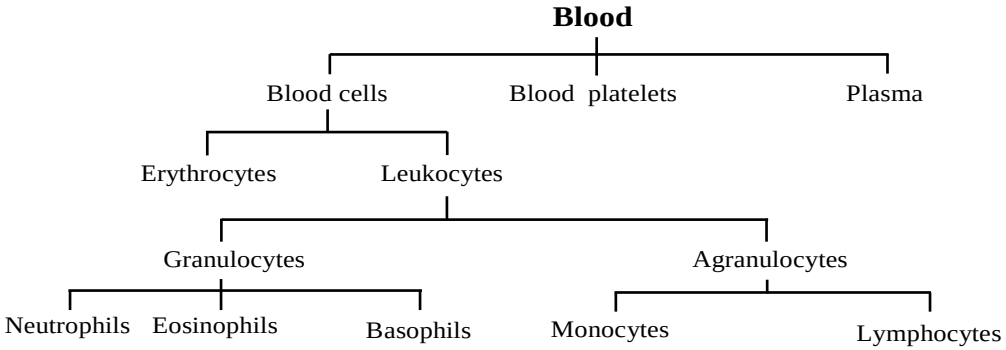
There are two types of Fluid connective tissue :

(1) Blood (2) Lymph

Matrix is liquid & fibre free

1. BLOOD :

COMPOSITION OF BLOOD



– Study of Blood – **Haematology**
– Process of blood formation **Haemopoiesis.**
– Colour – Red
– PH – 7.4 (Slightly alkaline)
– By weight – 7 to 8% of body weight
– By volume – 5 – 6 litres in male and 4-5 litres in female.
– Blood is a false connective tissue because

a. Cells of blood have no power of division.
b. Fibres are completely absent in blood.
c. Matrix of blood is produced and synthesized by liver and lymphoid organs.

- **Composition of Blood**

  Liquid Part – Matrix – Plasma 55%

  Solid Part – Blood corpuscles – 45% (RBC, WBC & Platelets) [Formed Elements]

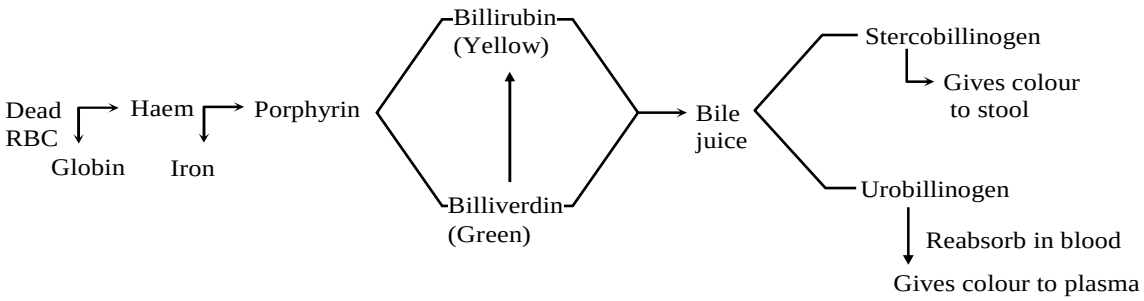
  Packed cell volume – (PVC)% volume or Total number of blood corpuscles is blood.

  Haematocrit Volume : - % volume or only number of RBC in blood.

  PVC ≈ HV because 99% of Packel cell volume is completed by RBC & in rest 1% WBC & Platelets are present.

PLASMA

– Matrix of blood is called Plasma.
– It is pale yellow in colour due to Urobillinogen. (Billirubin)



- **Composition of plasma**

  Water : 90% - 92%

  Solid part : 8 – 10%

  In which inorganic and organic compounds are present.

- **Inorganic part of plasma -** 0.9% in which -

1. Ions – Na^+ , K^+, Ca^{++}

Cl^- , HCO_3^+, SO_4^{--}, PO_4^{---}

Cl^- , > Na^+

2. Salts – NaCl, KCl, $NaHCO_3$, $KHCO_3$

Maximum : NaCl (also called as common salt.)

3. Gases – O_2, CO_2, N_2

Each 100 ml of plasma contains 0.29% O_2, 0.5% N_2, 5% CO_2

Present in dissolved form

- **Organic Part of Plasma** – 7% - 9%

Proteins 6 – 7% Maximum

Albumin → 4% (Max.)

– Produced and synthesized by liver

– Responsible to maintain BCOP (28 – 32 mm Hg.)

Globulin : - 1.5% – 2.5 %

– Ratio of Albumin & Globulin is 2 : 1.

– Produce and secreted by liver and Lymphoid organs.

– Transport or carry substance in body.

– Destory bacteria virus & toxic substances.

– In blood 3 types of Globulins are present.

(i) **α-Globulin** – Produced by liver.

e.g. Ceruloplasmin – Cu carrying protein.

(ii) **β-Globulin –** Produced by liver

e.g. Transferin – Fe carrying protein.

(iii) **γ-Globulin –** Produced by Lymphoid organs

Present in the form of antibodies which destroy Bacteria, Virus & Toxic substance. Also called **Immunoglobulins .**These are of 5 types. (Ig, G, IgA, IgM, IgD, IgE)

Prothrmbin – 0.3% Produced by liver

Fibrinogen – 0.3% Prodcued by liver

– Largest plasma protein .

– Help in blood clotting.

- **Digested Nutrients**

Amino acid

Glucose (Blood Glucose level – 80-100 mg %) → If exceeds 180 mg/100ml = appears in urine = Glucosuria

Fatty acid → 70 – 110 m/dl = Fasting Glucose

Glycerole → 110 – 140 mg/dl = Glucose PP

Cholesterole (Blood Cholesterol level - 80–180 mg/100ml)

vitamins

- **Waste Products**

  Urea, Uric acid, Creatine, Creatinine

  Normal blood urea level 17-30 mg%

  If blood urea becomes more than 40 mg this condition is called **Uremia** in which R.B.C. become irregular in shape called **burr cell** which are destroyed in spleen so uremia is a type of anaemia.

- **Anticoagulant**

– Heparin-A Mucopolysacchride which prevent clotting of blood in blood vesels.

- **Defence compounds**

1. **Lysozyme :** A protein which act as an enzyme which dissolve cell wall of the Bacteria & destroy them.
2. **Properdin :** Large protein molecules which destroy toxins synthesize by Bacteria or Virues so act as anti-toxin

- **Hormones**

– Secreted by endocrine glands which are transported by blood plasma.

BLOOD CORPUSCLES

- **Erthrocytes (Red blood Corpuscles)**

– Mammalian RBC's are Biconcave, circular & non nucleated.

– At the time of origin nucleus is present in the RBC but it degenerates during maturation process.

– Biconcave shape of RBC increase surface area.

– Due to absence of nucleus & presence of biconcave shape more Haemoglobin can be filled in RBC.

Exception :- Camel & Lama are mammals with bioconvex, oval shaped & nucleated RBC.

– In RBC Endoplasmic Reticulum is absent so endoskeleton is composed of structural protein, fats and Cholesterol

present in the form of network called **stromatin** which is a spongy cytoskeleton.

– Plasma Membrane of RBC is called **Donnan's membrane.** It is highly permeable to some ions like Cl & HCO_3 ions and impermeable to Na^+ & K^+ inos. It is called Donnan's phenomenon.

– Due to presence of stromatin spongy cytoskeleton & flexible Plasma Membrane RBC (7. 5μ) can pass through less diameter blood capillaries (5μ)

– In RBC higher cell organelles like Mitochondria & Golgi complex is absent.

– Due to absence of Mitochondria anaerobic respiration takes place in RBC.

– In RBC enzyme of glycolysis process are present, while enzyme of Kreb's cycle are absent.

– In RBC carbonic anhydrase enzymes is present which increases rate of formation & dissociation of carbonic acid by 5000 times. (Fastest catalyst (with zinc))

– Antigen of blood group is present on the surface of RBC.

– If Rh Antigen is present then it is also found on the surface of RBC.

– Single RBC is pale yellow in colour while group of RBC appear red in colour.

– In RBC. red coloured respiratory pigment **Haemogobin** is present.

– In each 26.5 crores molecules of Hb are present

– Molecular weigth of each molecule of haemoglobin 67,200.

– In composition of RBC 60% H_2O & 40% solid part is present. Only Hb. Constitutes 36% of total weight of RBC and 90% on of dry weight.

- **Haemoglobin**

  It is composed of two components

  1. Heam - 5% Lipid part
  2. Globin - 95% Protein part

(1) Heam (Iron and Porphyrin)

Iron Present in the form of Fe^{+2}

While in muscles myoglobin is present where iron is present in the form of Fe^{+3}

– Prophyrin is composed of **Acetic** acid and Glycene amino acid.

– Each molecule of Hb carries 4 molecules of O_2

– 1 gm Hb carries 1.34 ml O_2

– 100 ml blood contain 15 gm Hb

– 100 ml blood transport 20 ml O_2

(2) Globin: Each molecule of globin protein is composed of 4 polypeptide chains. Polypeptide chains are of 4 types.

(a) α polypeptide chain having 141 Amino Acids

(b) β polypeptide chain having 146 Amino Acids

(c) γ polypeptide chain having 146 Amino Acids

(d) δ polypeptide chain having 146 Amino Acids

On the basis of these polypeptide chains 3 type of Hb are formed in human

– Hb A (Adult Hb) – $2\alpha + 2\beta$

– Hb A_2 (Adult-2) – $2\alpha + 2\delta$

– HbF (Foetal Hb) – $2\alpha + 2\gamma$

(Oxygen binding capacity of foetal Hb is more than adult Hb)

- **Size of RBC**

  Human – 7.5 μ

  Rabbit – 6.9 μ

  Frog – 35 μ

– Largest RBC– Amphiuma 75-80 μ (Class Amphibia)

– Smallest RBC–Musk Deer 2.5μ. (Class Mammalia)

– Largest RBC among all mammals in Elephant 9-11 μ

– Change in the size of RBC is called as **Anisocytosis**

– Due to Vit. B_{12} deficiency RBC become larger in size called as **Macrocytes.** These are immature RBC which are destroyed in spleen. In these RBCs amount of haemoglobin is normal.

– Due to Fe deficiency RBC become smaller in size called as **Microcytes.** They are also destroyed in spleen. In these RBCs amount of haemoglobin is less.

- **Shape of RBC –**
  – Biconcave
  – Change in the shape of RBC is called as **Poikilcoytosis.**

– Uremia-RBC become irregular in shape.
– Sickle cell anaemia-RBC become sickle shaped.
– If RBC is kept in Hypertonic solution it will shrink (crenation).
– In Hypotonic solution it will burst.
– 0.8-1% NaCl solution is isotonic for RBC. (0.9% of NaCl)
– 80-100 mg% of glucose is also isotonic.

- **Life span of RBC**

Human	–	120 days
New Born Baby	–	100 days
Rabbit	–	80 days
Frog	–	100 days

Avg. life span of RBC in all mammals 120-127 days.

Radioactive chrominum method is used to estimate life span of RBC

- **RBC count**

Number of RBC in per cubic mm of blood is called RB count.

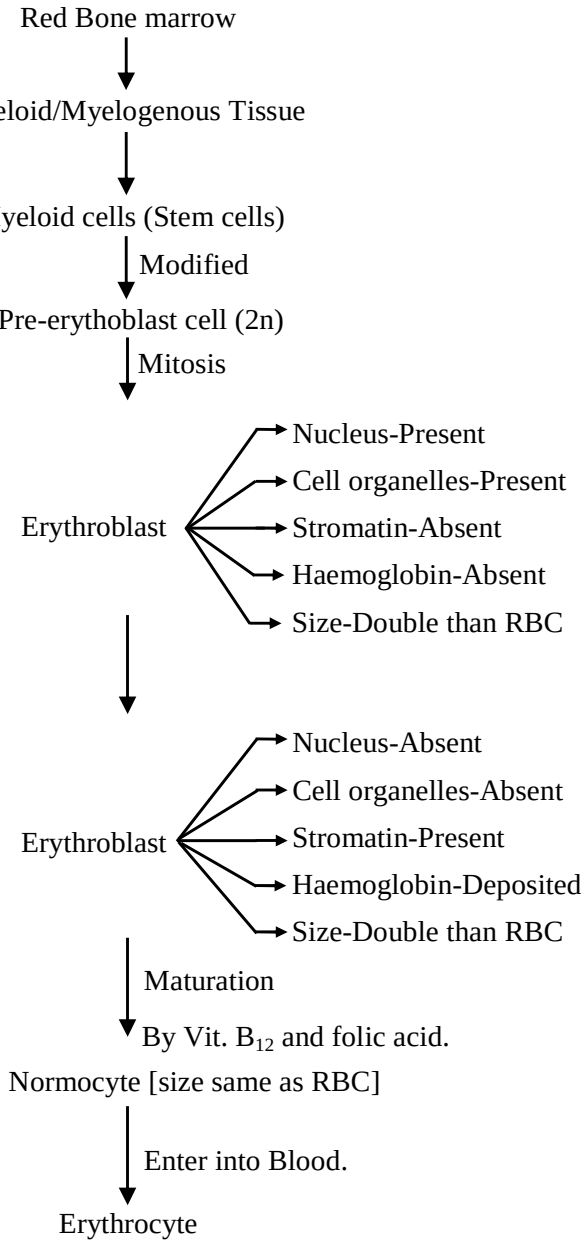
Human (Male)	5.5 million	15.5 ± 2.5 g/dl
Human (Female)	4.5 million	14.0 ± 2.5 g/dl
Newly born baby	6.8 million	16.5 ± 3.0 g/dl
Rabbit	7 million	
Frog	0.4 million	

– Increase in the RBC count condition is called **polycythemia.** This condition occurs at hill station.
– Decrease in RBC count condition is called **Anaemia.**

1. **Macrocytic Normochromic anaemia** – Due to Vit. B_{12} deficiency macroytes are formed which are destroyed in spleen. In Macrocytes % of Hb is normal.
2. **Microcytic/Hypochromic anaemia –** Due to Fe deficiency microcytes are formed.
3. **Normocytic/Normochromic Anaemia –** Excess blood loss.

- **Formation of RBC**

– Process of formation of RBC is called **Erythropoiesis.**
– Organs which produce RBC's called **Erythropoietic organs.**
– Hormone which stimulate Erthyropoiesis is called **Erythropoietin** synthesize by Kidney.
– 1^{st} RBC is produced by yolk sac.
– During embryonic life RBC are produced by Liver, Spleen, Placenta, Thymus gland.
– In adult stage RBC is produced by RBM which filled in Trabeculae of spongy bones.
– Kidney is an erthyropoietic organ in frog.

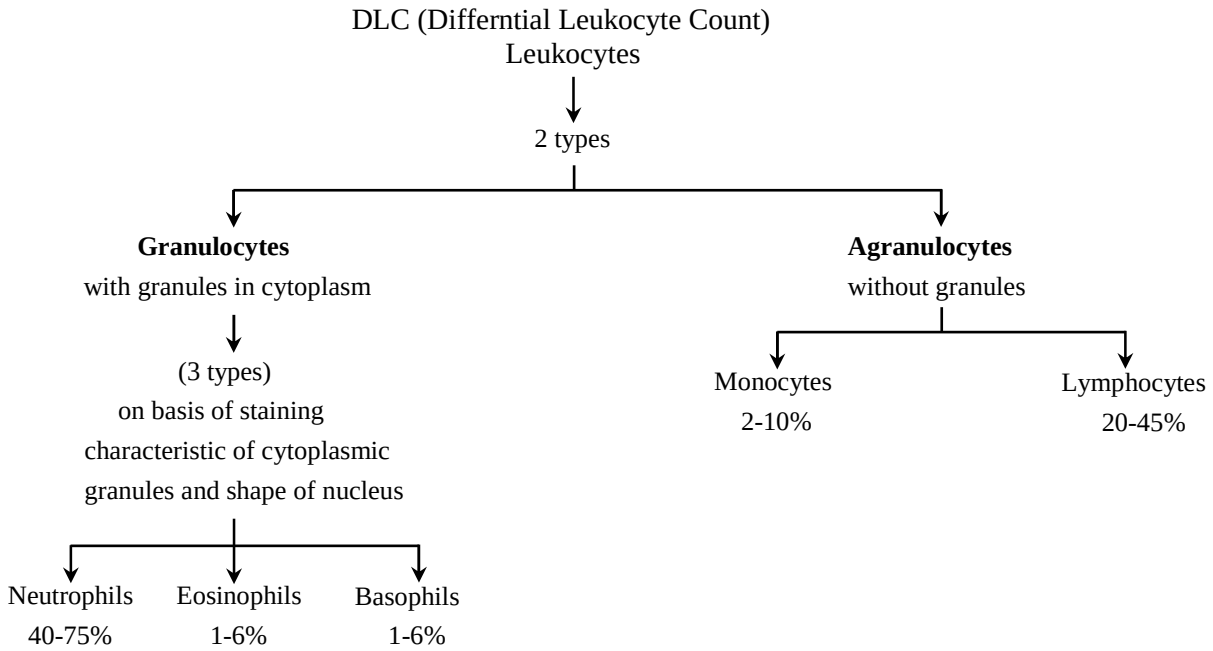


- 1% RBC are destroyed daily but in same number new RBC are entered in the blood.
- Destruction of RBC occur in spleen. So spleen is called **Grave yard** of RBC.
- Spleen stores excess blood corpuscles so it is called **Blood Bank of body.**
- In resting and slow flowing blood, the RBC form pile called **Roulaux** by adhering together due to surface tension. Fibrinogen favours rouleaux condtion.
- Minute bits of disintegrated red blood corpucles in known as **Haemoconia**
- Ghost of RBC is made up of its plasma membrance.

Table : Difference between different types of Leucocytes

Character	***Lymphocytes***	***Monocytes***	***Eosinophils***	***Basophils***	***Neutophils (Acidophils)***
Number/ percentage	20-25%	2-10%	2-3%	0.5-1%	60-65%

Granules in cytoplasm	Absent	Absent	Coarse	Coarse	Fine
Staining of cytoplasm	Basophilic	Basophilic	Eosinophilic	Basophilic	Neutrophilic
Nucleus	Rounded	**Bean-shaped**	Bilobed	S-shaped 3-lobed	Multilobed
Site of Formation	Lymph nodes, spleen, thymus, tonsils, Peyer's patches, Bone marrow	Bone marrow	Bone marrow	Bone marrow	Bone marrow
Life span	Few days or even years	10-20 hours in the blood tissue, months or even years	4-8 hours in blood and 4 to 5 days in tissue	4-8 hours in blood and 4 to 5 days in tissue	4-8 hours in blood and 4 to 5 days in tissue
Function	Antibody formation	Phagocytic	Important role in immunity anti-allergic	Secretion of heparin, histamine and serotonin	Phagocytic



- **LEUCOCYTES (WBC)**

– WBC (White Blood Corpuscles) are also called as **leucocytes** because they are colourless. **TLC** =Total leucocyte count. Number of WBC/mm^3 $\rightarrow$ 8000 – 11000/mm^3

Leucocytosis : - Increase in TLC. This condition occur in Bacterial & Viral infection.

Leucocytopenia :- Decrease in TLC. Normally TLC increases in Bacterial & Viral infection but in typhoid & AIDS, TLC decreases.

Leukemia :- Abnormal increase in TLC (more than 1 Lakh) it is called as blood cancer.

– **On the basis of nucleus & nature of cytoplasm, Leucocyte are of 2 types.**

- **Granulocytes**

– In their cytoplasm granules are present which can be stained by specific dye.
– Nucleus is multilobed and lobes are interconnected by protoplasmic strand.
– Due to presence of lobed nucleus they are called as polymorphonuclear WBC.
– Produced in Bone marrow
They are (i) Acidophils, (ii) Basophils & (iii) Neutrophils

- **Agranulocytes**

– Cytoplasm is clear & granular
– Nucleus do not divide in lobes so called as Mononuclear WBC.
– Produced in Bone marrow
They are of 2 types (i) Monocytes (ii) Lymphocytes

- **ACIDOPHILS/EOSINOPHILS**

– Amoeboid in shape.
– Size 10-14 μ
– Life span 4-8 hrs in blood
– In their cytoplasm acidiophilic granules are present which can be stained by acidic dye Eosin.
– Nucleus is bilobed
– They protect body against allergy & parastic infection.
– In allergy they synthesize **histamine.**
– In parasitic infection they act as lysosome. They attach with the surface or body wall of parasite and synthesize enzymes which dissolve body wall of parasite & destroy them.
– Increase in number of acidophils condition is eosinophilia which occurs in Taeniasis, Ascariasis, Hay fever (parasitic infection)

- **BASOPHILS**

– Minimum in number
– Amoeboidal in shape
– Size 8 -10 μ
– Smallest granulocytes
– Life span 4-8 hrs in blood
– In their cytoplasm basophilic granules are present which can be stained with basic dye methylene blue.
– Nucleus is divided in 2 or 3 lobes. 'S' shaped.
– Their main function is to secrete & transport Heparin, Histamine & Serotonin produced in liver.

- **NEUTROPHILS/HETEROPHILS**

– Maximum in number
– Amoeboid in shape
– Size 10-12 μ
– Life span – 4-8 hrs. in blood
– In their cytoplasm granules can be stained by any dye (acidic, neutral, basic).
– Nucleus is divided in 3-5 or more lobes. So maximum lobed nucleus is present in Neutrophils.
– Counting of lobes of Neutrophils is called **Arneth count.**
– They are active, motile WBC

– They can squeeze & comes out from the wall of blood capillaries in Tissue. This phenomenon is called **Diapedesis.**
– Phagocytic in nature
– Destroy Bacteria & Viruses by phagocytosis.
– Due to their smaller size & Phagocytic nature they are called **Microplice man.**
– Help in sex detection. In female neurophils barr body is attached with lobe of nucleus which is formed by the modification of x chromosomes.
– barr body is absent in male.

• **MONOCYTES**
– Size 12-20 μ
– Largest Blood Corpuscles.
– Life span-In blood 10-20 hours but in connective tissue it may be week/month.
– Nucleus kidney shaped/ bean shaped.
– Power of Diapedesis is present.
– Active motile WBC.
– Phagocytic nature.
– Destroy Bacteria & Viruses by phagocytosis so called **Macropoliceman.**
– Also called **scavenger** of blood because they engulf damaged or dead & minute bits of blood corpuscles.

• **LYMPHOCYTES**
– Amoeboid in shape.
– Size 6-16 μ (smallest WBC)
– Life span in blood less than 10 days but in connective tissue it may be month/year/whole life
– Large nucleus is present.
– Lymphocytes are of 2 types.

(a) **T-LYMPHOCYTES**
– Produced in bone marrow but mature in thymus gland. On the basis of function T-Lymphocyts are of 4 types :

1. T-Killer/Cytotoxic : - Direct kill Bacteria or Viruses
2. T-Helper : - Stimulate B-lymphocytes to produce antibody.
3. T-Suppressor : - Suppress T killer & protect immune system.
4. T-memory : - Stones profile of bacteria or virus or protein.

(b) **B-LYMPHOCYTES**
– Produced in bone marrow and mature in bone marrow. Its function is to produce, synthesize & transport antibodies

PLATELETS
– Also known as Thrombocytes
– Found only in mammals while in other vertebrates, Spindle corpuscles are present which perform same function.
– They are non nucleated and derived from **Megakaryocyte** cells of bone marrow.
– In shape platelets are disc like, oval shaped or biconvex.
– While spindle corpuscles are spindle in shape & round nucleus is present in the centre.

– In their cytoplasm basophilic granules are present which can be stained by methylene blue.
– Maximum part of cytoplasm is composed of contractile protein **Thrombosthenin.**
– Size 2-3 μ
– Life span – 2-4/5 days
– Count – 1.5-4.5 lakh/mm^3
– Decrease in number of Blood Platelets is called **Thrombocytopenia.**
– Critical count of Thromocytes is 40,000/mm^3. If number is less than critical count then red spot or rashes appears on the skin called **Purpura disease.**

Function :
– Repair endothelium of blood vascular system by the formation of platelet plug because they have tendency to attach on gelatinous or mucilaginous surface.
– Synthesize Thromoboplastin which help in blood clotting.
– Synthesize serotonin.

BLOOD CLOTTING

– Blood flows from cut or wound but after some times it stops automatically. It is called clotting of blood.
– Bleeding time 1-3 min.
Clotting time 2-8 min.
Some times clots are also formed in intact blood vessels which are of 2 types.

(a) Thrombus Clot
– Static clots which grow bigger & ultimately block the blood vessels.
– If this clot is formed in the coronary vessels then called as Coronary Thrombosis which can cause heart attack.
– If form in brain, then called as Cephalic Thrombus causes paralysis.

(b) Embolus clot
– Moving clots which flow with blood & ultimately dissolve in blood.
– More harmful due to their moving nature.

• **Machanism of blood clotting**
(Enzymes Cascade theory)
– Proposed by **Macfarlane & Co-workers.**
– According to this theory there are 3 steps in blood clotting.

(1) Releasing of Thromboplastin-
– Injured tissue synthesize exothrom hoplastin and platelets synthesize endothromboplastin.
– Both these thromboplstin react with plasma proteins in the presence of Ca^{++} ions to form **Prothrombinase enzymes.** (Thrombokinase)
– This enzymes inactivate Heparin. (Antineparin)

(2) Conversion of Prothrombin into Thrombin
– Prothrombinase enzymes convert inactive prothrombin into active Thrombin in the presence of Ca^{++} ion.

(3) Conversion of fibrinogen into fibrin
– Fibrinogen is soluble protein of plasma. Thrombin protein polymerise monomers of fibrinogen to form insoluble fibrous protein fibrin.

– Fibrin form network on cut in which blood corpuscles got trapped. This form clotting of blood.
– After clotting a pale yellow liquid oozes from clot called **Serum.** In which antibodies are found.

Blood	–	Corpuscles	= Plasma
Plasma	–	fibrinogen and large protein	= Serum

- **Clotting Factors :-**

– 13 factors help in blood clotting.
– These factors are mainly produced in liver.
– Vitamin K is required in the synthesis of these clotting factors.
– These factors are represented in Roman number.
– I – Fibrinogen
– II – Prothrombin
– III – Thromboplastin
– IV – Ca^{+2} (cofactor in each step of blood clotting)
– V – Proaccelerin
– VI – Accelerin (Rejected)
– VII – Proconvertein
– VII – AHG Anti Haemophelic Globin (Absent in Haemophilia-A)
– IX – Christmas factor
– X – Stuart factor
– XI – PTA (Plasma Thormboplastin Anticedent)
– XII – Hagman factor
– XIII – FSF Factors (Fibrin stabilizing factor) (Laki Lor and factor).
– Other natural anticoagulants are
Hirudin – found in leech.
Anophelin – found in female Anophelese.
Lampredin – found in Peteromyzon (Lamprey)
Cumerin – obtain from plants
Warfarin – obtain from plants
– To collect blood in bottle in blood bank artificial anticoagulants are used like
Sodium citrate
Sodium oxalate
EDTA (Ethylene diamine tetra acetic acid)
These chemicals act as Calcium binding units and remove Ca^{+2} ions from blood.

- **Blood Groups**

– Antigen of blood groups is present on the surface of RBC also called as **agglutinogen.**
– Antibody for blood group antigen is present in serum (Plasma) called **agglutinin.**
– Antigen & Antibody are special type of **glycoproteins.**
– Blood groups are of 4 type A, B, AB, O
– A, B, O discovered by **Landsteiner.**
– AB discovered by Decastello & Struli.

Blood groups	Antigen	Antibody	Receive	Donate
A	A	b	A , O	A , AB
B	B	a	B , O	B , AB
AB	A , B	-	A , B, AB, O	AB
O	-	ab	O	A , B , AB , O

- Blood group O is universal donar & Blood group is **AB** is universal acceptor.
- Blood groups are example of **multiple alleles.**
- For gene of blood group 3 alternatives are present.
- Gene A & B are dominant gene. They can give their expression in homozygous and hetrozgous condition so blood groups A & B are due to dominant gene A&B
- I^AI^O ┐
  A
- I^AI^A ┘
- I^BI^O ┐
  B
- I^BI^B ┘
- Gene O is recessive gene which gives its expression in homozygous condition. Blood Group O is due to recessivegene.
- I^0I^0 O
- Blood group AB is an example of co-dominance in which both dominant gene A&B are present.
- I^AI^B AB

RH FACTOR

- Discovered by **Landsteiner & Weiner** in Rhesus monkey.
- Rh antigen is due to dominant gene. So if one of the gamete possess gene of Rh factor, its off spring will be always Rh + Ve
- If antigen is present then Rh^+
- If antigen is absent then Rh^-

In India % ratio of Rh is

Rh^+ – 97%

Rh^- – 3%

In World

- Rh^+ – 80%
- Rh^- – 20%
- In Rh^+ antibody is absent for this antigen
- Rh antibody is also absent in Rh^-blood But

1. If Rh^+ blood is transfused to Rh^- then 1^{st} blood transfusion complete successfully but during Ist blood transfusion Rh antibodies are formed in receiver's blood so in next blood transfusion. agglutination of blood takes place.
2. If mother is Rh^- & father is Rh^+ then offspring is also Rh^+ In this case 1^{st} pregnancy is completely successful but during at the time 1^{st} delivery Rh antibody is formed in mother's blood due to damaged

blood vessel so in next pregnancy death of foetus will occur in the earilier stage due to agglutination of blood called **erythroblastosis foetalis.**

– To destroy Rh antibody medicines are used like **Rhogam, Rholin, Anti D.**

• **Lymph :** Blood, tissue fluid and lymph are almost contiguous parts of the body's "supply line".

– Infact the tissue fluid is a part of blood plasma that oozes out of arterial capillaries into intercellular substance and lymph is a part of tissue fluid.

– The blood plasma, tissue fluid and lymph have a basic similarity.

– **The lymph is like the blood but, having no RBCs**, it is colourless.

– It normally has more WBCs than the blood, and of these the lymphocytes are in large majority.

– It contains little of O_2 , but lot of CO_2 and metabolic wastes.

– It has the ability to coagulate like the blood. It coagulates outside the body.

– In mammals, lymph sinuses and lymph hearts are absent which are found in frog.

– The tissue of the mammals have lymph capillaries which join to form lymph vessels.

– In lymph vessel, the lymph flows from organs into the hearts.

– They are provided with semilunar valves to prevent reverse flow of the lymph.

– The lymph vessels are provided with lymph nodes which are found mainly in the head, neck, arm pits, near big blood vessels etc.

– **The lymph nodes form lymphocytes**, they clean the lymph by filtration and they form antibodies.

– Lymph nodes also from Payer's patches. The lymph vessels finally open into subclavian veins.

– The lymph capillaries in the villi of intestine are also called as lacteals.

– Cisterna chyle is also called as second heart which is situated just below the diaphragm in the abdominal cavity.

– **Functions of lymph :** The basic function of lymph is to bring back, into the vascular circulation, the cell debris, large colloid particles and the part of the blood plasma that had diffused out from arterial capillaries into the tissue fluid but has failed to return back into venous capillaries.

– The white corpuscles of the lymph are the same as those of the blood and have the same functions of defense and of assistance in tissue repair and healing. In intestinal wall, lymph capillaries, called lacteals, are specially meant for absorption of fats.

Comparison of blood and lymph

Blood		Lymph	
1.	Red corpuscles present.	**1.**	These are absent.
2.	White corpuscles fewer, neutrophils most numerous.	**2.**	White corpuscles more; lymphocytes most numerous.
3.	Soluble proteins more than insoluble proteins.	**3.**	Insoluble proteins more than soluble proteins.
4.	Amount of nutrients and O_2 comparatively more.	**4.**	Amount of nutrients and O_2 comparatively less.
5.	Amount of CO_2 and metabolic wastes normal.	**5.**	Amount of these much more.

- **Muscular Tissue**
  - **Origin**
  - It develop from the mesoderm of embryo.
  - **Special property**
  - **Contractibility** is the special property of muscular tissue. The cells of muscular tissue can shorten considerably and return to original relaxed state. The muscle cells contract in a definate direction.
  - **Functions of muscular tissue**
  - Muscles support the bone and other structure.
  - Muscles are responsible for heart beat production of sound, etc.
  - Muscles brings movements of the body parts and locomotion of individual.
  - Muscles are required for delivering a baby.

  ⇒ 40% to 50% of body weight is contributed by muscles.

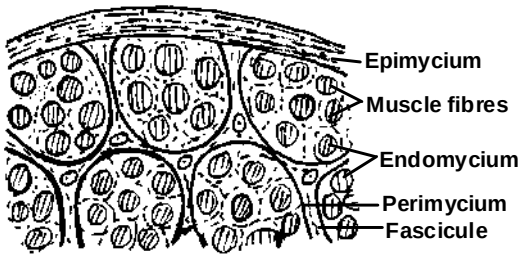


Fig. T.S. Muscle

  - **Types of muscles**

    Muscles are of three types :

    (1) Striated muscles **(2)** Unstriated muscles **(3)** Cardiac muscles

1. Striated Muscles

- **Structure**
- Striated muscle fibre is also called stripped. skeletal or voluntary muscle fibre.
- These muscle fibres occurs in bundles and are attached to the skeleton.
- Each muscle fibre is surrounded externally by a delicate membrane **sarcolemma**.
- In each fibre many nuclei appears at irregular interval, so each fibre is **syncytial**.
- The cytoplasm (Sarcoplasm) of each fibre possess large number of myofibrils which are tightly packed.
- Each myofibril possess dark and light bands alternating with each other.
- **Detailed structure of a myofibril**

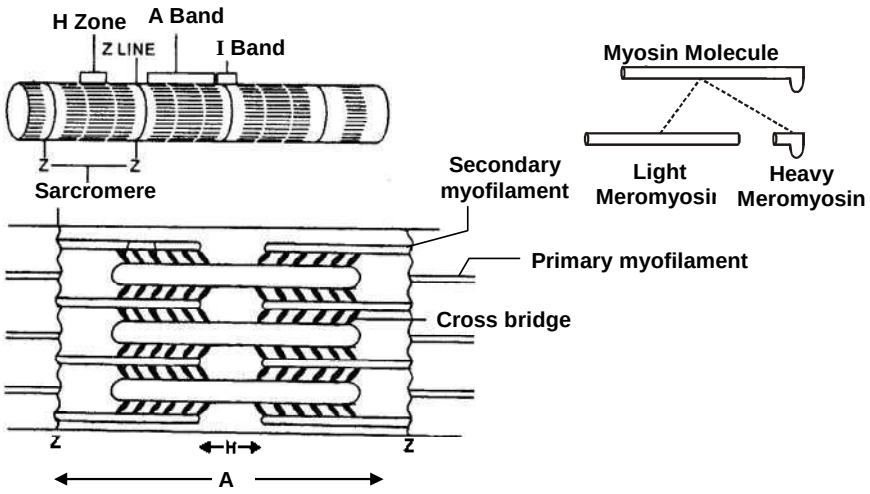

Fig. Structure of Vertebrate Striated Muscle at Magnification

- The dark band of myofibril is called **A-bands** (Anisotropic bands). Each A band possess a light zone called **H-zone or Henson's membrane** in the middle.

– The light band of myofibril is called **I-bands** (Isotropic bands). Each I-band possess a thin dark z-disc or krause's membrane in the middle.

⇒ Krause's membrane is also called **Dobie's line** or **Zwischencheibe line**.

The portion between two disc is called a **sarcomere. Sarcomere are the functional units of myofibrils**.

– Each sarcomere has two types of myofilaments; a coarse or primary and fine or secondary myofilaments arranged longitudinally. The primary myofilament is made of a protein called **myosin** whereas secondary myofilament is made up of 3 protein **actin** tropomyosin, troponin. Besides actin and myosin muscle fibre also contain **calcium ion, a phosphate** and adenosine triphosphate (ATP)

The primary filament remain confined to A bands only.

- **Location**

Striated muscles are found in the muscle of limbs, tongue, pharynx, beginning of oesophagus, etc.

- **Function**

These muscles are under control of will.

2. Unstriated muscle

- **Structure**

– Unstriated muscle fibre is also called smooth, involuntary, unstriped or visceral muscles.

– Each fibre is elongated or spindle shaped, having single oval nucleus surrounded by cytoplasm.

– Each muscle fibre possess longitudinally myofibrils arranged.

– The fibre is enclosed by plasma membrane and unlike striated muscle there is no sarcolemma.

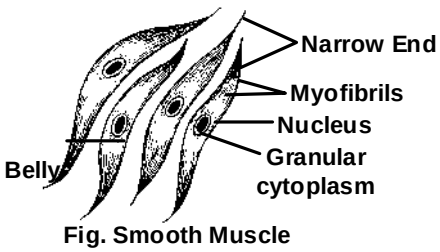

Fig. Smooth Muscle

– Several of muscles fibre are joined together in bundles by loose connective tissue.

- **Location**

Unstriated muscles are found in stomach, intestine, lungs, urinary bladder, urinogenital tract, iris of eye, dermis of skin, posterior part of oesophagus and arrector pilli muscles of hairs.

- **Function**

These muscle fibre helps in peristalsis. It causes slow and prolonged contraction which is involuntry i.e. not under control of will but are controlled by autonomic nervous system.

Single-unit smooth muscles	Multi-unit smooth muscles
(i) They have number of muscle fibres closely joined together.	(i) They have number of muscle fibres not so closely joined.
(ii) all the fibres contract together as a single unit, automatically and rhythmically. e.g. Walls of hollow visceral organs like stomach, intestine, urinary balder etc.	(ii) The individual fibres contract s separate units more of less as independent muscle e.g. hair roots, and on the walls of large blood vessels.

3. Cardiac muscles

- **Structure**

Cardiac muscle fibres shows character of both striped and unstriped muscles, fibres in some characteristic, but also have some peculiar characters of its own.

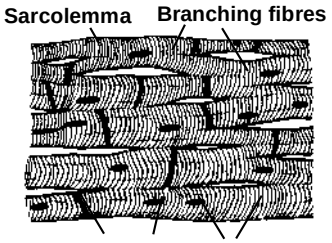

Fig. Cardiac muscle fibre

- **Similarities with striated muscle fibres :**
  Cylindrical, high vascularization, having more mitochondria and glycogen granules in the sarcoplasm; and having light and dark bands.
- **Similarities with smooth muscle fibres**
  Uninucleate; involuntary, covered by plasma membrane.
- **Unique character**

– Cardiac muscles fibre are joined with each other by flat dense zig-zag junctions, called **intercalated discs** or booster rings.
– Cardiac muscle fibre is supplied by both central nervous system and autonomic nervous system.
– These muscles never get fatigued, blood capillaries penetrate the cardiac muscles fibres. They have the property of contraction even when they are isolated from the body temporarily.
– Shows long refractory period.

Location :

These muscle fiber are found in the wall of heart and have very rich blood supply.

Differences between striated, non striated and cardiac muscles.

S.No.	Striped	Unstriped	Cardiac
1.	Occur in the body wall, limbs, tongue, pharynxand begining of oesophagus	Occur in the wall of hollow viscera, iris of the eye and dermis of the skin.	Occur in the walls of heart, pulmonary veins and superior venacava.
2.	Have numerous mitochondriaand glycogen granule	Have less numerous itocho-ndria and glycogen granules	Have numerous mitochondria and glycogen granules
3.	T-tubule system well developed	T-tubule system lacking	T-tubule system well developed
4.	No intercalated discs	No intercalated discs	Intercalated discs occur between the end of fibres.
5.	Voluntary	Involuntary	Involuntary
6.	Fibres unbranched	Fibres unbranched	Fibres join by short oblique bridges
7.	Blood supply is abundant, capillaries lie on the surface of fibres	Blood supply is scanty, capillaries lie on the surface of fibres	Blood supply is abundant, capillaries penetrate the fibres, Lymphatic capillaries also present
8.	Multinucleate, nuclei just near the sarcolemma	Uninucleate, nucleus at the centre	Mostly uninucleate, Nucleus at the centre.

9.	Myofibrils large and prominent, show distinct alternating light and dark cross bands, hence striped	Myofibrils indistinct and do not have light and dark bands, hence unstriped	My ofibrils distinct and with faint alternating light and dark bands
10.	Also called striated, skeletal and voluntary muscle fibres	Also called non-striated, smooth, visceral and involuntary muscle fibres	Also called heart muscle Fibres
11.	Contract quickly and power-fully, but cannot maintain contraction for a long time, hence soon get fatigued.	Contract slowly and mildly, but can remain contracted for a long time, are not fati-gued.	Contract quickly, Powerfully and rhythmically, non-fatigue. indefatigable
12.	Innervated by motor nerves from central nervous system (neurogenic)	Innervated by nerves from autonomic nervous system (neurogenic)	Innervated by nerves from central and autonomic nervous systems (neurogenic + Myogenic)

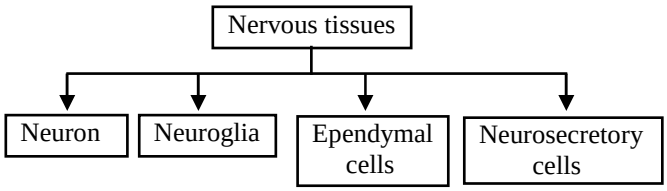
- **Nervous Tissue**
  - **Origin**

    Nervous tissues originates from ectoderm of embryo.
  - **Special properties**

– The special properties of the cells of nervous tissues are **excitability** and **conductivity**.

– The cells of nervous tissues are specialized for receiving stimuli and transmitting message.

These tissue forms nervous system of the body and include the following parts :



- **Composition**

Nervous tissue is formed of four types of cells –

(1) Neurons (2) Neuroglia (3) Neuro-secretory cells (4) Ependymal cells

1. Neurons

– A neuron is a nerve cell with all its branches, Neuron is formed from neuroblast.

– **It is structural and functional unit of nervous system.**

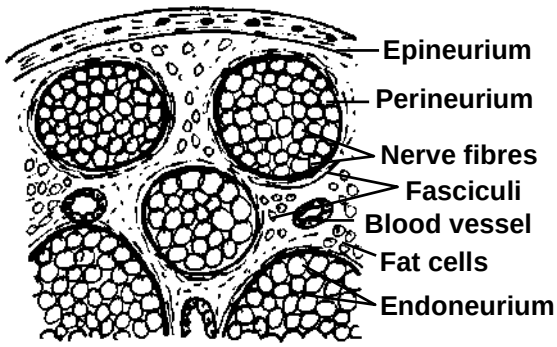


Fig. T.S. of

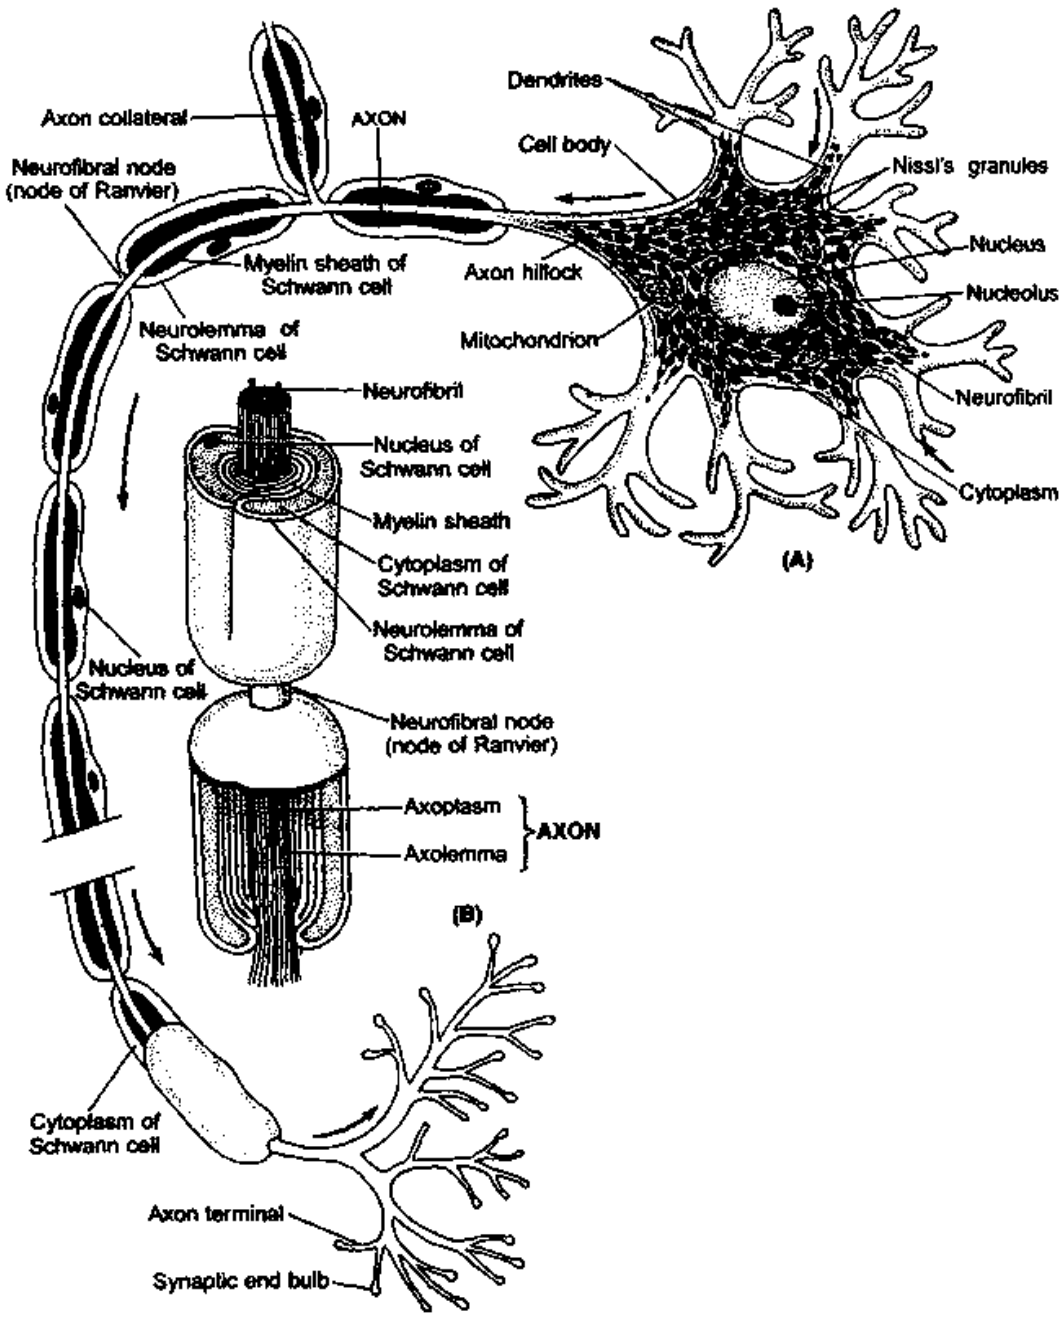
⇒ Neuron is the longest cell of the body.

Structure : Neurons is formed of two parts –

(A) Cyton (B) Nerve processes



(A) Basic Structure of a neuron (B) Section through a myelinated fibre

(A) Cyton

- Cyton is also called cell body or soma, its shape is variable.
- Its cytoplasm is granular called neuroplasm, within neuroplasm has a prominent spherical nucleus golgibodies, endoplasmic reticulum lysosome, fat globules, Nissl's granules and neurofibril is found.
- Nissl's granules are comparatively large and irregular masses of ribosomes and rough endoplasmic reticulum. **It is believed that nissil's granules synthesize protein in the cell**. Nissl's granules are made up of m-RNA, ER, Ribosomes and has affinity for basic dyes.

  A mature neuron cannot divide.

(B) Nerve processes

The nerve processess are also called neurites. Nerve processes can be divided into two parts-

(a) Dendrites (b) Axon

(a) Dendrites -

Dendrites may be one or several. It is branched structure.

(b) Axon -

– It is single, long and cylindrical process whose main function is to conduct the nerve impulses away from the cyton, so, axon is efferent in nature.

– It is the longest nerve process of a neuron.

Note :

– Giant squid (loligo) has axon of about 1500 μm in diameter.

– Neurons with very long axon is called golgi type I.

– Axon possess only neuro-fibrils. (Nissls Granule, Golgi body, Ribosome, fat globules are absent). The part of cyton from where the axon arises is called **axon hillock**. Some axon also give rise to side branches called **collateral fibres**.

– The plasmalemma of axon is called **axolemma** whereas cytoplasm is called **axoplasm**.

– The axon ends in a group of branched, the **terminal arborization**, ends of terminal arborization possess knob like structure called **synaptic knob** or **synaptic buttons**.

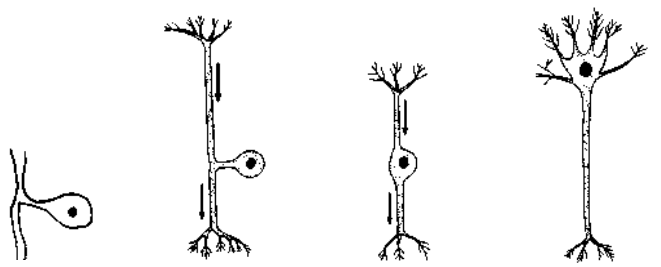
Synapse

– Synaptic knobs comes to lie very close to the dendrons of next neuron to form the synapses. There is a microscopic gap of about 200 Å called **synaptic cleft**.

– The nerve impulses are transmitted from axon to dendron with the help of chemical called **neurotransmitters** which is either acetylcholine or adrenalin (epinephrine) or Electrical symapse (with synaptic cleft of 2 nm)

⇒ Acetylcholine or adrenaline is produced by the secretory vesicles of the synaptic knobs.

- **Types of neurons**



Pseudopolar **Unipolar** **Bipolar** **Multipolar**

On the basis of number of dendron and axon neurons are of 3 types -

– **Unipolar neuron -** The neuron having a single process the axon are called unipolar neuron.
e.g.Unipolar nervous system occurs in embryo.

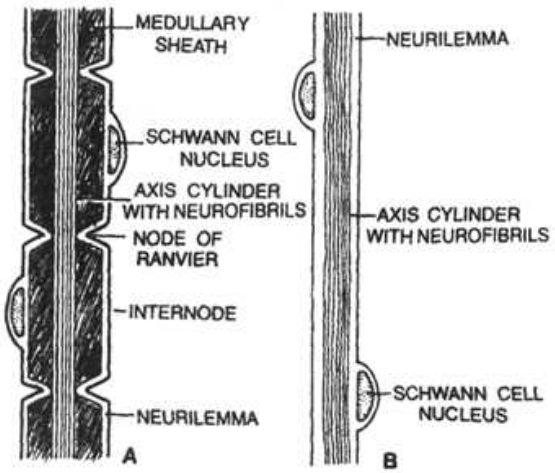
– **Bipolar neuron -** The neuron having one dendron and an axon at the opposite pole of the cell are known as **bipolar neuron**.
e.g. Bipolar neuron occur in retina of eye, Olfactory epithelium, Organ of Corti, Taste bonds.

– **Multipolar neuron :** The neuron which have many dendrons and one axon are termed as **multipolar neuron**.
  e.g. Multipolar neuron occur in nervous system of adults.

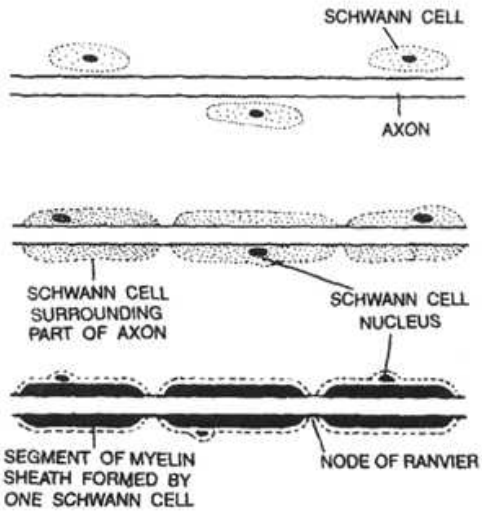
On the basis of functions neurons are of 3 types-

– **Sensory or afferent neuron -** They connect Sensory organs with central nervous system and brings sensory impulses into it.
– **Motor or efferent neuron -** They connect central nervous system with the effectors. (muscles and glands) and carry motor impulses to them.
– **Interneurons or adjustor neuron -** They are present in the central nervous system (Brain and spinal cord) and connect two or more neurons for distant transmission of impulses.

Nerve fibres



A - Medullated nerve fibre.
B - Non-medullated nerve



Stages in the formation of the myelin sheath by a Schwann cell

An axon of a neuron is covered with one or two sheaths.
On the basis of number of sheaths on nerve fibre, nerve fibres are of two types -
(a) Medullated or myelinated nerve fibre (b) Non medullary nerve fibre

(a) Medullated or myelinated nerve fibre

– In these nerve fibres around the nerve a sheath of fatty substance is formed which is termed as medullary sheath or myelin sheath.
– The medullary sheath is not continuous and point of absence of medullary sheath is called **nodes of Ranvier**. The part of medullated nerve fibre between two adjacent nodes is called an **internode**. Medullary sheath forms an insulating coat and prevents loss of energy during conduction of nerve impulse.
– The medullary sheath and node of ranvier are surrounded by a transparent cellular outer covering known as neurolemma of **Schwann cell**.
– Just beneath the neurolemma a thin layer of cytoplasm lies, which contains nuclei to form Schwann cells (Sheath cells) at intervals. These nuclei are termed nuclei of Schwann cell.
– Medullated nerve fibre are found in brain spinal cord, cranial and spinal nerves. In the central nervous system, medullated nerve fibres form white matter.

(b) Non-medullated (Non myelinated) nerve fibre

– In these nerve fibre no medullary sheath is found. The axon is surrounded by neurilemma and just below neurolemma a layer of cytoplasm containing nuclei at intervals is present. The node of Ranvier and internode are not present.
– The non medullated nerve fibres exists in autonomic nervous system.
– In central nervous system non medullated nerve fibre found in grey matter.

• **Functionally the nerve fibres are of two types :**

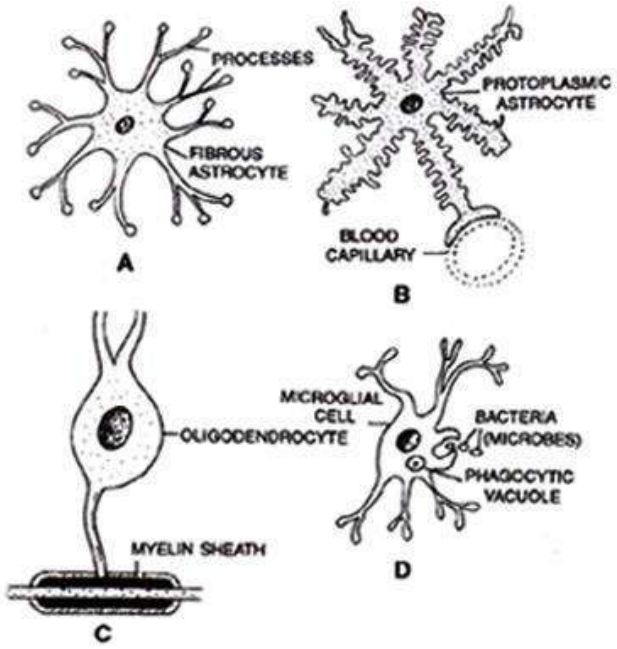
(a) Afferent or Sensory fibre - Afferent fibre carries the sensory impulse from the receptor organs to the central nervous system (brain and spinal cord).

(b) Efferent or motor fibre - Efferent fibre carries impulses from the central nervous system to the various effector organs (muscles and glands).

2. Neuroglia or Glial Cells

– These are non nervous cells which lie between the neurons of CNS, ganglia and retina of the eye.
– These are many times (10 times approx) more numerous than neurons.

• **Types of neuroglial cells**



Different kinds of neuroglial cells.
A. Fibrous astrocyte. B. Protoplasmic astrocyte C. Oligodendrocyte. D. Microglial cell.

Neuroglia cells are of following types

– **Microglia cell** - These are spindle shaped small cells.
– **Astrocytes** - These are highly branched.
– **Oligodendrocytes** - These have few branched processess which resemble dendrons of the neuron.

• **Functions**

– These act as packing cells between neurons.
– These provide nutrition to neurons
– These act as phagocyte and consume micro organism.

– These help in memory process
– These insulate the adjoining neurons.

3. Neuro-secretory cells

These are special type of neurons of the hypothalamus of brain. These are endocrine in function and release neurohormone (releasing factor) through portal system to anterior most lobe of pituitary gland where they regulate secretion of harmones TSH, GH, LH, ACTH, FSH and Prolactin.

4. Ependymal cells

These cells form an epithelium called **ependyma** that lines the ventricles of brain and the central canal of the spinal cord. The cells are generally ciliated.

MUSCLES

INTRODUCTION

Study of muscles known as Myology.

Myology also known as Sarcology.

- **Development of muscles : -**

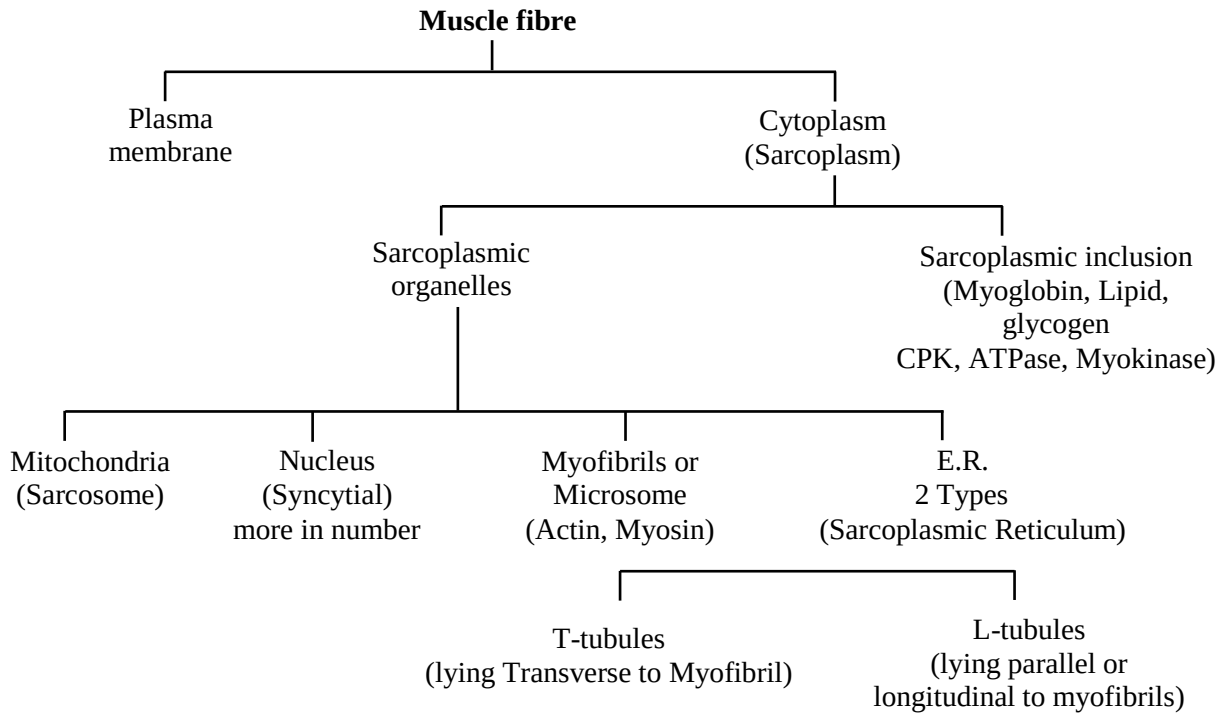
  Except muscles of Iris & cilliary body all muscles of body develop from **mesoderm.**

  - Muscle of Iris, cilleary body & myoepithelial cell of sweat gland develop form **Ectoderm.** Conductivity & contractility are the two main characteristics of muscles.
  - Three types of muscles are found in the body.

(i) Voluntary or skeletal muscles.

(ii) Involuntary or smooth muscles.

(iii) Cardiac muscles.



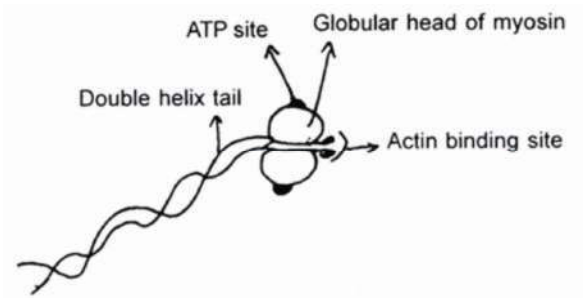
CHEMICAL COMPOSITION OF SKELETAL MUSCLES

- 75% water
- 25% solid
  - 20% Muscle proteins
    - Sarcoplasmic protein
      Globin, Globulin,
      Myoglobin
    - Contractile protein
      - Froce generating
        - Protein
          - Actin
            - G-Actin
            - F-Actin
          - Myosin
            - HMM
            - LMM
              - S_1 unit
              - S_2 unit
      - Regulating
        Protein
        - Tropomyosin
        - Troponin (T_p)
          - Sub unit
          - T_pC
          - T_pI
          - T_pT
      - Structure
        Protein
        - Z line Protein
          (Actinin)
  - 5% other substance
    - Nitrogenous
      Extractive
      Creatine & creatine
      phosphate
    - Nonnitrogenous
      extractive
      glycogen
      Inorganicion
      Eg. K^+, Na^+ , HCO_3^-

FORCE GENERATING PROTEIN

- **Actin –**

  The Actin or thin filament is a double helix made up of protein molecule called as. **G-Actin.** (Globular actin) Many G-actin combined to form a filament like structure, which is called as filamentous-actin. G-actin contain a active site where myosin head is attached.



- **Myosin –**

  Each myosin molecule consist of a tail & a head. Tail is made up of two chains interwined with each other like double helix. The myosin head has sites for attachments with (i) The actin filament (ii) ATP molecules.

  Each myosin (thick) filament is also a polymerised protein. Many monomeric proteins called Meromyosins constitute one thick filament. Each meromyosin has two important parts, a globular head with a short arm and a tail, the former being called the heavy meromyosin (HMM) and the latter, the light meromyosin (LMM)> The HMM component, i.e.: the head and short arm projects outwards at regular filament and is known as cross arm. The globular head is an active ATPase enzyme and has binding sites for ATP active sites for actin.

REGULATING PROTEIN

- **Tropomyosin –**

  It is one type of contractile protein. In the relaxed state of the muscle situated in **such a way**, that the active sites remain covered by the Tropomyosin & attached at the terminal end of actin.

- **Troponin –**

  It is one type of protein which attached with one of ends of the tropomyosin molecules.

  Troponin is made up of three subunit.

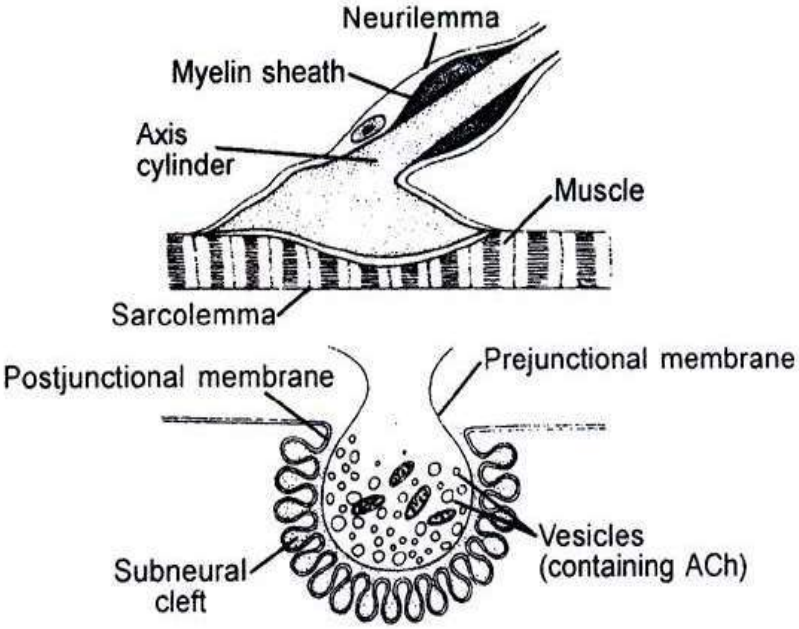
  (a) Troponin I (Inhibitory site) (b) Troponin T (Tropomyosin site) (c) Troponin C (Ca^{+2} binding site)

STRUCTURAL PROTEIN

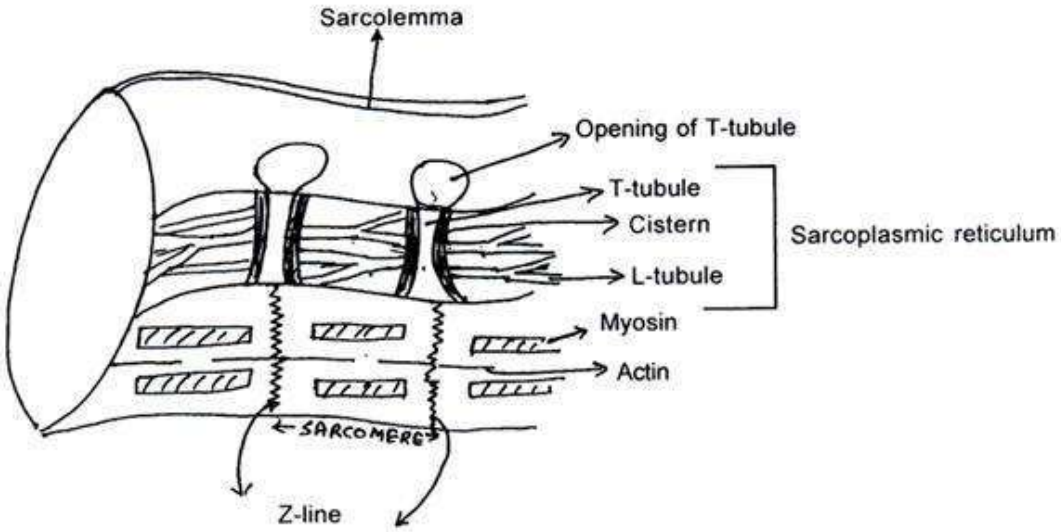
- **Actinin –**

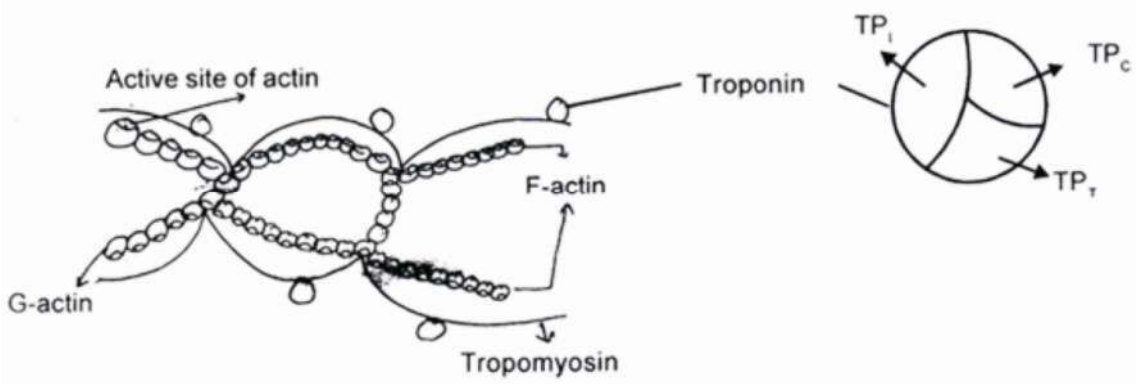
  It is one type of protein which found in Z-line.

PHYSIOLOGY OF MUSCLES CONTRACTION



Neuromuscular Junction





SLIDING FILAMENT THEORY

- This theory is given by A.F. HUXLEY, H.E. HUXLEY & HANSEN
- The junction of Nerve & muscle is called as neuromuscular junction.
- Terminal branches of Axon of motor nerve is embedded into sarcolemma.
- Its bulb like structure is called as **motor end plate.**
  Sarcolemma invaginate inside & form a fimbriated structure which is called **synaptic gutter or subneural cleft.** The cell membrane of the bulbous terminals is called as the **pre junctional membrane** where as the cell membrane of muscle fibre which invaginates called **post junctional membrane.**
  In motor end plate large number of vesicles & mitochondria are present. Each vesicle contains Ach in high concentration. In post junctional membrane, Ach receptor are presented.
  (Ach = Acetylcholine, it is a neurotransmitter chemical)

- **Neuromuscular Transmission –**
  - When motor nerve fibre stimulated it develops an **Action potential** (Resting potential 50 to 100 mV)
  - AP reaches in the neuromuscular junction & goes to bulbous expansion of the nerve terminal.
  - Than it increases permeability of Ca^{++} in the Pre junctional membrane & Ca^{++} enter from E.C.F. in to the cytosol of motor end plate by penetrating the prejunctional membrane.
  - Ca^{++} ions causes bursting of the vesicles & releases the Ach.
  - These Ach now cross the prejunctional membrane. via subneural cleft reach the post junctional membrane attach the **Ach receptor** also called as **End plate receptor.**
  - End plate receptor stimulate & develop end plate potential by opening of Na^{+}– K^{+} channels in post synaptic membrane.
  - When end plate potential sufficiently higher than A.P. develop on sarcolemma & myofibril.
  - Sarcolemma invaginates inside & form transverse & longuituidnal tubules which are also called as T-tubul and L-tubule
  - T-tubules are paralle = to Z-line wherease L-tubule is perpendicular to the Z-line.
  - T-Tubules communicates with ECF.
  - T & L system of tubules together called as **endoplasmic reticulum.**
  - L-Tubules dilated on both side of T-Tubules this dilated part called **cisterns.**
  - A.P. proceeds along the sarcolemma & A.P. contact with T-Tubules & further proceeds via T-tubules & enter with in muscle fibre & now this AP called as **T-tubule potential.**
  - T-tubule potential come in close contact of L-tubules at region of the **Triads** (T + L-tubules).
  - L-tubules in very rich source & store house of Ca^{++} ion in higher concentration release of Ca^{++} ion in large amount.
  - Released Ca^{++} ion combine with troponin C.

- In Relaxed state tropomyosin covers the active site of actin.
- But troponin-C combines with Ca^{++} ion some physiochemical changes occur in tropomyosin & Tropomyosin move away from active site of actin.
- Myosin have strong tendency to bind the actin molecule & Actomyosin complex
- Myosin head attach on active site of actin with the help of cross bridges.
- Now the myosin head twists in the groove of the active site of actin-F. This causes movement of actin toward H-zone.
- Contraction is caused by overlapping of actin filament over myosin – **sliding filament hypothesis.**
- All the cross bridges move simultaneously in one direction so the actin filaments move vigorously towards H-zone.
- When cross bridge disrupted than myosin molecule detached & reattach the new active site of actin.
- **After muscle contraction H-Zone disappears & length of sarcomere & I-band decreases by 20%. The length of A-band remains unchanged.**

  All process are reversible, at the time of relaxation Ca^{++} are goes into **L-tubules.**

- **Role of ATP –**

(i) The Rotational movement of myosin head with in the groove.

(ii) Deattachment of myosin head form the actin.

Muscle Contraction

- **Chemical reaction in Muscles :**

1. $ATP + H_2O \xrightarrow{\text{Creatine kinase}} ADP + P_1 + \text{Energy (For contractile muscle)}$
2. $\text{Creatine phosphate} + ADP \longrightarrow \text{Creatine} + ATP$ (Muscle contraction)
3. $\text{Gycogen} \xrightarrow{\text{Glyocysis}} \text{Lactic acid} + \text{Energy}$
4. 80% Lactic acid + Water $\xrightarrow{ATP}$ Glycogen (Liver cell)
5. 20% Lactic acid + Oxygen $\longrightarrow CO_2 + H_2O + ATP$ (Liver cell)
6. $\text{Creatine} + ATP \longrightarrow \text{Creatine phosphate} + ADP$ (Resting Muscle)

PROPERTIES OF MUSCLES

- **Terminology**

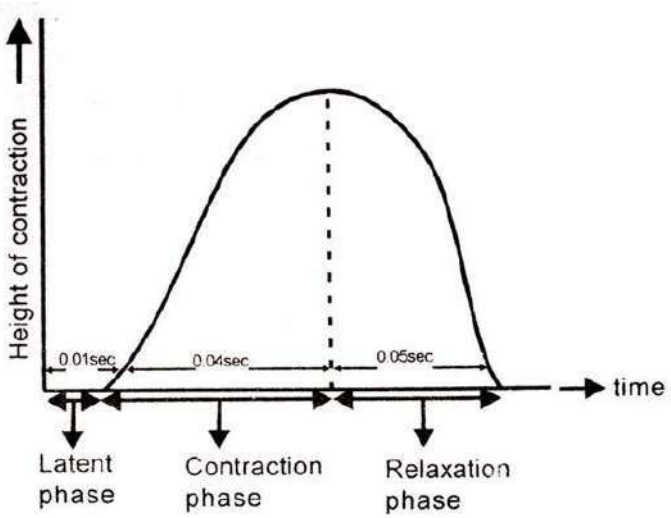
1. **Origin** – Fixed end of muscle (Proximal end)
   Insertion – Distal end of muscle which is attach to bone (Movable end)

2. **Excitability** – Muscles responds to stimuli which can be nervous, chemical, electrical & thermal mechanical.
   Conductivity – Stimulus acting in one region of muscle fibres propagated to all parts within no time.
   Contractility – On being stimulated the muscle fibres contract & shorten followed by Relaxation.
3. **Threshold stimulus** – Intensity of stimulus below the threshold value does not produces contraction in muscle fibres is called.
   Sub threshold Stimulus shambles stronger than threshold one is called suprathreshold stimulus.
4. **All or none law** – Response of muscle fibre is maximum whether the stimulus has threshold value or suprathreshold value. Response is absent when intensity is subthreshold. (Below threshold value)
5. **Muscle twitch** – It is single isolated contraction of Muscle fibres due to single stimulus. Muscle curve or kymograph indicates three phases.

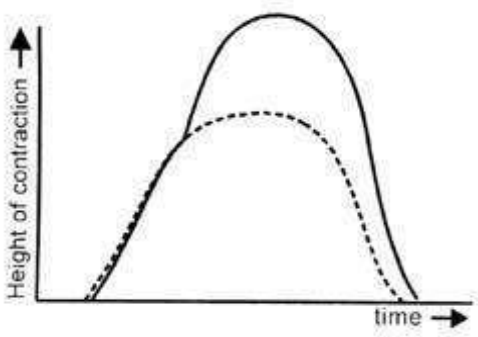
(a) Period of latent excitation (Latent period) Interval between the application of appropriate stimulus & initiation of contraction
It is 0.01 sec. in skeletal muscle. 3 sec. in smooth muscle.

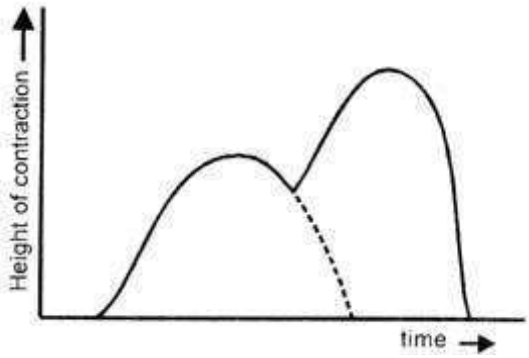
(b) Contraction phase – Duration for which muscle remain contracted state. It is 0.04 sec. in skeletal muscle. 20 sec. in smooth muscle.

(c) Relaxation phase – Interval for contracted muscle to regain its original/Relaxed state 0.05 sec. in skeletal muscle 23 sec. in smooth muscle.

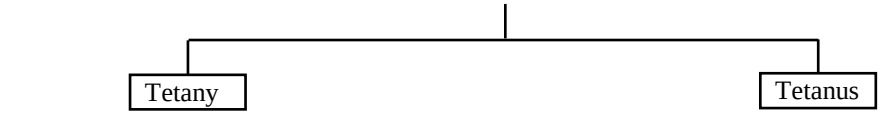


6. **Refractory Period** – It is period between two twitched during this muscle does not respond to second stimulus after single twitch.
   It is 0.002 – 0.005 second in skeletal muscles and 0.1 – 0.2 second in visceral muscles.
7. **Summation of stimuli** – Two subliminal stimuli Applied simultaneously get added up & Evoke the response
   Muscle response = (1^{st} stimulus +2^{nd} stimulus ≥ threshold value)
   Subliminal subliminal
   Howerver a muscles consist of large no. of muscle fibres with different threshold value so in intensity of stimulus increases contraction of muscle although individual fibres obey all/none law.
   Summation of IInd stimulus during contration phase





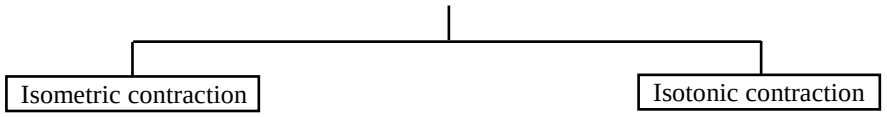
8. **Muscle tone** – In relaxed muscles, a few fibres always undergoing contraction alternately so maintain the health of muscles. It is known as Muscles tone
9. **Tetanic condition** – It is sustained muscles contraction due to rapid series of impulse, during this relaxation of muscles does not take place.



