(b) **Programmed senescence theory :** According to it certain genes switch on the process of ageing. Research shows that B and T cell lymphocytes have receptors for self antigens.

(c) **Immunological theory :** It states gradual reduction in immunity due to degeneration of thymus.

(B) **Damage and Error theories :**

(a) **Living theory :** According to it regular metabolism bring ageing. Rate of oxygen basal metabolism reduces life.

(b) **Free radicals theory :** Free radical is a molecule with an unpaired highly reactive electron. These are produced in metabolism. It damages various biomolecules proteins, DNA and mitochondria. These also triggers cancer, atherosclerosis, cataract and neurodegeneration.

(c) **Cross linking theory :** Accumulation of cross-linked proteins damages tissues. In **non enzymatic glycosylation** or **glycation** glucose joins to protein and leads to protein interwinding. **AGES Advanced glycosylation and products** makes the tissue tough and deteriate them, stiffening of arteries, eye coludness, nerve and kidney function reduces. Diabetes have also some relation to such deterioration.

(D) **Wear and Tear theory :** Regular functioning of cell reduces its efficiency. DNA undergo demage by O_2, U.V. rays. DNA repairing process slows down.

(E) **Theory of error catastrosphe :** Protein synthesis mechanism gradually become abnormal. Abnormal proteins lead to aging.

(F) **Somatic mutation theory :** Mutation in body cells produces abnormal proteins that causes ageing.

DEATH

It is a final breakdown of body's vital function. There are many causes of death.

(a) Heart, liver lungs, Kidney becomes weak and metabolic disorders finally lead to death.

(b) Immune system reduces functioning and reduced resistance makes the body pro to various disease.

EXERCISE - 1

A. SPERMATOGENESIS

Q.1 Temperature in scrotum necessary for sperm formation should be-

(1) 2ºC above body temperature

(2) 2ºC below body temperature

(3) 4ºC above body temperature

(4) 4ºC below body temperature

Q.2 Number of sperms present in a single ejaculation of semen contains-

(1) 10,000 (2) 100,000-1000,000

(3) 30-40 million (4) 300-400 million

Q.3 Centrioles of sperm control-

(1) Movement of tail

(2) Haploid number of chromosomes

(3) Help in fertilization

(4) None of the above

Q.4 The function of mitochondria in sperm is-

(1) To control the movement of sperm

(2) To provide energy of movement of sperm

(3) To provide energy to nucleus

(4) None of the above

Q.5 The function of hyaluronidase is-

(1) To form one of reception in egg

(2) To puncture the vitelline membrane of egg

(3) It is not produced in human sperm

(4) None of the above

Q.6 Testosterone is secreted by-

(1) Leydig's cells (2) Sertoli cells

(3) Pituitary (4) Testis

Q.7 Axial filament of sperm is formed by-

(1) Distal centriole (2) Proximal centriole

(3) Mitochondrial spiral (4) DNA

Q.8 Sertoli cells are found in the-

(1) Frog's testis (2) Rabbit's testis

(3) Cockroach's testis (4) Liver of frog

Q.9 Tail-less sperm occurs in-

(1) Frog (2) Ascaris

(3) Amphioxus (4) Rabbit

Q.10 Which is the correct sequence in spermatogenesis?

(1) Spermatogonia → Spermatids → Secondary spermatocytes → Primary spermatocytes → sperms

(2) Spermatogonia → Spermatids → Primary spermatocytes - Secondaryspermatocytes Sperms

(3) Primary spermatocytes → Secondary spermatocytes → Spermatids Spermatogonia → Sperms

(4) Spermatogonia →Primary spermatocytes → Secondary spermatocytes → Spermatids → Sperms

Q.11 How many sperms are produced from one primary spermatocyte ?

(1) 8 (2) 6

(3) 2 (4) 4

Q.12 How many sperms are formed from a secondary spermatocyte ?

(1) 4 (2) 8

(3) 2 (4) 1

Q.13 Longest phase of prophase of spermatogenesis is-

(1) Leptotene (2) Zygotene

(3) Pachytene (4) Diplotene

Q.14 Duration of spermatogenesis in man at 50ºC -

(1) Not possible (2) 3.5 months

(3) 2.5 months (4) 1 month

Q.15 Spermatogonia as a result of growth phase forms-

(1) Sperms

(2) Spermatids

(3) Primary spermatocyte

(4) Secondary spermatocyte

Q.16 The cells formed as a result of second maturation division in spermatogenesis-

(1) Polocytes (2) Spermatocytes

(3) Spermatids (4) Sperm

Q.17 Spermiogenesis changes

(1) Spermatogonium to primary spermatocyte

(2) Primary spermatocyte to secondary spermatocyte

(3) Secondary spermatocyte to spermatid

(4) Spermatid to sperm.

Q.18 Enzyme secreted by sperm is

(1) Sperm trypsin (2) Sperm lysin

(3) Male hormone (4) Sperm gastrin

Q.19 Sperms produce an enzymatic substance for dissolving egg coverings. It is called

(1) Hyaluronic acid (2) Hyaluronidase

(3) Androgamone (4) Diastase

Q.20 The apical part of the sperm which comes in contact to the ovum during fertilization-

(1) Acromione (2) Acromegaly

(3) Acronia (4) Acrosome

Q.21 Smallest sperm is of -

(1) Frog (2) Man

(3) Discoglossus (4) Amphioxus

Q.22 The sperms of birds are-

(1) Amoeboid (2) Spiral

(3) Hook shaped (4) None

Q.23 Sperm boat is formed in-

(1) Locust (2) Ant

(3) Fishes (4) Ascaris

Q.24 Sperms in the sperm bank are stored at-

(1) 4ºC (2) –4ºC

(3) –179ºC (4) –1000ºC

B. OOGENESIS

Q.25 Secondary oocyte is-

(1) Haploid (2) Diploid

(3) Polyploid (4) None of the above

Q.26 Eggs from ovary are released in-

(1) Oviduct (2) Kidney

(3) Ureter (4) Coelom

Q.27 Vitelline layer around the egg is deposited by-

(1) Ovary (2) Oviduct

(3) Egg itself (4) Coelom

Q.28 Vitelline membrane is a -

(1) Primary egg membrane

(2) Secondary egg membrane

(3) Tertiary egg membrane

(4) None of these

Q.29 An egg of bird was coated with varnish and then incubated. The egg did not hatch because the developing embryo-

(1) Could not excrete and died

(2) Could not utilize yolk in the presence of excess amount of nitrogenous wastes

(3) Died because of depleted O_2 supply

(4) Died because of toxic effect of varnish

Q.30 Human females possess 44 + XX chromosomes. The secondary oocyte shall have-

(1) 44 + XX (2) 22 + X

(3) 22 (4) 44

Q.31 Noncellular layer is-

(1) Theca interna

(2) Membrana granulosa

(3) Corona radiata

(4) Zona pellucida

Q.32 Corona radiata is derived from-

(1) Membrana granulosa

(2) Cumulus ovarious

(3) Theca interna

(4) Theca externa

Q.33 What is the total number of polar bodies formed during oogenesis in the ovary ?

(1) 4 (2) 3

(3) 1 (4) 2

Q.34 In oogenesis, divisions are mitotic except during the formation of-

(1) Ogonia

(2) Primary oocytes

(3) First polar body

(4) Secondary polar body

Q.35 Megalecithal eggs occurs in-

(1) Frog (2) Mammals

(3) Birds (4) Cockroach

Q.36 The amount of mDNA in a primary oocyte in comparison to nuclear DNA is-

(1) Less (2) More

(3) Equal (4) Not fixed

Q.37 What is the total number of polar bodies formed during oogenesis in the ovary ?

(1) 4 (2) 3

(3) 1 (4) 2

Q.38 Extrusion of second polar body from egg nucleus occurs-

(1) After entry of sperm before completion of fertilization

(2) After completion of fertilization

(3) Before entry of sperm

(4) Without any relation of sperm entry

Q.39 Polar bodies are-

(1) Haploid (2) Diploid

(3) Triploid (4) Polyploid

Q.40 Secondary oocyte is formed

(1) Before ovum maturation

(2) After mitosis of germinal cells

(3) After fertilization

(4) Before fertilization

Q.41 On fertilization of egg nucleus with sperm nucleus

(1) Second maturation is completed

(2) Embryo is formed

(3) First polar body is formed

(4) First maturation is completed

Q.42 In oogenesis, divisions are mitotic except during the formation of

(1) Ogonia (2) Primary oocytes

(3) First polar body (4) Second polar body

Q.43 Minute cells separating from ova are

(1) Primary oogonia

(2) Polar bodies

(3) Secondary oogonia

(4) Primary spermatogonia

Q.44 In spermatogenesis, a primary spermatocyte produce four similar sperms while in oogenesis a primary oocyte forms

(1) Four similar ova

(2) Three large ova and one polar body

(3) Two large ova and two polar bodies

(4) One large ovum and 3 polar bodies

Q.45 50 secondary oocytes in female and 50 secondary spermatocytes in male give rise to

(1) 50 ova and 100 sperms

(2) 100 ova and 200 sperms

(3) 200 ova and 50 sperms

(4) 100 ova and 100 sperms

Q.46 How many sperms and ova are produced from 25 primary spermatocytes and 25 primary oocytes ?

(1) 100 sperms and 100 ova

(2) 100 sperms and 25 ova

(3) 100 sperms and 30 ova

(4) 50 sperms and 25 ova

Q.47 A freshly laid unfertilized egg of hen contains

(1) One cell (2) A million cells

(3) 1000 cells (4) 100 cells

Q.48 Human eggs are (on the basis of amount of yolk)

(1) Alecithal (2) Telolecithal

(3) Mesolecithal (4) Macrolecithal.

Q.49 Freshly released human egg has

(1) Two Y-chromosome

(2) One X-chromosome

(3) Two X-Chromosomes

(4) One X-chromosome and one Y-chromosome

Q.50 What kind of eggs would be present in Elephant

(1) Microlecithal and isolecithal

(2) Microlecithal and telolecithal

(3) Mesolecithal and homolecithal

(4) Macrolecithal and centrolecithal

Q.51 Megalecithal eggs occur in

(1) Frog (2) Mammals

(3) Birds (4) Cockroach

Q.52 The eggs of some mammals have more yolk.They are
(1) Aquatic mammals (2) Metatherians
(3) Protherians (4) Eutherlans

Q.53 Insect egg is
(1) Homolecithal (2) Telolecithal
(3) Centrolecithal (4) Alecithal

Q.54 Cytoplasm with yolk in frog's egg is found in-
(1) Centre (2) Periphery
(3) Animal pole (4) Vegitative pole

Q.55 In a floating egg of frog, the vegital pole remains-
(1) Upside (2) Right side
(3) Left side (4) Down side

Q.56 The eggs which have yolk-less peripheral ooplasm-
(1) Alecithal (2) Centrolecithal
(3) Telocithal (4) None

Q.57 Term "alecithal" was coined by-
(1) Kent (2) Aristole
(3) Bear (4) Torry

Q.58 The eggs of crocodile & ostrich are-
(1) Telolecithal (2) Homolecithal
(3) Alecithal (4) None

Q.59 Largest egg is of-
(1) Elephant (2) Whale
(3) Shark (4) None

C. FERTILIZATION

Q.60 The fertilization membrane is secreted because-
(1) It checks the entry of more sperms after fertilization
(2) It checks the entry of antigens in ovum
(3) It represents the left out tail of sperm
(4) It represents the plasma membrane of sperm

Q.61 In man the sperm released from the testis take the following route to reach the ureter-
(1) Vasa efferentia, Bidder canal, uriniferous tubules and nephrostome
(2) Vasa efferentia, epididymis, vas deferens and urethra
(3) Vasa efferentia, Bidder's canal nephrostome
(4) Vasa efferentia, collecting tubules and bidder canals

Q.62 Sperms move actively in female genital tract by-
(1) Creeping (2) Gliding
(3) Swimming (4) Jet propulsion

Q.63 The rate of active movement of sperm is-
(1) 1.5 – 3.0 cm/min (2) 1.5 – 3.0 mm/min
(3) 1.5 – 3.0 m/min (4) 1.5 – 3.0 m/hr.

Q.64 The fertilization in mammals including man takes place in-
(1) Vestibule (2) Vagina
(3) Uterus (4) Fallopian tubes

Q.65 What is true about the process of fertilization?
(1) Only acrosome of sperm enters the egg
(2) Two haploid nuclei fuse but the fusion nucleus divides immediately to form two haploid nuclei
(3) Entry of sperm activates the egg to complete meiosis
(4) Only one sperm enters an egg

Q.66 Egg is liberated from ovary in-
(1) Secondary oocyte stage
(2) Primary oocyte stage
(3) Oogonial stage
(4) Mature ovum stage

Q.67 Fertilization is-
(1) Union of diploid spermatozoon with diploid ovum to form diploid zygote
(2) Union of haploid sperm with haploid ovum to form haploid zygote
(3) Union of haploid sperm with haploid ovum to form diploid zygote
(4) Union of diploid sperm with haploid ovum to form triploid zygote

Q.68 First step in activation of ovum during process of fertilization is-
(1) Formation of fertilization membrane
(2) Fertilizin-antifertilizin reaction
(3) Penetration of sperm in ovum
(4) Formation of fertilization cone

Q.69 Cortical granules are associated with-
(1) Oogenesis (2) Spermatogenesis
(3) Cleavage (4) Fertilization

Q.70 Fertilizins are emitted by
(1) Immature eggs (2) Mature eggs
(3) Sperms (4) Polar bodies

Q.71 Which chemical of the egg attracts and holds sperm?
(1) Fertilizin (2) Antifertilizin
(3) Agglutin (4) Antiagglutin

Q.72 After a sperm has penetrated on ovum, entry of other sperm is prevented by
(1) Condensation of yolk
(2) Formation of pigment coat
(3) Development of vitelline membrane
(4) Development of fertilization membrane

Q.73 One gamete has-
(1) Both alleles of a gene
(2) One allele of a gene
(3) All alleles of a gene
(4) None

D. CLEAVAGE

Q.74 If an unfertilized egg is pricked with a microneedle it will-
(1) Die immediately (2) Start dividing
(3) Remain undivided (4) None of the above

Q.75 During cleavage, nucleocytoplasmic ratio is-
(1) Maintained (2) Decreased
(3) Increased (4) Variable

Q.76 In embryo, cleavage brings about-
(1) Increased DNA content
(2) Increased mass of protoplasm
(3) Increased size
(4) Change in shape and size

Q.77 Determinate cleavage is found in-
(1) Coelentrates (2) Annelids
(3) Nematodes (4) All the above

Q.78 Coeblastula is found in-
(1) Labeo (2) Snakes
(3) Star fish (4) Unio

Q.79 The superficial blastula is the characteristic of-
(1) Birds (2) Reptiles
(3) Insects (4) Annelids

Q.80 Cleavage differs from mitosis because-
(1) In cleavage there is no growth phase
(2) In cleavage consumption of O_2 increases
(3) In cleavage nucleus-cytoplasmic ratio increases
(4) All the above

Q.81 During cleavage all divisions are-
(1) Equal (2) Reductional
(3) Mitotic (4) Determinate

Q.82 In some eggs the future organs can be demarcated as to the regions even before the beginning of cleavage. It is-
(1) Regulated development
(2) Mosaic development
(3) Gynogenesis
(4) Indetermined development

Q.83 What is true of cleavage -
(1) Daughter cells or blastomeres grow in size equal to parent cell
(2) Blastomeres separate
(3) Cytoplasm of blastomeres increases after each division
(4) There is no growth of daughter cells

Q.84 A morula can be differentiated from blastula in-
(1) Presence of cavity
(2) Presence of more yolk
(3) Presence of yolk
(4) Absence of cavity

Q.85 A zygote is completely divided into two by a cleavage furrow. The cleavage type is-
(1) Equatorial (2) Meroblastic
(3) Radial (4) Holoblastic

Q.86 Development of fertilized egg starts from
(1) Invagination (2) Regeneration
(3) Cleavage (4) Implantation

Q.87 During cleavage, what is true about cells ?
(1) Nucleocytoplasmic ratio remains unchanged
(2) Size does not increase
(3) There is less consumption of oxygen
(4) The division is like meiosis

Q.88 What is true of cleavage ?
(1) Daughter cells or blastomeres grow in size equal to parent cell
(2) Blastomeres separate
(3) Cytoplasm of blastomeres increases after each division
(4) There is no growth of daughter cells.

Q.89 Meroblastic cleavage takes place in
(1) *Hydra* (2) *Amphioxus*
(3) Frog (4) Chick

Q.90 Meroblastic cleavage is division

(1) Horizontal (2) Partial

(3) Total (4) Spiral

Q.91 Meroblastic segmentation occurs during the development of

(1) Pigeon (2) Human

(3) Frog (4) Dog Fish

Q.92 In centrolecithal eggs, the cleavage is

(1) Equal holoblastic

(2) Unequal holoblastic

(3) Meroblastic discoidal

(4) Meroblastic superficial

Q.93 A zygote is completely divided into two by a cleavage furrow. The cleavage type is-

(1) Equatorial (2) Meroblastic

(3) Radial (4) Holoblastic

Q.94 The morula stage of man is bounded by-

(1) Shell (2) Vitelline membrane

(3) Zona radiata (4) Albumin

Q.95 A morula can be differentiated from blastula in

(1) Presence of cavity

(2) Presence of more yolk

(3) Presence of yolk

(4) Absence of cavity

Q.96 Blastopore is

(1) Opening of neural tube

(2) Opening of gastrocoel

(3) Future anterior end of embryo

(4) Found in blastula

E. GASTRULA AND NEURULA

Q.97 Morphogenetic movement involve-

(1) Movement of organs

(2) Movement of small cell masses

(3) Movement of large cells masses

(4) Differentiation of cells

Q.98 Vertebral column develops from-

(1) Notochord (2) Nerve cord

(3) Mesoderm (4) Endoderm

Q.99 Emboly is-

(1) Migration of micromeres into the blastocoel

(2) Migration of macromeres into the blastocoel

(3) Migration of endoderm, mesoderm and notochord in the blastocoel

(4) None of the above

Q.100 The hypoblast (inner germ layer of gastrula) forms the-

(1) Ectoderm (2) Mesoderm

(3) Endoderm (4) None of the above

Q.101 During gastrulation blastomeres move from the surface to their destination in the embryo. These movements are called-

(1) Migratory movement

(2) Formative movements

(3) Morphogenetic movements

(4) All the above

Q.102 Gastrula end stage is characterised by-

(1) End of blastocoel

(2) Blastopore

(3) Formation of neural tube

(4) End of archenterone

Q.103 Termination of gastrulation is indicated by-

(1) Obliteration of blastocoel

(2) Obliteration of archenteron

(3) Closure of blastopore

(4) Closure of neural tube

Q.104 Archenteron begins forming in

(1) Early gastrula (2) Late gastrula

(3) Early morula (4) Blastula

Q.105 In mammals, the archenteron/primitive gut is lined with-

(1) Ectoderm

(2) Mesoderm

(3) Endoderm

(4) Mesoderm and endoderm

Q.106 The best definition of the process of gastrulation is that it is a process where the

(1) Simple layered blastula becomes two layered

(2) Archenteron is formed

(3) Cells move to occupy their definite position

(4) Zygote gets converted into larva

Q.107 During embryo development, blastocoel of blastula is replaced by a new cavity in gastrula. lt is
(1) Coelenteron (2) Archenteron
(3) Splanchnocoel (4) Haemocoel

Q.108 Gastrulation involves the differentiation of
(1) Ectoderm and endoderm
(2) Ectoderm, endoderm and mesoderm
(3) Ectoderm and mesoderm
(4) Mesoderm and endoderm.

Q.109 During gastrulation is formed -
(1) Notochord (2) Nerve cord
(3) Myotome (4) Archenteron

Q.110 Gastrula end stage is characterised by
(1) End of Blastocoel (2) Blastopore
(3) Formation of neural tube
(4) End of archenteron

Q.111 Termination of gastrulation is indicated by -
(1) Obliteration of blastocoel
(2) Obliteration of archenteron
(3) Closure of blastopore
(4) Closure of neural tube

Q.112 Embryologists can presume future organs of embryo in
(1) Morula (2) Blastula
(3) Early gastrula (4) Post gastrula.

Q.113 Cells become variable in morphology and function in different regions of the embryo. The process is
(1) Differentiation (2) Metamorphosis
(3) Organisation (4) Rearrangement

Q.114 If chorda mesoderm evaginates instead of invagination
(1) Only ectodermal and endodermal structures develop
(2) Only mesodermal and endodermal structures develop
(3) No development occurs
(4) Only ectodermal and mesodermal structures develop

Q.115 If the ectoderm from neural tissue area is removed from the embryo and transplanted in place of presumptive belly ectoderm, embryo will develop
(1) Without a neural tube
(2) With a neural tube
(3) With two ectodermal coats
(4) With two neural tubes

Q.116 Formation of notochord is
(1) Neurulation (2) Notogenesis
(3) Morulation (4) Blastulation

Q.117 Notochord grows from
(1) Neuropore (2) Prechordal plate
(3) Hypochordal rod (4) Chorda-mesoderm

Q.118 Notochord develops from
(1) Primary ectoderm (2) Primary endoderm
(3) Primary mesoderm (4) Both 1 and 2

Q.119 True coelom is lined by
(1) Mesoderm
(2) Mesoderm and ectoderm
(3) Endoderm
(4) Ectoderm

Q.120 Skeleton and muscles originate from
(1) Yolk plug (2) Mesoderm
(3) Endoderm (4) Ectoderm

Q.121 Ontogenetically liver and pancreas are
(1) Ectodermal (2) Mesodermal
(3) Endodermal (4) None

Q.122 The mesoderm gives rise to all the following structures in the fully developed animal except
(1) Muscular system (2) Nervous system
(3) Circulatory system (4) Gonads

Q.123 Vascular and excretory organs are formed from
(1) Endoderm (2) Mesoderm
(3) Ectoderm (4) Mesendoderm

Q.124 Sensory receptors, such as retina, develop from
(1) Ectoderm
(2) Endoderm
(3) Mesoderm
(4) Mesoderm and endoderm

Q.125 In which organ the bulk is formed of endoderm
(1) Intestine (2) Liver
(3) Heart (4) Kidney

Q.126 Choose the correct one
(1) Mesoderm-Skeleton
(2) Mesoderm-Brain
(3) Ectoderm-Liver
(4) Endoderm-Epidermis

F. EMBRYONIC MEMBRANE

Q.127 Foetal membranes produced by trophoblast are-

(1) Chorion and allantois

(2) Chorion and amnion

(3) Amnion and allantois

(4) Allantois and yolk sac

Q.128 Splanchnocoel is-

(1) Haemocoel (2) Pseudocoel

(3) True coelom (4) Pseuocoelom

Q.129 Extra-embryonic membranes of the mammalian embryo are derived from-

(1) Inner cell mass (2) Trophoblast

(3) Formative cells (4) Follicle cells

Q.130 Foetal membrane that provides the first blood corpuscle for circulation in embryo is-

(1) Trophoblast (2) Yolk sac

(3) Amnion (4) Chorion

Q.131 Amnion is helpful to embryo in

(1) Nutrition

(2) Protection from shock

(3) Excretion

(4) Respiration.

Q.132 Amnion is a membrane which develops on the outside of embryo in

(1) Fish (2) Cockroach

(3) Toad (4) Lizard

Q.133 Blastocyst has a selectively permeable and hormone secreting outer layer known as

(1) Mesoderm (2) Amnion

(3) Trophoblast (4) Chorion

Q.134 Allantois is embryonic membrane found in

(1) Mammals (2) Birds

(3) Reptiles

(4) Birds, mammals and reptiles

Q.135 Allantosis of the mammalian embryo helps in

(1) Respiration (2) Excretion

(3) Protection (4) Nutrition

Q.136 Umblical cord contains

(1) Umblicus (2) Placenta

(3) Discus proligerus

(4) Allantoic artery and vein

Q.137 For ensuring effectiveness of reproduction, the mammals possess

(1) Placenta

(2) Yolk sac

(3) Reduced number of eggs

(4) All the above

G. PLACENTA

Q.138 Chorionic gonadotropin is secreted by-

(1) Pituitary (2) Ovary

(3) Placenta (4) Uterus

Q.139 Placenta provides for-

(1) Storage of food

(2) Protection of embryo from shock

(3) Channelisation of nutrients

(4) Conveying nerve impulse

Q.140 Human placenta is-

(1) Haemochorial (2) Syndesmochorial

(3) Yolk sac (4) Haemo-endothelial

Q.141 Placenta is-

(1) Channel for providing essential requirement for growth of embryo

(2) Storage organ

(3) Conductor for nerve impulse

(4) Meant for protecting the embryo from shocks

Q.142 Placenta is the region where-

(1) Foetus is attached to mother by umbilical cord

(2) Foetus is provided with mother's blood

(3) Foetus receives nourishment from mother's blood

(4) Foetus is covered by membranes

Q.143 Zonary placenta occurs in-

(1) Herbivorous mammals

(2) Carnivorous mammals

(3) Both 1 and 2 (4) Birds

Q.144 Role of placenta is to

(1) Provide nutrition to developing embryo

(2) Protect embryo from shock

(3) Act as storage organ

(4) Convey nerve impulses

Q.145 Eutherian placenta is derived from

(1) Allantois (2) Aminon

(3) Chorion and allantois

(4) Yolk sac

Q.146 Parasitic mode of nutrition occurs in

(1) Amphibian embryo (2) Mammalian embryo

(3) Avian embryo (4) Reptilian embryo.

Q.147 The placental barrier between the foetal and maternal blood is minimum in

(1) Goat (2) Pig

(3) Cow (4) Man

Q.148 In simplest type of placenta, Six barriers separate maternal blood from foetal blood. How many barriers are lost in human placenta ?

(1) One (2) Two

(3) Three (4) Four

H. FROG EMBRYOLOGY

Q.149 The process by way of which a larva or miniature adult comes out of the egg membranes is called-

(1) Hatching (2) Emboly

(3) Epiboly (4) Ingression

Q.150 Metamorphosis in frog does not occur in the absence of-

(1) Thyroid (2) Pituitary

(3) Adrenal cortex (4) Adrenal medulla

I. HUMAN EMBRYOLOGY

Q.151 First menstrual cycle is-

(1) Parturition (2) Menopause

(3) Menarche (4) Implantation

Q.152 Menopause occurs in females at the age of-

(1) 55-60 years (2) 50-55 years

(3) 45-50 years (4) 37-42 years

Q.153 Menstrual cycle is generally of-

(1) 21 days (2) 28 days

(3) 30 days (4) 40 days

Q.154 In menstrual cycle ovum is released during-

(1) Beginning (2) Midway

(3) End (4) Any time

Q.155 Menstrual cycle is controlled by-

(1) Estrogen and progesterone of ovary

(2) FSH and LH of pituitary

(3) Both 1 and 2

(4) FSH of pituitary

Q.156 Stages in menstrual cycle are-

(1) Recovery phase and proliferative phase

(2) Proliferative phase and secretory phase

(3) Proliferative, secretory and menstrual

(4) Recovery phase, secretory phase and phase menstrual flow

Q.157 Lutea phase is the other name of-

(1) Follicular phase

(2) Proliferative phase

(3) Menstrual flow phase

(4) Secretory phase

Q.158 Human embryo completes development in-

(1) 180 days (2) 300 days

(3) 250 days (4) 266 days

Q.159 The delivery of child or child birth is called-

(1) Labour (2) Parturition

(3) Implantation (4) Insemination

Q.160 Zona pellucida disintegrates just-

(1) Before fertilization

(2) After fertilization

(3) Midway during cleavage

(4) After completion of cleavage

Q.161 Mesoderm proliferates from-

(1) Trophoblast

(2) Cephalic end of embryonic disc

(3) Caudal end of embryonic disc

(4) Ectoderm of embryonic disc

Q.162 For ensuring effectiveness of reproduction, the mammals posses-

(1) Placenta (2) Yolk sac

(3) Reduced number of eggs

(4) All the above

Q.163 Gestation period in human is-

(1) 10 weeks (2) 28 weeks

(3) 32 weeks (4) 38 weeks

Q.164 Onset of pregnancy-

(1) Stimulates testosterone secretion

(2) Inhibits further ovulation

(3) Leads to degeneration of ovary

(4) Inhibits fusion of egg and sperm nuclei

Q.165 Loss of reproductive capacity in women after age of 45 years is-

(1) Menstruation (2) Ageing

(3) Menopause (4) Menarche

Q.166 On fertilization, the urine of would be mother contains-

(1) LH (2) Progesterone

(3) FSH (4) hCG

Q.167 Which is correct ?