It is due to hypocalcaemia
It is hormonal deficiency disease

It is bacterial disease
(Clostridium tetani) **Lock jaw disease** during this abnormal muscles contraction of jaw muscle take place.

10. **Paralysis –** Supply of motor nerve impulse completely cut off. So function of muscle contraction is stoped.
11. **Shivering –** Involuntary contraction of muscles to make body warm.
12. **Muscle tension** – force produced during contraction of muscle is known as muscle tension.



Length same but tone changed
Eg. Pushing against an immovable object.

Length changed but tone same

- **Isometric –**

  Contraction occur when a muscle is stimulated adequately but is prevented to shorten.
  eg. applying too heavy load against the muscle so that the muscle but cannot lift the at all ext. work done is zero **Isotonic –**
  When muscles is stimulated adequately & is allowed to shorten, then the contraction is called Isotonic some external work is done. Technically called a load is lifted

13. **Antagonistic muscles**–
    They are pair of muscles which causes opposite movement at the same site when one muscle is contracting, the other is relaxes & viceversa.
    e.g. – Biceps (flexor) & Triceps of arms (extensor)
14. **Motor unit** – Groups of mucles fibres supplied by single motor neuron. It is a functional unit of muscles because all the muscle fibres of motor unit contract & relax simultaneously.
15. **Cori cyles** – Lactic acid accumulated in muscles during sustained contraction. formed lactic acid transported in blood as blood lactate to liver where is changes into liver glycogen which is changed in to glucose.

$$\text{Glycogen} \xrightarrow{\text{Muscle}} \text{Lactic acid} \xrightarrow{\text{Liver}} \text{Glycogen}$$

16. **Speed of –** Skeletal muscle = 0.1 sec. per contraction per cycle
    Cardiac muscle = 0.8 sec. per contraction per cycle
    Smooth muscle = 46 sec. per contraction per cycle
17.

Red muscle fibres	White muscle fibres
– Slow & Tonic muscles fibres	Fast & twitch muscle fibres
– Dark red b/o myoglobin +	Pale
– Mitochondria ++	Mitochondria+
– Slow sustained work from long period without getting fatigue	Perform fast, strenuous work for short duration & get fatigued quickly accumulation of lactic acids.
Sarcoplasmic reticulum – less	More
Eg : Extensor muscles of back, flight muscles	**Eg :** eyeball muscles

18. **Fatigue :** Marathian athelets develops red fibers in thigh muscles due repeated contraction
Due to sustained contraction initially muscle give beneficial effects of contraction (warm ups) but after it ATP is exhausted & muscle is as state of permanent contraction & no relaxation because no fresh ATP Available for detachment of actomysosin complex.
– B/o 1. Accumulation of lactic acids
2. Consumption of stores glycogen. ATP, CTP (Creatinine phosphate)
Infatigue–
(i) Increase latent period and phase of relaxation
(ii) decrease height of contraction
19. **Rigor Mortis**
After death fresh supply of ATP. become impossible so one the local store of ATP molecule are exhausted. Due to non availability of ATP/C.P. deattachment of myosin from actin cannot take place resulting in permanent state of contraction of muscle. This phenomenon is called rigor mortis. This condition helps fixation of the hour of death.
20. E.D.T.A (Ethylane diamine tetra acetic acid) injected inside muscle combined with Ca^{+} and stops contraction.
21. Muscle and nerve exitability is reduced by K^{+}.
22. During muscle contraction chemical energy changed into mechanical energy.
23. Over stretching of tendon is called sprain.

MUSCLE TYPES ON BASIS OF MOVEMENTS

1. **Flexor** = Fore arm move in upward direction. (Bend)
Bending of part over one another **Eg. biceps brachii**
Extensor – Fore arm move in downward direction. Straighting of bending part
Eg. Triceps
2. **Adductor -** Toward body axis. Towards the body
Lattissimus dorsi brings the arms towards body
Abductor-upper & lower limb move away from body axis. Away from the body (midline) **deltoids.**
3. **Pronator** – Palm state in down. Rotate downward eg **pronater teres**
Supinator – Palm state in upward Rotate upward eg **brachioradialis**
4. **Dilatation** – Diameter increases, widening of Iris (radial muscle of iris)
Constrictor – Diameter decreases, Closing an aperture–sphincter ani closes anus
5. **Depressor** – Lower Jaw move in downward direction. Lowering part depressor mandibularis
Elevator–Lower Jaw move in downward direction.Raising the part **eg. Massetar.**
6. **Median Rotation** – Upper & lower limb rotate in inward direction.
Lateral Rotation – Outward direction rotation
7. Inversion when sole of foot turn toward body axis.
Eversion - Away from body axis
Aryeiglotticus muscle is called Hilton muscle.
Gastrocenemius muscle present in shank.
Sartorius the **longest** muscle of body
Gluteus maximus (Buttock muscles) – Largest muscle of body
Stapedius – smallest muscle of body.
In Human beings 639 muscle are found 634 muscle are paired and 5 muscle are unpaired. 400 muscles are striated & most of muscles are found in back region & number of back muscles are 180. Jaw muscles are strongest. Longest smooth muscles is present in present in uterus of pregnant lady.

EXERCISE-1

EPITHELIAL TISSUE

Q.1 Pavement epithelium is the name of
(1) Cuboidal epithelium
(2) Squamous epithelium
(3) Columnar epithelium
(4) Ciliated epithelium

Q.2 Transitional epithelium occurs in
(1) blood vessels (2) Trachea
(3) Kidney (4) Ureter

Q.3 Pseudostratified columnar epithelium is found in
(1) Mouth
(2) Stomach/Oesophagus
(3) Kidney
(4) Trachea/Bronchiole

Q.4 Epithelium forming the inner layer of urinary bladder is
(1) Simple squamous (2) Transitional
(3) Simple columnar (4) Neurosensory

Q.5 Cells of squamous epithelium are
(1) Columnar
(2) Tall with elongated nuclei
(3) Flate plate-like (4) Cube-like

Q.6 Epithelial tissue with thin flat cells appearing like packed tiles occurs on
(1) Inner lining of cheek
(2) Inner lining of stomach
(3) Inner lining of fallopian tubes
(4) Outer surface of ovary

Q.7 Epithelial tissue is–
(1) Protective covering
(2) Reproductive structure
(3) Nerve cells (4) Corpuscles

Q.8 Epithelium of bronchioles is
(1) Simple cuboidal
(2) Pseudostratified columnar
(3) Simple squamous
(4) Pseudostratified sensory

Q.9 Podocytes are found in-
(1) Outer wall of Bowmann's capsule
(2) Inner wall of Bowmann's capsule
(3) Capillary (4) Henle's loop

Q.10 Ciliated cells are found in-
(1) Bronchus (2) Pancrease
(3) Liver (4) Uterus

Q.11 Which of the following is correct-
(1) Dermis of frog has melanophores
(2) Epidermis of frog contains only stratum corneum
(3) Hair is dermal in origin
(4) Sebaceous glands release watery fluid

Q.12 Desmosomes are associated with-
(1) Cell division (2) Cell excretion
(3) Cytolysis (4) Attachment

Q.13 Simple cuboidal epithelial is found in-
(1) Buccal cavity (2) Trachea
(3) Renal tubule (4) All

Q.14 Following is a character of simple epithelium-
(1) Cells are arranged irregularily
(2) Cells form a regular layer
(3) Cells divide constantly & help in the formation of organ
(4) None

Q.15 The mucous membrane of naso-pharynx is-
(1) Stratified (2) Ciliated
(3) Hair less (4) None

Q.16 Nuclei in the pseudostratified epithelium are arranged-
(1) At periphery
(2) In the centre of cells
(3) At different level
(4) Equally

Q.17 In which of the following organ lamina propria is developed maximum-
(1) Colon (2) Intestine
(3) Oesophagus (4) Stomach

Q.18 Schneiderian epithelium is-
(1) Ciliated (2) Hair less
(3) Stratified (4) None

Q.19 Term "epithelium" was coined by-
(1) Mayer (2) Ruysh
(3) Bichat (4) Robert

Q.20 The epithelium which has many layers of the cells-
(1) Simple (2) Stratified
(3) Squamous (4) All

Q.21 The epithelium of bronchioles is-
(1) Pseudostratified & columnar
(2) Squamous & sensory
(3) Pseudostratified & sensory
(4) Cuboidal & columnar

Q.22 Coiled glands is-
(1) Sweat gland (2) Sebaceous gland
(3) Mucous gland (4) None

Q.23 Cells secreting mucous are-
(1) Sweat (2) Goblet
(3) Paneth (4) Zymogen

Q.24 Pancrease is an example of-
(1) Compound tubular gland
(2) Compound alveolar gland
(3) Compound tubular-alveolar gland
(4) Simple alveolar gland

Q.25 Unicellular glands are-
(1) Parotid (2) Goblet
(3) Sweat (4) Sebaceous

Q.26 The peritoneal lining of the body cavity is-
(1) Cuboidal (2) Columnar
(3) Squamous (4) None

CONNECTIVE TISSUE

Q.27 Haversian canal includes-
(1) One arteriole & one venule
(2) Myelinated nerve fibres
(3) One lymphatic vessel & few bone cell
(4) One vein, one artery, lymph vessel, one nerve & few bone cells

Q.28 Latent period in skeletal muscle is-
(1) 0.1 second (2) 0.2 to 0.5 second
(3) 0.002 to 0.005 second
(4) 0.02 to 0.05 second

Q.29 The microtubules of the lacunae found in the bone maxtrix are called as-
(1) Semicircular canals (2) Canaliculi
(3) Bidder's canal (4) Capillaries

Q.30 An animal beings to run fast but get tired soon, because -
(1) Energy is exausted
(2) Succinic acid is formed in the muscles
(3) Lactic acid is formed in the muscles
(4) Muscles loses it's elasticity

Q.31 In a fatty person, the obesity is due to-
(1) Excess of blood
(2) More thicked bones
(3) More areolar tissues
(4) More adipose tissues

Q.32 Which tissue exhibit least changes after birth is-
(1) Connective (2) Epithelial
(3) Nervous (4) Muscle

Q.33 Intararticulated disc is found-
(1) In wall of liver (2) In wall of heart
(3) Pubic symphoises (4) Between vertebrae

Q.34 Mammalian liver can be identified by the presence of which of the following-
(1) Liver cells & venules
(2) Kupffer's cells & hepatic cords
(3) Leucocytes & bile canaliculi
(4) None

Q.35 Which forms most of the part of the body-
(1) Connective tissue (2) Epithelial tissue
(3) Muscular tissue (4) Nervous tissue

Q.36 Which is the strongest cartilage-
(1) Elastic (2) Fibrous
(3) Hyalin (4) None

Q.37 Chromatophores are found in-
(1) Areolar tissue (2) Muscle tissue
(3) Dermal connective tissue
(4) Epithelial tissue of epidermis

Q.38 Cartilage which is most common-
(1) Elastic (2) Fibrous
(3) Hyalin (4) None

Q.39 Whale blubber is madeup of-
(1) Skeletal tissue (2) Adipose tissue
(3) Muscular tissue (4) All

Q.40 The main inorganic substance of bone-
(1) $CaCO_3$ (2) $CaSO_4$
(3) $Ca_3(PO_4)_2$ (4) $CaCl_2$

CONNECTIVE SKELETON TISSUE

Q.41 Hardest tissue of the body is–
(1) Cartilage
(2) Fibrous connective tissue
(3) Bone (4) Areolar tissue

Q.42 Which of the following tissues has the minimum intercellular matrix
(1) Blood (2) Bone
(3) Cartilage (4) Areolar tissue

Q.43 Collagen fibres are–
(1) White (2) Yellow
(3) Green (4) Brown

Q.44 Ligament connects–
(1) Muscle to skin (2) Bone to bone
(3) Muscle to muscle (4) Muscle to bone

Q.45 Bone marrow is composed of–
(1) Areolar tissue and blood vessels
(2) Adipose tissue and fibroblasts
(3) Adipose tissue, areolar tissue and blood
(4) Adipose and areolar tissue

Q.46 Major inorganic component of vertebrate bone is
(1) Calcium carbonate
(2) Calcium phosphate
(3) Sodium hydroxide
(4) Potassium hydroxide

Q.47 Haversian canals found in bones contain
(1) Artery and vein
(2) Osteoblasts in areolar tissue
(3) Nerve and lymph vessel
(4) All the above

Q.48 Membrane surrounding a bone is–
(1) Endosteum (2) Periosteum
(3) Perichondrium (4) Pericardium

Q.49 Membrane lining the bone marrow cavity is–
(1) Endosteum (2) Periosteum
(3) Perichondrium (4) Pericardium

Q.50 Haversian canals are found in–
(1) Ear
(2) Mammalian bone
(3) Fish and amphibian bone
(4) Simple sponges

Q.51 Hardest substance of the body is–
(1) Bone (2) Enamel
(3) Cartilage (4) Tendon

Q.52 Cells occurring in the bones are–
(1) Osteoblasts (2) Osteocytes
(3) Chondroblasts (4) Chondrocytes

Q.53 Haversian canals found in–
(1) Humerus (2) Pubis
(3) Scapula (4) Clavicle

Q.54 Besides calcium phosphate the bones contain–
(1) Calcium chloride
(2) Magnesium carbonate
(3) Sodium chloride
(4) Potassium/Magnesium phosphate

CONNECTIVE VASCULAR TISSUE

Q.55 Mineral found in red pigment of vertebrate blood is
(1) Magnesium (2) Iron
(3) Calcium (4) Copper

Q.56 Red blood cells are produced in
(1) Bone marrow (2) Spleen
(3) Liver (4) Thymus

Q.57 B- and T-cells required for immune system are produced in
(1) Bone marrow (2) Liver
(3) Spleen (4) Lymph nodes

Q.58 In normal healthy female, the number of RBC/mm^3 of blood is
(1) 6.5 – 7.0 million (2) 5.5 – 6.0 million
(3) 4.5 – 5.0 million (4) 3.5 – 4.0 million

Q.59 Vitamin K is required for–
(1) Formation of thromboplastin
(2) Conversion of fibrinogen to fibrin
(3) Conversion of prothrombin to thrombin
(4) Synthesis of prothrombin

Q.60 Main haemopoietic tissue of human embryo is–
(1) Liver (2) Spleen
(3) Bone (4) Kidney

Q.61 Cells of squamous epithelium are
(1) Columnar
(2) Tall with elongated nuclei
(3) Flate plate-like
(4) Cube-like

Q.62 Red blood cell count is carried out by–
(1) Haemocytometer (2) Haemoglobinometer
(3) Sphygmomanometer
(4) Electrocardiogram

Q.63 In Camel, erythrocytes are–
(1) Circular, biconcave, non-nucleated
(2) Oval and nucleated
(3) Circular, biconcave and nucleated
(4) Oval and non-nucleated

Q.64 Blood clotting requires
(1) Na^+ and K^+
(2) Na^+ and prothrombin
(3) Na^+ and thromboplastin
(4) Ca^{2+} and thromboplastin

Q.65 Mammalian erythrocytes are–
(1) Circular (2) Biconcave
(3) Nonnucleated (4) All the above

Q.66 Epithelium of bronchioles is
(1) Simple cuboidal
(2) Pseudostratified columnar
(3) Simple squamous
(4) Pseudostratified sensory

Q.67 Thromboplastin required for blood clotting is produced by
(1) Platelets (2) Erythrocytes
(3) Monocytes (4) Lymphocytes

Q.68 Maximum number of WBC is that of
(1) Basophils (2) Neutrophils
(3) Monocytes (4) Eosinophils

Q.69 Proteolytic enzyme required for lysis of fibrinogen during fibrinolysis is
(1) Plasmin (2) Fibrin
(3) Platelet factor (4) Thrombin

Q.70 Which of the following are involved in body defence–
(1) Neutrophils (2) Lymphocytes
(3) Macrophages (4) All the above

Q.71 Largest corpuscles in human blood are–
(1) Erythrocytes (2) Monocytes
(3) Lymphocytes (4) Basophils

Q.72 Heparin is formed by–
(1) Liver cells (2) Plasma cells
(3) Blood cells (4) Spleen cells

Q.73 Following is not a granulocyte-
(1) Basophils (2) Monocytes
(3) Acidophils (4) Neutrophils

Q.74 Change in the caliber of blood vessels is-
(1) Vasomotion (2) Bradycardia
(3) Trachycardia (4) Circulation failure

Q.75 Fibrin is formed by-
(1) Liver (2) Thrombin
(3) Thrombokinase (4) Proteolysis

Q.76 White ghosts are formed by-
(1) Choanocytes (2) Thrombocytes
(3) Lymphocytes (4) Erythrocytes

Q.77 Correct for WBC -
(1) Non-nucleated (2) Formed in thymus
(3) Deficiency causes cancer
(4) Can pass out of the blood capallaries

Q.78 Reticulocytes are-
(1) Blood platelets (2) Immature RBC
(3) Lymphocytes (4) WBC

MUSCULAR TISSUE

Q.79 Certain fibres are long more than a feet. These are–
(1) Muscle Fibres (2) Nerve fibres
(3) Fibroblasts (4) All the above

Q.80 In mammals yellow fibres are found in–
(1) Ear pinna (2) Tip of nose
(3) Epiglottis (4) All of these

Q.81 Characteristics of smooth muscle fibres are–
(1) Spindle-shaped, unbranched, unstriated, uninucleate and involuntary
(2) Spindle shaped, unbranched, unstriped, mutlinucleate and involuntrary
(3) Cylindrical, unbranched, unstriped, multinucleate and involuntary
(4) Cylindrical, unbranched, striated, multinucleate and voluntary

Q.82 Which one possesses striated muscles–
(1) Gall blader (2) Leg muscles
(3) Bronchial wall (4) Lungs

Q.83 Heart muscles are–
(1) Voluntary and unstriated
(2) Voluntary and striated
(3) Involuntary and striated
(4) Involuntary and unstriated

Q.84 Which one contains voluntary muscles–
(1) Heart (2) Hind limb
(3) Liver (4) Lung

Q.85 Cardiac muscles are–
(1) Striated, syncytial and voluntary
(2) Striated, syncytial and involuntary
(3) Smooth, spindle-shaped and involuntary
(4) Striated, crossoconnected and involuntary

Q.86 Muscles involved in movement of arm are–
(1) Striated (2) Unstriated
(3) Cardiac (4) Smooth

Q.87 Striated muscles found in–
(1) Trachea (2) Lungs
(3) Gall bladder (4) Limbs

Q.88 Ligaments made up of –
(1) Yellow elastin fibre (2) White collagen fibre
(3) White elastin fibres (4) None of above

Q.89 Bundles of striated muscle fibres are enclosed in
(1) Periosteum (2) Epimysium
(3) Perimysium (4) Endomysium

Q.90 Unstriated, unstriped or smooth muscle fibres occur in–
(1) Iris (2) Eye muscles
(3) Tongue (4) Thigh

Q.91 What is not true of smooth muscle fibres–
(1) Spindle shaped (2) Under ANS
(3) Syncytial (4) Structurally simple

Q.92 Cross-bridges occur in–
(1) Mid brain of Rabbit (2) Mid brain of Frog
(3) Cranial nerves (4) Cardiac fibres

Q.93 Multi-unit smooth muscles are found in the wall of–
(1) Large blood vessels (2) Intestine
(3) Stomach (4) Urinary bladder

Q.94 Large irregular ovoid cells found in areolar tissue are
(1) Fibroblasts (2) Macrophages
(3) Mast cells (4) Chromatophores

Q.95 Smooth muscles occure in–
(1) Vein (2) Artery
(3) Uterus (4) All the above

Q.96 Muscles develop from–
(1) Ectoderm (2) Mesoderm
(3) Endoderm (4) All the above

Q.97 Muscular tissue is differentiated into–
(1) Striped and cardiac
(2) Unstriped, striated and cardiac
(3) Cardiac and unstriped
(4) Striped and unstriped

Q.98 Striped muscles are–
(1) Syncytial (2) Multinucleate
(3) Binucleate (4) Annucleate

Q.99 Voluntary muscles are controlled by-
(1) Cerebral hemisphere
(2) Medulla
(3) Cerebellum (4) Cerebrum

Q.100 Which has both voluntary & involuntary muscles-
(1) Blood vessels (2) Gland ducts
(3) Urethra (4) None

Q.101 Fatigued muscle contains-
(1) ADP (2) Lactic acid
(3) Keto acid (4) None

Q.102 In striated muscle, Krau's membrane separate many-
(1) Sarcomeres (2) Micromeres
(3) Chromosomes (4) All

Q.103 The stored food material found in the muscles of animals-
(1) Phosphogens (2) Proteins
(3) Lipids (4) Glycogen

Q.104 Intercostal muscle are attached to-
(1) Diaphragm (2) Ribs
(3) Fingers (4) None

NERVOUS TISSUE

Q.105 Nissal granules found in cyton of a neuron and having affinity for basic dyes are composed of
(1) DNA (2) RNA
(3) Proteins (4) Amino acids

Q.106 Area of coming together of two neuron ends or between a dendron and axon ends is
(1) Junction (2) Synapsis
(3) Synapse (4) Synapticula

Q.107 The efferent part of a neuron is–
(1) Dendron (2) Dendrite
(3) Axon (4) Cyton

Q.108 Area of synapse contains–
(1) Inhibitory chemicals
(2) Excitatory chemicals
(3) Both (4) None

Q.109 Most of the human neurons are–
(1) Multipolar (2) Bipolar
(3) Unipolar (4) Pseudo-unipolar

Q.110 Units of nervous system are–
(1) Cytons (2) Axons
(3) Neurons (4) Dendrites

Q.111 Schwann cells is associated with-
(1) Epithelial tissue (2) Muscle tissue
(3) Connective tissue (4) Nervous tissue

Q.112 Nerve cells differs from muscle cell in having-
(1) Sarcomere (2) Sarcolemma
(3) Z-line (4) Dendrites

Q.113 Nerve cells divide by-
(1) Amitosis (2) Meiosis
(3) Mitosis (4) They don't divide

Q.114 Which damaged cells can not be repaired-
(1) Dermal cells (2) Bone cells
(3) Brain cells (4) All

Q.115 Which contains non-myelinated nerve fibres-
(1) Optic nerves (2) Cranial nerves
(3) Spinal nerves (4) Autonomous nerves

Q.116 Nissl's granules are found in -
(1) Nerve cells (2) Mas cells
(3) Bone cells (4) All

Q.117 Node of Ranvier is found in-
(1) Right auricle (2) Muscle bundle
(3) Dendrite (4) Axon

Q.118 Cell which are more than one feet in length-
(1) Nerve cells (2) Muscle cells
(3) Bone cells (4) Not possible

Q.119 The junction of neurons is-
(1) Synapse (2) Synapsis
(3) Junction (4) All

GRANDULAR TISSUE

Q.120 When the glandular cells breakdown completely, the gland is known as
(1) Holocrine gland (2) Apocrine gland
(3) Merocrine gland (4) None of the above

EXERCISE-2

EPITHELIAL TISSUE

Q.1 Compound tissue is defined as–
(1) Similar types of cells held together by connective tissue
(2) Different types of cells which are different in structure and function
(3) Different types of cells performing one function
(4) Similar cells at different regions performing many functions.

Q.2 Epithelial cells get nutrient material from–
(1) Neighbouring cells (2) Blood vessels
(3) Lymph vessels (4) Underlying tissue.

Q.3 Microvilli of epithelial cells–
(1) Increase surface area
(2) Protect the cells
(3) Engulaf the foreign matter
(4) Give movements to the cells

Q.4 Squamous epithelium is also called–
(1) Germinal epithelium
(2) Columnar epithelium
(3) Pavement epithelium
(4) Sensory epithelium

Q.5 Epidermis of skin of vertebrates comprises
(1) Simple epithelium
(2) Stratified epithelium
(3) Transitional epithelium
(4) Columnar epithelium

Q.6 Ciliated epithelial cells are present in–
(1) Buccal cavity of Frog
(2) Stomach of Frog
(3) Pancreatic duct of Pancreas
(4) None of these

Q.7 Tesselated epithelium is found in–
(1) Lining of intestine
(2) Lining of blood vessel
(3) Seminiferous tubule
(4) Uriniferous tubules

Q.8 Germinal epithelial cells are present in–
(1) Seminiferous tubules
(2) Uriniferous tubules
(3) Lining of stomach
(4) Inner lining of trachea

Q.9 Transitional epithelium is found in–
(1) Larynx
(2) Vein
(3) Kidney
(4) Ureter and renal pelvis

Q.10 Outer layer of skin that frog casts off is composed of–
(1) Simple squamous epithelium
(2) Tesselated epithelium
(3) Ciliated epithelium
(4) Cuboidal epithelium

Q.11 Urinary bladder is lined with–
(1) Simple epithelium
(2) Stratified epithelium
(3) Transitional epithelium
(4) Pseudostratified epithelium

Q.12 Presence of extracellular basement membrane is the peculiarity of
(1) Epithelial tissue
(2) Connective tissue
(3) Nervous tissue
(4) Muscular tissue

Q.13 Which of the following in mammalian tissues is associated with filtration and diffusion
(1) Simple columnar (2) Simple squamous
(3) Stratified squamous (4) Stratifed columnar

Q.14 Ciliated epithelium lines–
(1) Stomach (2) Trachea
(3) Duodenum (4) Ileum

Q.15 Ciliated epithelium occurs in–
(1) Ureter and Trachea (2) Trachea and Lungs
(3) Trachea and Liver (4) Trachea and Uterus

Q.16 Germinal epithelium of ovary is formed of
(1) Columnar epithelium
(2) Squamous epithelium
(3) Cuboidal epithelium
(4) Stratified epithelium

Q.17 The epithelium found in the lining layer of stomach and intestine is
(1) Columnar (2) Squamous
(3) Stratified (4) Pseudostratified

Q.18 Epithelium present in cornea, oesophagus, urethra and vagina is
(1) Glandular (2) Ciliated
(3) Stratified columnar (4) Stratified squamous

Q.19 Ciliated epithelium occurs in Frog in–
(1) Buccal cavity and oviduct
(2) Stomach and urinary bladder
(3) Blood vessels and lymph vessels
(4) Kidney and stomach

Q.20 Cells of peritoneum comprise–
(1) Ciliated epithelium
(2) Columnar epithelium
(3) Glandular epithelium
(4) Squamous epithelium

CONNECTIVE TISSUE

Q.21 Human mammary glands belong to one of the following types of glands
(1) Simple alveolar
(2) Coiled tubular
(3) Compound tubulo-alveolar
(4) Simple tubular

Q.22 Areolar tissue connects–
(1) The skin with muscles
(2) Muscles to muscles
(3) Bone to bone (4) Bone to muscles

Q.23 Matrix of the connective tissue is secreted by–
(1) Fibrocytes (2) Histiocytes
(3) Mast cells (4) Plasma cells

Q.24 Dermis of the skin is formed of–
(1) Adipose connective tissue
(2) Epithelial tissue
(3) Muscular tissue
(4) Areolar connective tissue

Q.25 Tendon is made up of–
(1) Yellow fibrous connective tissue
(2) Adipose tissue
(3) Modified white fibrous tissue
(4) Areolar tissue

Q.26 Which of the following cell contains fat droplets–
(1) Macrophages (2) Plasma cells
(3) Adipoe cells (4) Leucocytes

Q.27 Tendons and ligaments belong to–
(1) Muscular tissue
(2) Epithelial tissue
(3) Fibrous connective tissue
(4) Areolar connective tissue

Q.28 Fibres present in connective tissue are–
(1) Reticular (2) Elastic
(3) Collagen (4) All the above

Q.29 Histamine secreting cells are found in
(1) Connective tissues (2) Lungs
(3) Muscular tissue (4) Nervous tissue

Q.30 Histiocyte is a connective tissue cell which takes part in
(1) Fibre production (2) Matrix production
(3) Phagocytosis (4) Secretion

Q.31 Mast cells occur in–
(1) Areolar tissue (2) Adipose tissue
(3) White fibrous tissue (4) Yellow fibrous tissue

Q.32 A tissue in which matrix is the source of structural and functional performance is
(1) Muscular (2) Epithelial
(3) Connective (4) Nervous

Q.33 In Camel, the hump is mainly made of tissue
(1) Areolar (2) Adipose
(3) Muscular (4) Skeleton

Q.34 The cartilage found in larynx, trachea & bronchi is-
(1) Hyalin (2) Elastic
(3) Fibrous (4) Calcified

CONNECTIVE SKELETON TISSUE

Q.35 Yellow fibres are made up of–
(1) Ossein (2) Elastin
(3) Chondrin (4) Collagen

Q.36 Perichondrium covers the–
(1) Bone (2) Cartilage
(3) Decalcified bone (4) Dried bone

Q.37 The process of bone formation is called–
(1) Ossification (2) Calcification
(3) Calcination (4) None of these

Q.38 Matrix of cartilage is secreted by–
(1) Chondrocytes (2) Chondroblasts
(3) Osteocytes (4) Histiocytes

Q.39 The main difference between bone and cartilage is of
(1) Mineral salts (2) Blood vessels
(3) Lymph vessels (4) Haversian canals

Q.40 60% inorganic components are present in–
(1) Cartilage (2) Bone
(3) Connective tissue (4) None of these

Q.41 Matrix of bone is arranged–
(1) In concentric layers
(2) Not in concentric layers
(3) Matrix forms the ground substance
(4) None of these

Q.42 Volkmann's canal connects–
(1) Osteocyte with matrix
(2) Different bones
(3) Haversian canal with matrix
(4) Haversian canal with other Haversian canals.

Q.43 Ossification of connective tissue results in
(1) Cartilage (2) Seasmoid
(3) Membrane bone (4) None of the above

Q.44 Bone has longitudinal canals, called–
(1) Central canals (2) Haversian canals
(3) Volkmann's canals (4) None of the above

Q.45 Hyoid apparatus is composed of–
(1) Hyaline cartilage (2) Fibrous cartilage
(3) Calcified cartilage (4) Elastic cartilage

Q.46 Calcified cartilage is found in–
(1) Head of femur (2) Pectoral girdle
(3) Ribs and sternum (4) Both 1 and 2

Q.47 Supportive connective tissue means
(1) Tendon (2) Cartilage and bone
(3) Ligament (4) Blood and lymph

Q.48 Yellow fibres are present in–
(1) Bundles
(2) Singly and branched
(3) Singly and unbranched
(4) None of these

Q.49 In hyaline cartilage, matrix is–
(1) Granular (2) Transparent
(3) Agranular (4) Semitransparent

Q.50 Sprain is due to pulling of–
(1) Muscles (2) Ligaments
(3) Tendons (4) Nerves

CONNECTIVE VASCULAR TISSUE

Q.51 RBC that lack nuclei when they are mature are of
(1) Frog (2) Lizard
(3) Man (3) Birds

Q.52 Blood clot is mainly due to–
(1) Plasma and RBC
(2) Plasma and thrombocytes
(3) Heparin and corpuscles
(4) Fibrin and corpuscles

Q.53 Which of the following is not a phagocytic cell–
(1) Neutrophils (2) Monocytes
(3) Lymphocytes (4) Eosinophils

Q.54 Blood cells are formed in bone marrow. The process is known as
(1) Haemolysis (2) Erythroblastosis
(3) Haemopoiesis (4) None of these

Q.55 Blood platelets are not present in the blood of–
(1) Fishes (2) Amphibians
(3) Reptiles (4) All the above

Q.56 Agranulocytes normally develop in–
(1) Bone marrow
(2) Liver
(3) Lymph glands and spleen
(4) None of these

Q.57 Granulocytes are produced in–
(1) Liver (2) Bone marrow
(3) Spleen (4) None of these

Q.58 Formation of platelets is known as–
(1) Haemopoiesis (2) Thrombopoiesis
(3) Haemolysis (4) None of these

Q.59 Percentage of protein is more in–
(1) Lymph (2) Blood
(3) Plasma (4) W.B.C.

Q.60 Which of the following acts as middle man–
(1) W.B.C. (2) Plasma
(3) Blood (4) Lymph

Q.61 Blood is a–
(1) Epithelial tissue (2) Muscular tissue
(3) Connective tissue (4) Supportive tissue

Q.62 In man, the number of R.B.C. per cubic mm of blood is
(1) 1 to 3 millions
(2) 5 to 5.4 millions
(3) Less than one million but more than 50 thousand
(4) Less than 50 thousand

Q.63 Life span of a W.B.C. in man is–
(1) 100 days (2) 50 days
(3) 7 days (4) None of the above

Q.64 The diameter of RBC is–
(1) 10-12 μm (2) 2-3 μm
(3) 7-8 μm (4) None of the above

Q.65 Formation of antibodies is the function of–
(1) Monocytes (2) Neutrophils
(3) Basophils (4) Lymphocytes

Q.66 Life span of mammalian R.B.C. is–
(1) 100-128 days (2) 100 days
(3) Less than 100 days
(4) None of the above

Q.67 The main difference in the blood and lymph is–
(1) Absence of RBC
(2) Absence of WBC
(3) Number of WBC is less in blood
(4) None of these

Q.68 Which blood corpuscle is largest in diameter-
(1) Erythrocyte (2) Monocyte
(3) Neutrophil (4) Lymphocyte

Q.69 Which of the W.B.C. has many lobed nucleus–
(1) Monocytes (2) Lymphoytes
(3) Neutrophils (4) Basophils

Q.70 Number of R.B.C. is more in persons living at hills because
(1) There is less oxygen
(2) Air is more purified
(3) Heat is required to warm the body
(4) None of these

Q.71 Name any mammal where R.B.C. are nucleated–
(1) Elephant (2) Rabbit
(3) Monkey (4) None

Q.72 Name the cells which help in clotting of blood in mammals
(1) Platelets (2) Thrombocytes
(3) Lymphocytes (4) Monocytes

Q.73 Plasma has water to the extent of–
(1) 80% (2) 60%
(3) 70% (4) 90%

Q.74 Blood platelets are–
(1) Nucleated cells
(2) Nonnucleated cells
(3) Nonnucleated cells fragments
(4) Nucleated cell fragments

Q.75 Instead of platelets, the non-mammals possess clotting factor in
(1) Nucleated cells called thrombocytes
(2) RBC
(3) WBC
(4) Plasma

Q.76 As compared to blood, lymph contains–
(1) More protein, same number of leucocytes mainly lymphocytes and few erythrocytes
(2) Less protein, more leucocyts chiefly granuclocytes and a few erythrocytes
(3) Less protein, large number of leucocytes mainly lymphocytes and a few granulocytes, no erythrocytes
(4) Less protein, same number of leucocytes mainly lymphocytes and a few erythrocytes

MUSCULAR TISSUE

Q.77 Muscle fibres having rounded ends are
(1) Unstriped muscles (2) Smooth muscles
(3) Striped muscles (4) All the above

Q.78 Inter-calated discs are present in–
(1) Cardiac muscles (2) Striped muscles
(3) Unstriated muscles (4) Ligament

Q.79 The cytoplasm of muscle fibre is known as–
(1) Neuroplasm (2) Protoplasm
(3) Germ plasm (4) Sarcoplasm

Q.80 "All or Non" rule can't be implicate on
(1) Non straited muscles
(2) Cardiac Muscles
(3) Straited muscles
(4) All the above

Q.81 Each myofibril has a diameter of–
(1) 1 to 2 μm (2) 0.1 to 0.2 μm
(3) .001 to .002 μm (4) None of the above

Q.82 Myofibrils show dark and light bands in–
(1) Cardiac muscles (2) Unstriped muscles
(3) Striped muscles (4) Both 1 and 3

Q.83 Myosin filaments are localized in–
(1) Z-Band (2) H-Band
(3) A-Band (4) None of the above

Q.84 Uninucleate muscles are–
(1) Smooth muscles (2) Cardiac muscles
(3) Involuntary muscles (4) All the above

Q.85 Multinucleate muscle cells are–
(1) Striped muscles (2) Smooth muscles
(3) Skeletal muscles (4) All the above

Q.86 Which of the muscles are attached to bones–
(1) Smooth muscles (2) Straited muscles
(3) Cardiac muscles (4) All the above

Q.87 Chemical ions responsible for muscle contraction are–
(1) Ca^{++} and K^{+} (2) Na^{+} and K^{+}
(3) Na^{+} and Ca^{++} (4) Ca^{++} and Mg^{++} ions

Q.88 Rhythmical contraction is noticed in–
(1) Cardiac muscles (2) Striped muscles
(3) Unstriped muscles (4) In all the muscles

Q.89 Muscles get fatigued due to accumulation of–
(1) Adenosine triphosphate
(2) CO_2
(3) Lactic acid
(4) Phosphate molecules

Q.90 Mitochondria are more in–
(1) Striated mucles (2) Cardiac muscles
(3) Smooth muscles (4) All the above

Q.91 Striped muscle fibres are held together by–
(1) Areolar connective tissue
(2) Adipose tissue
(3) White fibrous tissue
(4) Yellow fibrous tissue

Q.92 Cross connections are the characteristic feature of–
(1) Cardiac muscles (2) Striated muscles
(3) Smooth muscles (4) None of the above

Q.93 Power of regeneration is poor in–
(1) Nerve cell (2) Bone cell
(3) Chondroblasts (4) Striated muscles

Q.94 Basic unit of muscle contraction is–
(1) Actin (2) Myosin
(3) Sarcomere (4) Tropomyosin

Q.95 Schwann cells are present around–
(1) Medullated nerve fibre
(2) Non-medullated nerve fibre
(3) Medullated and non-medullated nerve fibres
(4) None of these

Q.96 Transmitter substance released at the synapse is–
(1) Secretin (2) Cholecystokinin
(3) Cholesterol (4) Acetylcholin

Q.97 The Muscles resistant to fatigue is–
(1) Striped (2) Unstriped
(3) Cardiac (4) Eye muscles

NERVOUS TISSUE

Q.98 Neurilemma is outer covering of
(1) Blood capillaries (2) Muscle fibre
(3) Intestine (4) Nerve fibre

Q.99 Unipolar nerve cell means–
(1) Nerve cell with one dendron
(2) Nerve cell with many dendrons
(3) Nerve cell without dendron
(4) None of the above

Q.100 Multipolar neuron means–
(1) With one dendron and one axon
(2) With many dendrons and one axon
(3) With one dendron and no axons
(4) With many dendrons and no axons

Q.101 Nissel's granules are absent in
(1) Dendrons and dendrites
(2) Cyton
(3) Axon
(4) Dendrons and cyton

Q.102 Neuro-fibrils are present in–
(1) Cyton (2) Muscles
(3) Bones (4) Connective tissue

Q.103 Plasmalemma of axon is called–
(1) Axolemma (2) Neurilemma
(3) Sarcolemma (4) None of these

Q.104 Collateral fibres are given out along its way is–
(1) Muscle fibre (2) Axon
(3) Dendron (4) Dendrites

Q.105 Myelin sheath is pressent around the–
(1) Non-medullated nerve fibre
(2) Medullated nerve fibre
(3) Medullated and non-medullated nerve fibres
(4) Muscle fibres

Q.106 Which of the following posesses nodes of Ranvier–
(1) Medullated nerve fibre
(2) Non-medullated nerve fibre
(3) Muscle fibre
(4) Medullated and non-medullated nerve fibres

Q.107 The packing cells around nerve cells in brain are called
(1) Histiocytes (2) Mast cells
(3) Matrix (4) Neuroglia cells

Q.108 Bipolar nerve cells are present in–
(1) Skin tactile corpuscles
(2) Spinal cord
(3) Retina of eye
(4) All the above

Q.109 Multipolar nerve cells are present in–
(1) Cochlea
(2) Dorsal root ganglia of spinal cord
(3) Retina of eye
(4) Brain

Q.110 Which is correct–
(1) A medullated nerve fibre appears grey
(2) A nonmedullated nerve fibre appears white
(3) Neurilemma is composed of Schwann cells
(4) Neurilemma is composed of neuroglia cells

Q.111 Tissue connecting bones is–
(1) Tendon (2) Ligament
(3) Areolar tissue (4) Adipose tissue

MUSCLES

Q.112 Muscle fibres having rounded ends are
(1) Unstriped muscles (2) Smooth muscles
(3) Striped muscles (4) All the above

Q.113 Inter-calated discs are present in-
(1) Cardiac muscles (2) Striped muscles
(3) Unstriated muscles (4) Ligament

Q.114 The cytoplasm of muscle fibre is known as-
(1) Neuroplasm (2) Protoplasm
(3) Germ plasm (4) Sarcoplasm

Q.115 "All or Non" rule can't be implicate on
(1) Non straited muscles
(2) Cardiac Muscles
(3) Straited muscles
(4) All the above

Q.116 Each myofibril has a diameter of-
(1) 1 to 2 mm (2) 0.1 to 0.2 mm
(3) .001 to .002 mm (4) None of the above

Q.117 Myofibrils show dark and light bands in-
(1) Cardiac muscles (2) Unstriped muscles
(3) Striped muscles (4) Both 1 and 3

Q.118 Myosin filaments are localized in-
(1) Z-Band (2) H-Band
(3) A-Band (4) None of the above

Q.119 Uninucleate muscles are-
(1) Smooth muscles
(2) Cardiac muscles
(3) Involuntary muscles
(4) All the above

Q.120 Multinucleate muscle cells are-
(1) Striped muscles (2) Smooth muscles
(3) Skeletal muscles (4) All the above

Q.121 Which of the muscles are attached to bones-
(1) Smooth muscles (2) Straited muscles
(3) Cardiac muscles (4) All the above

Q.122 Chemical ions responsible for muscle contraction are-
(1) Ca^{++} and K^{+} (2) Na^{+} and K^{+}
(3) Na^{+} and Ca^{++} (4) Ca^{++} and Mg^{++} ions

Q.123 Rhythmical contraction is noticed in-
(1) Cardiac muscles (2) Striped muscles
(3) Unstriped muscles (4) In all the muscles

Q.124 Muscles get fatigued due to accumulation of-
(1) Adenosine triphosphate
(2) CO_2
(3) Lactic acid
(4) Phosphate molecules

Q.125 Mitochondria are more in-
(1) Striated mucles (2) Cardiac muscles
(3) Smooth muscles (4) All the above

Q.126 Striped muscle fibres are held together by-
(1) Areolar connective tissue
(2) Adipose tissue
(3) White fibrous tissue
(4) Yellow fibrous tissue

Q.127 Cross connections are the characteristic feature of-
(1) Cardiac muscles (2) Striated muscles
(3) Smooth muscles (4) None of the above

Q.128 Power of regeneration is poor in-
(1) Nerve cell (2) Bone cell
(3) Chondroblasts (4) Striated muscles

Q.129 Basic unit of muscle contraction is-
(1) Actin (2) Myosin
(3) Sarcomere (4) Tropomyosin

Q.130 Schwann cells are present around-
(1) Medullated nerve fibre
(2) Non-medullated nerve fibre
(3) Medullated and non-medullated nerve fibres
(4) None of these

Q.131 Transmitter substance released at the synapse is-
(1) Secretin (2) Cholecystokinin
(3) Cholesterol (4) Acetylcholin

Q.132 The Muscles resistant to fatigue is-
(1) Striped (2) Unstriped
(3) Cardiac (4) Eye muscles

Q.133 Certain fibres are long more than a feet. These are -
(1) Muscle Fibres (2) Nerve fibres
(3) Fibroblasts (4) All the above

Q.134 In mammals yellow fibres are found in-
(1) Ear pinna (2) Tip of nose
(3) Epiglottis (4) All of these

Q.135 Characteristics of smooth muscle fibres are-
(1) Spindle-shaped, unbranched, unstriated, uninucleate and involuntary
(2) Spindle shaped, unbranched, unstriped, mutlinucleate and involuntrary
(3) Cylindrical, unbranched, unstriped, multinucleate and involuntary
(4) Cylindrical, unbranched, striated, multinucleate and voluntary

Q.136 Which one possesses striated muscles-
(1) Gall blader (2) Leg muscles
(3) Bronchial wall (4) Lungs

Q.137 Heart muscles are-
(1) Voluntary and unstriated
(2) Voluntary and striated
(3) Involuntary and striated
(4) Involuntary and unstriated

Q.138 Which one contains voluntary muscles-
(1) Heart (2) Hind limb
(3) Liver (4) Lung

Q.139 Cardiac muscles are-
(1) Striated, syncytial and voluntary
(2) Striated, syncytial and involuntary
(3) Smooth, spindle-shaped and involuntary
(4) Striated, crossoconnected and involuntary

Q.140 Muscles involved in movement of arm are-
(1) Striated (2) Unstriated
(3) Cardiac (4) Smooth

Q.141 Striated muscles found in-
(1) Trachea (2) Lungs
(3) Gall bladder (4) Limbs

Q.142 Ligaments made up of -
(1) Yellow elastin fibre
(2) White collagen fibre
(3) White elastin fibres
(4) None of above

Q.143 Bundles of striated muscle fibres are enclosed in
(1) Periosteum (2) Epimysium
(3) Perimysium (4) Endomysium

Q.144 Unstriated, unstriped or smooth muscle fibres occur in-
(1) Iris (2) Eye muscles
(3) Tongue (4) Thigh

Q.145 What is not true of smooth muscle fibres-
(1) Spindle shaped (2) Under ANS
(3) Syncytial (4) Structurally simple

Q.146 Cross-bridges occur in-
(1) Mid brain of Rabbit (2) Mid brain of Frog
(3) Cranial nerves (4) Cardiac fibres

Q.147 Multi-unit smooth muscles are found in the wall of-
(1) Large blood vessels (2) Intestine
(3) Stomach (4) Urinary bladder

Q.148 Large irregular ovoid cells found in areolar tissue are
(1) Fibroblasts (2) Macrophages
(3) Mast cells (4) Chromatophores

Q.149 Smooth muscles occure in-
(1) Vein (2) Artery
(3) Uterus (4) All the above

Q.150 Muscles develop from-
(1) Ectoderm (2) Mesoderm
(3) Endoderm (4) All the above

Q.151 Muscular tissue is differentiated into-
(1) Striped and cardiac
(2) Unstriped, striated and cardiac
(3) Cardiac and unstriped
(4) Striped and unstriped

Q.152 Striped muscles are-
(1) Syncytial (2) Multinucleate
(3) Binucleate (4) Annucleate

Q.153 Voluntary muscles are controlled by-
(1) Cerebral hemisphere
(2) Medulla
(3) Cerebellum
(4) Cerebrum

Q.154 Which has both voluntary & involuntary muscles-
(1) Blood vessels (2) Gland ducts
(3) Urethra (4) None

Q.155 Fatigued muscle contains-
(1) ADP (2) Lactic acid
(3) Keto acid (4) None

Q.156 In striated muscle, Krau's membrane separate many-
(1) Sarcomeres (2) Micromeres
(3) Chromosomes (4) All

Q.157 The stored food material found in the muscles of animals-
(1) Phosphogens (2) Proteins
(3) Lipids (4) Glycogen

Q.158 Intercostal muscle are attached to-
(1) Diaphragm (2) Ribs
(3) Fingers (4) None

EXERCISE - 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Compound squamous epithelium occurs in - **[BHU-1995]**

(1) Stomach (2) Pharynx

(3) Intestine (4) Trachea

Q.2 Epithelial tissue is **[MP-PMT-1995]**

(1) Protective covering

(2) Reproductive structure

(3) Nerve cells (4) Corpuscles

Q.3 Epithelium of bronchioles is **[MP-PMT-1996]**

(1) Simple cuboidal

(2) Pseudostratified columnar

(3) Simple squamous

(4) Pseudostratified sensory

Q.4 Stratified and nonkeratinised squamous epithelium occurs in **[MP-PMT-1996]**

(1) Epidermis of skin

(2) Vagina and cervix

(3) Buccal cavity (4) Both 2 and 3

Q.5 Basement membrane is formed of **[AIPMT-1996]**

(1) Epidermal cells

(2) Endodermal cells

(3) Both 1 and 2

(4) None of the above but present below epithelial cells

Q.6 Inner lining of gut, stomach and liver is made of **[AFMC-1997]**

(1) Simple squamous epithelium

(2) Simple columnar epithelium

(3) Simple cuboidal epithelium

(4) All the above

Q.7 Gastric glands are **[RPMT-1998]**

(1) Simple tubular

(2) Simple coiled tubular

(3) Branched tubular

(4) Compound tubular

Q.8 Regeneration after injury is absent in **[RPMT-1998]**

(1) Nervous tissue (2) Skin epidermis

(3) Tendon (4) Smooth muscles

Q.9 Brush border epithelium occurs in **[CPMT-1999]**

(1) Trachea (2) Stomach

(3) Small intestine (4) Fallopian tube

Q.10 Adjacent epithelial cells are held together by means of **[AFMC-1999]**

(1) Liposomes (2) Glyoxisomes

(3) Desmosomes (4) Microsomes

Q.11 Vertebrate salivary glands and exocrine part of pancreas are **[BHU-1991]**

(1) Apocrine (2) Holocrine

(3) Epicrine (4) Merocrine

Q.12 Simple epithelium is made of **[AIPMT-2000]**

(1) Noncellular layer of hyaluronic acid

(2) Actively dividing cells

(3) Loosely arranged cells

(4) Compactly packed single layer of cells.

Q.13 Goblet cells are **[JKCMEE2000]**

(1) Unicellular glands

(2) Multicellular glands

(3) Loosely arranged cells

(4) Dead keratinised cells

Q.14 Sebaceous glands are **[CPMT-2000]**

(1) Apocrine (2) Holocrine

(3) Mesocrine (4) Eccrine

Q.15 Squamous epithelium occurs in inner lining of **[Kerala-2000]**

(1) Kidney (2) Pancreatic duct

(3) Lung alveoli (4) Liver

Q.16 Branched tubular gland is **[CPMT-2001]**

(1) Salivary (2) Gastric

(3) Sebaceous (4) Sweat

Q.17 Characteristic of epithelial tissues is **[Karnataka-2001]**

(1) Never produce glands

(2) Cells can undergo rapid divisions

(3) Abundant vascularisation

(4) Large intercellular spaces

Q.18 Blood platelets are found only in the blood of **[UTTARANCHAL PMT-2004]**

(1) Birds (2) Reptiles

(3) Mammals (4) Amphibians

Q.19 Ligament connects **[UTTARANCHAL PMT-2004]**

(1) Bone to bone (2) Bone to muscle

(3) Muscle to muscle (4) Both 'b' and 'c'

Q.20 Mammary glands are modified **[UTTARANCHAL PMT-2004]**

(1) Sweat gland (2) Sebaceous gland

(3) Lacrymal gland (4) Endocrine gland

Q.21 The term haematocrit means **[UTTARANCHAL PMT-2006]**

(1) The percentage of blood having is red blood cells

(2) The ratio of blood volume to extracellular space

(3) The percentage of new blood cells formed every 120 days

(4) The percentage of blood that is white blood cells

Q.22 What is the main difference in human and frog RBC **[UTTARANCHAL PMT-2006]**

(1) Human RBC are non-nucleated

(2) Haemoglobin is found only in human RBC

(3) Human RBC have nucleus

(4) Human RBC are multinucleated

Q.23 Prothrombin is found in **[UTTARANCHAL PMT-2006]**

(1) Intestine and helps in cellulose digestion

(2) Liver and helps in production of bile

(3) Blood and gives red colour

(4) Blood and helps in blood clotting

Q.24 Which type of WBCs are most aboundant in blood of rabbit and other vertibrates **[UTTARANCHAL PMT-2006]**

(1) Acidophils (2) Basophils

(3) Lymphocytes (4) Neutrophils

Q.25 Blood clotting in a test tube can be prevented by adding a little of **[UTTARANCHAL PMT-2006]**

(1) Sodium oxalate (2) Sodium chloride

(3) Sodium hydroxide

(4) Ammonium chloride

Q.26 Oval, biconvex and nucleated RBCs are found in **[UTTARANCHAL PMT-2006]**

(1) Camel (2) Rabit

(3) Man (4) Rat

Q.27 Which of the following is an anticoagulant and checks blood coagulation in blood vessels **[UTTARANCHAL PMT-2006]**

(1) Prothrombin (2) Globulin

(3) Thromboplastin (4) Heparin

Q.28 In normal healthy female, the number of RBC/mm^3 of blood is **[UTTARANCHAL PMT-2006]**

(1) 6.5–7.0 million (2) 5.5 – 6.0 million

(3) 4.5 – 5.0 million (4) 3.5 – 4.0 million

Q.29 The tissue which forms the basic structure of lymphoid organs, spleen etc, is **[UTTARANCHAL PMT-2006]**

(1) Lymphoid tissue (2) Cartilage tissue

(3) Elastic tissue (4) Areolar tissue

Q.30 Which of the following should be avoided in Biological marriage **[UTTARANCHAL PMT-2006]**

(1) A^+ boy and A^+ girl (2) A^+ boy and A^- girl

(3) O^+ boy and O^+ girl (4) O^- boy and O^- girl

Q.31 After examining the blood group of husband and wife, the doctor advised them not to have more than one child. The blood groups of the couple are likely to be **[UTTARANCHAL PMT-2006]**

(1) Male Rh^- and male Rh^+

(2) Female Rh^- and male Rh^+

(3) Male Rh^+ and female Rh^+

(4) Male Rh^- and female Rh^-

Q.32 Blood colloidal osmotic pressure is maintained by **[WEST BENGAL JEE-2007]**

(1) Albumin (2) Globulin

(3) Fibrinogen (4) Thrombin

Q.33 Haversian canal is situated in **[WEST BENGAL JEE-2007]**

(1) Glandular connective tissue
(2) Skeletal connective tissue
(3) Fibrous connective tissue
(4) Nervous tissue

Q.34 Histamine is secreted by **[WEST BENGAL JEE-2007]**

(1) Neutrophils (2) Basophils
(3) Leucocytes (4) Monocytes

Q.35 Which one of the following is agranulocyte **[JHARKHAND-2006]**

(1) Neutrophil (2) Eosinophil
(3) Basophil (4) Monocyte

Q.36 Stratified squammous epithelium is found in **[JHARKHAND-2006]**

(1) Pharynx (2) Trachea
(3) Ileum (4) Bownan's capsule

Q.37 During the process of blood coagulation vitamin K helps in the **[JHARKHAND-2004]**

(1) Formation of thromboplastin
(2) Formation of prothrombin
(3) Conversion of prothrombin to thrombin
(4) Conversion of fibrinogen to fibrin

Q.38 In mature RBC, nucleus is present in **[JHARKHAND-2004]**

(1) Frog
(2) Rabbit
(3) Both 'a' and 'b'
(4) Neither in frog nor in rabbit

Q.39 ABO blood group system is given by **[BIHAR-2005]**

(1) Landsteiner (2) Wallace
(3) De vries (4) Lamarck

Q.40 Which of the following, does not help in clotting of blood **[BIHAR-2004]**

(1) Heparin (2) Prothrombin
(3) Ca^{2+} (4) Exposure to O_2

Q.41 Collagen fibres are secreted by **[BIHAR-2005]**

(1) Mast cells (2) Macrophage
(3) Histiocytes (4) Fibroblasts

Q.42 Haversian canal is found in the bone of **[BIHAR-2003]**

(1) Mammals (2) Reptiles
(3) Aves (4) Pices

Q.43 Haematocrit value gives **[BIHAR-2001]**

(1) Amount of RBC in blood
(2) Number of WBC in blood
(3) Amount of plasma in blood
(4) Haemoglobin concentration in blood

Q.44 Tendons and ligaments are specialized types of **[UP-CPMT-2003]**

(1) Nervous tissue
(2) Epithelial tissue
(3) Muscular tissue
(4) Fibrous connective tissue

Q.45 Which one of the follwoing is transparent tissue **[UP-CPMT-2001]**

(1) Tendon (2) Ligament
(3) Fibrous cartilage (4) Hyaline cartilage

Q.46 Ciliated epithelium is present in **[UP-CPMT-2002]**

(1) Trachea (2) Ureter
(3) Intestine (4) Nasal chamber

Q.47 Difference between bone and cartilage is **[UP-CPMT-2002]**

(1) Haversian canal (2) Blood vessel
(3) Lymph vessel (4) None of these

Q.48 Minimum regeneration power is present in **[UP-CPMT-2002]**

(1) Nervous tissue (2) Connective tissue
(3) Epithelial tissue (4) None of these

Q.49 Which one of the following couple were suggested by Doctors to not have more than one child **[UP-CPMT-2002]**

(1) Rh^+ male and Rh^- female
(2) Rh^- male and Rh^+ female
(3) Rh^+ male and Rh^+ female
(4) Rh^- male and Rh^- female

Q.50 The pH of blood is **[UP-CPMT-2003]**

(1) Between 7– 8 (2) Between 2 – 4
(3) Between 12 – 14 (4) Between 2 – 5

Q.51 Histamine is secreted by **[UP-CPMT-2003]**

(1) Goblet cell (2) Nerve cell

(3) Kupffer cell (4) Mast cell

Q.52 Universal blood recipient is **[MP-PMT-2003,06]**

(1) Blood group –O (2) Blood group–AB

(3) Blood group–A (4) Blood group–B

Q.53 Life span of RBC is **[UP-CPMT-2003]**

(1) 50 days (2) 70 days

(3) 120 days (4) 220 days

Q.37 During blood clotting which of the following is used **[UPCPMT-2003]**

(1) Co (2) Ca^{++}

(3) Na^{+} (4) Cl^{-}

Q.54 Haemoglobin contains **[UPCPMT-2003]**

(1) Fe^{++} (2) Mg^{++}

(3) Na^{++} (4) Ca^{++}

Q.55 Which of the following does not play a role in blood coagulation **[UPCPMT-2004]**

(1) Vitamin K (2) Vitamin D

(3) Calcium ions (4) Fibrinogen

Q.56 Which of the following cells of connective tissue secrete antibodies **[UPCPMT-2005]**

(1) Mast cells (2) Reticular cells

(3) Adipose cells (4) Plasma cells

Q.57 The cavities of brain are lined by **[UP-CPMT-2006]**

(1) Cuboidal cells (2) Polygonal cells

(3) Ependymal cells

(4) Simple squamous cells

Q.58 Ligament is mainly made up of **[MP-PMT-2007]**

(1) Reticulin (2) Elastin

(3) Myosin (4) Collagen

Q.59 Which is a sesamoid bone **[MP-PMT-2007]**

(1) Patella (2) Femur

(3) Ulna (4) Pterygoid

Q.60 Mammary glands are modified - **[MP-PMT-2004]**

(1) Sweat glands (2) Sebaceous glands

(3) Cutaneous glands (4) Scent glands

Q.61 Anaemia disease is caused by **[MP-PMT-2006]**

(1) Deficiency of Fe (2) Deficiency of Na

(3) Deficiency of Ca (4) Deficiency of Mg

Q.62 The main function of ligament is **[MP-PMT-2001, 06]**

(1) Joining of two bones

(2) Joining of muscles

(3) Joining of muscle to bone

(4) Joining of muscle to nerves

Q.63 The following are needed for blood clotting **[MP-PMT-2001]**

(1) Ca^{++} and Vitamin E

(2) Ca^{++} and Vitamin K

(3) Ca^{++} and Vitamin A

(4) K^{+} and Vitamin K

Q.64 The type of epithelium found in conjunctiva of eye is **[MPPMT-2001]**

(1) Stratified cuboidal

(2) Stratified columnar

(3) Stratified squamons

(4) Transitional epithelium

Q.65 Haversian canals are found in the **[MPPMT-2001]**

(1) Bones of birds (2) Bones of mammals

(3) Bones of frog (4) Cartilage

Q.66 It is not found in the Red Blood corpuscles of human being **[MPPMT-2001]**

(1) Haemoglobin (2) Plasmalemma

(3) Nucleus (4) Cytoplasm

Q.67 Lifr-span of human R.B.C. is **[MPPMT-2001]**

(1) 120 days (2) 90 days

(3) 2–3days (4) 20 days

Q.68 Volkmann's canals are found in **[MPPMT-2001]**

(1) Bones of birds

(2) Bones of amphilbians

(3) Bones of mammals

(4) Cartilage of mammals

Q.69 An example of merocrine gland is **[MP-PMT-2001]**

(1) Sebaceous gland (2) Pineal gland

(3) Salivary gland (4) Mammary gland

Q.70 Bones formed by ossification of a tendon is called **[MPPMT-2002]**
(1) Membrane bone (2) Sesamoid bone
(3) Dermal bone (4) Cartilage

Q.71 Epithelial tissues arise from **[MP-PMT-2002]**
(1) Ectoderm (2) Endoderm
(3) Mesoderm (4) All the aboves

Q.72 The percentage of Hb in RBC is **[MP-PMT-2003]**
(1) 48 % (2) 34 %
(3) 10% (4) 20%

Q.73 White adipose tissue contains **[MPPMT-2003]**
(1) Multilocular fat cells
(2) Bilocular fat cells
(3) Unilocular fat cells (4) Alocular fat cells

Q.74 In human fibrous cartilage is found abundantly **[MP-PMT-2003]**
(1) Hyaline cartilage of joints
(2) Nostrils
(3) Intervertebral discs
(4) External ear

Q.75 Which of the following is enucleate **[MP-PMT-2003]**
(1) Squamous epithelial cell
(2) Mature human erythrocyte
(3) Mature human leucocyte
(4) Mature frog erythrocyte

Q.76 Which one of the following anticogulant is added in blood during storage **[MP-PMT-2003]**
(1) Sodium carbonate (2) Sodium oxalate
(3) Sodium chloride (4) Sodium hydroxide

Q.77 Blood clotting requires
(1) Na^+ and K^+
(2) Na^+ and prothrombin
(3) Na+ and thromboplastin
(4) Ca^{2+} and thromboplastin

Q.78 Mammalian pinna is supported by **[MP-PMT1995]**
(1) Hyaline cartilage (2) Calcified cartilage
(3) Elastic cartilage
(4) White fibrous connective tissue

Q.79 Bone marrow takes part in **[MP-PMT-1995]**
(1) Controlling blood pressure
(2) As haemopoietic tissue
(3) Assisting kidneys
(4) Assisting liver

Q.80 Agranulocytes are **[BHU-2000, Har. PMT-2000]**
(1) Eosinophils and neutrophils
(2) Monocytes and lymphocytes
(3) Eosinophils and lymphocytes
(4) Lymphocytes and basophils

Q.81 Platelets are a source of **[MP-PMT-1996]**
(1) Fibrinogen (2) Calcium
(3) Thromboplastin (4) Heamoglobin

Q.82 Which is unrelated to blood plasma is **[BHU1996]**
(1) Fibrinogen (2) Fibrin
(3) Bilirubin (4) Calcium

Q.83 Major component of blood plasma is **[AFMC-1996]**
(1) Water
(2) Inorganic Substances
(3) Organic substances
(4) Blood cells

Q.84 Connective tissue belongs to **[MP-PMT-1996]**
(1) Ectoderm (2) Mesoderm
(3) Endoderm (4) Any of the above

Q.85 Which one is unrelated **[MP-PMT-1996]**
(1) Keratin (2) Elastin
(3) Dextrin (4) Collagen

Q.86 Thromboplastin required for blood clotting is produced by
(1) Platelets (2) Erythrocytes
(3) Monocytes (4) Lymphocytes

Q.87 Maximum number of white blood corpuscles is that of **[DPMT-1996]**
(1) Basophils (2) Neutrophils
(3) Monocytes (4) Eosinophils

Q.88 Protein present in cartilage is **[MIPMT-1997,2000]**
(1) Cartilagin (2) Chondrin
(3) Ossein (4) Oesein

Q.89 Life span of human white blood corpuscles is **[AIPMT1997, JIPMER-2000]**

(1) 24 hours (2) Less than 10 days
(3) 120 days (4) 100 hours

Q.90 Which of the following is not a granulocyte **[AIPMT-1997]**

(1) Lymphocyte (2) Basophil
(3) Neutrophil (4) Eosinophil

Q.91 Which of the following are involved in body defence **[CET Chd. 1997]**

(1) Neutrophils (2) Lymphocytes
(3) Macrophages (4) All the above

Q.92 Ends of two long bones are connected' by **[MP-PMT-1997, CPMT-2000]**

(1) Cartilage (2) Muscles
(3) Ligaments (4) Tendons

Q.93 Largest corpuscles in human blood are **[MP-PMT-1997]**

(1) Erythrocyrtes (2) Monocytes
(3) Lymphocytes (4) Basophils

Q.94 Heparin is formed by **[BHU-1997]**

(1) Liver cells (2) Plasma cells
(3) Blood cells (4) Spleen cells

Q.95 Prothrombin, albumin and fibrinogen are synthesised by **[AFMC-1997]**

(1) Pancreas (2) Bone marrow
(3) Spleen (4) Liver

Q.96 Regeneration of cartilage can occur from its **[CPMT-1997]**

(1) Matrix (2) Plasma
(3) Perichondrium
(4) A piece without perichondrium

Q.97 Mast cells occur in **[MP-PMT-1997]**

(1) Connective tissue (2) Epithelial tissue
(3) Skeletal tissue (4) Nervous tissue

Q.98 Ground susbtance of connective tissue is formed of **[MP-PMT-1997]**

(1) Phospholipids (2) Lipids
(3) Monosaccharides
(4) Mucopolysaccharides

Q.99 Matrix of hyaline cartilage contains **[CPMT-1998]**

(1) Collagen (2) Chondrin
(3) Ossein (4) All the above

Q.100 Ends of long bones are covered by **[MP-PMT-1998]**

(1) Blood cells (2) Ligaments
(3) Muscles (4) Cartilage

Q.101 Erythrocytes of adult mammals are formed in **[AFMC-1998]**

(1) Spleen (2) Liver
(3) Bone marrow (4) Kidney

Q.102 Histamine is secreted by **[AIPMT-1998, CPMT-1998]**

(1) Mast cells (2) Histiocytes
(3) Lymphocytes (4) Fibroblasts

Q.103 Blood leucocytes are **[Pb.PMT-1998]**

(1) Epithelial (2) Endothelial
(3) Glandular (4) Connective

Q.104 Which one is a factor for maturation of erythrocytes **[AIPMT-1998]**

(1) Vitamin B_{12} (2) Vitamin A
(3) Vitamin D (4) Vitamin C

Q.105 Antibodies are **[MP PMT-1998]**

(1) Albumins (2) Gamma-globulins
(3) Sucrose (4) Vitamin C

Q.106 In which state iron is present in haemoglobin

(1) Unionic (2) Fe^{2+}
(3) Fe^{3+} (4) None of these

Q.107 White fibrous tissue is **[CPMT-1999]**

(1) Nervous (2) Muscular
(3) Ligaments (4) Tendons

Q.108 Loose conective tissue is **[CPMT-1999]**

(1) Areolar (2) Adipose
(3) Blood (4) Cartilage

Q.109 Ligament is **[AIPMT-1999]**

(1) Modified white fibrous tissue
(2) Inelastic white fibrous tissue
(3) Modified elastic connective tissue
(4) None of these

Q.110 Percentage of haemoglobin in RBCs is **[DPMT- 1999]**

(1) 10% (2) 20%
(3) 34% (4) 48%

Q.111 Immature RBCs of mammals have **[BHU-1999]**

(1) No nucleus
(2) Single beaded nucleus
(3) Many nuclei
(4) Single nucleus

Q.112 Megakaryocytes **[MP-PMT-2000]**

(1) Produce leucocytes
(2) Forms blood platelets
(3) Are carriers of oxygen
(4) Are carriers of oxygen

Q.113 During blood clotting, fibrin is produced by **[MP-PMT-2000]**

(1) Thrombokinase (2) Prothrombin
(3) Liver (4) Proteolysis

Q.114 Cartilage present in trachea, larynx and bronchi is **[AFMC-2000]**

(1) Fibrous (2) Elastic
(3) Hyaline (4) Calcified

Q.115 Number of erythrocytes per mm^3 of human blood is **[AFMC- 2000]**

(1) 4 million (2) 5 million
(3) 6 million (4) 0.5 million

Q.116 Number of WBCs per mm^3 of human blood is **[Pb. PMT-2000]**

(1) 8000 (2) 7000
(3) 6500 (4) 6000

Q.117 RBCs are nucleated in **[MP PMT1991, Pb PMT-2000]**

(1) Man (2) Rabbit
(3) Rat (4) frog

Q.118 Cartilage is **[Har. PMT-2000]**

(1) Nonvascular (2) Poorly vascular
(3) Highly vascular
(4) Irregularly vascular

Q.119 An anticoagulant is **[BV-2000]**

(1) Heparin (2) Hirudin
(3) EDTA (4) All the above

Q.120 Collagen and elastin are formed by **[Kerala- 2000]**

(1) Macrophages (2) Fibroblasts
(3) Mast cells (4) Chondrocytes

Q.121 The rarest leucocyte of human blood is – **[Kerala-2000]**

(1) Basophil (2) Monocyte
(3) Neutrophil (4) Eosinophil

Q.122 Blood plasma has a pH of **[Kerala 2000]**

(1) 7.4 (2) 7.8
(3) 6.9 (4) 6.3

Q.123 In Camel, the RBCs are **[Manipal-2001]**

(1) Oval and nucleated
(2) Circular, biconcave and nucleated
(3) Circular, biconcave and nonnucleated
(4) Oval and nonnucleated

Q.124 Bilirubin and biliverdin are derived from **[Manipal-2001]**

(1) Globulin (2) Heam
(3) Iron (4) Fat

Q.125 Protein required for coagulation of blood is **[Manipal-2001]**

(1) Haemoglobin (2) Globulin
(3) Fibrinogen (4) Albumin

Q.126 Globulin is **[BHU-2001]**

(1) Plasma protein
(2) Antigen
(3) Serum
(4) Found in lymphatic tissue

Q.127 Which is not a component of areolar tissue **[Karnataka-2001]**

(1) Macrophage (2) Plasma cell
(3) Schwann cell (4) Adipose cell

Q.128 Structure absent from fresh frozen blood plasma is **[BV-2001]**

(1) Immunoglobulin (2) Plasma
(3) Albumin (4) Platelets

Q.129 To prevent clotting, donor's blood is treated with **[Wardha-2001]**

(1) Sodium glycochotate
(2) Sodium citrate
(3) Heparin
(4) Sodium taurocholate

Q.130 Bones are mainly formed of **[AFMC-20001]**

(1) Calcuim and Magnesium
(2) Calcium and phosphorus
(3) Calcium and Sulphur
(4) Calcium and Iron

Q.131 Nasal septum gets damaged. Its recovery requires cartilage called – **[AIPMT-2001]**
(1) Fibrous cartilage (2) Elastic cartilage
(3) Hyaline cartilage (4) Calcified cartilage

Q.132 Which cartilage is present at the end of long bones – **[CPMT-2002]**
(1) Calcified cartilage (2) Hyaline cartilage
(3) Elastic cartilage (4) Fibrous cartilage

Q.133 Continuous bleeding from an injured part of body is due to deficiency of - **[CPMT-2002]**
(1) Vitamin–A (2) Vitamin–B
(3) Vitamin–K (4) Vitamin–E

Q.134 What will happen if ligaments are cut or broken – **[CPMT-2002]**
(1) Bones will move freely at joints
(2) No movement at joint
(3) Bone will become unfix
(4) Bone will become fixed

Q.135 Abnormal increase in number of RBC in blood is called – **[RPMT-2003]**
(1) Anaemia (2) Polycythemia
(3) Leukemia (4) Sarcoma

Q.136 Which one of the following contains the largest quantity of extracellular material – **[AIPMT-2003]**
(1) Striated muscle
(2) Areolar tissue
(3) Stratified epithelium
(4) Myelinated nerve fibres

Q.137 Liquid which remain after clotting of blood is called as – **[RPMT-2005]**
(1) Serum (2) Plasma
(3) Lymph (4) Blood

Q.138 Four healthy people in their twenties got involved in injuries resulting in damage and death of a few cells of the following. Which of the cells are least likely to be replaced by new cells – **[AIPMT-2005]**
(1) Osteocytes
(2) Liver cells
(3) Neurons
(4) Malpighian layer of the skin

Q.139 Which of the following substances, if introduced into the blood stream, would cause coagulation of blood at the site of its introduction – **[AIPMT-2005]**
(1) Thromboplastin (2) Fibrinogen
(3) Heparin (4) Prothrombin

Q.140 Examination of blood of a person suspected of having anemia, shows large, immature, nucleated erythrocytes without haemoglobin. Supplementing his diet with which of the following is likely to alleviate his symptoms? **[AIPMT-2006]**
(1) Thiamine
(2) Folic acid and cobalamine
(3) Riboflavin (4) Iron compounds

Q.141 Areolar connective tissue joins – **[AIPMT-2006]**
(1) Fat body with muscles
(2) Integument with muscles
(3) Bones with muscles
(4) Bones with bones

Q.142 Mast cell secrete – **[AIPMT-2006]**
(1) Hippurin (2) Myoglobin
(3) Histamine (4) Hemoglobin

Q.143 Which one of the following mammalian cells is not capable of metabolising glucose to carbon - dioxide areobically ? **[AIPMT-2007]**
(1) Red blood cells (2) White blood cells
(3) Unstriated muscle cells
(4) White blood cells

Q.144 In which one of the following preparations are you likely to come across cell junctions most frequently ? **[AIPMT-2007]**
(1) Hyaline cartilage (2) Ciliated epithelium
(3) Thrombocytes (4) Tendon

Q.145 Drop of each of the following is placed separately on four slides. Which of them will not coagulate ? **[AIPMT-2007]**
(1) Whole blood from pulmonary vein
(2) Blood plasma
(3) Blood serum
(4) Sample from the thoracic duct of lymphatic system

Q.146 Which one is the most abundant protein in the animal world ? **[AIPMT Pre 2012]**

(1) Haemoglobin (2) Collagen

(3) Insulin (4) Trypsin

Q.147 Compared to those of humans, the erythrocytes in frog are : **[AIPMT Pre 2012]**

(1) nucleated and with haemoglobin.

(2) very much smaller and fewer.

(3) nucleated and without haemoglobin.

(4) without nucleus but with haemoglobin.

Q.148 Select the correct statement regarding the specific disorder of muscular or skeletal system : **[AIPMT Pre 2012]**

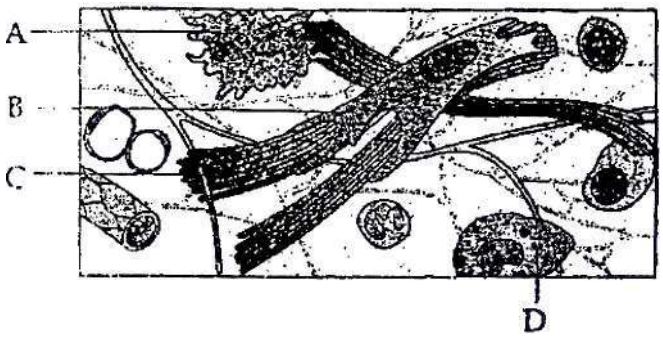
(1) *Oseoporosis* - decrease in bone mass and higher chances of fractures with advancing age.

(2) *Myasthenia gravis* - Auto immune disorder which inhibits sliding of myosin filaments

(3) *Gout* - inflammation of joints due to extra deposition of calcium.

(4) *Muscular dystrophy*-age related shortening of muscles.

Q.149 Given below is the diagrammatic sketch of a certain type of connective tissue. Identify the parts labelled A, B, C and D and select the right option about them.



Options : **[AIPMT Mains 2012]**

	Part–A	**Part–B**	**Part–C**	**Part–D**
(1)	Macrophase	Fibroblast	Collagen fibres	Mast cell
(2)	Mast cell	Macrophase	Fibroblast	Collagen fibres
(3)	Macrophase	Collagen fibres	Fibroblast	Mast cell
(4)	Mast cell	Collagen fibres	Fibroblast	Mcrophase

Q.150 Which one of the following pairs of chemical substances, is correctly categorised ?

[AIPMT Mains 2012]

(1)	Calcitonin and thymosin	Thyroid hormones
(2)	Pepsin and prolactin	Two digestive enzymes secreted in stomach
(3)	Troponin and myosin	Complex proteins in striated muscels
(4)	Secretin and rhodopsin	Polypeptide hormones

Q.151 The supportive skeletal structures in the human external ears and in the nose tip are examples of : **[AIPMT Mains 2012]**

(1) ligament (2) areolar tissue

(3) bone (4) cartilage

Q.152 The four sketches (A, B, C and D) given below, represent four different types of animal tissues. Which one of these is correctly identified in the options given, along with its correct location and function?

[AIPMT Mains 2012]

(A) 
(**B**) 
(C) 
(D) 
		Tissue	Location	Function
(1)	(B)	Glandular epithelium	Intestine	Secretion
(2)	(C)	Collagen fibres	Cartilage	Attack skeletal muscles to bones
(3)	(D)	Smooth muscle tissue	Heart	Heart contraction
(4)	(A)	Columnar epithelium	Nephron	Secretion and absorption

ANSWER KEY

EXERCISE – 3

Instruction for following questions :

Each of the questions given below consists of Assertion and Reason. Use the following Key to choose the appropriate answer.