(1) Menstrual cycle is present in all mammals

(2) Menstrual cycle is present in all primates

(3) Estrous cycle occurs in all mammals

(4) Most mammals are ovoviviparous

Q.168 In mammals, the onset of pregnancy causes

(1) Secretion of testosterone

(2) Degeneration of ovary

(3) Inhibits further ovulation

(4) Inhibits fertilization

Q.169 Human embryo is about an inch in length after

(1) Eight weeks (2) Six weeks

(3) Four weeks (4) Two weeks

Q.170 In human beings, the developing embryo resides in

(1) Fallopian tubes (2) Uterus

(3) Ovaries (4) Vagina

Q.171 Pseudopregnancy differs from normal pregnancy in

(1) Development of ovum

(2) Developmental changes in endometrium

(3) Absence of foetus

(4) Absence of corpus luteum

J. GROWTH REPAIR REGENERATION AGEING

Q.172 Growth is–

(1) Increase in size

(2) Increase in weight

(3) Synthesis of new proptoplasm

(4) All of the above

Q.173 Growth occurs when–

(1) Anabolism is higher than catabolism

(2) Catabolism is higher than anabolism

(3) Protoplasmic synthesis is more than apoplasmatic synthesis

(4) Apoplasmatic synthesis is more than protoplasmic synthesis

Q.174 Degrowth takes place when–

(1) Anabolism is higher than catobolism

(2) Catabolism is higher than anabolism

(3) Protoplasmic synthesis is more than apoplasmatic synthesis

(4) Apoplasmatic synthesis is more than protoplasmic synthesis

Q.175 Auxetic growth is characterised by–

(1) Increase in cell number

(2) Growth without increase in cell number

(3) Both increase in cell number and cell growth

(4) Expansion in transverse direction

Q.176 Accretionary growth is due to–

(1) Reserve cells (2) Meristematic cells

(3) Embryonic cells (4) Differentiated cells

Q.177 In human beings, which part shows the minimum increase in weight from birth to adulthood–

(1) Brain (2) Fat

(3) Muscles (4) Skeleton

Q.178 Adult females tend to have less weight than adult males due to lesser development of–

(1) Muscles

(2) Skeleton

(3) Both muscles and skeleton

(4) Fat

Q.179 As compared to whole body, the head of new born human baby is–

(1) One–third (2) One–half

(3) One–fifth (4) One–fourth

Q.180 Approximate age of sexual maturity in human being is–

(1) 10–14 years (2) 8–11 years

(3) 10–13 years (4) 11–16 years

Q.181 Growth at the end of childhood and during puberty is controlled by–
(1) Thyroxine
(2) Thymosin
(3) Somatorophic hormone
(4) Thyroxin and somatotrophic hormones

Q.182 Human body regularly loses cells in the region of–
(1) Skin surface (2) Lining layer of gut
(3) Red blood cells (4) All of above

Q.183 Repetitive regeneration is found in–
(1) Tadpole (2) Molluscs
(3) Hydra (4) Human beings

Q.184 Reparative regeneration occurs in–
(1) Invertebrates
(2) Vertebrates
(3) Both invertebrates and vertebrates
(4) A few vertebrates

Q.185 Restorative regeneration is common in–
(1) Vertebrates
(2) Mostly invertebrates
(3) In some verebrate groups
(4) In some invertebrate groups

Q.186 Salamander and Axolotl larve regenerate–
(1) Limbs, eye structures and intestine
(2) Jaws and external gills
(3) Both '1' and '2'
(4) Trunk

Q.187 What is true about regeneration–
(1) beak in birds (2) Tails in lizards
(3) Fish fins (4) All the above

Q.188 Autotomy is recorded in–
(1) Legs in crabs (2) Tail of lizards
(3) Viscera in holothurian
(4) All of the above

Q.189 Morphallaxis is–
(1) Reconstruction of the whole body
(2) Growth of lost limb
(3) Healing of injury
(4) Regeneration with the help of blastema

Q.190 Factors controlling regeneration seem to be–
(1) Neural (2) Hormonal
(3) Both neural and hormonal
(4) Genetic

Q.191 Gerontology is the branch of science that deals with–
(1) A sexual reproduction
(2) Ageing
(3) Embryo development
(4) Asexual reproduction

Q.192 During ageing, collagen present in intercellular spaces become–
(1) Destroyed
(2) Impermeable and rigid
(3) More elastic
(4) All of the above

Q.193 In an ageing person, there is a–
(1) Increase in mucopolysaccharide
(2) Gradual alteration in components of connective tissue
(3) Increasing collagen rigidity of connectvie tissue
(4) Both '2'and '3

Q.194 According to immunity theory, ageing is due to–
(1) Accumulation of errors
(2) Reduced functioning of endocrine glands
(3) Degeneration of thymus
(4) Accumulation of waste products

Q.195 With the advancenment of age, hair of males start thinning due to–
(1) Falling of hair
(2) Low ATP formation
(3) Reduced rate of protein synthesis
(4) None of the above

Q.196 Regeneration of Hydra is–
(1) Morphollaxis by interstitial cells
(2) Epimorphosis by interstitial cells
(3) Epimorphosis by archaeocytes
(4) Epimorphosis by glandular cells

Q.197 The correct sequence of growth curve for bacteria is–
(1) Lag, log, decline and stationary
(2) Lag, log, decline and stationary
(3) Stationary, lag , log decline
(4) Decline, lag and log phase

K. GENERAL QUESTION

Q.198 Formation of whole body from a fragment is–

(1) Morphallaxis (2) Epimorphosis

(3) Epigenesis (4) Auxetic growth

Q.199 Gestation period is duration of

(1) Between egg growth and ovulation

(2) Of fertilization

(3) Between fertilization and parturition

(4) Between preparation of sex cells and fertilisation

Q.200 Gestation period in humans is

(1) 10 weaks (2) 25 weaks

(3) 7 months (4) 9 months

Q.201 Gestation period of elephant is

(1) 22 months (2) 15 months

(3) 11 months (4) 10 months

Q.202 Gestation period of Rat is

(1) 5 weaks (2) 4 weaks

(3) 3 weaks (4) 2 weaks

Q.203 Gestation period of Rabbit is

(1) 18 - 20 days (2) 28 - 32 days

(3) 48-50 days (4) 60-70 days

EXERCISE - 2

Q.1 Cleavage takes place in–
(1) Ovum (2) Zygote
(3) Neuron (4) All

Q.2 Egg in which yolk is found in the centre. The peripheral part is yolk-less–
(1) Homolecithal (2) Microlecithal
(3) Centrolecithal (4) Telolecithal

Q.3 The type of cleavage in a egg is determined by–
(1) Number of egg membranes
(2) Amount & distribution of yolk
(3) Size & position of nucleus
(4) Size & shape of sperm

Q.4 The sperms gain the capacity of fertilization on contact with vaginal secretion is called as–
(1) Cortical reaction (2) Capactitation
(3) Acrosomal reaction (4) None

Q.5 In an egg of frog is divided in a way that one part has animal hemisphere and an other part is deficient in that then-
(1) Only animal hemisphere region forms embryo
(2) Both the sites form embryo
(3) Embryo is not formed from any region
(4) Animal hemisphere deficient region forms the embryo

Q.6 Sequential and regular conversion of zygote into an animal is known as-
(1) Transformation (2) Genetic characters
(3) Embryonic induction (4) Stimulation

Q.7 Body cavity is found between –
(1) Ectoderm & endoderm
(2) Ectoderm & mesonephros
(3) Ectoderm & body wall
(4) Body wall & mesoderm

Q.8 Polar bodies are formed in –
(1) Oogenesis (2) Spermatogenesis
(3) Gametogenesis (4) Spermiogenesis

Q.9 The release of the egg from the ovary is called as –
(1) Oogenesis (2) Ovulation
(3) Oviposition (4) Ovo-viviparity

Q.10 Law of organiser was given by –
(1) Spemann (2) Leeuwenhoek
(3) Von- Baer (4) Wolff

Q.11 Double axial gradient theory was given by–
(1) Child (2) Roux
(3) Driesch (4) Horstadius

Q.12 Connective tissues originate form–
(1) Ectoderm (2) Endoderm
(3) Mesoderm (4) Meso-endoderm

Q.13 The correct sequence of various stages in embryonic development –
(1) Fertilization – Cleavage –Morula – Blastula – Gastrula
(2) Cleavage – Fertilization – Gastrula – Blastula
(3) Blastula – Cleavage – Gastrula – Fertilization
(4) Gastrula– Fertilization – Cleavage – Blastula

Q.14 Eggs which have large amount of yolk–
(1) Microlecithal (2) Macrolecithal
(3) Oligolecithal (4) Mesolecithal

Q.15 The group which originate from mesoderm –
(1) Thyroid, Pancrease, Kidney
(2) Heart, Spleen, Gonad
(3) Pineal body, Stomodium, Proctodaeom
(4) Nervous system, Epidermis, Internal ear

Q.16 Chromosomes in primary sex cell –
(1) Haploid (2) Diploid
(3) Similar to sperm (4) Similar to ovum

Q.17 In which animal parthenogenesis is common–
(1) Rats (2) Hens
(3) Aphids (4) Monkeys

Q.18 Meroblastic cleavage takes place in–
(1) Spiral cleavage (2) Equal cleavage
(3) Complete cleavage (4) Partial cleavage

Q.19 In which blastula is called as blastocyst –
(1) Frog (2) Fish
(3) Bird (4) Eutherian

Q.20 5th cleavage results in the formation of–
(1) 16– cells (2) 48– cells
(3) 64– cells (4) 32–cells

Q.21 Convergence & divergence of embryonic cells is called as –

(1) Differentiation (2) Induction

(3) Morphogensis (4) Blastulation

Q.22 Which of the following is haploid–

(1) Primary oocyte

(2) Oogonia

(3) Secondary oocyte

(4) Primary spermatocyte

Q.23 In sperm , the acrosome is found –

(1) On the top part (2) In the mid piece

(3) Behind the nucleus (4) On the tail part

Q.24 Enzyme secreted by the acrosome of sperm–

(1) Hyaluronidase (2) Pepsin

(3) Carboxylase (4) Dehydroginase

Q.25 Begining of embryonic development in the egg is indicated by–

(1) Cleavage (2) Differentiation

(3) Polarity (4) organogenesis

Q.26 Liver and pancreas develops from–

(1) Ectoderm (2) Mesoderm

(3) Ecto-mesoderm (4) Endoderm

Q.27 Brain originates from–

(1) Mesoderm (2) Ectoderm

(3) Ecto-mesoderm (4) Endoderm

Q.28 Following is an example of recapitulation theory

(1) Extra-embryonic membrane in reptiles

(2) Tadpole larva of frog

(3) Placenta in mammals

(4) Gill cleft in human foetus

Q.29 What is present in the vegetal pole of the frog's egg –

(1) Pigment (2) Gray crescent

(3) Yolk (4) Germinal cup

Q.30 The name of the small cell separates from the ovum during maturation is –

(1) Primordial germinal cell

(2) Polocyte

(3) Secondary germinal cell

(4) Primary spermatocyte

Q.31 The upper coloured part of the frog egg is associated with –

(1) Nutrition (2) Camouflage

(3) Respiration (4) To provide colour

Q.32 Blastopore is found in –

(1) Blastula & opening of archenteron

(2) Blastula & opening of blastocoel

(3) Gastrula & opening of archenteron

(4) Gastrula & opening of blastocoel

Q.33 How many secondary spermatocyte will form 400 spems –

(1) 100 (2) 400

(3) 40 (4) 200

Q.34 100 primary oocyte will form how many egg –

(1) 300 (2) 400

(3) 200 (4) 100

Q.35 Oogenesis involves –

(1) Multiplication phase (2) Growth phase

(3) Maturation phase (4) All

Q.36 The mid-piece of the sperm contains –

(1) Nucleus (2) Proteins

(3) Centriole (4) Mitochondria

Q.37 Frog's eggs is –

(1) Isolecithal (2) Mesolecithal

(3) Megalecithal (4) Centrolecithal

Q.38 If an unfertilized egg of frog is pricked by a minute needle–

(1) It will remain live but undivided

(2) It will change into youngone soon

(3) It will begin to divide

(4) It will die

Q.39 External fertilization occurs in–

(1) Lizard (2) Bird

(3) Rat (4) Frog

Q.40 Development of embryo from unfertilized egg is called as–

(1) Parthenogenesis (2) Apogamy

(3) Pseudogamy (4) Parthenocarpy

Q.41 Yolk plug in gastrula is future –

(1) Anterior (2) Posterior end

(3) Dorsal side (4) Ventral side

Q.42 The organ which form gametes in animals is –

(1) Ovary (2) Testes

(3) Gonad (4) Oviduct

Q.43 Which form microlecithal eggs –

(1) Insects (2) Fishes

(3) Birds (4) Mammals

Q.44 Entry of sperm into the ovum results in–

(1) Formation of Ist polocyte

(2) Formation of 2nd polocyte

(3) Ist meiosis

(4) Formation of pronuclei

Q.45 The egg of placental mammals are–

(1) Microlecithal (2) Alecithal

(3) Mesolecithal (4) Homolecithal

Q.46 The part of the sperm which has mitochondria–

(1) Head (2) Middle-piece

(3) Neck (4) Tail

Q.47 The ovum released from human ovary contains–

(1) One X- chromosome

(2) One Y- chromosome

(3) Two X- chromosome

(4) XY- chromosome

Q.48 The number of chromosome in the spermatid of man –

(1) 48 (2) 23

(3) 24 (4) 46

Q.49 Head of the sperm contains–

(1) Nucleus (2) Golgi body

(3) Centriole (4) Mitochondria

Q.50 Sperm locomotes by –

(1) Head (2) Acrosome

(3) MId-piece (4) Tail

Q.51 The cleavage which cleaves the egg partially-

(1) Holoblastic (2) Meroblastic

(3) 1 & 2 Both (4) Spiral

Q.52 Unfertilized egg of honey bee develops into–

(1) Sterile male (2) Sterile female

(3) Fertile male (4) Fertile female

Q.53 The cells forming ectoderm spread & stretch to cover the embryo except a pore called blstopore. This movement in gastrulation is called as–

(1) Emboly (2) Involution

(3) Invagination (4) Epiboly

Q.54 Intestine in both invertebrates & vertebrates develops from –

(1) Ectoderm (2) Pharyngeal pouch

(3) Endoderm (4) Mesoderm

Q.55 Which of the following egg is found in cockroach–

(1) Alecithal (2) Microlecithal

(3) Centrolecithal (4) Oligolecithal

Q.56 Grey crescent structure is found in–

(1) Eye of cockroach (2) Eye of frog

(3) Brain of rabbit (4) Fertillized egg of frog

Q.57 Vegetal pole of egg has –

(1) Yolk (2) Pigment

(3) Grey Crescent (4) Germinal Vesicle

Q.58 Spermatogenesis involves–

(1) Mitosis (2) Meiosis

(3) Transformation (4) 1 & 2 both

Q.59 Hormone which control spermatogenesis is–

(1) FSH (2) LH

(3) LTH (4) Vasopressin

Q.60 Acrosome of sperm helps in-

(1) Locomotion (2) Ovum penetration

(3) To provide energy (4) None

Q.61 During fertilization, the point of entry of sperm is–

(1) Rotation centre of embryo

(2) Axis of cleavage

(3) Grey crescent

(4) Dorsal lip of blastopore

Q.62 Sperm in frog's egg enters from–

(1) Animal pole (2) Vegetal pole

(3) Grey crescent (4) From any where

Q.63 Apomixis is–

(1) Vegetative reproduction

(2) Asexual reproduction

(3) Sexual reproduction which is without meiosis & gametogenesis

(4) None

Q.64 In which of following, fertilization of ovum takes place in Rabbit and Man–

(1) Ovary (2) Vagina

(3) Fallopian tube (4) Uterus

Q.65 Eggs of egg laying mammals are –

(1) Macrolecithal (2) Alecithal

(3) Mesolecithal (4) Telolecithal

Q.66 Jelly of frog egg is laid –

(1) During ovulation

(2) After fertilization in water

(3) In oviduct

(4) In ovary

Q.67 Noncleidoic eggs are found in –

(1) Fish (2) Bird

(3) Reptile (4) Mammals (Platypus)

Q.68 Hyaluronic acid is present in –

(1) Human sperm

(2) Ovary

(3) Ovum of the female

(4) A type of protein of blood

Q.69 The human sperm releases a substance to dissolve egg membrane, called–

(1) Hyaluronidase (2) Hyaluronic acid

(3) Fertilizin (4) Antifertilizin

Q.70 Polar bodies are found during –

(1) Oogenesis (2) Spermatogenesis

(3) Spermeogenesis (4) None of these

Q.71 Insect's eggs are -

(1) Microlecithal and centrolecithal

(2) Megalecithal and isolecithal

(3) Megalecithal and centrolecithal

(4) Megalecithal and telocithal

Q.72 The site of fertilization in mammals is-

(1) Ovary (2) Abdominal

(3) Uterus (4) Fallopian tube

Q.73 Natural parthenogenesis is found in-

(1) Housefly (2) Honey bee

(3) Drosophila (4) All of these

Q.74 Spermatogenesis is induced by-

(1) FSH (2) ACTH

(3) ICSH (4) ATH

Q.75 Cleavage found in mesolecithal egg is-

(1) Holoblastic and equal

(2) Holoblastic and unequal

(3) Meroblastic

(4) Discoidal

Q.76 Egg of frog is-

(1) Alecithal (2) Macrolacithal

(3) Microlecithal (4) Mesolecithal

Q.77 Which is formed in gastrulation ?

(1) Archenteron (2) Heart

(3) Brain (4) None of these

Q.78 How many sperms are produced from first spermatocyte-

(1) 4 (2) 2

(3) 1 (4) 8

Q.79 Which chemical attracts sperms towards egg-

(1) Fertilizin (2) Antifertilizin

(3) Agglutinin (4) Thromobin

Q.80 Grey crescent is the area-

(1) At the point of entry of sperm into ovum

(2) Just opposite to the site of entry of sperm into ovum

(3) At the animal pole

(4) At the vegetal pole

Q.81 If mammalian ovum fails to get fertilized, which one of the following is unlikely-

(1) Corpus luteum will disintegrate

(2) Progesteron secretion rapidly declines

(3) Estrogen secretion further decreases

(4) Primary follicle starts developing

Q.82 Withdrawal of which of the following hormones is the immediate cause of menstruation?

(1) Progesterone

(2) Estrogen

(3) FSH

(4) FSH-RH

Q.83 Sertoli cells are regulated by the pituitary hormone known as-

(1) LH (2) FSH

(3) GH (4) Prolactin

Q.84 Which part of ovary in mammals acts as an endocrine gland after ovulation?

(1) Stroma (2) Germinal epithelium

(3) Vitelline membrane (4) Graffian follicle

Q.85 Compared to a bull a bullock is docile because of-

(1) Higher levels of cortisone

(2) Lower levels of blood testosterone

(3) Lower level of adrenaline/noradrenalin in its blood

(4) Higher level of thyroxin

EXERCISE-3 PREVIOUS YEAR'S QUESTIONS

Q.1 Human placenta is : **[AIIMS 99]**
(1) Haemochorial (2) Syndesmochorial
(3) Yolk sac (4) Haemo-endothelial

Q.2 Human eggs are **[MPPMT 2000]**
(1) Alecithal (2) Microlecithal
(3) Mesolecithal (4) Macrolecithal

Q.3 Middle piece of mammalian sperm possesses : **[CBSE 1991]**
(1) Mitochondria and centriole
(2) Mitochondria only
(3) Centriole only
(4) Nucleus and mitochondria

Q.4 Human egg has : **[MPPMT 2000]**
(1) One Y-chromosome
(2) One X-chromosome
(3) Two Y-chromosome
(4) One X-chromosome and one Y-chromosome

Q.5 Fertilizins are emitted by : **[J.I. PMER 2000]**
(1) Immature eggs (2) Mature eggs
(3) Sperms (4) Polar bodies

Q.6 Meroblastic cleavage takes place in : **[MPPMT 1991]**
(1) Hydra (2) Amphioxus
(3) Frog (4) Chick

Q.7 During cleavage, what is true about embryo ? **[CBSE 1991, CPMT 99]**
(1) Nucleocytoplasmic ratio remains unchanged
(2) Size does not increase
(3) There is less consumption of oxygen
(4) The division is like meiosis

Q.8 Meroblastic cleavage is division **[CBSE 1992, MPPMT-97]**
(1) Horizontal (2) Partial/Parietal
(3) Total (4) Spiral

Q.9 Eye lens is formed from : **[CBSE 1992]**
(1) Ectoderm
(2) Mesoderm
(3) Endoderm
(4) Ectoderm and mesoderm

Q.10 Extrusion of second polar body from egg nucleus occurs **[CBSE 2000]**
(1) After entry of sperm before completion of fertilization
(2) After completion of fertilization
(3) Before entry of sperm
(4) Without any relation of sperm entry

Q.11 Termination of gastrulation is indicated by : **[CBSE 1993]**
(1) Obliteration of blastocoel
(2) Obliteration of archenteron
(3) Closure of blastopore
(4) Closure of neural tube

Q.12 In telolecithal egg the yolk is found : **[CBSE 1993]**
(1) All over the egg (2) On one side
(3) Both the sides (4) Centre

Q.13 Acrosome reaction in sperm is triggered by **[CBSE 1993]**
(1) Capaciation (2) Release of lysin
(3) Influx of Na^+ (4) Release of fertilizin

Q.14 Amounnt of yolk and its distribution are changed in the egg. Which one is affected? **[CBSE 1993]**
(1) Pattern of cleavage
(2) Formation of zygote
(3) Number of blastomeres
(4) Fertilisation

Q.15 Fertilization is : **[KARNATAKA 1994]**
(1) Union of diploid spermatozoon with diploid ovum to form diploid zygote
(2) ovum of haploid sperm with haploid ovum to form haploid zygote
(3) Union of haploid sperm with haploid ovum to form diploid zygote
(4) Union of diploid sperm with haploid ovum to form triploid zygote

Q.16 At the end of first meiotic division, male germ cell differentiates into : **[CBSE 1994, MPPMT 96]**
(1) Secondary spermatocyte
(2) Primary spermatocyte
(3) Spermatogonium
(4) Spermatid

Q.17 Extra-embryonic membranes of the mammalian embryo are derived from : **[CBSE 1994]**

(1) Inner cell mass (2) Trophoblast

(3) Formative cells (4) Follicle cells

Q.18 What is true about cleavage in fertilized egg of humans? **[CBSE 1994]**

(1) Meroblastic

(2) Starts when egg reaches uterus

(3) Starts in fallopian tubes

(4) It is identical to normal mitosis

Q.19 Vascular tissue is derived from : **[KARNATAKA 1994]**

(1) Epithelium

(2) Ectoderm

(3) All germinal layers

(4) Mesoderm

Q.20 In a mamanalian sperm, spiraly arranged mitochondria around an axial filament occurs in **[BHU 1994, 2000]**

(1) Middle piece

(2) Head

(3) End piece of tail

(4) Principal piece of tail

Q.21 A mature sperm has **[AFMC 1994]**

(1) A pair of flagella

(2) A nucleus, an acrosome, and a centriole

(3) A nucleus, an acrosome, a pair of centrioles

(4) A nucleus, an acrosome, a pair of centroiles and a tail.

Q.22 Ovulation occurs under the influence of : **[AIIMS 96]**

(1) LH (2) FSH

(3) Estrogen (4) Progesterone

Q.23 Part of sperm involved in penetrating egg membrane is **[MP PMT 99, 2000]**

(1) Tail (2) Acrosome

(3) Allosome (4) Autosome

Q.24 Type of cleavage in an egg is determined by : **[CBSE 1995, RPMT 99]**

(1) Amount and distribution of yolk

(2) Number of egg membranes

(3) Size and location of nucleus

(4) Shape and size of sperm

Q.25 Which one develops from endodermis? **[BHU 1995]**

(1) Nervous system urinary bladder and eye

(2) Liver, connective tissue and heart

(3) Thymus, spiral cord and brain

(4) Liver, pancreas and thymus/thyroid

Q.26 Reptile and bird eggs are: **[AIIMS 1996]**

(1) Macrolecithal (2) Oligoleithal

(3) Mesolecithal (4) Alecithal

Q.27 Fertilization is fusion of : **[AIMS 1996]**

(1) Diploid spermatozoan with diploid ovum to form diploid zygote

(2) Haploid spermatozoan with diploid ovum to from diploid zygote

(3) Diploid spermatozoan with haploid ovum to form diploid zygote

(4) Haploid spermatozoan with haploid ovum to form diploid zygote

Q.28 Spermatozoa are nourished during their development by **[KARNATAKA 1997]**

(1) Setroli cells

(2) Interstitial cells

(3) Connective tissue cells

(4) None of the above

Q.29 Correct sequence in development is : **[CPMT 1998]**

(1) Fertilization $\rightarrow$ Zygote $\rightarrow$ Cleavage $\rightarrow$ Morula $\rightarrow$ Blastula $\rightarrow$ Gastrula

(2) Fertilization $\rightarrow$ Zygote $\rightarrow$ Blastula $\rightarrow$ Morula $\rightarrow$ Cleavage $\rightarrow$ Gastrula

(3) Fertilization $\rightarrow$ Cleavage $\rightarrow$ Morula $\rightarrow$ Zygote $\rightarrow$ Blastula $\rightarrow$ Gastrula

(4) Cleavage $\rightarrow$ Zygote $\rightarrow$ Fertilization $\rightarrow$ Morula $\rightarrow$ Blastula $\rightarrow$ Gastrula

Q.30 Eye develops from : **[CBSE 1998]**

(1) Ectoderm (2) Mesoderm

(3) Endoderm (4) Both 2 and 3

Q.31 Middle piece of mammalian sperm contains : **[AIIMS 1998, CBSE 99]**

(1) Nucleus (2) Vacuoles

(3) Mitochondria (4) Centriole

Q.32 Egg with peripheral cytoplasm around the yolk is : **[AIIMS 1998]**

(1) Isolecithal (2) Microlecithal

(3) Telocithal (4) Centolecithal

Q.33 Immediately after ovulation, the mammalian egg is covered by a membrane called : **[AIIMS 1998]**

(1) Chorion (2) Zona pellucida

(3) Corona raidata (4) 2 & 3

Q.34 Cleavage in the fertilized egg of humans : **[AFMC 1999]**

(1) Starts in uterus

(2) is meroblastic

(3) starts when egg is in fallopian tube

(4) is discoidal

Q.35 Polar body is produced during the formation of: **[Pb PMT 1999]**

(1) Sperm (2) Secondary oocyte

(3) Oogonium (4) Spermatocytes

Q.36 The head of mature mammalian sperm is made of : **[AIIMS 1999]**

(1) An acrosome

(2) Elongated nucleus covered by acrosome

(3) Two centrioles and an axial filement

(4) **N**ucleus, acrosome, cytoplasm and mitochondrial sheath

Q.37 Ovulation or release of ovum occurs on the day of menstrual cycle : **[Manipal 2000]**

(1) 8 – 10 (2) 12 – 14

(3) 4 – 14

(4) Last two day of menstrual cycle

Q.38 Division of human egg is : **[CBSE 2000]**

(1) Equal holoblastic

(2) Unequal holoblastic

(3) Superficial meroblastic

(4) Discodial meroblastic

Q.39 First successful animal clone was : **[CBSE 2000]**

(1) Dolly goat (2) Dolly sheep

(3) Molly goat (4) Molly sheep

Q.40 Sperms produce an enzymatic substance for dissolving egg coverings. It is called : **[KARNATAKA 2001]**

(1) Hylauronic acid (2) Hyaluronidase

(3) Androgamone (4) Diastase

Q.41 Oocyte is liberated from ovary under the influence of LH, after completing : **[AIIMS 2001]**

(1) Metosis and before liberating polar bodies

(2) Meiosis I and before liberating second polar bodies

(3) Meiosis

(4) Meiosis II after release of first polar body

Q.42 Noncleiodic eggs occurs in : **[BHU 2001]**

(1) Birds (2) Fish

(3) Reptiles (4) Platypus

Q.43 In which one Meroblastic cleavage is found **[RPMT 2000]**

(1) Dog (2) Owl

(3) Monkey (4) Rhinoceros

Q.44 In which of the following mosaic cleavage occurs : **[RPMT 2000]**

(1) Camel (2) Whale

(3) Dog fish

(4) Echinococcus granulosus

Q.45 Microlecithal eggs are gound in : **[RPMT 2001]**

(1) Reptilia + Aves

(2) Amphibia + Aves + Reptilia

(3) Reptilia + Aves + Chiroptera

(4) Eutheria

Q.46 Which cell div. is found during cleavage ? **[RPMT 2001]**

(1) Amitosis (2) Mitosis

(3) Closed mitosis (4) Meiosis

Q.47 10 oogonia yield 10 primary oocytes, then how many ova are produced on completion of oogenesis: **[RPMT 2001]**

(1) 5 (2) 10

(3) 20 (4) 40

Q.48 At the time of fertilization sperm head enters in the egg from **[RPMT 2001]**

(1) Any where (2) Animal pole

(3) Vegetal pole (4) Lateral side of egg

Q.49 Which have macrolecithal eggs? **[RPMT 2001]**
(1) Aves, Reptilia
(2) Aves, Reptilia, Amphibia
(3) Aves, Reptilia, Chiroptera
(4) Aves, Eutheria

Q.50 Which part of sperm provides energy it to fertilize the egg : **[RPMT 2001]**
(1) Sperm head (2) Acrosome
(3) Sperm tail (4) Middle piece

Q.51 In which stage of development the embryonic cells form the germinal layers by the movement : **[RPMT 2001]**
(1) Morula (2) Blastula
(3) Gastrula (4) Nerula

Q.52 Cleidoic egg is an adaptation for : **[RPMT 2001]**
(1) Aquatic life (2) Marine life
(3) Terrestrial life (4) Aerial life

Q.53 In mammals egg are microlecithal and isolecithal because these are : **[RPMT 2001]**
(1) Oviparou (2) Viviparous
(3) Ovoviviparous (4) None of them

Q.54 Eggs of birds are : **[RPMT 2001]**
(1) Microlecithal (2) Centrolecithal
(3) Megalecithal (4) Alecithal

Q.55 In which of the following animal cleavage divisions are restricted to a small part of cytoplasm & nucleus in animal pole of egg? **[RPMT 2002]**
(1) Cockroach (2) Frog
(3) Chick (4) Rabbit

Q.56 Which of the following is not the correct for gastrulation **[RPMT 2002]**
(1) Archenteron is formed
(2) All germinal layers are formed
(3) Morphogenetic movements
(4) Some blastomeres & blastocoel degenerate

Q.57 At which stage of spermatogenesis sperm aquire their whole structural maturity and they contain a haploid nucleus & other organs **[RPMT 2002]**
(1) Spermiogenesis (2) Growth phase
(3) Multiplication phase
(4) Maturation phase

Q.58 Insects eggs are : **[RPMT 2002]**
(1) Microlecithal & centrolecithal
(2) Megalecithal & isolecithal
(3) Megalecithal & centrolecithal
(4) Megalecithal & telolecithal

Q.59 In rabbit at the time of fertilization zygote is formed in : **[RPMT 2002]**
(1) Coelom (2) Fallopian tube
(3) Uterus (4) Vagina

Q.60 Sperm enters from which part of egg: **[RPMT 2002]**
(1) Any where in unfertilized egg from vegetal pole
(2) From animal pole in unfertilized egg
(3) In unfertilized egg from vegetal pole
(4) None

Q.61 Completion of gastrulation is indicated by **[RPMT 2003]**
(1) Obliteration of archenterone
(2) Obliteration of blastocoel
(3) Closing of blastopore
(4) Closing of neural tube

Q.62 In mammals, egg is fertilised in : **[RPMT 2003]**
(1) Ovary (2) Fallopian tube
(3) Uterus (4) Vagina

Q.63 In mesolecithal eggs, the cleavage is : **[RPMT 2004]**
(1) Equal, holoblastic (2) Unequal holoblastic
(3) Meroblastic (4) Discoidal

Q.64 Cortical granules are absent in : **[RPMT 2004]**
(1) Fish (2) Frog
(3) Man (4) Rat

Q.65 The egg of frog is : **[RPMT 2004]**
(1) Microlecithal (2) Mesolecithal
(3) Telolecithal (4) Alecithal

Q.66 What is formed at the time of gastrulation? **[RPMT 2004]**
(1) Gills (2) Heart
(3) Myotome (4) Archenteron

Q.67 Which part of the spermatid forms acrosomes of sperm ? **[RPMT 2004]**
(1) Mitochondria (2) Golgibody
(3) Nucleus (4) Lysosome

Q.68 How many sperms are formed by one primary spermatocyte ? **[RPMT 2005]**
(1) 4 (2) 3
(3) 2 (4) 1

Q.69 The chemical in ovun which attracts sperms : **[RPMT 2005]**
(1) Fertilizin (2) Antifertilizin
(3) Agglutinin (4) Thrombin

Q.70 Which of the following organ is differentiated first during development ? **[RPMT 2005]**
(1) Heart (2) Skin
(3) Brain (4) Neural tube

Q.71 Blastopore is the pore of : **[CBSE 2000]**
(1) Archenteron (2) Blastocoel
(3) Coelon (4) A.C.