(A) If both Assertion and Reason are correct, and Reason is the correct explanation of Assertion.

(B) If both Assertion and Reason are correct but Reason is not the correct explanation of Assertion.

(C) If Assertion is correct but Reason is incorrect.

(D) If Assertion is false but Reason is correct.

Q.1 **A :** Lymphocyte cells of connective tissue proper are called as cart wheel cells.
R : Lymphocytes cell is largest cell of connective tissue proper.

Q.2 **A :** Lymphocytes are the largest corpuscles.
R : Nucleus of lymphocyte is large and kidney shape.

Q.3 **A :** Ureter and Urinary bladder are lined with Transitional Epithelium.
R : Transitional Epithelium rest directly on Connective tissue.

Q.4 **A :** Cardiac muscle have striations and fibre is nucleated and involunlary.
R : Intercalated disc form three dimensional network of cardiac muscle fibre.

Q.5 **A :** Perikaryon contains neurofibrils.
R : Neurofibril in soma are responsible for afferent & efferent conduction.

Q.6 **A :** Multipolar neurons have several efferent process.
R : Axons are the afferent processes of a neuron.

Q.7 **A :** Calcified cartilage is formed by the calcification of hyaline cartilage.
R : Calcified cartilage is the strongest cartilage.

Q.8 **A :** Blood circulation is absent in Epithelium Tissue.
R : Blood vessels are unable to pierce Basement membrane.

Q.9 **A :** Mesenchymal cells are undifferentiated cells of Connective Tissue.
R : Their function is formation of other cells of Connective Tissue Proper.

Q.10 **A :** Reticular fibres connective Tissue is called as embryonic tissue.
R : Reticular fibrous connective tissue is mainly found in embryonic stage.

Q.11 **A :** New Born baby is resistant for cold.
R : The immune system of new born baby is very well developed.

Q.12 **A :** Simple columnar epithelium is also called as Germinal epithelium.
R : Columnar cells of gonads forms gametes.

Q.13 **A :** Epithelia are highly regenerative.
R : When epthelia get damaged, they regenerate more rapidly than other Tissue.

Q.14 **A :** Platelets play an important role in blood clotting.
R : In the blood oozing from an injury the platelets disintegrate and release thromboplasm that initiates clotting.

Q.15 **A :** Blood group 'O' is a universal donar blood.
R : Antiboidies of blood group are absent in blood group 'O'.

Q.16 **A :** Bone and cartilage are rigid connective tissue.
R : Blood is a connective tissue with matrix.

Q.17 **A :** Where a man usually travel in aeroplane RBC count increase in his body.
R : At high attitude production of vit. increase and percentage of haemoglobin is increase.

Q.18 **A :** Glands originate from all germinal layers.
R : All glands are composed of epithelial tissue.

Q.19 **A :** Brown fat produce more energy.
R : Brown fat composed of monolocular adipocyte.

Q.20 **A :** Simple cuboidal epithelium is called as germinal epithelium.
R : Cuboidal cells of gonads forms gametes.

Q.21 **A :** Mucoid connective tissue is called embryonic tissue .
R : Mucoid connective tissue is mainly form in embryonic stage.

Q.22 **A :** During embryonic development mother gives to child IgG.
R : IgG is able to cross placenta.

Q.23 **A :** Platelets repair damage endothelium of blood vessels
R : Platelets secrete serotonin which is a constrictor.

Q.24 **A :** Rh factor is considered in blood transfusion.
R : Rh antigen may leads agglutination of blood.

Q.25 **A :** Heparin is a anticoagulant found in mammals.
R : Heparin prevent conversion of Prothrombin to Thrombin.

Q.26 **A :** Epithelium cells get their nutrients from Adjacent cells.
R : In epithelium tissue large intercellular spaces are present.

Q.27 **A :** Urinary Bladder is lined by transitional epithelium.
R : Transitional epithelium keeps the size of the bladder constant at all times.

Q.28 **A :** Patella bone of knee is a sesamoid bone.
R : Skull bones and clavical bone are membranous bones.

Q.29 **A :** Epiphysis of long bone is haemopoietic.
R : In epiphysis yellow bone marrow is present which produce blood corpuscles.

Q.30 **A :** A woman of blood group AB when married to an 'O' group man will never get an AB group child.
R : Gene of blood group 'O' is dominent over the gene of blood group A, B or AB.

Q.31 **A :** Perichondrium is a white fibrous connective tissue.
R : Perichondrium is a connective tissue.

Q.32 **A :** Fibrous cartilage posses thick dense bundle of collagen fibre in matrix,
R : Fibrous cartilage is the hardest cartilage.

Q.33 **A :** All diploic bones of body are haemopoietic.
R : Red bone marrow is present in the diploic bone.

Q.34 **A :** Most bones body are cartilaginous.
R : Connective tissue originated first during embryonic development.

Q.35 **A :** Squamous epithelium helps in glomerular filtration.
R : It forms inner lining of Bowman's capsule.

Q.36 **A :** Deficiency of vitamin B_{12} and folic acid can cause anaemia.
R : Vitamin B_{12} and folic acid are essential for maturation of RBC.

Q.37 **A :** Prothrombinase enzyme act as antiheparin.
R : Heparin prevent coagulation of blood in Blood vessels.

Q.38 **A :** Lower most layer of stratified tissue is known as Germinative layer.
R : Lower most layer of stratified tissue is mostly cuboidal in shape and rest directly on connective tissue.

Q.39 **A :** Cells of epithelium tissue rest on a thin basement membrane.
R : Basement membrane has both fibrous and basal lamina part secreted by connective tissue and epithelial tissue respectively.

Q.40 **A :** Origin wise hair are epithelial tissue which are of ectodermal origin.
R : Epithelial tissue can be formed from mesoderm and endoderm also.

Q.41 **A :** Most of the human haemoglobin in our body has $2\alpha 2\beta$ polypeptide chains.

R : Haemoglobin is a conjugate protein and has 4 polypeptide chain in its one globin molecules.

Q.42 **A :** During contraction both half I-bands and A-band disappears.

R : Sarcolemma is a real contractile unit found between two Z-lines.

Q.43 **A :** Mammary glands are apocrine glands.

R : The product of secretion is shed with the whole cell leading to its destruction

Q.44 **A :** Human bone has haversian canals.

R : Haversion canals are interconnected by Volkmann's canal.

Q.45 **A :** In non-keratinished stratified squamous epithelium stratum corneum is absent.

R : Such epithelium occus over surface which are not exposed to drying but are subject to abrasions.

Q.46 **A :** Plasma cells give cart wheel appearance to the nucleus.

R : Nucleus contains peripheral clumps of heterochromatin.

Q.47 **A :** Yellow bone marrow is reserve erythropoietic tissue.

R : After severe bleeding yellow marrow may convert to red marrow.

Q.48 **A :** muscle cells are also called myofibrils

R : muscle cells are very thin and short.

Q.49 **A :** deficiency of proteins lead to poor healing of wounds.

R : plasma proteins immunoglobulins play a major role in the healing of wounds.

Q.50 **A :** smooth muscle fibres do not appear to be striated

R : this is due to regular alternate arrangement of thick and thin filaments in smooth muscle fibre.

Q.51 **A :** non-straited muscles are said to be voluntary in nature.

R : non-straited muscle can be moved according to will.

Q.52 **A :** cardiac muscle have striations and fibre is nucleated and involunlary.

R : intercalated disc form three dimensional network of cardiac muscle fibre.

Q.53 **A :** during contraction both half i-bands and a-band disappears.

R : sarcolemma is a real contractile unit found between two z-lines.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	**Good / Important questions**
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

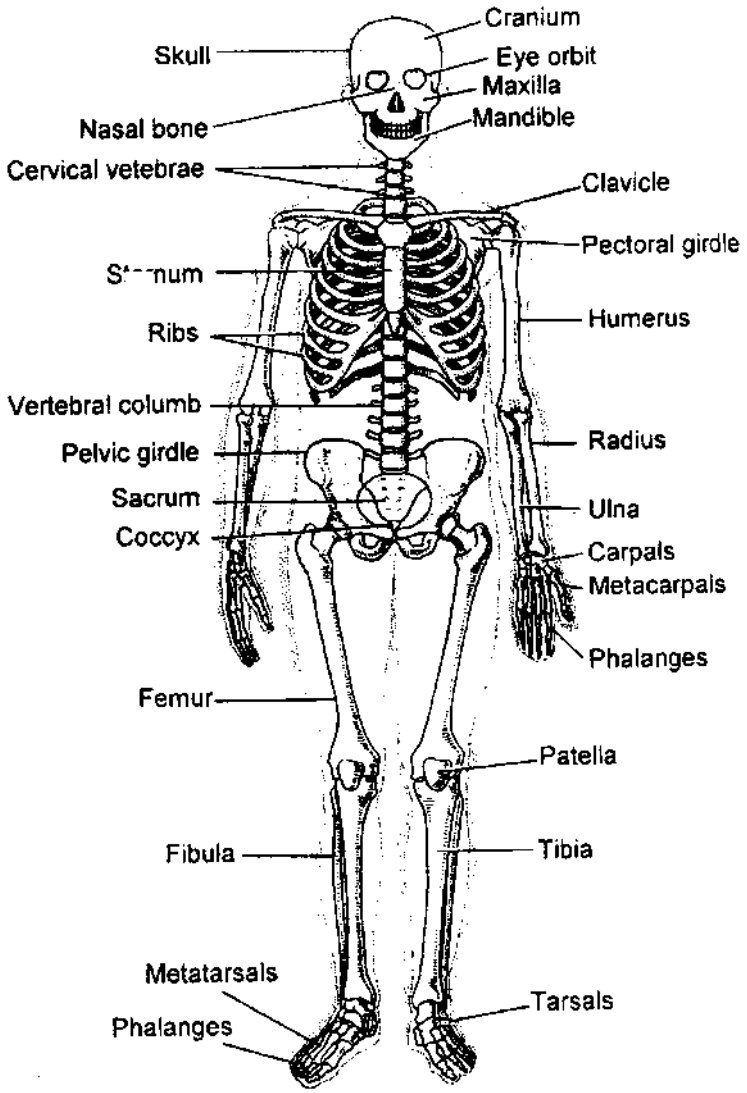
<u>Advantages</u>

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

SKELETAL SYSTEM

DEFINITION AND INTRODUCTION

- The hard protective or supportive part of the animal constitute **skeletal system**.
- Study of skeleton is called **Osteology or Skeletology**.
- Design of the skeleton depends on the animals mode of life.
- Skeleton of different design are needed for the aquatic or terrestrial animals.



Endoskeleton Framework of man

TYPES OF SKELETON

On the basis of location skeleton is of two types-

(1) Exoskeleton

(2) Endoskeleton

1. Exoskeleton

- It is formed by secretion of the skin from epidermis.
- It is always non living.
- It is found in invertebrate as well as vertebrate.
- It is composed of a non-living protein material called **keratin** or **horn**.

Epidermal exoskeleton

- Scales of reptiles are epidermal exoskeleton.
  Exception - Crocodile and Tortoise. (mesodermal in origin)
- Beak, claws, horn hoof, feathers, hairs and nail are epidermal exoskeleton.

Dermal exoskeleton

- Scales of fishes, crocodile and tortoise are dermal exoskeleton.

2. Endoskeleton

- The endoskeleton includes hard parts present inside the body. The bone and cartilage are example of endoskeleton.
- It is always living.
- Some invertebrate like, corals, cuttle fish and Echinodermata also possess endoskeleton.

TOTAL NUMBER OF BONES

In adult total number of bones are	-	206
Axial skeleton	-	80
Appendicular skeleton	-	126
		206

In neonates total number of bones are - 306

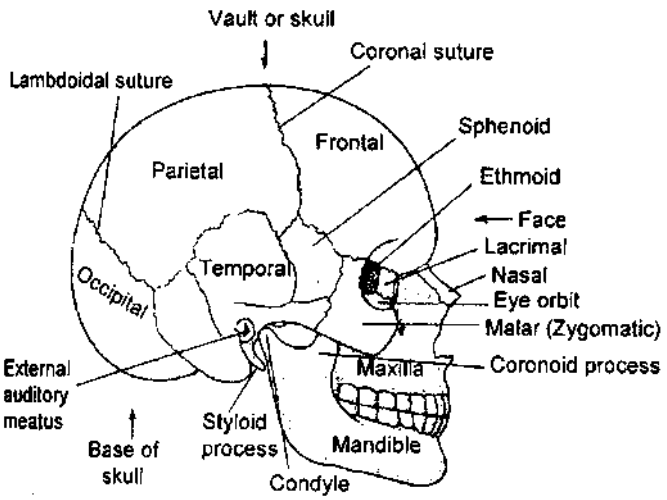
On the basis of the position of skeletal structure in the body Skeleton system is divided into 2 parts-

AXIAL SKELETON

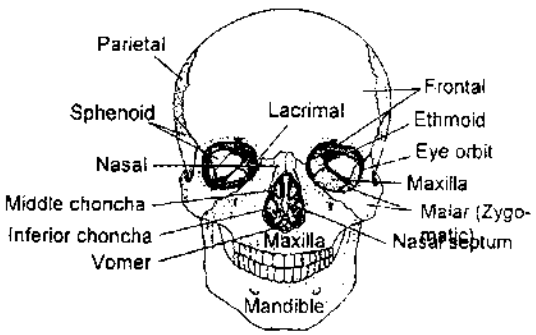
It is present on the median **longitudinal axis of the body**. It consists of -

- Skull
- Ribs
- Sternum
- Vertebral column

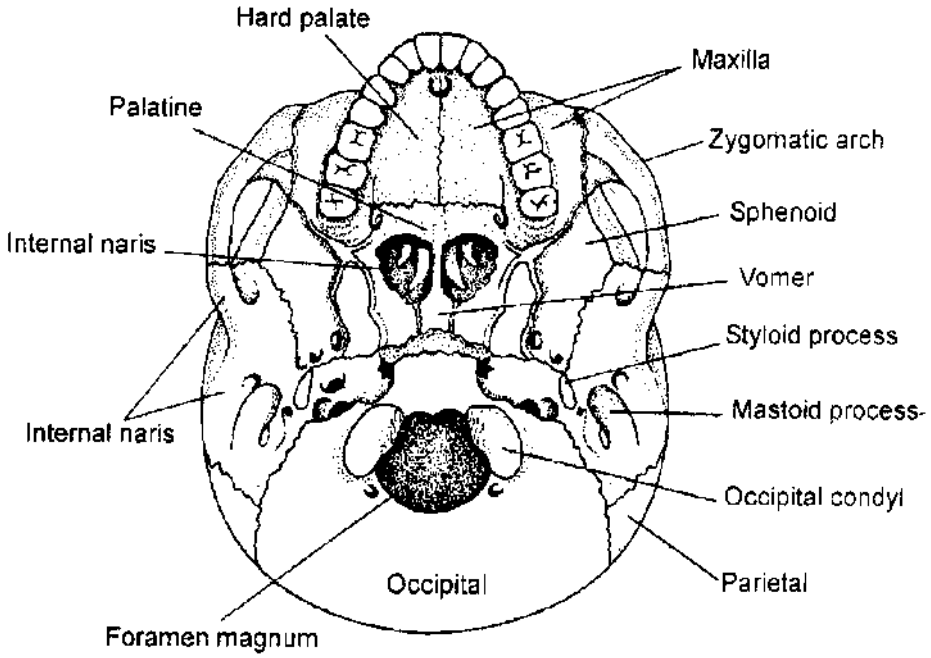
SKULL



HUMAN SKULL VIEWED FROM RIGHT SIDE



HUMAN SKULL VIEWED FROM IN FRONT



HUMAN SKULL VIEWED FROM BELOW

- Skull with two occipital condyles is called dicondylic. Human skull is **dicondylic**.
- Skull is formed of 29 bones.
- In rabbit 53 bones are found in skull.
- Skull is composed of **4 portions**.
  (A) Cranium
  (B) Face
  (C) Hyoid
  (D) Sensory capsule

A. Cranium

- It is also called brain box.
- It is large and hollow round part of skull which encloses and protects the brain in the **cranial cavity**.
- It has large opening **foramen magnum** at the posterior end , through which brain is continuous with spinal cord.
- Cranium is composed of 8 bones, which are as follows :

Frontal	-	1
Parietals	-	2
Temporal	-	2
Occipital	-	1
Sphenoid	-	1
Ethmoid	-	1
		8 bones

- These bones are joined by immovable fibrous joints called **Sutures**.

Coronal Suture lies between frontal and parietal.

Lambdoidal suture lies between parietal and occipital bones.

Sella Turcica - depression in sphenoid bone of skull that lodges pituitary body.

largest foramen - foramen magnun which is present below brain box, through it the spinal chord comes out.

B. Face

Face is composed of 14 bones which are as follows -

Maxillae	-	2
Palatine	-	2
Nasals	-	2
Lacrymals	-	2
Inferior turbinal	-	2
Zygomatic/malar bones	-	2
Vomer	-	1
Maldible	-	1
		14 bones

Note :

Mandible is movable to allow mastication and speech.(Only Movable bone apart from ear ossicles.) In its posterior part a pair of condyle are present which fit in the cavity of temporal bone, so the lower jaw attaches with the cranium. This type of suspension is called craniostylic.

C. Hyoid bone

- It is also called **tongue bone**.
- It is situated in the wall of the upper part of the throat, just above the larynx.

D. Sensory capsule

Ear is surrounded by bony auditory capsules, middle ear has 3 movable ear ossicles

(i) Maleus (Modification of articular bone)

(ii) Incus (Modification of Quadrate bone)

(iii) Stapes (smallest bone of body) modification of Hyomandibular bone.

RIBS

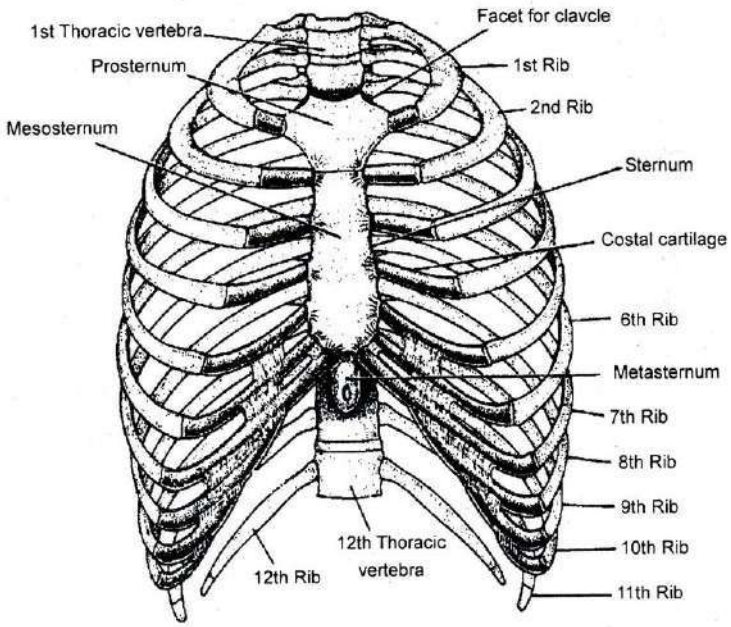
- There are 12 ribs on each side of thoracic cage
- First 7 which are connected throuhg cartilage to the sternum are called **True Ribs.** (Vertebrosternal ribs)
- Remaining 5 are **False Ribs,** out of these cartilage of the 8th, 9th & 10th ribs are joined to the next higher cartilage, 8th, 9th, 10th are called Vertebrochondral ribs. The anterior ends of 11th & 12th ribs are free & are called **floating ribs**.
- **Head -** Has two parts. Lower part articulates with numerically corresponding vertebrae
- While the upper part articulates with higher vertebrae.

Costal Cartilages

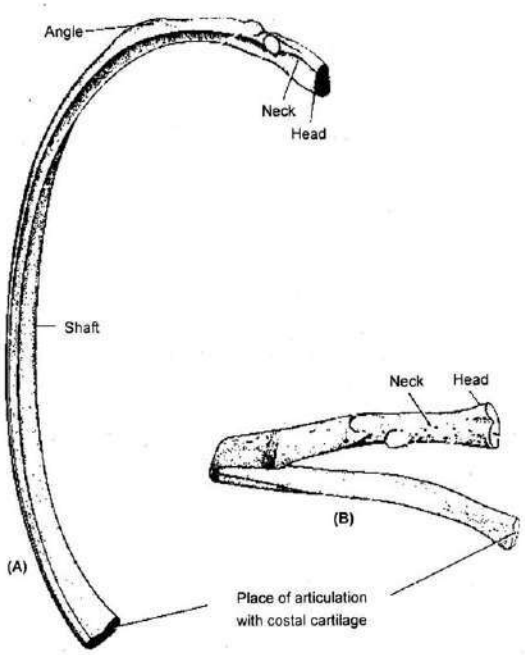
- Unossified anterior parts of ribs made of hyaline cartilage. These contribute to the elasticity of thoracic wall.

- Medial ends of CC of first seven ribs are directly attached to sternum.
- 8th, 9th & 10th CC articulate with one another. The cartilage of 11^{th} & 12^{th} ribs are small. Theri ventral end are free and lie in the muscle of abdominal wall.

Note : Like human in rabbit also 12 pairs of ribs are found.



Bones of thorax (front view)



A typical rib of left side
A - inferior aspect ; B – Posterior aspect

STERNUM

- It is also called **breast bone**.
- It is 15 cm long in man.
- In embryo sternum is made up of a series of bone called **sternebra**. In rabbit there is 7 sternebra while in human there is 3 sternebra.
- It is composed of 3 parts -

Manubrium	- Upper part
Body	- Middle part (It is largest part)
Cartilaginous Xiphoid (Xiphisternum)	- Lower part

Note : Sternum is absent in fishes.

VERTEBRAL COLUMN

General facts

- Presence of vertebral column is characteristic feature of vertebrates.
- It is also called **spinal column** or **backbone**.
- The component of vertebral column are called vertebrae. Vertebrae of man is acoelus (centrum is flat with cavity)
- In between vertebrae pads are found which are composed of fibrocartilage, called **intervertebral pads**.

These pads or disc acts as shock absorber.

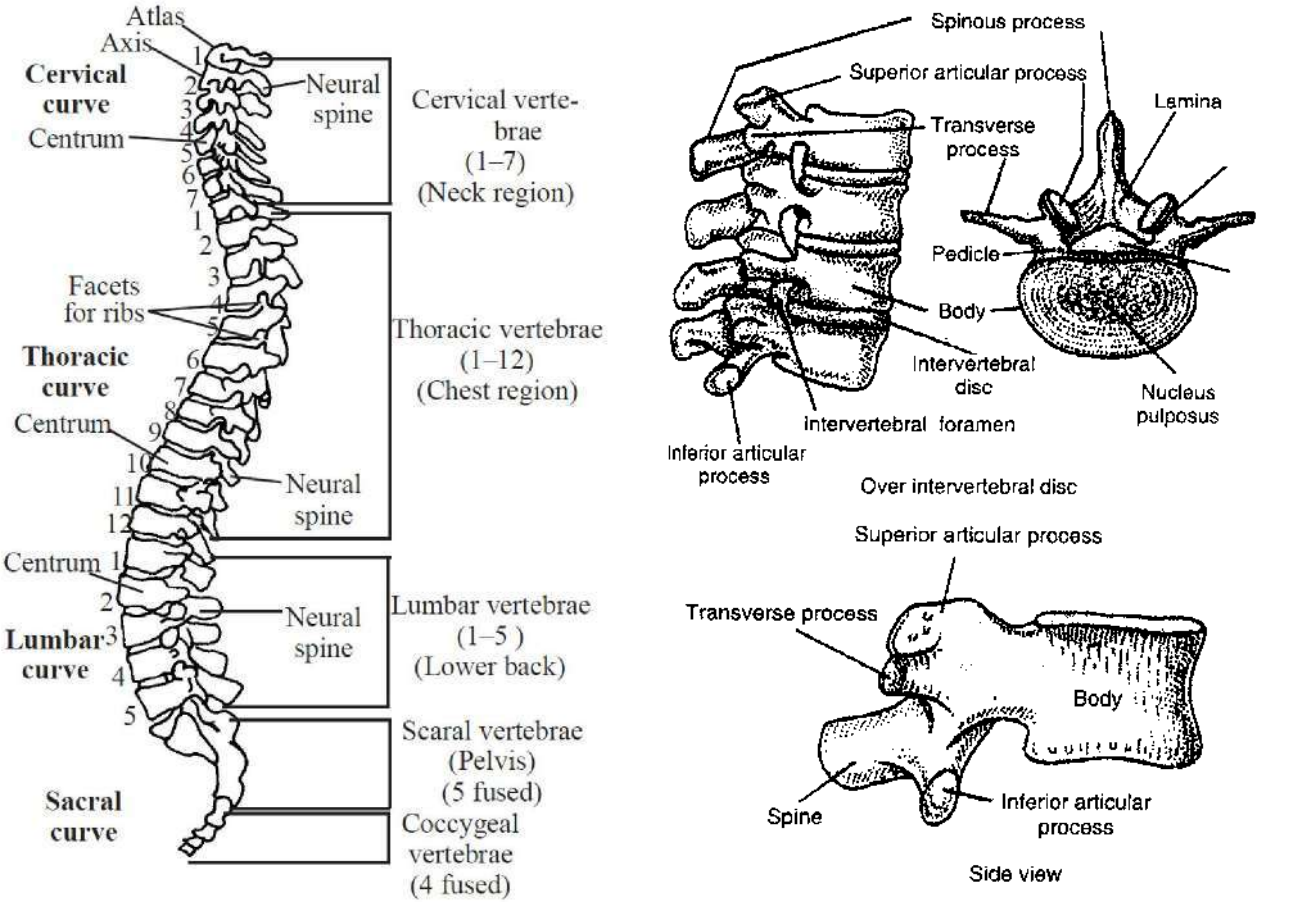


Fig.: Human vertebra with intervertebral foramina

- **Vertebral formula of man**

  The vertebral formula is $C_7T_{12}L_5S_{(5)}Co_{(4)}$ = 33 vertebrae.

- **Vertebral formula of rabbit**

  The vertebral formula is $C_7T_{12}L_7S_4Co_{16}$ = 46 vertebrae.

- **Basic structure of vertebrae**

(i) A vertebrae is typically a bony ring.

(ii) The two main portion of vertebrae is disc like **centrum or body** and **neural arch**.

(iii) Within neural arch a hole is found is called **vertebral foramen**. The vertebral formen of all the vertebrae when intact form a **vertebral canal**, that encloses the spinal cord.

Note :

Centrum of man is flat with no cavity, such centrum is called **Acoelus** or **Amphiplatyn**.

- **Functions of vertebral column**

(i) It encloses and protects the spinal cord.

(ii) It carries the weight of the body.

(iii) It helps in upright posture and locomotion.

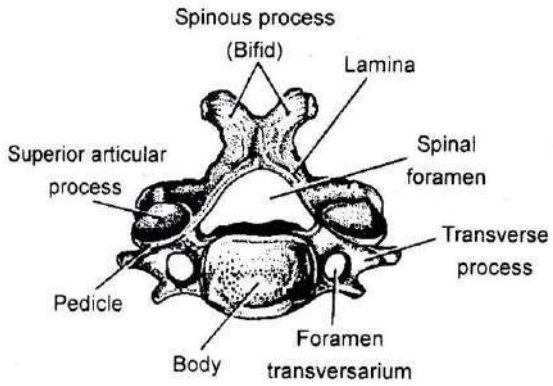
(iv) It helps in free movement of the head.

Groups of vertebrae

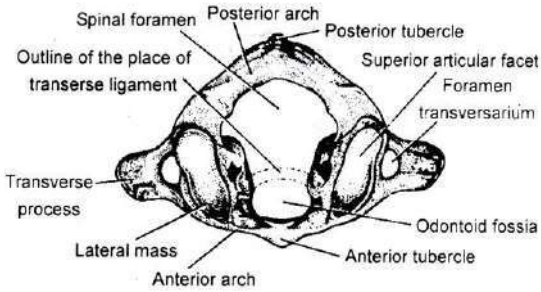
The vertebrae of vertebral column can be put in 5 groups, according to their location, which are as follows-

1. Cervical vertebrae

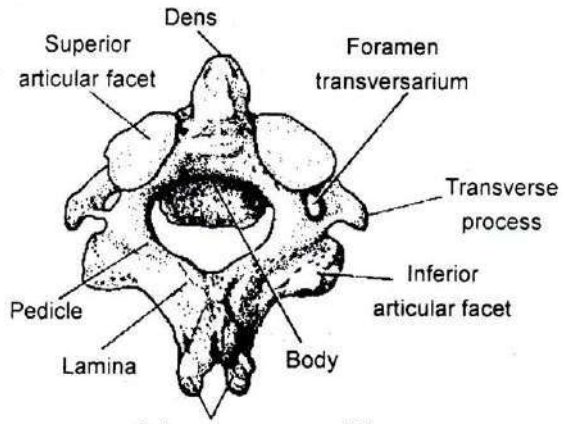
- Cervical vertebrae are present in neck.
- They are 7 in number. In most mammal number of cervical vertebrae is 7



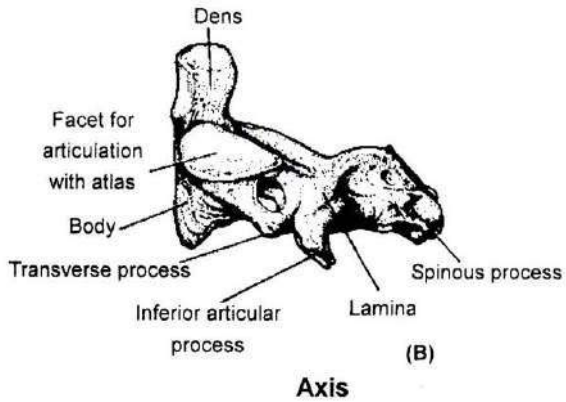
A typical cervical vertebra (superior aspect)



ATLAS



Axis



Axis

- All cervial vertebrae have apertures in their transverse process (**Foramina transversalis** which form vertebraterial canal on either side for vertebral artery to pass through to supply brain & posterior spinal cord).
- **C_1 & C_2** = Atypical, **C_3 to C_7 =** typical
- **Atlas : -** Transverse process are wing like, centrum is absent, Ring like.
- Neural arch of this vertebrae is divisible in 2 parts with a ligament. In the upper part of the ligament, Spinal cord is present. In lower part odontoid fossa is present in which odontoid process of axis is fitted to make pivot joint. (Also called as median atlanto axial joint)
- On each surface of atlas a pair of articular process are present. The upper pair articulates with condyle of skull to form Rt & Lt Atlantooccipital joints.
- Lower pair articulates with superior Articular process of axis to make Rt & Lt **Lateral atlanto axial joints.**
- Axis : C_2 - Centrum is present. At anterior surface of centrum a long odontoid process is present which fits into odonotoid fossa of atlas vertebrae.
- Only C_7 has demifacets where upper part of head of 1st Rib articulates.

Note : Cervical vertebrae are 7 in all mammals is despite of long or small neck.

2. Thoracic vertebrae

- Thoracic vertebrae are present in chest.
- They are 12 in number.
- Presence of costal demifacets helps in their identification

3. Lumbar vertebrae

- Lumbar vertebrae are present in the abdomen.
- They are 5 in number.
- Lumbar vertebrae are largest and heaviest.

4. Sacral vertebrae

- They are 5 in number.
- The 5 sacral vertebra fuse to form single bone.

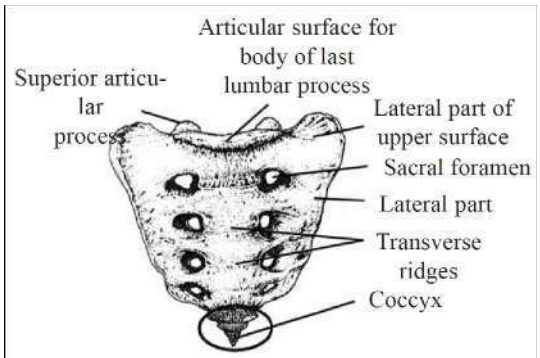


Fig.: Sacrum of man

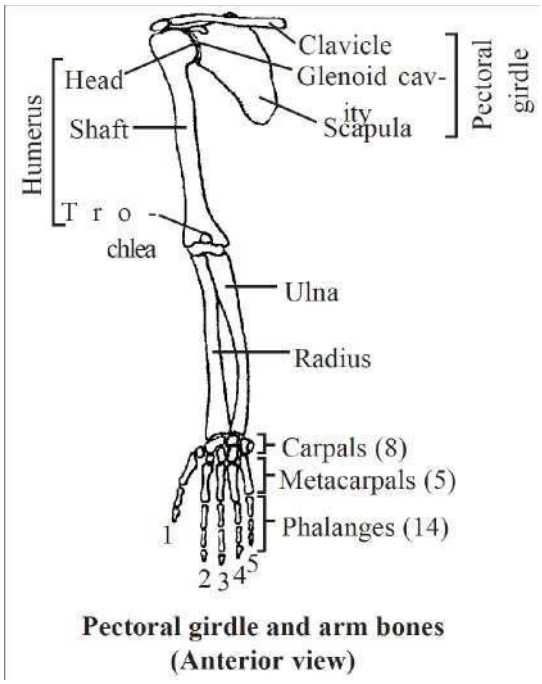
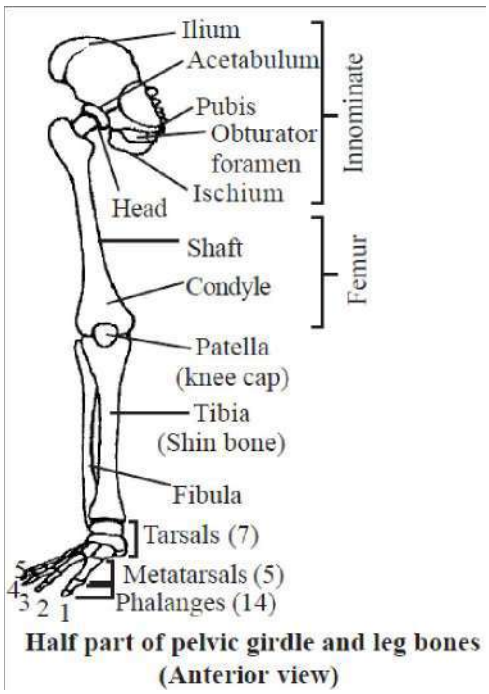
5. Coccygeal vertebrae

- These are 4 in number.
- The 4 vertebrae fuse to form curved and triangular bone, called the **coccyx** or **tail bone**.

APPENDICULAR SKELETON



Pectoral girdle and arm bones (Anterior view)



Half part of pelvic girdle and leg bones (Anterior view)

It is situated at lateral sides which extends outward from the principle axis. It is of composed of -

– Girdle bones
– Limb bones

- **Girdle bones**

These are of 2 types-

(A) Pectoral girdle (B) Pelvic girdle

(A) Pectoral girdle

Pectoral girdle is formed of two bones **clavicle** and **scapula**.

Clavical is also called collar bone.

Scapula is also called shoulder bone or shoulder blade. It is flat and triangular structure present at the back of shoulder.

At the junction of clavical and scapula a depression is found in the scapula called **glenoid cavity**.

In a glenoid cavity head of humerus fits to form shoulder joint.

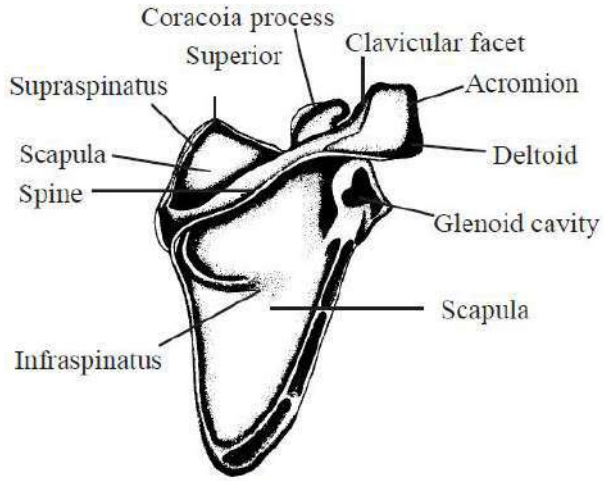


Fig. Scapula-Pectoral Girdle

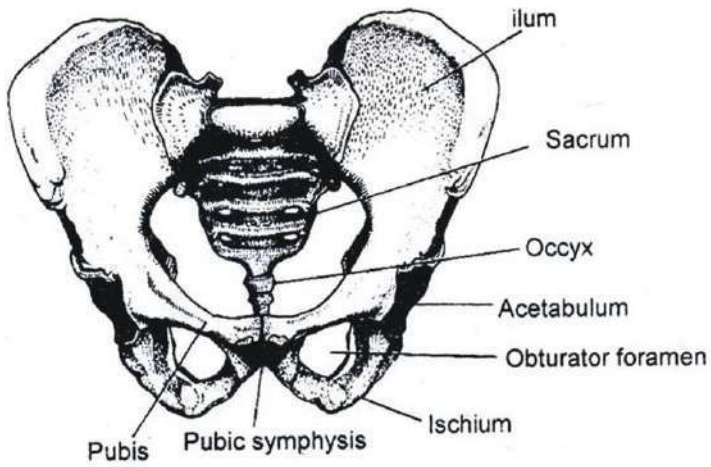
(B) Pelvic girdle

- It is also called hip girdle.
- It is composed of 3 bones, which are as follows-

Ilium	-	Upper side
Pubis	-	Inner side
Ischium	-	Below the pubis

- At the junction of these 3 bones, a depression is found. Which is called **acetabulum**.

  Femur fits in acetabulum to form hip joint.
- The pelvic girdle of female are broader than male.



Human pelvis from anterior aspect

- **Limb Bones**
  - **Bones of fore limb**

In each fore limb total 30 bones are found-

Upper arm	-	Humerus	-	1
Fore arm	-	Radius (outer) ulna (inner)	-	2
Wrist	-	Carpals	-	8
Palm	-	Metacarpals	-	5
Fingers	-	Phalanges	-	14
				30

Phalangeal formula for human hand is 2,3,3,3,3.

The Humerus

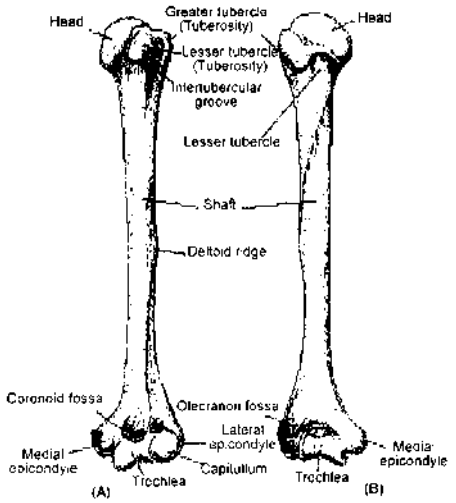
- Head : It articulates with the glenoid cavity of scapula to form shoulder joint.
- Deltoid ridge : Elevated rough part on the shaft here deltoid muscle is attached.
- Lower end : Articulated laterally with radius & medialy with ulna
- Coronoid fossa : depression just above the anterior aspect of trochlea. It accomodated the Coronoid process of ulna when elbow is flexed.
- Olecranon fossa : It accomodatee the olecranon process of ulna when Elbow is extended.

The Radius & Ulna

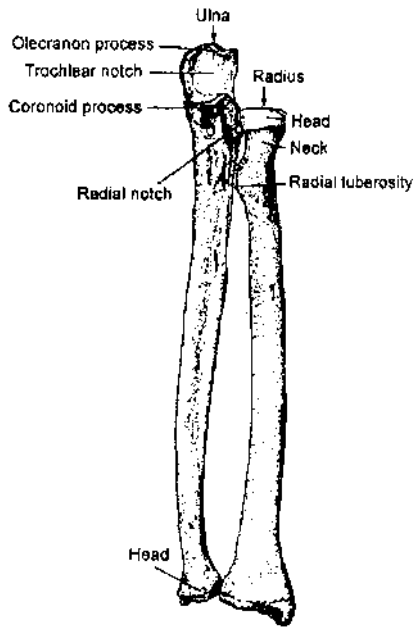
- **Radius :** Its head is disc shaped, covered with hyaline cartilage. it's superior concave surface articulates with the capitulum of humerus at the elbow joint.
- Circumference of head is also articular, it fits into socket formed by the radial notch of the ulna to form radioulanar joint.
- Olecranon process : Projects upwards from shaft of ulna. It is responsible for making elbow joint hinge.

Carpal Bones

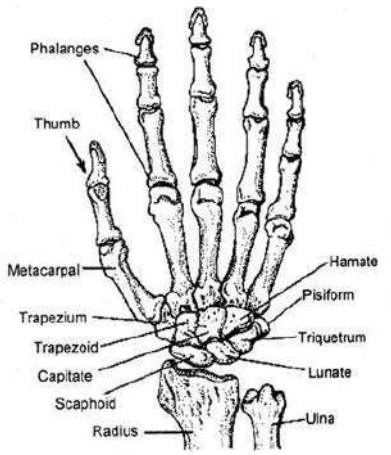
- Proximal Row : From lateral to medial - Scaphoid, lunate, triquetrum, pisciform
- Distal Row : Trapezium, trapezoid, capitate, Hammate.
- **Metacarpal bones :** 5 bones, numbered lateral to medial.
- **Phalanges :** There are 14 phalanges in each hand. 3 for each finger & for the thumb.



Left humerus from anterior (A) and posterior (B) aspects



Bones of left forearm (anterior aspect)



Bones of right hand and wrist

Bones of hind limb

In each hind limb total 30 bones are found.

Thigh	-	Femur	-	1
Shank	-	Tibia (inner)	-	2
		Fibula (outer)		
Ankle	-	Tarsals	-	7
In step	-	Metatarsal	-	5
Toes	-	Phalanges	-	14
Knee joint	-	Patella (Knee cap)	-	1
				30

Femur

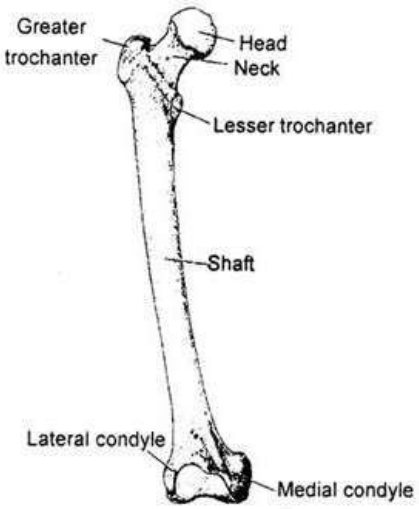
- Strongest heaviest and largest bone
- Articulates with acetabulum to form the hip joint.
- Lower end of femur is widely expanded to form two large condyles, one medial & one lateral.
- **Greater and lesser trochanter** are rough projections to provide attachement to muscles.

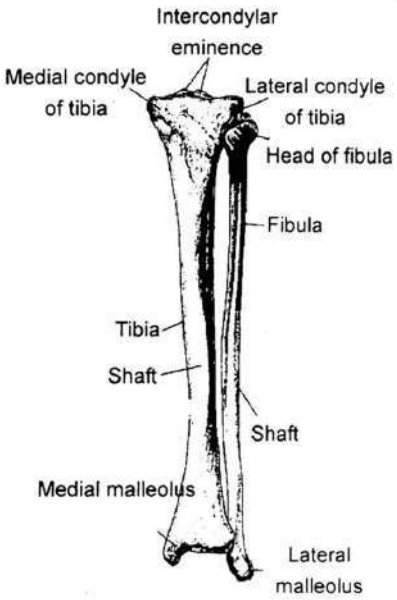
Tibia

- Medial & larger bone of the leg.
- **Upper end :** Expanded from side to side fo from two large condyles.
- **Medial condyle :** Its superior surface articulates with medial condyle of femur.
- **Lateral condyle :** Superior surface of condyle articulates with lateral condyle of femur.

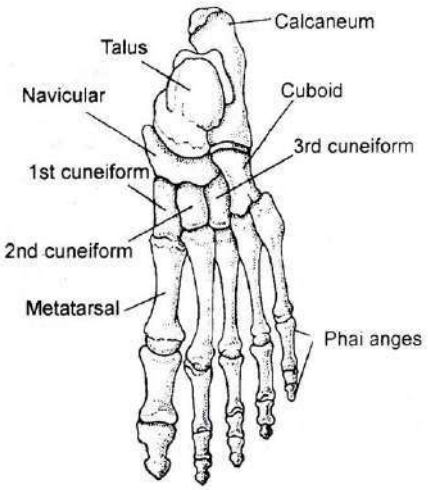
Fibula

- Lateral & smaller bone of the leg.
- Its upper end articulates with the lateral condyle of tibia.





Left tibia and fibula (anterior aspect)



Bones of left foot (Upper aspect)

Tarsus

- Tarsus is made of seven tarsal bones arranged in two rows.
- **Proximal row :** Talus above, Navicular in between and Calcaneum below. Tarsal bones are larger & stronger than carpal bones becuase they have to support & distribute body weight.

  Talus is second largest tarsal bone, lies between tibia above & calcaneum below.

  Calcaneum : Largest tarsal bone, forms the prominence of heal.
- **Distal row :** Four tarsal bones lying side by side (three cuneiform and one cuboid)

Meta tarsus

- Made of 5 meta tarsal bones which are **numbered medial to lateral.**

Phalanges

- 14 Phalanges, 2 for great tow & 3 each for each othe four toes.
- As compared to Phalanges of hand these are small in size.
- Phalangeal formula for human foot is 2, 3, 3, 3, 3.

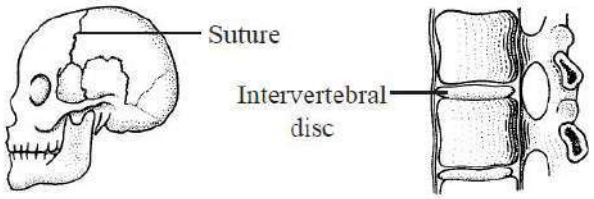
JOINTS

Study of joints is called **Arthrology**.

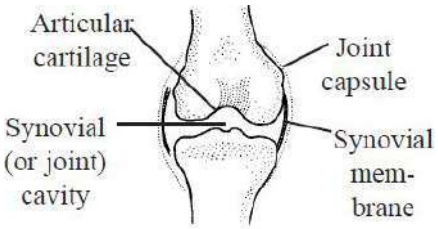
Types of joints

Joints are mainly of 3 types-

1. Immovable or fibrous joints / Synarthroses
2. Slightly movable or cartilaginous joints / Amphiarthroses.
3. Freely movable or synovial joints/Diarthroses



Synarthroses Amphiarthroses



Diarthroses

- **Structural Classification :**

(A) Fibrous joints (Immovable) : Also called as Synarthrosis.

(i) Sutures : Eg. Skull

(ii) Syndesmosis : Bones are connected by interosseus ligament e.g. inferior tibio fibular joints.

(iii) Gomphosis : (Peg & Socket) – e.g. tooth in its socket

(B) Cartilagenous joints (Slightly movable) : also called as amphiarthrosis

(i) **Primary :** hyaline cartilage joints (synchondrosis). After certain age the cartilage is replaced by bone e.g. jointbetween Epiphysis & Shaft.

(ii) **Secondary :** (Symphysis) fibro cartilagenous joints. Articular surface are covered by a thin layer of hyaline cartilage & united by a disc of fibro cartilage. there joint are persistant throughout life. e.g. Symphysis pubis, intervertebral joint.

(C) Freely movable or Synovial joint : also called as **diarthrosis**.

- The ends of both the bones are covered by **hyaline cartilage or articular cartilages**.
- The cartilage provides smooth and elastic surface and reduce friction and acts as shock absorber.
- In between two bones a space is found called **synovial space or cavity**. This space provides free movement to the bone.
- The synovial cavity is lined by a synovial membrane. Synovial membrane contains secretory cells. Synovial membrane secrete or fluid called **synovial fluid.**

  Synovial fluid lubricates and nourish the joints.

- **Type of Synovial joints : (Most mobile) :**

(a) **Plain synovial or gliding joint :** Permit slight gliding movement e.g., joint between articular processes of vetebrae and joints between Carpals.

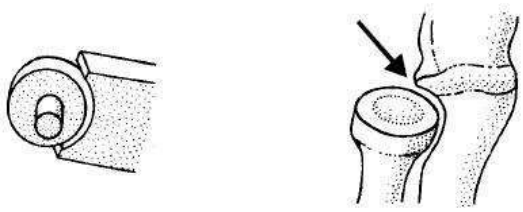
(b) **Hinge joint :** Movements are permitted in one plane around transverse axis e.g. elbow, ankle, intephalangeal joint.

Hinge joints

(c) **Pivot joint :** Articular surfaces comprise of

- a central bony pivot

- surrounded by osteoligamentous ring movement are permitted in one plane around vertical axis. e.g. radioulnar joint, median atlanto axial joint.

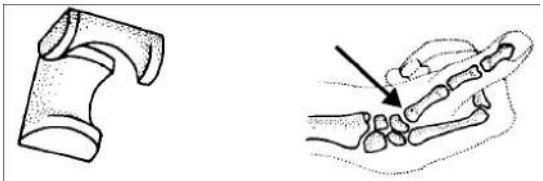


Pivot or rotating joints

(d) **Condylar joint :** Articular surface include two distinct condyles and movement are permitted in both transverse & vertical axis. Rt & left jaw joint.

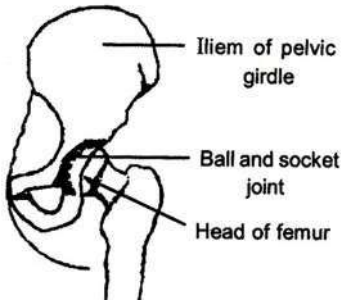
(e) **Ellipsoid joint :** e.g. wrist, Metacarpophalengeal joint. movement are permitted in both axis, but articular surfaces are not in form of condyles.

(f) **Saddle joint :** Articulating surface are reciprocally concavo convex. these are improperly developed ball & socket joints e.g. first carpometacarpal joint and calcaneocuboid joint.



Saddle joints (Biaxial joints)

(g) **Ball & socket joint :** Here one articular surface is like a ball and other of the shape of socket and movements are possible around infinte axises. e.g. shoulder & Hip joint.



ROLE OF MUSCLES AND BONES IN MOVEMENT

(i) Movement of an organ occurs due to the pulling of the bones caused by force generated due to contraction in muscles. Movements take place along the joints which act as fulcrum of the lever.

(ii) Three types of lever functioning can be observed in movements of human joints .

(A) Class I lever : Here Fulcrum is between effort & resistance.

Example : Joint between the first vetebra (ATLAS) and occipital bone of skull.

Fulcrum : is the joint

Effort : is contraction of back muscles.

Resistance : Weight of the facial bone of skull.

(B) Class II lever : Here resistance is between effort Y fulcrum.

Example : Human body restingh on toe.

Fulcrum : Is the toe

Effort : Is contraction of calf muscle.

Resistance : Is body Weight.

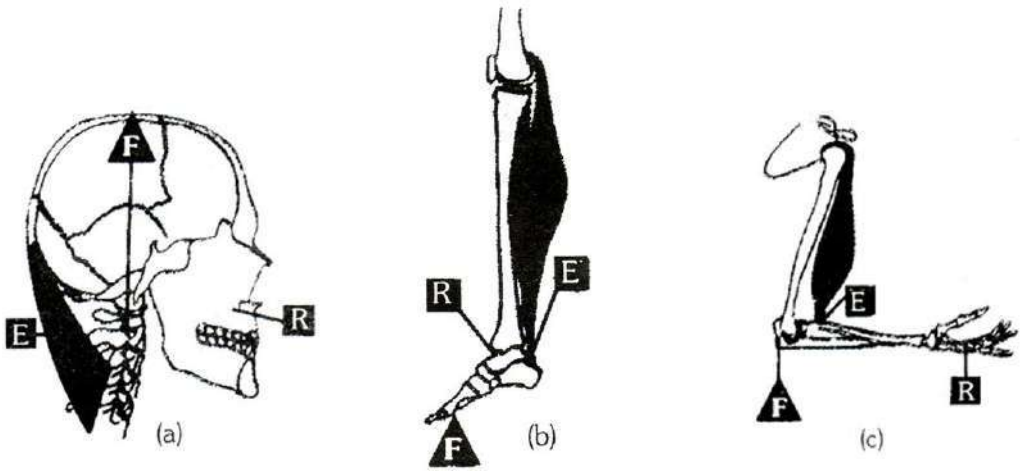
(C) Class III lever : Here effort is between resistance and fulcrum.

Example : Flexing movement of the elbow of forearm.

Fulcrum : Is the elbow joint.

Effort : Is contraction in Bicep muscle.

Resistance : Weight of distal part of hand.



SKELETAL DISORDER

(i) **Dislocation :** It is displacement of bone from their normal position at joint.

(ii) **Slipped disc :** It is displacement of intervertebral fibrocartilage disc or vertebrae from their normal position.

(iii) **Sprain :** It is stretching or tearing of tendons or ligaments.

(iv) **Osteitis or Osteomyelitis :** It is inflammation of bone.

(v) **Spondylitis :** It is inflammation of one or more vertebrae.

(vi) **Osteoporosis :** It is excessive loss of calcium and phosphorus from the bone.

(vii) **Rickets :** In this disease bones of leg get curved bowlegs, It is due to deficiency of **vitamin D**.

CHARACTERISTICS OF FEMALE'S SKELETON

(i) Skull - Female skull is lighter in comparison to male.

(ii) Shoulders - Female shoulder's are narrower.

(iii) Sacrum - Female sacrum is shorter and wider.

(iv) Pelvis - Female pelvis is lighter and broader.

(v) Pelvic cavity - The female cavity is wider in diameter to accommodate the growing foetus during pregnancy and to facitilate the child birth.

(vi) Coccyx : Female coccyx is more movable than male coccyx.

TYPES OF BONES (ON BASIS OF SHAPE AND SIZE)

(i) Long bones

e.g. Humerus, Radius, Ulna, Tibia fibula, Femur.

(ii) Short bones

e.g. Carpals and tarsals.

(iii) Flat bones

e.g. Skull bone, sternum and ribs.

(iv) Irregular bones

e.g. Ear ossicles and vertebrae.

(v) Sesamoid bones

e.g. Patella (knee cap)., pisciform

SPECIAL POINTS

(i) The bones of a children have large amount of organic matter, so, their bones are very flexible and less likely to break. (hence they may undergo green stick fracture)

(ii) In frog tibiofibula is the longest bone.

(iii) Bones formed by ossification in cartilages is called **replacing bone** e.g. Humerus, femur. (cartilagenous bones)

(iv) Bones formed by ossification in the dermis and sink to get attached over the cartilages. e.g. Frontals and parietals is called **investing bone** of the skull.(Dermal bones or membranous bones)

(v) Bones formed by ossification in the tendons at the joint is called **sesamoid bones** e.g. **Patella**.

(vi) Skull of reptiles and birds possess one occipital condyles so the skull is called **monocondylic,** skull of amphibians and mammals possess two occipital condyles, so the skull is called **dicondylic**.

(vii) Os penis : A bone supporting the penis of bats is called os penis.

(viii) Os cordis : A bone supporting the heart of cattle is called oscordis.

(ix) The end of two bones are connected by ligaments. While a muscle atlaches with bone through tendon.

(x) **Procoelous** - Centrum concave anteriorly but convex posteriorly 2^{nd} to 7^{th} vertebrae of frog. All reptilian vertebrae are procoelous.

Amphicoelous - Centrum concave on both sides. 8^{th} vertebrae of frog is amphicoelous.

Acoelous - Centrum remain flat. 9^{th} vertebra of frog is acoelous.

Heterocoelous - Centrum partly convex and partly concave on both sides.

Vertebrae of birds are heterocoelous.

Coeloplatyn vertebrae - Centrum concave anteriorly but flat posteriorly.

Platycoelous vertebrae - Centrum flat anteriorly but concave posteriorly.

(xi) In Avian skull sutures remains absent.

(xii) **Weberian ossicles -** These are modified in vertebrae in cat and fishes. These help in sound production by connecting air bladder and internal ear.

(xiii) Like mammals amphibian skull is also **dicondylic**.

Skull of reptiles and aves are **monocondylic**.

(xiv) The pelvic girdle of birds is attached to a complex structure formed by the fusion of last thoracic all lumbar and first five caudal vertebra this structure is called **synsacrum**.

(xv) Talus in Rabbit is called as Astragalus.

(xvi) Weberian ossicles are found in fishes.

(xvii) Fontanelles are temporary apertures present in the skull of a new born baby.

(xviii) Superior and inferjor articular processes of vertebrae are also called as pre and post zygapophysis respectively.

(xix) In rabbit elbow and knee joints are also called ginglymoid joints.

(xx) Cnenial crest is a ridge found is Tibia of Rabbit.

(xxi) Trochlear notch of Rabbit is also called as sigmoid notch.

(xxii) Zygomatic arch of rabbit is formed of maxilla, squamosal and jugal bone.

(xxiii) Pelvic girdles are made of two hip bones which are also called as Innominates.

(xxiv) Dentary is a membranous bone found in the lower jaw of same vertebrates like frog.

(xxv) Jaw suspension of mammals is craniostylic.

(xxvi) Pterygoid bone is a wing shaped extension of sphenoid bone in Rabbit's skull.

(xxvii) Movement of hands while walking occurs for balancing.

(xxviii) A small sessamoid bone Fabella often develops in the tendon of lateral haed of gastromenius muscles behind the knee joint.

DISORDERS OF BONES

1. Arthritis

It is caused by the inflammation of the joints. This of several types, e.g., **rheumatoid arthritis, osteoarthritis** and **gouty arthritis**.

(A) The Rheumatoid Arthritis

(Rheum = Watery secretion of the body) It is diagnosed by the presence of rheumatoid factor (a type of immunoglobulin IgM).

- It is the primary symptom of inflammation of synovial membrane.
- If it is left untreated, then the membrane thickens and synovial fluid increases, exerting pressure that causes pain.
- The membrane then starts secreting abnormal granules, called **pannus**, which after accumulating on the surface of the cartilage, cause its erosion.
- As a result, the fibrous tissues are attached with the bones and become ossified, making the joints immovable.

(B) Osteoarthritis

It is a degenerative joint disease characterised by the degeneration of the articular cartilage and proliferation of new bones. Usually, afflicted joints are of spine, knees and hands.

(C) Gouty Arthritis or Gout

It is caused either due to excessive formation of uric acid, or inability to excrete it. It gets deposited in joints as monosodium salt.

Treatment – Reduction of pain and inflammation by heat treatment and physiotherapy and, in extreme cases, replacement of the damaged joints. Traditionaly the toxin of honey bee is also used.

2. Osteoporosis

- It is an age-dependent systemic disorder characterised by low bone mass, microarchitectural deterioration of the bone, increased fragility and proneness or susceptibility to fracture.
- The elderly men and women are most susceptible.
- It may occur in a pregnant woman, In individuals under prolonged treatment of cortisone, the skeleton fails to withstand the stress of the body and bones are easily fractured.
- Imbalances of hormones like thyrocalcitonin, parathyroid and sex-hormones, deficiencies of calcium and vitamin D, menopause are the major causative factors.

IMPORTANT POINTS OF FROG SKELETON SYSTEM

1. Total number of bones in frog are 150.
2. Total number of skull bones are 30.
3. Skull of frog is dicondylic.
4. In frog, ribs are absent.
5. In frog, sternum is associated with pectoral girdle.

6. In frog, pectoral girdle is formed of episternum (cartilage), xiphisternum (cartilage) omosternum (bone) mesosternum (bone).
7. Half of the pelvic girdle of frog is osinnominatum. Each os-innominatum is formed of ilium, pubis and ischium.
8. Forelimb of frog includes humerus, radioulna, carpels, metacarpels and phalanges. Phalanges formula of hand is **02233**.
9. Hindlimb of frog includes. Femur, Tibia fibula, Astragalus, calcaneum and bones of foot.

Note :

In frog, largest and longest bone is **tibia fibula**.

Digital formula for foot in frog is 22343.

Vertebral column of frog is composed of 10 vertebrae 10th vertebrae is called **urostyle**.

EXERCISE - 1

Q.1 Part of pectoral girdle is :-
(1) Ileum (2) Glenoid cavity
(3) Acetabulum (4) Sternum

Q.2 Cervical vertebra is differentiated from other vertebra by :-
(1) Presence of odontoid
(2) Presence of transverse process
(3) Amphi platyan centrum
(4) Presence of vertebrarterial canal

Q.3 Bone of lower jaw of mammal :-
(1) Dentary (2) Jugal
(3) Both
(4) Dentary, Jugal & angulo. splenial

Q.4 Exoskeleton of rabbit have :-
(1) Hair (2) Hair & Hoof
(3) Hair & Claws (4) Hair+Claws+Hoof

Q.5 Humerus is different from femur by presence of:-
(1) Spines (2) Deltoid Ridge
(3) Glenoid cavity (4) Vertebral column

Q.6 Scapula part of :-
(1) Skull (2) Pelvic Gridle
(3) Pectoral Girdle (4) Vertebral column

Q.7 Obturator foramen present between :-
(1) Ilium & Ischium (2) Ischium & Pubis
(3) Ilium & pubis (4) None

Q.8 Long neck of Girraffe or camel due to :-
(1) More number of cervical vertebra
(2) More length of cervical vertebra
(3) Presence of muscular pads between cervical vertebra
(4) Presence of extra bony plates

Q.9 Strongest bone is -
(1) Tibia (2) Femur
(3) Humerus (4) Ulna

Q.10 Number of tarsal bone in ankle of rabbit :-
(1) 2 (2) 7
(3) 6 (4) 5

Q.11 Heel bone of rabbit :-
(1) Central (2) Meso cuneiform
(3) Ecto cuneiform (4) Calcaneal process

Q.12 Sesamoid bone of knee :-
(1) Patella
(2) Patella & Two fabellae
(3) Fabellae (4) Pisiform

Q.13 Cnemial crest part of :-
(1) Fibula (2) Tibia
(3) Femur (4) Calcaneum process

Q.14 Number of bone present 1^{st}, 2^{nd}, 3^{rd} rows of tarsals:-
(1) 2,2,1 (2) 2,3,1
(3) 2,1,3 (4) 1,2,3

Q.15 Sacro-iliac joint is:-
(1) Movable (2) Immovable
(3) lmpefect (4) None

Q.16 Which bone does not participate in formation of acetabulum:-
(1) Pubis (2) Ilium
(3) Ischium (4) None

Q.17 In Rabbit bone present between the pubis & acetabulum:-
(1) Cotyloid (2) Scapula
(3) Astragalus (4) Cuboid

Q.18 Supra trochlear fossa present:-
(1) Humerus of frog (2) Humerus of rabbit
(3) Radius of rabbit (4) Radius of frog

Q.19 Trochlea of which bone fit in sigmoid notch of ulna:-
(1) Humerus (2) Radius
(3) Femur (4) Scaphoid

Q.20 Acromian-process present in:-
(1) Pectoral girdle of frog
(2) Pectoral girdle of rabbit
(3) Pelvic girdle of rabbit
(4) Pelvic girdle of frog

Q.21 Shoulder joint present between:-
(1) Glenoid cavity of pectoral girdle &head of humerus
(2) Coracoid process of pectoral girdle & head of humerus
(3) Both
(4) None

Q.22 Number of vertebra present in frog man & rabbit-
(1) 10,12,24 (2) 10,33,46
(3) 10,33,40 (4) 10,26,33

Q.23 Typical vertebra of rabbit is :-
(1) Acoelous (2) Procoelous
(3) Amphicoelous (4) Amphiplatyan

Q.24 Feature of vertebra of mammals :-
(1) Centrum is amphi platyan
(2) Epiphysis present
(3) Inter vertebral disc present between two bone
(4) All the above

Q.25 Typical vertebra of rabbit is :-
(1) Cervical (2) Lumbar
(3) Sacral (4) Caudal

Q.26 Demifacets present at :-
(1) Thoracic vertebra (2) Lumbar vertebra
(3) Sacral vertebra (4) Cervical vertebra

Q.27 False rib in man is :-
(1) 8^{th} 9^{th} & 10^{th} rib (2) 7^{th} 8^{th}, 9^{th} rib
(3) 9^{th}, 10^{th} & 11^{th} rib (4) 6^{th} , 7^{th} & 8^{th} rib

Q.28 False ribs in rabbit:-
(1) 9^{th} & 10^{th} rib (2) 8^{th} & 9^{th} rib
(3) 8^{th} , 9^{th} & 10^{th} rib (4) 6^{th},7^{th}, 8^{th} rib

Q.29 Types of orbit in rabbit :-
(1) Tropo basic (2) Platy basic
(3) Both (4) None

Q.30 Middle ear of rabbit present in:-
(1) Prooptic bone (2) Tympanic bulla
(3) Peri-otic bone (4) Peri-optic bone

Q.31 Number of cartilagenous bone present around the foramen of magnum :-
(1) 2 (2) 4
(3) 3 (4) 2

Q.32 Type of suspension in lower jaw of rabbit:-
(1) Craniostylic (2) Auto stylic
(3) Both (4) None

Q.33 Number of bone present in skull of rabbit frog respectively:-
(1) 53+40 (2) 53+46
(3) 46+53 (4) 33+46

Q.34 Example of endo skeleton is:-
(1) Spicule of sponge
(2) Calcified plate in some mollusca
(3) Calcified plate in some echinodermata
(4) All the above

Q.35 Number of bone in axial skeleton of rabbit :-
(1) 132 (2) 128
(3) 80 (4) 126

Q.36 Total number of bones in rabbit :-
(1) 260 (2) 206
(3) 306 (4) 132

Q.37 Number of membranous bone present in each half of upper jaw :-
(1) 3 (2) 4
(3) 5 (4) 6

Q.38 Incisor present in which bone :-
(1) Premaxilla (2) Maxillae
(3) Palatine (4) None

Q.39 Cheek teeth present at :-
(1) Premaxilla (2) Maxillae
(3) Palatine (4) None

Q.40 Hard palate consist of :-
(1) Premaxilla (2) Maxillae
(3) Palatine (4) None

Q.41 Type of bone present in lower jaw of rabbit :-
(1) Cartilagenous (2) membranous
(3) Sesamoid (4) None

Q.42 Teeth are not present in which bone :-
(1) Premaxilla (2) Vomer
(3) Maxilla (4) Dentary

Q.43 Zygomatic arch compose of :-
(1) Jugal (2) Maxillae
(3) Squamosals (4) All the above

Q.44 Frontal segment in rabbit consist of :-
(1) Frontal bone (2) Pre sphenoid
(3) Orbito sphenoid (4) All the above

Q.45 Parietal segment in rabbit consist of :-
(1) Parietal & Periotic
(2) Basi sphenoid & Ali sphenoid
(3) Tympanic & inter parietal
(4) All the above

Q.46 Occipital segment consist of :-
(1) Supra occipital & Basioccipital
(2) Para occipital & Ex-occipital
(3) Both
(4) Basisphenoid & Alli sphenoid

Q.47 Membranous bone present in upper jaw :-
(1) Premaxillae & maxilla
(2) Palatine & jugals
(3) Pterygoid & squamosal
(4) All the above

Q.48 Hinge joint is :-
(1) Elbow joint
(2) Ankle joint
(3) Inter phalangeal joint
(4) All

Q.49 Pivot joint ;-
(1) At lanto. Axial joint (2) Shoulder joint
(3) Hip joint (4) None

Q.50 Study of joint known as :-
(1) Osteology (2) Arthrology
(3) Craniology (4) Kinesiology

Q.51 The skull of frog and Rabbit are -
(1) Dicondylic (2) Monocondylic
(3) Tricondylic (4) Tetracondylic

Q.52 Study of skeleton is called -
(1) Endoskeleton (2) Osteology
(3) Exoskeleton (4) Osteoblast

Q.53 Coracoid bone is found in-
(1) Pectoral girdle of rabbit
(2) Pectoral girdle of man
(3) Pectoral girdle of frog
(4) Forelimb of rabbit

Q.54 The total number of bones in upper arm is -
(1) 35 (2) 32
(3) 30 (4) 40

Q.55 The total number of bones in axial skeleton of adult human and rabbit are -
(1) 90,130 (2) 80,132
(3) 100,120 (4) 81,131

Q.56 The total number of vertebrae in man & rabbit is-
(1) 30,33 (2) 33, 30
(3) 33, 46 (4) 46, 33

Q.57 Acetabulum is the part of-
(1) Hind arm (2) Pelvic girdle
(3) Pectoral girdle (4) Fore arm

Q.58 Thoracic cage of man is formed of -
(1) Ribs (2) Sternum
(3) Thoracic vertebrae (4) All

Q.59 Which one of the following components is a part of the pectoral girdle ?
(1) Acetabulum (2) Sternum
(3) Ischium (4) glenoid cavity

Q.60 Function of skeleton is -
(1) Shape and symmetry
(2) Protection
(3) Physical supports to limbs
(4) All

Q.61 Bone of fore limb is -
(1) Femur & tibia (2) Femur & ulna
(3) Humerus (4) All

Q.62 The pectoral & pelvic girdles and the bones of the limb form-
(1) Appendicular skeleton
(2) Axial skeleton
(3) Visceral skeleton (4) Outer skeleton

Q.63 The smallest bone in rabbit's and man's skeleton is-
(1) Stapes (2) Nasal
(3) Patella (4) Dentine

Q.64 Funny bone of the body is -
(1) Humerus (2) Femur
(3) Radius (4) Ulna

EXERCISE - 2

Q.1 Skull of Rabbit / Man is :-
(1) Mono condylic (2) Dicondylic
(3) Tricondylic (4) Tetra condylic

Q.2 In Camel number of cervical vertebra is :-
(1) 6 (2) 7
(3) 8 (4) 9

Q.3 Joint between bones of human skull is :-
(1) Fibrous joint (2) Hinge joint
(3) Synovial joint (4) Pivot joint

Q.4 Smallest bone in Rabbit & Man is :-
(1) Nasal (2) Patella
(3) Stapes (4) Palatine

Q.5 Os Innominatum consist of :-
(1) Pubis (2) Ischium
(3) Ilium (4) All of the above

Q.6 Total number of bone in Appendicular skeleton of human :-
(1) 126 (2) 80
(3) 44 (4) 33

Q.7 Total number of bone in Appendicular skeleton of rabbit :-
(1) 128 (2) 120
(3) 80 (4) 37

Q.8 Longest bone of human skeleton :-
(1) Femur (2) Humerus
(3) Tibia (4) Radius

Q.9 Acromion process is part of :-
(1) Pelvic girdle (2) Pectoral girdle
(3) Vertebral column (4) Humerus

Q.10 Elbow joint is :-
(1) Ball & socket (2) Pivot
(3) Gliding (4) Hinge

Q.11 Total number of bone of human face :-
(1) 10 (2) 12
(3) 14 (4) 16

Q.12 Total number of skull bones in human :-
(1) 28 (2) 49
(3) 39 (4) 19

Q.13 Total number of skull bone in rabbits :-
(1) 53 (2) 40
(3) 39 (4) 29

Q.14 Number of floating ribs in human :-
(1) 6 pairs (2) 5 pairs
(3) 3 pairs (4) 2 pairs

Q.15 The second cervical vertebral process is called-
(1) Prezygapophysis (2) Odontoid process
(3) Metaphysis (4) Post zygophysis

Q.16 Single bone of lower jaw in human is :-
(1) Maxilla (2) Dentary
(3) Squamosal (4) Ptergoid

Q.17 Largest mammalian vertebra is :-
(1) Thoracic (2) Sacral
(3) Lumbar (4) Cervical

Q.18 Deltoid Ridge. is found in which one of following bone :-
(1) Radius (2) Ulna
(3) Humerus (4) Femur

Q.19 In rabbit the zygomatic arch is formed of :-
(1) Premaxilla & jugal & squamosal
(2) Maxilla & jugal & squamosal
(3) Premaxilla & Maxilla & jugals
(4) Premaxilla & jugals

Q.20 Pelvic girdle of rabbit is distinguished from that of frog by presence of :-
(1) Obturator foramen (2) Olecranon fossa
(3) Foramen magnum (4) Sigmoid notch

Q.21 Ventral wall of pubis has small bone in rabbit called :-
(1) Cotyloid (2) Coracoid
(3) Pubis symphysis (4) Ilium

Q.22 Astragalus calcaneum are found in :-
(1) Hind limb of man (2) Hind limb of rabbit
(3) Fore limb of man (4) fore limb of rabbit

Q.23 Sigmoid Notch is also called as :-
(1) Sciatic Notch (2) Digital Notch
(3) Olecranon Notch (4) Furcular Notch

Q.24 Digital formula of Manus (Hand) of rabbit is :-
(1) 23333 (2) 03322
(3) 33332 (4) 02233

Q.25 Digital formula of foot (Pes) of rabbit is :-
(1) 03332 (2) 03333
(3) 03322 (4) 23333

Q.26 Heaviest vertebra in man is :-
(1) Atlas (2) Axis
(3) Lumber (4) Thoracic

Q.27 Joint between Incus & stapes is present :-
(1) Ball & socket joint (2) Hinge joint
(3) Pivot joint (4) Gliding joint

Q.28 Joint between malleus & incus is :-
(1) Gliding joint (2) Ball & socket joint
(3) Pivot joint (4) Hinge joint

Q.29 Cervical vertebra 7 in number in all except :-
(1) Sea horse (2) Polar bear
(3) Sloth (4) All

Q.30 Atlas - Axis joint is :-
(1) Hinge joint (2) Saddle joint
(3) Pivot joint (4) None

Q.31 Vertebral column of rabbit consist of :
(1) 46 vertebra (2) 42 vertebra
(3) 33 vertebra (4) 26 vertebra

Q.32 Inter vertebral disc is a
(1) Cartilage bone in the body
(2) Pad in the centrum of a bone
(3) Pad between two centrum
(4) None of above

Q.33 Axis vertebra identified by :
(1) Olecranon process (2) Odontoblast
(3) Odontoid process (4) None

Q.34 Typical vertebra of frog is :-
(1) Amphicoelous (2) Procoelous
(3) Acoelous (4) Opisthocoelous

Q.35 A joint between humerus and radio Ulna :
(1) Ball & socket (2) Pivot
(3) Gliding (4) Hinge

Q.36 Total number of vertebra in Man :
(1) 30 (2) 33
(3) 40 (4) 35

Q.37 Pterygoid is :-
(1) Cartilage (2) Cartilaginous bone
(3) Membranous bone (4) Long bone

Q.38 Fabellae bones are associated with :-
(1) Angular joint (2) Elbow joint
(3) Knee joint (4) Neck joint

Q.39 In rabbit, the jaw suspensorium is :-
(1) Auto stylic (2) Amphi stylic
(3) Cranio stylic (4) Hyostylic

Q.40 Olecranon process is :-
(1) Proximal end of Ulna
(2) Distal end of Ulna
(3) Proximal end of Tibia
(4) Proximal end of Humerus

Q.41 Cotyloid bone is found in :-
(1) Pelvic girdle of frog
(2) Pelvic girdle of rabbit
(3) Pectoral girdle of rabbit
(4) Pectoral girdle of frog

Q.42 Bony sockets of jaws in which the teeth are implanted are known as :-
(1) Alveoli (2) Fossae
(3) Dentaries (4) Thecae

Q.43 Haversian system found in :
(1) Atlas vertebra of rabbit
(2) Ilium of rabbit
(3) Femur of rabbit (4) Tibiofibula of frog

Q.44 Sacrum in rabbit is formed by fusion of :
(1) 3 vertebrae (2) 4 vertebrae
(3) 8 vertebrae (4) 6 vertebrae

Q.45 If the olecranon process of a rabbit is broken the rabbit will :
(1) Not run (2) Limp
(3) Run very fast (4) None of these

Q.46 The presence of tympanic bulla is characteristic of :-
(1) skull of frog (2) skull of rabbit
(3) skull of both (4) None