Q.72 What is true for cleavage: **[CBSE 2002]**
(1) Size of embryo increases
(2) Size of cells decrease
(3) Size of cells increase
(4) Size of embryo decreases

Q.73 During embryonic development, the establishment of polarity along anterior/ posterior, dorsal/ ventral or medial/ lateral axis is called : **[CBSE 2003]**
(1) Organizer phenomenon
(2) Axis formation
(3) Anamorphosis
(4) Pattern formation

Q.74 Grey cresent is the area: **[CBSE 2005]**
(1) At the point of entry of sperm in to ovum
(2) Just opposite to the site of entry of sperm in to ovum
(3) At the animal pole
(4) At the vegetal pole

Q.75 Development of animal embryo from egg without fertilization is called : **[BIHAR 2004]**
(1) Parthenogenesis (2) Parthenocarpy
(3) Apospory (4) Apomixis

Q.76 During embryonic development, endoskeleton and muscle develop from which germinal layer **[BIHAR 2006]**
(1) Ectoderm (2) Endoderm
(3) Mesoderm (4) Blastopore

Q.77 In the development of a frog, the gastrulation process involves : **[UP CPMT 2001, RPMT 08]**
(1) Epiboly (2) Emboly
(3) Invagination (4) All of these

Q.78 Polar bodies are produced during the formation of : **[UP CPMT 2001]**
(1) Sperm (2) Oogonium
(3) Spermatocytes (4) Secondary oocyte

Q.79 The part where fertilization of ovum occurs in placental mammals is : **[UP CPMT 2001]**
(1) Ovary (2) Uterus
(3) Vagina (4) Fallopian tube

Q.80 In a vertebrate which germ layer forms the skeletal muscles **[UP CPMT 2004]**
(1) Ectoderm (2) Endodem
(3) Mesoderm (4) Both 1 and 2

Q.81 Grey crescent in fertilized frog's egg is the area: **[UP CPMT 2006]**
(1) At the point of the entry of sperm into ovum
(2) at the vegetal pole
(3) at the animal pole (4) none of these

Q.82 During embryonic development the establishment of polarity along anterio/posterior, dorsal/ ventral or medial/lateral axis is called : **[UP CPMT 2005]**
(1) anamorphosis
(2) organizer phenomenon
(3) pattern formation
(4) axis formation

Q.83 Liver and pancreas of frog and rabbit are derived from : **[UP CPMT 2006]**
(1) Ectoderm (2) Mesentery
(3) Endoderm (4) Both 1 and 3

Q.84 Which layer develops first during embryonic development : **[UP CPMT 2006]**
(1) Ectoderm (2) Mesoderm
(3) Endoderm (4) Both 1 and 3

Q.85 The egg of frog is : **[UTTARANCHAL 2004]**
(1) Telolecithal (2) Microlecithal
(3) Alecithal (4) Centrolecithal

Q.86 Which of the following undergoes spermiogenesis **[UTTARANCHAL 2004]**

(1) Spermatids
(2) Spermatogonia
(3) Primary spermatocytes
(4) Secondary spermatocytes

Q.87 Antifertilizin is present on : **[UTTARANCHAL 2004]**

(1) Egg (2) Tail
(3) Ovum (4) Spermatozoa

Q.88 Various changes in mammalian sperm which prepare it to fetilise the ovum are called : **[UTTARANCHAL 2004]**

(1) Capacitation (2) Regeneration
(3) Growth (4) None of these

Q.89 In gastrulation, which is (are) formed : **[Jharkhand 2005]**

(1) Endoderm
(2) Mesoderm
(3) Ectoderm, endoderm
(4) Ectoderm, mesoderm, endoderm

Q.90 During oogenis, the small structure separated from egg is : **[Jharkhand 2006]**

(1) Polar bodies
(2) Secondary endosperm
(3) Herring bodies
(4) Hela cells

Q.91 Foetal sex is determined by examining cells from amniotic fluid looking for **[Jharkhand 2004]**

(1) Chiasmata (2) Autosomes
(3) Sex-chromosomes (4) Nucleus

Q.92 Which of the following is not correct for gastrulation **[Jharkhand 2003]**

(1) Archenteron is formed
(2) All germinal layers are formed
(3) Morphogenetic movements
(4) Blastomeres and gastrocoel degenerate

Q.93 In human foetus, the heart begins to beat at developmental age of : **[Jharkhand 2002]**

(1) 4^{th} weak (2) 3^{rd} week
(3) 6^{th} week (4) 8^{th} week

Q.94 Acrosome of spermatozoa is formed from : **[MP PMT 2004]**

(1) Lysosomes (2) Golgi bodies
(3) Ribosome (4) Mitochondria

Q.95 Frog's egg is : **[MP PMT 2006]**

(1) Alecithal (2) Centrolecithal
(3) Isolecithal (4) Telolecithal

Q.96 The whole nervous system including neuron in frog and other vertebrates is derived from : **[MP PMT 2006]**

(1) Ectoderm (2) Endoderm
(3) Mesoderm (4) All of these

Q.97 The cavity, which formed during gastrulation is named as : **[MP PMT 2007]**

(1) Blastocoel (2) Archenteron
(3) Coelom (4) Pseudocoel

Q.98 In a sperm, the mitochondria occurs : **[MP PMT 2001]**

(1) In tail (2) In acrosome
(3) In middle piece (4) In head

Q.99 Identical twins will be produced when : **[MP PMT 2001]**

(1) One spermatozoan fertilizes two ova
(2) One ovum is fertilized by two spermatozoa
(3) Two eggs are fertilized
(4) One fertilized egg divides into two blastomers and they becomes separae

Q.100 Which set of enzymes is found in the acrosome of mammalian spermatozoa **[MP PMT 2001]**

(1) Hyaluronidase, Corona penetrating Enzyme (CPE)
(2) Hyaluronidase, CPE, Zona lysine
(3) Hyaluronidase, CPE, Peptidase
(4) Hyaluronidase only

Q.101 Fixing up of the blastocyst in the wall of the uterus is known as : **[MP PMT 2002]**

(1) Fertilization (2) Implantation
(3) Impreganation (4) Placentation

Q.102 The type of placenta found in human beings is of type **[MP PMT 2002]**

(1) Diffuse (2) Zonary
(3) Cotyledonary (4) Discoidal

Q.103 The number of foetal membranes in man is : **[MP PMT 2002]**

(1) 1 (2) 3
(3) 4 (4) 0

Q.104 Placenta in human beings in formed by : **[MP PMT 2002]**

(1) Amnion (2) Chorion
(3) Allantois
(4) Allantois, chorion and uterine wall

Q.105 The phenomenon of nuclear fusion of sperm and egg is known as : **[MP PMT 2002]**

(1) Karyogamy (2) Parthenogenesis
(3) Vitellogenesis (4) Oogenesis

Q.106 Cleidoic eggs are characteristic of : **[MP PMT 2002]**

(1) Mammals
(2) Reptiles, Birds & Insects
(3) Insects only (4) Fishes

Q.107 Arrchenteron cavity is found in : **[MP PMT 2002]**

(1) In Blastula (2) In Gastrula
(3) In Morula (4) In planula

Q.108 Microlecithal eggs with very small amount of food reserve are found in : **[MP PMT 2002]**

(1) Frog (2) Insects
(3) Man (4) Fish

Q.109 Mammalian placenta originates from : **[MP PMT 2007]**

(1) Allantois and chorion
(2) Yolksac
(3) Allantois (4) Amnion

Q.110 The eggs of reptiles and birds contain a large amount of yolk. We refer to such eggs as : **[CPMT 2009]**

(1) Alecithal (2) Oligolecithal
(3) Mesolecithal (4) Telolecithal

Q.111 Human egg is : **[Karnataka CET 2008]**

(1) Alecithal (2) Centrolecithal
(3) Telolecithal (4) Megalecithal

Q.112 Eggs having yolk in centre and cytoplasm in a peripheral region are called : **[Pb. PMT 2007]**

(1) Isolecithal (2) Telolecithal
(3) Microlecithal (4) Centrolecithal

Q.113 The eggs of silkmoth are : **[BHU 2008; Uttarakhand PMT 2008]**

(1) Telolecithal (2) Mesolecithal
(3) Homolecithal (4) Centrolecithal

Q.114 Fertilizin a chemical substance produced by : **[Manipal 2005; CMC, Vellore 2008]**

(1) Acrosome (2) Polar bodies
(3) Mature eggs
(4) Middle piece of sperm

Q.115 The fusion of male and female pronuclei is known as : **[JCECE 2008; JKCMEE 2009]**

(1) Eumixis (2) Endomixis
(3) Fertilization (4) Amphimixis

Q.116 The cell division that takes place in a zygote is known as : **[JKCMEE 2007]**

(1) Mitosis (2) Meiosis
(3) Cleavage (4) Differentiation

Q.117 What is true for cleavage? **[CBSE 2002; RPMT 2007]**

(1) Size of cell increases
(2) Size of embryo increases
(3) Size of cell decreases
(4) Size of embryo decreases

Q.118 In insects, cleavage is : **[RPMT 2002; AFMC 2006; JCECE 2007]**

(1) Equal holoblastic
(2) Meroblastic disoidal
(3) Unequal holoblastic
(4) Meroblastic superficial

Q.119 Differentiation of organs and tissues in a developing organism is associated with : **[CBSE 2007]**

(1) Lethal mutations
(2) Deletion of genes
(3) Developmental mutations
(4) Differential expression of genes

Q.120 The brain is evolved from embryonic : **[MH-CET 2003; Orissa JEE 2010]**

(1) Ectoderm (2) Mesoderm
(3) Endoderm (4) Archenteron

Q.121 Which of the following is correct grouping?

1. Ectoderm–Retina,epidermis,nevous system
2. Mesoderm–Ovary, urinary bladder, kidney
3. Mesoderm–Kiney, connective tissue, testis
4. Endoderm–Thyroid, pineal gland, thymus

Answer codes : **[BHU 2007]**

(1) 1 and 2 are correct
(2) 2 and 4 are correct
(3) 1 and 3 are correct
(4) 1, 2 and 3 are correct

Q.122 Where is jelly deposited as a covering on the egg of frog? **[VMMC-Safdarjung 2008]**

(1) Ovary
(2) Oviduct
(3) Water after fertilization
(4) Water during fertilization

Q.123 Grey crescent is the area : **[CBSE 2005; JIPMER 2007]**

(1) At the animal pole (2) At the vegetal pole
(3) At the point of the entry of sperm into ovum
(4) Just opposite to the site of entry of sperm into ovum

Q.124 Blastula of frog has : **[Uttarakhand PMT 2008]**

(1) Blastocoel (2) Blastopore
(3) Gastrula (4) Neurula

Q.125 Main processes involved in gastrulation in frog are : **[BHU 2007]**

(1) Epiboly, involution, cleavage
(2) Involution, epiboly, invagination
(3) Involution, invagination, epiboly
(4) Cleavage, Invagination, involution

Q.126 In which stage, blastopore is found? **[Karnataka CET 2010]**

(1) Morula (2) Blastula
(3) Neurula (4) Gastrula

Q.127 A blastopore is found in : **[AFMC 2007]**

(1) Blastula and is the opening of blastocoel
(2) Gastrula and is the opening of blastocoel
(3) Blastula and is the opening of archenteron
(4) Gastrula and is the opening of archenteron

Q.128 Yolk plug forms during : **[BHU 2007]**

(1) Neurulation
(2) Gastrulation
(3) Blastula formation
(4) Morula formation

Q.129 During embryonic development, the establishment of polarity along anterior / posterior, dorsal / ventral or medial/lateral axis is called : **[CBSE 2003; CPMT 2005; RPMT 2007]**

(1) Axis formation
(2) Anamorphosis
(3) Pattern formation
(4) Organizer phenomena

Q.130 The extraembryonic membranes of mammalian embryo are derived from : **[BHU 2004; Uttarakhand PMT 2008]**

(1) Triphoblast (2) Follicle cells
(3) Formative cells (4) Inner cell mass

Q.131 Find out the wrong statement : **[Kerala PMT 2007]**

(1) In mammals allantois is not excretory in function
(2) Amnion is the outer layer containing amniotic fluid that acts as shock absorber to the soft embryo
(3) Yolk sac is a foetal membrane that helps in the nourishment of the embryo in general
(4) Chorio-allantoic membrane develops villi and contribute much to the development of placenta
(5) Amnion and chorion develop as upward projecting folds of somatopleure called amniotic folds

Q.132 Which extraembryonic membrane in humans prevents desiccation of the embryo inside the uterus? **[CBSE 2008]**

(1) Amnion (2) Chorion
(3) Yolk sac (4) Allantois

Q.133 The extrastructure that provides nutrition to the embryo is : **[BHU 2005, 08]**

(1) Chorion (2) Amnion
(3) Placenta (4) Umbilicus

Q.134 In human being, placenta is formed by :
[Manipal 2006; AMU 2007]
(1) Chorion (2) Amnion
(3) Allantois (4) All of these

Q.135 In rabbit, placenta is formed by :
[EAMCET 2007]
(1) Chorio-allantoic membrane and endometrium
(2) Chorio-allantoic membrane and yolk sac
(3) Amnion, chorion and yolk sac
(4) Allantois and endometrium

Q.136 Which of the following has discoidal placenta?
[BCECE 2007]
(1) Pig (2) Deer
(3) Rabbit (4) Sheep

Q.137 On the basis of nature of maternal and foetal tissue, types of placenta are :
1. Haemo-endothelial placenta
2. Haemo-chorial placenta
3. Cotyledonary placenta
4. Deciduate placenta

Answer code : **[BHU 2007]**
(1) 1 and 2 are correct
(2) 2 and 4 are correct
(3) 1 and 3 are correct
(4) 1, 2 and 3 are correct

Q.138 Woman who counsumed the durg thalidomide for relief from vomiting during early months of pregnancy gave birth to children with :
[AIIMS 2004, 07]
(1) Harelip
(2) No spleem
(3) Extra fingers and toes
(4) Underdeveloped limbs

Q.139 The organs which have dual origin from embryonic layers :
1. Hypophysis 2. Adrenal gland
3. Sense organs 4. Pancreas

Answer codes : **[BHU 2008]**
(1) 2 and 4 are correct
(2) 1 and 3 are correct
(3) 2 and 3 are correct
(4) 1, 2 and 3 are correct

Q.140 Notochord, skeletal system and dermis of the skin are the derivatives of :
[Karnataka CET 2008]
(1) Ectoderm (2) Mesoderm
(3) Endoderm (4) All the there layers

Q.141 A gradual decrease in the size of the tail during metamorphosis in the life cycle of frog is a good example for : **[Karnataka CET 2008]**
(1) Cell necrosis
(2) Cell senescene
(3) Pinocytic activity
(4) Programmed cell death

Q.142 A change in the amount of yolk and its distribution in the egg will affect :
[CBSE 2009]
(1) Fertilization
(2) Pattern of cleavage
(3) Formation of zygote
(4) Number of blastomeres produced

Q.143 The chemical substance released by activated spermatozoa that acts on the ground substance of the follicle cells is known as :
[Kerala PMT 2009]
(1) Relaxin (2) Teratogen
(3) Progesterone (4) Hyaluronidase
(5) gonadotropin

Q.144 Identify the correctly matched pair/pairs of the germ layers and their derivatives :
A. Ectoderm – Epidermis
B. Endoderm–Dermis
C. Mesoderm – Muscles
D. Mesoderm –Norochord
E. Endoderm – Enamel of teeth
[Kernataka CET 2009]
(1) A and D only (2) A and B only
(3) A, C and D (4) A, B, C and E only

Q.145 The internal cavity commonly formed by cell division prior to gastrulation is the :
[DUMET 2010]
(1) Coelom (2) Enteron
(3) Blastopore (4) Blastocoel

Q.146 in mesolecithal egg the cleavage is : **[MPPMT 2010]**

(1) Meroblastic (2) Equal holoblastic

(3) Unequal holoblastic

(4) None of these

Q.147 The cavity formed during gastrulation is : **[MPPMT 2010]**

(1) Archenteron (2) Gastrocoel

(3) Primitive gut (4) All of these

Q.148 Which one of the following is the most widely accepted method of contraception in India at present? **[CET 2009]**

(1) Cervical caps (2) Tubectomy

(3) Diaphragms

(4) IUDs (intra uterine devices)

Q.149 Medical Termination of Pregnency (MTP) is considered safe up to how many weeks of pregnancy **[KARNATAKA 1996]**

(1) Eight weeks (2) Twelve weeks

(3) Eigtheen weeks (4) Six weeks

Q.150 The Test-tube Baby Programme employs which one of the following techniques ? **[AIPMT PRE 2012]**

(1) Intra uterine insemination (IUI)

(2) Gamete intra fallopian transfer (GIFT)

(3) Zygote intra fallopian transfer (ZIFT)

(4) Intra cytoplasmic sperm injection (ICSI)

Ans.	4	2	4	3	4	3	4	4	2	3										

These questions consist of two statements each, printed as Assertion and Reason. While answering to choose any one of the following four responses.

(1) If both Assertion & Reason are True & the reason is correct explanation of the Assertion.

(2) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.

(3) If Assertion is True but the Reason is False.

(4) If both Assertion & Reason are false.

Q.1 **A :** Up to morula stage, the cells divide without any increase in size.

R : Zona pellucida remains intact till cleavage is complete.

Q.2 **A :** A sperm sticks to an egg for fertilization.

R : Interaction of surface receptor's, fertilizen on the egg and antifertilization on the sperm head, makes them, adhere together.

Q.3 **A :** Zona pellucida disappears when blastocyst reaches the uterus.

R : Role of zona pellucida is to check the implantation of the blastocyst at an improper site.

Q.4 **A:** All members of bee society are diploid except the drones.

R : Drones are produced parthenogenetically.

Q.5 **A :** Testes originates in the abdomen but later descend in to the scrotum under the influence of testesterone.

R : The interstial cells of the testes secreates male sex harmone the testosterone.

Q.6 **A :** A woman passes out HCGH in the urine during pregnancy.

R : Excess harmones are excreted by the kidneys presence of HCGH in urine is the basis for pregnancy test.

Q.7 **A :** Cervix contains the largest and the most powerful spheneter muscles in the body.

R : Cervix opens into the vagina by external O.S.

Q.8 **A :** The "Chorda-mesoderm" is regarded as the 'organiser' of amphibians embryo.

R : The "Corda mesoderm" later gives rise to the notochord & the mesoderm.

Q.9 **A :** The fate of germ layers is same in all triploblastic animals.

R : There is a close relationship Among all triploblastic animals due to their evolution from common source.

Q.10 **A :** Foetal blood & maternal blood are in direct contact.

R : The placenta works as a link between them.

Q.11 **A :** Twins may arise from a single egg or from two eggs..

R : One egg gives rise to identical twins by separtion of blastomeres, and two eggs produce nonidentical twins.

Q.12 **A :** In a graffian follicles, the primary oocyte and the follicle cells may be regarded sibling cells.

R : Both arise from the same parent cell, the oogonium by mitotic division.

Q.13 **A :** A tadpole whose thyroid gland has been removed does not metamorphore into adult.

R : Calcitonin and thyroxine are produced from thyroid gland ; these hormones stimulate protein synthesis for the development and growth of tadpole larva.

Q.14 **A :** Emboly involves the invagination and involution.

R : Emboly is exhibited by the formation, elongation.

Q.15 **A :** Amniotic fluid serves as a protective cushion.

R : It breaks the mechanical shocks and lessens the effect of changes of temperature.

Q.16 **A :** Sperm of man not fertilized egg of rat.

R : Fertilizine and antifertilizine reaction not takes place between egg & sperm.

Q.17 **A :** Sperms of human being perform chemotaxis movement.

R : Egg of human being secrete antifertilizine.

Q.18 **A :** Asexual reproduction is also called blastogenesis.

R : In asexual reproduction, there is no formation & fusion of gametes.

Q.19 **A :** The middle part of sperm term as energy chamber.

R : Mitochondria of middle part provide the energy for activation of sperm.

Q.20 **A :** There is generally monospermy in most animals.

R : Vitelline membrane of ovum checks polyspermy.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A Question I am unable to solve in first attempt	COLUMN : B Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

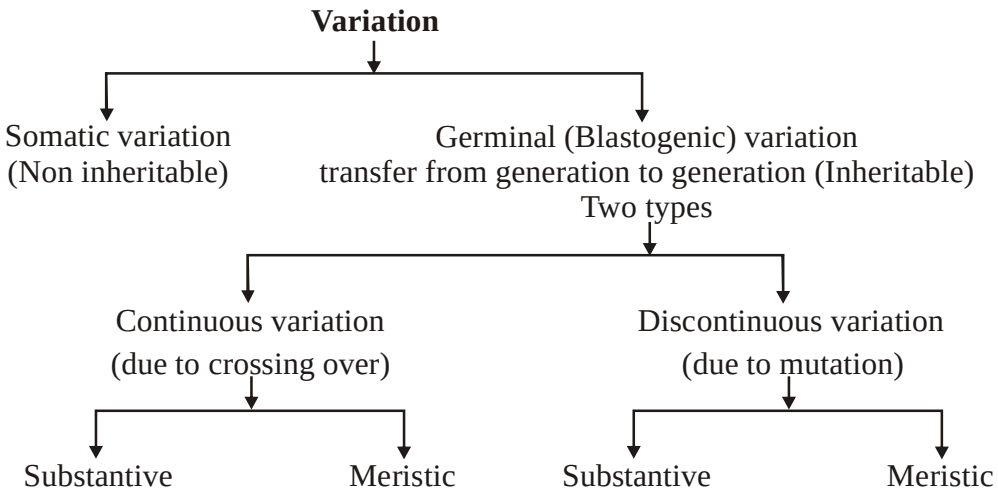
Exercise – 4	202 – 204
Quick Review Table	205

GENETICS

Genetics term was given by **W.Bateson**. (1905) (Father of Modern Genetics).
Genetics = Branch of biology which deals with the study of heredity and variation
Heredity – Transmission of genetic characters from generation to generation.
Variation – Individuals of same species have some difference, these are called variation.



INHERITANCE : HEREDITY AND VARIATIONS

HEREDITY : It is the transmission of genetic characters from parents to the offsprings. It deals with the phenomenon of ''like begets like'' e.g., human babies are like human beings in overall characteristics.

VARIATIONS : Variations are common in sexually reproducing organisms. Variations are of following two types :

1. **Somatogenic :** These are acquired variations and are non-inheritable in nature. The ability of an organism to alter its phenotype in response to environment is called **phenotypic plasticity**.

A. Blastogenic Variations : These are germinal variations and are hereditary in nature. They are again of two types:

(a) Continuous variations : These are the fluctuating variations and can not give rise to new species. These are further of two types

i. **Substantive :** Variation in size, shape and colour of organism.
ii. **Meristic :** Variation in number of parts e.g. number of grains in an ear of wheat.

(b) Discontinuous Variations : Also known as **mutations, sports** or **saltations.** These variation are responsible for formation of new species and organism thus formed is called **mutant**.
Types of discontinuous variations :

i. **Substantive variations :** These influence shape, colour, size etc., e.g., hairless cat, short legged ancon sheep.
ii. **Meristic variation :** These affect number of parts e.g. polydactyly in humans.

Variations are significance in evolution as they make the organism better suited to modifying environmental conditions, produce new trait in organism and provide raw material for evolution.

History :

- **Muller :** Proposed the term "**Cytogenetics**" (Cytology + Genetics)
  Father of Actinobiology.
  Actinobiology - Study the effect of radiation of living organisms.
- **Morgan :** Father of Experimental genetics. He experiment on Drosophila melanogaster & proposed various concepts
  Gene theory : According to gene theory; genes are linearly located on chromosome.
  Linkage term, Theory of sex linkage, Crossing over term, Criss - cross inheritance.

EARLY SPECULATIONS (PREMENDELIAN)

(1) Vapour Theory (2) Preformation Theory (3) Encasement Theory
(4) Theory of Epigenesis (5) Pangenesis Theory (6) Weismann Theory of Germ plasm
(7) Mendelism

(1) Vapour Theory :

- Proposed by a Greek philosopher **Pythagoras** in 500 B.C.
- Each organ of an animal body emitted some kind of vapour and that a new individual was formed by combination of the vapour from different organs.

(2) Preformation Theory (1632 – 1723) :

- Dutch scientist **'Swammerdam'** propounded the preformation theory. This theory holds that the sex cells (sperm and ova) had the **miniature copy of adults** and the development of embryo was actually only the enlargement of parts that were already present in the sperm or egg.
- This minature form of the animal present in the gamete was called **'Homunculus'**.
- This theory was supported by **Hartsoeker**.
- Those who considered homunculus to be present in sperms were called **Spermist**.
- Those who considered homunculus to be present in ova (eggs) were called **Ovist**.
- **Antony Van Leeuwenhoek** was the **first** to observe human sperms.

(3) Encasement Theory :

- **'Charles Bonnet'** and his supporters presumed that every female contains within her body minature prototypes of all the creatures which will every descend from her, one generation within the other **some what like a series of chinese bones.** (a box inside a box and so on).

(4) Theory of Epigenesis :

- **Wolff** proposed that germ cells contain definite but undifferentiated substances which, after fertilization becomes organized into various complex body organs (Differentiated) which form the **adult**.
  This idea was referred to as **epigensis**.

(5) Pangenesis Theory :

- **Charles Darwin** propounded pangenesis theory.
- According to this theory every cell, tissue and organ of animal body produces many minute particles known as **pangenes** or **gemmules**.
- These gemmules are discharged in the blood stream and are deposited in the reproductive organs. These reproductive cells contain these pangenes and a child develops as a result of blending of the pangenes from two parents.
- Thus the individual would represent the **mixture** of both of the parents.

(6) Theory of Germplasm :

- **'August Weismann' (1889)** suggested the theory of continuity of germplasm.
- They referred to the reproductive cells as germplasm and to rest of the body as somatoplasm.

- The **germplasm** forms the bridge of life and passes from one generation to the next.
- Soma is **'Mortal'** because it eventually dies and disintegrates, the germ is **"immortal"**, because it continues forever.

(7) Mendelism :

- Experiments performed by Mendel on genetics and description of mechanisms of hereditery processes and formulation of principles are known as Mendelism.
- **Gregor Johann Mendel (1822 – 1884)** : Mendel was born on july 22, 1822 at Heinzendorf in Austria a Silesia village. Mendel worked in Augustinian Monastery as monk at Brunn city, **Austria.**
- In 1856-57, he started his historical experiments of heredity on pea (pisum sativum) plant. His experimental work continued on pea plant till 1865 (19th century).
- The results of his experiments were published in the science journal, **"Nature For schender varien"** in 1866.
- This journal was in Germen language. Title was **"verschue uber Pflangen Hybridan"**.
- This journal was published by **'Natural History society of Bruno'.**
- A paper of Mendel by the name of ''Experiment in plant Hybridization'' published in this journal. Mendel was unable to get any popularity. No one understood of him. He died in 1884 without getting any credit of his work due to kidney disease (Bright disease).
- After 16 years of Mendel's death in 1900, Mendel's postulates were rediscovered. Rediscovery by three scientists independently.
- **Carl Correns** : Germany (Experiment on Maize).
- **Hugo deVries** (Holland) (Experiment on Evening Primerose).
  He republished the Mendel's results in 1901 in **Flora** magazine.
- **Erich von Tschermak Seysenegg** - (Austria) (Experiment on different flowering plants).
  The credit of rediscovery of Mendelism goes to three scientists.
  Correns given two laws of Mendelism
  Law of heredity / Inheritance / Mendel

✸ **Mendel Results Remain Hidden due to :**

- At that time Darwin's book ''Origin of Species'' published. Scientists were busy in discussion with this book.
- Medel's ideas were ahead of that time.
- Mendel used higher statistical calculation in his experiments so the results were complicated to understand.
- Mendel also performed his experiments on Hawkeweed (hieracium) and beans (Lablab) plant on suggestion of Karl Nageli but mendel did not get succeed in Heriacium, Parthenogenesis is present in it.

✸ **Reasons for Mendel's success :**

- Mendel studied the inheretance of one or two characters at a time unlike his predecessors who had considered many characters at a time (Kolreuter-Tobacco plant, John Goss & Knight-Pea plant).
- Selection of Material (Pea plant - Pisum sativum)
- Selection of garden pea plant is suitable for studies. Which have following advantage.
- Pea plant is annual plant with short life cycle of 2-3 months so large number of offsprings can be analysed within a short period of time.
- It has many contrasting traits.
- Natural self pollination is present in pea plant so purity of character is maintained in it.
- Cross pollination can be performed in it artificially so hybridization can be made possible.
- Pea plant easy to cultivate.
- Pea seeds are large. In addition to pea, Mendel worked on rajama.

- Mendel quantitatively analyse the inheritance of qualitative characters.
- He maintained the statistical records of all the experiments.

✸ **Mendel's work** : Mendel studied 7 characters or 7 pairs of contrasting traits.

Actual data obtained by Mendel in F_2 progenies in garden pea				
S.No.	**Character (Chromosomal position)**	**Dominant**	**Recessive**	**Ratio**
1	Length of plant (4)	787 (tall)	277 (dwarf)	2.84:1
2	Colour of flower (1)	705 (violet)	224 (white)	3.15:1
3	Pod or flower position (4)	651 (axial)	207 (terminal)	3.14:1
4	Shape of pod (4)	882 (inflated)	299 (constricted)	2.94:1
5	Colour of pod (5)	428 (green)	152 (yellow)	2.82:1
6	Shape of seed (7)	5,474 (round)	1850 (wrinkled)	2.96:1
7	Colour of cotyledon (1)	6,022 (yellow)	2,001 (green)	3.01:1
Average of all traits studied				2.98:(=3:1)

✸ **Technique of Mendel**

He developed a technique **Emasculation and Bagging** for hybridization in plants.

Flowers of pea plant are bisexual. In this method one considered as male and another as female.

The plant used as female, stamens of this plant are removed at juvenile stage, this is called Emasculation.

Emasculation is done to prevent self pollination.

Emasculated flowers covered by bags, this is called bagging.

Bagging is only used to prevent undersirable cross pollination.

Mature pollen grains are collected from male plants and spread over emasculated flower.

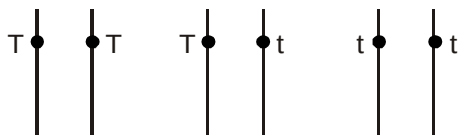
Seeds are formed in the female flower after pollination.

The plants that are obtained from these seeds are called First Filial generation or F_1 generation according to mendel.

Mendel was great plant breader (true breader)

SOME DEFINED TERMS

1. **Factors :** Unit of heredity which is responsible for inheritance and appearance of characters. These factors were referred as genes by **Johannsen** (1909). Mendel used term "**element**" for factor.
2. **Morgan** first use symbol to represent the factor. Dominant factor are represented by capital letter while recessive factor by small letter
3. **Allele :** Alternative forms of a gene which are located on same position [locus] on the homologous chromosome is called Allele. Term allele was coined by **Bateson.**

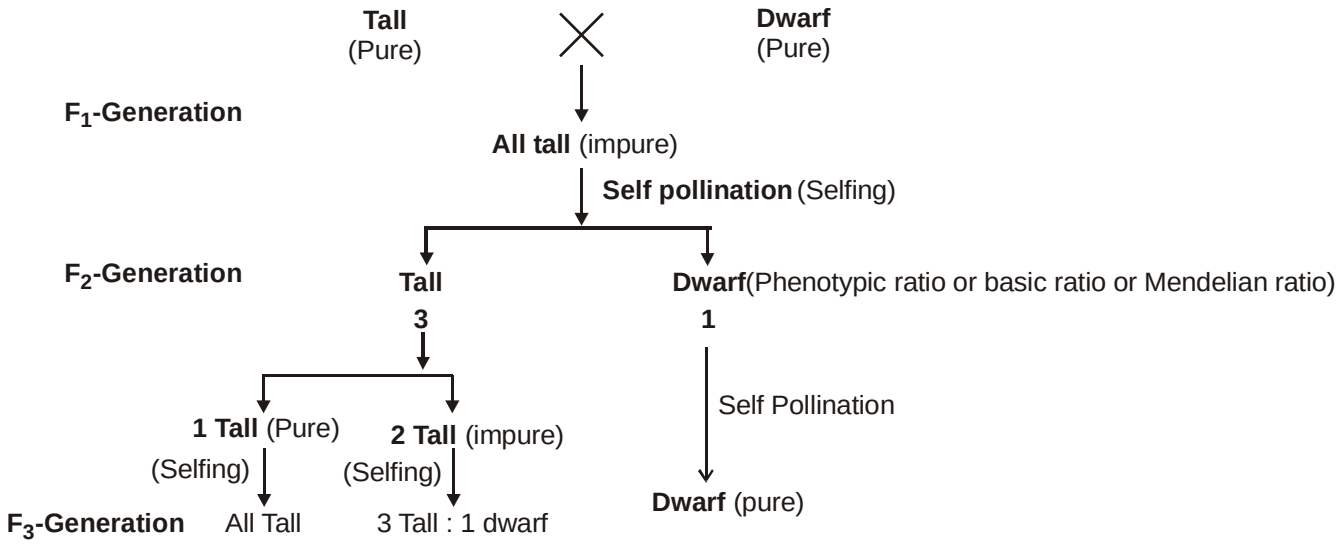


4. **Homozygous** : A zygote is formed by fusion of two gametes having identicle factors is called homozygote and organism developed from this zygote is called homozygous. Ex. TT, RR, tt
5. **Heterozygous :** A zygote is formed by fusion of two different types of gamete carrying different factors is called Heterozygous (Tt) (Rr) and individual developed from such zygote is called hetrozygous. The term homozygous and heterozygous are coined by **Bateson.**

6. **Hemizygous :** If individual contains only one gene of a pair then individual said to be hemizygous. Male individual is always hemizygous for sex linked gene.
7. **Phenotype :** It is the external and morphological appearance of an organism for a particular character.
8. **Genotype :** The genetic constitution or genetic make-up of an organism for a particular character. Genotype & phenotype terms were coined by **Johannsen.**
9. **Phenocopy :** If different genotypes are placed in different environmental conditions if they produce same phenotype. These individual are said to be Phenocopy of each other.

MONOHYBRID CROSS

When we consider the inheritance of one character at a time by a cross is called monohybrid cross. First of all, Mendel selected tall and dwarf plants



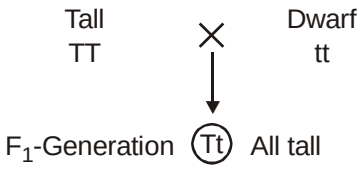
Conclusions (results) of Monohybrid Cross

- **Ist Conclusion :**

  According to Mendel each genetic character is controlled by a pair of unit factor. It is known as conclusion of paired factor or unit factor.

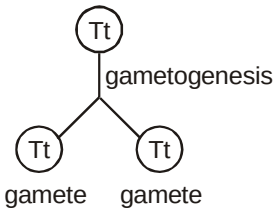
- **IInd Conclusion :**

  This conclusion is based on F_1 - generation. When two different unit factors are present in single individual, then only one unit factor is able to express itself and known as dominant unit factor. Another unit factor fails to express is the recessive factor. In the presence of dominant unit factor recessive unit factor can not express and it is known as conclusion of dominance.



- **IIIrd Conclusion :**

  During gamete formation; the unit factors of a pair segregate randomly and transfer inside different gamete. Each gamete receives only one factor of a pair; so gametes are pure for a particular trait. It is known as conclusion of purity of gametes or segregation.



DIHYBRID CROSS

A cross in which study of inheritance of two pairs of contrasting traits or two characters.

Mendel wanted to observe the effect of one character on another character.

Mendel selected traits for dihybrid cross for his experiment as follows :

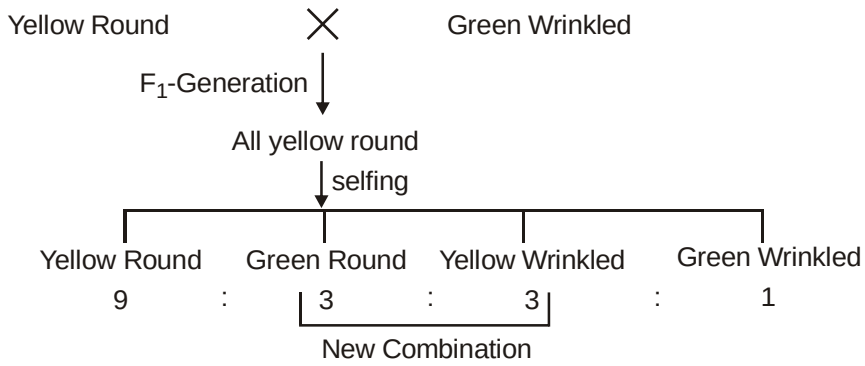
Colour of cotyledons → Yellow (Y) & Green (y)

Seed form → Round (R) and Wrinkled (r)

Yellow and round characters are dominant and green and wrinkled are recesive characters. Mendel crossed yellow and round seeded plants with green and wrinkled seeded plants. All the plants in F_1-generation had yellow and round seeds.

All the plants in F_1-generation had yellow and round seeds.

When F_1 plants were self pollinated to produce four kinds of plants in F_2 generation such as yellow round, yellow-wrinkled, green round and green wrinkled, there were in the ratio of 9 : 3 : 3 : 1. This ratio is known as Dihybrid ratio.



Expression of yellow round (9) and green wrinkled (1) traits shows as their parental combination. Green round and yellow wrinkled type of plants are produced by the results of new combination (Recombinant).

- **Conclusion :**

The F_2 generation plant produce two new phenotypes, so inheritance of seed coat colour is independent from the inheritance of shape of seed. Otherwise It can not possible to obtain yellow wrinkled and green round type of seeds.

This observation leads to the Mendel's conclusion that different type of characters present in plants assorted independently during inheritace.

This is known as **Conclusion of Independent Assortment**. It is based on F_2 - generation of dihybrid cross. The nonhomologous chromosome show random distribution during anaphasei-I of meiosis.

- **Explaination :**

A pure yellow and round seeded plant crossed with green and wrinkled seeded plant which are having genotype YYRR and yyrr to produced F_1 generation having YyRr genotype.

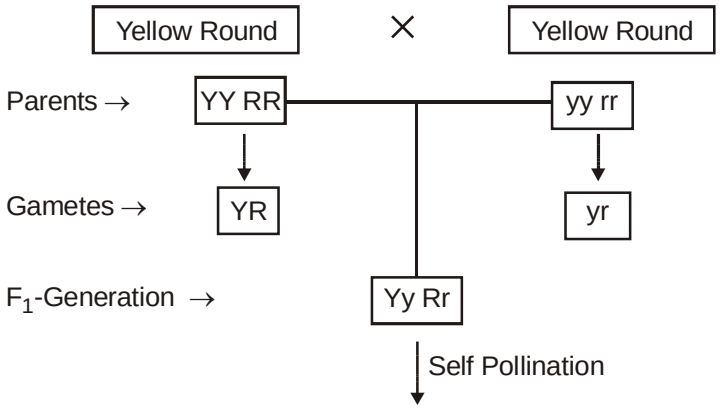
Both the characters recombine independently from each other during gamete formation in F_1 generation. Factor (R) of pair factor (r) is having equal change to (Y) factor or (y) factor of gametes during recombination to form two type of gametes (YR) and (yr).

Similarly (r) factor also having equal change with (Y) factor or (y) factor of gametes to form a two type gamets (Yr) and (yr).

Thus, total four types of gametes - (YR), (yr), (yR), (yr) are formed.

Therefore during the gametes formation in F_1 generation new combination or recombination appear in F_2.

✸ **Demonstration by checker board method**



F_2 - Generation ➡

	YR	**Yr**	**yR**	**yr**
YR	YYRR	YYRr	YyRR	YyRr
Yr	YYRr	YYrr	YyRr	Yyrr
yR	YyRR	YyRr	yyRR	yyRr
yr	YyRr	Yyrr	yyRr	yyrr

Yellow Round = 9 / 16 Green Round = 3 / 16

Yellow Wrinkled = 3 / 16 Green Wrinkled = 1 / 16

Phenotypic Ratio = 9 : 3 : 3 : 1

Phenotype		**Genotype**		
Homozygous yellow & Homozygous Round	—	YY RR	=	1
Homozygous yellow & Heterozygous Round	—	YY Rr	=	2
Heterozygous yellow & Homozygous Round	—	Yy RR	=	2
Heterozygous yellow & Heterozygous Round	—	Yy Rr	=	4
Homozygous yellow & Homozygous wrinkled	—	YY rr	=	1
Heterozygous yellow & Homozygous wrinkled	—	Yy rr	=	2
Homozygous green & Homozygous Round	—	yy RR	=	1
Homozygous green & Heterozygous Round	—	yy Rr	=	2
Homozygous green & Homozygous wrinkled	—	yy rr	=	1
F_2 Genotypic Ratio = 1:2:2:4:1:2:1:2:1	—			

Number of traits hybrid (n)	**Experiment**	**Types of gametes (2^n)**	**Number of Zygotes / offsprings (gametes)^2**	**Number of Phenotype (2^n)**	**Number of genotype (3^n)**	**Phenotypic Ratio**	**Genotypic Ratio**
1	Monohybrid cross (Aa × Aa)	$2^n = 2^1 = 2$	$2^2 = 4$	$2^n = 2^1 = 2$	$3^1 = 3$	3 : 1	1 : 2 : 1
2	Dihybrid cross (AaBb × AaBb)	$2^2 = 4$	$4^2 = 16$	$2^2 = 4$	$3^2 = 9$	$(3 : 1)^2$ = 9 : 3 : 3 : 1	$(1 : 2 : 1)^2$ = 2 : 4 : 2 : 1 : 2 : 1 : 1 : 2 : 1
3	Trihybrid cross AaBbCc × AaBbCc	$2^3 = 8$	$8^2 = 64$	$2^3 = 8$	$3^3 = 27$	$(3 : 1)^n$	$(1 : 2 : 1)^3$

- **Back Cross :**

  A back cross is a cross in which F_1 individuals are crossed with any of their parents.

  When F_1 individual is crossed with dominant parent then it is termed **out cross.** The generation obtained from this cross, all possess dominant character.

- **Test Cross :** When F_1 progency is crossed with recessive parent then it is called test cross. The total generations obtained from this cross, 50% having dominant character and 50% having recessive character. [Monoybrid test cross]. Test cross helps to find out the genotype of dominant individual. Whether it is homozyous or heterozyous for that character

- **Monhybrid Test Cross :** The progeny obtained, from the monohybrid test cross are in equal proportion, means 50% is dominant phenotypes and 50% is recessive phenotypes. It can be represented in symbolic forms as follows.

F_1 progeny(hybrid) T t × F recessive parent t t

	t
T	Tt
t	tt

Monohybrid test cross ratio = 1 : 1

Dilhybrid Test Cross : The progency is obtained from dihybrid test cross are four types and each of them is 25%

F_1 - dihybrid [T t R r] × recessive parent [t t r r]

	RT	Tr	Tr	Tr
tr	TtRr	Ttrr	ttRr	Ttrr

Phenotype or Genotype ratio of Dihybrid test cross = 1:1:1:1

- **Conclusion :** In test cross phenotypes and genotypes ratio are same.
- **Trihybrid test** cross (phenotype, genotype) ratio = 1 : 1 : 1 : 1 : 1 : 1 : 1 : 1
- **Reciprocal Cross :**

  When two parents are used in two experiments in such a way that in one experiment ''A'' is used as the female parent and ''B'' is used as the male parent, in the other experiment ''A'' will be used as the male parent and ''B'' as the female parent. Such type of a set of two experiments is called Reciprocal cross. Characters which are controlled by karyogene are not affected by Reciprocal cross. In case of cytoplasmic inheritance result become change by Reciprocal cross.

(a) TT (Female) × tt (Male) → All Tall

(b) TT (Male) × tt (Female) → All Tall

CYTOPLASMIC INHERITANCE (Correns)

Inheritance of characters which are contorlled by cytogene or cytoplasm is called cytoplosmic inheritance. Genes which are present in cytoplasm called **'Cytogene'** or **'Plasmagene'** or **extra nuclear gene.** Total cytogene present in cytoplasm is called '**Plasmon**'.

A gene which is located in the nucleus is called '**karyogene**'.

- Inheritance of cytogene in higher plants only through the female.
- The male gamete of higher plant is called male nucleus. It has very minute [equivelent to nil] cytoplasm.So male gamete only inherited karyogene.
- Thus, inheritance of cytogene only through female cytoplasm. (also called maternal inheritance)
- If there is a reciprocal cross in this condition, then result will be effected.

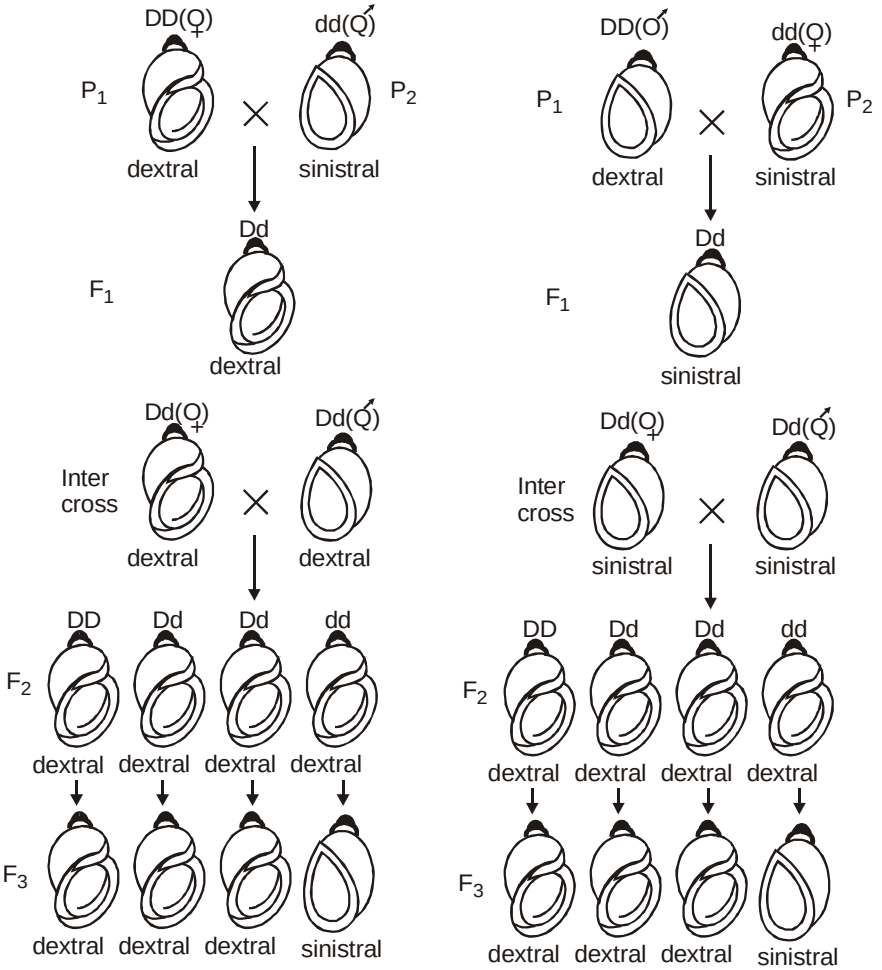
✸ **Cytoplasmic inheretance of three types :**

- Maternal effect depending indirectly on nuclear genes and involving no known cytoplasmic cytoplasmic hereditary unit called as **predetermination.** maternal effect is determine before fertilization.
- Cytoplasmic inheritance involving dispensable and infective heredetary particle in cytoplasm which may or may not depend on nuclear genes called as **Dauermodification.**
- Cytoplasmic inheritance involving essential organelles like, Chloroplast and mitochondria called as **organellar genetics.**

Example of predetermination :

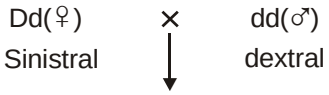
Shell coiling in snail (Limnaea peregra)

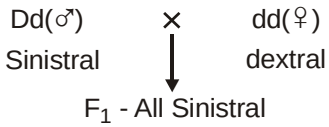
In Shell coiling of snail can be dextral (Coiling to the right) or sinistral (coiling to the left). This direction of coiling is genetically the dextral coiling depending upon maternal dominant allele D and sinistral coiling depending upon maternal recessive allele (d).



Above reciprocal cross indicates that phenotype of offspring is decided by genotype of female parent not the phenotype of female parent. If female parent contains only one dominant gene 'D' then phenotype of all offspring will be dextral.

Example :



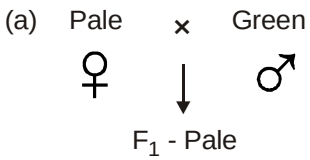


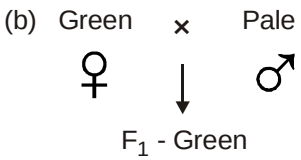
- **Example of Dauermodification -**
- **Sigma particle in Drosophila** these particle are virus like particles which are present in Drosophila and related to CO_2 sensitivity. Inheritance of sigma particle takes place through the egg cytoplasm.
- **Kaapa particle in Paramecium** kappa particles are found in certain ''Killer strains'' of Paramecium and are responsible for production of substance paramecin which is toxic to strain not prossessing Kappa. (Sensitive Strain)

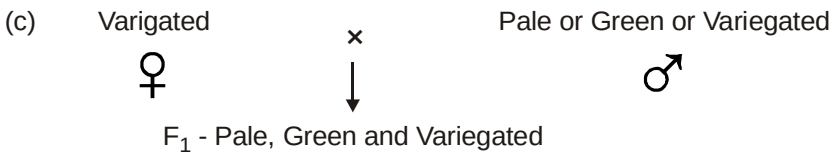
  The minimum number of kappa particlesis 400 to secrete paramecin. Kappa particles are symbiotic bacteria named **"Caedobacter taeniospiralis"**
- **Example of Organellar Genetics :** (True examles of cytoplasmic inheritance)
- **Plastid inheritance in Mirabilis jalapa –** cytoplasmic inheritance first discovered by **Correns** in Mirabilis jalapa.

  In Mirabilis jalapa plastid inheritance i.e. branch colour is example of cytoplasmic inheritance.

Branch colour







- **Male strelity in maize plant –** Gene of male sterelity present in mitochondria. If a normal male plant crossed with a female plant which has genes of male sterelity then all the generation become male sterile because a particular gene was present in female which inherited by female.
- **Albinism in plant :** Gene of albinism is found in chloroplast. Gene of albinism is leathal in plant.
- **Inheritance of Bacterial plasmid.** In bacteria plasmid inheritance is due to conjugation.
- **Petite form in yeast** = (mitochondrial gene) petite is mutant form of yeast. This mutant form is slow growing on culture medium.
- **Iojap inheritance in Maize** Iojap is characterized by contrasting strip of green and white colour of leaves.
- **Poky Neurospora** - (Mitochondrial gene) poky is mutant form of Neurospora. It is slow growing on culture medium.
- **Exceptions of conclusions of Mendel :**
- **Exception of Dominance :** There are two exceptions of law of dominance.

  (A) Incomplete dominance; (B) Co-dominance,

A. Incomplete Dominance : According to Mendel's law of dominance. Dominant character must be present in F_1 generation. But in some organisms, F_1 generation is **different** from the both parents.

Both factors such as dominant and recessive are present in incomplete dominance but dominant factors are unable to express their character completely, resulting different type of generation is formed which is different from the both parents.

Incomplete dominance was first discovered by **Correns** in Mirabilis jalapa. This plant is also called as **'4 O' clock plant** 'or' **Gul-e-Bans'**.

- Three different types of plant are found in Mirabilis on the basis of flower colour, such as red, white and pink. When plants with red flowers is crossed with white flower plants, pink flower obtained in F_1 generation the reason of this is that the genes of red colour incompletely dominant over the genes of white colour.

When F_1 generation of pink flower is self pollinated then the phenotypic ratio of F_2 generation is red, pink, white = 1 : 2 : 1 in placed of normal monohybrid cross - 3 : 1

The ratio of phenotype and gentype of F_2 generation in incomplete dominance is always same.

Red × White

R R ↓ r r

F_1 geheration R r (Pink) →

↓ Self pollination

F_2 – Generation

	R	r
R	RR	Rr
r	Rr	rr

RR = Red - 1

Rr = Pink - 2

rr = White - 1

- **Antirrhinum majus -** Incomplete dominance is also seen in this plant. This plant is also known as **'Snapdragon'** or **'Dog flower'**. Incomplete dominance is found in this plant which is the same as Mirabilis flower colour.
- **Andalusian Fowls -** Incomplete dominance is present for their feather colour. When a black colour fowl is crossed with a white colour fowl, the colour of F_1 generation is blue.

✸ **CO-DOMINANCE :** In this phenomenon, both the gene expressed for a particular character in F_1 hybrid progeny.

Examples : Co-dominance is seen in animals for coat colour.

When a black parent is crossed with white parent, a roan colour F_1 progeny is produced.

When we obtain F_2 generation from the F_1 generation, the ratio of black; black white (Roan);white of animals is 1 : 2 : 1.

Note : F_2 generation is obtained in animals by sib-mating cross.

BLACK × WHITE

R_1R_1 ↓ R_2R_2

F_1 generation R_1R_2 (Roan)

↓ Sib-mating cross

	R_1	R_2
R_1	R_1R_1	R_1R_2
R_2	R_1R_2	R_2R_2

R_1R_1 = Black 1 R_1R_2 = Roan - 2 R_2R_2 = White - 1

It is obvious by above analysis that the ratio of phenotype as well as genotype is 1 : 2 : 1 in co-dominance.

Sp. Note : In incomplete dominance, characters are blended phenotypically, while in co-dominace, both the ganes of a pair exhibit both the characters and effect of both the character is independent from each other.

Other Example of Co-dominance :

- AB blood group ibheritance (I^AI^B)
- Carrier of Sickle cell anaemia (Hb^ Hb^S)

✸ **Conclusion of Segregation :** There is no exception of law of segregation. The segeragation is essential during the meiotic division in all sexually reproducing organisms. (Nondisiunction may be exception of the law).

✸ **Exception of conclusion of independent assortment**

The law of independent assortment is most criticised. Linkage is the exception of this law.

LINKAGE :

Collective inheritance of character is called linkage first time seen by **Bateson and Punnett** in ***Lathyrus odratus*** and gave **coupling and repulsion phenomenon.** But they did not explain the phenomenon of linkage. Sex linkage was first discovered by **Morgan** in Drosophila & coined the term linkage. He proposed the theory of linkage.

In 1906, **Bateson and Punnet** crossed two varieties of Lathyrus odoratus (sweet pea) and observed that the results do not agree with the mendel's law of independent assortment. They formulated the hypothesis of **coupling and repulsion** to explain the unexpected F_2 results of dihybrid cross between a homozygous sweet pea having dominant alleles for blue flowers (BB) and long grains (LL) with another homozygous double recessive plant with red flowers and round pollen grains (bbll).

Test Cross Ratio of F_1 7 : 1 : 1 : 1 indicated that there was a tendency of the dominant alleles to remain together. Similar was the case with recessive alleles.

Parents	Blue flower & long pollen	×	Red flower & round pollen
	BBLL		bbll
Gametes	BL	×	bl
		↓	
F_1		BbLl	
		Blue flower & Long pollen	
Test cross		BbLl × bbll	

Test cross Progeny

7/16 :	1/16 :	1/16 :	7/16
Blue flower & long pollen (BbLl)	Blue flower & round pollen (Bbll)	Red flower & long pollen (bbLl)	Red flower & round pollen (bbll)

It was called **gametic coupling** by bateson and Punnet. The tendency of two dominant genes to remain together in the process of inheritance was called as **coupling.**

In another cross they took a sweet pea plant with blue flowers and round pollens (BBll) and other plant with red flowers and long pollens (bbLL) and obtained the **ratio of 1 : 7 : 7 : 1** by test crossing F_1 generation.

Parents	Blue flower & round pollen	×	Red flower & long pollen	
	BBll	↓	bbLL	
Gametes	Bl		bL	
F_1	BbLl			
	Blue flower & long pollen			
Test cross	BbLl	×	bbll	
	Blue flower & long pollen	↓	Red flower & round pollen	

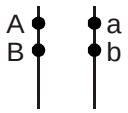
1/16	7/16	7/16	1/16
Blue flower & long pollen (BbLl)	Blue flower & round pollen (Bbll)	Red flower long pollen (bbLl)	Red flower & round pollen (bbll)

When two dominant or recessive genes comes from different parents, they tend to remain separate hence, this ratio is called repulsion ratio. **T.H. Morgan** in 1910 showed that coupling and repulsion are two aspects of the same phenomenon called linkage. He suggested that the two genes present on the same chromosome, are in **coupling phase** and when present on two different homologous chromosomes are in **repulsion phase**. Linkage therefore, may be defined as ''**The tendency of two genes of the same chromosome to remain together in the process of inheritance"**.

According to Morgan, the degree or the strength of linkage depends upon the distance between the linked genes in the chromosome.

Linkage and independent assortment can be represented in dihybrid plant

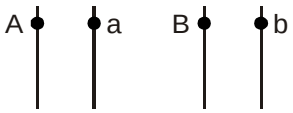
In case of linkage in dihybrid (AaBb)



It produces two types of gamete

AB : ab

In case of independent assortment in dihybrid (AaBb)



It produces four types of gamete

AB : ab : aB : Ab

✵ **Theory of linkage :**

Linkage genes are linearly located on same chromosome. They get separated if exchange (crossing over), takes place between them.

Strength of linkage α 1 / distance between the genes. It means, if the distance between two genes is increased then strength of linkage is reduced and it proves that greater is the distance between genes, the greater the probability of their crossing over.

Crossing over obviously disturbs or degenerates linkage. Linked genes can be separated by crossing over.

Factors effecting crossing over (C.O.) & Linkage

- Distance ↑ = C.O. ↑ Linkage ↓
- Temperature ↑ = C.O. ↑ Linkage ↓
- X-Ray ↑ = C.O. ↑ Linkage ↓
- Age ↑ = C.O. ↓ Linkage ↑
- Sex- Male C.O. ↓ (Crossing over totally absent in male Drosophila) Linkage ♂ > ♀

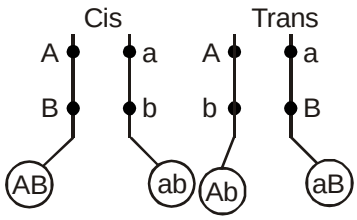
✸ **Arrangement of linked Genes on Chromosomes :**

The arrangement of linked genes in any dihybrid plant is two types.

A. Cis - Arrangement : When, two dominant genes located on one chromosome and both recessive genes located on another chromosome. Such type of arrangement is termed as cis-arrangement. Cis-arrangement is an original arrangement.

Two type of gomets can be produced in this arrangement → (AB) and (ab)

B. Trans arrangement : When a chromosome bears one dominant and one recessive gene, and another chromosome also possess one dominant and one recessive gene, such type of arrangement is called trans-arrangement. Trans arrangement is not an original form. It is due to crossing over. Two types of gamete also formed in trans-arrangement but it is different from cis-arrangement (Ab) and (aB).



✸ **Types of Linkage :**

There are two types of linkage

A. COMPLETE LINKAGE : Linkage in which genes always show parental combination. It never forms new combination.

Crossing over is absent in it. Such genes are located very close on the chromosomes. Such type of linkage very rare in nature e.g., male Drosophila, female silk moth.

B. INCOMPLETE LINKAGE : When new combinations also appear along with parental combination in offsprings, this type of linkage is called incomplete linkage, the new combinations form due to crossing over. The percentage of new combination is equal to the percentage of crossing over. (<50%)

Example : In maize incomplete linkage was observed by **Hutchinson.** w.r.t seed coat colour and seed shape.

The results show that parental combination of alleles (CS/CS and cs/cs) appear in about 96% cases. The other two are new combinations (Cs/cs and cS/cs) apear in about 4% cases. Thus in about 4% cases crossing over has occured between linked genes.

Parents	Coloured & full	×		Colourless & shrunken
	CS / CS			cs / cs
Gametes	CS	×		cs
		↓		
F_1		CS / cs		
		Coloured & full		
Test cross		Cs/cs	×	cs / cs
Gametes	cs			
Result :	CS	CS/cs	–	Coloured & full 48.2%
	cs	Cs/cs	–	Coloured & shrunken 1.8%
	cS	cS/cs	–	Colourless & full 1.8%
	cs	cs/cs	–	Colourless & shruken 48.2%

Incomplete Linkage

Another example was demonstrated by Morgan, while working with Drosphila. (i) Crossing of yellow bodied (Y) and white eyed (W) female with brown bodied (Y^+) red eyed (W^+) male produced F_1 to be brown bodied red eyed. In F_2 generation, obtained by selfing of F_1 hybrids, the ratio deviated significantly from expected. He found 98.7% to be parental and 1.3% as recombinants. (ii) In a second cross between white eyed and miniature winged female (wwmm) wild red eyed normal winged male ($W^+W^+M^+M^+$) all hybrids were found to be wild type. Test cross progency of this hybrid was found to be 62.8% parental and 37.2% recombinant.