Q.47 Scales are exoskeleton of -
(1) Reptiles (2) Fishes
(3) Both (4) None

Q.48 Angular process present in :-

(1) Dentary (2) Maxilla

(3) Phalanges (4) Premaxilla

Q.49 Acoelus or amphiplatyan centrum vertebrae present in-

(1) Frog (2) Rabbit

(3) Salamander (4) All

Q.50 Number of bone present in upper jaw of rabbit;-

(1) 10 (2) 12

(3) 14 (4) 16

Q.51 Lower jaw of mammals is formed by :-

(1) Dentary only

(2) Dentary & jugal

(3) Dentary & Hayo mandibularies

(4) Dentary, Merkel's cartilage

Q.52 The vestigeal notochord called nucleus purposus is found in :-

(1) Pelvic girdle (2) Inter vertebral disc

(3) Centrum (4) skull

Q.53 Which one forms heal in rabbit :-

(1) Tarsus

(2) Astragalus calcaneum

(3) Metatarsals

(4) Calcaneal process

Q.54 Strongest bone of axial skeleton is -

(1) Tibia (2) Mandible

(3) Humerus (4) Ulna

Q.55 The nutrient foramen is present in :-

(1) skull of frog

(2) Tibiofibula of frog

(3) Radius - Ulna of rabbit

(4) Pelvic girdle of frog & rabbit

Q.56 Which vertebra has long & backward directed neural spine in rabbit :-

(1) Cervical (2) Lumbar

(3) Thoracic (4) Sacral

Q.57 Neuro cranium (part of skull) includes :-

(1) Cranium (2) Olfactory capsule

(3) Optic capsule (4) All the above

Q.58 Formula of vertebral column of rabbit :-

(1) $C_6T_{12}L_6S_4C_{15}$ (2) $C_7T_{12}L_7S_4C_{16}$

(3) $C_7T_{12}L_5S_4C_{15}$ (4) $C_7T_{12}L_7S_5S_{16}$

Q.59 Bone which enclose tympanum in mammals is:-

(1) Tymphanic bulla (2) Petrous bone

(3) Temporal (4) Parietal

Q.60 Spinal cord passes to brain through :-

(1) Foramen of monro

(2) Foramen of magendie

(3) Foramen of ovale

(4) Foramen of Magnum

Q.61 The odontoid process of axis vertebra in mammals is regarded as :-

(1) A process of Neural spine

(2) Remnant of centrum of atlas vertebra

(3) Rib of axis vertebra

(4) Centrum of atlas vertebra

Q.62 Which of following helps in rotation of the neck:-

(1) Atlas (2) Axis

(3) Cervical

(4) Occipital condyle of skull

Q.63 Astragalus & calcaneum are also known as :-

(1) Tibiale & fibulae

(2) Meta tarsals & tarsal

(3) Carpal & metacarpals

(4) None

Q.64 Largest foramen of human body is :-

(1) Foramen ovale

(2) Foramen of magendie

(3) Foramen of magnum

(4) Foramen of monro

Q.65 Stapes is modification of :-

(1) Hypomandibular (2) Palatine

(3) Quadrate (4) Squamosal

Q.66 2 Pairs of false ribs present in :-

(1) Man (2) Rabbit

(3) Frog (4) None

Q.67 True rib are 7 pairs in :-

(1) Rabbit (2) Man

(3) Both (4) one

Q.68 Saddle joint is absent in :-

(1) Human (2) Rabbit

(3) Both (4) Frog

Q.69 Which bone attach with tibia at ankle of rabbit:-

(1) Navicular (2) Astragalus

(3) Cuboid (4) Cunciform

Q.70 Presence of obturator foramen is feature of :-

(1) Frog (2) Cockroach

(3) Rabbit (4) None

EXERCISE - 3 PREVIOUS YEAR'S QUESTIONS

Q.1 A vertebra having convexity both in front and behind is- **(AFMC 1993)**
(1) Acoelous (2) Procoelous
(3) Amphicoelous (4) Amphiplatyon

Q.2 Long bones function in- **(CBSE 1993)**
(1) Support
(2) Support, erythrocyte and leucocyte synthesis
(3) Support and erythrocyte synthesis
(4) Erythrocyte formation

Q.3 Trochanters occur in- **(CPMT 1994)**
(1) Humerus (2) Femur
(3) Radio-ulna (4) Tibia-fibula

Q.4 Acromion process is part of-**(MPPMT 1994)**
(1) Vertebral column (2) Pelvic girdle
(3) Femur (4) Pectoral girdle

Q.5 Part of the body having a single pair of bones is- **(MPPMT 1994)**
(1) Pelvic girdle (2) External ear
(3) Wrist (4) Lower jaw

Q.6 Comparative study of skulls is- **(Orissa JEE 1995)**
(1) Craniology (2) Conchology
(3) Malacology (4) Osteology

Q.7 Longest bone of frog is- **(Bih. PMT 1995)**
(1) Humerus (2) Tibia-fibula
(3) Femur (4) Radio-ulna

Q.8 Haversian system is diagnostic feature of- **(APMEE 1995)**
(1) Avian bones (2) Reptilian bones
(3) Mammalian bones (4) Bone of all animal

Q.9 Feeling of fatigue after running fast for some time is due to- **(CPMT 1996)**
(1) Loss of energy
(2) Accumulation of lactic acid in muscle
(3) Formation of succinic acid
(4) Formation of biuret crystals

Q.10 In mammals the lower jaw is made of- **(DPMT 1984, 1985, Bih. PMT 1996)**
(1) Maxilla (2) Dentary
(3) Mandible (4) Ethmoid

Q.11 Sesamoid bone is derived from-**(DPMT 1996)**
(1) Cartilage (2) Areolar tissue
(3) Tendon (4) Ligament

Q.12 Which one has the maximum glycogen- **(BHU 1996)**
(1) Liver (2) Muscles
(3) Nerves (4) Kidneys

Q.13 Ankle joint is- **(CBSE 1997)**
(1) Pivot joint (2) Ball and socket joint
(3) Hinge joint (4) Gliding joint

Q.14 Epiphysial plate is involved in- **(BHU 1997)**
(1) Formation of bone (2) Elongation of bone
(3) Thickness of bone (4) All the above

Q.15 Inter-articular disc occurs in- **(BHU 1997)**
(1) Wall of heart (2) Wall of liver
(3) Pubic symphysis
(4) In between two vertebrae

Q.16 Acetabulum is part of- **(CPMT 1997)**
(1) Pelvic girdle (2) Pectoral girdle
(3) Fore arm (4) Upper arm

Q.17 Number of bones in hind limb of human is- **(CBSE 1998)**
(1) 21 (2) 24
(3) 30 (4) 14

Q.18 Number of vertebrae in axial skeletal of frog leaving urostyle is- **(CPMT 1998)**
(1) 10 (2) 12
(3) 15 (4) 9

Q.19 Biceps are attached with- **(RPMT 1998)**
(1) Radius (2) Ulna
(3) Femur (4) Humerus

Q.20 Bones of pelvic girdle forms a cavity in which head of the femur is fitted are - **(RPMT 1998)**
(1) ilium only (2) ilium and ischium
(3) ilium, ischium and pubis
(4) ischium and pubis

Q.21 Lower jaw of Rabbit articulates with - **(RPMT 1998)**
(1) jugal (2) alisphenoid
(3) squamosal (4) parietal

Q.22 Which of the following is not an odd digitate pentadactytlus - **(RPMT 1998)**
(1) Donkey (2) Camel
(3) Zebra (4) Rhinoceros

Q.23 Joint between atlas and axis is-**(CBSE 1999)**
(1) Pivot joint (2) Saddle joint
(3) Angular joint (4) Hinge joint

Q.24 Astragalus and calcaneum are part of- **(Pb.PMT 1999)**
(1) Fore limb (2) Hind limb
(3) Scapula (4) Clavicle

Q.25 Coracoid is component of- **(BHU 1999)**
(1) Fore limb (2) Skull
(3) Pectoral girdle (4) Pelvic girdle

Q.26 Olecranon process occurs in- **(BHU 1999)**
(1) Femur (2) Radius
(3) Humerus (4) Ulna

Q.27 Two halves of pelvic girdle are joined together by- **(BHU 1999)**
(1) Pubic symphysis
(2) Ischiac symphysis
(3) Ischiopubic symphysis
(4) By fusion

Q.28 Deltoid groove is present in : **(RPMT 1999)**
(1) Radio-ulna (2) femur
(3) tibio-fibula (4) humerus

Q.29 Sutural joints are present between- **(MPPMT 2000)**
(1) Thumb and metatarsal
(2) Humerus and radio-ulna
(3) Parital of skull
(4) Glenoid cavity and pectoral girdle

Q.30 Which one is a bone of skull- **(CBSE 2000)**
(1) Atlas (2) Femur
(3) Tibia (4) Pterygoid

Q.31 Joint of sternum and ribs is- **(CBSE 2000)**
(1) Cartilaginous (2) Fibrous joint
(3) Angular joint (4) Hinge joint

Q.32 Myoglobin occurs in- **(AFMC 2000)**
(1) White muscle fibres (2) Red muscle fibres
(3) Involuntary muscles (4) All the above

Q.33 Coccygeal bone occurs in- **(CPMT 2000)**
(1) Skull (2) Pectoral girdle
(3) Vertebral column (4) Pelvic girdle

Q.34 Immediate source of energy for muscle contraction is- **(AFMC 2000)**
(1) Glucose (2) GTP
(3) Creatine phosphate (4) ATP

Q.35 Synovial fluid is present in- **(Har. PMT 2000)**
(1) Spinal cavity (2) Cranial cavity
(3) Freely movable joints
(4) Fixed joints

Q.36 EDTA injected into muscles combines with Ca^{2+} and- **(Pb. PMT 2000)**
(1) Stops contraction
(2) Causes contraction
(3) Slows down contraction
(4) None of the above

Q.37 Mentomeckelian is specially characteristic bone of : **(RPMT 2000)**
(1) *Rana tigrina* (2) *Aquas*
(3) *Bos indicus* (4) *Felis domestics*

Q.38 Haversian canals are found in the- **(MPPMT 2001)**
(1) Bones of birds (2) Bones of mammals
(3) Bones of frog (4) Cartilage

Q.39 From outer to innerside the sequence of three bones present in the middle ear of mammals is- **(CPMT 2001)**
(1) Incus, Malleus, Stapes
(2) Malleus, Incus, Stapes
(3) Malleus, Stapes, Incus
(4) Stapes, Malleus, Incus

Q.40 Obturator foraman is present in- **(CPMT 2001)**
(1) Pectoral girdle of frog
(2) Pectoral girdle of rabbit
(3) Pelvic girdle of frog
(4) Pelvic girdle of rabbit

Q.41 In frog, the vertebra with an anterior convex surface is- **(UP-CPMT-2001)**
(1) atlas (2) urostyle
(3) 8th vertebra (4) 9th vertebra

Q.42 Obturator foramen is found in- **(UP-CPMT-2001)**
(1) frog's pelvic girdle
(2) frog's pectoral girdle
(3) rabbit's pelvic girdle
(4) rabbit's pectoral girdle

Q.43 Which is the largest bone of middle ear- **(BHU 2002)**
(1) Incus (2) Malleus
(3) Stapes (4) Cochlea

Q.44 Largest smooth muscle is present in- **(UP CPMT 2002)**
(1) Leg
(2) Thigh
(3) Uterus of pregnant woman
(4) Urethra

Q.45 Pelvic girdle of rabbit consists of - **(UP-CPMT-2002)**
(1) ilium, ischium and pubis
(2) ilium, ischium and coracoid
(3) coracoid, scapula and clavicle
(4) ilium, coracoid and scapula

Q.46 Bones formed by ossification of a tendon is called– **(MP-PMT-2002)**
(1) Membrane bone (2) Dermal bone
(3) Sesamoid bone (4) Cartilage

Q.47 Fibulare bones are associated with- **(MP-PMT-2002)**
(1) Elbow joint (2) Knee joint
(3) Neck joint (4) Angular joint

Q.48 Thoracic cage of man is formed by- **(MP-PMT-2002)**
(1) Ribs and thoracic vertebrae
(2) Ribs, sternum and thoracic vertebrae
(3) Ribs and sternum
(4) Ribs, sternum and lumbar vertebrae

Q.49 Jaw suspension characteristic of mammals is- **(MP-PMT-2002)**
(1) Amphistylic (2) Craniostylic
(3) Autocliastylic (4) Hyostylic

Q.50 Joint between humerus and ulna is- **(RPMT 2003)**
(1) Saddle joint (2) Hinge joint
(3) Fibrous joint (4) Ball and socket

Q.51 The parasphenoid bone in frog forms- **(UP-CPMT-2004)**
(1) base of cranium (2) floor of cranium
(3) dorsal side of cranium
(4) dorsolateral side of cranium

Q.52 Ear ossicle, incus is modified form of which bone- **(MP-PMT-2004)**
(1) Jugal (2) Articular
(3) Quadrate (4) Hyomandibular

Q.53 An acromian process is characteristically found in the- **(CPMT-2005)**
(1) Pelvic girdle of mammals
(2) Pectoral girdle of mammals
(3) Skull of frog
(4) Sperm of mammals

Q.54 The parasphenoid bone in frog forms- **(MP-PMT-2005)**
(1) Base of cranium
(2) Floor of cranium
(3) Dorsal side of cranium
(4) Dorsolateral side of cranium

Q.55 Smallest bone in rabbit is- **(RPMT-2006)**
(1) Femur (2) Carpals
(3) Stapes (4) Nasal

Q.56 Metabolic arthritis is commonly called as - **(CMC Vellore-2006)**
(1) Rheumatism (2) Gout
(3) Tuberculosis (4) Cancer

Q.57 In human body, which one of the following is anatomically correct- **[AIPMT-2007]**
(1) Collar bones – 3 pairs
(2) Salivary glands– 1 pairs
(3) Cranial nerves– 10 pairs
(4) Floating ribs– 2 pairs

Q.50	2	Q.51	2	Q.52	3	Q.53	2	Q.54	2	Q.55	3	Q.56	2
Q.57	4												

These questions consist of two statements each, printed as Assertion and Reason. While answering to choose any one of the following four responses.

(1) If both Assertion & Reason are True & the reason is correct explanation of the Assertion.
(2) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.
(3) If Assertion is True but the Reason is False.
(4) If both Assertion & Reason are false.

Q.1 **A :** Locomotion enables the animal to find its partner.
R : Locomotion enables the animal to shift its entire body from place to place.

Q.2 **A :** Movement of body parts serves to change the body posture.
R : Body parts move in relation to body axis.

Q.3 **A :** There are similarities between the locomotion of unicellular organisms and multicellular animal.
R : Ciliary, flagellar and amoeboid movement occur in unicellular organisms.

Q.4 **A :** Locomotion in *Hydra* is carried out by two types of contractile cells.
R : Muscle fibres are lacking in *Hydra*.

Q.5 **A :** Starfish moves through crawling.
R : Starfish utilise a flow of water over the surface, for movement.

Q.6 **A :** Skeleton helps in blood cell formation.
R : Blood flows through skeleton.

Q.7 **A :** Skeleton serves as a storage depot.
R : Skeleton stores carbohydrate and protein.

Q.8 **A :** Ball and-socket-joints are the most mobile joints.
R : Synovial fluid is present here.

Q.9 **A :** Arthritis or inflammation of a joint makes the joint painful.
R : Some toxic substances are deposited at the joint.

Q.10 **A :** The contraction and relaxation of muscle fibre are controlled by nerve impulses.
R : The threshold stimulus is the minimum stimulus required for the beginning of contraction.

Q.11 **A :** Muscle twitch is related with tetanus.
R : Tetanus is caused by many nerve impulses at a time.

Q.12 **A :** Human skeleton also helps in hearing.
R : Internal ear of man is surrounded by bony labyrinth.

Q.13 **A :** Jaw suspension of man is craniostylic.
R : Squamosal of lower jaw is suspended from dentary of upper jaw.

Q.14 **A :** Human vertebrae are called amphiplatyan type.
R : Centrum of vertebrae is flat on both sides.

Q.15 **A :** Osteoarthritis is also called wear and tear disease.
R : In osteoarthritis, there is inflammation and degeneration of cartilages at the joints.

Q.16 **A :** Osteoporosis is characterized by increases in density of bones.
R : There is increased activity of the osteoblasts.

Q.17 **A :** Intervertebral discs are tough and strong than the pinna of man.
R : Intervertebral discs are formed of fibro cartilages while pinna is with calcified cartilage.

Q.18 **A :** Birds are with pneumatic bones.
R : Air sacs make the bones lighter which helps in the flight of the birds.

Q.19 **A :** In muscle concentration, length of the both A-bands and I-bands decreases.
R : Both myosin of A-bands and actin of I-bands are contractile proteins and decrease in size during muscle contraction.

Q.20 **A :** During exercise, a person undergoes fatigue very soon.
R : During this period, muscle fibres undergo oxygen debt.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

INTEGUMENTARY SYSTEM

INTRODUCTION

- Skin together with its derivative constitutes the integumentary system of the body.
- Skin is largest, functional organ of the body having 16-18% of the body weight.
- Skin is called **Jack of all trades**.
- Skin is ecto-mesodermal in origin.
- Skin of mammals possess **spy lines**, which is very distinct on palm and fingers. Every human has particular spy lines. No, two human, can have similar, finger print. (Quetlets rule)
- Total surfce area of skin in an adult person is about 1.6 m^2.
- Furrow (sulci cutis) and ridges (cristae cutis) are also present on the skin of Palm and Soles.

Note :

- Study of finger prints is called **Dactyloscopy**.
- The skin of rabbit is adopted for complete exposure to air due to terrestrial mode of life it is soft, but thick and dry completely covered with a thin blanket of hair called **palage**. Palage prevent excessive loss of heat. Presence of dense palage on rabbit shows that its native place is **Europe**.
- Skin in mammals are attached with underlying skeletal muscle layer by **tela subcutanea**.

Note :

- In human female after delivery, clear and permanent lines appears on the skin of abdomen these lines are called **linea gravidarum** after each delivery number of these lines becomes more and more dense.

GENERAL HISTOLOGY OF SKIN

Histologically, the skin is formed of two distinct layer, outer epidermis (ectodermal) and inner dermis (mesodermal).

EPIDERMIS

General character

- Epidermis develops from ectoderm.
- It has no blood capillary and is nourished by dermis which contain blood capillary.
- It is composed of keratinized stratified squamous epithelium and is extremely thick in palm and sole. It is thinnest in conjuctiva of eyes.

Epidermis is composed of five layers which are as follows : (from inside to outside)

Stratum malphighi

Stratum spinosum

Stratum granulosum

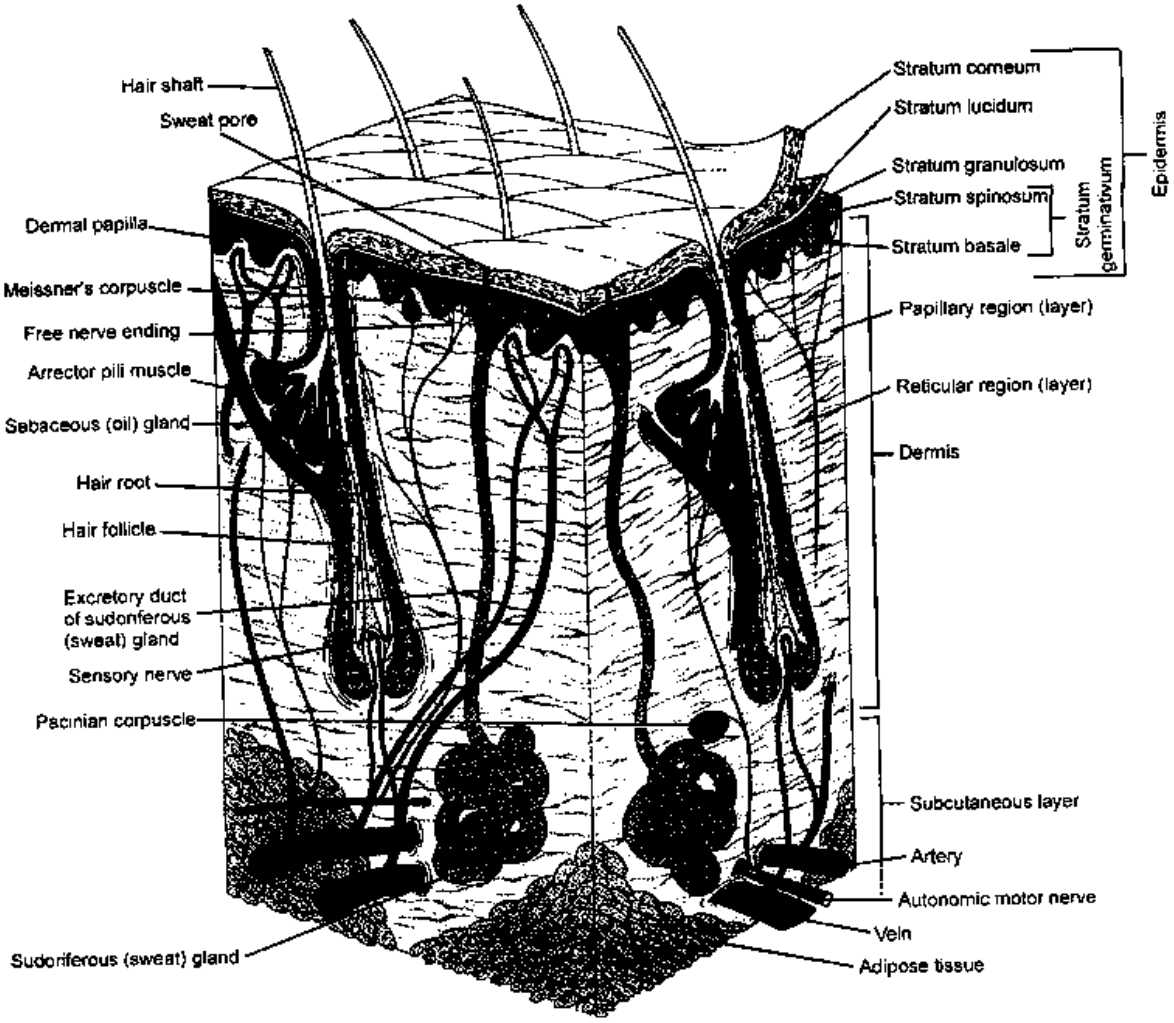
Stratum lucidium

Stratum corneum

1. Stratum malphighi

- It is innermost living layer and composed of single layer of columnar cells. When these cells spread outside the skin their shape changes from columnar to cuboidal.
- At many places on this layer elevation and depression are found. The elevation is called **(Rete pegs)**.

- The cells of the layer remain in touch with dermis, hence get, nutrition from it.
- This layer, undergoes, massive, mitotic divisions throughout the life and produce new cells which moves upward and forms new layer consistently.
- At numerous places, in between the cells pigmented dendritic cells are found, these cells are called **melanophores** or **melanocytes**.
- Melanocyte arise from melanoblasts which are present at the junction of epidermis with dermis.



- In cytoplasm of melanocytes numerous granules are found called **melanosomes**.

  In this granules melanin is synthesized. **Melanin** is a pigment of black colour.
- Melanin get synthesized from amino acid **tyrosine**. Enzyme **tyrosinase** induces melanin synthesis.
- In an organism (man in particular) inability of synthesis of an enzyme tyrosinase leads to a genetical disease **albinism**. In albinism a person lacks pigment completely.

Note :

- Melanin prevents skin cancer and mutation which leads to cancer, It absorbs harmful radiation (U.V.radiation).
- In lower vertebrate like amphibian and reptilian pigmented cells are found in dermis, these cells are called **chromatophores**. These pigmented cells of lower vertebrates have capacity to change colour of the pigment, this unique capacity is called **metachrosis**.

- Mammals, birds lacks this quality and capacity. On basis of pigment, chromatophores are of numerous types-

(a) Melanophores

In it melanin pigment is found.

It is of brown and black colour.

(b) Guanophores

In it crystal of guanine is found.

It is bright white in colour.

(c) Lipophore

Yellow coloured pigment lipids are found, called chromolipids. eg. Carotene.

Note :

- In fishes, amphibians, and reptilians, capacity of colour changing is controlled by MSH which is secreted by middlelobe of pituitary.

2. Stratum spinosum

- This is a stratum of six or seven sub layers of cell next to the stratum malpighi
- Cell of these layers are **polyhedral.**
- It provides **rigidity** to the epidermis.
- In cytoplasm of the cells of this layer numerous Golgi complex and mitochondria are found.

3. Stratum granulosum

- The cells of this layer are flattened or diamond shaped.
- Their nuclei are denser and cytoplasm contain the basophilic and **keratohyaline protein**.

4 Stratum lucidium

- This is the fourth layer which is not always seen.
- In these the keratohyaline, granule first dissolve and then transform into a protein, **eleidin**. Which is semi transparent and water proof and acts as a barrier layer.

5 Stratum corneum

- It is thickest and outermost layers of epidermis with 99% dead cells. The cells dies because of keratinisation and cornification.
- Composed of 8 to 10 layers
- It lack nucleus.
- Cells of this layer are scale like
- Eleidin present in cytoplasm get transformed into nonliving **keratin** which is **sceloprotein**.
- Majority of cells of this layer are non-living.
- It is thick at palm and sole.
- In this layer some living cells are found, which secretes hormones, these hormones controls the cell division of malphighi layer.
- S.corneum undergoes periodic shedding in pieces. This is called as Ecdysis. Complete shedding called sloughing occurs in snakes.

Note :

- Exoskeleton is formed from this layer in mammals and other vertebrates.

  eg. Hair, Nails, Wings beak etc.

DERMIS

General character

- Dermis originates from **mesoderm**.
- It is 2-3 times thick in comparison to epidermis.
- It is composed of connective tissue. In it white collagen fibres, white elastic fibres and unstriated muscle fibres are found.
- Elastin fibre provides flexibility whereas, collagen provides strength which makes dermis strong.
- Dermis is thick in male in comparison to female. From dermis leather is obtained, to obtain leather epidermis is dissolved, and this process is called **Tanning**.

Note :

Preservation of complete skin along with hairs are called **Taxidermy**.

Layers of Dermis

Dermis is composed of two layers :

Papillary layer

Reticular layer

1. Papillary layer (Pars Papillaris)

It is outer layer

This layer at many places remains embedded in epidermis called **dermal papilla**.

Collagen fibres are less in this layer.

Its lines are called (lines of langerhans)

In this layer tactile corpuscles or meisners granules are found. It is found in large number at the tips of fingers.

2. Reticular layer (Pars Reticularis)

It is thick in comparson to papillary layer.

It this layer at numerous places **mast cells**, **macrophages** and **melanin pigment** are found.

Large number of collagen fibres are found in this layer. These fibre is responsible for stretching of skin.

STRATUM ADIPOSUM (PANNICULUS ADIPOSUS)

This layer is composed of adipose tissues and lies just below dermis.

This layer is extremely thick in whale, elephant, rhino, and called **blubber**.

Functions of stratum adiposum

(i) It acts as **shock absorber**.

(ii) It is site of food storage.

(iii) It acts as heat insulator.

(iv) It helps in attaining shape to the body.

DERIVATIVES OF SKIN

Derivatives of skin includes

- Epidermal gland
- Exoskeleton structure
- Integumentary receptor

EPIDERMAL GLAND

Epidermal gland of skin includes :

- Sweat gland
- Sebaceous gland
- Meibomian gland
- Lacrymal gland
- Mammary gland
- Tyson gland
- Zeis gland

1. Sweat gland

- Sweat gland is also called sudoriferous gland.
- Sweat glands are simple coiled or simple branched tubular glands located in deeper zone of dermis.
- It is at most places merocrine gland but in some parts of body it is apocrine gland.
- In man over 2.5 million sweat glands is found, maximum on palm and sole, and is absent on **glanspenis** and lips.
- It is absent in dog, whale, shrew,, moles, cetacean, spinyanteater, sirenia.
- Red coloured sweat is produced in **Kangaroo**, **Hippopotamus** and **Rhesus monkey**.
- In rabbit maximum sweat glands found on lips.

Functions of Sweat gland

The chief function of sweat gland is as follows :

(i) Thermoregulation (ii) Excretion (iii) Water balance

2. Sebaceous gland

- Sebaceous gland is also called **oil gland**.
- Sebaceous gland generally remain associated with hair follicle but it may exist without hair follicle like in **glans penis**.
- It is branched alveolar gland, **holocrine** in nature.
- It secrets sebum which makes the skin and hair water proof.
- In sebum cholesterol is found which synthesizes vitamin D in presence of sunlight.
- In human being sebaceous gland is not found on palm, sole, forehead & face (maximum)

3. Meibomian gland

- Meibomian gland is modified sebaceous gland.
- It is found in the dense connective tissue plate (tarssus) that support the free edges of each eyelid.
- It opens into follicle of eye lashes
- It produces oily secretion which keeps the cornea moist and prevent from getting dried, moreover only secretion forms a thin film over the layer of lacrimal fluid.

4. Lacrimal gland

- Lacrimal gland is tear gland found beneath upper eyelids and produce watery secretion (tears) to keep eyes moist.

5. Mammary gland

- Mammary gland is modified sweat gland. It is compound tubulo alveolar, apocrine gland.
- It is characteristic feature of mammals, present in both sex, in human male it is vestigeal.
- In rabbit **4-5 pairs of mammary glands** are found on abdomen; whereas in human it is one pair.

Note :

- Study of mammary gland is called **Mastology**.
- Early milk which comes out after child birth is called **colostrum**.

6. Perineal gland or Inguinal gland

- These glands are found around the anus of rabbit and releases certain thin liquid of typical smell which attract animal of opposite sex. **Pheromones** are found in secretion of these gland.
- Except human it is found in all mammals.

7. Tyson gland

- It is modified sweat gland, apocrine glands, present in skin of prepuce of **glans penis**.
- It produces smegma which lubricates the glanspenis, during copulation.

8. Zeis gland

- Zeis gland is modified sebaceous gland found in skin of eye lashes.
- It opens into hair follicles of eyelashes.
- Its secretion keeps eyelashes smooth and supple.

9. Ceruminous gland

- Ceruminous gland is modified sebaceous gland, Holocrine
- It is found in skin of external auditory canal.
- It secrets cerumin which is called ear wax.
- It protects ear drum.

EXOSKELETON STRUCTURE

- Exoskeleton of skin is composed of **keratin**.
- Exoskeleton of skin includes, hairs scales, nail, horn claws, feather.

Hair

Hairs are characteristic feature of mammals. It develops as a thickening of the stratum germinativum of the epidermis.Each hair lies in a tubular pit called hair **follicle**.

Hair follicle

Hair follicle is composed of 2 layers outer layer and inner layer.

Outer layers is composed of stratum spinosum like cells whereas inner layers is composed of 3 sub layer, which are as follows.

(a) Cuticle (b) Huxley layer (c) Henley layer

Cuticle - It is innermost layer and is composed of dead, flat cells.

Huxley layer - Nucleus of this part of cells is horney.

Henley layers - Within cells of this layers **cuboidal nucleus** is found.

At the base of the hair, hair follicle invaginates inward to form **hair papilla**. Within hair papilla bunch of blood capillaries and nerve fibres are found.

Structure of hair

- Hair shaft - Part of hair which comes out of epidermis called hair shaft.
- Hair root - Hair root is slightly bulged called hair bulb. The cells of hair bulb just above hair papilla are live and divisible and is called **germinal matrix of hair**. Due to division of these cells, hair increases in size.

Note :

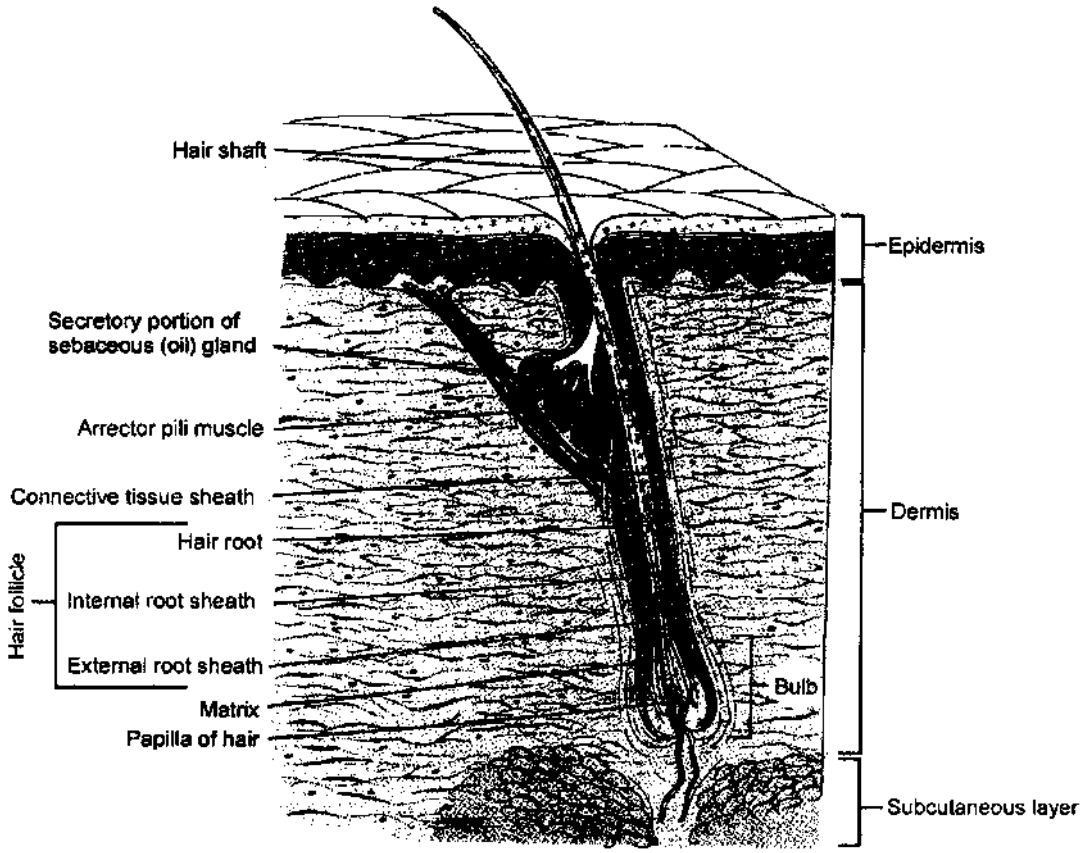
- Except germinal matrix of hair rest part of hair is composed of dead & keratinized cells.

Arrector Pilli

An arrector pilli muscles connect each hair with basement membrane of epidermis. When **arrector pilli** contracts it squeezes the oil out from the sebaceous gland, it results in errection of the hair. This process is

called Goose flesh. The contraction of arrector pilli muscle takes place due to adrenalin and sympathetic stimulation.

In T.S. of hair possess 3 regions :



- **Medulla -** It is large, vacuolated moderately keratinized cells is found.
- **Cortex -** It is middle layer heavily keratinized cells are found.
- **Cuticle -** It is outer most layer. It is Heavily keratinized overlapping cells are found having their free ends directed upward. Melanocyte present in hair bulb produces and transfer melanin to the cortical cells of the hair.

Note :

- In old age hair turns grey because air spaces between the cells of the medulla increases in number and pigment formation decreases.
- In old age hair loss becomes more because of reduction of blood supply.
- Hair on human body is vestigeal organ.

Functions

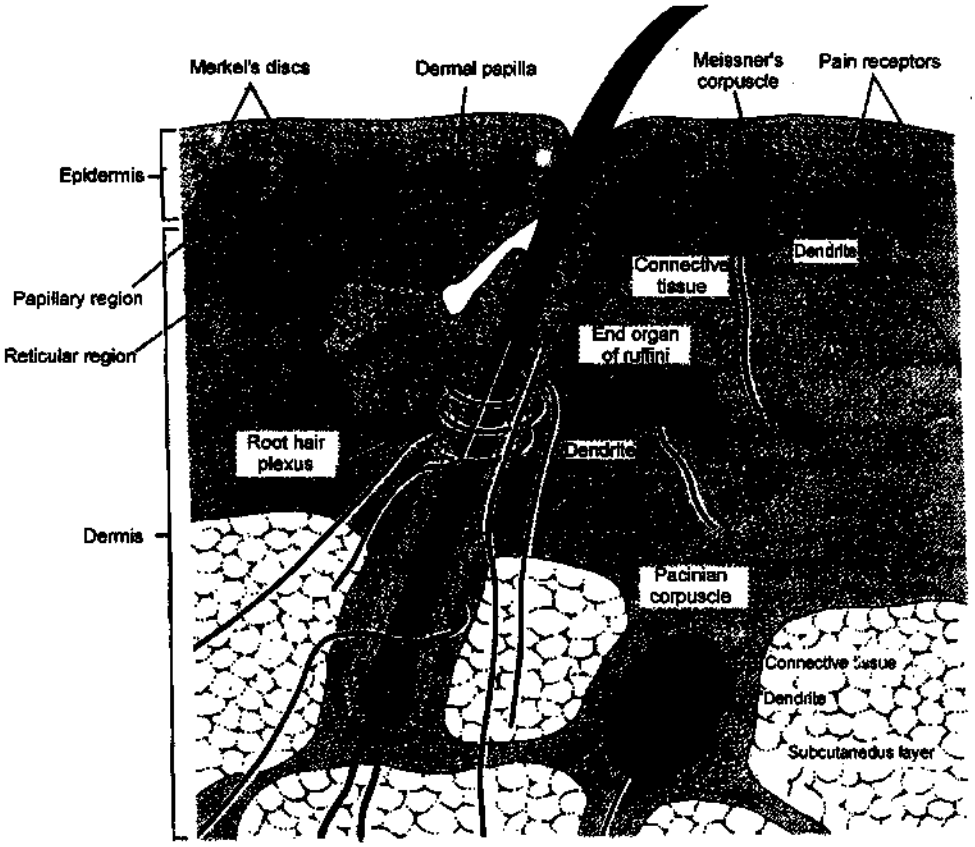
- Eyelashes, hairs in the nostril and ear canal, Keep out dust particles.
- Hair follicle helps in repairing the epidermis injured by burns and because it is deeply seated and retain stratum germinitavum.

INTEGUMENTARY RECEPTOR

1. Algesireceptor

- It is pain receptor.
- It is composed of naked nerve fibre.
- In human body 40 lakhs algesi receptor are found.

- It is maximum in all cutaneous receptor



Structure and location of cutaneous receptors

2. Tangoreceptor

- It provides sense of touch.
- In human body 5 lakhs **tangoreceptor** is found it is of numerous type which are as follows :

(a) Meissener's corpuscles

- It is found mainly and in maximum numbers on nipple, glanspenis, lips, end of finger tips, on palm, clitoris etc.

Note : Those meissners corpuscles which are found on external genital organ are called **genital corpuscles**.

(b) Merkel's discs

- Merkel's discs are found in epidermis are their junction with dermis of human and other mammals. These are absent in Rabbit.

3. Pacinian corpuscles (Proprioreceptors)

- Pacinian corpuscles are pressure receptors or baroreceptor.
- It is found deep in dermis.

4. End bulb of Krause or end organs of Ruffini

- Both are thermo receptor.
- Bulb of Krause is sensitive to Cold. (frigidoreceptors)
- End organ of Ruffini is sensitive to Hot. (Caloreceptors)

FUNCTIONS OF SKIN

(a) **Protection** - Skin forms cover on organs and protects the body from mechanical injury.

(b) **Safety against sunburn -** Melanin of epidermis gives protection against ultravoilet rays of sun, these rays causes sunburn.

(c) **Excretion** - The skin removes the excess of water, lactic acid, traces of urea and some salt (chiefly NaCl) from the blood as sweat. As a result of keratinization, horny dead cells are produced constantly, sheeding of corneal layer is a kind of excretion.

(d) **Secretion -** Skin secrets numerous important substances which is very important for survival of an animal. Preen gland in bird produces oil for water proofing their feather.

(e) **Chemical defence** - The sweat, oil and wax from skin gland contain lactic acid and fatty acid. These acids make the pH acidic enough to kill or retard the growth of many bacteria and fungi.

(f) **Nourishment -** The skin is capable of forming vitamin D from a cholesterol derivative in the presence of sunlight.

(g) **Barrier to germs and poison -** The outer hard and horney layer of insect checks the entry of microrganisms in the body.

(h) **Heat conservation -** Hair tend to trap a layers of air which insulates the body, reducing heat exchange with the environment. In some mammals such as sheep and rabbit, air retaining capacity is increased by the hairs sticking together to make a belt, subdermal fat also prevents body heat.

(i) **Regulation of body temperature -** The normal body temperature of man is 98.4 ºF. (37ºC). The temperature is maintained in all seasons. The sweat cools the skin if it get overheated. In winter, blood capillaries which lead to skin undergo constriction called **vasoconstriction**, as a result heat not get lost from the body. In contrast, in summer dilation takes place in blood capillaries which is called **vasodilation,** as a result heat get lost from the body.

Note :

In summer rabbit erect their ears as a result heat is lost through blood capillaries of ear.

- In summer dogs loses their body temperature through tongue by excessive salivation and panting .

SPECIAL POINTS

- During embryonic conditions, soft hair is called **lanugo**.
- In leucoderma skin pigment is not found at some places.
- Brown fat found in neonates, it prevents neonates from cold.
- During sweating PH of skin becomes 3 to 5.
- Sweat, saliva, tears possess **lysozyme**, which destroys microorganism.
- About 80 to 100 hairs are lost per day.
- Thinnest skin occurs over the eyelids. Thinnest epideris is of conjuctiva.
- **Bradykinin**- When body temperature rises the sweat gland release potent vasodilator peptide **bradykinin**, which dilates blood vessel to lose heat quickly.
- Vibrissae - These are special long, stiff sensory hair on the side of the mouth of certain mammals, such as rabbit and lion.(Vibrioreceptors)
- Seborrhoea - Oversecretion of sebaceous glands is called seborrhoea.
- The skin of older people becomes loose and wrinkled because elasticity of dermis decreases.
- During life time 23 kg of skin is shed.
- Goose flesh is also called **cutis anserina** (Erection of Hairs on skin).
- Colour variation in human being depends upon amount and colour of melanin rather than the number of melanocytes.
- Hippoptamus have sweat glands only on pinnal.

EXERCISE - 1

Q.1 Dermis develops from :–
(1) Ectoderm (2) Endoderm
(3) Visceral mesoderm (4) Mesoderm

Q.2 The substance responsible for making the stratum lucidum layer transparent is :–
(1) Eleidin (2) Keratin
(3) Keratohyalin (4) Albumin

Q.3 Vibrissae of Rabbit are :–
(1) Sensory organ (2) Nervous organ
(3) Female organ (4) Male organ

Q.4 Which one of the following muscles are responsible for moving and shaking the skin –
(1) Arrector pilli (2) Collagen fibres
(3) Paniculus carnosus (4) Sphincter muscles

Q.5 Lacrimal glands produces :–
(1) Sebum (2) Mucous
(3) Tear (4) Sweat

Q.6 Sebum is secreted by :–
(1) Ceruminous glands (2) Sweat glands
(3) Sebaceous glands (4) Mammary glands

Q.7 Hairs of man are :–
(1) Hollow (2) Solid
(3) Colourless (4) None

Q.8 Healing of wound takes place by :–
(1) St. corneum (2) St. malpighi
(3) Both (4) None

Q.9 Oil glands of the body are :–
(1) Sweat glands (2) Sebaceous glands
(3) Ceruminous glands (4) All of the above

Q.10 Xanthophores contain–
(1) Yellow pigment (2) Black pigment
(3) Green pigment (4) None

Q.11 Chromatophores are associated with :–
(1) Temperature regulation
(2) Respiration
(3) Colour changing
(4) None

Q.12 Exoskeleton is absent in :–
(1) Fishes (2) Amphibians
(3) Reptiles (4) Mammals

Q.13 Herbert corpuscles are found in :–
(1) Skin of mammals
(2) Buccal cavity of birds
(3) Ligament and tendon
(4) Rectum of frog

Q.14 Receptors of hunger pongs and pain are present in alimentary canal. These are known as :–
(1) Visceral receptors (2) Extero receptors
(3) Somatic receptors (4) None

Q.15 Receptors of the skin are called :–
(1) Gland receptors (2) Somatic receptors
(3) Visceral receptors (4) Intero receptors

Q.16 In nasal passage, the turbinal bones are present in which of the following groups :–
(1) In all vertebrates (2) Amphibia
(3) Mammals (4) None

Q.17 Receptors which are sensitive to pain are :–
(1) Tangorecptors (2) Frigido receptors
(3) Rheoreceptors (4) Nociceptor

Q.18 Nasal cavity has large number of :–
(1) Blood cells (2) Sensory cells
(3) Cuboidal cells (4) None

Q.19 Grandy's corpuscles are found in :–
(1) Frog (2) Birds
(3) Rabbit (4) All

Q.20 Dermis of mammalian skin is mainly composed of
(1) Muscular tissue (2) Connective tissue
(3) Epithelial tissue (4) All of the above

Q.21 Pigment of hair occur in :–
(1) Hair sheath (2) Cortex
(3) Medulla (4) Hair follicle

Q.22 Which of the following hormone is involved in homiothermy :–
(1) Glucocorticoids (2) Insulin
(3) Thyroxine (4) Adrenaline

Q.23 The fibres that make the skin elastic are :–
(1) Collagen fibres
(2) Yellow fibres
(3) Smooth muscle fibres
(4) Striated muscle fibres

Q.24 Peritoneum of rabbit invests its :–
(1) Erythrocytes (2) Integument
(3) Heart & lungs (4) Visceral organs

Q.25 In the mammalian skin, the adipose tissue is found:–
(1) In the epidermis (2) In the muscles
(3) In the dermis (4) Below the dermis

Q.26 Keratin of the integument is the :–
(1) Mucoprotein (2) Scleroprotein
(3) Cartilage (4) Bony tissue

Q.27 In rabbit, the thermoregulatory mechanism is basically–
(1) A neuro endocrine synergisue
(2) An endocrine based phenomenon
(3) A neural process
(4) A compound sensory neuro endocrine integrative mechanism

Q.28 Sweat glands are located in–
(1) Granular layer of epidermis
(2) Dermis
(3) St. malpighi (4) St. lucidum

Q.29 Integument does not perform the function of–
(1) Absorption (2) Protection
(3) Excretion (4) Circulation

Q.30 The brown colour of the skin is due to :–
(1) Haemoglobin (2) Haemoerythrin
(3) Porphyrin (4) Chromophils

Q.31 Stratum Iucidium is found in :–
(1) Epidermis below stratum corneum
(2) Dermis
(3) Epidermis where root hair follicles occur
(4) Dermis and secrete keratin

Q.32 Cutaneous glands are :–
(1) Gastric glands (2) Sebaceous glands
(3) Thyroid gland (4) Thymus gland

Q.33 Meibomian glands of rabbit are modification of–
(1) Sweat glands (2) Oil glands
(3) Mullerian glands (4) Tonsils

Q.34 If skin has lesions, the food must contain-
(1) Green vegetables (2) Ca & Fruits
(3) Ca (4) Vitamin C

Q.35 Skin is made up of -
(1) Dermis (2) Epidermis
(3) Both of these (4) None of these

Q.36 Which is apocrine gland-
(1) Meibomian gland (2) Zeis gland
(3) Tyson gland (4) Moll gland

Q.37 Which is holocrine gland-
(1) Mammary gland (2) Ceruminous gland
(3) Meibomian gland (4) Perineal gland

Q.38 Hair shaft consist of-
(1) Cuticle (2) Cortex
(3) Medulla (4) All of the above

Q.39 The function of skin is-
(1) Sexual attraction (2) Chemical defence
(3) Storage of food (4) All of the above

Q.40 Propria receptors respond to-
(1) Mechanical stimuli (2) Chemical stimuli
(3) Both 1 & 2 (4) None of these

Q.41 The horns of Rhinoceros are composed of-
(1) Bone (2) Cartilage
(3) Chitin (4) Keratin

Q.42 Cerumen is secreted by-
(1) Apocrine sweat glands
(2) Holocrine sebaceous glands
(3) Apocrine mammary glands
(4) Merocrine sweat glands

Q.43 Derivative of sweat glands is-
(1) Moll's gland (2) Scent gland
(3) Sebaceous gland (4) Mammary glands

Q.44 Silver colour of many fishes due to-
(1) Iridiocytes (2) Leukocytes
(3) Chromophores (4) Dermocytes

Q.45 Stratum corneum is-
(1) Dead mid-dermal layer
(2) Dead and innermost dermal layer
(3) Dead outermost epidermal layer
(4) Outermost dermal layer

Q.46 Stratum corneum is absent in-
(1) Bony fish (2) Amphibians
(3) Reptiles (4) All the above

Q.47 The scales characteristic of the cartilaginous fish are-

(1) Casmoid (2) Ganoid

(3) Placoid (4) Cycloid

Q.48 Periodical shed of epidermal covering in snakes is called-

(1) Dysis (2) Ecdysis

(3) Keratinization (4) None of these

Q.49 The gland cells and nerve plexus is-

(1) In between outer and inner epithelial layers

(2) In the outer epithelial layers

(3) In the inner epithelial layers

(4) Amidst ectodermal cells

Q.50 In mammals melanocytes give protection from-

(1) UV-rays (2) Infrared rays

(3) X-rays (4) Visible light

Q.51 Dermal papillae are present on-

(1) Tips of fingers (2) Palm of hand

(3) Sole of foot (4) All of these

Q.52 Hair increases every day-

(1) 4 mm (2) 1 mm

(3) 8 mm (4) 3 mm

Q.53 Stratum germinativum is an epithelium of the type-

(1) Squamous (2) Ciliated

(3) Columnar (4) Cuboidal

EXERCISE - 2

Q.1 Skin effect due to pattern of lines is called :–
(1) Dermatoglyphics (2) Taxidermy
(3) Dermatology (4) Liner graridarum

Q.2 Which of the following induces goose flesh :–
(1) Adrenal Cortex (2) Adrenal medulla
(3) Pituitary (4) Thyroxine

Q.3 Goose flesh in severe cold :–
(1) Reduces heat loss from body
(2) Increases heat loss from body
(3) Protects animal from external shocks
(4) Decrease activity of sweat glands

Q.4 Dense pelage is characteristic of animal inhabiting:–
(1) Cold Climate (2) Warm climate
(3) Tropical climate (4) Aquatic

Q.5 Skin epidermis is composed of :–
(1) Fibrous connective tissue
(2) Areolar tissue
(3) Stratified columnar epithelium
(4) Stratified squamous epithelium

Q.6 Which layer of skin possibly secretes harmones:–
(1) St. Malpighi (2) St. Lucidum
(3) St. granulosum (4) St. corneum

Q.7 Barrier layer refers to :–
(1) St. corneum (2) St. lucidum
(3) St. spinosum (4) St. germinivatum

Q.8 Dermis of rabbit is differentiated in :–
(1) St. compactum and St. spongiosum
(2) Papillary and Subcutaneous layer
(3) Papillary and reticular layer
(4) Parietal and visceral layer

Q.9 Which type of sweat glands secrete a pale sweat–
(1) Eccrine (2) Apocrine
(3) Holocrine (4) Endocrine

Q.10 In which layer of skin blood capillaries are absent:–
(1) Dermis (2) Epidermis
(3) Subcutaneous layer (4) Muscle layer

Q.11 Integument consist of :–
(1) Skin
(2) Skin + skin derivatives
(3) Skin + glands (4) Skin + hairs

Q.12 Integument of rabbit :–
(1) Conserves heat in winter
(2) Looses heat during summer
(3) Protects body (4) All the above

Q.13 Preservation of whole skin is called :–
(1) Tanning (2) Taxidermy
(3) Teratology (4) Toxicology

Q.14 Complete absence of melanin pigment in skin is called :–
(1) Albinism (2) Cretinism
(3) Alkaptunuria (4) Colour blindness

Q.15 Cell of stratum malpighi are :–
(1) Oval (2) Flat
(3) Columnar (4) Spherical

Q.16 Pigmented dendritic cells occur in :–
(1) Stratum malpighi (2) St. granulosum
(3) St. corneum (4) St. lucidum

Q.17 Which layer is thickest in sole and palm :–
(1) Corneum (2) Spinosum
(3) Granulosum (4) Subcutaneous

Q.18 Horns, Nails and hairs composed of :–
(1) Collagen (2) Elastin
(3) Keratin (4) Cutin

Q.19 Primary function of sweat glands is :–
(1) Thermoregulation (2) Excretion
(3) Osmoregulation (4) None of these

Q.20 Main function of mammalian skin is :–
(1) Removal of excess water
(2) Excretion
(3) Storage of food
(4) Acting as receptor organ

Q.21 Pressure receptors in skin :–
(1) Meissner's corpuscles
(2) Merkel's disc
(3) Pacinian corpuscles (4) Krause corpuscles

Q.22 Which of the following stimulated by cold :–
(1) End organ of Ruffini
(2) Meissner's Corpuscles
(3) End bulb of Krause
(4) Whiskers

Q.23 The tips of penis and Clitoris are more sensitive because of :–
(1) Genital corpuscles
(2) Sebaceous glands
(3) End organ of ruffini
(4) Pacinian corpuscles

Q.24 Type of locomotion in rabbit is :–
(1) Plantigrade (2) Digitigrade
(3) Unguligrade (4) None

Q.25 Blubber occurs in :–
(1) Seal (2) Whale
(3) Dolfins (4) All the above

Q.26 Which bone derived from skin :–
(1) Skull bones (2) Patella
(3) Flat bones (4) All the above

Q.27 Melanocytes are :–
(1) Cuboidal (2) Round
(3) Dendritic (4) Type of neuron

Q.28 Rabbit lives in :–
(1) Grass land (2) Burrows
(3) Warren (4) Caves

Q.29 Pars papillaris and pars reticularis are the regions of-
(1) Epidermis (2) Corium
(3) Hypodermis (4) None of the above

Q.30 Arrector pili muscles are :–
(1) Voluntary
(2) Involuntary
(3) Voluntary as well as involuntary
(4) None of the above

Q.31 In rabbit, sweat glands are present in :–
(1) Near the eyes (2) The digits
(3) The lips (4) None of the above

Q.32 Horns of Rhinoceros are made up of :–
(1) Keratin (2) Chitin
(3) Bone (4) Cartilage

Q.33 Sebaceous glands secrete oily substance to:–
(1) Make body surface smooth and water proof
(2) Help in temperature regulation
(3) Keep body warm (4) None of these

Q.34 Which of the following is present in frog's skin but not in mammalian skin :–
(1) Sebaceous glands
(2) Stratum germinativum
(3) Malpighian layer (4) Mucous glands

Q.35 Mammary gland are the modification of :–
(1) Sebaceous glands (2) Sweat glands
(3) Meibomian glands (4) None of these

Q.36 Sweat glands are primarily connected with :–
(1) Dissipation of body heat
(2) Regulation of water content
(3) Removal of extra salts
(4) Destroying skin bacteria

Q.37 Mucous glands do not occur in mammalian skin because it is :–
(1) Not respiratory (2) Tough
(3) Many layered (4) Not slippery

Q.38 Nails, claws, horns and hoofs are formed by–
(1) Cartilage (2) Bone
(3) Stratum corneum of skin
(4) Skin muscles

Q.39 Ecdysis is shedding of :–
(1) Stratum corneum (2) Epidermis
(3) Dermis (4) Stratum malphigi

Q.40 Simple coiled tubular glands occur in :–
(1) Dermis of skin (2) Spleen
(3) Liver (4) Kidney

Q.41 Organs of Ruffini are receptors of :–
(1) Cold (2) Pressure
(3) Heat (4) Touch

Q.42 Blood vessels do not pierce :–
(1) Dermis (2) Endodermis
(3) Epidermis (4) None of the above

Q.43 Epidermis of skin of vertebrates comprises :–
(1) Simple epithelium (2) Stratified epithelium
(3) Transitional epithelium
(4) Columnar epithelium

Q.44 Dermis of the skin is formed of :–

(1) Adipose connective tissue

(2) Epithelial tissue

(3) Muscular tissue

(4) Areolar connective tissue

Q.45 Yellow fibers are made up of :–

(1) Ossein (2) Elastin

(3) Chondrin (4) Collagen

Q.46 Complexion of skin in human beings is a mixed effect of :–

(1) Keratin, Melanin and haemoglobin

(2) Carotene, Keratin and haemoglobin

(3) Carotene, Melanin and haemoglobin

(4) Keratin, albinism and melanin

Q.47 Maximum tactile receptors are found on :–

(1) Lips and nipples

(2) Glans penis and valva

(3) Tips of Fingers (4) All of the above

Q.48 Which cell types occur in maximum percentage in skin epidermis of mammals :–

(1) Keratinocytes (2) Melanocytes

(3) Granulocytes (4) All the above

Q.49 Naked dendrites are receptors for :–

(1) Smell (2) Touch

(3) Taste (4) None of these

Q.50 Sweat glands in Rabbit are mainly found :–

(1) Near the lips (2) Base of tail

(3) Wide spread over the body

(4) Underside of claws

EXERCISE - 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Mammary glands are modified-**[CPMT 1993]**
(1) Sweat gland (2) Sebaceous gland
(3) Alveolar gland (4) Oil gland

Q.2 Hair are - **[CBSE 1993]**
(1) Epidermal and made up of non living cells
(2) Dermal and made up of living cells
(3) Epidermal and made up of living cells
(4) Dermal and made up of non living cells

Q.3 Secretion of gland is- **[CBSE 1993]**
(1) Holocrine (2) Apocrine
(3) Eccrine (4) Merocrine

Q.4 Coiled tubular glands are present in- **[CPMT 1993]**
(1) Villi (2) fundus of stomach
(3) skin dermis
(4) seminiferous tubules

Q.5 Which pair respectively gives opposite characteristics of frog and rabbit- **[CPMT 1994]**
(1) carnivorous : omnivorous
(2) white-coloured : green - coloured
(3) ectothermic : endothermic
(4) None of these

Q.6 Which one of the following sets of derivatives of integumentary structures characterise birds as glorified reptiles ? **[PCS 1994]**
(1) Syrinx and scales
(2) Scales and claws
(3) Claws and uropygial glands
(4) Syrinx and uropygial glands

Q.7 'Human thermostat' is- **[RPMT 1994]**
(1) Kidney (2) Medulla oblongata
(3) Hypothalamus (4) Pineal gland

Q.8 The term 'blubber' refers to- **[Karnataka CET 1994]**
(1) a substitute for natural rubber
(2) a subcutaneous deposition of fat in whales
(3) the irregular heart-beat sounds
(4) none of these

Q.9 A main function of skin in mammals is to- **[CPMT 1995]**
(1) Provide protection
(2) Prevent bacterial infection
(3) Cool the body in hot climate conditions
(4) None of these

Q.10 In Minamata Bay, Japan which animal remained free from Minamata disease - **[CBSE 1995]**
(1) Cat (2) Dog
(3) Rabbit (4) Pig

Q.11 Vibrissae of rabbit are- **[CPMT 1996]**
(1) papillae upon skin
(2) skin webs between toes
(3) long tactile hairs upon upper lip
(4) kill any bacteria present on the skin

Q.12 Nails, hoofs and horns are derived from the tissue: **[Orissa JEE 1996]**
(1) Cartilage (2) Bone
(3) supporting tissue (4) Epithelium

Q.13 The function of the sebaceous gland in the skin of a mammal is to : **[PCS 1997]**
(1) Remove waste matter from the skin
(2) Make skin soft and oily
(3) Maintain body temperature
(4) kill any bacteria present on the skin

Q.14 Stratum germinativum is derived from which epithelium - **[CBSE 97, CPMT 1997]**
(1) Columnar (2) Cuboidal
(3) Squamous (4) Ciliated

Q.15 Which gland is present in frog's skin but not in rabbit's skin - **[MP PMT 1997]**
(1) Moll's gland (2) Mucous gland
(3) Sweat gland (4) Sebaceous gland

Q.16 In human body ectoderm is responsible for the formation of - **[BHU 1997]**
(1) Lens of eye (2) Nervous system
(3) Sweat glands (4) All of them

Q.17 Mode of secretion by sebaceous (sebum-secreting) glands is- **[CMPT 1993, 97]**
(1) Merocrine (2) Apocrine
(3) Merocrine (4) Holocrine

Q.18 Epidermis of the skin is specialized for : **[CPMT 1998]**
(1) protection (2) respiration
(3) absorption (4) all of these

Q.19 Vitamin D_3 is produced in the skin by the action of sunlight upon : **[BHU 1998]**
(1) cephalocholesterol (2) Δ 5,7-cholesterol
(3) 1,4-dihydroquinone (4) all of these

Q.20 Melanoblasts lie : **[MPPMT 1998]**

(1) In dermis

(2) In stratum corneum

(3) In stratum Malpighi

(4) At the junction of epidermis and dermis

Q.21 Cutaneous glands are- **[MPPMT 1998]**

(1) Sebaceous glands (2) gastric glands

(3) thyroid glands (4) thymus glands

Q.22 Thermoregulatory centre in mammals is located in- **[CPMT 1983, 84, 86, 88; BHU 1998]**

(1) Skin (2) Pituitary

(3) Diencephalon (4) Hypothalamus

Q.23 Pacinian corpuscles are receptor of- **[RPMT - 98]**

(1) Deep pressure (2) Pain

(3) Temperature (4) Hearing

Q.24 Exposed surface of the human body is covered by the tissue- **[RPMT - 98]**

(1) Glandular epithelium

(2) Striated squamous epithelium

(3) Ciliated epithelium (4) Epidermis

Q.25 Sharpey's fibres are invaded in- **[RPMT - 98]**

(1) Collagen (2) Muscle

(3) Bone (4) Skin

Q.26 In frog, stratum spongiosum is made up of : **[EAMCET 1999]**

(1) stratified epithelium

(2) dense connective tissue

(3) loose fibrous connective tissue

(4) none of these

Q.27 Which structure is formed by keratin ? **[RPMT - 99]**

(1) Dermal papilla (2) Hair shaft

(3) Root of hair (4) Hair follicle

Q.28 Which one of the following is a matching pair of a certain secretion and its primary role in human physiology ? **[CBSE 2000]**

(1) Saliva—tasting food

(2) Sebum—sex attraction

(3) Sweat—thermoregulation

(4) Tears—excretion of salts

Q.29 Which one of the following animal contains idiophores in its integument ? **[RPMT - 2000]**

(1) Dog fish (2) Parrot

(3) Siren (4) Orangutan

Q.30 An example of merocrine gland is- **[MPPMT 2001]**

(1) Sebaceous gland (2) Pineal gland

(3) Salivary gland (4) Mammary gland

Q.31 During aging collagen present in intercellular spaces becomes - **[MPPMT 2001]**

(1) Destroyed

(2) Impermeable and rigid

(3) More elastic (4) All of the above

Q.32 Which one of the following is compound tubular gland - **[CPMT 2001]**

(1) Sweat gland (2) Sebaceous gland

(3) Mammary gland (4) Salivary gland

Q.33 The adipose tissue in the skin is found in the : **[RPMT - 2001]**

(1) dermis (2) subcutaneous layer

(3) Malpighian layer (4) epidermal layer

Q.34 The colour of the skin is due to the presence of : **[RPMT - 2001]**

(1) Keratohyalin found in the layer stratum granulosum

(2) collagen found in the subcutaneous layer

(3) melanin present in the dermis

(4) both 'a' and 'b'

Q.35 The mammary glands are derived from: **[RPMT- 2001]**

(1) sweat glands (2) adipose tissue

(3) hair follicles (4) sebaceous glands

Q.36 Which of the following is not a function of the mammalian skin ? **[RPMT - 2001]**

(1) Display of emotions

(2) Formation of vitamin D

(3) Absorption of food stuff

(4) Excretion of water matter

Q.37 Which one of the following is not the part of the epidermis ? **[RPMT - 2001]**

(1) Stratum granulosum (2) Stratum lucidum

(3) Stratum corneum (4) Subcutaneous layer

Q.38 Maximum power of division is found in the skin layer : **[MPPMT 2002]**

(1) stratum corneum (2) stratum spinosum

(3) stratum Malpighi (4) stratum granulosum

Q.39 Shivering with cold in winter is caused by : **[MPPMT 2002]**

(1) voluntary action of striated muscles

(2) voluntory action of unstriated muscles

(3) involuntary action of striated muscles

(4) involuntory action of unstriated muscles

Q.40 Which gland is associated with fur hairs of Rabbit ? **[RPMT - 2002]**

(1) Mucous gland (2) Sweat gland

(3) Mammary gland (4) Sebaceous gland

Q.41 Body temperature is regulated by- **[Orissa JEE-2003]**

(1) Lungs, muscles and skin

(2) Skin only

(3) Circulatory system (4) Skeletal system

Q.42 A camel is able to tolerate the heat of the desert by- **[BV Pune-2003]**

(1) Storing water in hump

(2) Shunting blood to its hump

(3) Having a small ratio of surface area to volume

(4) Allowing its body temperature to drop at night

Q.43 The animals which have a built in thermostat to maintain constant body temperature is called- **[CPMT-2003, Pb. PMT-2003]**

(1) Biothermic (2) Oligothermic

(3) Homoiothermic (4) Poikilothermic

Q.44 Sudoriferous glands occur in- **[CPMT 2004]**

(1) Skin (2) Lung

(3) Kidney (4) Alimentary canal

Q.45 Melanin is secreted by- **[PCS 2005]**

(1) Erythroblasts of blood

(2) Chromatophores of skin

(3) Cells of stratum compactum

(4) Ganglions of sensory nerves

Q.46 Nails of vertebrates are derived from - **[PCS -2005]**

(1) Stratum corneum

(2) Stratum lucidum

(3) Stratum germinativum

(4) Stratum granulosum

Q.47 Function of skin of mammals is- **[RPMT-2006]**

(1) Protection

(2) Thermoregulation and sensation

(3) Excretion (4) All the above

Q.48 Gland found in the skin of eye rabbit is- **[RPMT-2006]**

(1) Perineal gland (2) Meiobian gland

(3) Lacrymal (4) Harderian gland

Q.49 Nails, Hoof and Horn are madeup of - **[RPMT-2007]**

(1) Keratin (2) Chitin

(3) Cartilage (4) Bone

Q.50 Where are cornified cells found- **[RPMT-2007]**

(1) Epidermis (2) Hypoderm

(3) Mesoderm (4) Dermis

Q.43	3	Q.44	1	Q.45	2	Q.46	1	Q.47	4	Q.48	2	Q.49	1
Q.50	1												

These questions consist of two statements each, printed as Assertion and Reason. While answering to choose any one of the following four responses.

(1) If both Assertion & Reason are True & the reason is correct explanation of the Assertion.

(2) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.

(3) If Assertion is True but the Reason is False.

(4) If both Assertion & Reason are false.

Q.1 **A :** Skin provides us safety against sunburn.
R : Melanin present in the epidermal cells absorb UV-rays of the sun that can cause sunburn.

Q.2 **A :** Arrector pili muscles, by contraction, make hair erect in cold weather.
R : Arrector pili muscles are striated to move the hair quickly.

Q.3 **A :** Skin becomes wrinkled in old age.
R : Dermis contains white (collagen) fibers.

Q.4 **A :** Human skin lacks mucous glands.
R : Vertebrate epidermis is a stratified epithelium.

Q.5 **A :** Skin acts as a nourishing organ also.
R : Skin forms vitamin D from a cholesterol derivative in the presence of sunlight.

Q.6 **A :** Finger prints help in tracing criminals.
R : Each person has a characteristic pattern of finger prints.

Q.7 **A :** Sweat produced by apocrine sweat glands may produce unpleasant odour.
R : Apocrine secreted sweat is odourless but bacterial degradation of substances present in it generates unpleasant odour.

Q.8 **A :** Humans perspire on hot days and severe exercise.
R : Sweat cools the body.

Q.9 **A :** Keratin of horny layer of skin is water proof.
R : Epidermis is a stratified squamous epithelium.

Q.10 **A :** Mammalian skin has hairy coat and subcutaneous fat.
R : Homeothermy requires retention of body's heat.

Q.11 **A :** All derivative of skin are ectodermal in origin.
R : Hairs and nails are cutaneous derivatives which derive from dermis of skin.

Q.12 **A :** All cutaneous glands are ectodermal in origin.
R : All cutaneous glands are form by invagination of epidermis in dermis.

Q.13 **A :** Mammalian skin is also called as jack of all trades.
R : Skin performs many function

Q.14 **A :** Human skin is considered as a respiratory organ.
R : Human skin eliminates some carbon dioxide in the sweat.

Q.15 **A :** Skin contributes in regulation of body temperature by loosing or preserving body heat.
R : Regulation of body temperature is primarily a function of skin only.

Q.16 **A :** During surgery, incisions are made parallel to the line of langerhans.
R : This is done to minimize the damage to integument & promote fast healing of scar.

Q.17 **A :** Cutis anserina occurs on exposure to cold.
R : It occurs to conserve heat & prevent its loss body.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

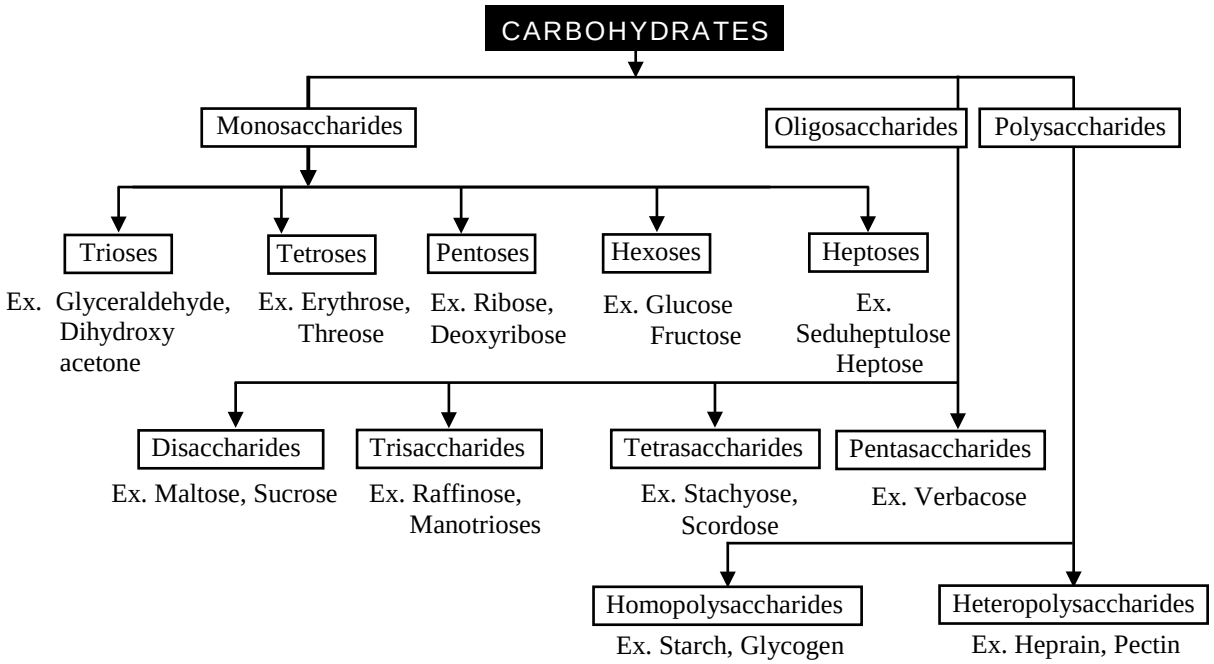
Robert Hook

BIOMOLECULE

CLASSIFICATION OF CARBOHYDRATES :



On the basis of numbers of saccharides in hydrolysis, Carbohydrates are classified as **Monosaccharides, oligosaccharides** and **Polysaccharides.**

A. Monosaccharides : -

(i) They are **simplest sugars** which can not be further hydrolysed.

(ii) In their generalized formula **x is always equal to y** i.e. number of Carbon and Oxygen atoms same.

(iii) First step of oxidation – **Phosphorylation**

(iv) All monosaccharides occur in d and ℓ form, except the **DHAP.**

$$\begin{array}{l} CH_2OH \\ | \\ C = O \\ | \\ CH_2OH \end{array}$$

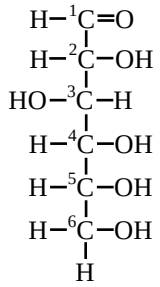
Dihydroxy acetone

(v) The structure of saccharides is either **ring or straight chain.**

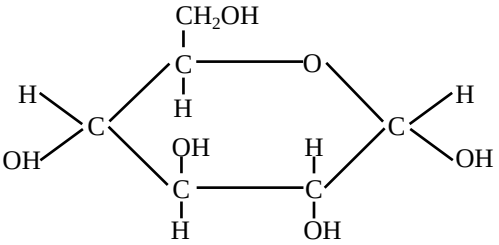
(vi) A six membered ring is known as **pyranose** and five membered ring is **furanose.**

Pyranose and furanose names were given by **''Haworth.''**

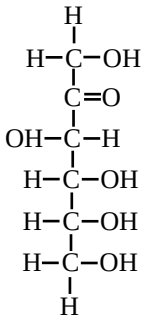
(vii) **Anomers –** In aqueous solution, Glucose occurs in cyclic structure. In anomers, position of –H and –OH groups are changed on C_1 carbon atom.



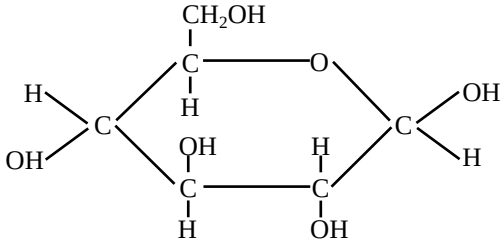
Glucose (Straight chain)



α-Glucose (Pyranose structure)



Fructose (Straight chain)



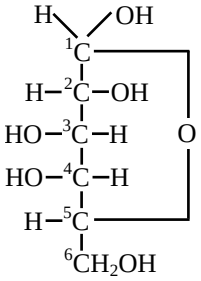
β-Glucose

Epimer : Isomer formed as result interchange of the –OH and –H groups on carbon atom 2, 3 and 4 of glucose, are know as epimer.

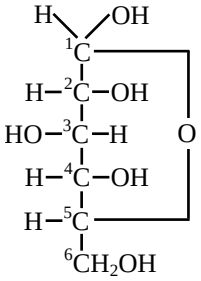
Epimer of Glucose :

Mannose (Difference on C_2 carbon)

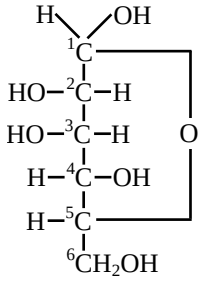
Galactose (Difference on C_4 carbon)



Galactose



Glucose



Mannose

CLASSIFICATION OF MONOSACCHARIDE				
No. of carbon atom	**Name of group**	**Example**		
	Sugar	**Formula**	**Aldose** **Suffix – ''ose''**	**Ketose** **Suffix – ''ulose''**
3	Triose	$C_3H_6O_3$	Glyceraldehyde	Dihydroxy acetone
4	Tetrose	$C_4H_8O_4$	Erythrose Threose	Erythrulose
5	Pentose	$C_5H_{10}O_5$	Ribose Xylose Arabinose **Deoxyribose** **($C_5H_{10}O_4$)**	Ribulose Xylulose
6	Hexose	$C_6H_{12}O_6$	Glucose, Galactose Mannose, Rhamnose	Fructose or Levulose

7	Heptose	$C_7H_{14}O_7$	Sedoheptose	Sedoheptulose

On the basis of number of carbon atoms monosaccharides are classified in following groups :

(i) **Trioses** – $C_3H_6O_3$ e.g. Glyceraldehyde and Dihydroxy acetone. **PGAL and DHAP are percursors of all other carbohydrates.**

(ii) **Tetroses** – $C_4H_8O_4$ e.g. Erythrose, Erythrulose

(iii) **Pentoses** – $C_5H_{10}O_5$ e.g. Ribose, Ribulose, Xylulose, Arabinose, *Deoxyribose ($C_5H_{10}O_4$)

(iv) **Hexoses** – $C_6H_{12}O_6$ e.g. Glucose Fructose, Galactose, Mannose, *Rhamnose ($C_6H_{12}O_5$)

(v) **Heptose** – $C_7H_{14}O_7$ e.g. Sedoheptulose

- Chemically all carbohydrates are **polyhydroxy aldehyde or ketones.**
- Monosaccharides with free aldehyde group are termed as ***Aldoses*** (PGAL, Erythrose, Ribose, Arabinose, Deoxyribose, Glucose, Galactose, Mannose).
- While monosaccharides with free ketone group are called ***ketoses*** (DHAP, Erythrolose, Ribulose, Xylulose, Fructose, Sedoheptulose).
- All monosaccharides are **''reducing sugars''** as their free aldehyde or ketone groups are capable of reducing Cu^{++} to Cu^{+}.

  This property is the basis of **Benedict's test or fehling's test** used to detect the **presence of glucose in urine.**
- Beside RNA **ribose sugar** is an important component of ATP, NAD, NADP and FAD
- In deoxyribose the second carbon is devoid of oxygen atom
- Arabinose occurs in **''Gum arabic''.**
- Glucose is dextrorotatory so it is called **''dextrose''**
- Glucose is found in grapes in abundant quantity so it is known as **''grape sugar''**
- Glucose is the main respiratory substrate in the body. Other types of hexose are converted into glucose by liver.
- Fructose is Laevorotatory so it is called **''Laevulose''**
- Fructose is found in honey and sweet fruits so it is called as **''Fruit Sugar''.**
- Fructose is the **sweetest sugar.**
- Galactose is not found in free stage.
- In mammalian body, galactose occurs as a part of milk sugar lactose.
- Galactose is also found as a component of **glycolipids** (for e.g. **cerebrosides**) and **pectin, Hemi cellulose** etc.
- **Mannose** not found in free state.
- Mannose occurs in **albumin of egg** and in **wood** as component of hemicellulose.
- Most sweetest chemical substance is **Thaumatine,** Obtained from a bacteria ***Thaumatococcus danielli.*** Glucose is also known as **blood sugar**. **Aspartame** is most commonly used **artificial sweetner.**
- Galactose is known **brain-sugar**

DERIVATIVES OF MONOSACCHARIDES :

(1) **Amino sugars** – Formed by the displacement of hydroxyl group from second carbon atom by amino group e.g. **Glucosamine**, **Galactosamine.**

(2) **Sugar alcohol –** Aldehyde group (–CHO) of the sugar is changed to primary alcohol (–CH_2OH). **Sorbitol** and **Mannitol** are respectively formed from glucose and mannose.