Linkag group : All the genes which which are loacated on one pair of homologous chromosome form one linkage group. Genes which are located on homologous chromosomes are allelic so we consider one linkage group.

Linkage group – haploid no. of homologous chromosomes.

	2n	**n**	**Pair**	**Linkage group**
Human	46	23	23	23
Mouse	42	21	21	21
Frog	26	13	13	13
Maize	20	10	10	10
Pea	14	7	7	7
Drosophila	8	4	4	4
Neurospora	7	7	7	7
Bacteria / B.G.A.	–	–	–	1

Application of Linkage :

Distance can be identified by the incomplete linakage. It's unit is centi Morgan (cM).

$$\text{Strength of linkage} \propto \frac{1}{\text{Distance b/w linked gene}} \propto \frac{1}{\text{Crossing Over}}$$

Genetic map / Linkage map / chromosome map – In genetic map different linked genes are linearly arranged or chromosome according to percentage of crossing over ($\propto$ Distance) between them.

With the help of genetic map we can find out the position of a particular gene on chromosome. Genetic map is helpful in the study of genome.

- **Sex Linkage**

When the genes of vegetative / somatic characters are present on sex-chromosome is termed as sex linked gene and such phenomenon is known as sex-linkage. Two - types of sex linkage :

- **X-linkage :** Genes of sometic characters are found on x-chromosome. the inheritance of x-linked character may be through the males and females.

  e.g., Haemophilia, Colour blindness

- **Y-linkage :** The genes of somatic characters are located on Y-chromosome. The inheritance of such type of character only through the males, such type of character is called Holandric character these characters only found in male.

  e.g. Gene which forms TDF

  Hypertrichosis (excessive hair on ear pinna.)

Gene which is located on differential region of Y - chromosome is known as Holandric gene.

Example of X- linkage :

- **Eye colour in Drosophila :** Eye colour in Drosophila is controlled by a X-linked gene. If a red eyed colour gene is represented as '+' and white eyed colour represented as 'w', then on basis of this different type of genotypes are found in Drosophila.
  Gene for red eye domainant (+) and white colour of eye is recessive (w)
  Homozygous red eyed female = X^+X^+
  Heterozygous red eyed female = X^+X^w
  Homozygous white eyed female = X^wX^w
  Hemizygous red eyed male = $X^+ Y$
  Hemizygous white eyed male = X^wY
  It is clear by above different types of genotype that female either homozygous or heterozygous for eye colour. But, for the male eye colour, it is always hemizygous.
- **Haemophilia :** Haemophilia is also called "**bleeder's disease"** and first discovered by **John Otto** (1803). The gene of haemophilia is recessive and x-linked lethal gene.
  On the basis of x-linked, following types of genotype are found.
  X^hX = Carrier female
  X^hX^h = Affected female
  X^hY = Affected male
  But X^hX^h type of female dies during embryo stage because in homozygous condition, this gene is lethal and causes death.
- Haemophilia - A $\rightarrow$ due to lack of factor - VIII (Antihaemophilic globulin AHG)
- Haemophilia B or Christmas disease - due to lack of factor - IX (plasma thromboplastin component)
  Haemophila -C - due to lack of factor XI (plasma thromboplastin anticedent)
  Colour Blindness : The inheritance of colour blindness is like as haemophilia, but it is not a lethal disease so it is found in both male and female (discoverd by **Horner**)
  Three types of colour blindness are :
- **Protanopia** : It is for **red** colour.
- **Deuteranopia :** It is for **green** colour
- **Tritanopia : Blue** colour blindness. Colour blindness is cheked by **Ishihara - chart**.
- **Other examples of X - linkage**
  - Diabetes insipidus (recessive).
  - Duchenne muscular dystrophy (recessive)
  - Fragile x syndrome (recessive).
  - Pesudoricketes (Dominant)
  - Defective enamel of teeth (Dominant)

Types of Inheritance of sex linked characters :

- **Criss Cross inheritance (Morgan) :** In criss-cross inheritance male or famale parent transfer a X-linked character to grandson or grand daughter through the offspring of opposite sex.
- **Diagenic :** Inheritance in which characters are inherited from father to the daughter and from daughter to grandson.
  Father $\rightarrow$ Daughter $\rightarrow$ Grand Son
- **Diandric :** Inheritance in which characters are inherited from mother to the son and from son to grand daughter. Mother $\rightarrow$ Son $\rightarrow$ Grand Daughter
- **Non criss-cross inheritance :** In this inheritance male or female parent transfer sex linked character to grand son or grand daughter through the offspring of same sex.

- **Hologenic :** Mother → Daughter → Grand-daughter (female to female)
- **Holandric :** Father → Son → Grand-son (male to male)

✸ **Sex-Limited Character :** These characters are expressed in one sex and unexpressed in another sex. But their genes are present on autosome of both the sexes and their expression is depend on sex hormone.
Example : Secondary sexual characters → these genes located on the autosomes and these genes are present in both male and female, but effect of these are depend upon presence or absence of sex-hormones. For example - genes of beard & moustache express their effects only in the presence of male hormone - testosterone.

✸ **Sex Influenced Characters :** Genes of these characters are also present on autosomes but they are influenced differently in male and female. In heterozygous condition their effect is different in both the sexes. Example : Baldness : Gene of baldness is dominant (B).

Genotype	Male (♂)	Female (♀)
BB	Baldness present	Baldness present
bb	Baldness absent	Baldness absent
Bb	Baldness present	Baldness absent

Gene Bb shows partiality in male and female, Baldness is found in male, but baldness is absent in female with this genotype.

MULTIPLE ALLELE

More than 2 alternative forms of a gene is called multiple allele.
Multiple allele is formed due to mutation.
Multiple allel located on same locus of homologous chromosome.
A diploid individual contains two allele and gamete contains one allele for a character.
Ex. Blood group - 3 alleles
Coat colour in rabit - 4 allels

If n is the number of allele of a gene then number of different possible genotype = $\frac{n(n+1)}{2}$

Example of multiple allele :

✸ **ABO blood group –** ABO blood groups are determined by allele I^{λ}. allele I^B, allele I^0
I^A = dominant
I^B = dominant
I^O = recessive
Possible phenotypes - A, B, AB, O

Blood Group	Genotype	Antigen or agglutinuogen	Antibody or agglutinin
A	I^AI^A, I^AI^O	A	b
B	I^BI^B, I^BI^O	B	a
AB	$I^\wedge I^B$	A & B	None
O	I^OI^O	none	a & b

Possible genotype number = $\frac{3(3+1)}{2}$ = 6 genotype

- **Coat Colour in rabbit :** Four allels for colour in rabbit

Wild type = Full coloured = agouti = C^+

Himalayan [white with black tip on extremities (like nose, tail and feet)] = c^h

Chinchilla [mixed coloured and white hairs] = c^{ch}

albino = olourless = c^a

These allels show order of dominance $C^+ > c^{ch} > c^h > c^a$

Possible genotypes –

Coloured = C^+C^+, C^+c^{ch}, C^+c^h C^+c^a

Chinchilla = $c^{ch}c^{ch}$, $c^{ch}c^h$, $c^{ch}c^a$

Himalayan = c^hc^h, c^hc^a

Albino = c^ac^a

Possible genotype = $\frac{4(4+1)}{2}$ = 10 genotypes

Eye colour in Drosophila and self incompatibility genes in plants are also the example of multiple allelism.

LETHAL GENE

Gene which causes death of individual in early stage when it comes in homozygous condition called lethal gene. Lethal gane may be dominant or recessive both.

Many of these genes which do not cause definite lethelity are called semilethals.

In semilethal gene death occurs in late stage.

- Lethal gene was discovered by **L.Cuenot** in coat colour of mice, Yellow body colour (Y) was dominant over brown colour (y).

Gene of yellow body colour is lethal.

So homozygous yellow mice are never obtained in population. It dies in embryonal stage.

When yellow mice were crossed among themselves segregation for yellow and brown body colour is obtained in2 : 1 ratio.

Yy × Yy

	Y	y
Y	YY (Death)	Yy
y	Yy	yy

YY - death in embryonal stage so modified ratio = 2 : 1

In plant lethal gene was first discovered by **E.Baur** in Snapdragon (Antirrhinum majus)

Snapdragon → Golden leaves (G)

Snapdragon → Green leaves (g)

Golden (Gg) × Golden (Gg)

	G	g
G	GG (Death)	Gg
g	Gg	gg

Modified Ratio : 2 : 1

Homozygous golden leaves are never obtained.

Sickle cell anaemia in human. In human, gene of sickle cell anaemia Hb^S is the example of sub lethal gene. When two carrier individual of sickle cell anaemia are crossed then offsprings are obtianed.

$Hb^SHb^A \times Hb^SHb^A$

	Hb^S	Hb^A
Hb^S	Hb^SHb^S (Death)	Hb^SHb^A
Hb^A	Hb^SHb^A	Hb^AHb^A

Modified ratio 2 : 1

PLEIOTROPIC GENE

Gene which controls more than one character is called pleiotropic gene.

This gene shows multiple phenotypic effect.

For example :

In Pea plant : Single gene influences → Seed coal colour, Red spot on leaf, Flower colour

In Drosophila recessive gene of vestigial wings also influence the some another characters

- Structure of reproductive organs
- Longevity (Length of Body)
- Bristles on wings.
- Reduction in egg production.

Example of pleiotropic gene in human.

- **Sickle cell anaemia-** Gene Hb^s provide a classical example of pleiotrophy. It not only causes haemolytic anaemia but also results increased resistance to one type of malaria that caused by the parasite *Plasmodium falciparum*.

The sickle cell Hb^S allele also has pleiotropic effect on the development of many tissue and organs such as bone, lungs, kidney, spleen, heart.

G **Cystic fibrosis -** Hereditary metabolic disorder that is controlled by a single autosomal recessive gene. The gene specifies an enzyme that produces a unique glycoprotein.

This glycopotien results in the production of mucous.

More mucous interfere with normal functioning of several exocrine glands including those in the skin, lungs liver and pancreas.

POLYGENIC INHERITANCE :

Inheritance of characters in which one character is controlled by many genes and intensity of character depends upon the number of dominant allele or gene.

Polygenic inheritance first described by **Nilsson - Ehle** in kernal colour of wheat.

Nilsson - Ehle said explain kernal colour of wheat is regulated by two pairs of gene.

RRBB × rrbb

Red White

↓

F_1- gen. RrBb (intermediate)

↓

	Full red	light red	Intermediate red	very light	white
Number of dominant allele	4	3	2	1	0

1 Red : 14 intermediate : 1 white

Example - Colour of the skin in Human.

The inheritance of colour of skin in human studied by **Devenport.**

When Negro (AA BB) phenotype crossed with white (aa bb) phenotype, intermediate phenotype produced in F_1 generation. Phenotypes of F_2 generation as follows.

Negro × White

AA BB ↓ aa bb

F_1 - generation → Aa Bb (Intermediate)

↓

F_2

	A B	**A b**	**a B**	**a b**
A B	AA BB Negro	AA Bb Dark	AbBB Dark	AaBb Intermediate
A b	AA Bb Dark	AA bb Intermediate	AaBb Intermediate	Aabb Light
a B	AaBB Dark	AaBb Intermediate	aa BB Intermediate	aa Bb Light
a b	AaBb Intermediate	Aabb Light	aaBb Light	aabb White

Thus, **Phenotypic ratio** of F_2 generation of quantitative inheritance as (2 pair)

Negro	:	Dark	:	Intermediate	:	Light	:	White
1	:	4	:	6	:	4	:	1

If human skin colour and kernal colour in wheat is regulated by **3 pairs** of alleles so phenotypic ration of F_2 generation

Ratio	1	:	6	:	15	:	20	:	15	:	6	:	1

Negro Intermediate or Mullato White

GENE INTERACTION

Gene interaction is two types (i) allelic interaction : allelic interaction takes place between allele of same gene which are present at same locus.

e.g. Incomplete dominance

Co-dominance

- **Non allelic gene interaction :** When interaction takes place between non allele is called non allelic gene interaction. It changes or modifies other non allelic gene.

✸ **Examples of nonallelic interaction :**

- **Epistasis :** When, a gene prevents the expression of another non-allelic gene, then it is known as epistatic gene and this phenomenon is known as Epistasis.

  Gene which inhibit the expression of another non-alleleic gene is called epistatic gene and expression of gene which is suppressed by epistatic gene is called hypostatic gene.

  Example : Hair Colour in Dog :

  B = Dominant allele for black colour of hairs

  b = Recessive allele for brown colour of hairs.

  I = Epistatic gene (White).

  If the genotype bbii for brown colour and BBII for white colour. Following types of generation will be obtained by following crosses.

bbII × BBII

↓

F_1 generation BbIi White colour

↓ F_2 generation

	BI	Bi	bI	bi
BI	BBII White	BBIi White	BbII White	BbIi white
Bi	BBIi White	BBii Black	BbIi White	Bbii Black
bI	BbII White	BbIi White	bbII White	bbIi white
bi	BbIi White	Bbii Black	bbIi White	bbii Brown

It is obviously clear by above analysis, the phenotypic ratio of F_2-generation in epistasis is 12 : 3 : 1.

✸ **Complementary Gene :** Two pair of non allelic genes are essential in dominant form to produce a particuar character.

Such genes that act together to produce an effect that neither can produce, its effect separately are called complementary genes.

Both types of gene must be present in dominant form.

C – P purple coloured

C – pp colour less

cc – p colour less

cc – pp colour less

Row material $\xrightarrow{\text{Gene C}}$ Chromogen $\xrightarrow{\text{Gene P}}$ Anthocyanin (purple)

CC PP × cc pp

(coloured) (Colourless)

↓

F_1 - Generation → CcPp (Coloured)

↓

	C P	C p	c P	c p
C P	CC PP Coloured	CC, Pp Coloured	Cc, PP Coloured	Cc, Pp Coloured
C p	CC Pp Coloured	CC pp Colourless	Cc, Pp Coloured	Cc, pp Colourless
c P	Cc PP Coloured	Cc Pp Coloured	cc PP Colourless	cc Pp Colourless
c p	Cc Pp Coloured	Cc pp Colourless	cc Pp Colourless	cc pp Colourless

Thus phenogypic ratio of complementary genes = Colourled : Colourless [9 : 7]

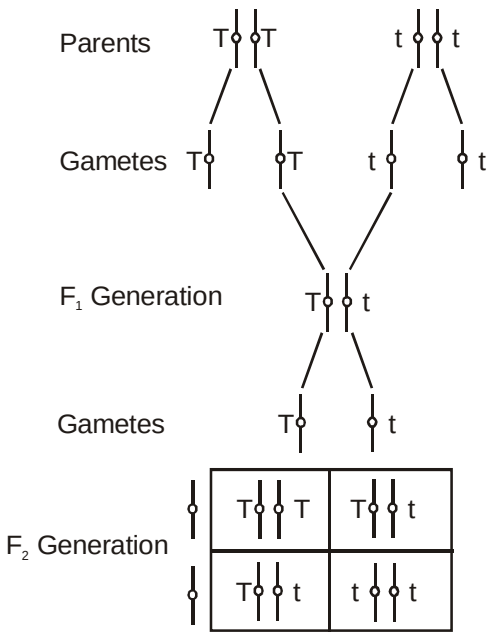
Examples of some autosomal characters in human

Character	Dominant	Recessive
Eye colour	Brown / Black	Blue
Eye size	Large	Smal
Hair	Curly hair	Straight
Cheek	Dimple	Normal
Hand	Right Handed	Left Handed
Rolling of tongue	Roller	Non-Roller
Rh Factor	Rh^+	Rh^-
PTC taster	Taster	Non Taster
Skin pigmentation	Normal	Albino

CHROMOSOMAL THEORY OF INHERITANCE

This theory was proposed by **Walter Sutton** and **Theodor Boveri** (1902). Following are the main points of the theory :

- Male and Female gemetes play an **equal** role in contributing hereditary components of future generation.
- Gemetes serve as the **bridge** between two successive generations.
- Only the nucleus of sperm combines with ovum. Thus, the hereditary information is contained in the **nucleus**.
- Chromatin in the nucleus is associated with the cell division in the form of chromosomes.
- Any type of deletion or addition in the chromosomes can cause structural and functional changes in living beings.
- A sort of **parallelism** is observed between Mendelian



factors and chromosomes.

- A number of genes or Mendelian factors are found on chromosome.
- Determination of sex in most of the animals and plants is affected by specific chromosomes. These chromosomes are called sex chromosomes.

✸ **Parallelism Between Gene and Chromosomes**

- Chromosomes are also **transferred** from one generation to the next as in the case of genes (Mendelian factors).
- The number of chromosomes is **fixed** in each living species. These are found as homologous pairs in diploid cells. One chromosome from father and the other contributed by the mother constitute a homologous pair.
- Before cell division, each chromosome as a whole and the alleles of genes get **replicated** and are separated during mitotic division.
- Meiosis takes place during **Gamete formation.** Homologous chromosomes form synapses during prophase-I stage which in later course get separated and transferred to daughter cells. Each gamete or a haploid cell has only one allele of each gene present in the chromosome.
- A characteristic diploid number is again established by the **union** of the two heploid gametes.
- Both chromosomes and the alleles (Mendelian factors) behave in **according to Mendel's law** of **segregation**.

  Homologus chromosomes of a pure tall plant. allele (T) is found for tallness in each chromosome. Likewise. in a pure dwrf plant (tt) allel (t) is present in each chromosome.

  These homologous chromosome. Likewise. in a pure dwarf plant (tt) allele (t) is present in each chromosome. These homologous chromosomes get separated during meiotic division. Hence, each gamete possess only one chromosoms each pair. Accordingly all the gamets of tall plants possess a chromosome with an allele of tallness (T), while the gametes of dwarf plants possess a chromosome with an allele for dwarfness (t). Their cross to produce F_1 generation will yield tall hybrid plants with homologous chromosomal pair containing Tt allele with homologous chromosomal pair containing Tt allelic pair. In this generation two kinds of gamete will be formed during gametogenesis. 50% with the allele (T) for tallness and 50% with the allele for dwrfness (t). **Random combination** of these gametes will produce offsprings in F_2 generation in the ratio of 25% pure tall (TT). 50% hybrid tall (Tt) and 25% dwarf (tt).

SEX DETERMINATION

SEX DETERMINATION

Establishment of sex through differential development in an individual at an early stage of life, is called sex determination. Various methods operate in sex determination like enviromental, non-allosomic genetic determination, allosomic sex determination and haplodiploidy

- **Sex Determination on the basis of fertilization.**
- **Three types :**
- **Progamic :** Sex is determined before fertilization. eg. – Drone in honey bee
- **Syngamic –** Sex is determined during fertilization. eg. – most of plants & animals
- **Epigamic –** Sex is determined after fertilization. eg. – Female in honey bee.

Environmental Determination of Sex. It is non genetic determination of sex which is based purely on environmental conditions. The organisms are potentially hermaphrodite and capable of expressing any of the sexes.

- In marine worm **Bonellia**, larva develops into female if it settles down alone in an isolated place. Any larva coming in contact with the already grown female, it changes into male, and lives as a parasite in the uterus of female.
- **Crepidula** (marine mollusca) where larva develops into male in the company of female and develops into female if left alone.
- In **Crocodiles** low temperature induces femaleness and high temperature maleness.
- In **turtles** temperature **below 28ºC** induces maleness, above **33ºC** femaleness while between **28 - 33ºC** equal number of male and female animals are formed.
- In marine fish **Medusa** sex changes according to environmental condition, becoming male in cold water and female in warm water.

- **Allosomic determination of sex**

Chromosomes are of two types :

i. Autosomes or somatic chromosomes. These regulate somatic characters.

ii. Allosomes or Hetersomes or Sex chromosomes

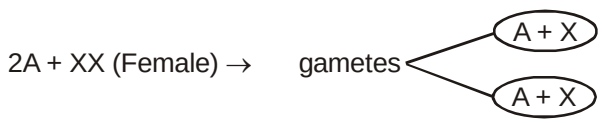
These chromosomes are associated with sex determination. Term "Allosome" & "Heterosome" were given by **Montgomery**.

Sex chromosomes first discovered by "**Mc Clung**" in grass hopper

X - Chromosome discovered by "**Henking**" and called 'x-body'.

Wilson & **Stevens** proposed **chromosomal theory for sex determination**.

- **XX - XY type or Lygaeus type :** This type of sex determination first observed by **Wilson** & **Stevens** in **Lygaeus** insect. Two types.
- **XX female and XY male :** In this type of sex determination female is Homogametic produces one type of gamete



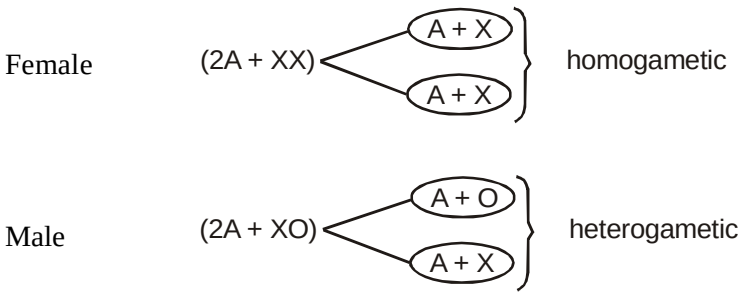
- Male is heterogametic (male produces two types of gamete)

In male X-chromosome containing gametes is called **"Gynosperm**" and Y-chromosome containing gamete is called "**Androsperm**". e.g. Man and dioecious plants like Cocinea, Melandrium

- **XY female and XX male or ZW female and ZZ male** : In this type of sex determination female is hetergametic produces two types of gamete and male individual is homogametic produces one type of gamete.

  It is found in some insects like **butter flies, moths** and **vertebrates** like **birds**, **fishes** and **reptilies.** In plant kingdom this type of sex determination is found in **Fragaria elatior.**

- **XX female and XO male** : or **"Protenor type"** : In this type of sex determination deficiency of one chromosome in male. In this type, female is homogametic and male is heterogametic.



Example :

Grass hopper

Squash bug Anasa

Cockroach

Ascaris and in plants like - Dioscorea sinuta & Vallisneria spiralis.

GENIC BALANCE THEORY

C.B. Bridges proposed genic balance theory for sex determination in Drosophila.

- According to Bridges in Drosophila Y-chromosome is heterchromatic so it have no role in sex determination.

In Drosophila sex determination takes place by sex index ratio.

$$\text{Sex index ratio} = \frac{\text{No.of x chromosomes}}{\text{No. of set of Autosomes}} = \frac{X}{A} \text{ (0.5 is male and 1 is female)}$$

In Drosophila gene of femaleness (Sxl = Sex lethal gene) is located on x-chromosome and gene of maleness is located on autosome.

Gene of male fertility is located on y-chromosome and in Drosophila, y-chromosome plays addition role in spermatogenesis and development of male reproductive organ, so y-chromosome is essential for the production of fertile male.

Sex index ratio $\frac{X}{A} = 1 \rightarrow$ female (2A + XX), (3A + XXX)

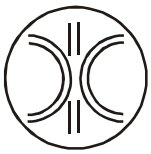
$\frac{X}{A} = 0.5 \rightarrow$ male $\begin{cases} \text{(2A + XY) = Fertile male} \\ \text{(2A + XO) = Sterile male} \end{cases}$

$\frac{X}{A}$ = 1.5 → Super female or meta female (sterile) (2A + XXX)

$\frac{X}{A}$ = less than 0.5 → Super male or meta male (Sterile) (3A + XY)

$\frac{X}{A}$ = In between 0.5 and 1 → Intersex (Sterile) (3A + XX)

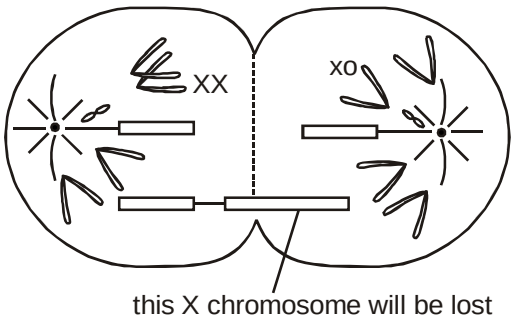
$\frac{X}{A} = \frac{1}{2}$ = 0.5 (Male)



Chromosmal diagram of Drosophila

- **Gynandromorph -**

Body of some Drosophila has some cells with male (X0) and some cells with female genotype (XX). Body of such type of Drosophila has half lateral part of male and half lateral part of female and it is called bilateral gynandromorph. It is formed due to **loss of one x-chromosome at metaphase** plate during first zygotic division. Formation of gynandromorph is the best evidence that y-chromosome does not play any role in sex determination.



HAPLOID - DIPLOID MECHANISM

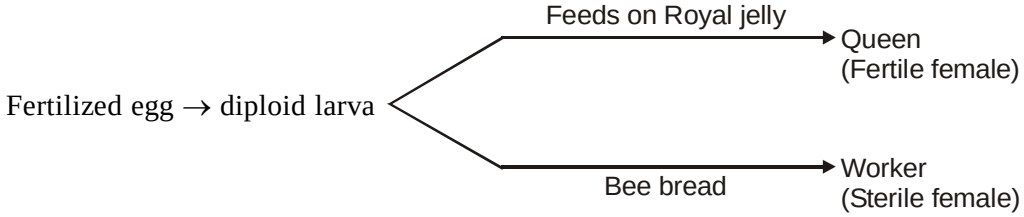
In insects of order Hymenoptera which includes ants. honey bees, wasps etc.

Sex determination takes place by sets of chromosomes.

Diploid (two sets) → Female

Haploid (One set) → Male

In honey bee, male individual (Drone) develops from unfertilized eggs (Haploid.) Male is always parthenote. Queen and worker bees develop from diploid eggs i.e. fertilized egg.



SEX DETERMINATION BY HORMONE

Dizygotic twins are common in cattle like cow, sheep, goat etc. Some times the placenta of the two dizgytic twins fuse forming blood vascular connections between two developing foetus. If twins are dizygotic, one foetus may be male and the other female.

- **Male hormone produced before female** hormone by male twins which suppress the differentiation of female (♀) sex organ. Such a sterile female with underdeveloped overties ovducts, Uterous etc. is called **free martin.**

  In free martin conditions, female is sterile & male is normal.

  Y spots : Males are identified by **Y spots (Zech 1970). Number of Y spots are equal to number of Y chromosomes.**

CYTOLOGICAL BASIS OF SEX DETERMINATION

Barr body technique or **Lyon's hypothesis** -

Interphasic nucleus of human female contains two X-chromosomes. Out of two, one X - Chromosome becomes heterochromatin and other X - Chromosome is euchromatin. By staining X - heterochromatin, it appears as a dens body which is called Barr body. (Facultative hetrochromatin)

No. of Barr body = (No. of X chromosomes - 1)

So a Normal female (2A + XX) $\rightarrow$ One Barr body

Normal male (2A + XY) $\rightarrow$ Barr body absent

Turner syndrome (Sterile female) (2A + XO) $\rightarrow$ No. Barr body

Klinefelter syndrome (Sterile male) (2A + XXY) $\rightarrow$ One Barr Body

Drum stick which occurs in blood of female of mammals, is also a type of barr body. Drum stick is absent in neutrophils of Male.

SEX DETERMINATION IN HUMAN

There occur a special gene on differential region of Y-chromosome of human. called Sry - gene (Sex determine region on y-chromosome). This gene forms a proteinaceous factor called TDF (testes determining factor). TDF responsible for the development of male reproductive organs. So presence and absence of Y-chromosome determines sex.

- **Sex determination in plant :**

  H.E. Warmke discovered sex determination in Melandrium plant. In Melandrim Y- chromosome is long as compare to X - chromosome. In plant sex chromosomes are found only in unisexual plant.

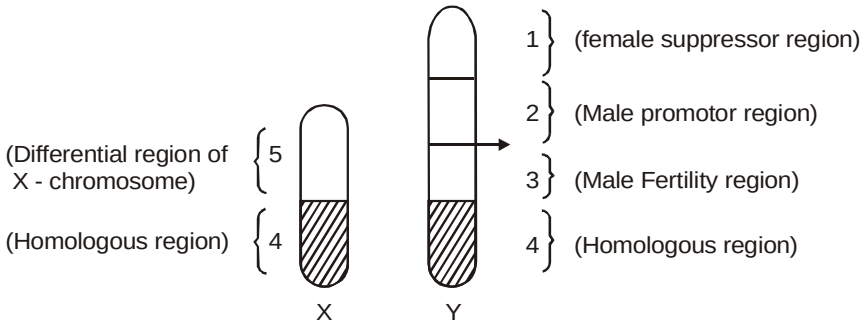
  Prof. R.P. Roy gave the importance of Y-chromosome in plant.

  He discovered sex determination in **Coccinea Indica** (Family - cucurbitaceae)

  Y - Chromosome contains four regions and X - chromosome contains two regions. Different functions of these regions.

- I^{st} region - (Female suppressor region) : This region suppress the development of female reproductive structures.
- II^{nd} region (Male promotor region) : This region initiates or start the development of Anther
- III^{rd} region (Male fertility region) : This region induces the further development of Anther.
- IV^{th} region (Homologous region) : This region helps in the disjunction & Pairing of X and Y chromosome during meiosis.

- V^{th} region (Differential region of X-chromosome) : This region induces the development of female gonads So when one or more than one Y - chromosome is present then plant is male and in female plant Y-chromosome is absent.



✸ **Special Case :**

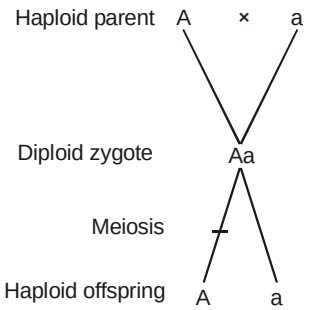
If I^{st} region of Y chromosome is removed then plant becomes **bisexual**

If II^{nd} region of Y chromosome is removed then plant becomes **female** due to absence of II^{nd} region, I^{st} region of Y chromosome does not suppress the V^{th} region of X - chromosome.

If III^{rd} region of Y chromosome is removed then plant becomes **sterile male** due to absence of III^{rd} region so further development of anther does not take place.

PHENOTYPIC EXPRESSION IN HAPLOID ORGANISMS

Diploid organisms such as pea and *Drosophila*, have two allels for each gene. With the result, the recessive allele is not expressed in the phenotype in presence of the dominant one. However, this is not so in the case of haploid organisms. Contrary to diploid organisms, the genetics of haploid organisms exhibit the following features.

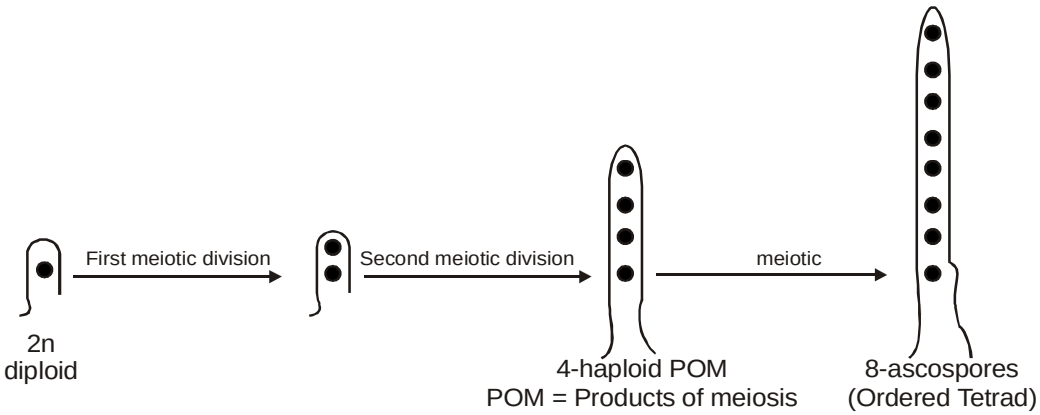


- Haploid organisms contain only one allele of a gene, so there is no complication of dominance. All the genes, whether dominant or recessive, express itself in the offsprings.
- In absence of dominance, any new mutation is immediately expressed, in hapoid organism
- Study inheritance of mutated gene, linkage, crossing over and biochemical consequence of a mutation can easily be studied in haploid.

LINKAGE AND RECOMBINATION IN NEUROSPORA (Drosophila of plant kindgom)

Detection of linkage and recombination of genes in haploid organisms as in fungi, bacteria etc. is comparatively simple. Fungus **Neurospora** is one of the favourite material with geneticists, because :

- The life cycle is of a short duration.
- The life cycle of **Neurospora** is the product of a single meosis
- The meiotic products are **linearly arranged** in ascus as 8 ascospores as ordered tetrads (i.e., the eight ascospores are arranged in the same order in which chromatids were on the meiotic metaphase plate. This is called **linear** or **ordered tetrad**. Each of the four products of meiosis can be culutred separately to study their phenotypes and genotypes. This is called **tetrad analysis**.



- **First Division Segregation Between Centromere and Gene - a.**

  A cross between two strain of Neurospora, one normal (a^+) and other mutant (a) strain produces 8-ascospores, out of which four are normal (a^+) and other four mutants (a). The linear arrangement of ascospores in ascus is $4a^+ : 4a$. It indicates the absence of crossing over between locus-a and centromere. This described as first division segration (4 : 4).

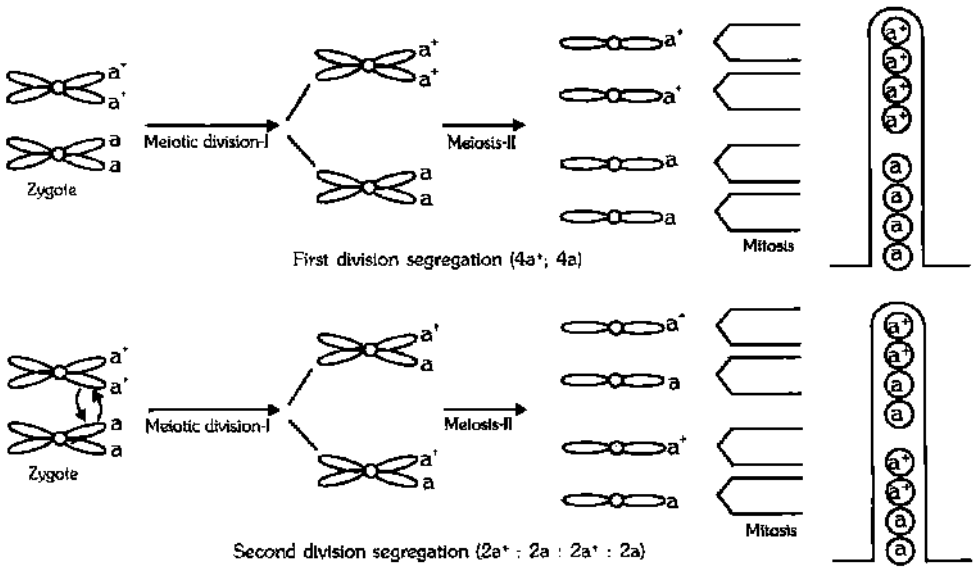
- **Second Division Segregation Between Centromere and Gene-a**

  In a similar cross if crossing over takes place leading to paired arrangement of ascospores with a prticular gene, it is described as **second division segregation.** The arrangement of ascopores in the sequence (2 : 2 : 2 : 2) is as follows :

  $a^+ : a^+ : a : a : a : a : a^+ : a^+$ (2 : 4 : 2)

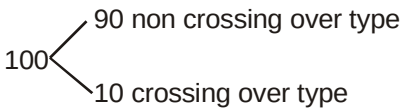
  $a : a : a^+ : a^+ : a^+ : a^+ : a : a$ (2 : 4 : 2)

  $a^+ : a^+ : a : a : a^+ : a^+ : a : a$ (2 : 2 : 2 : 2)



- **Single Gene Mapping in Neurspotra**

  In Neurospora centromere behaves as a gene for mapping gene pair. In such a case distance of gene from the centromere is calculated by calculating the percentage of cross over between centromere and gene. Que. If 10% asci show crossing over what will be distance between gene and centromere. If total 100 asci are precsent in a Neurospora



1 asci is derivative of 8 spores

100 asci are derivative of (100 × 8 = 800 spore)

10 asci are derivative of 80 spores

(Out of 80 only 40 will be the recombinant type)

$$\% \text{ C.O.} = \frac{\text{recombinant spore}}{\text{Total spore}} \times 100$$

$$= \frac{40}{800} \times 100 = 5\% \qquad \textbf{Ans. 5 cM}$$

MUTATION

- Sudden Heritable change in genetic material of an organism is called as Mutation.
- Mutation are discontinuous source of variation.
- Frequency of mutation at present is 1 × 10-6 (1 cell in : 1 million-cell). But it will increase in future due to pollution and destruction of ozone layer.
- Mutation word was given by Hugo De Vries.
- De Vries studied mutations in the plant Oenothera lamarckiana (evening primrose). It is a hybrid plant.
- De Vries gave (proposed) mutation theory of evolution.
- This theory was given in support of Darwinism because Darwin was unable to explain the source of variations. Darwin called variation as sport.
- According to De Vries there are two types of variations in evolutions.

✸ **Continuous variations :**

- The variations are develop in every generation of an organism.
- These variations are developed by crossing over/meiosis/sexual reproduction.
- Only minor variation are developed by crossing over.

✸ **Discontinuous variations :**

- These variations are developed by mutations.
- Suddenly in any generation
- Both minor and major type of variations are developed by mutations mostly major type.

✸ **Seth Right :**

- Mutation was first observed by him.
- He observed some short legged sheep (Ancon) variety in a population of long legged sheep.
- It was an example of dominant germinal of mutation.
- Those mutation are only heritable which occur in germinal cell of an organism. While somatic mutations are non heritable.
- Somatic mutations are also heritable in vegetative propagated plants.

✸ **Morgan :**

- Credit of discovery of mutation is given to him. He observed some white eyed male Drosophila in a population of red eyed Drosophila.
- In Drosophila eye colour is a sex linked character. Gene of eye colour is located on X chromosome. Gene of Red eye is dominant over the gene of white eye. So in Drosophila genotypes for eye colour are of following types.

Male	Female
X^WY - Red	X^W Y - White
50 - 50% Red & White $X^W X^W$ = Red	$X^W X^W$ = Red $X^W X^W$ = White

- **Muller :**
- Discoverer of Induced Mutations.
- He induced mutations in Drosophila by the help of X-rays.
- **Mac Farlane Burnitt, Neil Jerne :**
- Induced mutations in B-lymphocytes of blood to obtain new antibodies.
- **Beadle and Tatum :**
- Induced mutations in Neurospora to study nutritional mutation by the help of U.V. rays. or X-rays.

$$\underset{\text{(Prototroph)}}{\text{Wild Neurospora}} \xrightarrow{\text{U.V. ryas}} \underset{\text{(Auxotroph)}}{\text{Mutant Neurospora}}$$

- Normal-Neurospora can be grown in minimal medium (which lacks some nutrients), because it can make all nutrients for it. This is known as prototroph.
- Mutant Neurospora doesn't has capability to grow in minimal medium because due to mutation it loses those genes which prepare some special nutrients for it. Eg. Vita. -B or Thiamine.
- When Vit-B or Thiamine was given to mutant Neurospora then the growth of Neurospora was normal. This form is known as Auxotroph.
- **M.S. Swaminathan :**
- He induced mutations in wheat by the help of -rays to obtain good varieties for eg. Sharbati Sonora
- Swaminathan established garden in IARI-New Delhi (Pusa Institute).
- Largest Institute in the field of Agriculture in Aisa.
- **Main Points :**
- Mostly mutations are harmful.
- Sometimes they are lethal which leads to death of organisms.
- But sometimes they are benefical which are used to obtain good varieties of plants and animals. It is called as **Mutation Breeding**.
- Mostly mutations are recessive and being recessive they never eliminate from a population it is called as hardy-weinberg law.
  Which is applicable to large population and random mating.
- Dominant lethal mutation always eliminate from a population either it is large or small.

FORWARD AND BACKWARD MUTATION

- $\text{Wild gene} \underset{\text{Backward}}{\overset{\text{Forward}}{\rightleftharpoons}} \text{Mutant gene}$

- **Mutator gene and Mutable gene :**
- Gene which induce mutation in another gene is called mutator gene and in which mutation is induced is called as mutable gene.

✸ **Neutral Mutation\Suppression :**

- Mutation in one gene is neutralized by mutation in another gene called as neutral mutation. So it means mutation without effect and in neutralization two mutations are required.

✸ **Complementation :**

- Occur in Heterokaryon or dikaryon cells in which two genetically different nuclei are present in a cell. Mutation effect in one nucleus is neutralized by the another nucleus of heterokaryon. This condition occur in Neurospora during somatogamy.

✸ **Hot Spot :**

- Place on DNA or gene where frequency of mutation is high.
- In Prokaryotes frequency of mutation is high than eukaryotes due to naked DNA.

✸ **Muton (unit of mutation) :**

- Smallest part of DNA which undergoes mutation.
- It is one nucleotide.

✸ **Types of mutation :**

(A) Chromosomal Mutation

(B) Gene Mutation

A. CHROMOSOMAL MUTATIONS

- Change in number or structure of chromosome.

  Types of chromosomal mutation :

  (a) Heteroploidy/Genomatic mutation → change in chromosome number

  (b) Chromosomal aberration → change in structure of chromosome.

(a) Heteroploidy/Genomatic mutation :

- Change in number of sets or chromosomes in sets. Two types-

  (i) Euploidy → Change in number of sets.

  (ii) Aneuploidy → Change in number of chromosome in set.

(i) Euploidy :

- Change in number of sets/loss or addition of sets of chromosomes.
- In a normal diploid cell two sets of chromosome are present
- Loss of one set (2n - n = n) monoploidy
- Add^{n}. of set called as polyploidy

Add^{n}. of one set	called as Triploidy	2n + n = 3n
Add^{n}. of two sets	called as Tetraploidy	2n + 2n = 4n
Add^{n}. of three setscalled as	Pentaploidy	2n + 3n = 5n
Add^{n}. of four sets	called as Hexaploidy	2n + 4n = 6n
Add^{n}. of five fsets	called as Heptaploidy	2n + 5n = 7n

- Octaploid plants rarely survive.
- Polyploid plants with even number of sets are always fertile, reproduce sexually and form seeds.
- Polyploid plants with odd number of sets are always sterile don't reproduce by sexual reproduction, They don't produce seeds but they may produce seedless fruits by parthenocarpy.

  eg. Banana and seedless grapes.

  Polyploidy is of two types :

(1) Autopolyploidy :

- It is repetition of same set of chromosomes. Eg. AAA.

- **Cyanodon and Rose** → Autotriploid plants
- These are sterile plants.
- Reproduce by vegetative propagation.

(2) Allopolyploidy :

- More than one type of sets are present in these plants eg. AA BB.
- These plants are obtained by intergeneric cross.

  e.g., Raphanobrassica is obtained by cross between Raddish and cabbage and first time obtained by Rusian Scientist Karpechenko.

Raphanus Sativus X **Brassiaca oleracea**
2n = 18
↓
Raphanobrassica Sterile Plant
2n = 18
Colchicine ↓
Raphanobrassica Fertile
4n = 36

Triticale : Triticum durum X Rye (Secale Cereale)
4n = 28 2n = 14
↓
Triticale Sterile Plant
3n = 21
Colchicine ↓
Triticale Fertile
6n = 42

Triticale : Triticum aestivum X Rye (Secale Cereale)
6n = 42 2n = 14
↓
Triticale Sterile Plant
4n = 28
Colchicine ↓
Triticale Fertile
8n = 56

(ii) Aneuploidy :

Loss or addition of chromosomes in sets of chromosomes. Types of Aneuploidy:

(1) Hypoaneuploidy (loss)

- 2n - 1 = monosomy:- (loss of one chromosome in one set)
- 2n - 1 - 1 = double monosomy (loss of one chromosome from each set, but these are non homologus.)
- 2n - 2 = Nullisomy (loss of two homologus chromosome)

(2) Hyperaneuploidy (add.)

- 2n + 1 = Trisomy: addition of one chromosome in one set.
- 2n + 1 + 1 = Double Trisomy: addition of one chromosome in each set.
- 2n + 2 = Tetrasomy: addition of two chromosomein one set.
- Cause of aneuploidy is chromosomal non disjunction means chromosomes fail to separate during meiosis.
- Chances of aneuploidy are more in higher age female due to less activity of oocyte, so chances of syndrome increase in children who are born from higher age female.

(b) Chromosomal Aberrations :

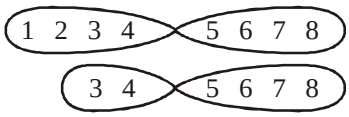
Change in structure of chromosome.

(i) Deletion :

Loss of a part or segment of chromosome which leads to loss of some gene is called as deletion.

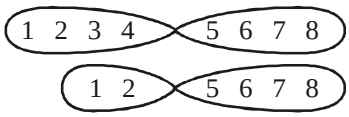
It is of 2 types:-

(1) Terminal deletion- Loss of chromosomal segment from one or both ends. e.g., The cry-du-chat syndrome is an example of terminal deletion in 5th chromosome.



e.g., The cry-du-chat syndrome is an example of terminal deletion in 5^{th} chromosome.

(2) Intercalary deletion- Loss of chromosomal part between the ends.

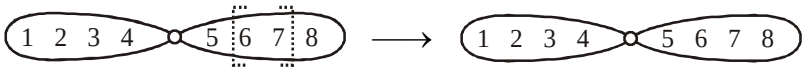


(ii) Inversion :

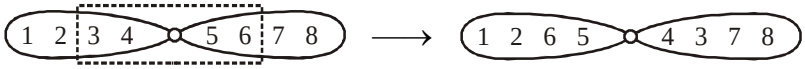
Breakage of chromosomal segment but reunion on same chromosome in reverse orders. It leads to change in distance between genes on chromosome or sequence of genes on chromosome so crossing over is affected.

It is of 2 types :

(a) Paracentric - If inversion occur only in one arm and inverted segment does not include centromere.



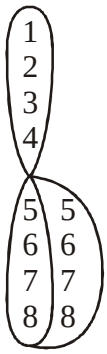
(b) Pericentric - In this type of inversion inverted segment include centromere.



(iii) Duplication :

Occurrence of a chromosomal segment twice on a chromosome. If in this segment any recessive gene is present, then it given it's expression due to homozygous condition. If in this segment any recessive but lethal gene is present, it lead to death of organism.

Example: In drosophila "Bar eye character" is observed due to duplication in X-chromosome. Bar eye is a character where eyes are narrower as compared to normal eye shape.

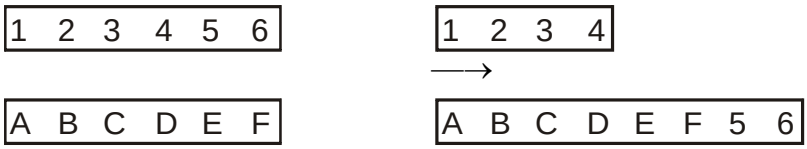


(iv) Translocation :

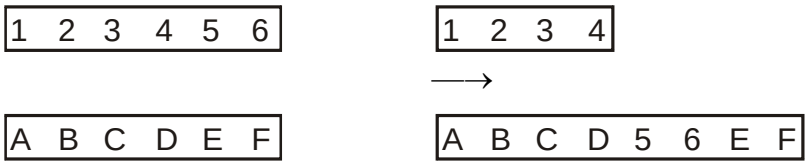
In this, a part of the chromosome is broken and may be joined with non homologous chromosome. This is also known as Illegitimate crossing over (illegeal crossing over)

Three types of translocation-

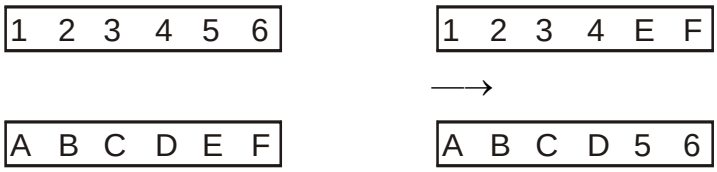
(a) Simple Translocation : When a chromosomal segment breaks and attached to the terminal end of a non-homologous chromosome.



(b) Interstitial or shift translocation : If a segment of chromosome breaks and gets inserted in interstitial position of a non homologous chromosome.



(c) Reciprocal Translocation : Exchange of segments between two non-homologous chromosome.



e.g., Chronic myloid leukemia [C M L] is a type of blood cancer. This disease is a result of reciprocal transiocation between 22 and 9 chromosome.

Note: If exchange of segments takes place in between homologous chromosomes then it is called crossing over.

B. GENE MUTATION OR POINT MUTATION

Two types : -

(1) Substitution **(2) Frame shift mutation.**

(1) Substitution :

Replacement of one nitrogenous base by another nitrogenous base is called as substitution.

- It causes change in one codon in genetic code which leads to change in one amino acid in structure of protein. *e.g.,* Sickle cell anaemia

Main Point :

- Change may not occur because for one animo acid more than one type of codons are present.

Substitution is of two types :

(a) Transition (b) Transversion.

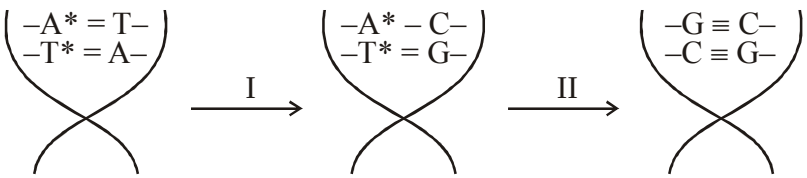
(a) Transiton :

Replacement of one purine by another purine or replacement of pyrimidine by another pyrimidine.

Methods of Transition :-

1. **By Tautomerisation :** By this method transition is induced by HNO_2. HNO_2 changes normal structure of nitrogenous base and changed nitrogenous base is called as **Tautomer**.

- In structure of adenine and guanine, amino group is present, HNO_2 changes it into imino group.

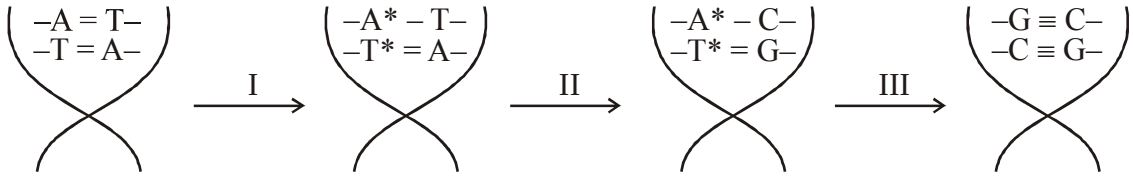


Forbidden

- In the structure of cytosine and thymine, keto group is present. Which is change into enol group by HNO_2.
- In first DNA replication, Tautomer of adenine pairs with a normal cytosine and Tautomer of thymine pairs with normal guanine.

- It is unusual pairing which is called as forbidden pairing so a wrong type of DNA is formed in cell.
- In second DNA replication normal cytosine pairs with normal guanine and normal guanine pairs with normal cytosine.
- It is usual pairing so transition completes in two DNA replication (Tautomers always perform forbidden pairing).

2. **By Ionisation :** By this method transition is induced by ionizing radiation like X-ray. These radiations convert nitrogenous bases in their ions and ions perform forbidden pairing. So by this method transition is completed in two DNA replications.
3. **By Base Analogues :** Transition is induced by chemicals which are same as nitrogenous base in function. They are called base analogues or duplicates of nitrogenous base.
   e.g., Aminopurine is base analogue to Adenine (purine) 5-Bromo uracil is base analogue to thymine (pyrimidine), 5-Iolo uracil is base analogue to guanine, 5-Chloro uracil is base analogue to cytosine.



Forbidden pairing

- In I DNA replication base analogues get establish in normal structure of DNA
- IN II DNA replication they perform forbidden pairing
- In III DNA replication transition is completed.

(b) Transversion :

- Replacement of purine by pyrimidine or pyrimidine by purine is called transversion.
- EMS ⇒ Ethyl methane sulphonate
- MMS ⇒ Methyl methane sulphonate
- These chemicals causes depurination means they remove one purine from structure of DNA. So a gap is formed.
- If this gap is filled by another purine then it is called as transition.
- But if this gap is filled by pyrimidine then it is called as transversion.
- So EMS and MMS may cause both transition and transversion.

(2) Frame shift mutation/Gibberish mutation :

(1) Arredine (2) proflavin

These chemicals causes loss or addition of one or two nitrogenous bases in structure of DNA so complete reading of genetic code is changed. It leads to change in all animo acids in structure of protein so a new protein is formed which is completely different from previous protein.

ATG ACG GAC AGA AAC……

ATG CGG ACA GAA AC……..

- So frame shift mutations are more harmful as compared to substitution.
- Thallesemia (lethal genetic disorder)

Mutagens :

- Mutagens are those substance which cause mutations : -

1. **Radiation :** - They are two types
   (i) Ionising:- [redacted], X-ray
   (ii) Non ionizing:- U.V. rays

- U.V. rays has less penetration power and skin of higher organisms absorb radiations. So they don't cause any effect in higher animals, but U.V. rays and radiations are effective mutagens in microbes and due to more effect leads to death of microbes. So U.V. rays are used to sterilize operation theatre.

- Radiations mainly cause chromosomal aberrations which cause major change in organisms. So chromosomal mutations are more important in evolution.
- U.V. rays and HNO_2 cause deamination of nitrogenous base means they remove amino group from nitrogenous base by deamination of,

  Adenine $\longrightarrow$ Hypoxanthine
  Guanine $\longrightarrow$ Xanthine
  Cytosine $\longrightarrow$ Uracil

  U.V. rays do not cause deamination in thymine. By U.V. rays two adjacent thymine bind together and form **thymine-dimer**.

2. Chemical mutagens :

eg. Mustard gas (first identified Chemical Mutagens)
Carbon tetra sulphide, Nitrous acid (HNO2)
Organic peroxide, Ethyl urethane, Pesticides etc.
DDT (Dichloro Diphenyl Trichloro Ethane)
LSD (Lysergic acid diethylamide)

- Chemical mutagens are more harmful than radiations because body is not protected against chemicals.
- Source of chemical mutagens are food, air and water.
- Effect of radiation is localized, while chemical mutagens spread in complete body through blood circulation and when they reaching gonads they cause germinal mutation.
- Chemicals also cause chromosomal mutations.

Antibiotics :

1. Neomycin 2. Kenamycin 3. Streptomycin

These antibiotics combine with small subunit of prokaryotic ribosome and Cause misreading of genetic code or induce error in translation.

Main Point :

- Same effect of puromycin antibiotic in eukaryotes.

Special Point

Mis-sense mutation : When a nucleotide change in genetic code cause the change of one amino acid of a polypeptide chain it is called mis-sense mutation.

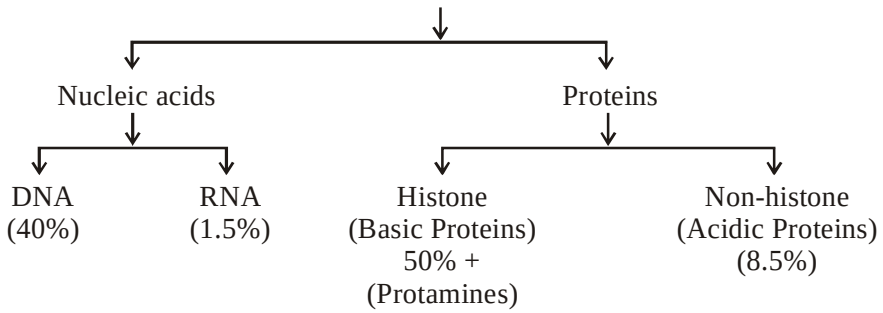
Non-sense mutation : When a nucleotide change in one codon causes termination of polypepetide synthesis by producing non-sence codon.

Same sense codon - A change in one nucleotide in a codon does not change amino acid in polypeptide chain, because both codons code same amino acid.

NUCLEIC ACIDS -

CHEMICAL COMPOSITION :

Chemical analysis of chromosomes reveals the following substances

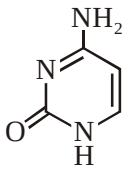


- Meischer discovered nucleic acids in nucleus of pus cell and called it "nuclein". The name nucleic acid proposed by "Altaman".
- Nucleic acids are polymer of nucleotides.

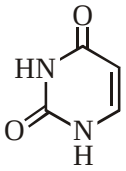
  = Nitrogen base + pentose + phosphate

  On the basis of structure nitrogen bases are broadly of two types :

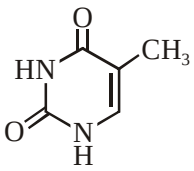
1. **Pyrimidines :** Consist of one pyrimidine ring. Skeleton of ring composed of two nitrogen and four Carbon atoms e.g. Cytosine, Thymine and Uracil.



Cytosine

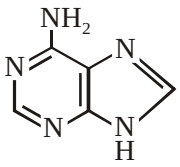


Uracil

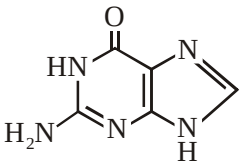


Thymine

2. **Purines :** Consist of two rings i.e. one pyrimidine ring (2N + 4C) and one imidazole ring (2N + 3C) e.g. Adenine and Guanine.

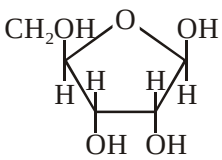


Adenine

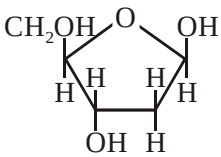


Guanine

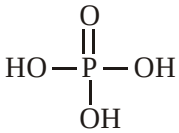
Pentose Sugar :



Ribose



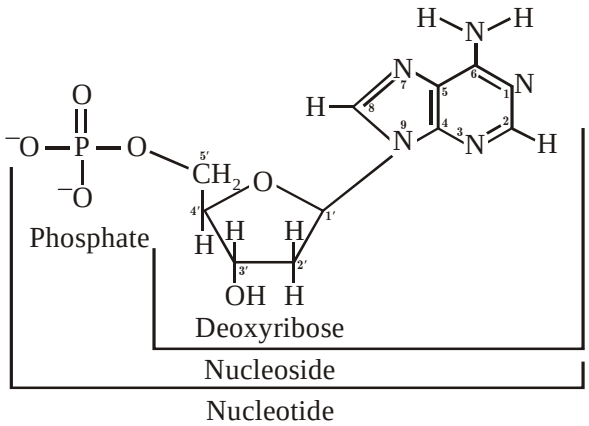
Deoxy Ribose



Phosphoric acid

Nitrogen base forms bond with first carbon of pentose sugar to form a nucleoside. Nitrogen of first place (N_1) forms bond with sugar in case of Pyrimidines while in purines nitrogen of ninth place (N_9) forms bond with sugar.

Phosphate forms ester bond (covalent bond) with fifth carbon of sugar to form a complete nucleotide.



Types of Nucleosides and Nucleotides

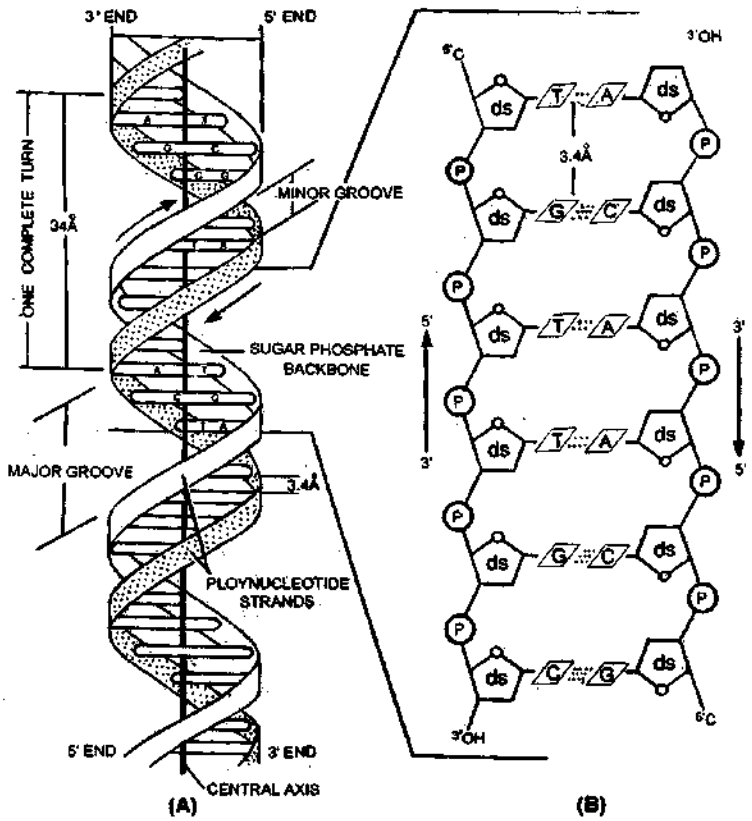
1. Adenine + Ribose = Adenosine

   Adenosine + Phosphate = Adenylic acid

2. Adenine + Deoxyribose = Deoxy adenosine
   Deoxy adenosine + P = Deoxy adenylic acid
3. Guanine + Ribose = Guanosine
   Guanosine + P = Guanylic acid
4. Guanine + Deoxyribose = Deoxy guanosine
   Deoxy guanosine + P = Deoxy guanylic acid
5. Cytosine + Ribose = Cytidine
   Cytidine + P = Cytidylic acid
6. Cytosine + Deoxyribose = Deoxycytidine
   Deoxycytidine + P = Deoxycytidylic acid
7. Uracil + Ribose = Uridine
   Uridine + P = Uridylic acid
8. Thymine + Deoxyribose = Deoxy thymidine
   Deoxythymidine + P = Deoxythymidylic acid

DNA

- Discovered by - **Meischer**
- DNA term given by - **Zacharis**
- In DNA pentose sugar is deoxyribose sugar and four types of nitrogen bases A, T, G, C.
- Wilkins and Franklin studied DNA molecule with the help of X-Ray crystallography.
- With the help of this study, **Watson** and **Crick** (1953) proposed a double helix molel for DNA. For this model Watson, Crick and **Wilkins** were awarded by noble prize in 1962.
- According to this model, DNA is composed of two polynucleotide chains.
- Both polynucleotide chains are complementary and antiparallel to each other.