(3) **Sugar acids** – They are formed by the oxidation of terminal –CHO or –CH_2OH group of sugar to produce carboxyl group –COOH e.g. **Glucoronic acid**, **Galacturonic acid.**

(4) **Glycoside** – They are compounds formed by condensation reaction between a sugar (eg. glucose) and hydroxyl group of another substance which may be a sugar, a sterole, methanol in presence of dry HCl. They are acetel which can be hydrolysed by strong reagents like HCN, NH_2OH, $C_6H_5NHNH_2$. They cannot be hydrolysed in acidic condition. **Streptomycin is a glycoside.**

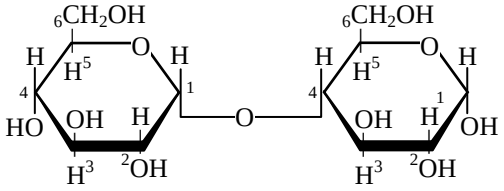
B. Oligosaccharides

Oligosaccharides are those carbohydrates which on hydrolysis yield **2 to 10 monosaccharide** units (monomers). In oligosaccharides, monosaccharides are linked together by **glycosidic bonds.** Aldehyde or ketone group of one monosaccharide reacts with alcoholic group of another monosaccharide to form glycosidic bond. One molecule of H_2O eliminates during glycosidic bond formation (**dehydration synthesis**). Direction of glycosidic bonds is usually 1'.4".

Types of Oligosaccharides : -

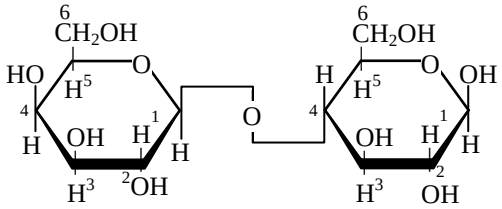
(i) **Disaccharides** – composed of **two monosaccharide** units e.g. **Maltose**, **Sucrose**, **Lactose**, **Trehalose.**

- All disaccharides are water soluble and sweet in taste, so they are known as **sugar.**



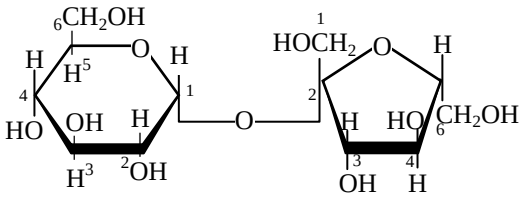
Glucose Glucose

Maltose



Galactose Glucose

Lactose



Glucose Fructose

Sucrose

- **Maltose** is commonly called **malt sugar.** It is intermediate compound in starch digestion. Maltose has 1'-4" glycosidic linkage between **α-D glucose** and **α-D glucose**
- Lactose is milk sugar with β-1'-4" glycosidic linkage between **glucose** and **galactose**
- Lactose is **least sweetest sugar**.
- Maximum % of lactose = Human milk ≈ 7%
- In plants transport of sugar is present in form of sucrose.
- Sucrose is also known as **invert sugar.**
- Sucrose is called **Cane Sugar or Table Sugar or Commercial Sugar.** Sucrose composed of **α-D Glucose** and **fructose.**

- **Trehalose** is present in **haemolymph** of insects. It has glycosidic linkage between two anomeric carbon (**α-glucose and β-Glucose**).

(ii) **Trisaccharides –** ***e.g*** Raffinose (Galactose + Fructose)

(iii) **Tetrasaccharides –** ***e.g*** Stachyose (Gal. + Gal. + Glu. + Fructose)

(iv) **Pentasaccharides –** ***e.g*** Barbascose (Gal + Gal + Glu + Glu + Fructose)

Raffinose and stachyose occur in phloem and may be employed for translocation carbohydrates.

C. Polysaccharides : -

- Poly saccharides composed of large number of monosaccharide units.
- Suffix '–an' added in their names and they are known as **glycans.**
- Pentose polysaccharides are called **pentosans** for e.g.
  Araban (from L-arabinose), xylan (from D-xylose), all these found in cell wall.
- Hexose polysaccharides are called **''hexans''** . for e.g. mannan (from mannose) **cellulose, starch** etc.
- Polysaccharides are insoluble in water and do **not taste sweet.**
- All polysaccharide are **non-reducing**
- Accroding to function, they are classified as **nutritive** and **structural**.

On structural basis polysaccharides are of two types.

(I) Homopolysaccharides : -

Composed of same monomers. Biologically important homopolysaccharides are as follows :

(a) Cellulose : - Linear polymer of **β-D-glucose** units (6000 to 10,000) . It has **β 1'-4'' linkage**. Partial digestion yields a **cellobiose units** (Disaccharide).
Cellulose is main component of plant cell wall. In **wood,** cellulose is **50%** and in **cotton,** it is **90%.**

- **Most abundant organic molecule on earth.**
- In urochordates animals their occur cellulose like material and it is called **''Tunicine''** It is also called **animal cellulose**.
- It is also used to form **Rayon fibre** (Artificial silk).

(b) Starch – It is main stored food in plants. Starch is polymer of **α-D-glucose units**. Starch consists of two types of chains.

(i) **Amylose –** 250-300 glucose units are arranged in an **unbranched chain** by **α 1'-4'' linkage.**

(ii) **Amylopectin –** A **branched chain molecule**. Approximately 30 glucose units are linked by **α-1' 4''** and **α-1', 6''** linkage.

- Amylose gives **blue colour** with **iodine**.
- Amylopectin gives **red** colour with **iodine.**
- Starch present in **potato** contains **20% amylose** and **80% amylopectin.**

(c) Glycogen – storage form of carbohydrate in animals, storage region of glycogen is **liver** and **muscles.** Storage of glycogen **liver > muscle**. Glycogen is also called as **animal starch.** Glycogen is highly branched polymer of α-D-glucose.

- Glycogen is formed by the 1'-4" bond linkage at long chain and 1', 6" bond linkage at branching point.
- Glycogen gives **red colour** with **iodine.**
- Glycogen is store food of **fungi.**

(d) Chitin – Linear polymer of **N-acetyl-D-glucosamine** with β-1', 4"-linkage.

- N-acetyl D-glucosamine is an amino acyl (-NH-CO-CH_3) derivative of β-D-glucose.
- Chitin is an important component of **exoskeleton of Arthropods** and **cell walls of fungi.**
- **Second most abundant organic molecule** on earth.
- It is also called **Fungal cellulose.**

(e) Inulin – Linear polymer of fructose units linked with β-1', 2" bonds. Inulin is found in **roots of Dahalia** and **Artichoke.** It is water soluble polysaccharide and it is used to know the **glomerular filteration rate.**

- It is **smallest storage polysaccharide.**

(f) Dextrin – Dextrin is an intermediate substance in the digestion of glycogen and starch. By hydrolysis of dextrin, glucose and maltose are formed. It also occurs as **stored food** in **yeast and bacteria.**

(II) Heteropolysaccharide –

Composed of different monosaccharide units.

(a) Hyaluronic acid – Found in **vitreous humour**, **umbillical cord, joints** and **connective tissue** in the form of lubricating agent. It also occurs in animal cell coat as binding material **(Animal cement).**

- Hyaluronic acid is made up of **D-glucouronic** acid and **N-acetyl – D-glucosamine** arranged in alternate orders. These different monosaccharides have β-1'-4" bonds and such disaccharides have β -1- 4 bonds.

(b) Chondriotin – D-glucuronic acid + N-acetyl galactosamine.

- Chondriotin occurs in **connective tissue.**
- Sulphate ester of chondriotin is main structural component of **cartilages, tendons** and **bones.**

(c) Heparin – It is **anticoagulant** of blood. Heparin is made up of D-glucuronic acid and N-sulphate glucosamine arranged in alternate order

(d) Pectins – Methylated galacturonic acid + galactose + arabinose.

- Pectin found in cell wall where it binds cellulose fibrils in bundles.
- Salts of pectin i.e Ca and Mg-pectates form **middle lamella** in plants.
- It is also called **Plant cement.**

(e) Hemicellulose – Mannose + Galactose + Arabinose + Xylulose.

- Store material – **Phytalophus (Ivory palm)**. Hemicellulose which is obtained from this plant is white, hard and shiny and it is used to form **billiard ball** and **artificial ivory.**

MUCOPOLYSACCHARIDES :

Slimy polysaccharides with capacity to bind proteins and water are called mucopolysaccharides. In plants mucilage is a common mucopolysaccharide formed of galactose and mannose units.

Hyaluronic acid, chondriotin, heparin are other examples.

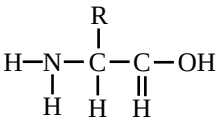
Special Points :

1. **Peptidoglycan –** Present in cell wall of bacteria.
   – Composed of **N-acetyl Glucosamine** + **N-acetyl muramic acid** + **peptide chain of 4-5 amino acids.**
2. **Agar-Agar –** It is a mucopolysaccharide which is obtained from some red algae – **Gracilaria**, **Gelidium, Chondrus.** Its is composed of **D-galactose** and **L-galactose** unit and after every 10^{th} unit a sulphate group is present it is used for preparing **culture medium** (1, 3 linkage)

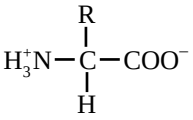
PROTEINS

Protein name is derived from a greek word which means **'' holding first place ''** (**Berzelius and Mulder**)

- Essential elements in protein are C, H, O, N,
- Most of the proteins contain sulphur. In some proteins iodine, iron and phosphorus are present.
- After water proteins are most abundant compounds in protoplasm. (**7-14%**)
- Proteins are **polymer of amino acid** (Fisher and Hofmeister). There are approximately 300 amino acids known to exist but only **20 types of amino acids** are used in formation of proteins.



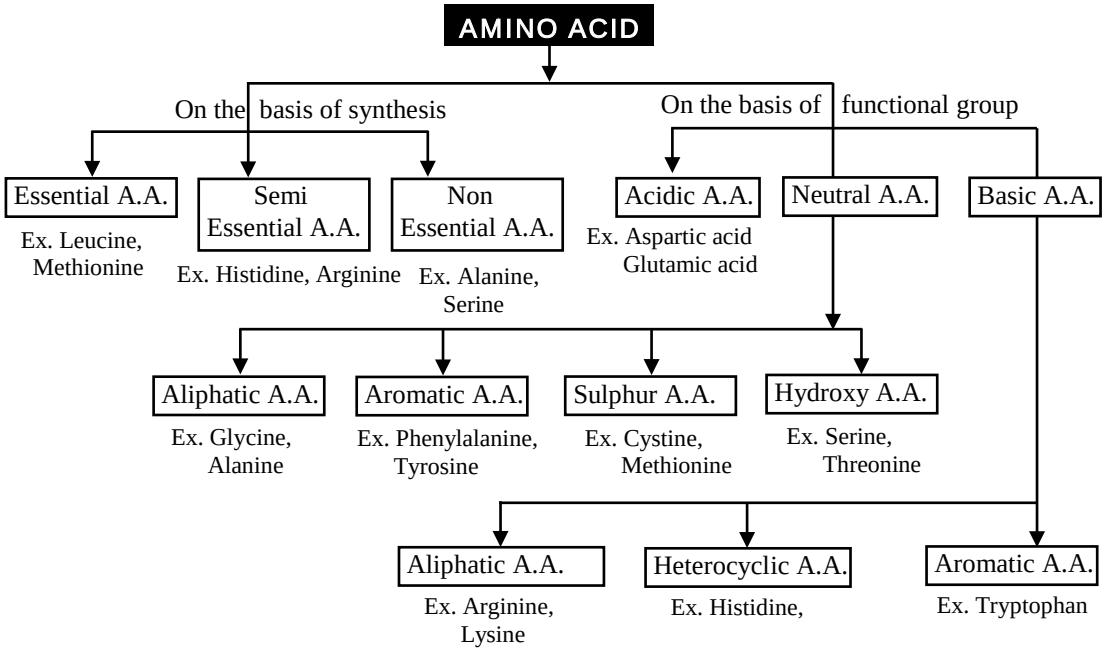
- Each amino acid is **amphoteric compound** because it contains one weak acidic group –COOH and a weak alkaline group $–NH_2$
- In protoplasm free amino acid occurs as ions **(at iso electric point)**



Zwitter ion

- **Iso electric point is** that point of pH at which amino acids do not move in electric field.
- Out of 20 amino acids, 10 amino acids are not synthesized in body of animals so they are must in diet. These called **Essential amino acid**. e.g. Threonine, Valine, Leucine, Isoleucine, Lysine, Methionine, Phenylalanine Tryptophan, arginine, Histidine. **Arginine and Histidine are semi essential.**
- 10 amino acids are synthesized in animal body so these called **Non essential amino acids.** for e.g. Glycine, Alanine, Serine, Cysteine, Aspartic acid, Glutamic acid, Asparagine, Glutamine, Tyrosine, Proline

Classification of Amino Acids –



(A) Amino acids can be classified on the basis of their group –

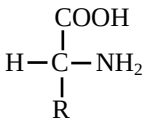
(i) **Non-polar R group –** Glycine, Alanine, Valine, Leucine, Isoleucine, Proline, Methionine, Phenyl alanine, Tryptophan.

(ii) **Polar but uncharged R group –** Serine, Threonine, Cysteine, Tyrosine, Asparagine, Glutamine

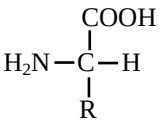
(iii) **Positively charge polar R-group –** Lysine, Arginine, Histidine **(Basic Amino acid)**

(iv) **Negatively charged polar R-group –** Aspartic acid, Glutamic acid **(Acidic Amino acid)**

Except glycine, each amino acid has two enantiomeric isomers

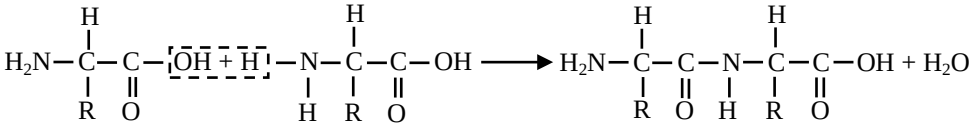


D-amino acid



L-amino acid

- Eukaryotic proteins have L-amino acid while D-amino acid occurs in bacteria and antibodies : Amino acids join with peptide bond to form protein.



Dipeptide

- **Peptidyl transferase** enzyme catalyses the synthesis of peptide bond.
- Property of protein depends on **sequence of amino acid** and configuration of protein molecules.

Special points on Amino acid :

- **Glycine is** the **simplest** and **tryptophan** is **complex** Amino acid.
- Cysteine, Cystine, Methionine are the sulphar containing Amino acid.
- Phenyl alanine, Tyrosine, Tryptophan Amino acids are aromatic Amino acid.
- Serine & Threonine are alcoholic amino acid.
- Histidine, Proline & hydroxyproline are heterocyclic amino acid.
- **All the amino acids are laevo-rotatory, except Glycine which is non-rotatory.**

- Amino acids which participate in protein synthesis called protein Amino acid and which do not participate called non-Protein.

eg. GABA, Ornithine, Citrulline.

- **Proline, Hydroxy proline** contain imino group $\left(-\ddot{\underset{|}{N}}H\right)$ instead of amino group so they are also called **imino acid.**

Configuration of Protein Molecule –

(1) **Primary configuration or structure –** A straight chain of amino acids linked by **peptide bonds** form primary structure of proteins. This structure of protein is most unstable. Newly formed proteins on ribosomes have primary structure .

(2) **Secondary configuration –** Protein molecules of sec. structure are spirally coiled. In addition to **peptide bond, amino acids** are linked by **hydrogen bonds** form between oxygen of one amide group and hydrogen of another amide group. This structure is of two types –

(i) **α–Helix** – Right handed rotation of spirally coiled chain with approximately $3\frac{1}{2}$ amino acids in each turn. This structure has **intramolecular hydrogen bonding** i.e. between two amino acids of same chain e.g. **Keratin, Myosin, Tropomyosin.**

(ii) **β-Helix or pleated sheath structure –** Protein molecule has zig – zag structure. Two or more protein molecules are held together by **intermolecular hydrogen bonding. e.g. fibroin** (silk).

(3) **Tertiary Structure –** Protein of tertiary structure are highly folded to give a globular appearance. They are **soluble in water** (colloid solution). This structure of protein has following bonds –

(i) **Peptide bond** = strongest bond in proteins.

(ii) **Hydrogen bonds**

(iii) **Disulphide bond –** These bonds form between – SH group of amino acid (**Methionine, Cysteine**). These bonds are second strongest bond and **stabilize tertiary structure** of protein.

(iv) **Hydrophobic bond –** Between amino acids which have hydrophobic side chains for ***e.g.*** Aromatic amino acid

(v) **Ionic bond –** Formation of ionic bond occus between two opposite ends of protein molecule due to **electrostatic attraction**

Majority of proteins and enzymes in protoplasm exhibit **tertiary** structure.

Quaternary Structure –

Two or more poly peptide chains of tertiary structure unite by different types of bond to form quaternary structure of protein. Different polypeptide chains may be similar **lactic - dehydrogenas** or dissimilar types (**Haemoglobin, insulin**).

Quaternary structure is most stable structure of protein.

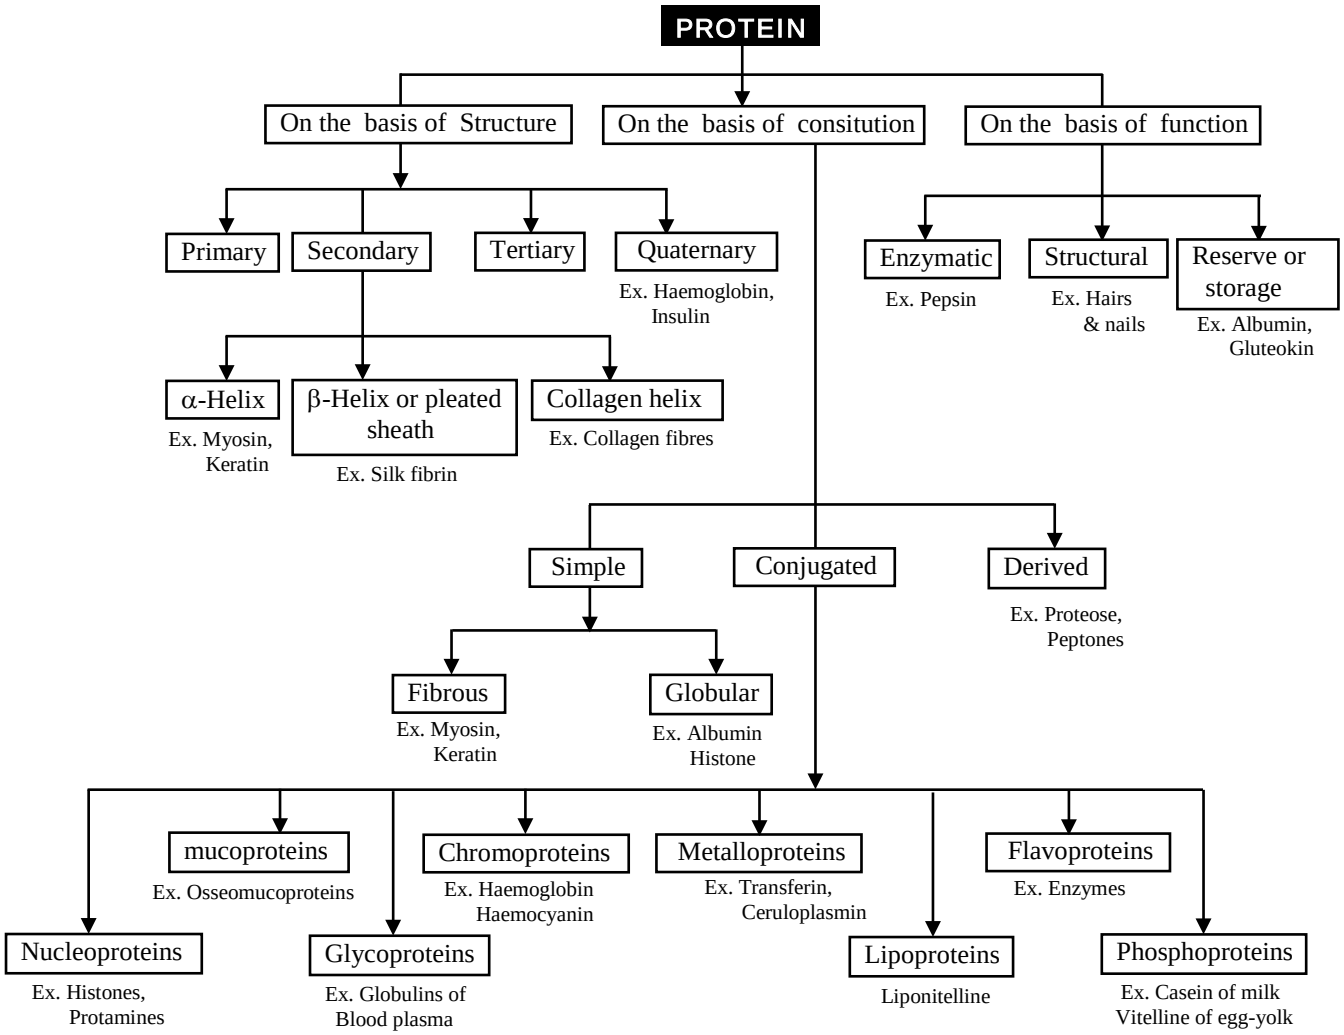
Significance of Structure of Protein –

- The most important constituents of animals are protein and their derivatives. Proteins form approximately 15% of animal protoplasm. The physical and biological properties of proteins are dependant upon their secondary and tertiary configurations. Protein is electrically charged because it has $-NH_3^+$ and $-COO^-$ ionic components. **In an acidic medium** the $-COO^-$ group of protein converts in COOH and the protein itself becomes positively charged. In contrast, in **an alkaline medium** the $-NH_3^+$ group of protein changes to $-NH_2 + H_2O$ and as a result it becomes **negatively charged.** Therefore, at a specific pH a protein will

possess an equal number of both negative and positive charges and it is at this specific pH a protein becomes soluble.

- If the pH changes towards either acidic or alkaline side, then the protein begins to precipitate. This property of protein has great biological significance. The cytoplasm of cells of organisms has an approximate pH of 7 but the pH of proteins present in it is about 6 and thus, the proteins are present in a relatively alkaline medium. Therefore, the proteins are negatively charged and also are not in a fully dissolved state. It is because of this insolubility, proteins form the structural skeleton of organismal cells. Similarly, the pH of nucleoplasm is about 7 but the pH of proteins, namely, histones and protamines, in it is relatively more. Therefore, as a result they are positively charged and do not remain fully dissolved in the nucleoplasm forming minute organelles, the most important being the chromosomes.
- As has been described above, the structural units namely amino acids of proteins contain both a carboxyl group (–COOH) or acidic group and an amino group ($–NH_2$) or alkaline group attached to the same carbon atom. Therefore, proteins depending upon the pH of the medium can exhibit both alkaline and acidic properties. Such compounds which exhibit **both acidic and alkaline properties** are called amphoteric compounds or zwitter ions. In the protoplasm, this dual property of proteins is utilized for neutralisation of strong acids and alkalis since the protein acts an an ideal buffer in either of the situations.
- Besides changes **in pH, salts, heavy metals, temperature, pressure,** etc. also cause precipitation of proteins. Because of these changes, the secondary and tertiary configuration of proteins is destroyed and many times the tertiary structured globular proteins become converted to secondary configuration fibrous proteins . Such alternations in the physical state of proteins is called **denaturation.** If the change in the medium of proteins is mild and for a short period, then denaturation of the proteins is also temporary, however, if the change in medium is strong and prolonged then denaturation is permanent and **the protein becomes coagulated**. For example, the white or albumen of egg is a soluble globular protein but on heating it permanently coagulates into fibrous insoluble form. It is clear, that strong alternations result in the denaturation of proteins and they lose their biological properties and significance. It is this reason, that cells of organisms are unable to bear strong changes and they ultimately die.

TYPES OF PROTEINS :



1. Simple Proteins - proteins which composed of only amino acid.

(i) **Fibrous Protein – *e.g.*** Collagen, Elastin, Keratin

(ii) **Globular Proteins – *e.g.*** Albumin, Histones, Globin, Protemines, Prolamines (Glaidin, Gluten, Zein), Gluteline – slimy part of gluten of wheat.

2. Conjugated Proteins – Simple protein + non protein part (Prosthetic group)

(i) **Nucleoproteins –** e.g. Chromatin, Ribosomes etc.

(ii) **Chromoprotein –** Prosthetic group is a porphyrin pigment e.g Haemoglobin, Haemocyanin, Cytochromes etc.

(iii) **Lipoprotein** eg. Cell membrane, Lipovitelline of Yolk.

(iv) **Phospho proteins –** Casienogen, Pepsin, Ovovitelline, Phosvitin.

(v) **Lecitho protein –** Fibrinogen.

(vi) **Metallo protein –** Cu-tyrosinase, Zn-Carbonic anhydrase, Mn-Arginase, Mo-Zanthine Oxidase Mg-Kinase

(vii) **Glycoproteins and Mucoproteins –** Glyco proteins have less than 4% Carbohydrates in their structure. They are most specific type proteins e.g. α, β γ-globuline of **blood group proteins**, **mucin**, **Erythropoetin** etc.

Muco proteins have more than 4% Carbohydrate e.g. **Mucoids of synovial fluid**, **Osteomucoprotein** of bones, **Tendomucoprotein of tendons, Chodro mucoprotein** of cartilage.

3. **Derived Protein –** These are formed by denaturation or hydrolysis of protein.

(i) **Primary derived proteins** are denaturation product of normal proteins e.g. **Fibrin, Myosin**

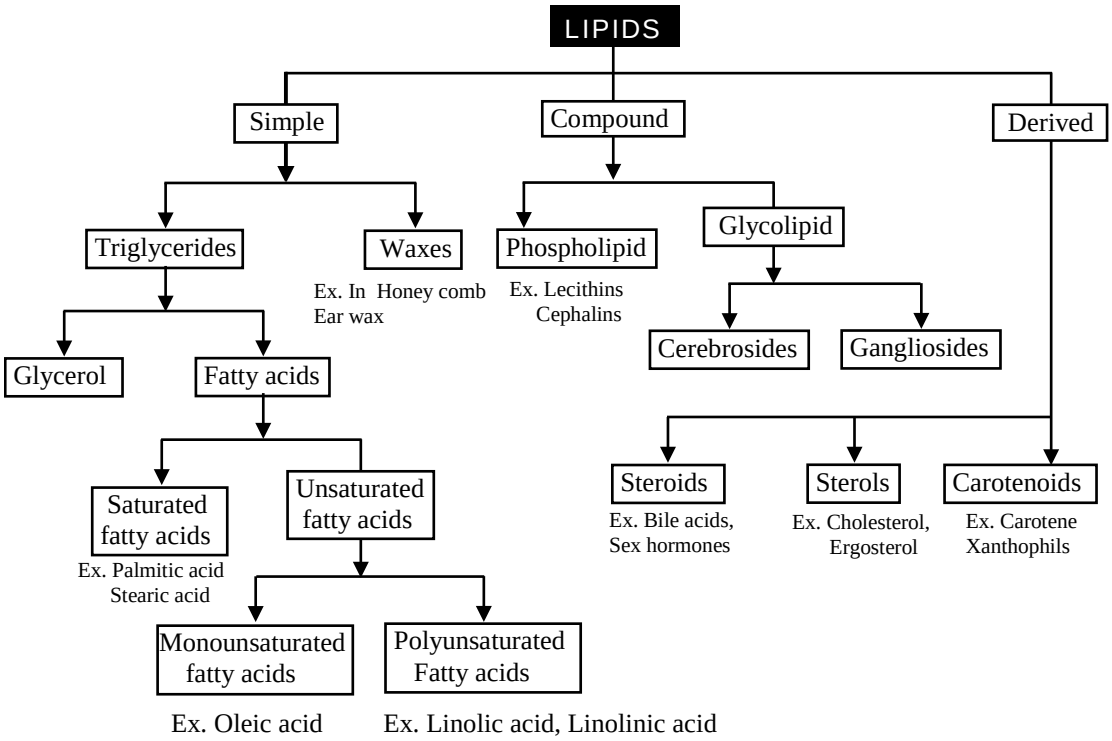
(ii) **Secondary derived proteins** are digestion products of proteins e.g. Proteoses, peptones, Peptides.

Special Point on Protein :

- **Monomeric protein :** Protein composed of one polypeptide chain.
- **Oligomeric/Polymeric/Multimeric protein :** Protein composed of more then one polypeptide chains.
- **Peptide :** A molecule short than 20 Amino acids.
- **Polypeptide :** It usually has more than 20 Amino acids.
- **Protein :** It contains miniumum 50 Amino acids or more than 50 Amino acids.

LIPIDS

- **Fat and its derivatives** are combindly known as lipid.
- Lipid term coined by Bloor.
- Compounds of C, H, O but the ratio of Hydrogen and Oxygen is not 2 : 1. The amount of oxygen is considerably very less.
- Lipids are **insoluble in water** and **soluble in organic solvents** like acetones, chloroform, benzene, hot alcohol, ether etc.
- Lipids occur in protoplasm as **minute globules.**
- Lipids do not form polymer.
- Lipids provide more than double energy as compare to carbohydrate.
- In animals, fat present in **subcutaneous layer** and working as **food reservior** and **shock-absorber.**
- Lipid require less space for storage as compare to carbohydrate because lipid molecule is **hydrophobic** and **condense.**
- Animal store **maximum amount of food** in the form of **lipid.**
- Lipid provides maximum amount of **metabolic water** as compare to carbohydrate and protein on oxidation.
- Lipids are **not strictly macromolecules.**



A. Simple Lipid or Neutral Fats -

- These are esters of long chain fatty acids and alcohol. In majority of simple lipids, the alcohol is a trihydroxy sugar alcohol i.e. **glycerol.**
- Three molecules of fatty acid linked with one molecule of glycerol. The linkage is called **"ester bond"**. such type of lipids called **Triglycerides.** Three molecules of water are released during formation of triglycerides (**dehydration synthesis**)
- Similar or different fatty acids participate in the composition of a fat molecule. Simple lipids contain two types of fatty acids.

(i) **Saturated Fatty acids –** are those in which all the carbon atoms of hydro-carbon chain are saturated with hydrogen atoms

e.g. **Palmitic acid** – $CH_3(CH_2)_{14} - COOH$

Stearic acid – $CH_3(CH_2)_{16} - COOH$

(ii) **Unsaturated fatty acids –**are those in which some carbon atom are not fully occupied by hydrogen atoms

e.g. **Oleic acid** – $CH_3(CH_2)_7\ CH{=}CH(CH_2)_7COOH$

Linoleic acid – $CH_3(CH_2)_4 –(CH{=}CH–CH_2)_2 –(CH_2)_6 –COOH$

Linolenic acid–$CH_3–CH_2 –(CH{=}CH–CH_2)_3 –(CH_2)_6 –COOH$

Polyunsaturated = fatty acids with more than one double bonds in their structure e.g. **Linoleic acid**, **Linolenic acid**, **Arachidonic acid**, **Prostagladins** (derived from archidonic acid)

- Unsaturated fatty acid also called as **essential fatty acids** because no animal is able to synthesize them.
- Simple lipids with saturated fatty acid remain **solid** at normal room temperature e.g. **fats**
- Simple lipids with unsaturated fatty acids remain **liquid** at room temperature e.g. **oils.**
- **Saturated fatty acids** are less reactive so they tend to store in body and cause **obesity.**
- Unsaturated fatty acids are more reactive so they tend to metabolise in body and provide energy.

- Oils with poly unsaturates are recommended by physicians for persons who suffer from **high blood cholesterol or cardio-vascular diseases**. This is because increasing the proportion of poly unsaturated fatty acids to saturated fatty acids, without decreasing the fats in the diet tend to lower the **cholesterol level in blood**.

Waxes – are monoglycerides with only one molecule of fatty acid attached to a **long chain monohydroxy alcohol**. Waxes are more resistant to hydrolysis as compared to triglycerides. Waxes have an important role in protection. They form **water insoluble coatings** on hair and skin in animals and stem, leaves and fruits of plants.

e.g.

Bees Wax (Hexacosyl palmitate)

Carnauba (Myricyl cerotate)which occurs on leaves, stem and fruits.

Spermaceti in skull of whale and Dolphin.

Cerumen or ear wax – occurs in external auditory canal.

Lanoline or **cholesterol ester** – occurs in blood, sebum and gonadial ducts as lubricating agent.

It is also obtained from wool of sheep.

(B) Conjugated or Compound Lipids –

(i) Phospholipids or phosphatide or phospholipins –

2 Molecules of fatty acid + Glycerol + H_3PO_4 + Nitrogenous compound. Phospholipids are most abundant type of lipids in protoplasm.

Phospholipids have both hydrophilic polar end (H_3PO_4 and nitrogenous compound) and hydrophobic non polar end (fattty acids). Such molecules are called **amphipathic.** Due to this property, phospholipids form bimolecular layer in cell membrance.

Some biologically important phospholipids are as following :

(a) Lecithin or Phosphatidyl choline

- Nitrogenous compound in lecithin is **choline**
- Lecithin occurs in **egg yolk, oil seeds** and **blood.**
- In blood lecithin functions are carrier molecule. It helps in transportation of other lipid.

(b) Cephalin – Similar to lecithin but the nitrogenous compound is **ethanolamine, cephalin** occurs in **nervous tissue**, **egg yolk** and **blood platelets.**

(c) Sphingolipids or **sphingomylins** similar to lecithin but in place of glycerol it contains an amino alcohol **sphingosine**.

Sphingolipids occur in **myelin-sheath** of **nerves**, other examples of **phospholipids** are **phosphatidyl serine, phosphatidyl inositol, plasmologens.**

(ii) Glycolipid – 2 fatty acid + sphingosine + galactose

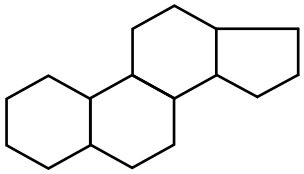
eg. **Cerebroiside** which occurs in **white matter of brain** –

Gangliosides – These occur in **nerve ganglia and spleen**. These also contain **N-acetyl neurominic acid** and glucose beside other compounds.

(iii) Derived Lipids – Lipid derived from simple or conjugated lipid. Derived lipids are complex in structure.

They are insoluble in water and soluble in organic solvents.

(A) Steroids – Steroids exhibit tetracyclic structure called **''Cyclo pentano perhydrophenanthrene** nucleus"



On the basis of functional group, steroids are of two types –

(a) **Sterols –** Alcoholic steroids e.g. **cholesterol –** Cholesterol abundantly occurs in **brain, nervous tissue, Adrenal gland** and **skin**. Cholestrol is a parent steroid. Several other biologically important steroids are derived from cholesterol. **7-dehydro cholesterol** which occurs in skin is a provitamin. On exposure to ultraviolet radiation, it transforms in **cholecalciferol** i.e. **vitamin D.**

Cholesterol is also called **''most decorated micromolecule in biology''.**

Ergosterol – It occurs in **oil seed, fungi like ergot and yeast.** Ergosterol is precursor of another form of Vitamin **D-Ergocalciferol.**

Coprosterol – Occurs in faecal matter. It forms decomposition of cholesterol by colon bacteria.

Bile acid – Bile juice contains different types of steroid acids. E.g. **cholic acid, Lithocholic acid etc.** They help in emulsification of fats.

(b) **Sterones –** Ketonic steroids, for e.g. **sex hormones**, **Adreno corticoids, ecdyson** hormone of insects, **Diosgenin** obtained from yam plant (**Dioscorea**), is used in manufacture of antifertility pills.

(B) Chromolipid = It is also called **terpene.**

Most complex lipid in protoplasm.

Chromolipids composed of repeated **isoprene units**

Example : Carotenoids, vitamin A, E, K, Natural Rubber (Polyterpene).

$$CH_2=\underset{\displaystyle CH_3}{\overset{\displaystyle |}{C}}-CH=CH_2$$

(Isoprene)

Special Points :

Prostaglandins –

It is Derived lipid. Prostaglandins are derivatives of **PUFA** (**Polyunsaturated fatty acid**) They are helpful in **contraction of uterus** and **fallopian tube, blood clotting, Muscle contraction**.

NUCLEIC ACID

- Nucleic acid discovered by **Friedrich Meischer,** he called it nuclein.
- He discovered the nucleic acid in nucleus of pus cells.
- Term Nucleic acid given by **Altmann**
- Nucleic acid is of two types –

  (1) DNA (Deoxyribonucleic acid) (2) RNA (Ribonucleic acid)

1. DNA (Deoxyribonucleic acid)

- Nucleic acids are polymers of Nucleotides and are macromolecules.
- Nucleotides consists of **nucleosides** and **phosphate group**.

- Nucleosides consists of **Nitrogen base** and **Pento sugar**.
- 3 components of nucleotides = N_2 base + Pentose sugar + phosphate group.
- N_2 base are of two types –
  (i) Purines (Adenine, Guanine)
  (ii) Pyrimidines (Cytosine, Thymine, Uracil)

2. RNA (Ribonucleic acid)

- RNA does not follow Chargaff's Rule (RNA is normally single stranded).
- Reoviruses has double staranded RNA which follows Chargaff's Rule.
- Double stranded RNA follows Chargaff's Rule.
- Thymine absent in RNA in place of which Uracil is present.

Three types of RNA :

(i) r-RNA (Ribosomal RNA)
(ii) t-RNA (Transfer RNA)
(iii) m-RNA (Messenger RNA)

ENZYMES

- Enzymes are proteinaceous, biocatalysts.
- First enzyme discovered by **Buchner**
- Term **enzyme** was given by **Kuhne.**
- **Zymase** (from yeast) was the **first discovered enzyme. (Buchner)**
- The first purified and crystalized enzyme was **urease** (by **J.B. Sumner)** from Canavalia/Jack Bean (Lobia plant)
- **Proteinaceous nature** of enzyme was established by **Northrop** and **Sumner.**

DEFINITION

- **Enzymes are biocatalysts made up of proteins (except ribozyme), which increases the rate of biochemical reactions by lowering down the activation energy.**
- First discovered **ribozyme** was **L_{19} RNAase** by **T.Cech** from rRNA of a protozoan ***Tetrahymena thermophila*** and **RNAase P** or **Ribionuclease P** by Altman in prokaryotic cell (Nobel prize).

GENERAL PROPERTIES OF ENZYMES

Large sized biomolecules, colloid nature with high molecular weight -

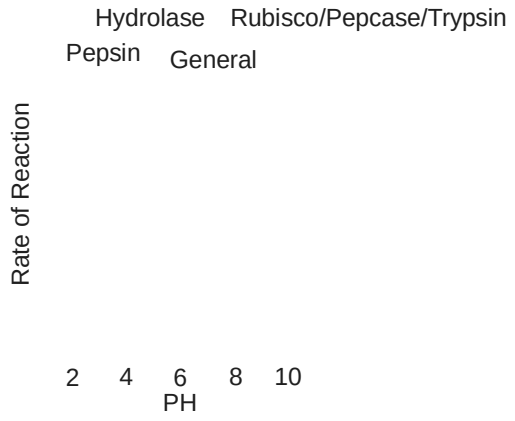
- Large size (equal to colloid particles) provide, more surface area so passes large no. of active site. Large number of substrate converted into product by one molecule of enzyme at a time.
- Highest molecular weight is of enzyme **pyruvate dehydrogenase complex** (46 lakh) participate in **link reaction** of respiration.

Proteinous nature

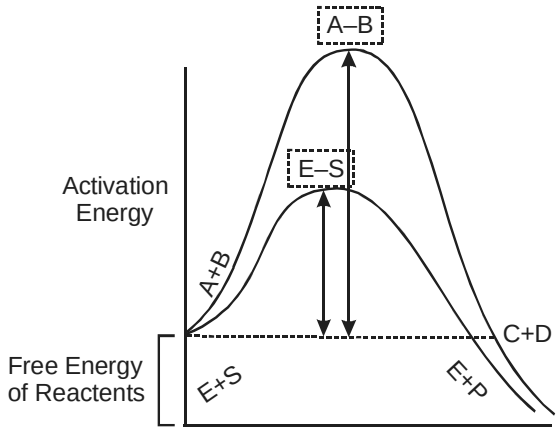
- Monomer unit of a enzyme is Amino acid
- Amino acids linked togather to form polypeptide chain
- Enzymes are polypeptide chains
- Most of enzymes arrange in **tertiary structure** of protein or **globular proteins** except isoenzyme (Quaternary st.)
- Tertiary structure of protein provides stability and water soluble nature to enzymes.
- synthesis of enzymes occurs on **ribosomes** under the control of **genes**.
- According to one gene one polypeptide hypothesis, if a enzyme is made up of same kind of polypeptide chains then synthesize under control of same gene and if made up of different kinds of polypeptide chains then synthesized under the control fo different genes. Ex. Rubisco, cytochrome oxidase, Nitrogenase.

Specificity

- Enzymes are specific for **pH**, **temperature** and **substrate**
- **pH** - The common pH range of enzymes activity is 6 - 8.
- Every enzyme works on specific pH, Pepsin-2.5 pH, Hydrolase-4-5,
- Rubisco, Pepcase-8.5 pH, Trypsin - 8.5 pH



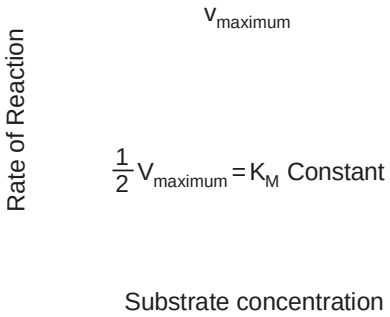
- **Temperature**
  - Common range of temperature for enzyme activity is 20 – 40°C
  - Enzymes works on body temperature of organism not on environmental temperature.
  - Enzymes of plants are affected by evironmental temperature change as plants does not show homeostasis.
  - At low temperature enzymes become functionally inactive, at high temperature denatured.
- **Substrate**
  - Every enzyme works on specific substrate.
  - Substrate binds at active site of enzyme which is made of specific sequence of amino acids and recognise it's substrate.
  - Ex. succinic dehydrogenase acts on succinic acid while pyruvate dehydrogenase acts on pyruvic acid.
- **Enzymes increase the rate of reaction by decreasing activation energy** -
  - Activation Energy - Minimum amount of energy more than the free energy of reactents required to reach the transiation state of chemical reaction or to undergo the chemical reaction.



- **Turn Over Nubmer (T.O.N) -**
  - The number of reactent moleules converted into product by one molecule of enzyme in unit time
  - Highest T.O.N is of **carbonic anhydrase** (360 lakh / minute)

$$CO_2 + H_2O \xrightarrow[\text{anhydrase}]{\text{Carbonic}} H_2CO_3$$

- **KM constant -**
  - Enymes follows the Michaelis-Menten reaction kinetics
  - It represents the substrate concentration at which rate of enzymetic reaction becomes the half of maximum velocity or rate.
  - If a enzyme passes high km constant then it's affinity towards substrate is low and rate reaction is also low.



- **Ki constant (Enzyme inhibitor complex dissociation constant)**
  - The substrate concentration at which enzyme inhibitor complex dissociate and reaction becomes normal
  - It is applicable only for competitive reversible inhibitions.

STRUCTURE OF ENZYME

Simple enzymes

- They are made up of only protein. eg. **pepsin, trypsin.**

Conjugated enzymes

They are made up of protein & non protein part.

- **Co-enzymes -** Co-enzymes are non-protein, orgainc groups, which are loosely attached to apoenzymes. They are generally made up to vitamins.
- **Prosthetic group -** When non-protein part is tightly or firmly attached to apoenzymes.

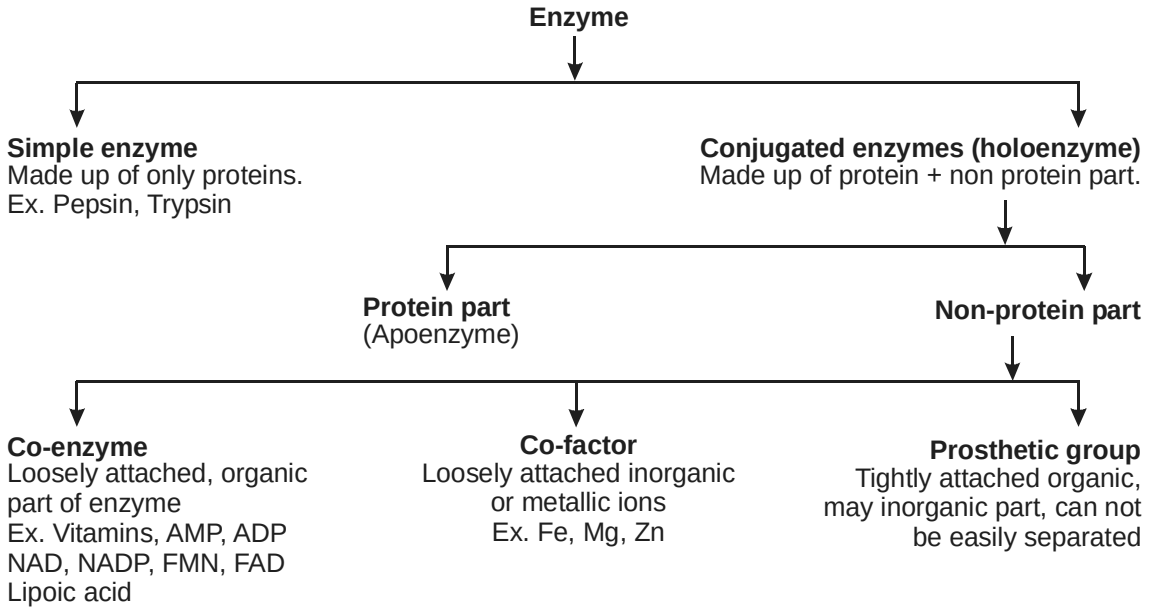
- Metal activators/**co-factros**/metallic factor :- Lossely attached inorganic co-factor eg. Mn, Fe, Co, Zn, Ca, Mg, Cu

Active site :

The part of polypeptide chain made up of specific sequence of amino acids at which specific substrate is to be binded and catalysed, known as **active site. Very specific sequence of amino acids,** at active site is determined by genetic codes.

Allosteric site :

Besides the active site's some enzymes posess additional sites, at which chemical **other than substrate (allosteric modulators)** are bind. These sites are known as allosteric sites and enzyme with allosteric sites are called as **allosteric enzymes.** e.g. **hexokinase, phosphofructokinase.**



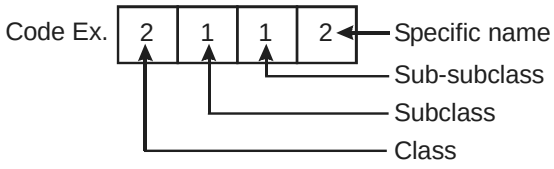
TERMINOLOGY

- **Endoenzymes -** Enzymes which are functional only inside the cells. Ex. Enzymes of metabolism.
- **Exoenzymes -** Enzymes catalysed the reactions outside the cell Eg:- **enzymes of digestion, some enzymes of insectivorous** plants, **Zymase** complex of fermentation.
- **Proenzyme/Zymogen-** These are precursor of enzymes or inactive forms of enzymes.eg. Pepsinogen, Trypsinogen etc.
- **Isoenzymes-** Enzymes having similar action, but little difference in their molecular configuration are called isoenzymes. 16 forms of **α-amylase** of wheat & 5 forms of **LDH (Lactate dehydrogenase)** 3 Forms of **Pepcase** are known. These all isoenzyme forms are synthesised by different genes and tissue and organ specific.
- **Inducible enzymes -** When formation of enzyme is induced by substrate availability. eg. Lactase, Nitrogenase, β-galactosidase.
- **Extremozymes -** Enzymes, which may also function at extremely adverse conditions (very high temperature) e.g. Taq polymerase.
- **Abzymes -** When the monoclonal antibodies (Mab) are used as enzymes.
- **Biodetergents -** Enzymes used in washing powders are known as bio-detergents eg.-amylase, lipase, proteolytic enzymes.

- **House keeping/constitutive enzymes -** Which are always present in constant amount & are also essential to cell. Ex. Enzymes of cell respiration.

NOMENCLATURE AND CLASSIFICATION

Enzyme commision of IUB-1961 divides all enzyes into 6 major classes on basis of types of reactions catalysed by them. It also proposed an international code of 4 digits for each enzyme. Suffix '-ase' is used for a enzyme.



- **Class-1 : Oxido-reductases -** These enzymes involve in oxidation-reduction reactions.

  It involves 3 sub classes (i) Oxides (ii) dehydrogenase (iii) reductase

  e.g. Cytochrome oxides.
- **Class-2 : Trasferases -** These Enzymes transfer specific group from one substrate to another.

  e.g. Transaminase, Hexokinase.
- **Class-3 : Hydrolases -** These Enzymes involve in hydrolysis reactions with help of H_2O

  e.g. Protease, Lipase, Carbohydrase. $AB + HOH \rightarrow AH + BOH$
- **Class-4 : Lyases -** Spilt the sustrate molecule without water. These Enzymes splits the specfifc covalent bonds without hydrolysis or H_2O addition. $AB \rightarrow A + B$

  e.g. Aldolase
- **Class-5 : Isomerases -** Rearrangement of molecular structure to form isomers.

  e.g. Isomerase, Epimerase
- **Class-6 : Ligases (Synthases) -** Covalent bonding of two substrates to from a large molecule. $A + B \rightarrow AB$

  e.g. Citrate synthetase, Ligase, ATPsynthase

MODE OF ACTION OF ENZYME

- **Lock and Key theory or template theory :-**

  Given by **Emil Fischer**

  According to this theory **active sites of enzymes** serve as a **lock**, at which the **reactant/substrate fits like a key. Supported by competitive inhibition.**
- **Enzyme-substrate complex theory :-**

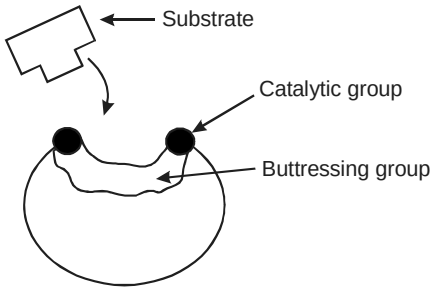
  Given by **Michaelis & Menten**

  $E + S \longrightarrow ESC \longrightarrow ESC \longrightarrow E+P$

- **Induced fit theory : -**

  Given by **D.E. Koshland** (1973-74)

– According to this theory active site is not static, but it undergoes a conformational change which is induced by specific substrate. The active site has two groups, (1) **Buttressing** (supporting) group & (2) **Catalytic group.**



– Butterssing group is meant for supporting the substrate, while the catalytic group break the substrate into product.

ALLOSTERIC MODULATION

- **Jacob & Monad.** - First discovered **L-threonine dehydratase**, inhibited by its product isoelucine.
- In the allosteric modulation, chemical or products fits in allostric sites & bring change in shape of active site of enzyme.
- Chemicals which bind at allostric site of allostric enzymes are known as **allostric modulators.**
- These modulators may be **activators** (positive modulators) or **inhibitors** (nagetive modulators) of allosteric enzymes.
- If allostric modulator positively change the configuration of active site, then called **positive allosteric modulation** and if negatively change then called **negative allosteric modulation** respctively by+ve modulator (activators) and-ve modulator (inhibitors).

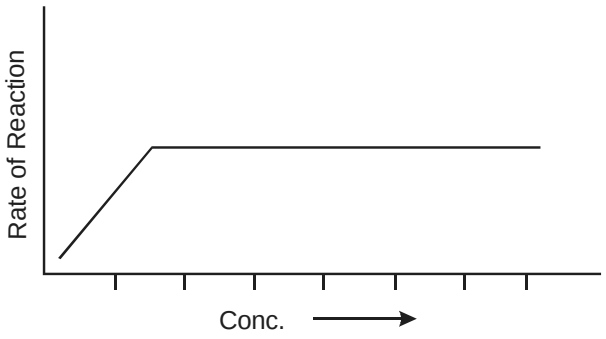
  Ex. **Phosphofructokinase** inhibited by ATP, activated by ADP.
- Some times product also binds at allostetric site and inhibits the enzyme.

  Ex. **Hexokinase** inhibited by glucose-6P and exhibits feed back inhibition.

  This is a type of reversible and non-competitive inhibition found in allosteric enzymes.
- All allosteric modulation are **not feed-back inhibition.**

FACTORS

- **pH** - Enzymes very sensitive to pH.
- **Temperature -** High temp inactivates enzyme causing their denaturation. They also get inactive at lower temp. Generally all enzymes better perform at body temp. of organism.
- **Enzyme concentration -** Increase in conc. of enzymes will increases the rate of enzymetic reaction till enough the substrate.
- **Substrate con^{n}-** Increase in substrate con^{n} increases the activity of enzymes until all the active sites of enzyme ae saturated.



• Inhibitors/Enzyme inhibition :-

– **Competitive inhibitors or competitive inhibition and reversible type -**

These are **substrate analogues,** which bind to the active site and enzymes get inhibited, such inhibition is called as competitve inhibition.

Eg. **Succinic dehydrogenase** is inhibited by its competitor **malonate.**

This is reversible inhibition. **Malonate** is known as substrate analogue of **succinate.**

- Similarly **sulpha drugs** are substrate analogue of para-amino benzoic acid **(PABA)** used in folic acid synthesis in bacterical cells. Hence these drugs are used to kill bacterial cells.
- **Non-competitve inhibitors or non competitive inhibition and irreversible type :-**

– In this type of inhibition, inhibitor substance can bind simultaneously to an enzyme, at any site and destroy the **sulfhydryl (S-H) group** of enzyme.

Example :- Toxic metals, CO, CN poisoning of cytochrome oxidase.

Such inhibition are **irreversible inhibition.**

- **Non competitive & reversible type :-**

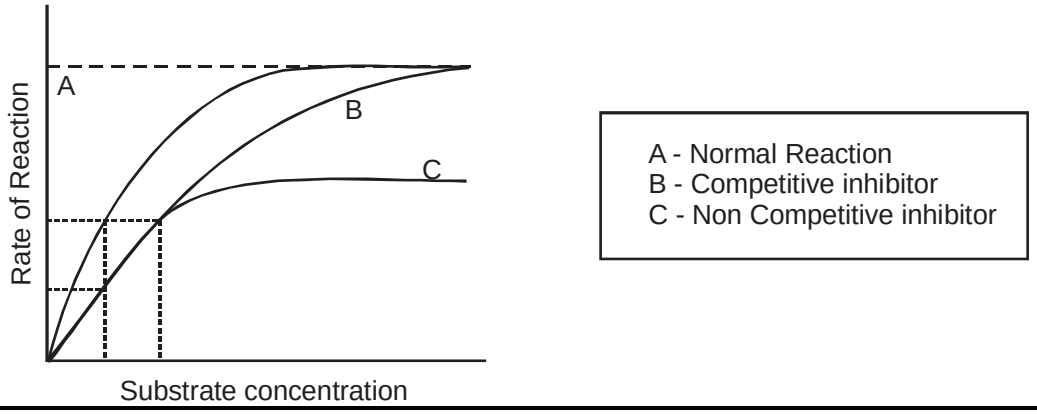
– When inhibitor binds at allosteric site reversibly.

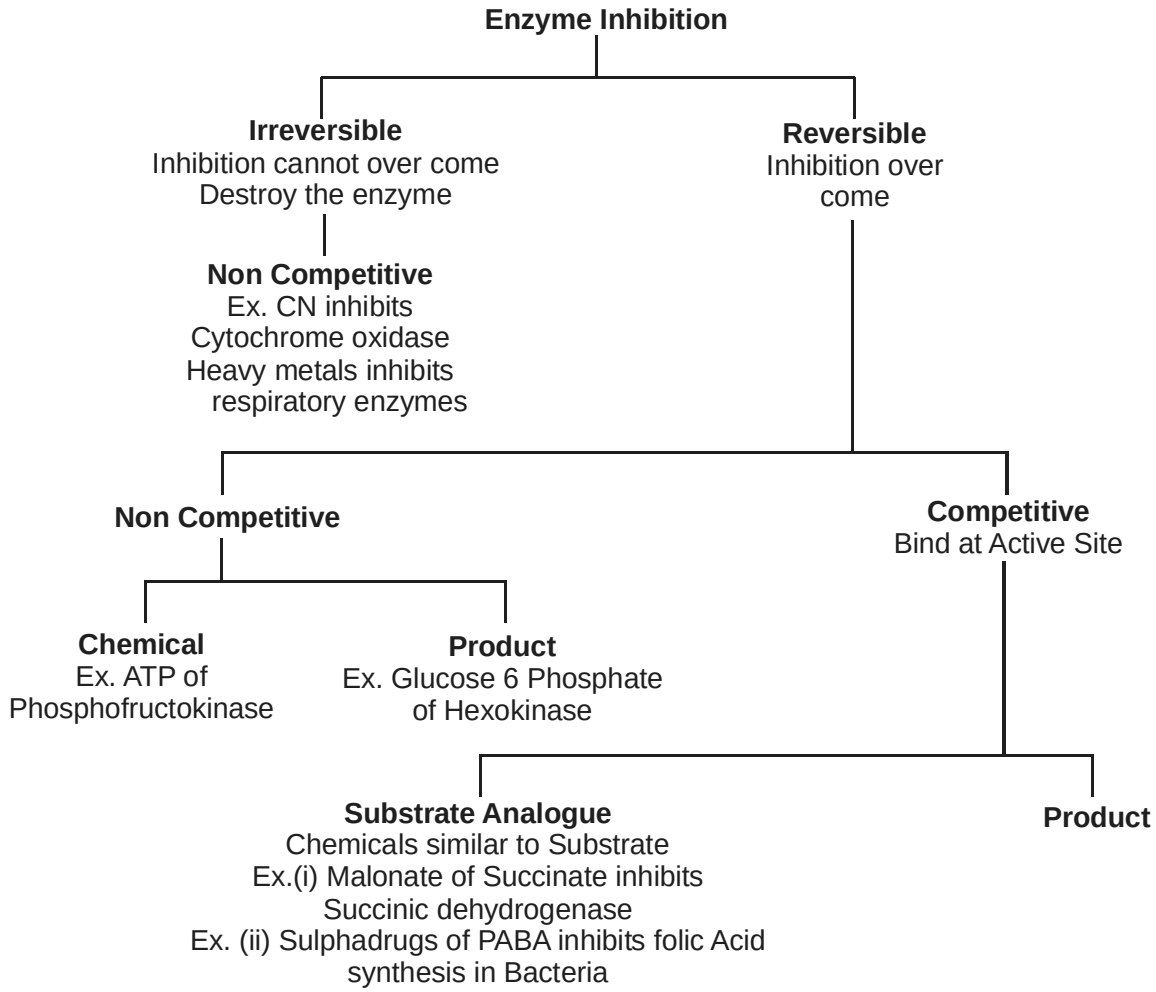
– When product of biochemical reaction inhibits the enzyme action, it is known as **product inhibition** or **retro inhibition** or **feed back inhibition.**

– The product may binds at **allosteric site** of allosteric enzyme then it is **non-competitive, reversible, allosteric inhibition** Example : **inhibition of hexokinase by glucose 6P.**

So, **product inhibition** is always **reversible inhibition.**

- If **competitive inhibitor (Reversible)** is present, then, **km** - ↑ **and V_{max} - No change.**
- If **Non competitive** (reversible) inhibitor is present, then, **Km-No change, V_{max} -Decrease**
- **Competitive inhibition** is overcome by increase in concentration of substrate.





SPECIAL POINTS OF ENZYMES

- NAD = Nicotinamide Adenine Dinucleotide
- DPN = Diphospho Pyridine Nucleotide
- NADP = Nicotinamide Adenine Dinuclotide Phosphate
- TPN = Triphospho Pyridine Nucleotide
- FAD = Flavin Adenine Dinucleotide
- FMN = Flavin Mono Nucleotide
- Co A = Adenosine Triphospho Panta thenyl thio Ethanol Acetyl Amine
- I ATP = 7.6 K cal

- **Important Coenzymes are**

Co-1 (NAD)/DPN	Niacin
Co-II (NADP)/TPN	Niacin
FAD	Riboflavin
FMN	Riboflavin
TPP	Thiamine
CO-Q	Ubiquinone
CO-R	Biotine
CO-A	Pantothenic Acid

- **Important Co-factor :-**

Fe^{++}	=	Cytochrome Oxidase, Catalase, Peroxides, Aconitase
Cu^{++}	=	Cytochrome oxidase, Tyrosinase
Zn^{++}	=	Carbonic anhydrase, Alcohol dehydrogenase
Mg^{++}	=	Hexokinase, Glucokinase, Pyruvate kinase, Pepcase, Rubisco
K^{+}	=	Pyruvate kinase
Mn^{++}	=	Arginase, Ribonucleotide reductase, Decarboxylase.
Mo	=	Nitrogenase complex, Nitrate reductase.
Se	=	Glutathione peroxidase

EXERCISE – 1

CARBOHYDRATES

Q.1 How many possibler isomers will be formed of open chain glucose molecule :
(1) 4 (2) 8
(3) 16 (4) 32

Q.2 Callose is polymer of-
(1) Fructose (2) Sucrose
(3) Glucose (4) Xylans

Q.3 Which is odd -
(1) Chitin-Carbohydrates
(2) Pectin - protein
(3) Steroid - Lipid
(4) Wax - Lipid

Q.4 Glycogen is stored in -
(1) Liver and muscles (2) Liver only
(3) Muscles only (4) Pancreas

Q.5 Which is a disaccharide -
(1) Galactose (2) Fructose
(3) Maltose (4) Dextrin

Q.6 Which substance is not carbohydrate -
(1) Starch (2) Glycogen
(3) Wax (4) Glucose

Q.7 To get quick energy one should use -
(1) Carbohydrate (2) Fats
(3) Vitamins (4) Proteins

Q.8 Which is not a polysaccharide -
(1) Sucrose (2) Starch
(3) Glycogen (4) Cellulose

Q.9 External coat composed of cellulose like material occurs in -
(1) Hemichordata (2) Urochordata
(3) Cephalochordata (4) Cyclostomata

Q.10 Monosaccharides is -
(1) Pentose Sugar (2) Hexose Sugar
(3) Glucose (4) All the above

Q.11 Sugar which is found in haemolymph of insects is called-
(1) Maltose (2) Lactose
(3) Trehalose (4) Galactose

Q.12 In which form, extra sugar is stored in the body-
(1) Glucose monosaccharide
(2) Sucrose Disaccharide
(3) Glycogen polysaccharide
(4) Fatty acid and glycerol

Q.13 Glycogen is -
(1) Polymer of amino acids
(2) Polymer of fatty acids
(3) Unsaturated fats (4) Polymer of glucose

Q.14 Sugars are-
(1) Polymers of fatty acid
(2) Polymers of amino acids
(3) Poly hydroxy aldehyde or ketone
(4) None

Q.15 Which compound produces twice the amount of energy than carbohydrates -
(1) Protein (2) Fats
(3) Vitamins (4) Glucose

Q.16 Starving person will first use from the following -
(1) Fats (2) Glycogen
(3) Blood protein (4) Muscle protein

Q.17 Translocation of sugars in flowering plants occurs in the form of -
(1) Glucose (2) Sucrose
(3) Fructose (4) Maltose

Q.18 How many are incorrect match :
A. Chondritin sulphate - Heart valves
B. Fucose+ sialic acid - Blood group substance
C. Heparin - leech anticoagulant
D. Methanogen - cellulose
E. amylopection - water soluble
F. Inulin - Urochordates
(1) ACF (2) CEF
(3) BDE (4) CDF

Q.19 Sucrose is composed of -
(1) Glucose & Glycogen
(2) Glucose & Fructose
(3) Two molecule of Glucose
(4) Glycogen & Fructose

Q.20 Which of the following sugar is found in ATP -
(1) Deoxyribose (2) Ribose
(3) Trehalose (4) Glucose

Q.21 Lactose is composed of -
(1) Glucose + galactose (2) Glucose + Fructose
(3) Glucose + Glucose
(4) Glucose + mannose

Q.22 True statements for cellulose molecule-
(1) β-1-4 linkage, unbranched
(2) β-1-4 linkage, branched
(3) α-1-4 linkage, branched
(4) β-1-6 linkage,unbranched

Q.23 Sweetest sugar among the naturally occuring sugar-
(1) Glucose (2) Fructose
(3) Sucrose (4) Saccharine

Q.24 Sugar with five membered ring is called -
(1) Pyranose (2) Furanose
(3) Dextrorotatory (4) Laevorotatary

Q.25 Which sugar occur only in mammals -
(1) Trehalose (2) Galactose
(3) Lactose (4) Mannose

Q.26 Which sugar does not give Benedict's test or Fehling's tests-
(1) Glucose (2) Maltose
(3) Fructose (4) Sucrose

Q.27 Amylose and Amylopectin occur in -
(1) Glycogen (2) Starch
(3) Cellulose (4) Chitin

Q.28 The blood group proteins of man are composed of-
(1) Glycoproteins (2) Mucoproteins
(3) Lipoproteins (4) Phosphoproteins

Q.29 Animal starch (glycogen) differs from plant starch in-
(1) Having short chain branched structure
(2) Being reserve food of animals mostly
(3) Give no blue colour with iodine
(4) All of the above

Q.30 The most commonly occuring oligosaccharides of protoplasm are-
(1) Glucose frutose & maltose
(2) Galactose, starch & glycogen
(3) Maltose, Lactose & Sucrose
(4) Ribose, deoxyribose & ribulose

PROTEINS AND AMINO ACID

Q.31 Albuminiod or scleroproteins are :
(1) Albumin containing proteins eg. ovalbumin
(2) Water insoluble fibrous proteins eg keratin, collagen
(3) Proteins present in connective tissue
(4) Proteins present in egg.

Q.32 Which group is correct :
(1) Glycoprotein – Mucin
(2) Salmin – Phosphoprotein
(3) Lipoprotein – Lecithin
(4) Cytochrome – Mucoprotein

Q.33 In infants of under 6 months of age, deficiency of protein may cause -
(1) Marasmus (2) Kwashiorkar
(3) Rickets (4) Galactosemia

Q.34 Kwashiorkar disease develops due to -
(1) Malnutrition (2) Overeating
(3) Catalysis (4) Mutation

Q.35 Which element is normally absent in proteins-
(1) C (2) N
(3) S (4) P

Q.36 Protein most abudant in human body are -
(1) Collagen (2) Myosin
(3) Actin (4) Albumin

Q.37 Common in feather and silk is -
(1) Carbohydrate (2) Fats
(3) Protein (4) Nucleic acid

Q.38 Proteins which are present in protoplasm are very important because -
(1) They provide rigidity to cell
(2) They function as biocatalyst
(3) They yield energy
(4) They are stored food

Q.39 Essential component of all living organisms -
(1) Hemoglobin (2) Protein
(3) Chlorophyll (4) Carbohydrate

Q.40 Which test is not used for proteins :
(1) Xanthoproteic test (2) Mollish test
(3) Millons test (4) Ninhydrin test

Q.41 Products of proteins catabolism -
(1) NH_3, CO_2 and Urea
(2) Urea, CO_2 and NH
(3) Urea, NH_3 and uric acid
(4) Urea, NH_3, alanine and creatine

Q.42 Unit of proteins which unite in long chains to form proteins are called -
(1) Sugar (2) Purines
(3) Pyrimidines (4) Amino acids

Q.43 Milk protein is -
(1) Lactogen (2) Myosin
(3) Casein (4) Pepsin

Q.44 The simplest amino acid is-
(1) Tyrosine (2) Lysine
(3) Glycine (4) Aspartic acid

Q.45 The amino acids which are not synthesized in the body are called -
(1) Non-essential (2) Essential
(3) Deaminated (4) All of them

Q.46 Which of the following will be different in different animals -
(1) Fats (2) Carbohydrates
(3) Proteins (4) Vitamins

Q.47 In India the best source for proteins in herbivorous persons is-
(1) Pulses (2) Potato
(3) Egg (4) Meat

Q.48 Proteins are transported in the body of herbivourous persons as -
(1) Amino acids (2) Natural proteins
(3) Enzymes (4) Nucleic acid

Q.49 The formation of protein can be considered as-
(1) Dehydration synthesis
(2) Dehydration analysis
(3) Hydration synthesis
(4) Hydration analysis

Q.50 Who won the noble prize of 1954 for unravalling the –helical structure of keratin
(1) Thomes & whatson
(2) L. Pauling & R.B. Corey
(3) Berzilius & Moulder
(4) F. sanger.

Q.51 In most of the Amino acid Metabolism the first step is :
(1) Transamination (2) Decarboxylation
(3) Transamidation (4) Deamination.

Q.52 Genetic code determines -
(1) Structural pattern of an organism
(2) Sequence of amino acid in a protein chain
(3) Variation in offsprings
(4) Constancy of morphological trait

Q.53 Which of the following amino acid is essential-
(1) Alanine (2) Glycine
(3) Tryptophan (4) Tyrosine

Q.54 Which is most important structural part of the body-
(1) Protein (2) Carbohydrates
(3) Lipid (4) Nucleic acid

Q.55 Which of the following Harmone set do not favour protein synthesis :
(1) Growth Harmone and Insulin
(2) Testosterone and Thyroxin
(3) Glucocorticoids and Parathormone
(4) Progesteron and Thymosin.