- In both strand of DNA direction of phosphodiester bond is opposite. i.e. If direction of phosphodiester bond in one strand is 5'-3' then it is 3'-5' in another strand.
- Both strand of DNA held together by Hydrogen bonds. These hydrogen bond are present between Nitrogen bases of both strand.
- Adenine binds to Thymine by two hydrogen bonds and cytosine binds to Guanine by three hydrogen bonds.
- Chargaff's equivalency rule - In a double stranded DNA amount of purine nucleotides is equal to amount of pyrimidine nucleotides.

  Purine = Pyrimidine

  $[A] + [G] = [T] + [C]$

- Base ratio = $\frac{[A]+[G]}{[T]+[C]}$ = constant for a given species.
- In a DNA, A + T > G + C $\Rightarrow$ A - T type DNA. Base ratio of A - T type of DNA is more than one. eg. Eucaryotic DNA
- In a DNA G + C > A + T $\Rightarrow$ G - C type DNA. Base ratio of G -C type of DNA is less than one. eg. Procaryotic DNA
- Melting point of DNA depends on G - C contents.

  More G - C contents then more Melting point.
- Tm = Temperature of melting.

  Tm = of prokaryotic DNA > Tm of Eucaryotic DNA
- DNA absorbs U.V. rays means 2600Å wavelength.
- Out of two strand of DNA only one strand participates in transcription, it is called **Antisense strand/ Non coding strand / Template strand**.
- Other strand of DNA which does not participate in transcription is called **sense strand/Coding strand**.
- Denaturation and renaturation of DNA - If a normal DNA molecule is placed at high temperature (80 - 90°C) then both strand of DNA will separate to each other due to breaking of hydrogen bonds. It is called **DNA-denaturation**.

  When denatured DNA molecule is placed at normal temperature then both strand of DNA attached and recoiled to each other. It is called **Renaturation of DNA**.
- Hyperchromicity - When a double stranded DNA is denatured by heating then denatured DNA molecule absorbs more amount of light, this phenomenon is called **hyperchromicity**.
- Hypochromicity - When denatured DNA molecule cool slowly then it becomes double stranded and it absorb less amount of light. This phenomenon is called **hypochromicity**.

Configuration of DNA Molecule :

- Two strands of DNA are helically coiled like a revolving ladder. Back bone of this ladder (Reiling) is composed of phosphates and sugars while steps (bars) composed of pairs of nitrogen bases.
- Distance between two successive steps is 3.4Å. In one complete turn of DNA molecule there are such 10 steps (10 pairs of nitrogen bases.) So the length of one complete turn is 34Å. This is called **helix length**.
- Diameter of DNA molecule i.e. distance between phosphates of two strands is 20Å.
- Distance between sugar of two strands is 11.1 Å.
- Length of hydrogen bonds between nitrogen bases is 2.8-3.0 Å. Angle between nitrogen base and C_1 Carbon of pentose is 51°.
- Molecular weight of DNA is 106 to 109 dalton.
- In nucleus of eukaryotes the DNA is associated with histone protein to form nucleoprotein. Histone occupies major groove of DNA at 30° angle.

- Bond between DNA and Histone is salt linkage (Mg^{+2}).
- DNA in chromosomes is linear while in prokaryotes, mitochondria and chloroplast is circular.
- In $\phi \times 174$ bacteriophage the DNA is single stranded and circular isolated by Sinsheimer. G-4, S-13, M-13, F_1 and Fd-Bacteriophages also contain ss-circular DNA.

Types of DNA

On the basis of direction of twisting, there are two types of DNA.

1. Right Handed DNA -

Clockwise twisting e.g. The DNA for which Watson and Crick proposed model was 'B' DNA. Other e.g. of right handed DNA.

DNA	Helix Length	No. of base pairs	Distance between two pairs	Diameter
'A'	28 Å	11 pairs	2.56 Å	23 Å
'B'	34 Å	10 pairs	3.4 Å	20 Å
'C'	31 Å	9.33 pairs	3.32 Å	19 Å
'D'	24.24 Å	8 pairs	3.03 Å	19 Å

2. Left handed DNA -

Anticlockwise twisting e.g. Z-DNA-discovered by Rich. Phosphate and sugar backbone is zig-zag. Units of Z-DNA are dinucleotides (Purine and pyrimidine in alternate order)

Helix length - 45.6 Å

Diameter - 18.4 Å

No. of Base pairs - 12 (6 dimers)

Distance between base - pairs - 3.75 Å

- Palindromic DNA - Wilson and Thomas

$\longrightarrow$

C C G G T A C C G G

G G C C A T G G C C

$\longleftarrow$

Sequence of nucleotides same from both ends.

Special Points :

- DNA molecule is Dextrorotatory while RNA molecule is Laevorotatory.
- C-value = Total amount of DNA in a haploid genome of organism.

THE SEARCH FOR GENETIC MATERIAL

The experiments given below prove that DNA is the genetic material.

(I) **Evidence from bacterial transformation**. The transformation experiments, conducted by Frederick Griffith in 1928, are of great importance in establishing the nature of genetic material.

He used two strains of bacterium Diplococcus or Streptococcus pneumoniae or Pneumococcus i.e., S-III and R-II.

(1) **Smooth (S)** or **capsulated** type which have a mucous coat and produce shiny colonies. These bacteria are virulent and cause pneumonia.

(2) **Rough (R)** or **non-capsulated** type in which mucous coat is absent and produce rough colonies. These bacteria are nonvirulent and do not cause pneumonia.

The experiment can be described in following four steps:

(a) Smooth type bacteria were injected into mice. The mice died as a result of pneumonia caused by bacteria.

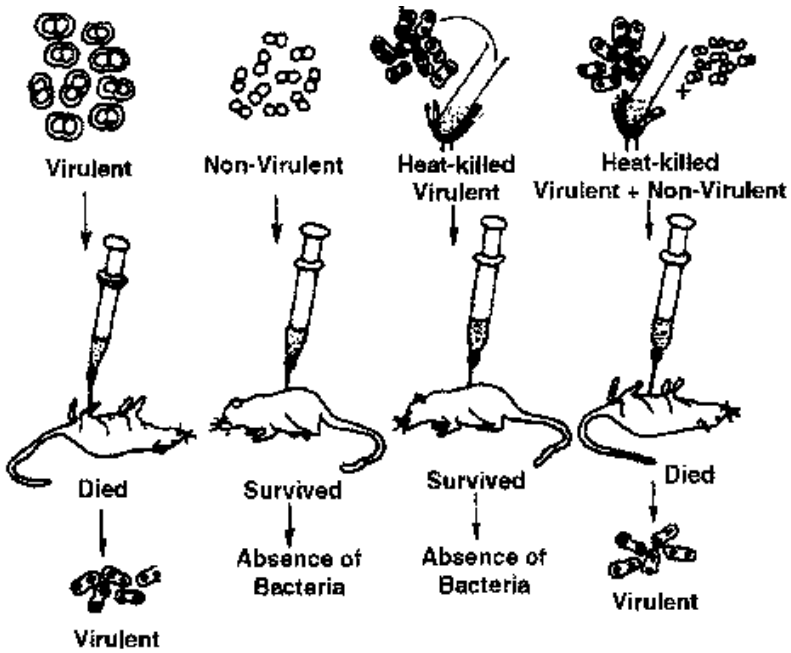
(b) Rough type bacteria were injected into mice. The mice lived and pneumonia was not produced.

(c) Smooth type bacteria which normally cause disease were **heat killed** and then injected into the mice. The mice lived and pneumonia was not caused.

(d) Rough type bacteria (**living**) and smooth type **heat-killed** bacteria (both known not to cause disease) were injected together into mice. The mice died due to pneumonia and virulent smooth type living bacteria could also be recovered from their bodies.

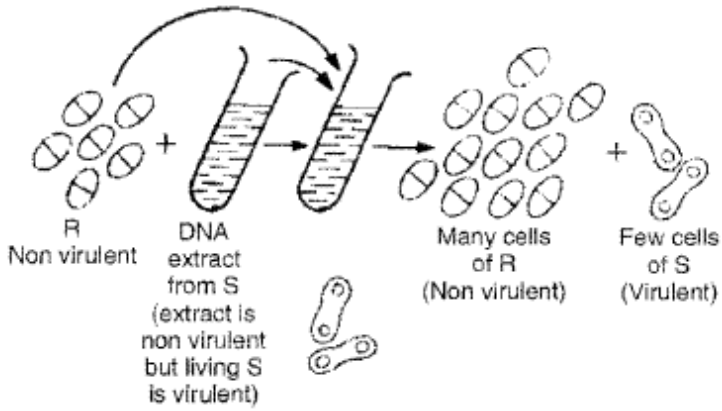
He concluded from fourth step of the experiment that some rough bacteria (nonvirulent) were transformed into smooth type of bacteria (virulent). This occured perhaps due to absorption of some **transforming substance** by rough type bacteria from heat killed smooth type bacteria. This transforming substance from Smooth type bacteria caused the synthesis of capsule which resulted in production of pneumonia and death of mice. Therefore, transforming principle appears to control genetic characters (for example, capsule as in this case). **However the biochemical nature of genetic material was not defined from his experiments**. Later, **Avery, Macleod** and **McCarty** (1944) repeated the experiment in vitro to identify transforming substance. They proved that this substance is DNA.

Pneumococcus bacteria cause disease only when capsule is present. Capsule production is under genetic control.



Bacterial transformation experiments conducted by Griffith

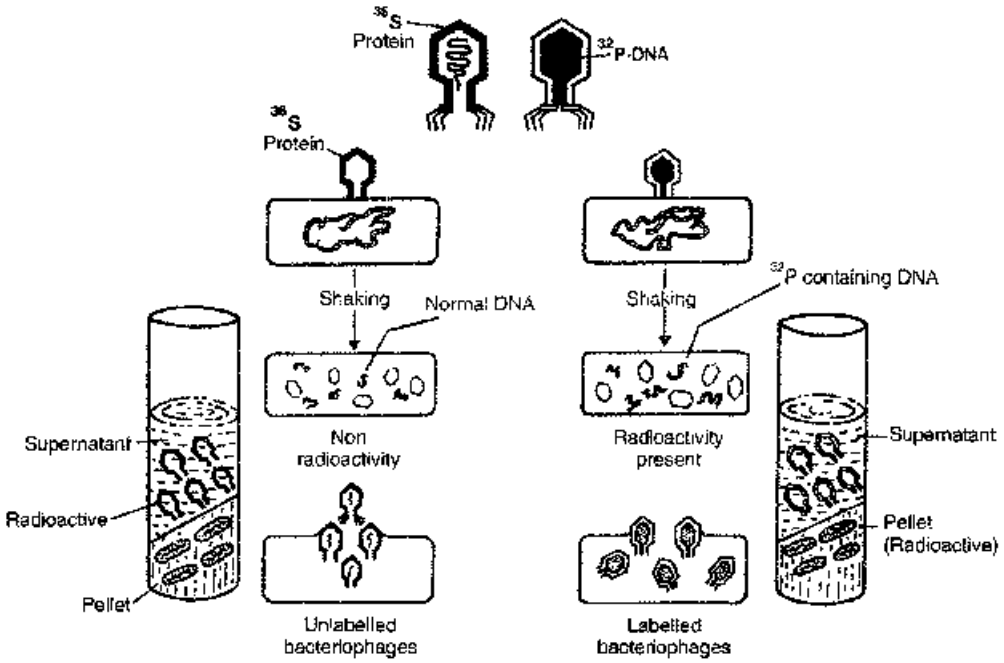
In the experiments, rough type bacteria (non-capsulated and non-virulent) were grown in a culture medium to which DNA extract from smooth type bacteria (capsulated and virulent) was added. Later, the culture showed the presence of smooth type bacteria also in addition to rough type. This is possible only if DNA of smooth type was absorbed by rough bacteria type which thus developed capsule and became virulent. **This process of transfer of characters of one bacterium to another by taking up DNA from solution is called transformation**. When DNA extract was treated with DNAase (an enzyme which destroys DNA), transformation did not occur. The transformation occurs when proteases and RNases were used. **This clearly shows that DNA is the genetic material**.



In vitro experiment of Avery and others demonstrating that DNA is genetic material

(II) Evidence from experiments with bacteriophage. T_2 bacteriophage is a virus that infects bacterium Escherichia coli and multiplies inside It T_2 phage is made up of DNA and protein coat. Thus, it is the most suitable material to determine whether DNA or protein contains information for the production of new virus (phage) particles. Hershey and Chase (1952) demonstrated that only DNA of the phage enters the bacterial cell and, therefore, contains necessary genetic information for the assembly of new phage particle.

The functions of DNA and proteins could be found out by labelling them with radioactive tracers. DNA contains phosphorus but not sulphur. Therefore, phage DNA was labelled with P^{32} by growing bacteria infected with phages in culture medium containing $^{32}PO_4$. Similarly, protein of phage contains sulphur but no phosphorus. Thus, the phage protein coat was labelled with S^{35} by growing bacteria infected with phages in another culture medium containing $^{35}SO_4$. Both types of labelled phages were allowed to infect normally cultured bacteria in separate experiments. These bacterial cells were agitated in a blender and radioactivity was observed. The bacterial cells showed the presence of radioactive DNA labelled with P^{32} while radioactive protein labelled with S^{35}appeared on the outside of bacteria cells (i.e., in the medium). Labelled DNA was also found in the next generation of phage. This clearly showed that only DNA enters the bacterial host and not the protein. DNA, therefore, is the infective part of virus and also carries all the genetic information. **This provided the unequivocal proof that DNA is the genetic material**.



Hershey and Chase's experiments with bacteriophages showing that DNA is genetic material or DNA is infective part of virus

Properties of Genetic Material :

Following are the properties and functions which should be fulfilled by a substance if it is to qualify as genetic material.

(1) It should chemically and structurally be stable.

(2) The genetic material should be able to transmit faithfully to the next generation, as Mendelian characters.

(3) The genetic material should also be capable of undergoing mutations.

(4) The genetic material should be able to generate its own kind (replication).

This can be concluded after examining the above written qualities, that DNA being more stable is preferred as genetic material, as

(a) Free 2'OH of RNA makes it more labile and easily degradable. Therefore DNA in comparison is more stable.

(b) Presence of thymine at the place of uracil also confers additional stability to DNA.

(c) RNA being unstable, mutates at a faster rate.

RNA World

RNA was the first genetic material. There are evidences to suggest that essential life processes, such as metabolism, translation, splicing, etc. evolved around RNA. RNA used to act as a genetic material as well as a catalyst, there are some important biochemical reactions in living systems that are catalyzed by RNA catalysts and not by protein enzymes (e.g., splicing). RNA being a catalyst was reactive and hence unstable. Therefore, DNA has evolved from RNA with chemical modifications that make it more stable. DNA being double stranded and having complementary strand further resists changes by evolving a process of repair. RNA is adapter, structural molecule and in some cases catalytic. **Thus RNA is better material for transmission of information**.

RIBO NUCLEIC ACID (RNA)

Structure of RNA is fundamentally the same as DNA, but there are some differences. The differences are as follows :

(1) In place of De-Oxyribose sugar of DNA, there is present Ribose sugar in RNA.

(2) In place of nitrogen base Thymine present in DNA, there is nitrogen base uracil in RNA.

(3) RNA is made up of only one polynucleotide chain i.e. R.N.A. is Single stranded.

Exception - RNA found in Reo - virus is double stranded, i.e. it has two polynucleotide chains.

Types of RNA :

1. Genetic RNA or Genomic RNA - In the absence of DNA, sometime RNA working as genetic material and genomic RNA transfer informations from one generation to next generation.

eg. Reo virus, TMV, QB bacteriophage.

Non-genetic RNA - 3 types -

(A) r-RNA (B) t-RNA (C) m-RNA

(1) Ribosomal RNA (r–RNA) :

- This RNA is 80% of the cell's total RNA
- It is found in ribosomes and it is produced in nucleolus.
- It is the most stable form of RNA.
- There are present 80s type of ribosomes in Eukaryotic cells. Their subunits are 60s and 40s . In 60s sub unit of ribosome three type of r-RNA are found - 5s, 5.8s, 28s
- In the same way 40s sub unit of ribosome has only one type of r-RNA = 18s.
- So 80s ribosome has total 4 types of r-RNA.
- Prokaryotic cells have 70s type of ribosomes and its subunits are 50s and 30s.

- 50s sub unit of ribosome contains 2 molecules of r-RNA = 5s and 23s.
- 30s sub unit of ribosome has 16s type of r-RNA.
- So 70s RNA has total 3 types of r-RNA.

Functions -

- At the time of protein synthesis r-RNA provides attachment site to t-RNA and m-RNA and attaches them on the Ribosome.
- The bonds formed between them are known as Salt linkages. It attaches t-RNA to the larger subunit on the Ribosome and m - RNA to smaller sub-unit of ribosome.

(2) Transfer - RNA (t-RNA) -

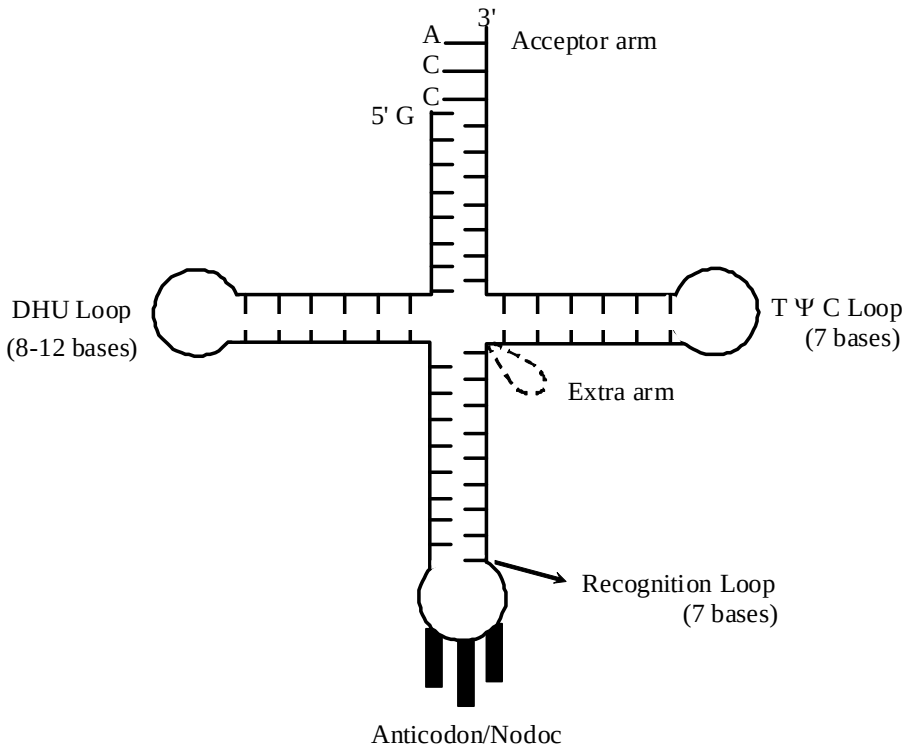
- It is 10-15% of total RNA.
- It is synthesized in the nucleus by DNA.
- It is also known as soluble RNA (sRNA)
- It is also known as Adapter RNA.
- It is the smallest RNA (4s).

Function - At the time of protein synthesis it acts as a carrier of amino-acids.

Discovery - t-RNA was discovered by Hogland, zemecknike and Stephenson.

Structure - The structure of t-RNA is most complicated.

A scientist named Holley presented Clover leaf model of its structure. In two dimensional structure the t-RNA appears clover leaf like but in three dimensional structure (by Kim) it appears L-shaped.



- The molecule of t-RNA is of single strand.
- There are present three nucleotides in a particular sequence at 3′ end of t RNA and that sequence is = CCA.
- All the 5′ ends i.e. last ends are having G(guanine).
- 3′ end is known as Acceptor end.
- t-RNA accepts amino acids at acceptor points. Amino acids binds to 3′ end by its -COOH group.

- The molecule of t-RNA is folded and due to folding some complementary nitrogenous bases comes across with each other and form hydrogen bonds.
- There are some places where hydrogen bonds are not formed, these places are known as **loop**.

Loops -

There are some abnormal nitrogenous bases in the loops, that is why hydrogen bonds are not formed. e.g. Inosine (I), Pseudouracil (Ψ) Dihydrouridine (DHU)

(i) T ψ C Loop or Attachment loop -

This loop connects t-RNA to the larger subunit of ribosome.

(ii) Recognition Loop -

- This is the most specific loop of t-RNA and different types of t-RNA are different due to this loop. There is a specific sequence of three nucleotides called **Anticodon**, is present at the end of this loop.
- On the basis of Anticodon, there are total 61 types of t-RNA, or, we can also say that there are 61 types of Anticodon.
- t-RNA recognizes its place on m-RNA with the help of Anticodon.
- The anticodon of t-RNA recognizes its complementary sequence on m-RNA. This complimentary sequence is known as codon.

(iii) DHU Loop -

- It is also known as Amino-acyl synthetase recognition loop. Amino-acyl synthetase is a specific type of enzyme. The function of this enzyme is to activate a specific type of amino acid. After activation this enzyme attaches the aminoacid to the 3 end of t-RNA.
- There are 20 types of enzymes for 20 types of aminoacids.
- The function of DHU loop is to recognize this specific Aminoacyl synthetase enzyme.

(3) Messenger RNA (m-RNA) -

- The m-RNA is 1-5% of the cell's total RNA.

  Discovery - Messenger RNA was discovered by Huxley, Volkin and Astrachan. The name m-RNA was given by Jacob and Monad.
- The m-RNA is produced by genetic DNA in the nucleus. This process is known as Transription.

GENETIC CODE

Term Given by George Gamow.

- The relationship between the sequence of amino acids in a polypeptide chain and nucleotide sequence of DNA or m-RNA is called genetic code.
- There occur 20 types of amino acids which participate in protein synthesis. DNA contains information for the synthesis of any types of polypeptide chain. In the process of transcription, information transfer from DNA to m-RNA in the form of complementary N_2-base sequence.
- m-RNA contains code for each amino acid and it is called **codon**. A codon is the nucleotide sequence in m-RNA which codes for particular amino acid; wherease the genetic code is the sequence of nucleotides in m-RNA molecule, which contains information for the synthesis of polypeptide chain.

Triplet Code -

- The main problem of genetic code was to determine the exact number of nucleotide in a codon which codes for one amino acid.
- There are four types of N_2-bases in m-RNA (A, U, G, C) for 20 type amino acids.

	U	C	A	G	
U	UUU Phe UUU UUU Leu UUU	UUU UCC UCA UCG Ser	UAU Phe UUU UAA Ochre (terminator) UAG Amber (terminator)	UGU Cys UGC UGA Terminator UGG Try	U C A G
C	CUU CUC CUA CUG Leu	CCU CCC CCA CCG Pro	CAU His CAC CAA CAG Gln	CGU CGC CGA CGG Arg	U C A G
A	AUU AUC AUA IIe AUG Met	ACU ACC ACA ACG Thr	AAU Asn AAC AAA Lys AAG	AGU Ser AGC AGA AGG Arg	U C A G
G	GUU GUC GUA GUG Val	GCU GCC GCA GCG Ala	GAU Asp GAC GAA Glu GAG	UGU UGC UGA UGG Gly	U C A G

Triplet codons of mRNA for amino acids represented in tabular form.

- If genetic code is singlet i.e. codon is the combination of only one nitrogen base, then only four codons are possible A, C, G and U. These are insufficient to code for 20 types amino acids.

A	Codons
C	
G	
U	

Singlet Code : 4 × 1 = 4 codons

- Singlet code = 4 = 4 × 1 = 4 codons
- If genetic code is doublet (i.e. codon is the combination of two nitrogen bases) then 16 codons are formed.
- Doublet code = 42 = 4 × 4 = 16 codons.
- 16 codons insufficient for 20 amino acid

AA	AC	AG	AU
CC	CA	CG	CU
GG	GA	GC	GU
UU	UA	UG	UC

Doublet Code : 4 × 4 = 16 condons

Gamow -

- (1954) Pointed out the possibility of three letter code (Triplet code).
- Genetic code is triplet i.e. one codon consists of three nitrogen base.
  Triplet code = $43 = 4 \times 4 \times 4 = 64$ codons
- In this case there occurs 64 codons in dictionary of genetic code.
- 64 codons are sufficient to code 20 types of amino acids.

Characteristic of Genetic Code -

(1) Triplet in Nature

- A codon is composed of three adjacent nitrogen bases which specifies the one amino acid in polypeptide chain.
  For Ex. :
- In m-RNA if there are total 90 N_2 - bases.
- Then this m-RNA determines 30 amino acids in polypeptide chain.
- In above example, number of Nitrogen bases are 90 so codons ==> 30 and 30 codons decide 30 amino acid in polypeptide chain.

(2) Universality

The genetic code is applicable universally. The same genetic code is present in all kinds of living organism including viruses, bacteria, unicellular and multicellular organism.

(3) Non-Ambiguous -

- Genetic code is non ambiguous i.e. one codon specifies only one amino acid and not any other.
- In this case one codon never code two different amino acids. Exception GUG codon which code both valine and methionine amino acid.

(4) Non-Overlapping -

A nitrogen base is a constituent of only one codon.

(5) Comma less -

- There is no punctuation (comma) between the adjacent codon i.e. each codon is immediately followed by the next codon.
- If a nucleotide is deleted or added, the whole genetic code read differently.
- A Polypeptide chain having 50 amino acids shall be specialized by a linear sequence of 150 nucleotides. If a nucleotide is added in the middle of this sequence, the first 25 amino acids of polypeptide will be same but next 25 amino acids will be different.

(6) Degeneracy of Genetic code -

- There are 64 codons for 20 types of amino acids, so most of the amino acids (except two) can be coded by more than one codon. Single amino acid coded by more than one codon is called "Degeneracy of genetic code". This incident was discovered by Baurnfield and Nirenberg.
- Only two amino acids Tryptophan and Methionine are specified by single codon.

  UCG for Tryptophan

  AUG for methionine

- All the other amino acid are specified or coded by 2 to 6 codons.
- Leucine, serine and arginine are coded or specified by 6-codons.
  Leucine = CUU, CUC, CUA, CUG, UUA & UUG
  Serine = UCU, UCC, UCA, UCG, AGU, AGC
  Arginine = CGU, CGC, CGA, CGG, AGA, AGG
- Degeneracy of genetic code is related to third position (3 - end of triplet codon). The third base is described as "Wobby base"

Exception -

Different Codon -

- Normally UAA and UGA are chain termination codon but in Paramecium and some other ciliated, UAA and UGA code for glutamine amino acid.

Mitochondrial Gene -

- Normally AGG and AGA code for Arginine amino acid but in human mitochondria these function as stop codon.
- UGA, a termination codon corresponds to tryptophan while AUA (Codon for isoleucine) denotes methionine in human mitochondria.

Chain Initiation and Chain Termination Codon -

- Polypeptide chain synthesis is signalled by two initiation codons AUG or GUG.
- AUG codes methionine amino acid in eukaryotes and in prokaryotes AUG codes N-formyl methionine.
- Some times GUG also functions as start codon it codes for valine amino acid normally but when it is present at starting position it code for methionine amino acid.
- Out of 64 codons 3-codons are stopping or nonsense or termination codon.
  Nonsense codons do not specify any amino acid.
  UAA (Ochre)
  UAG (Amber) Non-Sense Codon
  UGA (Opal)
- So only 61 codons are sense codons which specify 20 amino acid.

WOBBLE HYPOTHESIS

- It was propounded by CRICK.
- Normally an anticodon recognizes only one codon, but sometimes an anticodon recognise more than one codon. This known as Wobbling. Wobbling normally occurs for third nucleotide of codon.
- For e.g. Anticodon AAG can recognize two anticodons i.e. UUU and UUC, both stand for phenyl alanine.

Types of m-RNA : m-RNA is of 2 types -

(1) Monocistronic - The m- RNA in which genetic signal for the formation of only one polypeptide chain.

(2) Polycistronic - The m-RNA, in which genetic signal is present for the formation of more than one polypeptide chains.

- Non sense codons are found in middle position in polycistronic m-RNA.

CENTRAL DOGMA

- Central dogma term was given by **Crick**.
- The formation (production) of m-RNA from DNA and then synthesis of protein from it, is known as **Central Dogma**.

$$\text{DNA} \xrightarrow{\text{Transcription}} \text{RNA} \xrightarrow{\text{Translation}} \text{Protein}$$

- It means, it includes transcription and translation.
- The central dogma scheme of protein synthesis was presented by **Jacob and Monad**.
- The delailed study of central dogmas is done by **Nirenberg, Mathai and Khorana.**
- **Beedle and Tatum** studied central dogma in a fungus ***Neurospora***.