Q.56 Which protein is oxidised by light producing animals:
(1) Gramicidin (2) Leuciferin
(3) Flavin (4) Leumin

Q.57 Contractile protein is -
(1) Actin (2) Myosin
(3) Troponin (4) Tropomyosin

Q.58 Variations in proteins are due to -
(1) Sequence of amino acids
(2) Number of amino acids
(3) R-group
(4) None

Q.59 Histone is a basic protein due to -
(1) Alanine & Glycine
(2) Methionine & serine
(3) Tryptophan & tyrosine
(4) Lysine & Arginine

Q.60 Which amino acid is an important constituent of vitamin folic acid :
(1) Glycine (2) Glutamic acid
(3) Argenine (4) Lysine

Q.61 Isoelectric pH of arginine is
(1) 7 (2) less than 7
(3) more than 7 (4) 6.8

LIPIDS

Q.62 Cholesterol is synthesized in -
(1) Pancreas (2) Brunners gland
(3) Spleen (4) Liver

Q.63 Long chain molecules of fatty acids are formed by-
(1) Polymerisation of 2 carbon compounds,
(2) Decomposition of fats
(3) Polymerisation of glycogen
(4) Conversion of glycogen

Q.64 Fats in the body are formed when -
(1) Glycogen is formed from glucose
(2) Sugar level becomes stable in blood
(3) Extra glycogen storage in liver and muscles is stopped
(4) All of them

Q.65 Gaucher's dissease is concerned with which of the following -
(1) Abnormal fat metabolism
(2) Abnormal protein metabolism
(3) Abnormal carbohydrate metabolism
(4) None of them

Q.66 Lipid derivative which occur in fecal material-
(1) Cholesterol (2) Ergesterol
(3) Lanoline (4) coprosterol

Q.67 Cerebrosides & Gangliosides are -
(1) Phospholipids (2) Chromolipids
(3) Glycolipids (4) Sulpholipids

Q.68 Lecithin is chemically :
(1) Phosphatidyl choline
(2) Phosphatidyl ethanolamine
(3) Phosphatidyl serine
(4) Phosphatidyl sphingosin

Q.69 Cholesterol is an important compound in the body, because it-
(1) Regulates blood pressure
(2) Gives rise to steroid hormone
(3) Regulates filtration pressure in kidneys
(4) Is involved in Ca^{++} absorption from gut

Q.70 An antifertility steroid is-
(1) Cortisol (2) Progesterone
(3) Diosgenin (4) Estrogen

Q.71 Which of the following lipids is most abundant in cell membrane-
(1) Steroid (2) Cholesterol
(3) Phospholipid (4) Cutin

Q.72 The 'free fatty acid" (FFA) of plasma are-
(1) Metabolically inert
(2) Mainly bound to beta lipoproteins
(3) Stored in fat
(4) Mainly bound to serum albumin

Q.73 A phospholipid lecithin contains-
(1) A fatty acid, an alcohol, a phosphate group and choline
(2) A fatty acid and an alcohol
(3) A fatty acid and a phosphate group
(4) A fatty acid, an alcohol and a phosphate group

Q.74 Postaglandins are fatty acid derivaties found in trace amount. What is the role of such dervatives :
(1) Inflammatory and allergic reactions
(2) Clotting of blood
(3) Smooth muscle contraction
(4) All of the above

Q.75 Bacteria which cause tuberculosis and leprosy produce which substance that contibute to their pathogenecity-
(1) Sterols (2) Wax-D
(3) Tristearin (4) None of the above

Q.76 Esters of long chain fatty acid with long-chain monohydric alcohols are called-
(1) Fats (2) Waxes
(3) Both of the above (4) None of the above

Q.77 Naturally occuring fatty acids usually contain-
(1) Even number of C atoms
(2) Odd number of C atoms
(3) Both 1 & 2 (4) None of these

Q.78 Prostaglandins are synthesised from-
(1) Arachidonic acid (2) Oleic acid
(3) Linoleic acid (4) Linolenic acid

Q.79 Lecithin contains a nitrogenous base called as-
(1) Ethanolamine (2) Choline
(3) Inosiiol (4) Either of the three

Q.80 The density of lipoproteins increases as the protein content-
(1) Decreases (2) Increases
(3) Not related with the protein content
(4) None of these

Q.81 In sphingomyelins, the alcoholic moiety is-
(1) Glycerol (2) Acetyl alcohol
(3) Glycol (4) Sphingosin

ENZYME

Q.82 An indispensible role in energy metabolism is played by -
(1) Phosphorus (2) Lithium
(3) Sodium (4) Calcium

Q.83 Mineral activator needed for the enzymes aconitase of TCA cycle is -
(1) Mn (2) Fe
(3) Mg (4) Cu

Q.84 If the temperature is incresed above 35°C
(1) Rate of decline of respiration will be earlier than decline of photosynthesis
(2) Rate of decline of photosynthesis will be eartlier than decline of respiration
(3) Both decline simultaneously
(4) Both do not show fixed pattern

Q.85 Which of the following is coenzyme-II ?
(1) NAD (2) NADP
(3) FAD (4) None of the above

Q.86 Where does the synthesis of enzyme occur in a cell-
(1) Inside the nucleus (2) In lysosomes
(3) On the surface of ribosome
(4) Inside the vacuole

Q.87 Excess of ATP inhibits the enzyme-
(1) Phosphfructokinase
(2) Hexokinase
(3) Aldolase (Lyases)
(4) Pyruvate decarboxylase

Q.88 Enzyme cytochrome oxidase can be inhibited by :
(1) Iodo acetate (2) Cyanides
(3) Oilgomycins (4) Dinitrophenol

Q.89 Different steps in respiration are controlled by-
(1) Enzymes (2) Auxins
(3) Sugars (4) Kinins

Q.90 Which one is both structural & functional (catalytic) protein :
(1) Hexokinase (2) Myosine
(3) Ribozyme (4) Acdtyl Co-A

Q.91 The full form of NAD is -
(1) Nicotine adenosine diphospate
(2) Nicotinamide adenosine dinucleotide
(3) Nicotinamide adenine dinucleotide
(4) Nicotinamide adenine diphosphate

Q.92 First discovered Enzyme was -
(1) Isomerase (2) Transaminase
(3) Zymase (4) Transferase

Q.93 Enzyme were discovered for the first time in -
(1) Bacteria (2) Yeast
(3) Algae (4) Spinach

Q.94 Who coined the term enzyme -
(1) Pasteur (2) Buchner
(3) Kuhne (4) Summer

Q.95 Vitamin serves the function of -
(1) An enzyme (2) A coenzyme
(3) A substrate (4) A hormone

Q.96 Which of the follwoing is a coenzyme-
(1) NAD (2) NADP
(3) FAD (4) All the above

Q.97 What is NADP -
(1) An enzyme
(2) An ion carrier
(3) H_2 acceptor coenzyme
(4) A part of t-RNA

Q.98 The prosthetic group of various respiratory enzymes is -
(1) Ca (2) B
(3) Mg (4) Mo

Q.99 Most enzymes consist of two parts these are -
(1) Enzyme & substrate
(2) Enzyme & coenzyme
(3) Apoenzyme and enzyme
(4) Apoezyme & prosthetic group

Q.100 The first enzyme is isolated in crystalline form was -
(1) Catalase (2) Urease
(3) Peroxidase (4) Amylase

Q.101 In plants enzymes are present in -
(1) Only in flowers (2) Onlly in leaves
(3) All the living cells of plant body
(4) Only in parenchyma

Q.102 An enzyme is made up of -
(1) Vitamin (2) Growth factor
(3) Protein (4) Carbohydrates

Q.103 Which of the following is not an enzyme ?
(1) Oxidase (2) Pepsin
(3) Auxin (4) Trypsin

Q.104 Enzyme capable of changing thier shape are called -
(1) Apoenzyme (2) Coenzyme
(3) Allosteric enzyme (4) Co-factor

Q.105 What is the chemical nature of the majority of prosthetic groups ?
(1) Lipoidal (2) Organic
(3) Metallic (4) Alkaloidal

Q.106 Which of the following coenzyme is a derivative of pantothenic acid? (vit-B complex)
(1) NAD (2) NADP
(3) FAD (4) Co-A

Q.107 Which of the following is not consumed in a biochemical process ?
(1) Hormone (2) Enzyme
(3) vitamin (4) Nucleotide

Q.108 How the presence of an enzyme affects the activation energy of a reaction ?
(1) It becomes increased
(2) It becomes decreased
(3) It is first increaed and then decreased
(4) Activation energy in not affected at all

Q.109 The cheif enzyme found in yeast cell is ?
(1) Invertase (2) Maltase
(3) Zymase (4) Amylase

Q.110 Which of the enzyme joins the broken strands of DNA ?
(1) Nuclease (2) Kinase
(3) Ligase (4) Endonuclease

Q.111 Inhibition of succinic dehydrogenase by malonate is an example of -
(1) Competitve inhibition
(2) Non competitive inhibition
(3) Allosteric inhibition (4) Enzyme repression

Q.112 At a temperature below the freezing point an enzyme is -
(1) Unaffacted (2) Inactivated
(3) Slightly inactivated (4) Killed

Q.113 Enzyme inhibition caused by a substrate analog is -
(1) Competitive (2) Non competitive
(3) In competitve (4) Semi-competitive

Q.114 At boiling temperature an enzyme is -
(1) Denatured (2) Unaffected
(3) Inactivated (4) Killed

Q.115 Enzyme have very narrow optima for -
(1) Light (2) Temperature
(3) pH (4) Humidity

Q.116 Which enzyme is without protein?
(1) Hexokinase (2) Synthetase
(3) Endonuclease (4) Ribozyme

ANSWER KEY

EXERCISE – 2

CARBOHYDRATES

Q.1 The basic unit of chitin is-
(1) N-acetyl glucosamine
(2) Glucose
(3) Galactose
(4) Fructose

Q.2 The formation of glucose from non-carbohydrate materials is called-
(1) Glycogenesis (2) Glycogenolysis
(3) Gluconeogenesis (4) Glycolysis

Q.3 Glucose, galactose and fructose all have the same molecular size and composition and their absorption through the mucosal cells takes place-
(1) At the same rate
(2) Glucose is absorbed most rapidly
(3) Fructose is absorbed most rapidly
(4) Galactose is absorbed most rapidly

Q.4 Cellulose is a linear polymer of-
(1) β-glucose pyranose molecules
(2) Sucrose molecules
(3) α-glucose pyranose molecules
(4) None of the above

Q.5 Gun cotton is-
(1) Nitrosucrose (2) Nitrocellulose
(3) Nitrofructose (4) None of these

Q.6 Disaccharides and polysaccharides are formed by glycosidic bonds, sucrose is formed when glucose and frutose join between their-
(1) 1 and 4 carbon (2) 1 and 2 carbon
(3) 1 and 3 carbon (4) 2 and 4 carbon

Q.7 Three polysaccharides, starch glycogen and cellulose are structurally and biochemically distinct, even though they are polymers of same monosacharide glucose. The basis for their difference lies-
(1) The way of branching
(2) Type of bonds
(3) Both 1 and 2
(4) Only in their arrangement

Q.8 Which one of the following is epimer of glucose?
(1) Fructose (2) Galactose
(3) Cellulose (4) Ribose

Q.9 Honey contains the hydrolytic product of-
(1) Lactose (2) Maltose
(3) Insulin (4) Starch

Q.10 Human heart muscle contains-
(1) D-Ribose (2) D-Lyxose
(3) D-Xylose (4) D-Arabinose

Q.11 Which of the following compounds is found to be present in heart valves-
(1) Hyaluronic acid
(2) Chondroitin sulphate
(3) Heparin
(4) Glucosamine

Q.12 In human being, galactose is most easily available-
(1) By the conversion of glucose
(2) By the conversion of fructose
(3) By the hydrolysis of maltase
(4) By the hydrolysis of milk

Q.13 Lactose is formed in mammary gland under the influence of lactose synthetase by the reaction of-
(1) Glucose and glactose
(2) UDP-glucose and galactose
(3) UDP-galactose and glucose
(4) UDP-glucose and UDP-galactose

Q.14 Mucopolysaccharides consist of repeating units of disaccharide molecules consisting of-
(1) Two monosaccharides
(2) Glucoronic acid + amino sugar
(3) Uronic acid + acylated amino sugar
(4) Uronic acid + Amino sugar

Q.15 Which of the following is not a mucopoly-saccharide-
(1) Heparin
(2) Chondroitin sulphate
(3) Hyaloronic acid
(4) Inulin

Q.16 In case of insufficient supply of glucose, gluconeogenesis is the important source of glucose in-
(1) Muscles (2) Adipose tissue
(3) Nervous tissues (4) Liver

Q.17 The normal blood glucose level of an adult in the post absorptive state is-
(1) 40–60 mg/100 ml
(2) 80–100 mg/100 ml
(3) 120–130 mg/100 ml
(4) 160–180 mg/100 ml

Q.18 Function of brain is disturbed when the blood glucose level falls from the normal fasting value (80 mg/100 ml) to-
(1) 60 mg / 100 ml (2) 40 mg / 100 ml
(3) 20 mg / 100 ml (4) 10 mg / 100 ml

Q.19 A diasachharide formed by condensation of a tetrose and Hexose, will have general formula:
(1) $C_{10}H_{18}O_9$ (2) $C_{10}H_{20}C_{10}$
(3) $C_{10}H_{16}O_8$ (4) $C_{12}H_{16}O_{10}$

Q.20 Which one of the following is used in shatterproof glass -
(1) Cellulose nitrate
(2) Cellulose acetate
(3) Carboxylmethyl cellulose
(4) Simple cellulose

Q.21 What is the normal ratio of sugar in human -
(1) 0.01 % (2) 0.1%
(3) 1% (4) 0.18%

Q.22 Carbohydrate metabolism is controlled by-
(1) Parathormone (2) Insulin
(3) Glucose (4) Vitamin B_{12}

Q.23 Which is sweet in taste, but is not sugar-
(1) Starch (2) Saccharine
(3) Lactose (4) Protein

Q.24 The sweetest sugar is-
(1) Fructose (2) Saccharin
(3) Monellin (4) Thaumatin

Q.25 Xylitol is-
(1) Artificial sweetener
(2) Nutritive sweetener
(3) Nonnutritive sweetener (calorifree)
(4) Both '1' and '2'

Q.26 Leavulose present in honey is-
(1) Disaccharide (2) Glucose
(3) Fructose (4) pentose

Q.27 In Fehling' or Benedict's solution, a reducing sugar causes conversion of-
(1) Ferric to ferrous state
(2) Ferrous to ferrric state
(3) Cuprous to cupric state
(4) Cupric to cuprous state

Q.28 Use of artificial sweetener saccharin has been discontinued it is-
(1) Carcinogenic
(2) Liable to decompose in hot weather of tropics
(3) Bitter in the beginning
(4) All the above

Q.29 The commonly used artificial sweetener is -
(1) Acesulfame K (2) Cyclamate
(3) Aspartame (4) Saccharin

Q.30 Mannose is-
(1) Disaccharide
(2) hexosan monosaccharide
(3) Pentosan monosaccharide
(4) A tetrose

Q.31 Mannitol is-
(1) Amino acid (2) Amino alcohol
(3) Sugar alclhol (4) Sugar acid

Q.32 Inulin is a polymer of-
(1) Glucose (2) Galactose
(3) Fructose (4) Arabinose

Q.33 Raffinose is a
(1) Monosaccharide (2) Disaccharide
(3) Trisaccharide (4) Tetrasaccharide

Q.34 Most sugars are dextrorotatory which means they-
(1) Tilt light to right
(2) Rotate polarised light to right
(3) Tilt light to left
(4) Rotate polarised light to left

Q.35 A mucopolysaccharide is-
(1) Slime, phycocolloid and pectin
(2) Mucin, callose and heparin
(3) Hemicellulose, pectin and mucin
(4) Hyaluronic acid, chondroitin sulphate

Q.36 Cellulose acetate is raw meterial for-
(1) Photographic films (2) Tericot
(3) Shatter proof glass (4) All the aobve

Q.37 Smoothening agent in icc-creams and brightening agent in detergents is-
(1) Cellulose hypoxanthate
(2) Cellulose xanthate
(3) Carboxymethl cellulose
(4) All of these

Q.38 In food, starch is detected by its-
(1) Graanular form
(2) White appearance
(3) Energy reserve
(4) Blue reaction with iodine

Q.39 Cellulose eaten by grazing animals is-
(1) Passed out undigested
(2) Digested by digestive enzymes
(3) Digested by intestinal bacteria
(4) Digested by digestive enzymes of intestinal bacteria

PROTEINS & AMINO ACIDS

Q.40 Example of phosphoprotein is-
(1) Mucin (2) Fibrinogen
(3) Casein (4) Myosin

Q.41 Serotonin is derived in the body from the following amino acid-
(1) Phenyl alanine (2) Glycine
(3) Tyrosine (4) Tryptophan

Q.42 The essential amino acids-
(1) Must be supplied in the diet because the organism has lost the capacity to aminate the corresponding keto acid
(2) Must be supplied in diet because the human has an impaired ability to synthesize the carbon chain of corresponding keto acids
(3) Are indentical in all species
(4) Are defined as those amino acids which cannot be synthesized by the organism at a rate adequate to meet metabolic requirements

Q.43 Which of the following is sulphur containing amino acid -
(1) Alanine (2) Lysine
(3) Methionine (4) Argenine

Q.44 Following are Aromatic amino acid.
(1) Glucine, valine, Alanine
(2) Phenylalanine, Tyrosine, Tryoptophan
(3) Cystne, Methionine, Glutomic acid
(4) Threonine, Levcine, Argenine

Q.45 Which one is not a protein :
(1) Cytochrome (2) Myoglobin
(3) Flbrinogen (4) urea

Q.46 Proteins of silks fibres are examples of-
(1) Simple linear proteins
(2) Secondary pleated proteins
(3) Tertiary folded proteins
(4) Quarternary super folded proteins

Q.47 Histones are-
(1) Nucleic acids
(2) Nitrogen bases of DNA
(3) Proteins of eukaryotes
(4) Proteins of prokaryotes

Q.48 Growth repair and protection against diseases in our body is carried by-
(1) Vitamins (2) Hormones
(3) Proteins (4) Lipids

Q.49 The process of protein synthesis is also called-
(1) Translation
(2) Tranduction
(3) Translation & tranduction
(4) Transcription - Translation

Q.50 All α-amino acids are optically active except-
(1) Glycine (2) Alanine
(3) Serine (4) Phenylalanine

Q.51 Amino acids have net charge zero at-
(1) Every pH (2) No pH
(3) A specific pH (4) None of these

Q.52 In many proteins, the hydrogen bonding produces a regular coiled arrangment called-
(1) α-helix (2) β-helix
(3) both (4) None

Q.53 The number of amino acid present in each turn of α-helix is-
(1) 2.8 (2) 3.2
(3) 3.4 (4) 3.6

Q.54 Spirulina protein is obtained from :
(1) Blue green algae (2) Bryophyta
(3) Mycorhiza (4) Wheat

Q.55 Under normal conditions, food proteins are generally readily digested upto-
(1) 67-73% (2) 74-81%
(3) 82-89% (4) 90-97%

Q.56 The unwanted amino acid abstracted from the tissues are either used up by the tissue or in the liver converted into-
(1) Ammonia (2) Urea
(3) Ammonium salts (4) Uric acid

Q.57 Metabolism of all proteins ingested over and above the essential requirements is called-
(1) Endogenous metaolism
(2) Exogenous metabolism
(3) Both of the above
(4) None of the above

Q.58 Transamination is a-
(1) Reversible process
(2) Irreversible process
(3) Both of the above (4) None of the above

Q.59 Which one is the method used for amino acid estimation :
(1) Edmann reaction (2) Ninhydrin reaction
(3) Formol titration (4) All the above

Q.60 Protein amino acids are-
(1) Laevorotatory (2) Dextrootatory
(3) Laevorotatory except glycine which is nonrotatory
(4) Laevorotatory except glycine which is dextrorotary

Q.61 An aromatic amino acid is-
(1) Tryptohan (2) Tyrosine
(3) Phenylalanine (4) All the above

Q.62 A functional but nonprotein amino acid is-
(2) Ornithine (2) Citrulline
(3) Diaminopimelic acid
(4) All of these

Q.63 The most abundant organic molecule is-
(1) RUBISCO (2) Starch
(3) Cellulose (4) Chitin

Q.64 Most abundant portein in the human body is -
(1) Haemoglobin (2) Keratin
(3) Collagen (4) Immunoglobulin

Q.65 Oxygen transproting protein is haemoglobin. Which one is oxygen storing protein-
(1) Myoglobin (2) Actin
(3) Myosin (4) Cascinogen

Q.66 Calmodulin is-
(1) Carotene binding protein
(2) Cadmium binding protein
(3) Calcium binding protein
(4) ChlorophyII binding protein

LIPIDS

Q.67 The majority of the absorbed fat appears in the form of-
(1) HDL (2) LDL
(3) VLDL (4) Chylomicrons

Q.68 Lengthening of the carbon chain of fatty acid takes place only in-
(1) Cytosol
(2) Mitochondria only
(3) Microsomes only
(4) Mitochondria and microsomes

Q.69 Human system lacks the enzymes capable of synthesing-
(1) Oleic acid
(2) Archidic acid
(3) Linolenic acid
(4) Linoleic and linolenic acid

Q.70 Prostaglandins are used for-
(1) The induction of menstruation
(2) The prevention of conception
(3) The termination of pregnancy
(4) All the three cases

Q.71 The total amount of cholesterol in human body weighing 70 kg is about-
(1) 140 gm (2) 160 gm
(3) 180 gm (4) 200 gm

Q.72 The normal concentration of cholestrol in plasma is-
(1) 100 mg to 150 mg / 100 ml
(2) 150 mg to 250 mg /100 ml
(3) 250 mg to 500 mg /100 ml
(4) 300 mg to 500 mg /100 ml

Q.73 Essential oils are those which are-
(1) Essential for plants themselves
(2) Essential for human kind
(3) Used for soaps and cosmetics
(4) A source of perfumes

Q.74 The melting point of unsaturated fatty aicds -
(1) Increases with increase in double bonds
(2) Decreases with increase in double bonds
(3) Rises in some and falls in others
(4) These is no relationship between unsaturation and melting point

Q.75 Essential fatty acids were discovered by-
(1) Evans and Burr (2) Bloor
(3) Sutherland (4) Beevers

Q.76 Definciency of EFA causes-
(1) Follicular keratosis (2) Kidney failure
(3) Sterility (4) All the above

Q.77 Arachidonic acid gives rise to-
(1) Terpenes (2) Prostaglandandins
(3) Gangliosides (4) Cerebrosides

Q.78 Hydrogenation-
(1) Increases percentage of EFA
(2) Destroys EFA
(3) Converts waxes into neutral fats
(4) Forms conjugated linoleic acid

Q.79 Major function of PUFA is-
(1) Supply of essential fatty acids
(2) Lowering of cholesterol level
(3) Prevent atherosclerosis
(4) All the above

Q.80 Number of fatty acids present in a molecule of phospholipid is-
(1) Two (2) Three
(3) One (4) None

Q.81 In contact with water, fatty acids produce-
(1) Monolayer (2) Bilayer
(3) Trilayer (4) membrane

Q.82 A steroid that prevents fertility is-
(1) Campesterol (2) Cholesterol
(3) Diosgenin (4) Testosterone

Q.83 Wax present in human blood is-
(1) Mericyl palmitate (2) Cetyl palmitate
(3) Cholesterol palmitate
(4) Ceryul palmitate

Q.84 Lycopene, the colouring agent of Tomato, is a-
(1) Sterol (2) Terpenoid
(3) Sphingolipid (4) Phospholipid

Q.85 Rubber is-
(1) Monoterpene (2) Diterpene
(3) Tetraterpene (4) Polyerpene

Q.86 Which is the following lipid is essential part of good diet-
(1) Oleic acid (2) Linoleic acid
(3) Stearic acid (4) Palmitic acid

ENZYMES

Q.87 Allosteric inhibition of enzyme was discovered by -
(1) Kuhne (2) Krebs
(3) Jacob & Monad (4) Buchner

Q.88 Allosteric enzymes have allosteric sites for -
(1) Inhibition only
(2) Activation only
(3) Reduction in activation energy
(4) Both activation and inhibition

Q.89 Substrate concentration at which an enzyme attains half of its max. velocity is ?
(1) Half life of enzyme
(2) Km-constant of enzyme
(3) Concentration ratio
(4) None

Q.90 Part of active site of enzyme, where substrate is supported -
(1) Catalytic group (2) Butteressing group
(3) Activation chamber
(4) Ki-constant

Q.91 Who gave the name enzyme ?
(1) Sumner (2) Kuhne
(3) Buchner (4) Gay Lussac

Q.92 Who was successful in isolating an enzyme in pure and crystallized form ?
(1) Sumner (2) Buchner
(3) Kuhne (4) Gay Lussac

Q.93 Which was the first enzyme obtained in crystallized form?
(1) Zymase (2) Amylase
(3) Urease (4) Protease

Q.94 Which of these is Coenzyme I and Coenzyme II –
(1) NAD/NADP (2) NADP/NAD
(3) NAD/FAD (4) FAD/NAD

Q.95 Who discovered the enzyme called ribozyme?
(1) Holley
(2) Thomas Cech & Sydney Altman
(3) Benda & Altmann
(4) None of the above

Q.96 Which are called zymogen ?
(1) Substances digesting the enzymes
(2) Precursor substances of the enzymes
(3) Substance attached to the enzymes
(4) Enzyme found in yeast

Q.97 What are the multiple molecular forms of an enzyme called ?
(1) Isomer
(2) Isoenzyme
(3) Multiple form enzyme
(4) None of the above

Q.98 Which is the specific character of isoenzyme ?
(1) All forms express reaction specificity on one substrate only
(2) They are generally quaternary proteins
(3) They are formed by different genes
(4) All the above

Q.99 Which of these characters is of enzymes ?
(1) Colloidal nature
(2) High molecular weight
(3) Catalytic nature
(4) All the above

Q.100 What is true about enzymes ?
(1) Required in minute amounts
(2) Increase the reaction rate
(3) Available as such at the end of reaction
(4) All the above

Q.101 Enzymes are affected by –
(1) pH (2) Temperature
(3) Activator/Inhibitor (4) All the above

Q.102 What is not true about activity of enzymes ?
(1) They start the reaction
(2) They change the direction of reaction
(3) They increase the rate of reaction
(4) (1) and (2) above mentioned

Q.103 What is turn over number of enzyme ?
(1) The number of substrate molecules which is converted to products in one minute by an enzyme molecule
(2) The number of product molecules which is formed by one molecule of enzyme in one minute
(3) The number of molecules of the enzymes which is essential for forming one product molecule
(4) None of the above

Q.104 How the effect of competitive inhibitors can be nullified ?
(1) By increasing concentration of substrate
(2) By decreasing concentration of substrate
(3) By increasing concentration of enzyme
(4) By decreasing concentration of enzyme

Q.105 Which statement is correct about enzyme activity and pH ?
(1) Most enzymes are active at pH of 6-7.5
(2) Some enzymes are active at acidic or alkaline pH
(3) Each enzymes has its own separate optimum pH
(4) All the above

Q.106 Sometimes the product binds the active site of the enzyme to reduce rate of reaction. What is it called?
(1) Inhibition
(2) Competitive inhibition
(3) Feed back inhibition
(4) None of the above

Q.107 The turn over number of enzymes is related with its –
(1) Efficiency (2) Protein nature
(3) Catalytic nature (4) Specificity

Q.108 In cytochrome, Fe^{++} is linked –
(1) Tightly (2) Loosely
(3) All the above (4) None of the above

Q.109 Organic substance loosely linked to the apoenzyme is called –
(1) Coenzyme (2) Cofactor
(3) Holoenzyme (4) Prosthetic group

Q.110 Which part of holoenzyme is proteinaceous ?
(1) Apoenzyme (2) Prosthetic group
(3) Complete (4) None

Q.111 Which of these is not a coenzyme ?
(1) FMN (2) Riboflavin
(3) Thiamine (4) Fe++

Q.112 What is the minimum energy value, besides the average energy of the substrate molecules in the reaction, which is essential to make the product ?
(1) Energy barrier (2) Activation energy
(3) Vibration energy (4) All the above

Q.113 What is true about active sites of enzymes ?
(1) Active site has group of specific amino acids
(2) Active sites are small parts of enzyme and an enzyme has more than one active sites
(3) One substrate combines with active site to form the product
(4) All the above

Q.114 Which are allosteric sites?
(1) Acceptor site besides the active site
(2) That site of holoenzyme where prosthetic group binds
(3) Inhibitor site
(4) All the above

Q.115 According to the induced fit theory which are the two groups at the active site?
(1) Buttressing group/Catalytic group
(2) Buttressing group/Degrading group
(3) Catalytic group/Degrading group
(4) None of the above

Q.116 Which of these are enzymes of the class oxidoreductases ?
(1) Oxidase (2) Reductase
(3) Dehydrogenase (4) All the above

Q.117 Which are the enzymes of group transferase ?
(1) Hexokinase (2) Transaminase
(3) Both of above (4) Isomerase

Q.118 Which of these are enzyme of isomerases ?
(1) Isomerase (2) Epimerase
(3) Mutase (4) All the above

Q.119 Fructose 1-6 $DiPO_4 \xleftrightarrow{\text{Aldolase}}$ PGAL + DiHAP To which group Aldolase enzyme belongs in the above reaction ?
(1) Ligases (2) Lyases
(3) Isomerase (4) Transferases

Q.120 The lower value of Km means –
(1) Lower affinity of enzyme with substrate
(2) Higher substrate affinity of enzyme
(3) Higher enzyme activity
(4) No effect on reaction

Q.121 Which one of the following is not true for iso enzymes ?
(1) isoenzymes are quartenary proteins
(2) all forms synthesized by different genes'
(3) increse activation energy of substrate.
(4) All the above

ANSWER KEY

EXERCISE – 2

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

Ques.	121																			
Ans.	3																			

Carbohydrates, Fats, Proteins

Q.1 Glycogen is stored in **[MPPMT, AIPMT 79]**
(1) Liver and muscles (2) Liver only
(3) Muscles only (4) Pancreas

Q.2 Cholesterol is synthesized in – **[MPPMT - 94]**
(1) pancreas (2) Burnners gland
(3) Spleen (4) Liver

Q.3 Which is a disaccharide – **[MPPMT - 94]**
(1) Galactose (2) Fructose
(3) Maltose (4) Dextrin

Q.4 Which element is normally absent in proteins **[RPMT - 94]**
(1) C (2) N
(3) S (4) P

Q.5 Which substance is not carbohydrate- **[MPPMT - 94]**
(1) Starch (2) Glycogen
(3) Wax (4) Glucose

Q.6 To get quick energy one should use- **[RPMT - 94]**
(1) Carbohydrate (2) Fats
(3) Vitamins (4) Proteins

Q.7 Protein most abundant in human body is – **[RPMT - 94]**
(1) Collagen (2) Myosin
(3) Actin (4) Albumin

Q.8 Which is not polysaccharide - **[RPMT - 94]**
(1) Sucrose (2) Starch
(3) Glycogen (4) cellulose

Q.9 Decreasing order of amount of organic compound in animal body- **[RPMT - 94]**
(1) Carbohydrate, Protein, fat and nucleic acid
(2) Protein, fats, nucleic acid and carbohydrate
(3) Protein, fats, carbohydrates and nucleic acid
(4) Carbohydrate, fats, Proteins and nucleic acid

Q.10 Characteristic feature of heamoglobin- **[RPMT - 94]**
(1) Reversible union with oxygen
(2) Red Colour
(3) Presence of Cu
(4) Presence of Globulin protein

Q.11 External Coat composed of cellulose like material occurs in - **[RPMT - 94]**
(1) Hemichordata (2) Urochordata
(3) Cephalochordata (4) Cyclostomata

Q.12 Common in feather and Silk is –
(1) Carbohydrate (2) Fats
(3) Protein (4) Nucleic acid

Q.13 Monosaccharide is - **[RPMT 93]**
(1) Pentose Sugar (2) Hexose Sugar
(3) Only Glucose (4) All the above

Q.14 Sugar which found in haemolymph of insects is called- **[RPMT 93]**
(1) Maltose (2) Lactose
(3) Trehalose (4) Galactose

Q.15 Which substance is most abundant in cell – **[RPMT 93]**
(1) Carbohydrates (2) Protein
(3) Water (4) Fats

Q.16 Proteins which present in protoplasm are very important because- - **[RPMT 93]**
(1) They provide definite shape to cell
(2) They function as biocatalyst
(3) They yield energy
(4) They are stored food

Q.17 Dipeptide is - **[RPMT 93]**
(1) Structure of two peptide bonds
(2) Two amino acids linked by one peptide bond
(3) bond between one amino acid and one peptide
(4) None

Q.18 Which amino acids is non essential for human body - **[RPMT 92]**
(1) Glycine (2) Phenyl alanine
(3) Arginine (4) Methionine

Q.19 In which form the extra Sugars stored in the body- **[RPMT - 91]**
(1) Glucose monosaccharide
(2) Sucrose Disaccharide
(3) Glycogen polysaccharide
(4) Fatty acid and glycerol

Q.20 Products of proteins catabolism **[RPMT 89]**
(1) NH_3, CO_2 and Urea
(2) Urea, CO_2 and NH
(3) Urea, NH_3 and uric acid
(4) Urea, NH_3, alanine and creatine

Q.21 Galactosemia disease in children can be prevented if they are provided – **[RPMT - 89]**
(1) milk less food (2) proteinaceous milk
(3) more milk (4) vitamin less milk

Q.22 Glycogen is - **[RPMT - 88]**
(1) Polymer of amino acids
(2) Polymer of fatty acids
(3) Unsaturated fats
(4) Polymer of glucose

Q.23 Carbohydrate is - **[RPMT - 88]**
(1) Polymer of fatty acids
(2) Polymer of amino acids
(3) Poly hydroxy aldehyde or ketone
(4) None

Q.24 In which form, food stored in animal body **[RPMT - 88]**
(1) Glucose (2) Glycogen
(3) Cellulose (4) ATP

Q.25 Which compound produces more than twice the amount of energy as compared to carbohydrates **[AIPMT -75, BHU 78]**
(1) Protein (2) Fats
(3) Vitamins (4) Glucose

Q.26 What is the normal ratio of sugar in human blood - **[BHU – 80,81]**
(1) .01% (2) 0.1%
(3) 1% (4) 0.18%

Q.27 Carbohydrates are stored in mammals as- **[AIPMT - 81]**
(1) Glucose in liver
(2) Glycogen in muscles and spleen
(3) Lactic acid in muscles
(4) Glycogen in liver and muscles

Q.28 Carbohydrate metabolism is controlled by- **[AIPMT -78]**
(1) Parathormone (2) Insulin
(3) Glucose (4) Vitamin B_{12}

Q.29 Fattyness is due to the excess of - **[AIPMT - 86]**
(1) Connective tissue (2) Blood
(3) Muscular tissue (4) Adipose tissue

Q.30 Which one of the following is polysaccharide **[AIPMT - 86]**
(1) Sucrose (2) Lactose
(3) Glycogen (4) Glucose

Q.31 Starving person will first use- **[AIPMT 88]**
(1) Fats (2) Glycogen
(3) Blood (4) Muscle protein

Q.32 Units of proteins which unite in long chains to form proteins, are called- **[BHU 77, 78]**
(1) Sugar (2) Purines
(3) Pyrimidines (4) Amino acids

Q.33 Milk protein is - **[BHU - 63]**
(1) Lactogen (2) Myosin
(3) Casein (4) Pepsin

Q.34 Chemically enymes are - **[AIPMT-78]**
(1) Fats (2) Carbohydrates
(3) Hydrocarbons (4) Proteins

Q.35 Long chain molecules of fatty acids are formed by - **[NCERT - 76]**
(1) Polymerisation of 2 carbon compounds
(2) Decomposition of fats
(3) Polymerisation of glycogen
(4) Conversion of glycogen

Q.36 Most simple amino acid is - **[BHU - 86]**
(1) Tyrosine (2) Lysine
(3) Glycine (4) Aspartic acids

Q.37 Fats in the body are formed when – **[NCERT -76]**
(1) Glycogen is formed from glucose
(2) Sugar level becomes stable in blood
(3) Extra glycogen storage in liver and muscles is stopped
(4) All of them

Q.38 For body growth and repair one needs- **[AIPMT - 88]**
(1) Carbohydrates (2) Fats
(3) Protein (4) Vitamins

Q.39 In India the best source for proteins in herbivorous persons is - **[NCERT - 76]**
(1) Pulses (2) Potato
(3) Egg (4) Meat

Q.40 Proteins are conducted in the body in the form of - **[NCERT - 76]**
(1) Amino acids (2) Natural protein
(3) Enzymes (4) nucleic acids

Q.41 Which is sweet in taste, but is not sugar- **[AIPMT – 83]**
(1) Starch (2) Saccharine
(3) Lactose (4) Protein

Q.42 The formation of protein can be considered as - **[AIPMT - 86]**

(1) Dehydration synthesis
(2) Dehydration analysis
(3) Hydration synthesis
(4) Hydration analysis

Q.43 Translocation of sugars in flowering plants occurs in the form of – **[RPMT - 1998]**

(1) Glucose (2) Sucrose
(3) Fructose (4) Maltose

Q.44 Sucrose is composed of – **[RPMT - 1989]**

(1) Glucose & Fructose
(2) Glucose & Glycogen
(3) Two molecules of Glucose
(4) Glycogen & Fructose

Q.45 Which of the following amino acid is essential- **[RPMT - 1997]**

(1) Alanine (2) Glycine
(3) Tryptophan (4) Tyrosine

Q.46 Which of the following disaccharides will give two molecules of glucose on hydrolysis **[RPMT - 1997]**

(1) Maltose (2) Sucrose
(3) Lactose (4) None

Q.47 Which is very most structural part of the body– **[RPMT - 1997]**

(1) Protein (2) Carbohydrates
(3) Lipid (4) Nucleic acid

Q.48 Which of the following sugar is found in ATP– **[RPMT - 1997]**

(1) Deoxyribose (2) Ribose
(3) Trehalose (4) Glucose

Q.49 Deficiency of protein leads to –**[AIPMT 1998]**

(1) Rickets (2) Scurvy
(3) Kwashiorkor (4) Carotenemia

Q.50 Lactose is composed of - **[RPMT – 1998, AIPMT 1998]**

(1) Glucose + galactose (2) Glucose + fructose
(3) Glucose + glucose
(4) Glucose + mannose

Q.51 True statement for cellulose molecule – **[AIPMT - 1998]**

(1) β-1' - 4" linkage. unbranched
(2) β-1' - 4" linkage. branched
(3) α-1' - 4" linkage. branched
(4) β-1' - 6" linkage. unbramched

Q.52 Contractile protein is - **[AIPMT - 1998]**

(1) Actin (2) Myosin
(3) Troponin (4) Tropomyosin

Q.53 Variations in proteins are due to – **[AIPMT - 1998]**

(1) Sequence of amino acids
(2) Number of amino acids
(3) R-group (4) None

Q.54 The antibodies are - **[MPPMT - 1998]**

(1) γ (Gamma)-globulins
(2) Albumins
(3) Vitamins (4) Sugar

Q.55 Which of the following does not contains metal - **[AIPMT - 99]**

(1) Glycoproteins (2) Ferritin
(3) Cytochromes (4) Chromoproteins

Q.56 Which protein found in maximum amount – **[AIPMT - 99]**

(1) Catalase
(2) Zinc carbonic anhydrase
(3) Transferase (4) RUBISCO

Q.57 Proteoglycan in cartilages which is part of polysaccharide – **[AIPMT - 2000]**

(1) Condriotin (2) Ossein
(3) Casein (4) Cartilegen

Q.58 In the genetic code dictionary, how many codons are used to code for all the 20 essential amino acids – **[AIPMT - 2003]**

(1) 20 (2) 64
(3) 61 (4) 60

Q.59 Enzyme concerned with transfer of electrons are - **[MP PMT 2002]**

(1) Hydrolasase (2) Dehydrogenase
(3) Transaminase (4) Protease

Q.60 At which pH enzymes of lysosomes are usually active ? **[MP PMT 2002]**

(1) pH 5 (2) pH 7
(3) pH 8 (4) In any pH

Q.61 Enzymes are made up of - **[CPMT 2002]**

(1) Edible proteins (2) Proteins
(3) Nitrogen containing carbohydrates
(4) Carbohydrates

Q.62 Hydrolytic enzymes, which act on low pH are called as ? **[CPMT 2002]**

(1) Protease (2) α-Amylase
(3) Hydrolases (4) Peroxidase

Q.63 Enzymes, vitamins and hormones can be classified into a single caregory of biological chemicals, becouse all of these - **[AIPMT 2005]**

(1) enhence oxidative metabolism

(2) are conjugated proteins

(3) are exclusively synthesized in the body of a living organism

(4) help in regulating metabolism

Q.64 Which of the following statements regarding enzyme inhibition is correct ? **[AIPMT 2005]**

(1) Non-competitive inhibition of an enzyme can be overcome by adding large amount of substrate

(2) Competitive inhibition is seen, when a substrate competes with an enzyme for binding to an inhibitor protein

(3) Competitive inhibition is seen, when the substrate and the inhibitor compete for the active site on the enzyme

(4) Non-Competitive inhibitors often bind to the enzyme irreversibly.

Q.65 The catalytic efficiency of two different enzyme can be compared by the - **[AIPMT 2005]**

(1) The Km value

(2) The pH optimum value

(3) Formation of the product

(4) Molecular size of the enzyme

Q.66 The graph below shows the effect of substrate concentration on the rate of reaction of the enzyme green-gram-phosphatase. What does the graph indicates ? **[AIIMS 2005]**

(1) The rate of enzyme reaction is directly proportional to the substrate concentration.

(2) Presence of an enzyme inhibitor in the reaction mixture

(3) Formation of an enzyme substrate complex

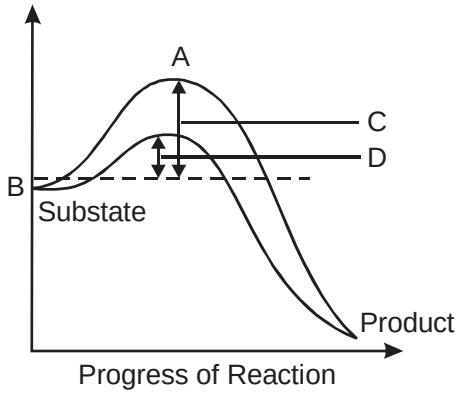
(4) At higher substrate concentration the pH increases

Q.67 An organic substance bound to an enzyme and essential for its activity is called - **[AIPMT 2006]**

(1) Apoenzyme (2) Isoenzyme

(3) Coenzyme (4) Holoenzyme

Q.68 The figure given below shows the conversion of a substrate into product by an enzyme. In which one of the four otpion (1-4) the components of reaction labelled as A, B, C and D are identified correctly? **[AIPMT-2010 (Mains)]**



Option :

	A	B	C	D
(1)	Transition state	Potential energy	Activation energy without enzyme	Activation energy with enzyme
(2)	Potential energy	Transition state	Activation energy with enzyme	Activation energy without enzyme
(3)	Activation energy with enzyme	Transition state	Activation energy without enzyme	Potential energy
(4)	Potential energy	Transition state	Activation energy with enzyme	Activation energy without enzyme

Q.69 Three of the following statements about enzymes are correct and ione is wrong. Which one is wrong? **[AIPMT-2010 (Mains)]**

(1) Enzymes are denatured at high temperatures but in certain exceptional organisms they are effective even at temperatures 80º-90ºC

(2) Enzymes are highly specific

(3) Most enzymes are proteins but some are lipids

(4) Enzymes required optimum pH for maximal activity

Q.70 The fastest acting enzyme, in the biological kingdom, is - **[Uttaranchal 2004]**
(1) Lipase (2) Amylase
(3) Peptidase (4)Carbonic anhydrase

Q.71 Urease enzyme was obtained from - **[Uttaranchal 2005]**
(1) Urine (2) Canavalia
(3) Ficus fruit (4) Pancreas

Q.72 Apoenzyme is - **[Uttaranchal 2005]**
(1) Protein (2) Vitamin
(3) cabohydrate (4) Amino acid

Q.73 The non-protein part of an enzyme is - **[West Bengal 2007]**
(1) Prosthetic group (2) Coenzyme
(3) Cofactor (4) All the above

Q.74 Ribozymes are : **[West Bengal 2007]**
(1) RNA acting as enzymes
(2) antibody acting as enzymes
(3) ribosomes acting as enzymes
(4) None of the above

Q.75 Many of the hydrolytic reactions are : **[MP PMT 2001]**
(1) Reversible (2) Irreversible
(3) Endothermic (4) Exothermic

Q.76 Enzymes concenred with transfer of electrons are : **[C.G. PMT 2005]**
(1) Hydrolysases (2) Dehydrogenases
(3) Transaminases (4) Proteases

Q.77 Enzymes are basically : **[C.G. PMT 2006]**
(1) Fat (2) Protein
(3) Nuclic acid (4) All the above

Q.78 Enzymes are sensitive to : **[C.G. PMT 2006]**
(1) Cold (2) Cell wall
(3) Heat (4) Pressure

Q.79 Enzymes are functional at :**[Jharkhand- 2005]**
(1) 10-15°C (2) 15-25°C
(3) 25-40°C (4) 30-60°C

Q.80 Which of the following inactivates the enzyme by changing its shape ? **[Jharkhand- 2002]**
(1) Competitive inhibitor
(2) Allosteric inhibitor
(3) Coenzyme (4) All of the above

Q.81 Enzymes that catalyse endergonic synthesis, coupled with exergonic hydrolysis of ATP are: **[Jharkhand- 2004]**
(1) ligases (2) isomerases
(3) lyases (4) transferases

Q.82 Proteinaceous nature of enzyme was suggested by : **[Bihar- 2003]**
(1) Summer (2) Kuhne
(3) E.Buchner (4) Northrop

Q.83 Most of the hydrolytic enzymes of lysosomes function at : **[UP CPMT- 2001]**
(1) Acidic pH (2) Basic pH
(3) Neutral pH (4) None of the above

Q.84 Kuhne : **[UP CPMT- 2004]**
(1) Discovered parathyroid
(2) Coined the term enzyme
(3) Coined the term gene
(4) Discovered enzyme

Q.85 Which of the following is not a co-enzyme - **[UP CPMT- 2004]**
(1) NAD (2) NADP
(3) FAD (4) ATP

Q.86 Cytochrome oxidase is a/an -**[MP PMT- 2007]**
(1) Exoenzyme (2) Endoenzyme
(3) Proenzyme (4) Coenzyme

Q.87 Enzymes concerned with transfer of electrons are : **[MP PMT- 2002]**
(1) Hydrolysase (2) Dehydrogenase
(3) Transaminase (4) Protease

Q.88 Yeast enzyme which converts glucose into ethyl alcohol is called : **[MP PMT- 2003]**
(1) Diastase (2) Invertase
(3) Zymase (4) Maltase

Q.89 Basically the Enzymes are : **[MP PMT- 2004]**
(1) Vitamins (2) Fats
(3) Proteins (4) Carbon

Q.90 The globular proteins undergo structural changes, in response of pH or temperature, are called - **[Uttaranchal PMT 2004]**
(1) Renaturation (2) Denaturation
(3) Combination (4) Both 'a' and 'b'

Q.91 Which of the following fatty acid is not synthesized in the human body - **[Uttaranchal PMT 2004]**
(1) Glycerol (2) Cholesterol
(3) Linoleic acid (4) Both 'a' and 'b'

Q.92 Cellulose is a - **[Uttaranchal PMT 2005]**
(1) Monosaccharide (2) Disaccharide
(3) Polysaccharide (4) Lipid

Q.93 The stored food material of muscles is - **[Uttaranchal PMT 2005]**
(1) Starch (2) Glycogen
(3) Lipid (4) Protein

Q.94 Two free ribonucleotide units are interlinked with – **[Uttaranchal PMT 2005]**
(1) Peptide bond (2) covalent bond
(3) Hydrogen bond
(4) Phosphodiester bond

Q.95 Which one of the following enzyme is responsible for the synthesis of DNA from RNA - **[Uttaranchal PMT 2006]**
(1) DNA polymerase (2) RNA polymerase
(3) Reverse transcriptase
(4) DNA ligase

Q.96 Which of the following carbohydrate is absentin honey – **[West Bengal JEE 2007]**
(1) Glucose (2) Levulose
(3) Lactose (4) Maltose

Q.97 Which of the following is not an essential amino acid - **[West Bengal JEE 2007]**
(1) Alanine (2) Valine
(3) Histidine (4) Methionine

Q.98 Which is non reducing sugar - **[West Bengal JEE 2007]**
(1) Sucrose (2) Fructose
(3) Galactose (4) Glucose

Q.99 Which of the following is a polysaccharide **[West Bengal JEE 2007]**
(1) Glucose (2) Fructose
(3) Sucrose (4) Cellulose

Q.100 Which enzyme is used in transcription - **[West Bengal JEE 2007]**
(1) Amino acyl synthetase
(2) DNA polymerase III
(3) RNA polymerase (4) DNA ligase

Q.101 The name 'protoplasm' was given by **[C.G. PMT 2004]**
(1) Hooke (2) A.K. Sharma
(3) Schwann (4) Purkinje

Q.102 The physical basis of life is - **[CG PMT 2004]**
(1) Nucleus (2) sex chromosome
(3) Protoplasm (4) DNA

Q.103 Who called the living matter of the cell as protoplasm - **[C.G. PMT 2005]**
(1) Purkinje (2) Virchow
(3) Hooke (4) Khorana

Q.104 Only R.NA. contains which of the following base - **[C.G. PMT 2005]**
(1) Thymine (2) Uracil
(3) Adenine (4) None of these

Q.105 Among the following examples which is a monosaccharide - **C.G. PMT 2005]**
(1) Glucose (2) Maltose
(3) Sucrose (4) Raffinose

Q.106 Cellulose is - **[C.G. PMT 2006]**
(1) Mono saccharide (2) Disacchride
(3) Polysacchride (4) None

Q.107 The site for protein synthesis in plants is the **[C.G. PMT 2006]**
(1) Chloroplast (2) Ribsosomes
(3) Pyrenoids (4) Mitochondria

Q.108 DNA is present in - **[C.G. PMT 2006]**
(1) Nucleus only (2)Mitochondrion only
(3) Chloroplast only (4) All the above

Q.109 Which one is polymer - **[Jharkhand 2006]**
(1) sucrose (2) Glycogen
(3) Fructose (4) Lactose

Q.110 The term protoplasm was coined by - **[Jharkhand 2005]**
(1) Virchov (2) Purkinje
(3) Dujardin (4) Kollinker

Q.111 Which of the following is a disaccharide **[Jharkhand 2003]**
(1) Glucose (2) Fructose
(3) Sucrose (4) Galactose

Q.112 The scientist who was awarded Nobel prize in 1959 for in vitro synthesis of polyribonucleotide - **[Jharkhand 2003]**
(1) Mendel (2) Calvin
(3) Khorana (4) Ochoa

Q.113 The chemical formula of starch is - **[Jharkhand 2003]**
(1) $(C_6H_{10}O_5)_n$ (2) $(C_6H_{12}O_6)_n$
(3) $C_{12}H_{22}O_{11}$ (4) CH_3COOH

Q.114 Non-essential amino acids are synthesized in the human body during - **[Jharkhand 2002]**
(1) Protein catabolism (2) Protein anabolism
(3) Both 'a' and 'b' (4) None of these

Q.115 According to modern colloidal theory the protoplasm is a polyphasic colloidal system. This was first suggested by - **[Jharkhand 2002]**
(1) Purkinge (2) Max Schultze
(3) R.A. Fisher (4) E. Strasburger

Q.116 The function of chromosome of carrying the genetic information from one cell generation to another is performed by - **[Bihar-2005]**
(1) RNA (2) DNA
(3) Histones (4) Calcium

Q.117 Richest energy compound is - **[Bihar-2005]**
(1) Creatinine phosphate
(2) ATP
(3) Carbohydrate (4) Fat

Q.118 Unit of nucleic acid is - **[Bihar-2005]**
(1) Nucleotide (2) Nucleoside
(3) Nucleic acid (4) All of these

Q.119 Number of carbons in deoxy ribose sugar is **[Bihar-2004]**
(1) Four (2) Five
(3) Six (4) Three

Q.120 Bond present between two carbohydrate molecules is - **[Bihar-2004]**
(1) Glycosidic (2) Hydrogen bond
(3) Phosphodiester (4) Amide

Q.121 In mammals, carbohydrates are stored as- **[Bihar-2003]**
(1) Glycogen in liver
(2) Lactic acid in muscles
(3) Glucose in liver
(4) Glycogen in liver and muscles

Q.122 Raffinose is - **[Bihar-2003]**
(1) Monosaccharides (2) Disaccharides
(3) Trisaccharides (4) Polysaccharides

Q.123 Prokaryotic DNA is - **[Bihar-2002]**
(1) double stranded round
(2) single stranded round
(3) double stranded straight
(4) double stranded RNA as nucleic acid

Q.124 Which one is hexose sugar - **[Bihar-2001]**
(1) Mannose (2) Galactose
(3) Both 'a' and 'b' (4) Cellulose

Q.125 Nucleoside is - **[Bihar-2001]**
(1) Polymer of nucleic acid
(2) Phosphoric acid + base
(3) Phosphoric acid + sugar + base
(4) Sugar + base

Q.126 DNA is a genetic material was proved - **[Bihar-2001]**
(1) Griffith
(2) Linus Pauling
(3) Messelson and stahl
(4) Watson

Q.127 Protein in silk thread is – **[UP CPMT- 2003]**
(1) Fibroin (2) Keratin
(3) Albumin (4) Globulin

Q.128 Amino acid derivative hormone is - **[UP CPMT- 2004]**
(1) Insulin (2) Oxytocin
(3) Erythropoietin (4) thyroxine

Q.129 Which is soluble RNA – **[UP CPMT- 2005]**
(1) hnRNA (2) rRNA
(3) mRNA (4) tRNA

Q.130 Which of the following is not found in DNA : **[UP CPMT- 2005]**
(1) adenine (2) Cytosine
(3) Uracil (4) Thymine

Q.131 The type of linkage present in carbohydrates is - **[UP CPMT- 2005]**
(1) Peptide (2) glycosidic
(3) Amide (4) Phosphate bonds

Q.132 Retrovirus have genetic material - **[MP PMT- 2007]**
(1) DNA only (2) RNA only
(3) DNA or RNA only (4) None

Q.133 Prions consists mainly of - **[MP PMT- 2007]**
(1) Protein (2) DNA
(3) RNA (4) Both 2 and 3

Q.134 RNA is not found in - **[MP PMT- 2007]**
(1) Chromosome (2) Plasmalemma
(3) Nucleus (4) Ribosome

Q.135 Which one is a laevo-rotatory sugar- **[MP PMT- 2007]**
(1) Sucrose (2) Glucose
(3) Fructose (4) None of these

Q.136 Which one is the sweetest sugar - **[MP PMT- 2007]**
(1) Glucose (2) Fructose
(3) Sucrose (4) Maltose

Q.137 Functional unit of gene is - **[MP PMT- 2001]**
(1) Muton (2) Recon
(3) Cistron (4) Codon

Q.138 T.M.V. contains - **[MP PMT- 2001]**
(1) D.N.A. (2) R.N.A. + Protein
(3) D.N.A. + R.N.A. (4) D.N.A. + Protein

Q.139 The cell wall of plants is made up to cellulose which is - **[MP PMT- 2002]**
(1) A lipid (2) A Protein
(3) A Polysaccharide (4) An Aminoacid

Q.140 The smallest RNA is - **[MP PMT- 2003]**
(1) r-RNA (2) m-RNA
(3) t-RNA (4) nuclear RNA

Q.141 The most abundant RNA of cell is - **[MP PMT- 2003]**
(1) r-RNA (2) t-RNA
(3) m-RNA (4) None of these

Q.142 Main components of ribosome are - **[MP PMT- 2006]**
(1) Protein and RNA (2) sucrose
(3) starch (4) glycogen

Q.143 Most abundant RNA of cell is – **[MP PMT- 2006]**
(1) m-RNA (2) t-RNA
(3) r-RNA (4) None of these

Q.144 Carriers of genetic information are - **[MP PMT- 2005]**
(1) t-RNA (2) DNA
(3) m-RNA (4) Nucleoproteins

Q.145 The chemical name of vitamin D is - **[MP PMT- 2005]**
(1) Riboflavin (2) Ascorbic acid
(3) Niacin (4) Calciferol

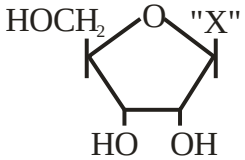
Q.146 Growth hormone affects growth by controlling the production of …at cellular level – **[MP PMT- 2006]**
(1) r-RNA (2) m-RNA
(3) t-RNA (4) None of these

Q.147 Model of DNA molecule was first proposed by- **[MP PMT- 2002]**
(1) Tatum and Beadle (2) Mc Clung
(3) Purkinje (4) Watson and Crick

Q.148 DNA or RNA segment tagged with a radioactive molecular is called :**[CPMT- 2010]**
(1) Vector (2) Probe
(3) Clone (4) Plasmid

Q.149 The main areana of various types of activites : **[CPMT- 2010]**
(1) Plasma membrane (2) Mitochondrian
(3) Cytoplasm (4) Nucleus

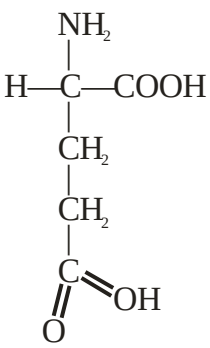
Q.150 Given below is the diagrammatic representation of one of the categories of small molecular weight organic compounds in the living tissues. Identify the category shown and the one blank component "X" in it. **[AIPMT PRE 2012]**



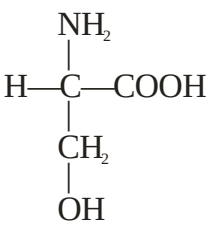
Category	**Component**
(1) Amino acid	NH_2
(2) Nucleotide	Adenine
(3) Nucleoside	Uracil
(4) Chojesterol	Guanin

Q.151 Which one out of A - D given below correctly represents the structural formula of the basic amino acid ? **[AIPMT PRE 2012]**

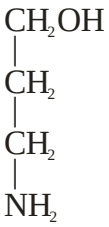
A



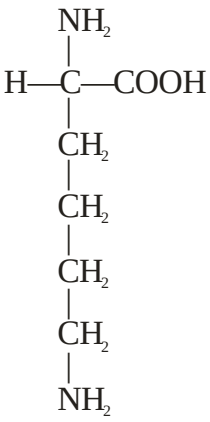
B



C



D



(1) D (2) A
(3) B (4) C

ANSWER KEY

EXERCISE - 3

Ans.	1	1	3	2	4	2	4	2	3	3	1									

These questions consist of two statements each, printed as Assertion and Reason. While answering these Questions are required to choose any one of the following four responses.

(1) **If both Assertion & Reason are True & the Reason is a correct explanation of the Assertion.**

(2) **If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.**

(3) **If Assertion is True but the Reason is False.**

(4) **If both Assertion & Reason are false.**

Q.1 **A :** Protoplasm show conductivity.
R : Ions are responsible for transmission of stimulus.

Q.2 **A :** Valine is a protein amino acid.
R : It participates in protein synthesis.

Q.3 **A :** Nerve cells are more active as compared to bone cells.
R : In nerve cells protoplasm occurs in gel stage.

Q.4 **A :** Heparin is a natural anticoagulant inside the blood vessels.
R : It is an example of homopolysaccharide.

Q.5 **A :** Cellulose is a macromolecule.
R : It is formed by union of repeated units of fructose.

Q.6 **A :** Haemoglobin is a monomeric protein
R : It is madeup of by two polypeptide chains.

Q.7 **A :** Saturated fatty acids are non essential fatty acids.
R : They can be synthesized in animal body.

Q.8 **A :** Lipids provides more energy as compared to carbohydrates on oxidation.
R : Lipid is first respiratory substance.

Q.9 **A :** Serine amino acid is an alkaline amino acid.
R : It contain one -COOH group and two $-NH_2$ groups.

Q.10 **A :** In protoplasm protein functions as a buffer.
R : Protein molecule is amphoteric.

Q.11 **A :** Lipid require less space for storage as compared to carbohydrate.
R : Lipid is polymer of amino acid.

Q.12 **A :** Phospholipid form bimolecular layer in aqueous medium.
R : Phospholipid molecules are amphipothic.

Q.13 **A :** In unit area glycogen stores more energy as compared to starch.
R : Molecule of glycogen is more branched as compared to starch.

Q.14 **A :** Linolenic acid is essential Fatty acid for human being.
R : Human being lack the mechanism to synthesize linolenic acid.

Q.15 **A :** Alanine-glycine- tryptophan and tryptophan - glycine-alanin are two different tripeptide.
R : A polypeptide chain has direction.

Q.16 **A :** Silk fibre protein are made up of glycine, alanine and serine amino acids.
R : This fibrous protein consists of parallel β pleated sheet.

Q.17 **A :** Starch is the storage polysaccharide in plants.
R : Starch is a polymer of β-glucose.

Q.18 **A :** Glucose 6- phosphate dehydrogenase deficiency in red cells seems to protect a person from falciparum malaria.
R : The parasites that causes this disease require the pentose phosphate pathway and reduced glutathione for optimal growth.

Q.19 **A :** Milk forms interfacial boundry.
R : Milk is a coloidal solution.

Q.20 **A :** Lecithin is important in membranes.
R : Amphiatic nature.

Q.21 **A :** Glucose is dextrose.
R : Glucose open chain have 4 assymmetrical carbon.

Q.22 **A :** Histones are acidic proteins.
R : These joins to all nucleic acids.

Q.23 **A :** Water do not radially forms $-OH^-$ & $-H^+$.
R : Dissociation constant of water is very high.

Q.24 **A :** Disaccharides show optical activity.
R : Cellobiose is an example of disaccharide.

Q.25 **A :** Sucrose is a reducing sugar.
R : All disaccharides are reducing sugar.

Q.26 **A :** Whales can live in extremely cold regions.
R : They contain blubber.

Q.27 **A :** Hibernating animals store fat prior to onset of winter.
R : Migratory birds also store fat before migration.

Q.28 **A :** Souring of milk occurs due to condensation of glucose and galactose.
R : Condensation of glucose and galactose form lactic acid.

Q.29 **A :** Bacterial cell wall are not like the plant cell.
R : Bacterial cell wall is not made up of cellulose.

Q.30 **A :** Lipoproteins are conjugated proteins.
R : Lipoproteins are conjugated lipids.

Q.31 **A :** α-helix is the secondary structure of protein.
R : The haemoglobin molecule is composed of four polypeptide chains.

Q.32 **A :** Magnesium is involved in chlorophyll formation.
R : Magnesium takes part in protein synthesis.

Q.33 **A :** Iron is a minor mineral.
R : Iron is a constituent of haemoglobin, myoglobin and cytochromes.

Q.34 **A :** Frozen water requires more space and is lighter than water.
R : Ice is solid.

Q.35 **A :** Hydrogen bonding between water molecules occurs not only in liquid water but also in ice and in water vapour.
R : Hydrogen bonding exist even at 100 ^oC.

Q.36 **A :** Inulin is a storage polysaccharide.
R : Inulin is not metabolised in human body and is readily filtered through the kidney.

Q.37 **A :** Isabgol is used as medicine.
R : Husk of isabgol contains mucilage.

Q.38 **A :** Monellin is the sweetest chemical.
R : Monellin is a protein.

Q.39 **A :** Pectin produces cementing layer between adjacent plant cells.
R : Pectin is able to undergo sol = gel interchange.

Q.40 **A :** At high temperature, proteins are liable to denaturation.
R : Globular proteins are not coagulated by heat.

Q.41 **A :** Cocoon of silk fibres and spider webs are madeup of cellulose.
R : These are structures for their beautification.

Q.42 **A :** Natural silk is made up protein.
R : Artificial silk is a polysaccharide.

Q.43 **A :** Co-enzymes are usually proteins
R : Co-enzymes are synthesized in mitochondria.

Q.44 **A :** Malonic-Acid is competitive and reversible inhibitor of enzyme Succinic dehydrogenase
R : Malonic acid binds to allosteric site of this enzyme.

Q.45 **A :** Enzymes increase the rate of biochemical reactions
R : Enzymes function at near neutral pH

Q.46 **A :** Specific substrate binds at active site of thier enzyme.
R : Enzymes increase the activation energy of substrate.

Q.47 **A :** Enzymes only increases the rate of biochemical reactions
R : Enzymes are proteinaceous biocatalysts

Q.48 **A :** Enzymes are synthesized on ribosomes under the control of genes.
R : Enzymes only function inside the ribosome

Q.49 **A :** Enzymes become denatured at high temperature
R : Tertiary structure of proteins damaged at high temperature

Q.50 **A :** All enzymes are proteins.

R : Ribozymes are enzymes without proteins.

Q.51 **A :** Allosteric modulators accelerate or retard the rate of catalysis of an allosteric enzyme.

R : Allosteric modulators modulates the configuration of active site of enzyme.

Q.52 **A :** Taq polymerase is an example of extremozyme.

R : The enzyme is made up of polypeptide chain.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	**Good / Important questions**
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

CELL BIOLOGY

Cytology : Structural study of cell

Cell Biology : Structural & Functional study of cell.

HISTORY :

(A) Robert Hooke – He discoved the cell in 1665 examined in the thin slices of cork under his self made microscope (Magnification = 42 times). The cork seen was dead bark of spanish oak **(***Quercus suber***)**. Robert Hook coined the term "Cellula" for Honey comb like structure which later modified to cell. Actually he saw only the dead cell walls of plant cells. He published his findings in his book '**Micrographia**'.

(B) R.Virchow stated "Omnis cellula e cellula" which means all cells arises from pre existing cell. This is known as "Law of Lineage".

(C) Karl Nageli showed that cells in plants arises by the division of pre existing cell.

(D) Leeuwenhoek – Discovered living cell and Leeuwenhoek examined mud, semen, saliva, blood, Insects etc. Under his self made microscope and observe protozoans, sperm, bacteria, RBC, muscle cells etc. He called these tiny creatures as "Animalcules" and published his finding in "Secrets of nature". He is known as father of microbiology, father of bacteriology, father of protozoology.

(D) Hertwig & **R. Hooke –** Father of cytology.

(E) C.P. Swannson – Father of modern cytology.

(F) Dr. A.K. Sharma – Father of Indian cytology.

GENERAL FACTS RELATED WITH CELLS :

(A) Longest cell is nerve cell of Giraffe. (more than 1m) (90 cm in man).

(B) Largest cell is egg of ostrich (17cm x 13.5 cm dimension).

(C) Smallest cell is PPLO (Pleuro Pneumonia Like Organism).

(D) Smallest plant cell *Mycoplasma laidlawii* 0.1 μ.

(E) Centre for cellular and molecular biology is at Hyderabad.

(F) Largest plant cell – *Acetabularia* (10cm)

(G) Longest plant cell – Remie fibre (*Boehmeria nevia*)

CELL THEORY :

(A) Cell theory was proposed by **Schleiden** (Botanist, 1838) and **Schwann**. (Zoologist, 1839)

(B) According to cell theory, all livings things are made up of cells.

(C) Cell is structural and Functional unit of living being.

(D) They has power of Reproduction.

(E) All cells arise from preexisting cells.

(F) All cells are basically similar in structure and metabolic function

(G) Each cell has a unit of heredity

Exceptions to Cell Theory :

According to this theory all the living organism are made up of cells. Viruses are exception of this theory because virus lacks cell organization.

According to moderm scientists all the acellular organism - monera and protista, Xanthophytes, (Vaucharia) Phycomycetes (Rhizopus) are exception of cell theory.

TYPE OF CELLS :

On the basis of nuclear organization, cells are classified into three types [mainly two types] -

(A) Prokaryotic cell (B) Eukaryotic cell

An intermediate nuclear organization of prokaryotic and eukaryotic cell was given by **Dodge**. He told that **mesokaryotic cells** have well organized nuclear membrane, but their DNA is without histone proteins. e.g. Dinoflagellates

Multicellular organism have three types of cells regarding their capacity to divide and differentiate.

(a) Undifferentiated cells - These are the meristematic cells which possess the power of division, e.g. apical meristem

(b) Differentiated cells - These are post-mitotic specialized cells with a distinct structure and function, e.g., RBC.

(c) Dedifferentiated cells - These are specialized cells that revert to function of division for wound healing, regeneration, secondary growth etc.

DIFFERENCE BETWEEN PROKARYOTIC AND EUKARYOTIC CELL :

(A) Basis of difference is nucleus.

(B) Term prokaryote and eukaryote was given by Von Neil.

S.No.	Feature	Prokaryotes	Eukaryotes
1.	Nucleus	(a) Nuclear envelope, nucleolus are absent	(a) Nuclear envelope, nucleolus as nucleoli are present
		(b) Nuclear material consists of folded nucleoid, circular, ds DNA (G-C rich) which is not associated with proteins. (Histones are absent polyamines are present) & is called as Nucleoid, genophore or fibrillar nucleus or Incipient nucleus.	(b) Nuclear DNA is linear and is associated with proteins (Histones are present).
		(c) The nucleoid contains a single prochromosome (Haploid).	(c) The nucleus contains two to many chromosomes (Haploid and Diploid both).
2.	Size	Prokaryotic cells are smaller (0.5 – 10μm)	Eukaryotic cells are relatively large (10 – 15 μm)
3.	Cell wall	Cell wall is present surrounding plasmamembrane and is made of peptidoglycan, polysaccharides & amino acids strengthening material is murein.	Cell wall is present in some protists, most fungi & all plants but absent in animals, it is composed of polysaccharides. Strengthening material is cellulose in plants, while in fungi it is chitin.
4.	Plasma membrane	Present & bears respiratory enzymes (mesosome).	Present but lacks respiratory enzymes

5.	Photosynthetic apparatus	Takes place in Carboxysomes or lamelles or Chlorosomes in BGA (in Bacteria chromatophores membrane infoldings).	Thylakoids are present but within the membrane enclosed organelle called as chloroplast.
6.	Cell organelles	Cytoplasm lacks membrane bound cell organelles like E.R., Mitochondria, Golgibody, lysosomes etc.	Cytoplasm contains organelles.
7.	Vacuoles	Sap vacuoles are absent but gas vacuoles may occur.	Sap vacuoles in plants.
8.	Ribosomes	Ribosomes are 70s lie free in cytoplasm or joined to cell membrane. Ribosome occurs as polysomes i.e. remain united by m-RNA.	Ribosomes are 80S may lie free or bound to E.R. and nuclear envelope (70S in organelles). Polysomes are seen only during translation.
9.	Cyclosis	There are no streaming movements of cytoplasm.	Cytoplasm shows streaming movements.
10.	Cytoskeletal structures	Microtubules, micro filaments are absent	They are present
11.	Sexuality	Sexuality or true sexual reproduction absent in prokaryotic cell (In Bacteria genetic - recombination or parasexual reproduction by conjugation, transduction & transformation)	Sexuality or sexual reproduction present (Meiosis, gamete formation & true fertilization occurs)
12.	Flagella	Flagella if present is simple (without 9 + 2 arrangement) and is formed of a protein Flagellin Flagella is 20 mm in dia. It is not enclosed in cell membrane.	Flagella if present are complex, have 9 + 2 pattern & is formed of protein tubulin. It is 200 nm is dia. It is enclosed in cell membrane.
13.	Plasmids and pilli	Present	Absent
14.	Cell cycle	It is short & takes about 20–60 minutes to complete. Cell divide by Amitosis.	It is long & takes about 12–24 hours or even days to complete. Mitosis, Meiosis both occurs.
15.	Mitotic spindle	It is not formed in cell division	It is formed during cell division.
16.	Centrioles	Absent	Present (Plants - absent)
17.	Protein synthesis	Takes places in cytoplasm	Transcription in nucleus & Translation in cytoplasm on ribosomes.

18.	Example	Bacteria, Cyanobacteria (BGA) Mycoplasma (PPLO), Ricketsias, Actinomycetes. [Monera]	All plant & Animal cells including Human cells. Protista, Algae, Fungi, Protozoa.

S.No.	Feature	Animal Cell	Plant Cell
(i)	Cell wall	Cell wall is absent	It is present & is made up of cellulose.
(ii)	Vacuole	Vacuoles are absent if present are	Vacuoles are always present & are usually larger.
(ii)	Plastids	Absent	Vacuoles are always present & are usually larger.
(ii)	Mitochondria	Mitochondria are numerous & have plate–like cristae	Vacuoles are always present & are usually larger.
(ii)	Centriole	Centriole is present	Vacuoles are always present & are usually larger.
(ii)	Nucleus	Nucleus usually near the centre	Vacuoles are always present & are usually larger.
(ii)	Division	Cytoplasm divides by furrowing or cleavage method	Vacuoles are always present & are usually larger.
(ii)	Crystals	Absent	Vacuoles are always present & are usually larger.
(ii)	Plasmolysis	Due to plasmolysis animal cells	Vacuoles are always present & are usually larger.

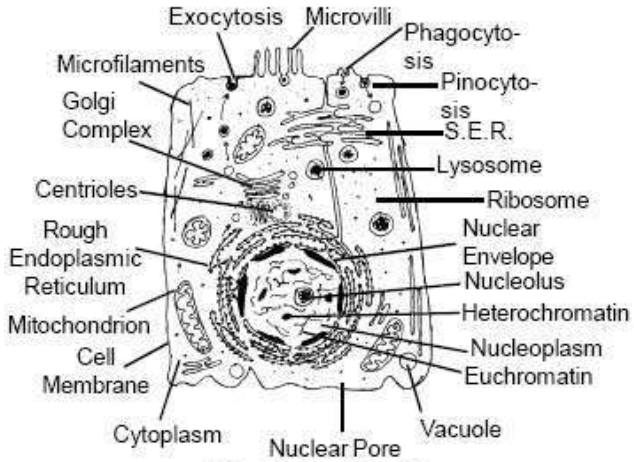

Fig.Animal Cell

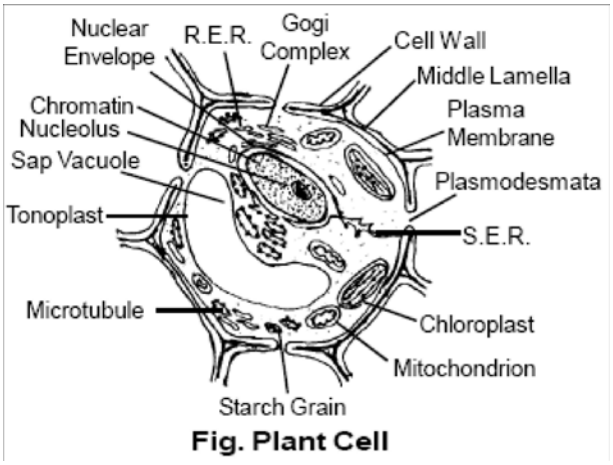

Fig. Plant Cell

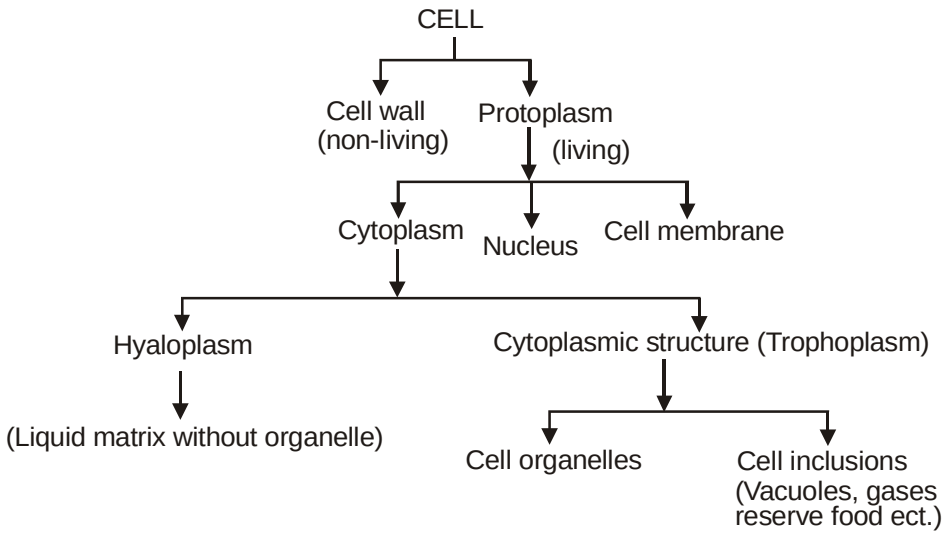
STRUCTURAL ORGANISATION OF A CELL :



A typical cell is classified into three parts –

(A) Cell envelope (B) Cytoplasm (C) Nucleus

(A) CELL ENVELOPE – Plant cell has 3 layer in its envelope.

(i) Cell wall (ii) Glylocaylax (iii) Plasmamembrane

(i) CELL WALL

Each plant cell is surrounded by a rigid and **dead** cell wall. It is secretory substance of the protoplasm which protects the cell.

Generally it is made up of cellulose however the cell wall of fungi is made up of fungul cellulose or chitin and the cell wall of bacteria & BGA is made up of peptidoglycon.

Numerous threads like fibrils are found in the wall. One fibril is formed of about 250 microfibrils (main structural elements). One microfibril is also formed about 20 to 22 microfibrils which is called elementary Fibril or Micelle. One micelle is formed about 100 chains of cellulose molecules. Approximately 3000 chains of glucose molecules are found in one molecule of cellulose. Matrix is found between the microfibrils, this matrix is a gel like substance in which pectin lignin etc are found.

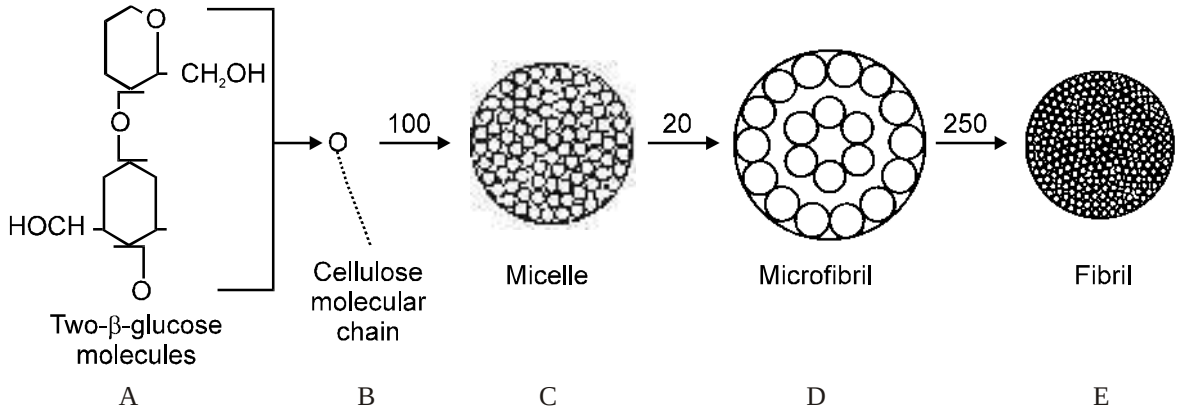


Fig. Molecular organization of cell wall

- **Layers of cell wall**
  - (i) Middle lamella
  - (ii) Primary wall
  - (iii) Secondary wall
  - (iv) Tertiary wall

Middle lamella

At the time of division the minute drops of substances of protoplasm become aligned at the equatorial plate and forms cell plate. It is formed of calcium (more) and magnesium (less) pectate (plant cement). It functions as cementing between two cells.

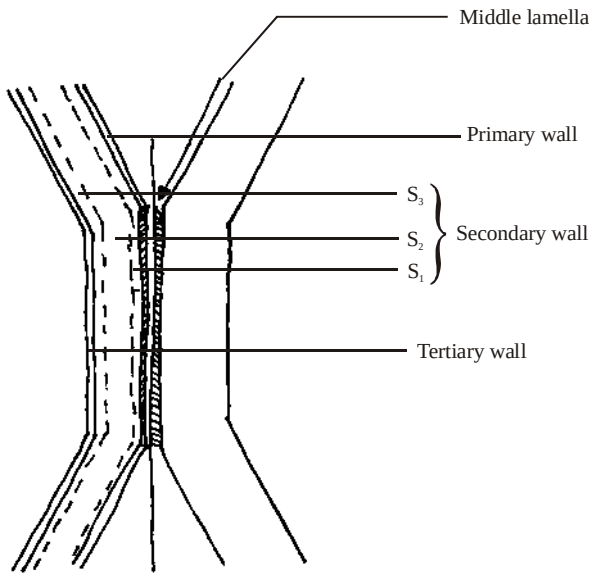

Fig. CELL WALL

Primary wall

(i) Protoplasm deposits some substances on the middle lamella due to which a soft, delicate elastic primary wall is formed. (universal layer)

(ii) Following substances are found in this wall

(a) Pectic substance (Arabinose, galactose, galacturonic acid)

(b) Cellulose

(c) Hemicellulose (mannose, Xylose, gluconic acid) (50%)

(iii) Parenchymatous cells and meristematic cells are formed of only primary wall

Secondary wall (absent in meristem cell)

(i) After the complete development of primary wall, deposition starts due to which secondary wall is formed

(ii) Generally lignin, leutin and suberin are deposited.

(iii) This wall is made up of cellulose, hemicellulose and pectin inside the primary wall.

(iv) This wall is non-elastic and thick (5 - 10 μ)

(v) It is formed of three layers in most of the cells (Thickest wall)

Tertiary wall (mainly hemicellulose & xylan)

Tertiary wall and secondary wall is commonly known as secondary thickenings. Found only in Tracheids of Gymnosperm.

Plasmodesmata

(i) The cytoplasmic bridge between adjacent cells are called Plasmodesmata (discovered by Strassberger). Plasmodesmata contains E.R. tubules called Desmotubules.

(ii) Due to presence of plasmodesmata entire protoplasm are found in the form of continuous system which is called symplast.

Growth of cell wall

A special protein called expansin helps in growth of cell wall by loosing the cellulose microfibril and addition of new cell wall material takes place in the space. Thus expansin is called as "cell wall loosening factor".

Growth of cell wall takes place by two methods :-

(A) Intussusception (B) Apposition

(A) Intussusception

(i) When the particles are deposited between the substance which are already present then this types of growth is called Intussusception Growth

(ii) This types of growth takes place in primary, secondary and tertiary cell wall.

(B) Apposition (Accretion)

(i) When the layers are desposited on to the layers which are present already , then this types of growth is called apposition growth

(ii) This types of growth takes place in secondary cell wall.

Inter cellular spaces

As compared to young cells some intercellular spaces are found in old cells. Intercellular spaces are of following three types :-

(A) Lysogenous Cavities

(B) Schizogenous Cavities

(C) Schizo-Lysogenous Cavities

(A) Lysogenous cavities

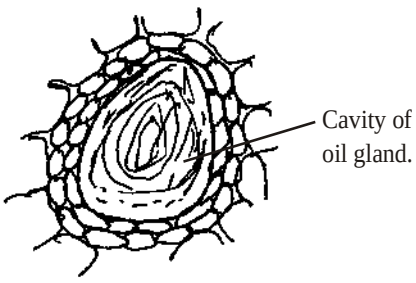
Cavities which are formed by the destroying of cells, called lysogenous cavities. e.g. Oil cavities of citrus.

(B) Schizogenous Cavities

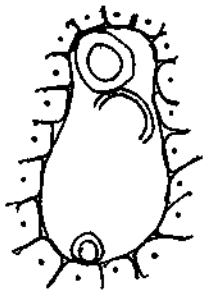
Cavities which are produced by the separation of cells from one another, called schizogonous cavities. e.g. Resin canals in pinus.

(C) Schizo-lysogenous cavities

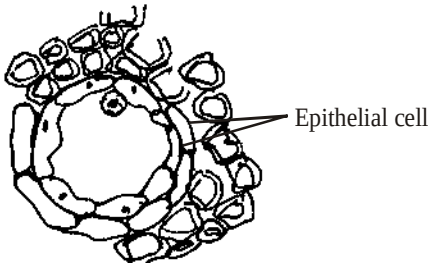
When cavities are produced by both destroying and separation of cells together then , such types of cavities are called Schizo-lysogenous cavities. e.g : Cavity in maize protoxylem.



LYSOGENOUS CAVITY OF CITRUS



SCHIZOLYSOGENOUS CAVITY OF MAIZE PROTOXYLEM



SCHIZOGENOUS CAVITY OF PINUS

Functions of cell wall

(i) Cell wall protects the protoplasm.

(ii) Cell wall gives a particular size & shape to cell & functions in form of exoskeleton of cell.

(iii) It gives a mechanical support to cell.

(iv) Cell wall is permeable so it helps in transport of water & mineral substances

(v) Cell wall plays an important role in absorption, transpiration, transport and secretion etc.

CELL COAT (GLYCOCALYX) :

It is found outside the plasma membrane in many **protistants** and animals cell. Made by **sialic acid** mucin & Hyluronic acid

Function –

(i) It provides definite shape to the cell.

(ii) It helps in recognition of microbes for defence.

(iii) It protects the underlying plasma membrane.

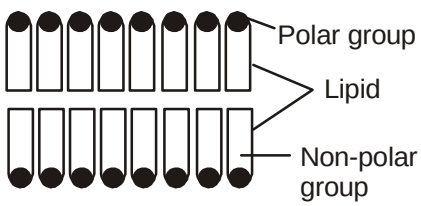
PLASMA MEMBRANE :

Term plasma lemma was given by J.Q. Plower (1885). Term cell membrane or plasma membrane was given by Nagelli. Term unit membrane was given by Robertson. At first, structure of cell membrane was studied by Overton and postulated that cell membrane is composed of a continous layer of lipid material. It is outermost boundary of animal cell. Plasma membrane is a thin selective permeable & living membrane. It is flexible and porus membrane. Plasmalemma of animal cells is elastic due to the presence of lipids.

Model of cell membrane

To describe structure of plasma membrane numerous models have been proposed but the important model are as follow :–

(A) Lipoidal model - This model was proposed by Overton. This postulated that membranes are composed of Lipid bilayer only.



Models of plasma-membrane proposed by Overton

(B) Lamellar model (PLLP) - (1935) :

(i) This model was proposed by Danielli and Davson.

(ii) It is also called trilayered, trilaminar or sandwitch model.

(iii) According to this model plasma membrane is a trilayered structure composed of lipoprotein.

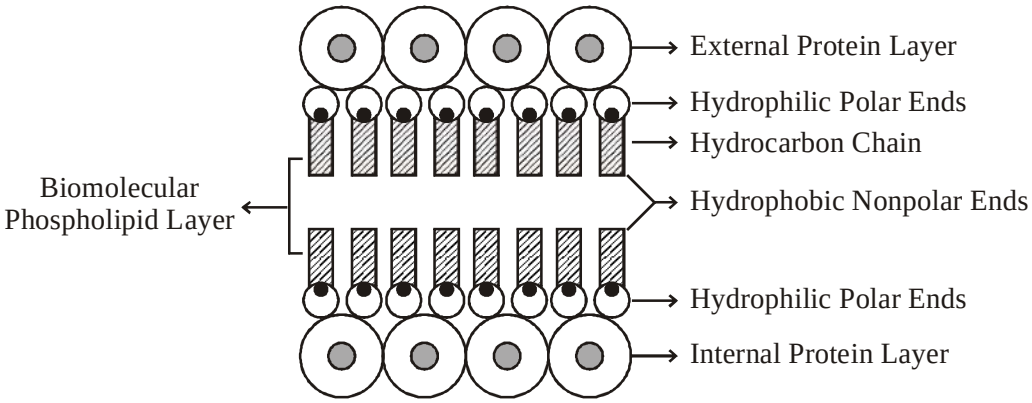
(iv) The bilayered phospho lipid is sandwitched in between two layer of protein molecule.

(v) The bilayered lipid is 35 Å thick whereas, each layer of protien is 20Å thick so plasma membrane is 75Å thick (75 – 100 Å)

(vi) The polar heads of the phospholipids molecules are directed towards protein. The two are held together by electrostatic forces.

(vii) The non polar tails of the two lipids layer is directed towards the centre, where they are held together by Vander Walls forces.

(viii) Plasma membrane is a porous membrane, it has microscopic pores of 7 to 10 Å.

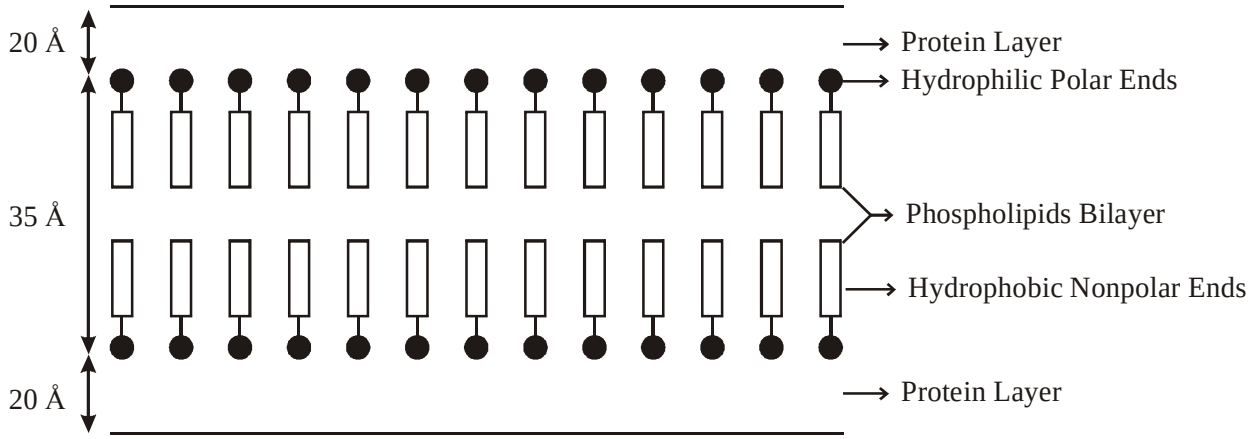


Sendwitch Model

(C) Unit membrane model [(1959) A.D.]

It was proposed by J. David Robertson. **Robertson** coined the term **unit membrane**. According to this model all the cellular and organeller membranes are structurally & functionally similar.

In this model membranes are different to each other on the basis of their chemical behavier & size.



Unit membrane Model

(D) Fluid mosaic model (1973)

This model was proposed by **Singer** and **Nicholson**. It described protein as ice bergs in a sea of lipids. It is the most accepted model.

Their is a central bilipid layer (2 layer) composed of phospholipids arranged in a specific manner. Hydrophilic polar head constitute top and bottom surfaces. Hydrophobic non polar tail end-are buried in the membrane.

Within phospholipid, bilayer, proteins are arranged in two forms.

(a) Extrinsic protein (b) Intrinsic proteins

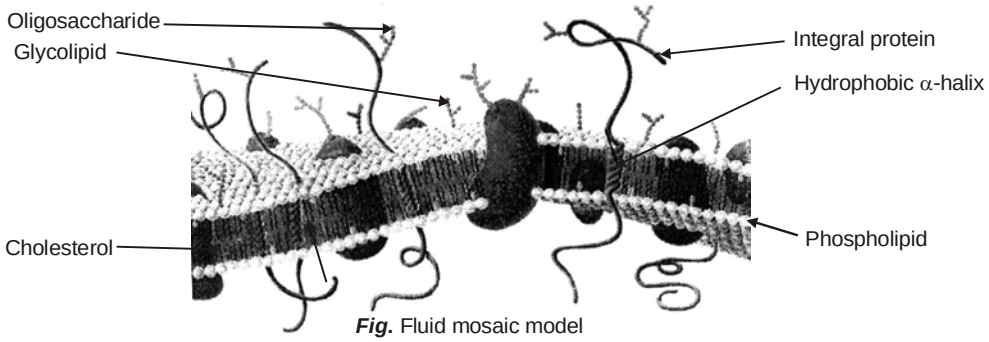


Fig. Fluid mosaic model

Plasma Membrane

Extrinsic proteins | Intrinsic proteins | Phospholipids | Carbohydrates

(a) Extrinsic protein (30%)

(i) Such proteins are arranged superficially on the outer and inner surfaces of membrane and can be easily removed by mild treatment.

(ii) Such proteins are **soluble and unstable**.

(iii) Such proteins can be seperated by change in pH.

(iv) Spectrin, Acetylcholine, Cytochromes are its best example. Spectrins are part of **cytoskeleton**

(v) Some protein like **permeases** and **translocase** function as **carrier** for the transport of materials.

(vi) Plasma membrane is an **asymmetrical structure** because carbohydrate is presents on outer surface and **spectrin protein** is present only in inner surface of plasma membrane.

(b) Intrinsic proteins (70%)

(i) Such protein partially or wholly remain embedded in phospholipid.

(ii) Such proteins can not be seperated easily.

(iii) Some intrinsic protein are confined in lipid bilayer (**Stable protein**).

(iv) Some integral proteins traverse the complete thickness of membrane. These type of protein are called as **tunnel protein** which passage water soluble material across the membrane.

(v) Some intrinsic protein extending from outside to inside are called as **transmembrane protein** eg. **glycophorin, porins.**

(vi) **Porins** founds in outer mitochondrial memberane and bacterial memberane

(c) Phospholipids

Main type of phospholipids are phosphatidylserine, phosphatidylcholine (Lecithin), cephalin. **Cholesterol** is also present in plasmamembrane. Cholestrol are more rigid than phospholipid. So it helps in stability of membrane structure at high temperature. Cholesterol is absent in membrane of prokaryote. Thus Hopanoides (Pentacyclic sterol) provides stability to prokaryotic cell membrane. The lipid act as a barrier to the entry or exit of charged polar substance.

(d) Carbohydrates

The plasma membrane of RBC and liver cell contain 5% carbohydrate Hexasamine sialic acid if carbohydrate attached to lipid it is called **glycolipid** and if attached to protein called **glycoprotein**. Carbohydrate is just 1 percent of the plasma membrane.

Oligosaccharides of the glycolipids & glycoproteins on the outer surface of plasma membranes are involved in cell to cell recognition mechanism. Best example of cell recognition is fertilisation, (where sperm & egg recognize to each other) and blood-Antigens.

Fluidity of the cell membrane

It has been demonstrated by the experiment conducted by **Frye and Edidin (1970).**

Two different animal cells i.e., human and mouse cells were taken. Human cell was labelled with red fluorescent (rhodomine dye) antibody, whereas mouse cell was labelled with green fluorescent (fluorescein dye) antibody. Both the cells were then fused using PEG and examined under the microscope. One half of the fused cell was observed green and the other half as red. They are now divided into lots. One lot is kept at 0ºC, while the other is kept at 37ºC. In the lot kept at 37ºC, there is thorough mixing of the two pigments. No mixing occurs in the fused cells kept at 0ºC, where most of membrane lipids tend to solidify. It these cells are now kept at 37ºC, pigment mising occurs showing that membrane or lipid fluidity has been restored.

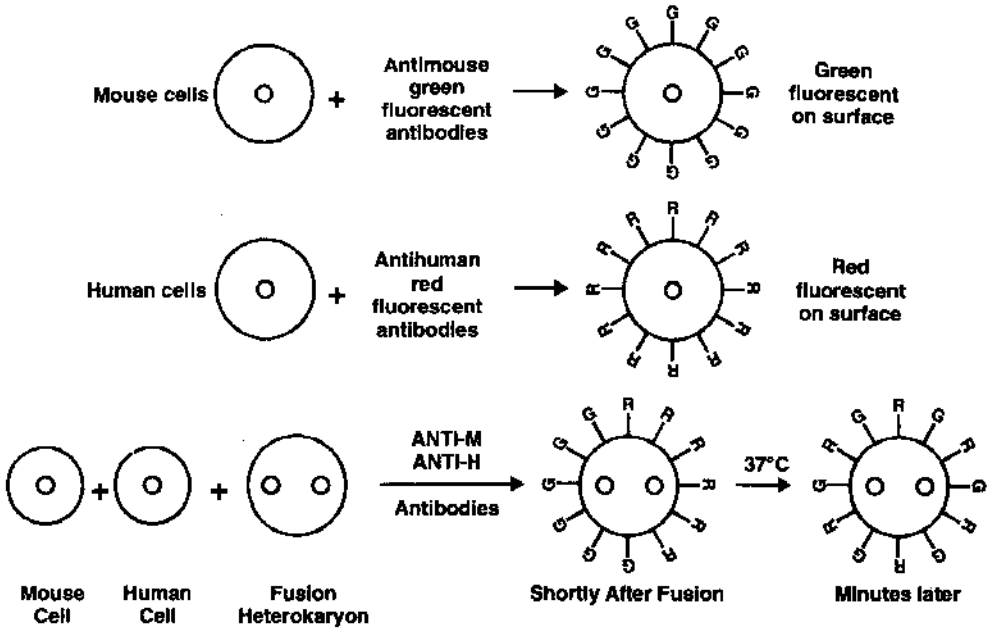

Fig. Experiment to demonstrate lateral movement of protein molecules of the membrane due to fluidity of lipid molecules

Flip-flop concept in fluid mosaic model :

Flip Flop means exchange of molecules from onse monolayer with those in the monolayer on the other side. However phospholipid bilayer has fluid property but no evidence of flip flop mechanism for protein molecule Rotational diffusion and lateral diffusion of protein and lipids is possible in membrane. Absence of flip flop movement detected by electro spin resonance (ESR) spectroscopy.

Modification of plasma membrane :

(A) Microvilli

The free surface of the epithelial cell posses extremely minute thread like structure called **microvilli**. Increase surface area for absorption.

(B) Desmosomes (zona adherence)

In certain epithelial cells plasma membrane of adjacent cells becomes thicker in certain regions s u c h local thickning of plasma membrane are called **desmosomes**. From desmosomes many minute fine fibrils known as tonofibril are radiated towards the interior of the cell. Generally occur in Epithelial cell for cell adhesion.

(C) Interdigitation

At some places the plasma membrane of adjacent cells gives out finger like projection called interdigitation. Interdigitation increase the area of the contact between cells for exchange of material

(D) Tight junction or Zona occludence - These are fused outer layers of two P.M. at the site of attachment, fused membrane has a 5-layered structure. Tight junction occur in nerve tissue at synapses.

(E) Gap junction or Nexus - These are fine protein channels (connexons) which joins two P.M. of adjacent cells with protein connexine. Desmosomes, interdigitation, tight junction and gap junction occurs in animal cell.

(F) Mesosomes

Mesosomes are plasma lemma in folding found in bacteria. In aerobic bacteria respiratory enzymes found in it.

(G) Lomasomes / Border body

Lomasomes are plasmalemma folding found in fungal cell in between cell membrane and cell wall. Discovered by Moore and Mc Aear. It is belived that it is related with formation of cell wall.

FUNCTION OF PLASMA MEMBRANE :

Main function of plasma membrane is transport. It is following types :

(A) Active transport

(i) Occurs from **lower concentration** to **higher concentration**.

(ii) During this type of transport, energy is utilized. e.g.- **Sodium pump**.

(B) Passive transport

(i) Occurs from **higher concentration** to **lower concentration**.

(ii) During this type of transport energy is not utilized.

(C) Endocytosis (Bulk transport)

(i) **Pinocytosis** or **Cell Drinking** - Term proposed by **W.H.Lewis** (1934). Ingestion of liquid material by plasmalemma in the form of vesicles or bag like structure (**Pinosome**) is called pinocytosis.

(ii) **Phagocytosis** or **Cell eating** - Term given by **Metchnikoff**. Ingestion of solid complex materials by Membranes in the form of vesicles (**Phagosome**) is called Phagocytosis.

(D) Exocytosis / Emiocytosis / Cell vomitting - Egestion of waste materials from cell through plasma membrane.

(E) Rophaeocytosis -

This is transfer of complex materials from **one cell to another cell**, through membrane in vescicular form. (Transfer of Hb from Red Bone marow cells to maturing RBCs is good example of Rophaocytosis).

(F) Plama membrane provide definite shape to the cell. Conduction of nerve impulse takes place through plasma membrane of nerve cell.Plasma membrane plays important role in recognition of various cells. e.g. Macrophages engulfes only dead RBC.

(G) The microvilli of intestinal cells increases surface area of absorption so, rate of absorption increase. The site for cells recognition are located on the surface of plasma membrane. The antigenic property of a cells are located on the surface of plasma membrane.

CYTOPLASM

Mass of protoplasm lying in between outside of nucleus and plasma membrane is called **cytoplasm**. (term - strassberger). It is colourless homogenous, translucent, amorphours and colloidal fluid. The peripheral part of cytoplasm is normally non-granular and clear and known as **ectoplasm**. The inner portion is granular and less viscous known as **endoplasm**. Liquid matrix of cytoplasm except organelles called **Ground plasm**

/ **Hyaloplasm / Cytosol**. Part of cytoplasm containing organelles & non living inclusions called **Trophoplasm**. Cell inclusions are non - living matter.

CELL ORGANELLES :

Cell organelles are organised structure of cytoplasm capable of growth and in some cases multiplication.

CELL ORGANELLES

Double membranous structure	**Single membranous structure**	**Non membranous structures**
Nucleus, Mitochondria and Plastids.	Lysosomes ,Microbodies, Golgi complex and Endoplasmic reticulum.	Ribosome and centriole.

MITOCHONDRIA

(i) Power house of cell or ATP-mill in cell.
(ii) Cell within cell / second largest organelle
(iii) Cell furanaces or storage batteries.
(iv) Most busy and active organelle in cell
(v) Semi autonomous cell organelle.
(vi) It was discovered by Kolliker 1880. (In straited muscles of insect)
(vii) It was named bioplast by **Altman** in 1886.
(viii) It was named mitochondria by **C. Benda**.
(ix) **C. Benda** stained it with **crystal voilet.**

Number

The cell in which energy requirement is high large numbers of mitochondria are reported.

(i) *Microsterias* and *Tripanosoma* & *Chlorella* (Algae) - One
(ii) *Yeast* - Less than 10.
(iii) Liver cells - 500
(iv) Kidney - 300 to 400
(v) *Chaos chaos* (amoeba) - (50,000).
(vi) Flight muscles of Birds - (5 lakh). (sarcosome)

Shape and size

Mitochondria may be spiral, rod shaped, spherical elongated or cup shaped. Yeast cell possess smallest mitochondria (0.1 μ). Oocytes of amphibians possess largest mitochondria (40 μ).

Structure

Mitochondria is made up of three component :

(A) Mitochondrial membrane,
(B) Oxysome &
(C) Matrix

(A) Mitochondrial membrane : Mitochondria is covered by **double unit membrane**. Each membrane is 60-75 Å thick and separated by a space (80 - 100 Å) called perimitochondrial space. This space is rich in coenzymes and enzymes required for oxidation of fats.

Inner membrane	Outer membrane
(i) It is projected into the central space in the form of finger like projections called cristae (ii) Cristae name was given by palade. (iii) The cristae increase the surface area and provide abundant space for metabolism. (iv) Inner membrane is selectively permeable. (v) It contains all enzymes of electron transport chain.	(i) It is not projected and continious. (ii) Cristae is not formed. (iii) The cristae is absent. (iv) Outer membrane is fully permeable. (v) It contains porine protien enzyme for tranport. (vi) It contain more Phaspholipid and Cholestrol.

Note :

(i) It outer membrane of mitochondria is removed then structure is called as mitoplast.

(ii) Outer surface of inner membrane is called C-face while inner surface called M-face.

(iii) Some sessile particles attached to outer membrane are known as "subunit of parsons".

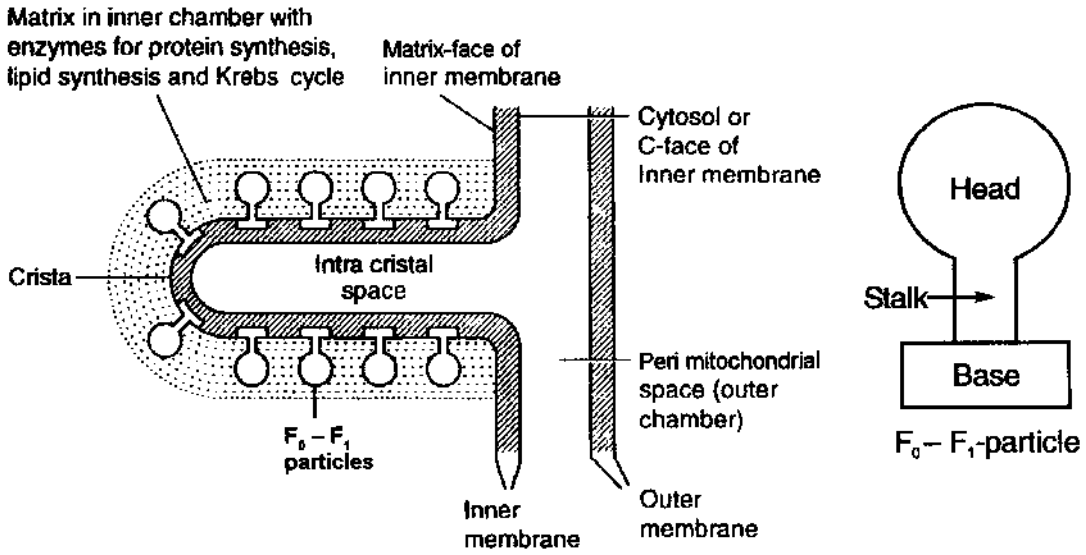

Fig. Detailed structure of crista

(B) Elementary particles or oxysome or F_1–particles

F_1 particles was at first described by Fernandez moran. It contain enzyme of electron transport system and oxidative phosphorylation. It differentiated into base, stalk and head. A mitochondria may contain 10^4–10^5 particle. The head piece (f_1) is associated with ATP synthesis by enzyme ATP base.

Base (Multiprotein complex) is also called F_0 subunit. It is embedded in inner mitochondrial membrane. F_0 subunit is also called oligomycin sensitivity conferring protiens (OSCP). (It provide tunnel for protons)

(C) Matrix

Mitochondrial matrix have enzyme for kreb's cycle. (Ribosome (70-s) - DNA, RNA enzyme). Mitocondrial DNA was discovered by Nash and Margit in 1963. Mitochondrial DNA is 1% of total DNA is a cell. It is rich is G-C content. Mitochondria of mammals have 55 s ribosomes (35s, 25s units)

Function of Mitochondria

(i) Mitochodria is site for **cellular respiration** because it contains all enzymes required for it.

(ii) Since mitochondria is a site of cellular respiration energy, (ATP) is formed in it.

(iii) Mitochondria help in **yolk formation** during the development of ovum. **(vitellogenesis)**

(iv) Mitochondria help in formation of **middle piece of sperm** during sperm maturation. **(spiral sheath)**

(v) Mitochondria help in elongation of fatty acids.

(vi) Cytoplasmic inheritance.

Note :

(i) Altman stated mitochondria is a semiautonomous cell organelle. The mitochondrial DNA carries enough information for the synthesis of about 30 proteins only but that is not enough to make a new mitochondria, so the mitochondria depend upon the nuclear DNA. Mitochondria replicate and uses cytoplasmic enzyme and other molecules of the cell, during cell division.

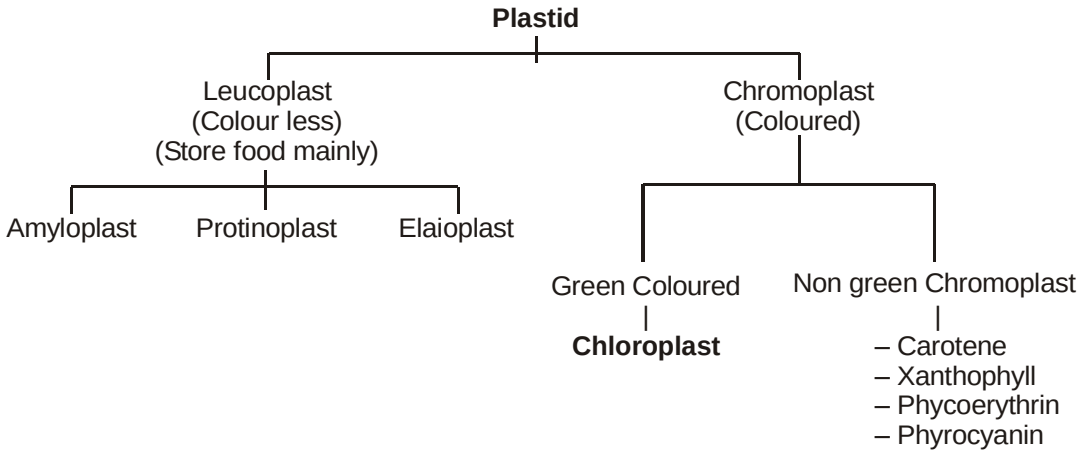
(ii) Endosymbiotic origin of mitochondria from Purple Sulphur bacteria or prokaryotic cells, explain that mitochondria are similar to prokaryotic cell. Both are similar in DNA type of ribosomes (70s). sensitivity of antibiotic (chloremphenicol) with protein synthesis and divide by amitosis.

(iii) In scurvy disease numerous mitocondria combine with each other and from large lobe called **condriosphere / chondriome**.

PLASTIDS

First all the term plastid was coined by **Haeckel**. It was discovered by **Schimper** in 1883. Plastids are found in all plant cells except bacteria, fungi and blue green algae. It may be colourless or coloured and get converted from one form of plastid to another. [Chromoplast to Chloroplast never occur]

On the basis of colour these are following two types –



Leucoplast

These are **colourless** and irregular in shape. These are found in those cells in which light is not available e.g. under ground stem and root. These are found in parenchymatous cells, sex cells, embryonic and meristematic cells. On the basis of storage of food leucoplast are divided in the following three types :

(A) Amyloplast

(i) These are of large size and store starch.

(ii) These are found in root, seed and stem.

(B) Protienoplast (Aleuronoplast) :

They store **proteins** and are found in seeds (pulses).

(C) Elaioplast :

They store **fats** & **oil** and are found in seeds. They are also called **olleosome**. [castor, groundnut]

(D) Etioplasts :

These are plastids without pigments, stored food and lamellar structures. These plastids occur in etiolated plants due to the absence of light

Chromoplast

Non-green plastid. Chromoplast is found in fruits and flower. They exhibits red, orange and red yellow colour. Chromoplasts also occurs in petals but colour of petals are mainly due to water soluble pigments occurs in cell sap. e.g. Anthocyanin - (Blue or violet or red pigment) Anthoclor (yellow pigment Beta cyanin - Beetroot) Chromoplast contains following types of pigments

(1) Carotenoids

It is of orange, red or yellow colour. Due to soluble in fats these are called lipochrome. These are found in all parts of plants and for its synthesis light is not necessary.

It is of following two types –

(a) **Carotene :** Redcolour of chillies and red tomatoes is due to the red pigment "Lycopene" of chromoplasts. Yellowish - orange colour of fruits are due to α-carotene, β-carotene and γ-carotene. β-carotene is precursor of vitamin-A. Richest source of β-carotene are carrot roots.

(b) **Xanthophylls**

These yellow coloured carotenoids are also called Xanthols. Fucoxanthin is found in brown algae which provides brown colour to algae.

(2) Phycobilins

(a) Water soluble in nature.

(b) These are of following three type and found in blue green algae & red algae.

(i) Phycoerythrin

(ii) Phycocyanin

(iii) Allophycocyanin

(3) Chromatophores - These are clusters of pigment granules in cytoplasm of **photosynthetic bacteria**. In blue-green algae pigments are located on membranous lameller structures, scattered in Cytoplasm. These structures are known as chlorosomes or Lamellisomes or Carboxysomes.

Chloroplast

First of all Mayer seen it in plant cell and named Autoplast. Schimper discovered it and term chloroplastid was given. Chloroplast name was given by Errera. Due to presence of chlorophyll in these plastids leaves and parts of plants exhibits green colour. These are found in the mesophyll of leaves and chlorenchyma region of higher plants. Due to presence of DNA & RNA chloroplast is known as Semiautonomous organelle and Cell within cell. DNA of chloroplast was discovered by **Ris & Plaut**. (Upto 14% DNA of cell)

(A) Structure

In lower plants (e.g. Algae) chloroplast structure are as followings :

(a) Cup shaped – *Chlamydomonas*

(b) Girdle shaped – *Ulothrix*

(c) Spiral shaped – *Spirogyra*

(d) Reticulate shaped – *Oedogonium*

(e) Stellate shaped – *Zygnema*

Chloroplast has an envelope composed of two unit membranes. Blank space is found between unit membrane which is called periplastidial space. In this bilayered membrane bounded structures, the proteinaceous matrix is found, which is called stroma. Stroma contains a variety of particles, osmiophilic droplets, Strands of RNA and DNA (ds, circular, naked) Ribosomes, Enzymes and Dissolved salts.

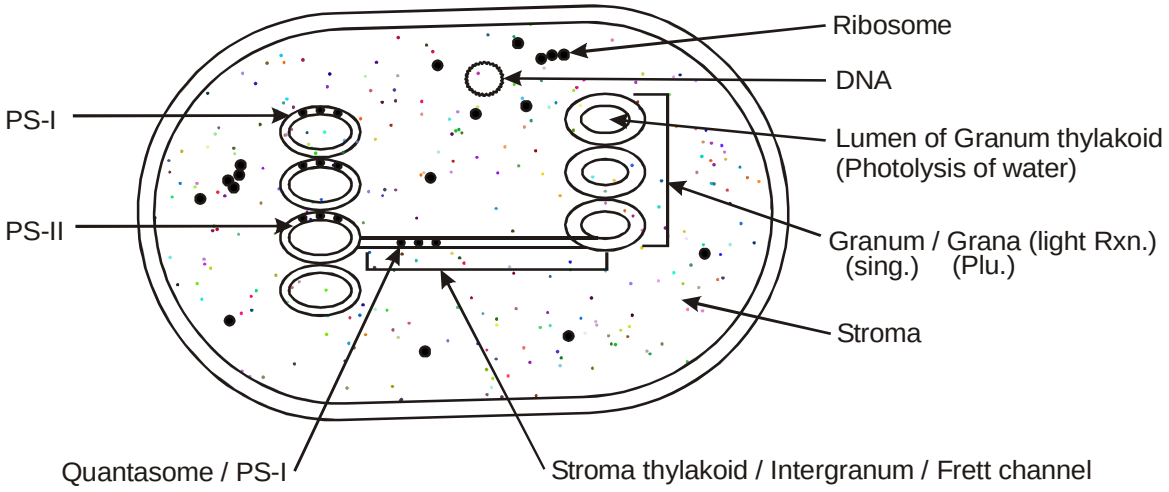


Fig. Chloroplast

Rubisco is the most abundant enzyme on the earth. It made 16% protein of the chloroplast. In the stroma many membranes which are running parallel to each other throughout the length of the chloroplast, called Thylakoid lamellae. Thylakoid Lamellae have some rounded flat, sac-like structures stalked one above the other, these structures are called Granum thylakoid. Thylakoid was discovered by Menke. The group of granum thylakoids is called grana (plural), different grana are connected with the help of tubular connections called Frets or Intergranum. A photosynthetic functional unit, which consists of about 230 to 400 molecules of various pigment (Chl-a, Chl-b, carotenes, xanthophylls etc.) is called as Quantasomes (By Park & Biggins 1964). Main pigment of chloroplast is chlorophyll. It was discovered by **Pelletier** & **Caventou**. The following types of chlorophylls are found in plants -

(A) Chlorophyll 'a'

This chlorophyll is found in all photosynthetic organism except **photosynthetic bacteria**, so it is also called as **universal chlorophyll**.

(B) Chlorophyll 'b'

This chlorophyll is found in all higher plants and in green algae but not present in algae of other group.

(C) Chlorophyll 'c'

It is found in brown algae (Phaeophyceae) and diatoms.

(D) Chlorophyll 'd'

It is found in red algae (Rhodophyceae).

(E) Chlorophyll 'e'

It is found in Xanthophyceae e.g. Vaucheria.

(F) Bacteriochlorophyll - a

It is found in photosynthetic bacteria

(G) Bacteriochlorophyll 'b' : It is found in Rhodopseudomas

(H) Chlorobium chlorophyll : It is found in green sulphur bacteria

Function :

The chloroplasts perform following functions like;

(i) Photosynthesis - light reaction (in thylakoids), Dark reaction (in stroma)

(ii) Storage of starch, vitamin K, E, Rubisco protein and iron etc.

ENDOPLASMIC RETICULUM :

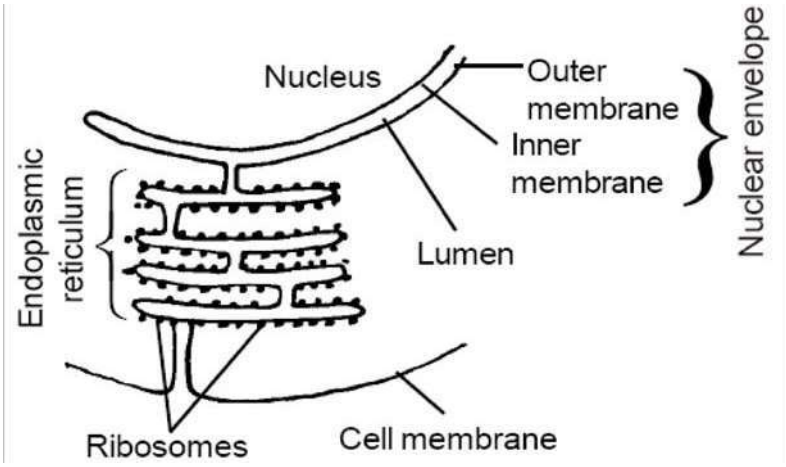
Endoplasmic reticulum was discovered by Porter in 1945. It was first of all observed under light microscope by Garnier in 1897. The term E.R. was first of all used by Porter. It was named ergastoplasm by Garnier. Robertson described relationship inbetween endoplasmic reticulum and plasma membrane. It is absent in Prokaryotes, present in all eukaryotes except germinal cells and mature mammalian erythrocytes. It is found scattered in whole cytoplasm. Structure of E.R. is like the golgi body but in E.R. cisternae, vesicles and tubules are isolated in cytoplasm and these do not form complex. Golgi body is localised cell organelle while E.R. is widespread in cytoplasm. E.R. is often termed as "System of membranes"

Structure

(i) Endoplasmic reticulum is composed of lipoprotein. Protein constitute 60 % whereas lipids 40%.

(ii) Endoplasmic reticulum is network of highly branched fine tubules.

(iii) Its one end, is connected with nuclear membrane whereas other end with plasma membrane.



Ultrastructure of endoplasmic reticulum

(iv) It is composed of three types of forms which are as follows.

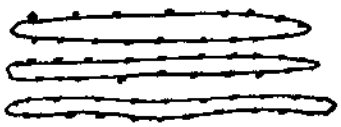
1. Cisternae 2. Vesicles 3. Tubules

1. Cisternae

(a) It is elongated flattened, **unbranched** tubular structure which are found arranged in parallel rows.

(b) It is generally granular due to presence of ribosome.

(c) It is mainly found in cells actively indulged in protein synthesis like in liver, pancreas etc.



Cisternae

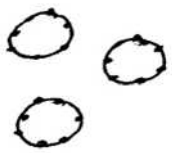
2. Vesicles

(a) It is rounded oval form of 25-500 micron.

(b) It is found well scattered in the cytoplasm.

(c) It is mainly found in protien forming cells.

(d) It is also granular structure.



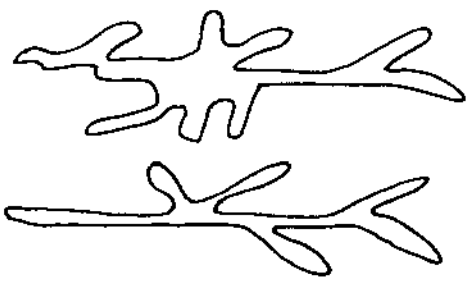
Vesicles

3. Tubules

(a) It is tubular, **highly branched**, found near the cells membrane.

(b) It is smooth structure, because ribosome is absent from its surface.

(c) It is mainly found in cells associated with **synthesis of cholesterol, glycerides, hormones** etc.



Tubules

Type of E.R.

S.No.	Smooth ER	Rough ER
(a)	Ribosome-absent	Ribosome-present
(b)	Mainly present near the cell membrane	Mainly present near the nucleus
(c)	Found in cell related with synthesis of fat, glycogen and steroides	Found in cells related with synthesis of Protein
(d)	Mainly formed of tubules	Mainly formed of cisternae & vesicle
(e)	Less stable	more stable
(f)	Eq. Adipose tissue, Muscles	Eq. Liver, Pancrease
(g)	SER get originated from RER by loss of ribosome.	RER arises by evagination of outer nuclear membrane.

Note :

(i) Ribosome are attached to ER by a glycoprotein called ribophorin-I & II

(ii) SER of pigmented epithelial cells of retina is called myeloid body.

(iii) RER of nerve cells is called nissle's granules (Ergastoplasm)

(iv) **Sarcoplasmic reticulum** occurs in skeletal and cardiac muscles. Sarcoplasmic reticulum stores Ca^{+2} and energy rich compounds required for muscle contraction. It is modified S.E.R.

(v) **T-tubules -** these are transversely arranged tubules in skeletal and cardiac muscle cells. These transmits stimulus for contraction of muscls.

(vi) Microsomes are fragments of E.R. associated with ribosome. It was was first discovered by **Claude** in 1951. It is obtained by high speed **centrifugation**.

Functions

(i) E.R. acts as cytoskeleton and provide mechanical support and shape to the cell.

(ii) E.R. helps in the formation of primary lysosome, Golgi body, microbodies etc.

(iii) E.R. also helps in synthesis of nuclear envelope during telophase.

(iv) It helps in lipid synthesis.(Phospholipid, Steroid hormone & Cholestrol)

(v) It helps in glycogenolysis. (glycogen $\rightarrow$ glucose)

(vi) It helps in synthesis of ascorbic acid.

(vii) **Intracellular exchange -** E.R. forms intracellular conducting system. Transport of materials in cytoplasm from one place to another may occurs through the E.R.

(viii) **Cellular metabolism -** The membranes of the reticulum provides an increased surface for metabolic activitities within the cytoplasm.

(ix) **Detoxification -** Smooth ER concerned with detoxification of drugs, pollutants and steroids.

(x) **Cytochrome P_{450}** in E.R. act as enzyme which function in detoxification of drugs and other toxins.

(xi) It provides the precursor of secretory material to golgi body.

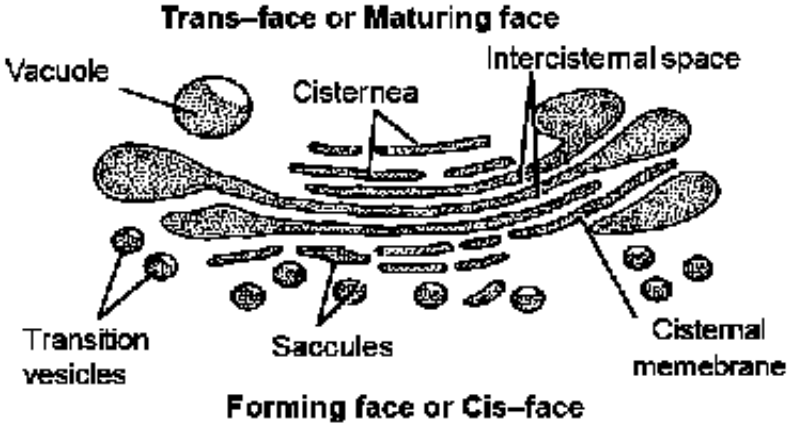
GOLGI COMPLEX :

It is also called as Lipochondrian, Dalton complex, Idiosome, Baker's body, Golgi body. In plant cell it is also called dictyosome. It was discovered by Camilo golgi in nerve cells of owl and cats. Baker at first stained it with Sudan black reticular apparatus. Golgi body is termed as "Principal director of macromolecular trafic in cell" or middle men of cell. Found in large number in secretory and glandular cells. The cytoplasm surrounding Golgi body have fewer or no other organelles. It is called zone of exclusion. Golgi bodies are pleomorphic structures because component of golgi body are differ in structure & shape in different cells.

Structure

It is composed of lipoprotein. Protein is 60% whreas lipid is 40%. Golgi body originated from ER. Structure of golgi complex described in detail by Dalton and Felix. In golgi body 4 types of structure is found which are as follows.

1. Cisternae 2. Vesicles 3. Vacuole 4. Tubules



Internal Structure of golgi body

1. Cisternae

(a) It is elongated flattened sac and **unbranched tubules**.

(c) It is curved structure with swollen ends present one upon the other.

(c) The curved convex structure is directed towards nucleus(cis-face / forming face), whereas (maturing face / trans face) is directed towards plasma membrane.

(d) The functional unit of golgi apparatus is cisternae.

2. Vesicles

(a) It is numerous droplet like structure.

(b) They are found around convex surface or edges of cisternae.

(c) It is formed by budding from cisternae. Filled with secretory materials.

3. Vacuole

It is large round structure found around concave or edges of cisternae.

4. Tubules

These are **branched** and irregular tube like structure associated with cisternae.

Function

(i) Cell Secretion is cheif function of golgi body is secretion (export) of macromolecules.

Stepes of Secretion :

(a) Golgi body recieve the materials from E.R. through its cis-face.

(b) **Glycosidation** and **Glycosylation** of proteins and lipids takes place in golgi body and it yields **glycoprotiens** and **glycolipids**.

(c) After chamical modification materials are packed in vesicles. These vesicles are pinched of from trans face of golgi body and discharged out side the cell (Reverse pinocytosis).

(ii) During spermatogenesis it forms Acrosome of sperm.

(iii) Lysosome get formed from it.

(iv) It is helpful in synthesis and storage of yolk & vitelline membrane of egg.

(v) It is helpful in synthesis of melanin pigment.

(vi) In plant cell it forms cell plate (phragmoplast).

(vii) It stimulate mitochondria for the production of ATP.

(viii) It helps in synthesis of carbohydrate. Mainly polysaccaride (cell wall material).

(ix) Secretion of Zymogen from Pancrease. Lactoprotein from mammary glands & Hormones.

(x) Mucilage secretion by root cells.

(xi) Secretion of hormone by endocrine glands is mediated through golgibody.

LYSOSOME

Lysosome is also called sucidal bags. It was discovered by Christan De Duve (1955) accidently when he was working on rat liver cell to isolate certain enzyme. P.Matile (1964) reported in plant cells. In begening it was named paracanalicular bodies. First observed by Novikoff.

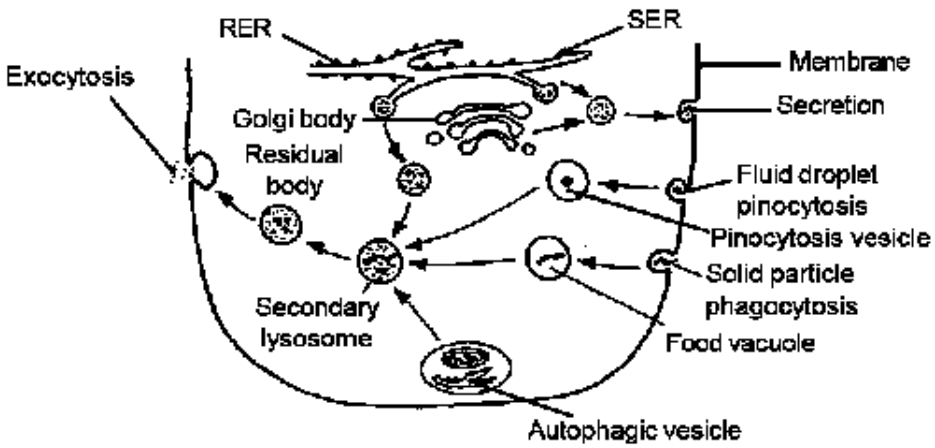


Fig. Differnt types of Lysosome

It is absent in prokaryotic cells, RBC and sperm. These are found in abundant in Phagocytic and secreted cells like WBC, Kupffer's cells, pancreatic cells, liver cells & Fungi. Lysosome get originated from plasma membrane by the process of pinocytosis or phagocytosis. Biogenesis of Lysosome system of GERL (Golgi Associated Endoplasmic Reticulum) from which Lysosomes arise.

E.R. $\rightarrow$ Golgi bogy $\rightarrow$ Lysosome

Note :

(i) In 1973 Pit and Galpin discovered its presence in higher plants. In majority of higher plants large food vacuole act as a lysosome.

(ii) In bacteria space in between cell wall and cell membrane act as a lysosome. (periplasmic space)

Structure

Lysosome shows **polymorphism** (Different morphological and physiological stages).

(i) It is round, sac like structure bounded by single unit membrane composed of lipoprotein.

(ii) It is filled with granular matrix. In matrix nearly 50 acid hydrolases is found which are digestive enzyme.

(iii) Acid hydrolases are capable of hydrolysing all classes of macromolecules.

Following are the important acid hydrolases found in lysosome.

S.No.	Enzyme	Substrate
(i)	Nuclease	Nucleic acid.
(ii)	Protease	Protein.
(iii)	Glycosidase	Polysaccharides.
(iv)	Lipase	Lipids.
(v)	Phosphatase	Phosphate linked compounds.
(vi)	Sulphatase	Sulphate linked bonds

All enzymes found in lysosome requires acid for their action, hence called **acid hydrolases**. These enzyme function at **pH-5**. Membrane of lysosome has an **active H^+ pump** mechanism which produce acidic pH in lumen of lysosome.

Type

Lysosome attains four different form so it is called **polymorphic** organelle. The four forms are as follows-

(a) Primary Lysosome

(b) Secondary Lysosome

(c) Residual body

(d) Autophagic Vacuole

(A) Primary Lysosome (Protolysosome).

(i) The primary lysosome or prelysosome are small sac like bodies.

(ii) These are secreted directly by endoplasmic reticulum and cisterne of golgi complex and get filled with inactive enzyme.

(B) Secondary lysosome (Heterophagosome or digestive vacuoles)

(i) When the primary lysosome fuses with the other vacuoles (pinosome / phagosome) it is called secondary lysosome.

(ii) In it active enzymes are found.

(iii) It is also called phagolysosome.

(C) Residual body / Tertiary Lysosome

(i) Secondary lysosome + Undigested food = Residual body.

(ii) After the products of digestion have been absorbed in to the cytoplasm. The undigested remains are left in the lysosome, it is called residual body.

(iii) This moves to the surface and throws the contents by exocytosis.

(iv) It is also called telolysosome.

(D) Autophagic Lysosome (Autophagosomes or cytolysosomes)

(i) This type of lysosome, contain part of its own cells (Generally unwanted structure) and digest it

(ii) It is a part of the normal activity by which old organ cells are digested and new ones are formed.

(iii) It occurs more frequently during differentiation.

Function

(i) **Intracellar digestion / Heterophagy -** Lysosome digests substance which enter within a cell by phagocytosis and pinocytosis.

(ii) **Extracellular digestion -** Lysosomes of osteoclast (bone eating cells) dissolve unwanted part of bones. (Extracellular digestion also occurs by fungal lysosomes)

(iii) **Autophagy -** Lysosome digest old and damaged cell, during this process, lysosome get brust, and enzyme enclosed within lysosome get released. This mechanism is called autolysis. (starvation) Unwanted organs of embryo are destroyed by autolysis, Cathepsin of lysosome digests the tail tadpole of frog during metamorphosis.

(iv) Lysosome help in digestion of harmful substance WBC digest bacteria, germs, viruses and help to give defence to the body.

(v) Lysosome help in dissolving the egg membrane, during fertilization.

(vi) **Crinophagy -** Excessive secretory granules of hormone in endocrine gland may be digested by lysosomes. This event is called **crinophagy**. **Thyroglobin** stores in thyroid gland with in its follicles and after crinophagy by proteases it produces **thyroxine**.

RIBOSOME

Ribosome was discovered & termed by Palade. Ribosome was at first seen by Claude in electron microscope in animal cell. Ribosome was discovered by Robinson and Brown in plant cell of bean roots. Ribosome are without any membrane. Ribosomes are the smallest and largest in number organelles in a cell. Ribosome are also called as "Organelle with in an organelle" & "Protein factory of cell".

Structure

It is composed of RNA and Protein. 55 s ribosome in mitochondria of mammal.

Each rirosome composed of two subunits i.e. larger and smaller subunits. Larger subunit is dome shaped and smaller unit is ovoid. Smaller subunit has a platform, a cleft & head. The larger subunit has a protuberance, a ridge and a stalk. Larger subunit also contains a tunnel which opens in cavity of E.R.

80s = 60s + 40s

70s = 50s + 30s

Magnesium ion is essential for the binding the ribosome sub units.

Mg^{+2} form **ionic bond** with phosphate groups of r–RNA of two subunits. Minimum 0.001 M Mg^{+2} concentration is required for structural formation of ribosomes. If Mg^{+2} concentration increased 10 times then ribosome dimer are formed.

In prokaryotes ribosome originate in cytoplasm. In eukaryotes ribosome originates in nucleolus. There fore nucleolus is also called as ribosomal factory. After synthesis move to cytoplasm where protein synthesis occur. The proper folding and transport of proteins is assisted by specific proteins called chaperons.

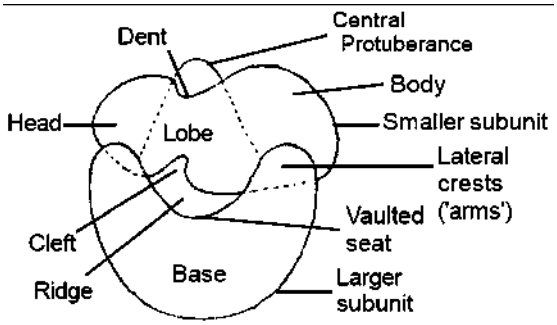

Fig. Stoffler and wittman's model of ribosome

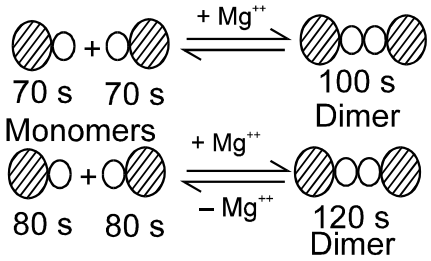


Types

Ribosome is mainly of two types, which are as follows –

Prokaryotic Ribosome (60% RNA + 40% protein)	Eukaryotic ribosomes (40% RNA + 60% Protein)
(i) Prokaryotic ribosome is 70S type and have two subunits 50S and 30S. **(A) 50S** (i) It is larger subunit. (ii) Its base is spherical. (iii) RNA found is **23'S rRNA** and **5S rRNA**. S = Swedberg unit or Sedimentation rate. **(B) 30S** (i) It is small subunit. (ii) Its base is rod like. (iii) RNA found is **16S rRNA**.	(i) Eukaryotic ribosome is 80S type and composed of 60S and 40S subunits. **(A) 60S** (i) It is larger subunit. (ii) It contain **28S**, **5S**, **5.8S rRNA**. (iii) Larger subunit contains Peptidyl transferase enzyme. This is an example of Ribozyme. (Noller 1992). A-site and P-site present in this unit **(B) 40S** (i) It is smaller subunit. (ii) It contain **18S rRNA**.

Function

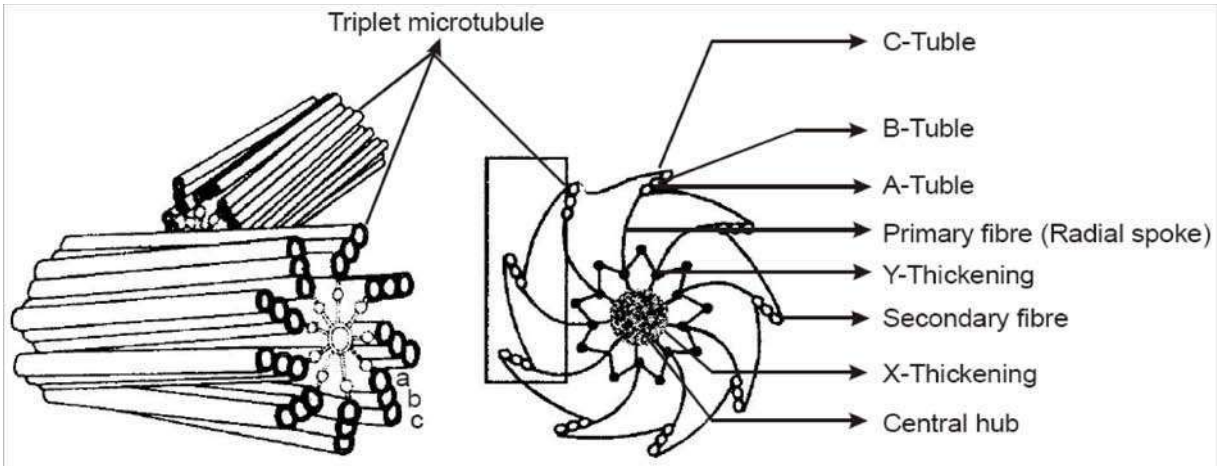
Main function of ribosome is **protein synthesis** so called protein factory or cell engine.

CENTROSOME :

Centrosome was discovered by Benden. Boveri named as centrosome. Centrosome is absent in higher plants. Two centrioles located just outside the nucleus and lie at right angle (90º) to each other. Cytoplasm which surrounded centrioles called as "Centrosphere". Centrioles and centrosphere collectively called centrosome or Microcentrum or diplosome.

Structure :

Each centriole is surrounded by peri centriolar mass, which is called as massules or crown or satellite. Centrioles are membraneless elongated structure which exhibit cart wheel structure (Just like Basal body of cilia). Basal body is also a type of centriole.



(A) (B)

(A) A pair of centrioles (Diplosome), (B) T.S. of a centriole

Centriole mainly consist of 9 triplet fibers of tubulin. (9 + 0 arrangement). Centrioles are self duplicating units, which contains DNA, RNA and protein synthesis machinery. Centriolar DNA discovered by Randall and Disprey. Centriolar DNA is probably ds circular and naked. Replication of centriole occur in s-phase.

Function :

In animal cells centroiles play important role in initiation of cell division by arranging spindle fibres between two poles of cell. The location of centrioles during cell division decides the plane of division. The plane of division is always at right angle to the long axis of spindle. Thus centrioles is also termed as "cell centers".

CILIA AND FLAGELLA :

Cilia and Flagella are hair like cellular appendages and locomotory structure. Flagellar apparatus is consist of following Parts.

Structure :- (A) Kinetosome, (B) Rootlet Rhizoplast, (C) Shaft or Ciliary part

(A) Kinetosome it is also known as basal granule or Blepheroplast or Basal body. It is membraneless structure lies immediately below the plasmamembrane. Basal body exhibit cart wheel structure similar to centriole. (9 triplet fibriles connected to a central hub in basal body.)

(i) Arrangement of microtubules is 9 + 0. In basal granule there occurs 9 microtubules on periphery and each microtubule is composed of three tubules i.e. A-tubule, B-tubule and C-tubule.

(ii) Central part of basal granule is composed of semisolid cytosol called **"Central Hub."**

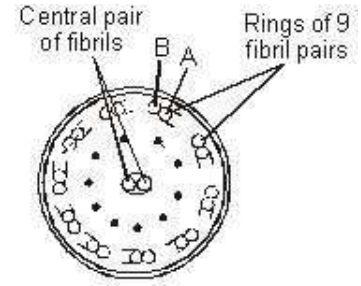
(iii) Microtubules connected to central Hub with the help of protein fibres called Primary fibres or spokes.

(iv) Secondary fibres connect microtubules with each other.

(v) Each primary fiber have a thickening called X-thickening. In between X-thickenings there occurs Y-thickenings, X and Y-thickening are inter connected.

(B) Rootlet Rhizoplast : This is a conical bundle of protein fibers which arises from basal body to different directions. Rootlet have dark bands composed of ATPase.

(C) Shaft or Ciliary part : It is projecting hair like part of ciliary apparatus. Cilium is composed of 11 microtubules. (9 doublet + 2 singlet)



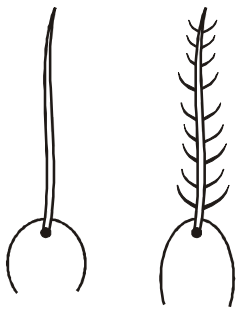
T.S. Of flagellum Showing characteristic 9+2 fibrilla organization

(i) Bundle of microtubules is called as axonema. Nine microtubules are peripheral and each composed of two small tubules i.e. A tubule with two arms and B-Tubules without arms.

(ii) Microtubules is consists of a contractile protein tubulin similar to actin of muscles.

(iii) Arms of A tubules consist of an enzymatic protein dynien similar to myosin of muscle cells. Dynien have ability of hydrolysis of ATP & liberates energy for ciliary movement.

(i) The central tubules are connected by bridges and is also enclosed by a central sheath, which is connected to one of the tubules of each peripheral doublets by radial spoke. Thus there are nine radial spokes. The peripheral doublets are also interconnected by linkers.



Flagellum and cillium

Type of Flagella :

Whiplash - When the lateral hair like structures absent.

Tinsel - When the flagella bears lateral hairs like structure (Flimmers)

Cilia and Flagella are similar in structure but some differences may observed-

S.No.	Cilia	Flagella
(i)	The cilia are small size (5-10mm)	Flagella are long (up to 150 mm)
(ii)	Number of cilia per cell is very large.	Few in number
(iii)	Cilia beat in a coordinated manner.	Flagella beats independently (Non coordinated manner)
(iv)	They take part in locomotion, attachment, feeding and sensation.	Flagella involved only in locomotion. May in sansation
(iii)	Tubulin protein	Flagellin protein

Function

(i) Both act as organs of locomotion (cilla may help aeration, feeding and circulatio of food also.)

(ii) Cilla of respiratory tract help in retaining the dust particles and prevent their entry into the lungs.

VACUOLE :

Vacuoles are discovered by Spallanzani. Vacuoles are generally absent in animal cells and meristematic cells in plants. Cell of permanent tissue in plants have well developed vacuoles. Vacuoles are surrounded by an unit membrane called tonoplast. Inside vacuole there is a nonliving fluid called cell sap. Cell sap contains water, salts, sugars, organic acids, Vitamins and waste materials of metabolism. Sometimes call sap have certain water soluble pigments like anthocyanin (blue or violot), anthoclor (yellow) etc. Beta cyanin in beet

root cells.

Functions of vacuole :

(i) Storehouse of nutrients.

(ii) Removes waste materials from cytoplasm.

(iii) Solutes is cell sap regulates osmotic relations of plant cell.

(iv) Pigments of cell sap provide different colouration to petals.

(v) Mature plant cell store water in vocuole.

MICROBODIES :

Microbodies are single membrane bound small spherical structures. Size vary from 0.3 – 1.5 μm. It includes following Peroxisome, Spherosome, Glyoxisome and Transosome.

Peroxisomes

It is also known as Uricosomes. Discovered by Rhodin and Tolbert. In animal cells, peroxisomes are concerned with Peroxide Metabolism. Peroxisomes contain several enzymes like urate oxidase, amino acid oxidase, peroxidase catalase. Catalase is the fastest acting enzyme known after corbonic anhydrase& it is a marker enzyme of peroxisomes. Peroxisomes are involved in β–oxidation of fatty acids. In plants, they occur in cells of green tissue and are concerned with photorespiration (glycolate pathway)

Spherosomes

Hanstein (1880) discovered them & named microsomes. Perner (1953) gave the name 'spherosome'. They occur in plant cells only. They are major site for lipid storage and synthesis. Cutin & Suberin are synthesized in it.

Glyoxysomes

Discovered by Beever in oil containing seeds, yeast cells, guard cells etc. Glyoxysomes occur only in plants especially in fatty seeds (castor seed), guard cells of stomata and unripe fruits. Glyoxysomes are considered as a highly specialised peroxisomes. Glyoxylic acid cycle takes place in glyoxysomes. This cycle convert fats into carbohydrates (Gluconeogenesis).

Transosome

Special microbodies in ovary cells of birds (concern with yolk formation). These covered by three unit membranes.

CYTOSKELETON :

Microtuibules, microfilaments and intermediate filaments are proteinaceous strectures to support the extensive system of membranes. They collectively form cytoskeleton of the cel. These prform a variety of functions. These are of three types :

(A) Microtubules (B) Microfilaments (C) Intermediate filaments

(A) Microtubules : The microtibules were first discovered by Robertis and Franchi.

The microtubules are found in the cytoplasmic matrix of all eukaryotic cells. They also occur in cilia, flagella, centrioles and basal bodies, mitotic apparatus etc. Prokaryotic cells lack microtubules.

The microtubules are hollow, unbramched cylinders generally about 25 nm in diameter with a hollow core of about 15 nm. The boundary of a microtubule is composed of 13 parallel protofilaments. Each protofilament is made up of α and β subunits of tubulin protein. The assembly and disassembly of microtubles requri GTP and Ca^{+2}.

Function

(i) These help in the spindle and astral ray formation during cell division.

(ii) These form the cytoskeletion of cilia and flagella.

(iii) These help in generating the shape, rigidity and form of the cell and cell mobility.

(iv) Microtubules help in the anaphasic movement of chromosomes.

(v) Microtubules help in the intracelluar transport of nutrients and inorganic ions.

(vi) Position of future cell plate is determined by microtubles.

(B) Microfilaments : (Paleviz et. al.) The microfilaments are found in eukaryotic cells. The microfilaments are solid, unbranched, rod-like fibrils of indenfinite length. They are mainly composed of a globular protein actin, but have filamentous protien myosin also. They form an ectensive network in the cytoplasm of cells and may be associated with plasme membrane.

Fuction

(i) The microfilaments provids support to PM.

(ii) These represent teh contractile system of the cell and are involved in cytoplasmic streaming and amoeboid movements.

(iii) Help in pseudopodia formation

(iv) These help in the formation of cleavage furrow during cell division.

(C) Intermediate Filaments : Non-contractile hollow filaments of acidic proteins. They are involved in formation of scaffolds for chromatin and in forming a basket around nucleus.

Function

Once intermediate filaments are formed, they are stable ans usually do not breakdown. Intermediate filaments provide mechanical strength to the cell & cell-cell junction.

CELL INCLUSIONS :

These are metabolically inctive, non-living substances present in the cell, also called **ergastic substances**. These can be organic or inorganic in nature and may get solubilized or remain unsoluble.

These include reserve materials, excretory or secretory products and minaral matter.

1. **Reserve materials :** Carboyhdrates (starch grains, glycogen granules), nitrogenous substances (aleurone grains), fats, oils are important reserve materials.
2. **Excretory products :** Several types like, alkaloids essential oils, gums, glycogen granules), nitrogenous, latex, organic acids, resins, tannins, etc., are major excretoty products occuring in the plants. Canada Balsam obtained from *Abies balsemia* is a type of Resin
3. **Mineral matter :** The crystals of silica, calcium carbonte and calcium oxalate are found in plant cells.

(a) Silica : Silica is deposited either on the wall or may remain embedded in surface of grasses (garden grass, wheat, oat, etc.).

(b) Calcium oxalate : In the leaves of Indian Rubber Plant (Ficus elastica), banyan (Ficus benghalalensis), numerous small calcium carbonate crystals are found accumulated on peg-like ingrowth of the multilayered epidermal cells, giveng an appearance of a bunch of grapes. This crytalline mass is called cystolith. Cells containing these are called lithocysts.

(c) Calcium oxalate : These are present in almost all the plant organs and are particularly common in storage organs, pith and cortical tissues. The shape of the crystals is variable. Needle-like or acicular crystals called raphildes are found in many aquatic palnts (Lemna, Eichhornia). These crystals may also group into star-like aggregates called sphaeraphides or druses e.g., Begonia, Colocasia, Chenopodium, etc.

ORGANIC EXCRETORY

(A) Nitrogenous

(i) **Alkaloids -** Nitrogenous waste materials, bitter in taste and insoluble in water. Alkaloids are of great medicinal importance.

(ii) **Glycosides** - Nitrogen containing degradation products of carbohydrates e.g. **Digitoxin** obtained from leaves of Fox glove ***(Digitalis purpurea)***. Digitoxin is used as heart stimulant.

(B) Non nitrogenous

(i) **Tannins -** Derivatives of glycosides, soluble in water. Tannins are bitter in taste. These occur more in unripe fruits. Tea leaves have 18% tannins, **kattha** obtained from **heart wood** of **Acacia catechu** have high concentration of tannins.

(ii) **Resin** - Oxidation products of essential oils. These occur as viscous water insoluble fluid inside plants. Formation of resins takes place inside special ducts called resin ducts. Resins commonly occurs in Pines.

(iii) **Gums** - Water soluble degradation products of plant cell wall.

(a) **Gum arabic** - obtained from **Acacia senegal** and **A.arabica**

(b) **Guar gum** - Obtained from pods of **Cyamopsis tetragonoloba**

(i) **Bengal Kino** - Stem of **Butea monosperma**

(iv) **Latex -** Composition of latex vary in different plants. It may contain sugars, starch gains, amino-acids, minerals, alkaloids, toxins, resins, gums, oils etc. Latex is produced in laticiferous tissue composed of either latex cells or latex vessels. Latex eg. **Heavea brasiliensis** serves the function of protection, healing wounds, nutrition etc.

(v) Plants which provide latex for **biofuel** are called **petrocrops**. (first studies by calvin) **Jatropa**, Calotropis, Euphorbia etc.

(vi) **Essential oils -** Highly aromatic water soluble volatile organic compounds. Chemically they are terpens. They perform a number of functions : attract insects, repel animals and act as antiseptic substance e.g. Rose oil, sandal wood oil, Jasmine oil, Khus-Khus oil, camphor (Cinnamomum camphora), Lemon glass oil, parasosaoil, Eucalyptus oil etc.

RESERVE MATERIALS

(A) Hemicellulose - Hemicellulose is a part of cell wall, Shining white colour of **Date** and **coconut** endosperm is due to high conc. of hemicellulose.

(i) Howerver hemicellulose occurs as stored food in **Ivory palm (Phytelophas)**.

(ii) This hemicellulose is used to manufacture **artificial ivory** and **billiard balls**.

(B) Inulin - Inulin is a soluble homopolysaccharide composed of fructose units. It occurs as stored food in roots of **Dahalia** and **Artichoke**.

SECRETORY MATERIAL

These occur in special glands and sacs. These includes enzymes, colouring materials, Nectar, etc.

NUCLEUS :

Credit of discovery goes to **Robert Brown**. Nucleus is double membrane bound dense protoplasmic body which controls all cellular metabolism and encloses the genetic information of cell. If the nucleus of a cell is, experimentally removed then unicellular organism will die after some time. Thus nucleus is very important and largest component of cells.

Generally eukaryotic cell contain at least one nucleus but nucleus is absent in mature phloem sieve tube elements and mature RBCs of mammals. (exceptionly nucleus is present in RBCs of camal & lama). Dikaryotic (Paramecium) and multikaryotic cells are also known.

Structure

(i) Nuclear membrane or nuclear envelope or karyotheca.

(ii) Nucleoplasm/Karyoplasm/Karyolymph.

(iii) Chromatin net

(iv) Nucleolus/little nucleus/Ribosome factory

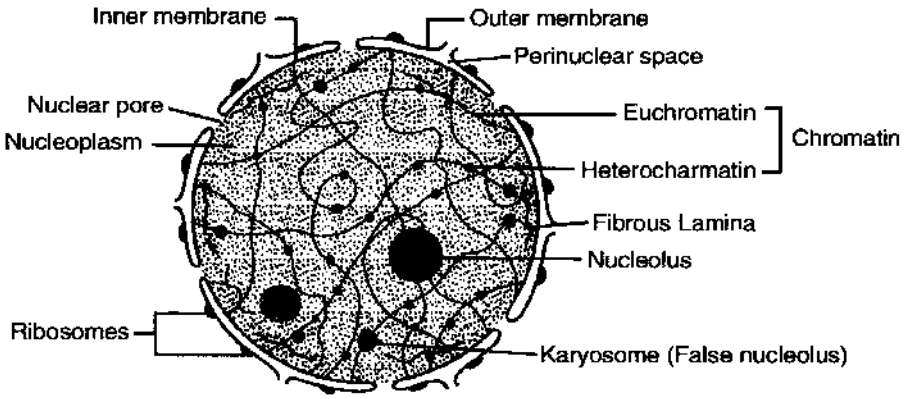


Fig. Ultrastructure of interphase nucleus

(A) Nuclear membrane :- Nucleus is surrounded by two unit membranes. Space (150 to 300Å) between two membranes is known as **perinuclear space.** Outer membrane, of nucleus may connected with **E.R.** at several places and ribosome also may found on it.

Nuclear membrane is perforated by minute **nuclear pores** of size, 300 to 1000Å diameter. Each nuclear pore is guarded by a **octagonal** discoid structure of **nucleoplasmin protein** this structure is called as **annulus** or **Bleb.** (Annulus + Pore = Nuclear Pore complex). The inner side of inner nuclear membrane is lined by **nuclear lamina**. This structure is formed by filaments of **lamin protein**.

(B) Nucleoplasm or Karyolymph :- (Term by **Strasburger** 1882)

Nucleoplasm or Nuclear sap is a ground substance of nucleus which is a complex colloidal formed of a number of chemicals like nucleotides, nucleosides, ATPs, proteins and enzymes of RNA and DNA polymerases, endonucleases, minerals, (Ca^{++}, Mg^{++}) etc. Nucleoplasm contain high concentration of Nucelotides in the form of triphosphate. Nucleoplasm also have enzymes for Glycolysis, thus nucleus may obtain energy by glycolysis. **Chromatin net** and **nucleolus** are embeded in nucleoplasm. Nucleoplasm provides site for process of transcription.

(C) Chromatin net : - (Term given by **Flemming**)

Chemically chromatin consists of DNA (31%), RNA (2-5%), Histone protein (36%) and non histone (28 %). On the basis of relative amount of arginine and lysin there are five type of Histone protein. (H_2A, H_2B, H_3,H_4, H_1)

Chromatin net has two type of chromatins (by Emil Heitz)

(a) Euchromatin (b) Heterochromatin

Type of Heterochromatin :

Constitutive heterochromatin :- Occurs in all cells in all stages e.g. centromeric region.

Facultative heterochromatin :- Occurs in some cells in some stages. e.g., Barr body.

Barr body in female cell is a facultative heterochromatic structure. (By M.Barr)

Number of Barr body in nucleus of an individual is number of (X-chromosome) minus one.

Difference between Euchromatin and Heterochromatin :

S.No.	Euchromatin	Heterochromatin
(i)	Consist of thin, extended, **light stained** part of chromatin.	Consists of thick coild, condensed part of Chromatin and **dark stained**.
(ii)	Genetically **more active** chromatin	**Less active** or inert chromatin.
(iii)	Lies at **centre of nucleus**.	Lies **near the nuclear membrane**
(iv)	Less histone protein	More histone protein
(v)	Replicate in early s-phase	Replicate in late s-phase
(iv)	DNA ⟶ mRNA	DNA ⟶ rRNA, tRNA

Note :-

(i) Heterochromatin takes light stain during cell division stages (M-phase) & takes dark stain during interphase.

(ii) At some place hetrochromatin form thick, dark dense granule called Karyosome / chromcentre / False nucleoli.

(D) Nucleolus :- Discovered by **Fontana** and Term by **Bowman**.

Nucleolus is naked or **membraneless**, attached to chromatin (or chromosomes) of specific site called **Nucleolar organiser** region/NOR. Calcium is essential for maintenance of nucleolus. Nucleolus disappears during Prophase and reappears in telophase.

Chemically nucleolus is made up of

Proteins 85%

RNA 10%

DNA 5%

(Ultrastructure of nucleolus) :

(i) Fibrillar region :- This is central fibrous part of nucleolus, which is consist of mainly rDNA and proteins. (Nucleonema)

(ii) Granular region :- This is peripheral granular part of nucleolus which is consist of rRNA and proteins.

(iii) Amorphous matrix or pars amorpha :- This is proteinaceous ground matrix, which contains both fibrous and granulus.

Functions of nucleolus

Ribosome formation is the chief role of nucleolus, thus is called as **Ribosome factory of cell**, the proteins of ribosome are synthesised in cytoplasm but it diffused in to nucleus and reach at nucleolus. Here rRNA and ribosomal proteins are assembled to form ribosomes which move to cytoplasm through nuclear pores.

Functions of Nucleus

(i) **Genetic information :-** Nucleus contains genetic information in its chromatin. (store house of genetic material)

(ii) **Transmission of genetic information :-** Nucleus takes part in transmission of genetical information from parent cell to daughter cell or the one generation to next.

(iii) **In cell-division :-** Division of nucleus is pre-requisite to cell division.

(iv) **Control of metabolism :-** Nucleus controls metabolism of cell by sending m-RNA in cytosol (Basically biomolecule DNA controls cellular activities through directing synthesis of enzyme).

(v) **Variations :-** Variation develope due to change in genetic material of nucleus. (Evolutionary role).

CHROMOSOMES :

First of all, chromosomes was observed by **Hofmeister (1818)** and Karl Nageli in pollen mother cells (PMC) of Tradescantia. Credit of discover of chromosomes goes to Strasburger. Term "Chromosome" was proposed by Waldeyer in 1889. Term 'Chromatin, was suggested by Flemming.

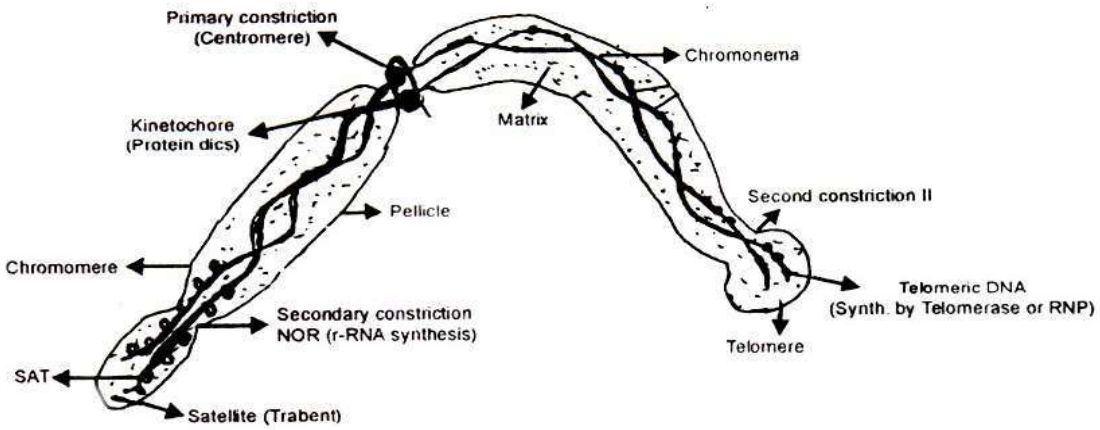
Gametes of all diploid organisms contain only one of each chromsome. The number of chromosomes in a gamete is called **"Genome"** or haploid chromosome. A complete set (n) of chromosome inherited as a unit from one parent is known as genome.

Structure of chromosome

(i) **Pellicle :-** This is outermost, thin proteinaceous covering or sheath of chromosome.

(ii) **Matrix :-** Ground substance of chromosome, which has different type of enzymes, minerals, water, proteins.

(iii) **Chromonema :-** Term given by **Vejdovsky.** This is an important, gentical, highly coiled thread, throughout the length of a chromosome or chromatid. Each chromonemata is consist of a single long thread of DNA associated with histone. Sometimes bead like structure are seen on chromonema fibres, which are called as chromomeres. Singular form of chromonema is chromonemata.

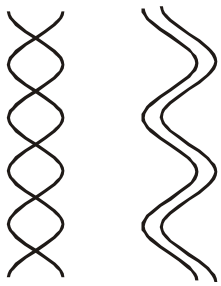


A schematic diagrammatic representation of chromosome

Coiling in chromonema

(a) **Plectonemic-coiling :-** When both the chromonema are inter twined and can not be separated easily this coiling is called Plectonemic-coiling. It apper in mitotic prophase chromosomes.

(b) **Paranemic coiling :-** When both chromonema can be easily seperable. In **meiotic** prophase.



Plectonemic Paranemic

(iv) **Centromere/Kinetochore :-** (Primary constriction)

Each chromosome (at metaphase) is consist of two half chromosome or two chromatids. Both the chromatids of a chromosome are joined or connected by a structure called Centromere. At this point or centromere two protein discs are present which is called Kinetochore. Centromeric DNA is called as alphoid DNA (Hetrochromatic).

(v) **Chromatid :-** At metaphase stage each chromosome is consist of two cylindrical structures called Chromatids. Both sister chromatids or longitudinal half chromatids (in Anaphase or Telophase) or two chromatid. (as in metaphase)

(vi) **Secondary constriction :** Besides primary constrictions one or two, other constriciton may also occurs on some chromosome, which are known as secondary constriction. Secondary constriction is also known as **NOR (Nucleolar organiser region)** (13,14,15,21,22 chromosomes in human)

(viii) **Satellite / Trabent**

(a) Found in chromosome in which secondary constriction is found.

(b) It is small spherical part of chromosome distal to secondary constriction.

(c) Chromosome with satellite is called **SAT chromosomes**.

(ix) **Telomere**

(a) Tip of chromosome is known as **telomere**. (rich in **guanine** base) show polarity.

(b) Perform two important function

It prevent ends of two chromosomes from sticking with each other. (fusing of chromosome)

Help chromosome in attachment to nuclear envelope.

(c) Enzyme **telomerase** present in Telomere which is a type of Ribozyme.

Type of Chromosome on basis of position of centromere

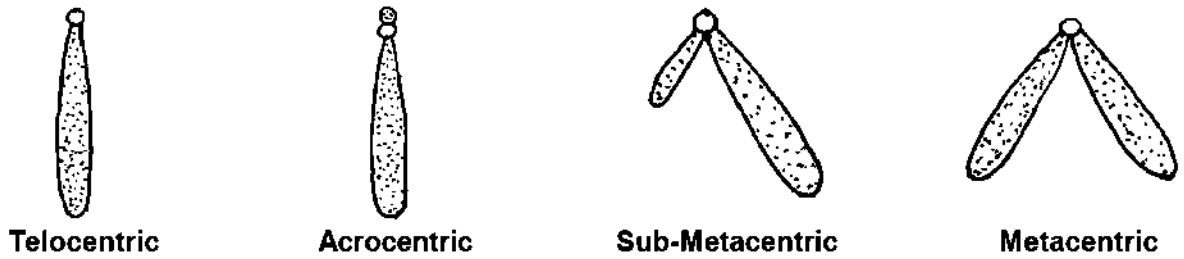
(i) **Metacentric** - Centromere in mid two arms are equal so chromosome is **v-shaped**.

(ii) **Submetacentric** - Centromere slightly away from mid so chromosome is **L-shaped**.

(iii) **Acrocentric** - Centromere occupies sub terminal position, so one arm is very long whereas other arm is extremely short. Acrocentric chromosome is **J-shaped**. [Arm ratio maximum]

(iv) **Telocentric** - Centromere occupies terminal most position so chromosome is single armed.

Telocentric is **i-shaped**.



Types of Chromosomes

Chromosome number in some organisms :

Animals	**2n**	**n**
Ascaris megalocephala (Round worm)	2	1
Drosophila melanogaster (Fruit fly)	8	4
Chimpanzee/Gorilla	48	24
Homo sapiens	46	23
Aulocantha (a protozoan)	1600	800
Plants		
Mucor hemelis (fungi)	2	1
Haplopappus gracilis (Familiy compositae) & Brachycome plant	4	2
Takakia (Bryophyta)	4	2
Pisum sativum (Pea)	14	7
Maize (Zea mays)	20	10
Wheat (Triticum)	42	21
Ophioglossum reticulatum (Pteridophyta)	1262	631

Special type of Chromosome (Giant Chromosome)

(A) Lampbrush Chromosome

(i) Lampbrush chromosome was first observed by Flemming (1882) in amphibian oocyte at Diplotene stage of cell divition.

(ii) A detail study was made by J. Ruckert (1892) in the oocyte of sharks.

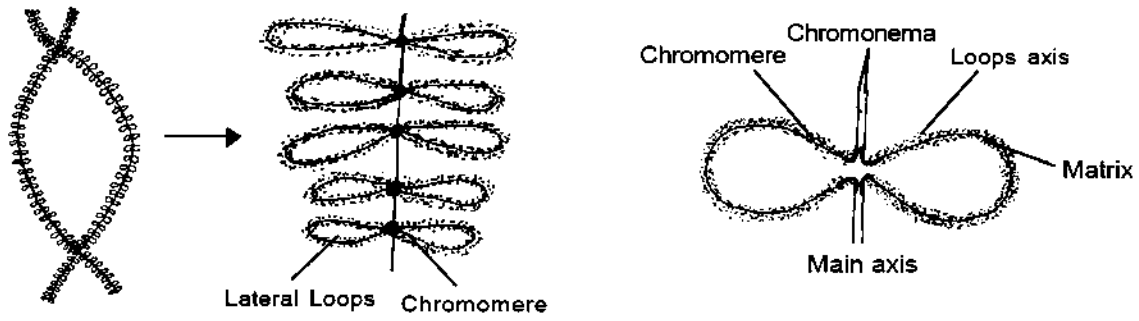
(iii) Found in the oocytes of insect, sharks, amphibian, reptiles and birds which produce yolky eggs.

(iv) Lampbrush chromosome composed of main axis which possess series of chromomere.

(v) Main axis formed of DNA and Protein.

(vi) Main axis give rise to lateral loops (composed of DNA). Lateral loops axis remain surrounded by matrix. Matrix is composed of RNA and Protein.

(vii) It is concerned with protein synthesis, yolk formation (vitellogenesis) and RNA synthesis.



Lamp brush chromosome

(B) Polytene chromosome / Salivary gland chromosome

(i) It was discovered by Balbiani in 1881.

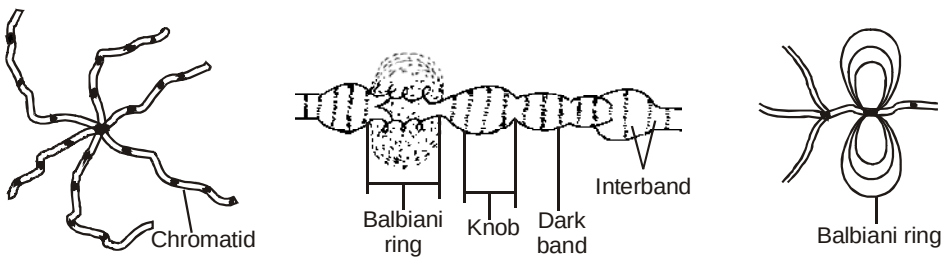
(ii) It is found in salivary gland of chironomous larva, Salivary gland, malphigian tubule, epithelial lining of drosophila, salivary glands of certain Diptera.

(iii) The larger size of chromosome is due to the presence of numerous chromatids. so called polytene (Many stranded) chromosome.

(iv) Numerous chromatids (512 to 1000) presence is because of repeted division of chromosome without cytoplasmic division such division is called endomitosis or endoreduplication [repeated replication of DNA].

(v) Possess two types of transverse bands, dark band, which is Feulgen positive and posses more DNA, Light band is Feulgen negative which posses more RNA.

(vi) **Balbiani ring / puffs :** The bands get enlarged at certain place and because of uncoiling of chromonemata and form swelling called puffs or Balbiani ring. Balbiani rings are concerned with synthesis of mRNA and protein.



Polytene chromosome

(vii) Ecdyson hormone of insect stimulates formation of balbiani ring.

(viii) Polytene chromosome is related with **metamorphosis of an insect**.

(C) Supernumerary / B-chromosome / Accessory chromosome

(i) In certain plants and animal one or more additional chromosome were observed in addition to the normal number called supranumerary chromosome (named by D.Jones).

(ii) It is genetically inert, Heterochromatic and small sized.

(iii) It is present in the nucleus.

(iv) Its presence does not effect an organism phenotypically if its number is high **they reduce the fertility and vigour**.

(v) **Wilson** in 1905 discovered it in **metapodium insect**.

(vi) Increase ecological adaptation to organism.

Karyotype Analysis

All the membrane of a species of a plant or the animal are characterised by a set of chromosomes, which have certain constant characterstics including the number of chromosomes, relative size, position of centromere, length of the arm, secondary constriction and satellites. All such features by which a particular set of chromosome can be identified is called karyotype of a species. A diagrammatic representation of karyotype (morphological) os a species is called idiogram, where the choromosome of a diplois det of an organism are ordereed in a series of decreasing size.

There are two basic types of karyotype :

1. **Symmetric Karyotype :** A karyotype showing small differences between smallest and largest chromosomes and have comparatively more metacentic chromosome is called symmetric karyotypes. This type of karyotype is considered to be relatively primitive feature.
2. **Asymmetric Karyotype :** A karyotype showing large differences between smallest and largest chromosomes and have comparatively fewer metacentic chromosome is called asymmetric karyotypes. This type of karyotype is considered to be relatively advanced feature.

Uses of Karyotyping or Karyotype Analysis

(i) After comparing the karyotypes of different froups of organisms, sometimes similarities are observed in karyotypes, which are presumed to represent evolutionary relationships.

(ii) Primitive or advanced features of an organism can also be suggested by karyotype.

(iii) Genetic disorders occurring due to chromosomal abnormalities can be detected.

Certain specific terms

(i) Idiogram : Karyotype of a species is representes with the help of a diagram called idiogram (pictorial presentation), where the chromosomes are arranged in descending order of size.

(ii) Genome : Genome is defined as a haploid set of chromosomes.

(iii) Plasmon : Hereditary factors or genus present in cytoplasm are called 'plasmon'.

Genus present in plastids are called plastogenes and genes present in mitochondria are called chondriogenes.

Banding technique

It is used to study of the specific pattern of band and interbands on chromosome. This include the use of **flurochromes** (Flurescent dyes).

1. **Q-banding :** It is obtained when chromosomes are stained with **quinacrine mustard.** It stains **A-T rich** areas (developed by **casperson** for Y chromosomes).
2. **C-banding :** It is used to stain constitutive **heterochromatin**, usually in **centromeric** region of the chromosome.
3. **G-banding :** Chromosomes are stained with ***Giemsa***. It stains **sulphur rich** protein parts.

   A variety of different bands are obtained by the modification of Q-banding and G-banding like C, T and N-bands. Q, C, G and R banding used for animal karyotypes while **C and N banding** used in plants.
4. **R-banding :** The process involved incubation of the chromosomes in a buffer at high temperature followed by use of Giemsa stain. This brings about the visualization of sulphur deficient region of chromosomes thus named as reverse giemsa.

CELL DIVISION

INTRODUCTION :

(i) **W.Flemming** at first studied mitotic division in **Salamander**.

(ii) Strasburger discovered meiosis.

(iii) Strasburger gave name prophase, metaphase, anaphase, telophase.

(iv) Meiosis name was given by **Farmer** and **Moore**.

(v) It is important for development, regeneration and reproduction.

(vi) Hormone cytokinin increases rate of cell division.

TYPES OF DIVISION :

(A) Amitosis **(B) Mitosis** **(C) Meiosis**

(A) Amitosis (No spindle, No chromosome) :

(i) It is the simplest mode of cell division at first described by **REMAK** (1841).

(ii) This type of division starts with elongation of nucleus.

(iii) Nucleus becomes dumbbell shaped, and get divided into two daughter nucleus.

(iv) Nucleur division is followed by the division of cytoplasm its results in formation of two daughter cells.

(v) In this division, **no spindle formation** and **no distinct chromosome** formation occurs. Nuclear evelope remains intact. The daughter cells are approximately the two equal halves of a parental cell. e.g. PPLO, Blue-green algae, Bacteria and Eukaryotic cells. Examples are yeast-budding occurs by amitosis.

(vi) Ameoba multiple fission occurs by amitosis.

(vii) Paramecium division of meganucleus.

(viii) Mammals-growth of foetal membranes (amnion, chorion, allantois, yolk sac)

(ix) Division of mitochondria and chloroplasts.

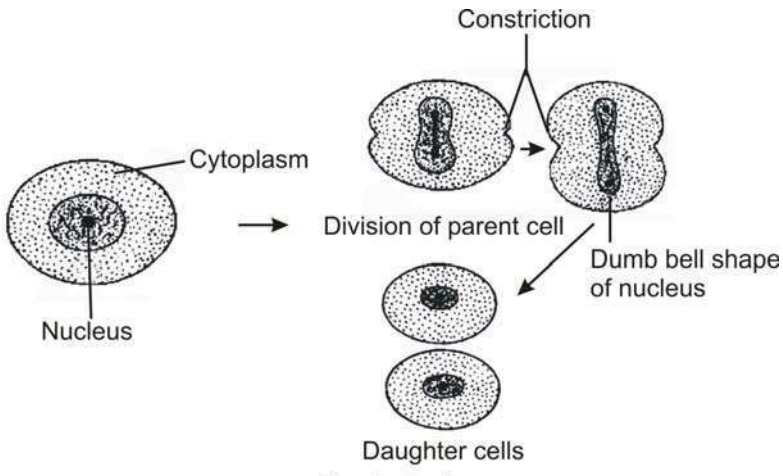


Fig. Amitosis

(B) MITOSIS :

(i) Mitosis was discovered by **Flemming** in 1879 in animal cell and in plants cells by **Strasburger** in 1875.

(ii) Mitosis is a cell division in which parent cell divide to form two daughter cell, in which **number of chromosome**, **amount of DNA**, number and types of gene are equal to parent cell.

(iii) It occurs in **somatic cell (n, 2n, polyploid any)**.

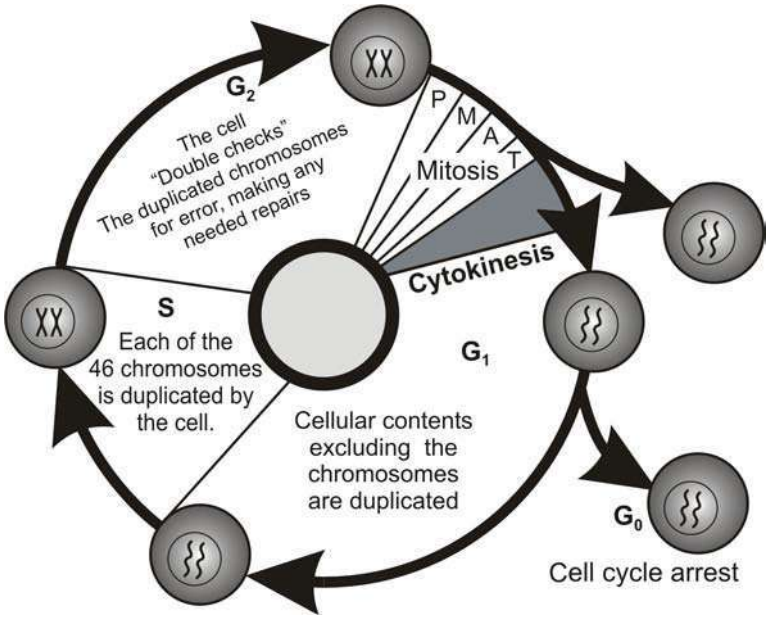
(iv) It is called **indirect division.**

(v) Mitosis results in increase in number of cells in the body.

Mitosis cell division can be divided into two phases.

1. Interphase

2. Division phase or M phase



1. Interphase / Cell cycle

(i) Interphase is phase between two cell division. group into three sub stages G_1 S and G_2.

(ii) In this phase cell prepares itself for division so, called **preparatory phase**.

(iii) It is longest phase of cell cycle. It get completed approx. in 19-22 hours.

(iv) It is also called **resting phase**. (previously)

(v) In this phase, cell remain **metabolically extremely active**.

(vi) In this phase synthesis of protein, enzyme, DNA and RNA takes place

(vii) Centriole duplicates into two. Thus two centrioles are formed.

(viii) Cell cycle can remain **arrested only G_1 phase. Then G_1 is called as G_0 phase. G_0 phase found in** cells of permanent tissue.

(ix) **Cell cycle is running** by a group of special proteins "**Cyclins and Cdks** (MPF), (Nurse, T-Hunt & Hartmann **2001** studies on sacchromyces (**Baker yeast**))

1. **Three sub stages of interphase :**
2. **G_1 phase [longest phase 12 - 15 hr]**

(i) Cell growth occurs in this phase.

(ii) Mitochondria, Chloroplasts (plants), Lysosomes, Ribosome, Endoplasmic Reticulum Golgi Complex, Vacuoles etc. are produced.

(iii) Structural and functional proteins are formed.

(iv) Nucleolus produces rRNA, mRNA and tRNA. (RNA synthesis may inhibited by **actinomycin**).

(v) **Metabolic rate** of the cell becomes **very high**.

(vi) It may be called **pre DNA synthesis phase**.

(vii) It is known as post mitotic phase.

3. **S-phase [6 - 10 hr)**

(i) **Replication of DNA takes place**. (DNA get doubled)

(ii) Protein molecules called **histones** are synthesized that cover each strand of DNA.

(iii) **Centriole** replicate is late **S-phase**

4. **G_2-phase [3 - 12 hr]**

(i) **Tubulin protein synthesis** start for spindle formation.

(ii) This phase may be called **post DNA synthesis** phase.

(iii) Cell division involves enormous expenditure of energy thus cell **stores ATP** in G_2 phase

(iv) After G_2 phase cell enters in division or M-phase

CAUSE OF MITOSIS :

(i) **Karyo plasm theory :** Hertwig, says that mitosis occurs due to disturbance in karyoplasmic index (KI) of cell.

$$KI = \frac{V_n}{V_c - V_n}$$

Here V_n = Volume of nucleus

V_c = Volume of cell

$V_c - V_n$ = Volume of cytoplasm

$$KI \propto \frac{1}{\text{Volume of cytoplasm}}$$

Small cell → less cytoplasm → High KI → No division it show nucleus control the activity of cytoplasm and no division occur.

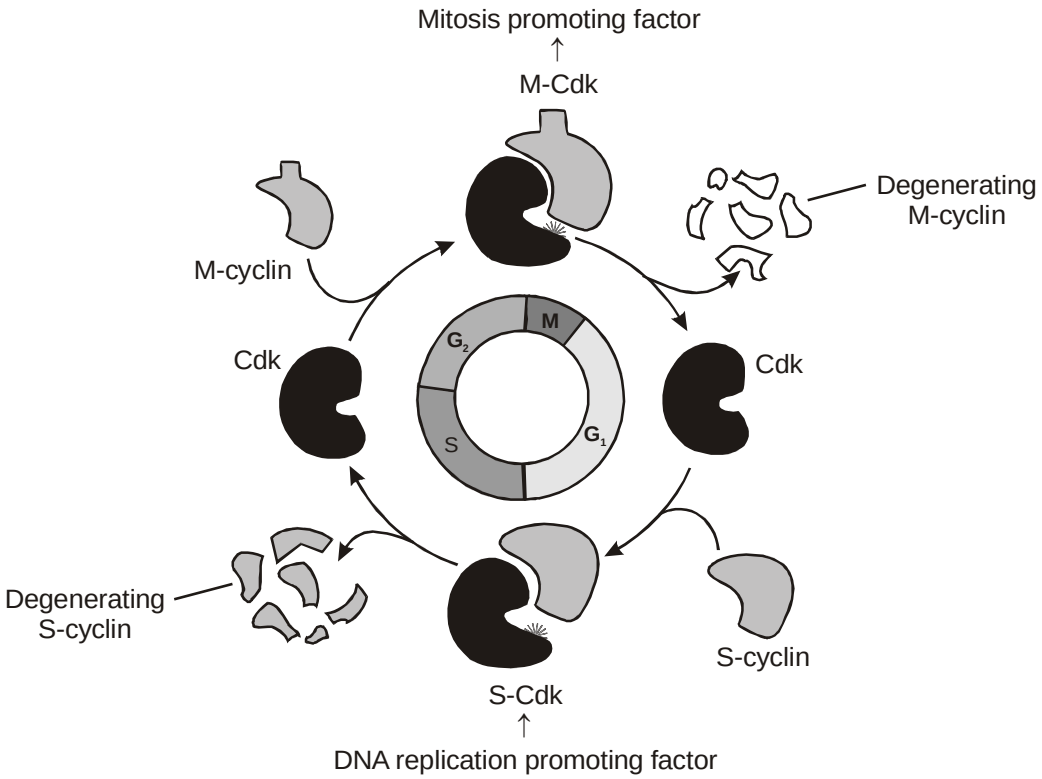
Large cell → More cytoplasm → Low KI → Division occur. It cause to loose control of nucleus on cytoplasmic metabolism so large cell divide into two

(ii) **Surface volume Ratio :** It says that when cell grows in size its volume increases but surface area remain less so it affect metabolic activity of cell which result into division of cell.

Note : Above two hypothesis regarding the division of cell are completely discarded because new concept give the genetic control of cell division.

CELL DIVISION CONTROL :

(i) A cell reproduces by performing an orderly set sequences of irreversible events, In which it duplicates It's contents & then divides into two, these events are known as cell cycle.



(ii) Molecular biologists, identifying the biomolecules, that control or drive the cell cycle, many biologists, some of whom worked with **invertebrate** or **frog egg's** others with **yeast** cell or cell culture.

(iii) Scientists concluded that the activity of enzymes, known as **cyclin dependant kinases. (Cdk's)** regulates the cell cycle.

(iv) They are activated when they combined with key protein called **cyclin**.

(v) Kinase is an **enzyme** that removes a phosphate group from ATP & add to another protein.

(vi) At some check points $\begin{pmatrix} G_1 \to S \\ G_2 \to M \end{pmatrix}$ a **kinase** enzyme combines with **cyclin** & this moves the cell cycle forwardly.

(vii) **S-kinase** is capable of starting the replication of DNA after it combined with **S-cyclin (G_1 - Cyclin)**. After some time S-cyclin is destroyed & S-kinase is no longer active.

(viii) **M-kinase** is capable of turning on mitosis after it has bind with **M-cyclin**, **(G_2-cyclin)**.

2. Division Phase

In this phase nuclear and cytoplasmic division takes place.

A. Karyokinesis- Nuclear division.

B. Cytokinesis-Cytoplasmic division.

A. **Karyokinesis**

It is divided into four phases –

(a) Prophase **(b)** Metaphase **(c)** Anaphase **(d)** Telophase

(a) Prophase

(i) It is the **longest phase** of karyokinesis.

(ii) Chromosomes appear as pairs of chromatids joined by centromere (chromatin condensation start).

(iii) The nuclear membrane disintegrate and disappear into the cytoplasm.

(iv) **Nucleolus start disappearing**.

(v) Each centrioles Separates and start to move towards the opposite pole of the cell.

(vi) Around each centriole **astral rays** are formed in the cytoplasm. due to (**gelation of protein**).

(vii) **Anastral mitosis -** In plants, centrioles are absent and no asters are formed. Mitosis without asters is known as anastral mitosis.

(viii) **Amphiastral Mitosis -** In animals, the asters are present and the mitosis is described as amphiastral, or astral mitosis.

(b) Metaphase

(i) The chromosome arrange at the **equatorial plane**.

(ii) Each centromere is joined by two **chromosomal fibre or kinetochore spindle** one from each pole.

(iii) Some other fibres of the spindle extend from one pole to the other pole. These are known as **continous fibres** or **non kinetochore spindle**

(iv) Centromere lies at equator and arms remain directed towards **poles**.

(v) Chromosomal fibre have polarity i.e. + end at equator and – end at the pole.

(vi) In metaphase each chromosome **splits lengthwise upto the centromere** (division of matrix of chromosome). Thus replicated chromatids clearly visible at metaphase stage.

(c) Anaphase (Smallest stage)

(i) The fibres which occur in between the chromosomes are called **interzonal/non kinetochore spindle fibres.**

(ii) In early anaphase interzonal fibres (small and contracted) **appears at equator** of cell.

(iii) **Centromere of each chromosome splits lengthwise** (**division of centromere**).

(iv) Number of chromosome becomes **double** in cell during mitotic anaphase.

(v) Interzonal fibres **expands** and they push chromosomes towards the oppsite poles.**(Pushing)**

(vi) Chromosomal fibres **contract** and they pull chromosome towards opposite poles. **(Pulling)**

(vii) By **pulling and pushing** mechanism chromosomes rapidily move towards the opposite poles.

(viii) Approximately 30 ATP are required to carry a chromosome to pole. Chromosomes reach at poles in late anaphase.

(ix) At this phase cytokinesis process starts.

(d) Telophase (Reverse prophase)

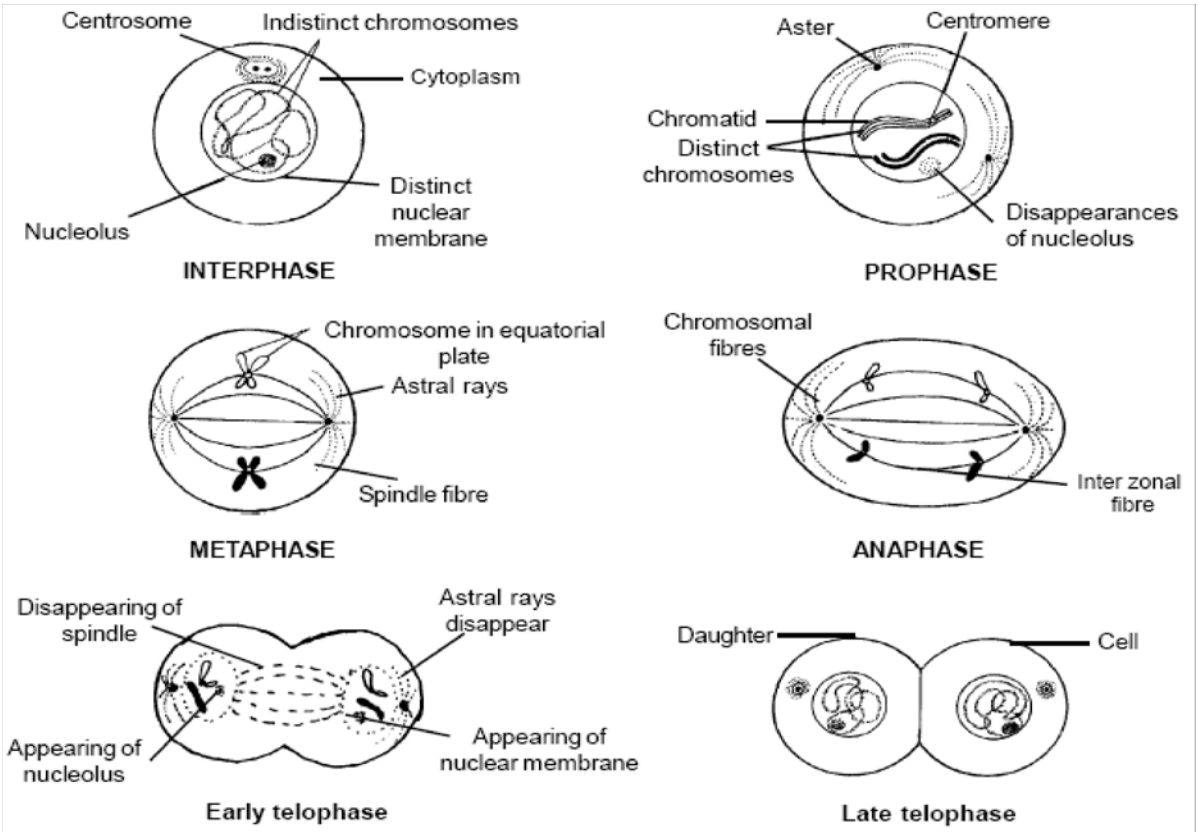
(i) The daughter chromosomes with their **centromere at the poles** begin to uncoil and lengthen. They aggregate together to form a mass at the poles.

(ii) The **nucleolus reappear**.

(iii) New nuclear membrane develops around the chromosomes from the elements of the **E.R.**

(iv) Spindle and astral fibre are absorbed in the cytoplasm.

(v) Thus two daughter nuclei are formed and they have the appearance of the interphase nuclei.



B. **Cytokinesis**

(i) After nuclear division (Karyokinesis) cytoplasm get divided into two (more or less) equal parts, this results in formation of two daughter cells from a single parent cell.

(ii) The cytoplasmic division differs in animal and plant cells.

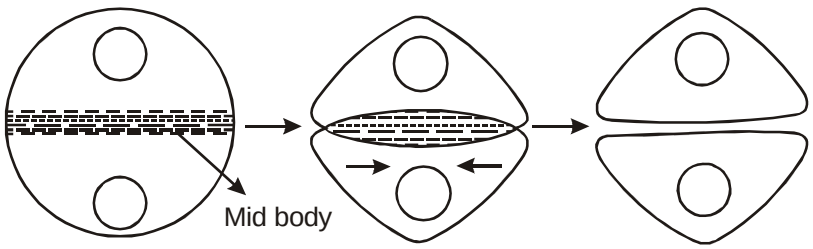
(iii) Cytokinesis starts in **late anaphase**.

(iv) In **animals** cytokinesis occurs by **constriction & furrow formation**. Microtubules and microfilaments arrange on equator to form midbody.

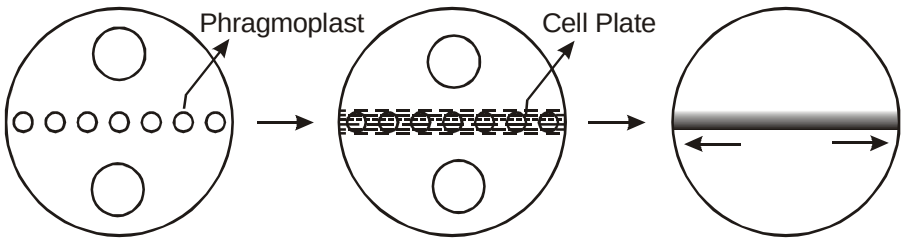
(v) Contraction occurs in midbody and Plasma membrane starts constricting to form **contratile** ring.

(vi) Thus a furrow forms form the out side to inside in cell. Furrow deepens continuosly and ultimately a cell divides into two doughter cells.

(vii) In animals cytokinesis occurs in **centripetal order**.



(viii) **Cytokinesis in plants :** Takes place by **cell plate formation** because constriction is not possible due to presence of the rigid cell wall.



(ix) Many golgi vesicles arrange themselves on equator to form **phragmoplast**. ER and Fragmets of spindle fibres also collect on equator. Collectively this structure is known as **Cell plate**.

(x) Golgi vesicles secrete calcium and magnesium pectate. Further cell plate is modified into middle lamella.

(xi) In plants, cytokinesis occurs in centrifugal order (cell plate formation is form centre to periphery).

SIGNIFICANCE OF MITOSIS :

(A) Identical gene composition

(i) **In mitotic cell division daughter cell contain the same number of chromosomes as the parent cell**.

(ii) The daughter cells carry the same hereditary information as is in the parental cells.

(iii) There is no variation in genetic information.

(iv) It gives a genetic stability within a population.

(B) Growth

Mitotic cells division is responsible for growth in an organism.

(C) Cell Replacement

Mitotic cell division is responsible for the replacement of lost cells , healing of wound.

(D) Regeneration and Asexual reproduction

In many lower animals mitotic cell division is responsible for regeneration and asexual reproduction.

MODIFICATION OF MITOSIS :

(i) **Cryptomitosis of Promitosis :-** It is a primitive type of mitosis. In this type of divsion, nuclear membrane **does not disappear** but remain intact throughout the division.

All the changes of karyokinesis

Occurs inside nucleus even the formation of spindle **(Called as intranuclear spindle)**. eg. some protozoans (Amoeba) during Binary fission.

(ii) **Dinomitosis :-** Dinomitosis founds in **dinofilagellates**, which are **mesokaryotes**. In mesokaryotic cells histones are absent. Because of this, the **chromosomes fail to condense properly** and hence are not distinctly visible during cell division.

Nuclear membrane persists throughout the cell division and so spindle formed is intranuclear type.

(iii) **Free nuclear division :-** Karyokinesis is not followed by cytokinesis so such divisions lead to **coenocytic** condition. eg. endosperm, fungi of phycomycetes group.

(iv) **Endomitosis :-** This is **duplication of chromosomes** without division of nucleus. Endomitosis leads to **polyploidy**. i.e. Increase in number of sets of chromosome.

(v) Colchicine induces polyploidy in plants. Colchicine is a mitotic poison as it arrest the formation and arrangement of spindle fibres.

(vi) **Endoreduplication :-** Endoreduplication is a modification of endomitosis. The **polytene** chromosomes form by process of **endorduplication**. In endoreduplication, the **chromatids (DNA) replicate** but do not get seprated. This process is also known as **polyteny**.

(vii) **Mustard gas and Ribonucleases** are also mitotic poisons.

MEIOSIS (TERM BY FARMER & MOORE) :

(i) It occurs in **male and female germ cells**, such cells are called **meiocytes**.

(ii) In this type of division parent cell **divides to produce four daughter cell (genetically different)**.

(iii) It is a reduction division in which the number of chromosomes (genetic matter) is reduced to half i.e. diploid number (2n) becomes haploid (n).

(iv) It is responsible for transmission of hereditary information from generation to generation.

It is divided into two main phases.

(a) **Meiosis I :** Heterotypic division or reduction division. It leads to reduction in chromosome numbers. Division of chromosome does not occurs in meiosis-I and only segregation of homologus chromosomes takes place.

(b) **Meiosis II :** Homotypic division or equational division. It does not leads to any change in chromosome number. Meiosis II is just like mitosis. Division of centromere occur in meiosis II. In Meiosis, division of nucleus takes place twice but division of chromosome occurs only once.

(A) Prophase - I (Longest and complex step of meiosis)

It is divided in five sub - stages :

(a) Leptotene **(b)** Zygotene **(c)** Pachytene

(d) Diplotene **(e)** Diakinesis

(a) Leptotene

(i) The volume of the nucleus is increased and chromatin condense to from chromosome.

(ii) Chromosomes becomes distinct, long and uncoiled. (**Longest and Thinest**)

(iii) On chromosomes contain a series of beaded structure appear called **chromomere**.

(iv) The centriole divides into two.

(v) The ends of all chromosomes are directed **towards cetriole** on one side of nucleus forming **bouquet**.

(vi) At this stage orgamism shows a peculiar type of orientation of chrmosomes - **animals** show **bouquet** type while **plants synizesis** type.

(b) Zygotenes

(i) Two **homologous chromosomes** approach each other and being to pair, this pairing is called **synapsis**. Each pair consists of a maternal chromosomes (the chromosomes of the mother) and a paternal chromosomes (the chromosomes of the father). The pair so formed are known as **bivalents**.

(ii) The chromosomes become thicker and shorter.

(iii) There develops a structure in between homologous chromosomes, Which is termed as ***synaptonemal complex***. Synaptonemal complex is composed of three thick lines of, DNA and proteins.

(iv) According to **Mosses (1956)** synaptonemal complex helps in pairing and chiasmata formation.

(v) About **0.3% DNA** is synthesized in Zygotene substage.This DNA is used in chromosome pairing or synapsis. (Zyg. DNA)

(vi) The centrioles move to the opposite poless.

(c) Pachytene

(i) Each individual chromosome of each **bivalent** begins to **split longitudinally** into two similar chromatids. As a result, each bivalent now contains **four chromatids**. This stage is called **tetrad stage**.

(ii) Due to increased attraction, homologous chromosomes tightly coil around each other.

(iii) Both the chromatids of a chromosome are called **sister chromatids** and each chromosome is called **Dyad.**

(iv) **Nonsister chromatids** of homologous pair develops ***recombination nudules*** and exchange their parts i.e. **crossing over**. Crossing over was discovered by **Morgan** and **Castle** in **Drosophila**.

(v) **Endonuclease** first breaks the nonsister chromatids at the place of recombination nodule.

(vi) Nonsister chromatids reunite after exchanging their parts (by **Ligase**) As the result of crossing over cross like structures - **chiasmata** (discovered by Janseen) form in bivalent.

(d) Diplotene

(i) In this stage, the homologous chromosomes repel (**desynapsis**) each other. The two homologous chromosomes thus separate from each other. So **chiasmata become visible**.

(ii) By the end of this stage, the chiasmata begin to move alone the length of the chromosomes from the centromere towards the end. This displacement of chiasmata is termed as **terminalization**.

(iii) **Diplotene** (Dictyotene) may last long up to month or year (12 to 15 years in Human Female)

(e) Diakinesis

(i) Terminalization is completed in this stage.

(ii) The bivalents tend to repel each other and migrate to the periphery of the nucleus just inside the nuclear membrane.

(iii) The **nucleolus disappears**.

(iv) The **nucleus membrane** also begins disintegrate and disappear.

(i) Spindle fibres make their appearance in the cytoplasm.

(B) Metaphase-I

(i) The spindle fibres get well developed are of three types

(a) Chromosomal / Kinetochore microtubules

(b) Continous / non kinetochore microtubules (pole to pole)

(c) Interzonal / non kinetochore microtubules (between the chromosomes)

(ii) The chromosomes move towards the equator and finally they orient themselves on the equator.

(iii) The centromeres lies towards the poles and the arms towards the equator.

(iv) At this stage each chromosome have two chromatids.

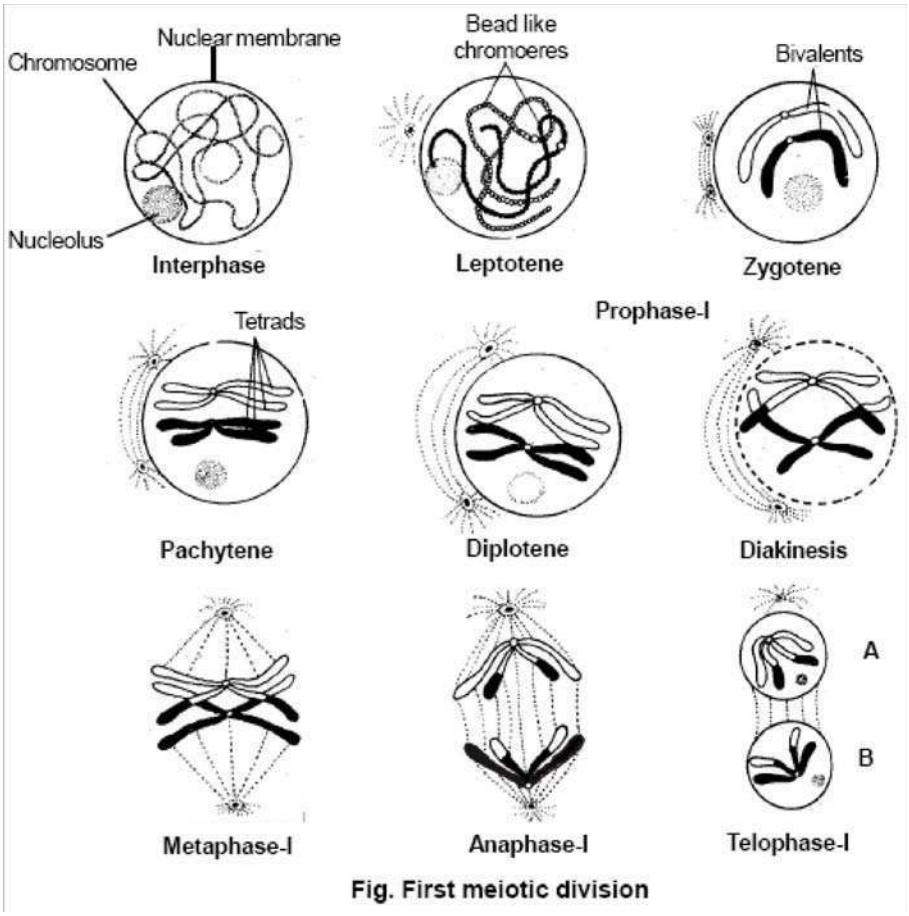


Fig. First meiotic division

(C) Anaphase-I

(i) Chromosomal fibre contracts and interzonal fibre **expands**. So homologous chromsomes segregate from each other and move towards the opposite poles.

(ii) Anaphase-I is characterised by **segregation** or **disjunction** of homologous chromosomes. **Division of centromere** is absent.

(iii) Unlike the condition in mitosis, the two chromatids of each chromosomes do not separated in meiosis-I because centromere does not splited.

(iv) Anaphase-I is responsible for reduction in chromosome number in daughter cells.

(D) Telophase-I

(i) The haploid number of chromosomes after reaching their respective poles, become very long and uncoil.

(ii) The nuclear membrane and the nucleolus reappear and thus two daughter nuclei formed are haploids.

(E) Cytokinesis-I

(i) In animals - by constriction and furrow (successive type)

(ii) In plants mostly cytokinesis absent.

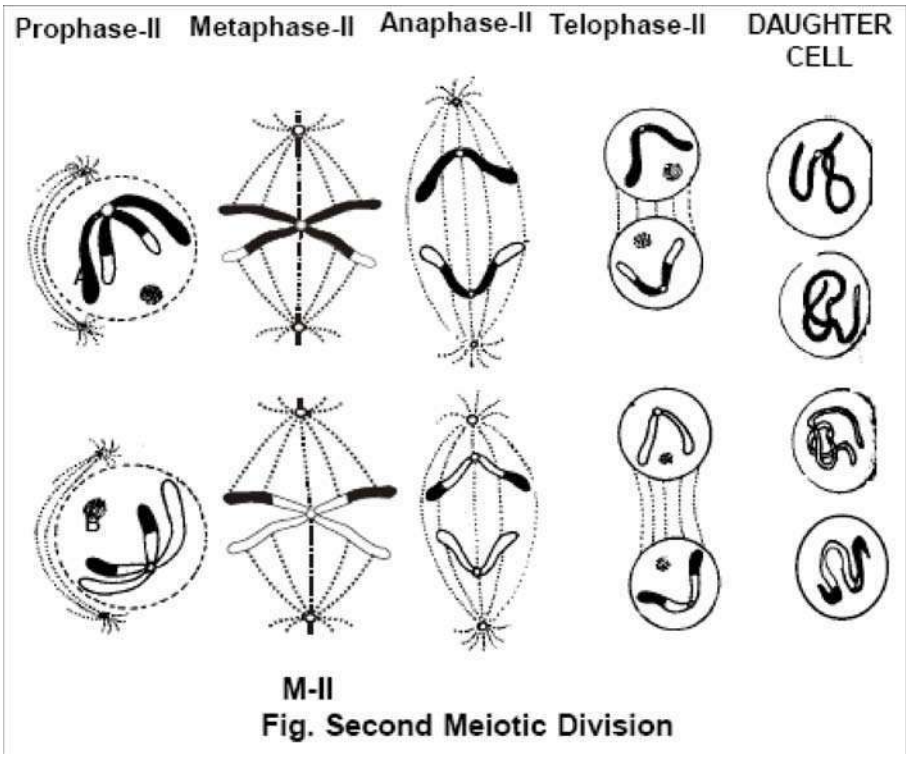
(iii) In plants, all the four daughter cells are produced **simultaneously**. Group of four cells produced simultaneously is called **tetrad**. (Tetrad of pollen grains).

Interphase-II

It is period in between meiosis-I and Meiosis-II. It may or may not be present. It is generally present in animal cell. There is **no s-phase** and **no DNA synthesis**. So called **Interkinesis**.

MEIOSIS-II

In this division no change in number of chromosome takes place (**Haploid to haploid**).



M-II

Fig. Second Meiotic Division

(A) Karyokinesis

Like meiotic-I, it is divided into four phases.

(B) Prophase - II

(i) The chromosomes appear distinct with two chromatids.

(ii) Each centriole divides into two resulting in the formation of two centrioles. Then each moves to opposite pole. They produce **asters**. Spindle fibres are formed between the asters.

(iii) The nucleus membrane and nucleolus disappear.

(C) Metaphase - II

(i) The chromosomes get arranged on the equator similar to mitosis.

(D) Anaphase II

(i) The two chromatids of each chromosomes are separated by the **divisions of centromere** and are attached to the spindle fibres.

(ii) The separated chromatids becomes daughter chromosomes and move the opposite poles due to the contraction of the spindle fibres.

(C) Telophase II

(i) During this stage, the daughter chromosomes again form chromatin thread.

(ii) The nuclear membrane surrounds each group. The nucleolus reappears.

(iii) Spindle fibre disappears.

(D) Cytokinesis-II

(i) After this there is cleavage of cell membrane in animal cells or cell wall formation in plant cells.

(ii) Each daughter cell of meiosis-I produces two haploid cells at the end of meiotic II

(iii) Hence this leads to the formation of **four daughter cells** (gametes). genetically different from eachother.

SIGNIFICANCE OF MEIOSIS :

Gametes are produced by meiosis. In meiotic cell division number of chromosome get reduced to half. When male and female gametes fuse, it again leads to (2n) number of chromosomes in the zygote. In this way by meiotic cell division number of chromosome is maintained constant in a sexually reproducing organism. During crossing over exchange of genes takes place in between maternal and paternal (two) chromosomes, this exchange of genes leads to **variation**. Variation is the raw material for evolution.

TYPE OF MEIOSIS :

(i) **Zygotic or Initial meiosis :** When the meosis in life cycle of an organism occurs in **zygote cell**. eg. in Thallophyta.

(ii) **Sporic meiosis or Intermediate Meiosis :** Meiosis takes place during **spore** formation eg. all the plants except thalophyta.

(iii) **Gametic or Terminal Meiosis :** Meiosis during the **gamete** formation. Eg. Animals.

(G) Differences between Mitosis and Meiosis Division

S.No.	Contents	Mitosis	Meiosis
(i)	Occurence	May occur in haploid, diploid or polyploid cells.	Occurs only in diploid or polyploid cells.
(ii)	Kind of cell	Somatic cells and some spores	Only Germ cells
(iii)	Number of cells	Two daughter cells	Four daughter cells
(iv)	General process	Whole process completes in one sequence with DNA replication only one time in interphase.	Process completes in two successive divisions which occur one after the other with DNA replication only once during interphase -I.
(v)	Prophase	(i) Shorter duration without substages. (ii) Homologous chromosomes remain separate. (iii) No crossing over and chiasmata formation.	(i) Longer duration with five substages. (ii) Homologous chromosomes pair up to **form bivalents**. (iii) Presence of **Crossing over** and chiasmata formation.
(vi)	Metaphase	(i) Centromeres are directed towards the equator and arms are directed towards the poles.	(i) Centromeres are directed towards the poles and arms are directed towards the centre.
(vii)	Anaphase	(i) Centromeres divide (ii) Chromatids separate. (iii) Chromatids are identical.	(i) Centromeres divide during meiotic -II Only. (ii) Chromatids separate during meiotic -II Only. (Chromosomes separate in meiotic-I) (iii) Separated chromosomes may not be identical due to **crossing over**.
(viii)	Telophase	(i) Same number of chromosomes as in parent cell. (ii) Both the homologous chromosomes present.	(i) Chromosome number is half than the parent cell. (ii) Only one of each pair of homologous chromosomes present.

TOOL & TECHNIQUE

UNIT OF MEASURMENT :

1 Millimeter (mm) = 1/10 cm.

1 Micron (μ) or Micrometer (μm) = 1/1000 mm.

1 Millimicron (mμ) or nanometer (nm) = 1/1000 m.

1 Angstrom (Å) = 1/10 mμ.

STAINING :

As most of cell components are transparent, to make these visible, different dyes are used to stain them. The cellular components take-up these dyes according to their chemical nature.

Stain	Final colour	Suitable for
Janus green	Greenish blue	Mitochondria
Brazlin	Red	DNA
Aurantia	Yellow	Mitochondria
Toludin-Blue / Azure-B	Sky blue	RNA
Para Rosailin	Purple	DNA
Feulgen stain	Red/Purple	DNA
Methylene	Blue	Nucleus
Sudan black and red	Black/Red	Lipid
Iodine solution	Blue/Red	Starch /Glycogen
Eosine	Red/Pink	Cytoplasm /Cellulose
Basic fuschin	Magenta red	Nucleus, Yeast, Golgi complex
Acid fuschin	Magenta	Cortex, Cell wall, mitochondria
Hematoxylin	Violet	Nucleus, cell wall & cellulose
Safranin	Red	Nucleus, Lignified tissue
Aniline blue	Blue	Fungal hyphae
Crystal violet	Violet	Bacteria
Phloroglucinol + HCl	Red	Lignin
Ruthenium red	Red	Pectin
Sudan III or IV	Red	Suberin, cutin, oil

TOOLS IN CYTOLOGY :

(A) Microscopy :

The study of fine structure of an object under a microscope is called **Microscopy**. The term, 'Microscope', was given **Faber**. **De-Vinci** was first person to use lens.

(B) Types of Microscope :–

(i) **Simple Microscope :**

The microscope used by Robert Hooke is considered as **simple microscope**. Its magnification power was 14–42 times only.

(ii) **Compound or Light Microscope :**

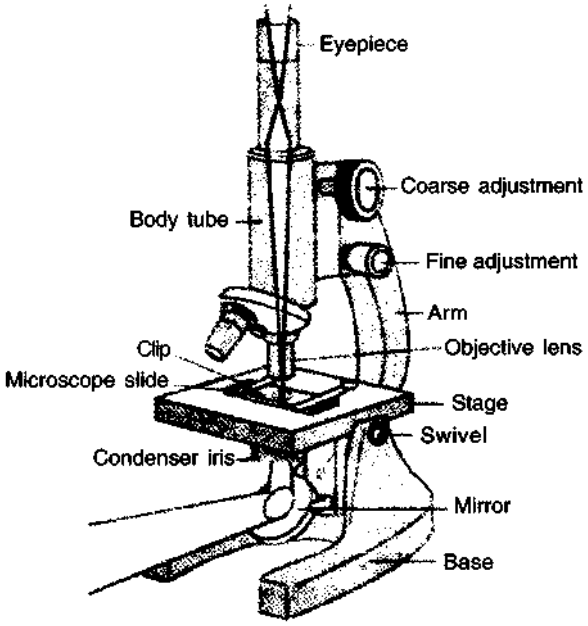


Fig : Compound Microscope

(iii) Compound microscope was first assembled by Z. Janssen and J.Janssen in 1590.

(iv) It is one of the oldest and most commonly used microscope to study the structure of cells and organisms.

(D) Special Note :

(i) Light microscope can magnify an object to about 1000 times the actual size of the specimen.

(ii) Light microscope is used to study the live unstained materials as well as the preserved and stained specimens.

(iii) This type of microscope is also called **Bright Field Microscope.** In this image is formed when the light is transmitted through the specimen.. The specimen is denser and more opaque than its surroundings. The image produced by the specimen will be darker than the surrounding brightly illuminated field. It is used to study live, unstained materials as well as preserved and stained materials.

(E) Dark Field Microscope :

(i) It was invented by **Z singmondy** in 1905.

(ii) In this, the image of specimen is illuminated bright against dark background.

(iii) The dark background, is achieved by keeping special disc called ‘stop’ on the condenser which blocks all the light from the centre and now only oblique beam of light reaches object or specimen. This type of microscope is used to see nuclei, mitochondria and vacuoles of cells.

(F) Phase contrast Microscope :

(i) It was invented by **F. Zernicke** in 1935.

(ii) It is used to study **living cells and tissues without staining**. Also used to study **chromosomes in mitosis & meiosis**.

(iii) As composition and densities of various cell organelles are different, their refractive indexes are also different.

(iv) This microscope converts the differences in refractive in dexes into relative darkness and brightness. It alters the light that passes through the specimen into different light intensity.

(G) Fluorescence Microscope :

(i) It was invented by **Coones** in 1945.

(ii) It uses **ultraviolet light** instead of visible light.

(iii) The fluorescent compounds like collagen, chlorophyll, riboflavin, vitamin A absorb UV light and then emit light of longer wavelength (Fluorescence).

(iv) Certain fluorescent dyes are also used like acridine orange and coriphosphine.

(v) This is used to **study the chromosome behavior** and **to identify pathogenic microorganism**.

(H) Differential or Interference Contrast Microscope :

(i) This is based on the principle of phase contrast but it gives quantitative data also.

(ii) It is used **to measure thickness of cell**, to determine protein lipids and nucleic acids in the cell parts to measure dry weight and water contents of the specimen etc.

(iii) In these microscopes the light rays are split into two beams before passing through specimen by the help of 2 prisms that creates contrasting colour in a image and two sources of light.

(iv) One beam passes thought the object and undergoes a phase change (diffracted wave). The second beam does not pass through the object and remains unchanged (undeviated wave).

(v) Since the two beams of light interfere with each other and also in combined state, it is called as interference contrast microscope.

(I) Electron Microscope :

(i) The electron microscope was invented by **Knoll** & **Rusk**a in 1931.

(ii) In E.M. the image is formed by a **beam of electrons rather than by visible light**. The image is formed by differential scattering of electrons from specimen.

Various parts of EM –

(i) **Filament –** It is made up of **tungsten**.
It is heated in vacuum tube to emit a beam of electrons for illumination **(source of light is electron beam)**.
Vacuum is kept in the tube so that the electrons may not collide with oxygen or nitrogen atoms of air.

(ii) **Electromagnetic condenser Lens –** It collects and focuses the beam of electrons on the object.

(iii) **Electromagnetic objective lens –** It produces an enlarged image of the object.

(iv) **Electromagnetic projector lens –** It further magnifies the image and projects it on to a **fluorescent viewing screen** or **photographic plate**.

(v) **Specimen used –**

(a) The specimen used is treated with chemicals and dyes to enhance the contrast and as such the live objects cannot be observed.

(b) Since images produced by electrons do not have the colour, the electron micrographs always have shades of black, grey and white.

(c) The colour enhanced micrographs are produced by computer.

There are two types of E. M. →

1. Transmission Electron Microscope (TEM) :

(i) TEM was developed by **Knoll** & **Ruska**.

(ii) It is used for the **study of ultrastructure of cell organelles**.

(iii) Magnification **power 1,00,000 to 3,00,000 times**.

(iv) In TEM the electrons pass through the object & produce an image.

(v) In order to increase the contrast & to prevent damage of tissue by electron bombardment the **specimen is fixed, coated or stained by the salts of various heavy metals (e.g. – Lead, Tungsten, Uranium) Usually Osmium tetroxide & formaldehyde are used**. After fixation the specimen embedded in plastic material & ultrathin sections are cut on a specially designed ultramicrotome using glass or diamond knife. After this the sections are placed on a thin membrane which is kept on a copper grid in the EM for observations.

2. Scanning Electron Microscope (SEM) :

(i) It was invented by **Knoll** in 1935.

(ii) It is used for **detailed study of surface of specimens**.

(iii) It gives **3D image**.

(iv) Magnification power **upto 2,00,000**.

(v) In SEM the image is formed due to reflection of electrons from the surface of the specimen.

(vi) A shower of electrons are strike on the surface of specimen in SEM.

Magnification (M) of a Microscope :

It is ratio of the visible size of an object to its actual size.

$$M = \frac{\text{Size of image seen with microscope}}{\text{Size of image seen with naked eye}}$$

For laboratory microscope it is calculated by multiplying the magnification of the objective lens by that of the ocular lens.

Resolving Power of a Microscope :

The ability to see two close points as separate and distinct points is called **resolving power**.

(i) Resolving power of a microscope is given by the **Abbe equation**.

$$L_m = \frac{0.61\lambda}{N.A.}$$

Where,

L_m = limit of resolution or resolving power.

0.61 = Constant

λ = wavelength of light

N.A. = n sin α (n = refractive index of medium)

(sin α = sine of half angle of light entering the objective lens from the specimen)

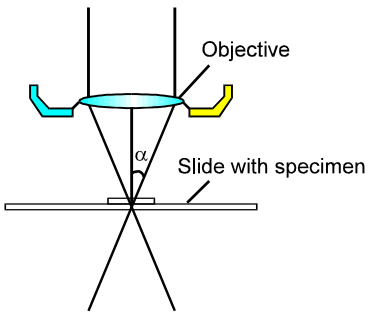

Fig : Semiangle of aperture

(ii) If L_m becomes small the resolution increases. Limit of resolution is inversely proportional to resolving power.

(iii) As limit of resolution is inversely proportional to wavelength of light, the highest resolution is obtained with

the light of shortest wavelength i.e. (450–500nm). Therefore, blue filter is used in a microscope.

(iv) The function of condenser in microscope is to produce a cone of light striking on it. This cone has a narrow angle, it does not spread out much after leaving the slide and does not form separate images causing low resolution.

(v) Most oil immersion objectives have a maximum numerical aperture of 1.4, with the numerical apertures commonly ranging from 1.0 to 1.35.

(vi) The maximum resolution of light microscope that can be achieved is 200nm. (at 426nm which is shortest visible wavelength).

(vii) Another important thing for a microscope is in choosing good microscopic objective lens having short **working distance**. Working distance of an object can be defined as the distance between the surface of objective lens and the object or coverslip.

TECHNIQUES IN CYTOLOGY :

(A) X-ray diffraction :

(i) This technique is based on the **diffraction of radiations** when they fall on small obstacles.

(ii) X-rays diffraction is one of the most important tools in **molecular biology and ultrastructure**.

(iii) It permits biologists to determine the orientation of molecules and to recognize atomic organization.

(iv) X-ray diffraction is a good technique to determine the three dimensional positions of the atoms in the molecules like nucleic acid and protein.

(B) Autoradiography :

(i) It is **direct use of radiations** in the study of biological molecules.

(ii) One of the important techniques used to study the synthesis of molecules and to trace the metabolic pathways or events in the cells is autoradiography.

(iii) **Autoradiographic techniques can be used to trace the path of carbon in photosynthesis**.

(iv) Autoradiography involves the incorporation or radioactive substances into the molecules and the detection of their presence by photographic technique.

(v) The most useful **radioactive isotopes employed in autoradiography are beta emitters including ^{3}H, ^{14}C, ^{32}P, ^{35}S, ^{45}Ca, ^{59}Fe and ^{131}I**.

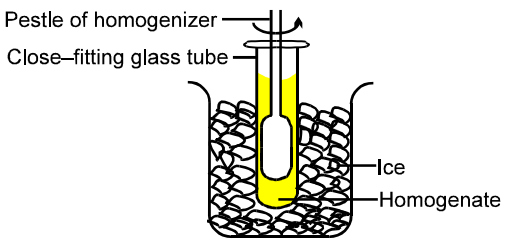
(C) Cell Fractionation :

It is a technique **to separate the various cell component into fractions**. Fractionation involves two methods.

(a) Homogenization **(b)** Centrifugation

(a) Homogenization –

(i) This method involves the homogenization or destruction of cell boundaries by different mechanical or chemical procedures followed by the separation of the subcellular fractions according to mass, surface tension and specific gravity.



(ii) Homogenization of cell can be brought by simple grinding of cells with glass beads (warning blender) breaking cell by pressure, by osmotic shock, by ultrasound waves etc. The resultant slurry obtained is called **cell homogenate**.

(iii) The important thing, which is considered in cell homogenization is the **temperature**, **pH** and **isolation medium**. Normally **homogenization is done at 0-4°C to prevent enzymatic breakdown of cell**. The commonly used isolation mediums are ice cold 0.25M sucrose solution, sorbitol, mannitol.

(iv) For biochemical analysis of mitochondria, the cells must be subjected to cell fractionation.

(b) Centrifugation –

(i) It is a process of separation of various components of a cell under the influence of Centrifugal Force. And the instruments in which this force develops is called Centrifuge. Due to centrifugal force the various components move outward in the medium with different speeds depending upon their size & density.

A centrifuge is a motor driven machine. Centrifuge can be of several types – Normal clinical centrifuge which can rotate upto 5000 rpm (revolutions per minute). The high speed centrifuge (Ultracentrifuge) has speed from 50,000 to 1,00,000 rpm & may be refrigerated.

(ii) Depending upon the specific requirement, different kinds of rotors are used to hold the cell homogenate/ solutions to be fractionated during centrifugation.

(iii) In most of the clinical centrifuges there are only swing out rotors having suspended test tubes.

(iv) Homogenate contains other debris also. These impurities can be removed by low speed centrifugation. The resultant supernatant is called **cell free extract**. From this cell free extract the various cell organelles can be isolated.

(D) Types of Centrifugation :

Density Gradient Centrifugation : for subcellular component

(i) This involves centrifugation through a **gradient of increasing sucrose density**.

(ii) The denser solution is at the bottom and its density gradually decreases towards the top.

(iii) After formation of gradient the homogenate is layered at the top and centrifuged. After centrifugation, components from the homogenate with different moving speeds reach equilibrium with the gradient or may form bands at different position. Hence this type of separation is also called **isopycnic (equal density) centrifugation.**

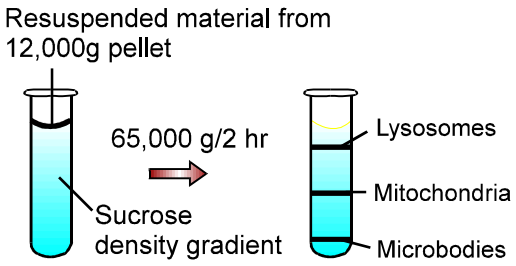


Fig : Sucrose-density Equilibrium Centrifugation

(iv) Sedimentation of the components depends on **sedimentation coefficient** or **svedberg units (S)** which is **proportional to molecular weight of sediments particles**.

Special Points :

(i) **T. Svedberg** won the **nobel prize** for chemistry for the development of **analytical ultracentrifugation**.

(ii) On the basis of the knowledge of the sedimentation coefficient, **the size and composition of the cell, and types of components can be determined**.

(iii) The force exerted on the homogenate is expressed in terms of gravitational force (g). This force is related to the speed of rotations per min.

(A) Molecular Fractionation :

In this technique molecules present in the cell cytosol can be seperated. The two important techniques are:

(a) Chromatography **(b)** Electrophoresis

(a) Chromatography :

(i) It was proposed by **Michael Tswett** - 1906. This technique is based on the **principle of differential migration of components of a mixture** resulting in their separation.

(ii) It is a technique of separation of components of biochemical mixture by partitioning between two solvent systems. One of them is held immobile (stationary phase) and the other mobile (liquid phase). The original experiments were concerned with the separation of **coloured substances** (**plant segments**) and, therefore, this method was called **chromatography**.

(iii) In biology this technique is used in isolating and **purifying materials ranging from plant pigments to amino acids**.

(iv) This technique is useful for preparative as well as analytical purposes.

(v) Depending on the types of solid phase used, the chromatography is of five types. These are–

(a) **Adsorption or column chromatography** commonly used for separation of **mixture of tissue lipids**.

(b) **Thin layer and paper chromatography** (used for **separation of amino acids, nucleotides** and **low** molecular weight products).

(c) **Ion exchange chromatography** (used for **insulin purification** and **plasma fractionation**).

(d) **Gel filtration chromatography** (used for **determination of molecular weight of proteins**).

(e) **Affinity chromatography** (used for separation of immunoglobulins, cellular enzymes and mRNA).

(b) Electrophoresis :

(i) Electrophoresis is a technique in which **charged molecules are placed in a medium and exposed to an electric fiel**d.

(ii) The charged molecules migrate through the medium at different rates, according to **charge, mass length size, shape and other properties**.

(iii) A spot or band of sample to be detected is applied to a solid support, than electric field is applied. The sample molecules moves through the support towards the positive or negative electrodes depending on the net charge of molecule.

(iv) Support media includes paper and cellulose acetate, starch, agarose, polyacryl amide (PAGE) and silica gels.

(v) The voltage used depends upon the nature of the sample & type of support medium. Higher voltage is used for paper supports than for gels because of higher resistance of paper.

(vi) Electrophoresis is useful for the **analysis of numbers and types of components in a mixture** as well as for isolating and purifying molecules.

(vii) Protein electrophoresis is used to detect amino acid variations in hundreds of human proteins.

(viii) Proteins with slight variations in their amino acid sequence will migrate at different rates through electrically charged gels.

EXERCISE - 1

Q.1 The heterochromatin is condensed in the following region of the chromosome -
(1) Secondary construction - I
(2) Secondary constriction - II
(3) Both the above
(4) Telomere

Q.2 One solenoid composed of -
(1) 8-nucleosome (2) 6-nucleosome
(3) 10-nucleosome (4) 16-nucleosome

Q.3 The chromosomes appear as beaded structures at -
(1) Leptotene (2) Pachytene
(3) Diakinesis (4) Telophase - I

Q.4 Histone which links the nucleosomes together is called -
(1) H_1 (2) H_2A
(3) H_2B (4) H_4

Q.5 The protein nucleoplasmin occurs in -
(1) Nuclear pore complex
(2) Sieve cells
(3) Nucleolus
(4) Heterochromatin

Q.6 Nucleus stores energy in the form of -
(1) ATP (2) GTP
(3) TTP
(4) CTP and all the above

Q.7 Ribounucleic acid occurs in -
(1) Nucleus
(2) Cytoplasm
(3) Nucleus and cytoplasm
(4) Mitochondria and chloroplast

Q.8 The chromatin material which takes darker stain in interphase is called-
(1) Euchromatin
(2) Heterochromatin
(3) Primary constriction
(4) Satellite body

Q.9 In human being secondary constriction II found on -
(1) X - chromosome
(2) Y - chromosome
(3) 13, 14, 15, 21, 22 chromosome
(4) 1, 10, 13, 16 & y-chromosome

Q.10 Nucleosome is made up of -
(1) Nonhistone protein + RNA
(2) Histone protein and DNA
(3) Non-histone and histone protein
(4) Phospholipid and protein

Q.11 Structure which provide shape to chrosome is called -
(1) Telomere (2) Satellite
(3) Centromere (4) Chromomere

Q.12 Who first Synthesized artificial Gene in laboratory -
(1) Mandle (2) Khorana
(3) Sutton (4) Kornberg

Q.13 Feulgen reaction is used to stain :-
(1) DNA
(2) RNA-polymerase
(3) DNA-polymerase
(4) (1) and (3) both

Q.14 Indicate the increasing order of size -
(1) Lysosome, ribosome, mitochondria, choroplast
(2) Ribosome, lysosome, chloroplast, mitochondria
(3) Ribosome, lysosome, mitochondria, chloroplast
(4) Chloroplast, mitocondria, lysosome, ribosome

Q.15 Microsomes are obtained by -
(1) Vital staining
(2) Sonography
(3) Fractionation of cell by ultrasonic sound wave
(4) X-ray crystallography

Q.16 Longest plant cells are :-
(1) Vessels (2) Trachieds
(3) Cotton fiber (4) Fibers of Ramian

Q.17 Cell organells can be separated by method of-
(1) Autoradiography
(2) Microtomy
(3) Differential centrifugation
(4) X-ray differaction

Q.18 Calvin isolated the different chemical of calvin cycle by -
(1) Autoradiography (2) Chromatography
(3) Cell fractionation (4) x-ray diffraction

Q.19 The biggest cell is : -
(1) Hen egg (2) Human egg
(3) Kidney cell (4) Ostrich egg

Q.20 Cell Lineage theory proposed by :-
(1) Schieiden (2) Schwann
(3) Rudolph (4) Hooke

Q.21 Which of the following is absent in an intact cell :-
(1) Microsomes (2) Golgibody
(3) Glyoxysomes (4) Microtubules

Q.22 Animal and plant cells differ in their :-
(1) Movement (2) Growth
(3) Nutrition (4) Respiration

Q.23 Which microscope is best study cell division in function state -
(1) EM (2) SEM
(3) Phase contrast microscope
(4) Simple microscope

Q.24 Protoplasm of a single cell without cell wall is called -
(1) Plasmodium (2) Trophoplasm
(3) Hyaloplasm (4) Protoplast

Q.25 An exception to cell theory is -
(1) Erythrocytes (2) Bacteria
(3) Fungi (4) Virus

Q.26 Cell theory states that -
(1) All cells have Nucleus
(2) Cell are the functional and structural units of Plants and animals
(3) All cells are living
(4) Cells reproduce by Mitosis & Meiosis

Q.27 The stem and leaves of grasses are rough due to :-
(1) Calcium carbonates
(2) Resins
(3) Silica
(4) Calcium oxalate

Q.28 Resin canals abundantly occur in :-
(1) Conifers (2) Cycads
(3) Gnetales (4) Dicots

Q.29 Deposition of lignin mainly occurs in -
(1) Primary cell wall
(2) Secondary cell wall
(3) Tertiary cell wall
(4) Middle lamella

Q.30 Euglena stores food in the form of paramylum (β 1 $\rightarrow$ 3 glucan) which is conversion product of :-
(1) Starch (2) Fructose
(3) Hyaluronic acid (4) Pectin

Q.31 Suberisation mainly occurs in :-
(1) Middle lamella (2) Primary cell wall
(3) Sec. cell wall (4) Cytoplasm

Q.32 Tonoplast, the membrane of vacuole is :-
(1) Living membrane
(2) Non living membrane
(3) Impermeable
(4) Permeable

Q.33 Stored food in onion leaves :-
(1) Starch (2) Sugars
(3) Inulin (4) Glycogen

Q.34 Ripening fruits softene due to -
(1) Conversion of starch into sugars
(2) Solubilisation of pectates in middle lamella
(3) Formation of organic acids
(4) Conversion of fats into carbohydrates

Q.35 Resins are :-
(1) Cell wall degradation products
(2) Alkaloids
(3) Glycosidic derivative
(4) Oxidation products of essential oils

Q.36 ''Drus'' are :-
(1) Crystals of calcium carbonate
(2) Crystals of calcium oxalate
(3) Alkaloids
(4) Crystals of silica

Q.37 Mineral Crystal Raphides found in :-
(1) Rubber plant (2) Papaver
(3) Sunflower (4) Brinjal

Q.38 Electron microscope was invented by-
(1) Knoll and Ruska
(2) Rudolph and Kolliker
(3) C.P. Swanson
(4) None of the above

Q.39 Phase contrast microscope is -

(1) based on the scattering of light and using a dark field condenser

(2) used for the study of living cells

(3) related to retardation and thickness of object

(4) the best method for studying non-living ultra structure

Q.40 A fluorescent microscpe is used -

(1) for increasing resolving power

(2) for obtaining X-ray diffraction pattern of DNA

(3) to study cell and their components in a living state

(4) To localise cell structure stained with fluorochome dyes

Q.41 Fuelgen reaction of DNA is due to -

(1) aldehyde produced by acid hydrolysis

(2) removal of RNA but not DNA

(3) phosphoric acid carbohydrated and nitrogen based

(4) phosporic acid

Q.42 Magnification power of a light compound microscope depends on :-

(1) Power of eye piece lens

(2) Power of objective lens

(3) Source of light

(4) (1) and (2) both

Q.43 Which dye is used to stain chromosomes:-

(1) Acetocarmine

(2) Haematoxylin

(3) Feulgen

(4) All the above

Q.44 Toludene blue specifically stains :-

(1) DNA (2) RNA

(3) Chitin (4) Lignin

Q.45 Which stain is used for electron microscopy-

(1) PAS

(2) Aurantia

(3) Para Rosailin

(4) Osmium tetraoxide

Q.46 Which one is a vital stain :-

(1) Janus green (2) Methylene blue

(3) Neutral red (4) All the above

Q.47 Cell organelles can be separated by method of :-

(1) Autoradiogrphy (2) Microtomy

(3) Differential centrifugation

(4) X-ray differaction

Q.48 Structure of RNA can be studied by :-

(1) Feulgen (2) Toludene blue

(3) X-ray crystallography

(4) Chromatography

Q.49 In electron microscope source of light is :-

(1) White light (2) U.V ray

(3) Electron beam (4) Green light

Q.50 The best microscope to study ultra structure of cell is :-

(1) Phase contrast microscope

(2) Electron microscope (EM)

(3) Scanning electron microscope (SEM)

(4) Flourescent mcroscope

Q.51 Chromosome number in gynoecium is 12, then in endosperm it will be -

(1) 18 (2) 36

(3) 12 (4) 6

CELL DIVISION

Q.52 The main difference between a dividing animals and plant cell lies in-

(1) Cell plate formation

(2) Coiling of chromosome

(3) Chromosome movement

(4) Types of spindle fibres

Q.53 Cytoplasmic structures involved in cell division are-

(1) Mitochondria (2) Ribosomes

(3) Lysosomes (4) Centrioles

Q.54 Cell division is not present in the cells of-

(1) Skin (2) Gonads

(3) Brain (4) Bone marrow

Q.55 Before cell division, the entire DNA content of the cell gets doubled during interphase. This doubling takes place-

(1) At the beginning of the interphase

(2) At the end of the interphase

(3) Throughout the interphase

(4) Somewhere during the middle of the interphase

Q.56 Where can we study mitosis-

(1) Brain (2) Nail base

(3) Legs (4) Kidneys

Q.57 Tetrad is made of-

(1) Four non homologous chromatids

(2) Four homologous chromosomes with four chromatids

(3) Four non homologous chromosomes

(4) Two homologous chromosomes each with two chromatids

Q.58 During meiotic cells division, genetic recombinations between two homologous chromosomes are facilitate by-

(1) Movement of centromeres

(2) Extrusion of polar bodies

(3) Movement of centrioles

(4) Formation of synaptonemal complex

Q.59 Meiosis I is reductional division. Meiosis II is equational division due to-

(1) Pairing of homologous chromosomes

(2) Separation of chromatids

(3) Disjunction of homologous chromosomes

(4) Crossing over

Q.60 In the somatic cell cycle–

(1) In G_1 phase DNA content is double the amount of DNA present in the original cell

(2) DNA replication takes place in S-phase

(3) A short interphase is followed by a long mitotic phase

(4) G_2 phase is followed by mitotic phase

Q.61 What is true about cell cycle–

a. During G_1 phase there is active synthesis of RNA and proteins but no change in its DNA content

b. In synthesis or S phase each chromosome carries a duplicate set of genes

c. During G_2 phase a cell contains double the amount of DNA present in the original diploid cell (2n)

d. In S-phase a cell doubles the original diploid (2n) chromosome number

(1) c and d (2) a, b and c

(3) all (4) b, c and d

Q.62 Mitosis is not found in -

(1) Cartilage cells (2) Bone cells

(3) Nerve cells (4) All of the above

Q.63 If the cells in the root of an angiosperm have 12 chromosomes, 6 chromosomes will be present in -

(1) Synergid (2) Endosperm cell

(3) Leaf cell (4) Cotyledonary cell

Q.64 The number of chromosomes present in the leaf tip cells of a plant species, having six chromosomes in each of the four cells of its pollen tetrad, would be -

(1) Three (2) Six

(3) Twelve (4) Twenty four

Q.65 At which stage during meiotic prophase I the synaptic forces, between homologous chromosomes, are the maximum ?

(1) Leptotene (2) Zygotene

(3) Pachytene (4) Diplotene

Q.66 The number of chromatids in a chromosome at metaphase is -

(1) Two each in meiosis and mitosis

(2) Two in mitosis and one in meiosis

(3) Two in mitosis and four in meiosis

(4) One in mitosis and two in meiosis

Q.67 Find out the incorrect statement -

(1) Balbiani rings (puffs) are the sites of RNA synthesis

(2) Cytokinesis refers to the division of cytoplasm

(3) Tetrad is made of two homologous chromosomes each with two chromatids

(4) The chromosome end is called nucleolus

Q.68 Decondensation of chromosome occurs in-

(1) Prophase (2) Metaphase

(3) Anaphase (4) Telophase

Q.69 The quantity of DNA in a chromosome at metaphase is -

(1) Two each in meiosis and mitosis

(2) Two in mitosis and one in meiosis

(3) Two in mitosis and four in meiosis

(4) One in mitosis and two in meiosis

Q.70 A red blood cell was kept in a solution for a few minutes, where it got burst. The solution taken was–

(1) Hypotonic

(2) Concentrated sugar solution

(3) Isotonic

(4) Hypertonic

Q.71 Function of telomeres in nucleus is –

(1) Poleward movement

(2) To initiate the RNA synthesis

(3) To seal the ends of chromosome

(4) To recognise the homologous chromosome

Q.72 The salivary gland chromosomes in the dipteran larvae, are useful in gene mapping because

(1) these are fused

(2) these are much longer in size

(3) These are easy to stain

(4) They have endoreduplicated chromosomes

Q.73 DNA synthesis takes place in -

(1) S phase (2) G_1 phase

(3) G_2 phase (3) None

Q.74 When pairing occurs in chromosomes (meiosis) -

(1) Leptotene (2) Zygotene

(3) Pachytene (4) Diakinesis

Q.75 Most active stage of cell cycle is -

(1) Prophase (2) Metaphase

(3) Telophase (4) Interphase

Q.76 Which of the following is the method of cytokinesis in plant cell -

(1) By cell plate formation

(2) By constriction

(3) By phragmoplast

(4) (1) and (3) both

Q.77 In which stage of cell cycle nucleus becomes bigger -

(1) G_1 (2) G_2

(3) S (4) M

Q.78 What happens in interkinesis -

(1) DNA - replication

(2) Chromosome duplication

(3) Preparation of second meiotic div.

(4) Resting stage

Q.79 Which can be observed in an interphase nucleus under the light microscope -

(1) Chromosomes (2) Nucleosomes

(3) Centromere (4) Heterochromatin

Q.80 Angular divergence of spindle decreases at-

(1) Metaphase (2) Early anaphase

(3) Late anaphase (4) Telophase

Q.81 Minimum number of meiotic div. required to produce 62 pollengrains -

(1) 15 (2) 31

(3) 62 (4) 16

Q.82 In cell cycle, changes of which stage are not visible under microscope -

(1) Interphase (2) Prophase

(3) Metaphase (4) Anaphase

Q.83 Which type of division leads to polyploidy-

(1) Cryptomitosis (2) Meiosis

(3) Endomitosis (4) Amitosis

Q.84 Which of the following not ocurs in Anaphase-I but occurs in Anaphase-II -

(1) Condensation of chromosomes

(2) Poleward movement of chromosome

(3) Contraction of spindle fibers

(4) Splitting of centromere

Q.85 In which stage of cell division, division of matrix of chromosome occurs -

(1) Late prophase (2) Early metaphase

(3) Late metaphase (4) Anaphase

Q.86 During G_2 - phase a diploid cell contains the amount of DNA equal to a -

(1) Diploid cell (2) Tetraploid cell

(3) Haploid cell

(4) Nothing can be said

Q.87 Crossing over takes place in -

(1) Zygotene (2) Pachytene

(3) Diplotene (4) Diakinesis

Q.88 A contractile mid body forms during cytokinesis in -

(1) Animals (2) Higher plants

(3) Fungi (4) Algae