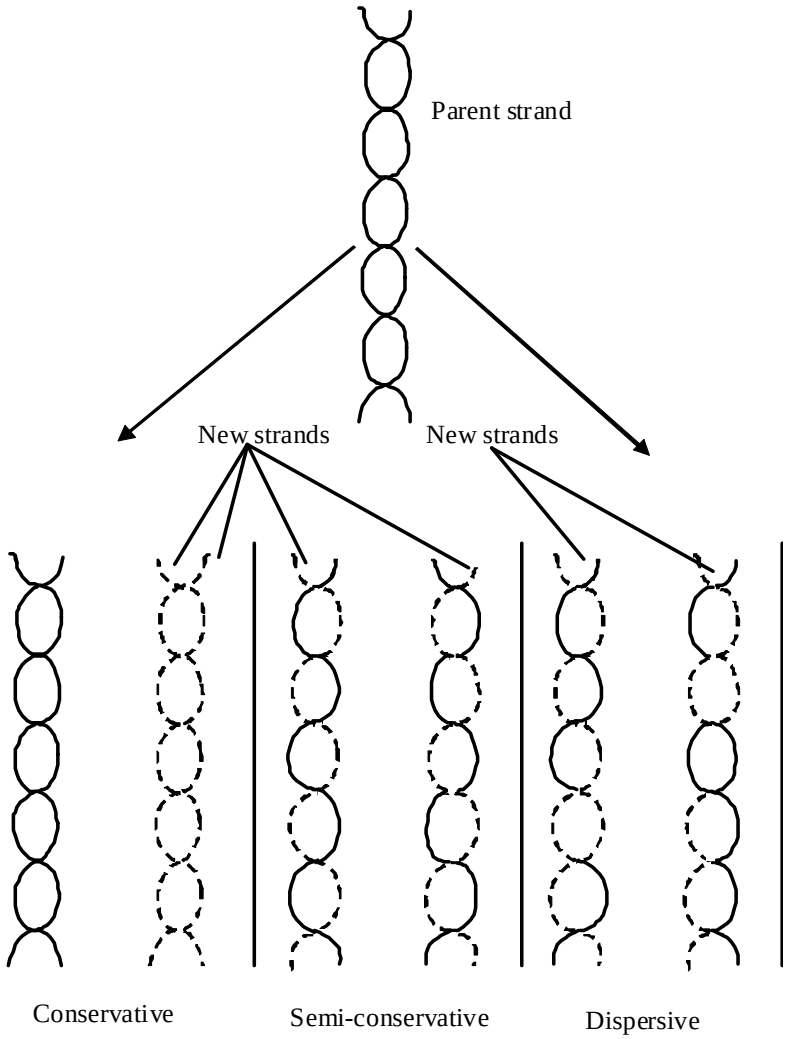
$$\text{Replication} \circlearrowleft \text{DNA} \underset{\text{Reverse Transcription}}{\overset{\text{Transcription}}{\rightleftharpoons}} \text{RNA} \circlearrowleft \xrightarrow{\text{Translation}} \text{Protein}$$

Reverse Transcription -

- The formation of DNA from RNA is known as **Reverse - transcription**. It was discovered by Temin and Baltimore in Rous - sarcoma virus. So it is also called **Teminism**.
- ss-RNA of Rous-Sarcoma virus (Retro virus) produces ds-DNA in host's cell with the help of enzyme reverse transcriptase (DNA Polymerase). This DNA is called **c-DNA (Complimentary DNA)**. Some times this DNA moves in host genome. Such mobile DNA is called **"Retroposon" (Oncogene)**.

D.N.A. REPLICATION

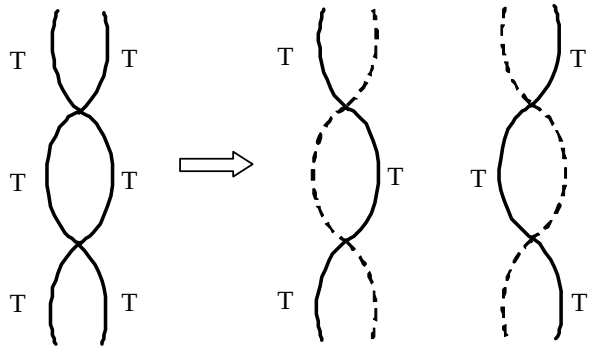
- D.N.A. is the only molecule capable of self duplication so it is termed as a **"Living molecule"**.
- All living beings have the capacity to reproduce because of this characteristic of D.N.A.
- D.N.A replication takes place in **"S - Phase"** of the cell cycle. At the time of cell division, it divides in equal parts in the daughter cells. Delbruck suggested three methods of DNA-replication i.e.
  (1) Dispersive
  (2) Conservative
  (3) Semi-conservative



DNA replication

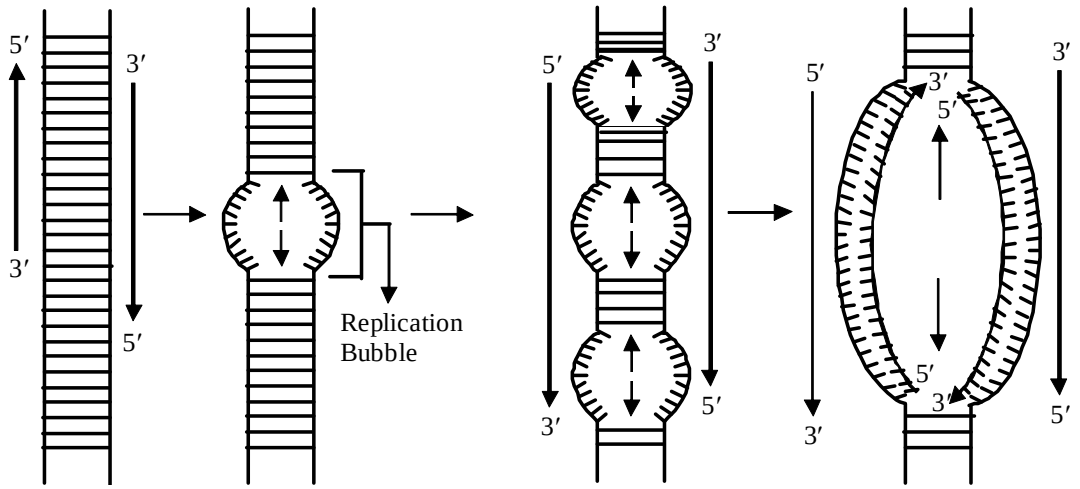
SEMI CONSERVATIVE MODE OF DNA REPLICATION

Semi conservative mode of DNA replication was first theoritically proposed by Watson & Crick. Later on it was experimentally proved by Meselson & Stahl (1958) on E-Coli and Taylor on Vicia faba. To prove this method , they used Radiotracer Technique in which Radioisotops are used. Meselson and Stahl used N15 and Cairns (1963) used radioactive Thymidine (with H3).



- Due to the replication of active Thymidine containing DNA., two DNA. molecules were obtained in which 50% radioactivity was found.
- When these two D.N.A. molecules containing active Thymidine were made to replicate, the next time four D.N.A. molecules were obtained. Out of these 4 D.N.A., 2 D.N.A. molecules were radioactive and remaining 2 were not radioactive.
- In the same sequence, the obtained DNA. molecules were further made to replicate then also, the no. of radioactive DNA remains 2.

MECHANISM OF DNA REPLICATION



The following steps are included in DNA replication -

(1) Unzipping -

- The separation of 2 chains of DNA is termed as unzipping and it takes place due to the braking of H bonds. The process of unzipping starts at a certain specific point which is termed as initiation point or origin of replication . In procaryotes there occur only one origin of replication but in eucaryotes there occur many origin of replication i.e. unzipping starts at many points simultaneously.
- The enzyme responsible for unzipping (breaking the hydrogen bonds) is Helicase (= Swivelase). In the process of unzipping Mg^{+2} act as cofactor. Unzipping takes place in alkaline medium.

- At the place of origin, the topoisomerase enzyme (a type of endonuclease) induces a cut in one strand of DNA (Nicking) to relax the two strands of DNA.
- A protein, "Helix destabilizing protein" prevents recoiling of two separated strands during the process of replication. An another protein SSB (single stranded DNA binding protein) prevents the formation of bends of loops in separated strands.

DNA-Gyrase : A type of topoisomerase prevent supercoiling of DNA.

Note -

The process of DNA replication takes a few minutes in prokaryotes and few hours in Eukaryotes.

(2) Formation of New Chain -

- To start the synthesis of new chain, special type of RNA. is required which is termed as R.N.A Primer. The formation of RNA. primer is catalysed by an enzyme - RNA. Polymerase (primase) Synthesis of RNA - primer takes place in 5' $\rightarrow$ 3" direction. After the formation of new chain, this R.N.A. is removed. For the formation of new chain Nucleotides are obtained from Nucleoplasm. In the nucleoplasm, Nucleotides are present in the form of triphosphate like dATP, dGTP, dCTP, dTTP etc.
- During replication, the 2 phosphate groups of all Nucleotides are separated. In this process energy is yielded which is consumed in D.N.A replication. So, it is clear that D.N.A. does not depend on mitochondria for it's energy requirements.
- The formation of new chain always takes place in 5' - 3" direction. As a result of this, one chain of D.N.A is continuously formed and it is termed as Leading strand. The formation of second chain begins from the centre and not from the terminal points, so this chain is discontinuous and is made up of small segement called **Okazaki Fragments**. This discontinous chain is termed as Lagging strand. Ultimately all these segments joined together and complete new chain is formed.
- The Okazaki segment are joined together by an enzyme DNA Ligase. (Khorana)
- The formation of new chains is catalysed by an enzyme DNA polymerase. In prokaryotes it is of 3 types :

(1) DNA - Polymerase I : This was discovered by **Kornberg** (1957). So it is also called as **Kornbergs enzyme**. Kornberg also synthesized DNA first of all, in the laboratory. This enzyme functions as exonuclease. It separates RNA - primer from DNA and also fills the gap. It is also known as DNA- repair enzyme.

(2) DNA - Polymerase II : It is least reactive in replication process. It is also helpful in DNA-repairing in absence of DNA-polymerase-I and DNA polymerase-III.

(3) DNA - Polymerase III : This is the main enzyme in DNA - Replication . It is most important. It was discovered by **Delucia and Cairns**. The larger chains are formed by this enzyme. This is also known as **Replicase**.

DNA - polymerase III is a complex enzyme composed of seven polypeptides α, α, θ, β, γ, δ, γ_2.

In Eucaryotes, there occur five types of DNA-polymerase enzyme.

(i) α-DNA - polymerase = Similar to DNA - polymerase I

(ii) β-DNA - polymerase = It concerned with DNA repair.

(iii) γ-DNA - polymerase = It concerned with replication of cytoplasmic DNA

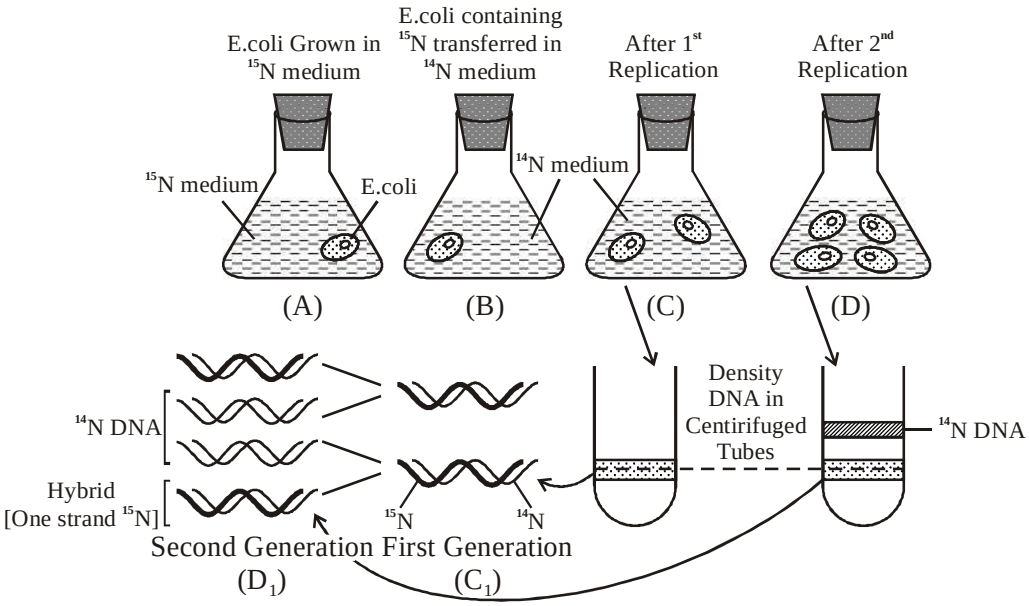
(iv) δ-DNA - polymerase = Similar to DNA - polymerase II

(v) ε-DNA - polymerase = Similar to DNA - polymerase III

- Thus DNA - Replication process is completed with the effect of different enzymes.
- In the semi conservative mode of replication each daughter DNA molecule receives one chain of polynucleotides from the mother DNA - molecule and the second chain is synthesized.

Special Point :

All DNA polymerase I, II and III enzymes have 5'-3" polymerisation activity and 3'-5" exonuclease activity.



Meselson and Stahl's Experiment

TRANSCRIPTION

- Formation of RNA over DNA templet is called transcription. Out of two strand of DNA only one strand participates in transcription and called **"Antisense strand"**.
- The segment of DNA involved in transcription is **"Cistron"**.
- RNA polymerase enzyme involved in transcription. In eukaryotes there are three types of RNA polymerases.
  - **RNA polymerase-I** for 28s rRNA, 18s RNA, 5.8s rRNA
  - **RNA polymerase-II** for m-RNA.
  - **RNA polymerase enzyme-III** for t-RNA, 5s RNA, SnRNA
- In eukaryotes RNA polymerase enzyme composed of 10-15 polypeptide chains.
- Prokaryotes have one type of RNA polymerase which synthesizes all types of RNAs.
- RNA polymerase of E. Coli has six polypeptide chains β, β′, α, α, ω, and σ.
- σ Polypeptide chain is also known as **σ factor** (sigma factor).
- Core enzyme + Sigma factor ⇒ RNA Polymerase
  (β, β′, α, α, ω) + (σ)

Following steps are present in transcription -

(1) Initiation -

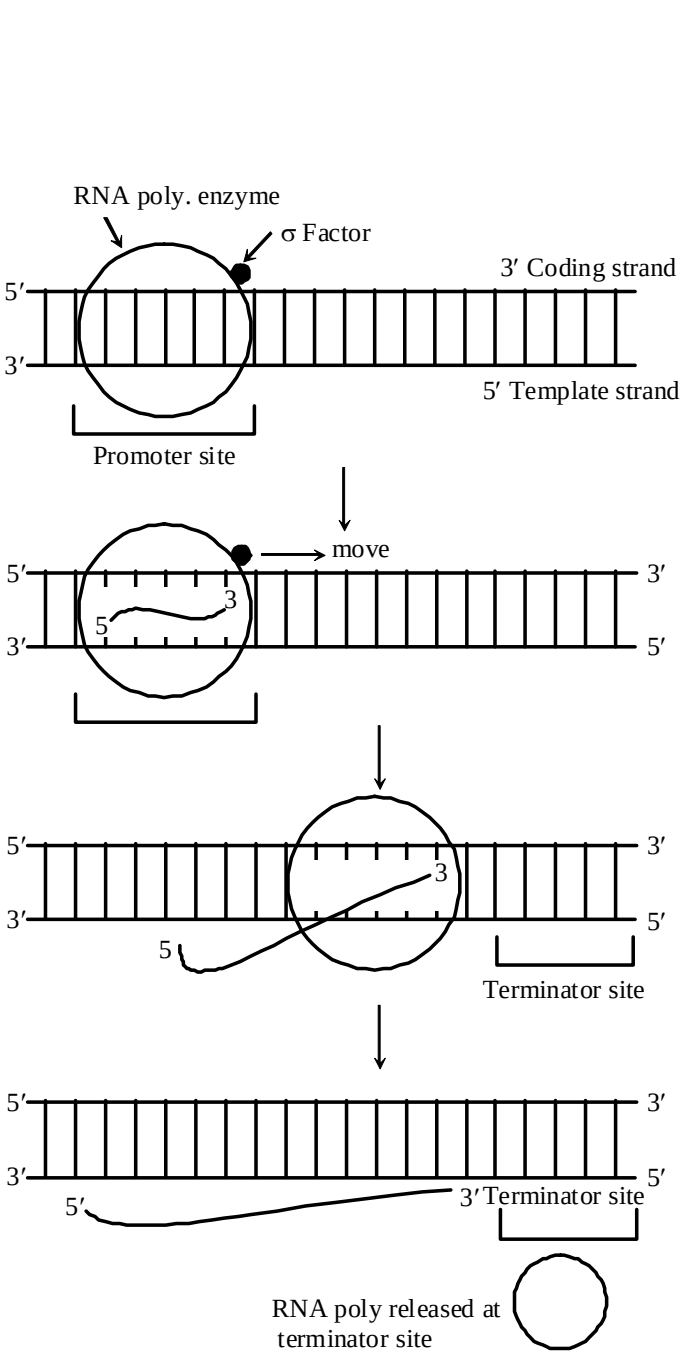
- DNA has a "Promoter site or initiation site" where transcription begins and a "Terminator site" where transcription stops.
- Sigma factor (σ) recognizes the promoter site of DNA.
- With the help of sigma factor RNA polymerase attached to a specific site of DNA called ''**Promoter site**''.
- In prokaryotes before the 10 N_2 base from "Promoter site" a sequence of 6 base pairs (TATAAT) is present on DNA, Which is called ''**Pribnow box**''.
- In eukaryotes before the 20 N_2 base from "Promoter site" a sequence of 7 base pairs (TATAAA) or (TATATAT) is present on DNA which is called **"TATA box or Hogness box"**.
- At promoter site RNA polymerase enzyme breaks H-bonds between two DNA strands and separates them One of them strand takes part in Trancription. Transcription proceeds in 5′ → 3′′ direction.
- Ribonucleotide triphosphate come to lie opposite complementary nitrogen bases of anti sense strand.
- These Ribonucleotides present in the form of triphosphate ATP, GTP, UTP and CTP in nucleoplasm. When they used in transcription, pyrophosphates hydrolyse two phosphates from each activated nucleotide. This releases energy.
- This energy used in process of transcription.

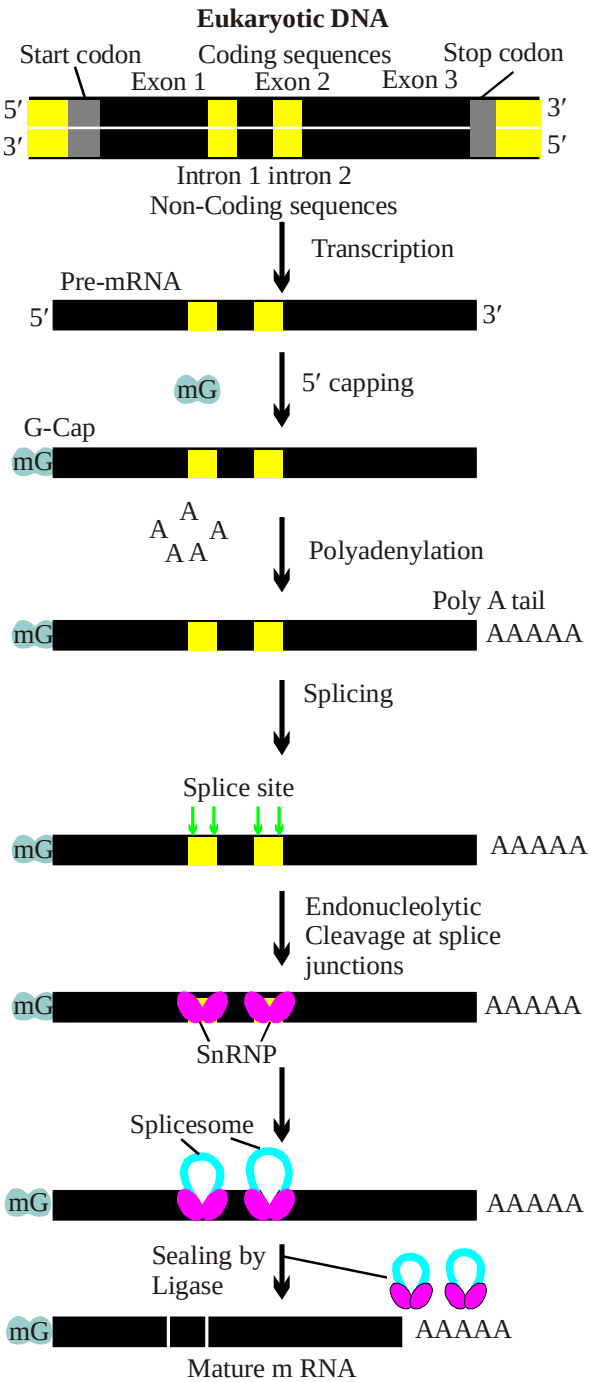
(2) Elongation -

- RNA polymerase enzyme establishes phosphodiester bond between adjacent ribonucleotides.
- Sigma factor separates and core enzyme moves along the anti sense strand till it reaches terminator site.

(3) Termination -

- When RNA polymerase enzyme reaches at terminator site, it separates from DNA templet.
- In terminator site on DNA, N_2 bases are present in palindromic sequence.
- In most cases RNA polymerase enzyme can recognize the "Terminator site" and stop the synthesis of RNA chain, but in prokaryotes, it recognizes the terminator site with the help of Rho factor (factor).
- Rho (ρ) factor is a specific protein which helps RNA polymerase enzyme to recognize the terminator site.





Post : Transcription in eukaryotes

PROTEIN-SYNTHESIS

(1) Activation of Amino acid -

- 20 types of amino acid participate in protein synthesis.
- Amino acid reacts with ATP to form "Amino acyl AMP enzyme complex", which is also known as 'Activated Amino acid.'

$$\text{Amino acid} + \text{ATP} \xrightarrow[\text{t-RNA synthetase}]{\text{Amino acyl}} \text{Amino acyl-enzyme complex} + \text{PP}$$

- This reaction is catalyzed by a specific 'Amino acyl t-RNA synthetas' enzyme
- There is a separate 'Amino acyl t-RNA synthetase' enzyme for each kind of amino acid.

(2) Charging of t-RNA -

- Specific activated amino acid is recognized by its specific t-RNA.
- Now amino acid attaches to the 'Amino acid attachment site' of its specific t-RNA and AMP and enzyme are separated from it.

$$\text{Amino acyl AMP-enzyme complex} + \text{t-RNA} \rightarrow \text{Amino acyl t-RNA complex} + \text{AMP} + \text{enzyme}$$

- Amino acyl t-RNA complex is also called '**Charged t-RNA**'.
- Now Amino acyl t-RNA moves to the ribosome for protein synthesis.

(3) Translation :

(A) Initiation of polypeptide chain

- In this step 30 's' and 50 's' sub units of Ribosome, GTP, Mg^{+2}, charged t-RNA, m-RNA and some initiation factors are required.
- In prokaryotes there are three initiation factors present - IF1, IF2, IF3.
- In Eukaryotes there are more than 3 initiation factors are present. 16 initiation factors have been identified in red blood cells-

  elF1, elF2, elF3, elF4A, elF4B, elF4C, elF4D, elF4F, elF5, elF6
- Initiation factors are specific protein.
- GTP and initiation factors promote the initiation process.
- In starting the both sub units of ribosome are separated with the help of IF3 factor.
- In prokaryotes with the help of "S D sequences" (Shine-Delgarno sequence) m-RNA recognizes the smaller sub unit of ribosome. A sequence of 8 N_2 base is present before the 4-12 N_2 base of initiation Condon on mRNA, called **"SD sequence"** In smaller subunit of ribosome, a complementary sequence of "SD sequence" is present on 16 'S' rRNA, which is called **"Anti Shine-delgarno sequence"**. (ASD sequence)
- With the help of 'SD' and 'ASD' sequence m-RNA recognizes the smaller sub unit of ribosome.
- While in Eukaryotes smaller sub unit of ribosome is recognised by "7mG cap".
- In Eukaryotes, 18 'S' rRNA of smaller sub unit has a complementary sequence of "7mG cap".

$$30\text{'S' sub unit} + \text{m-RNA} \xrightarrow[Mg^{+2}]{\text{IF3}} 30\text{'S' m-RNA-complex}$$

- This "30 'S' m-RNA - complex" reacts with 'Formyl methionyl t-RNA-complex' and "30 'S' mRNA -Formyl methionyl t-RNA-complex" form. This t-RNA attaches with codon part of m-RNA. A GTP molecule is required.

$$30'S'm-RNA-complex + Formylmethionylt-RNA\,complex$$
$$GTP \downarrow {}^{IF2,IF3}_{Mg^{+2}}$$
$$30'S'm-RNA\,formylmethionylt-RNA-complex$$

- Now larger sub unit of ribosome (50'S' Sub unit) joins this complex. The initiation factor released and complete 70 'S' ribosome is formed.
- In larger sub unit of ribosome there are three sites for t-RNA.

  'P' site = Peptidyl site

  'A' site = amino acyl site

  E-site = exit site
- Starting codon of m-RNA is near to 'P' site of ribosome, so t-RNA with formyl methionine amino acid first attached to 'P' site of ribosome and next codon of m-RNA is near to 'A' site of ribosome. So new t-RNA with new amino acid always attach at 'A' site of ribosome but in initiation step 'A' site is empty.

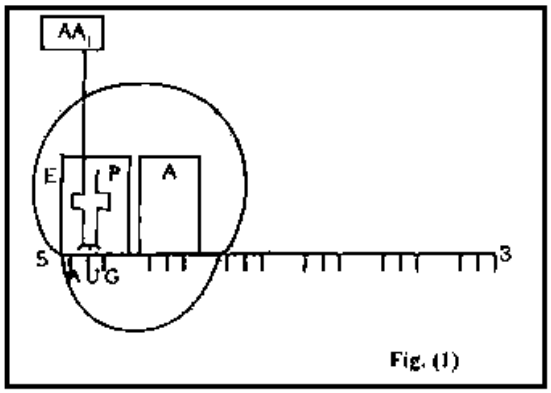


Fig. (1)

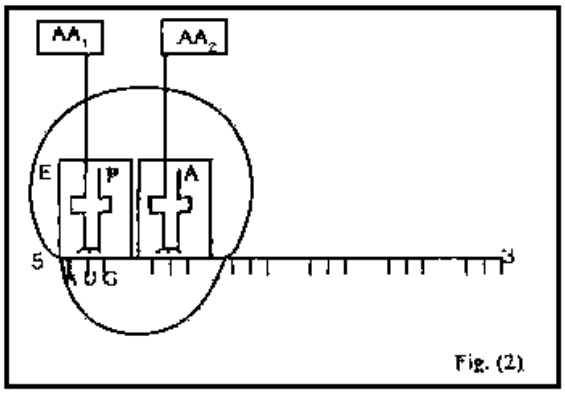

Fig. (2)

(B) Chain elongation

- New tRNA with new Amino acid at 'A' site of Ribosome.
- First of all t-RNA of P-site is discharged so-COOH of p-site A.A. becomes free.
- Now peptide bond formation takes place between -COOH group of P site amino acid and $-NH_2$ group of A site amino acid.
- Peptidyl transferase enzyme induces the formation of peptide bond. In Peptide bond formation, a 23 'S' r-RNA, 28 'S' r-RNA in eukaryotes is also helpful. This r-RNA acylt acts as an enzyme so it is also called **"Ribozyme"**.
- After formation of peptide bond t-RNA of P site released from ribosome via E-site and dipeptide attaches with A site.
- Now t-RNA of A site is transferred to P site and A site becomes emplty.
- Now ribosome slides over m-RNA strand in 5' $\rightarrow$ 3" direction. Due to sliding of ribosome on m-RNA, new condon of m-RNA continously available at A site of ribosome and according to new codon of m-RNA new amino acid attaches in polypeptide chain.
- Translocase enzyme helpful in movement of ribosome. GTP provides energy for sliding of ribosome.
- In elongation process some protein factors are also helpful, which known as **'Elongation factors'**.
- In prokaryotes three 'Elongation factors' are present -EF - Tu, EF - Ts, EF - G..
- In Eukaryotes two elongation factors are present-eEF1, eEF2.

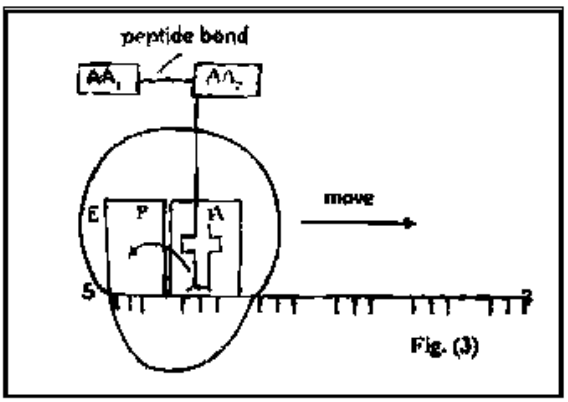

Fig. (3)

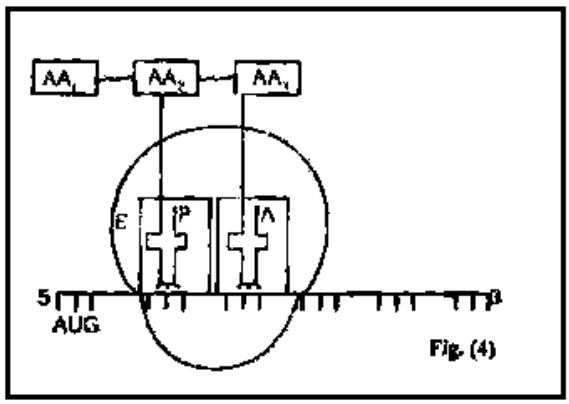

Fig. (4)

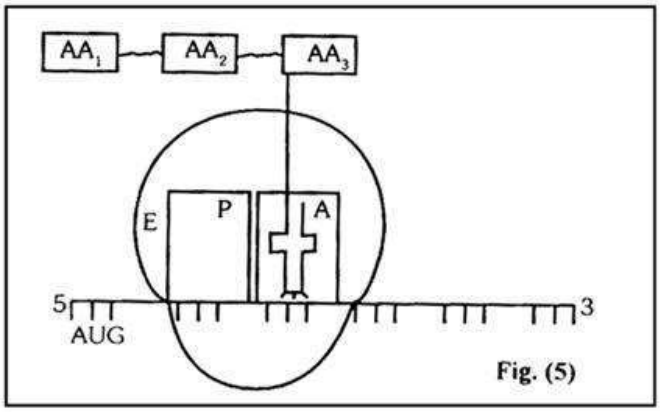

Fig. (5)

(C) Chain - Termination

- Due to sliding of ribosome over m-RNA when any Nonsense codon (UAA, UAG, UGA) available at A site of ribosome, then polypeptide chain terminate.
- The linkage between the last t-RNA and the polypeptide chain is broken by three release factor called **RF1, RF2, RF3** with the help of GTP.
- Peptidyl transferase enzyme also catalysed the releasing process.
- In eukaryotes only one Release factor is known - **eRF1**.

SPECIAL POINTS :

1. The chargraff's rule is not valid (true) for RNA. It is valid only for double helical DNA.
2. The duplication of DNA was first of all proved in E.coli bacterium.
3. E.coli Bacterium is mostly used for the study of DNA duplication.
4. **Hargovind singh Khurana** first of all recognized the triple codon for Cysteine and Valine amino acids
5. Cytoplasmic DNA is 1-5% of total cells **DNA**.
6. Three lady scientists named Avery, Mc-Leod and Mc Carty (by their transrformation experiments on bacteria) proved that DNA is a genetic material.
7. Hershey and chase first of all proved that DNA is genetic material in bacteriophages.
8. Frankel and Conret proved, RNA as a genetic material in viruses (g-RNA).
9. AUC, ACU, AUU } These anticondons do not exist.
10. The structure formed by the combination of m-RNA and Ribosomes is known as polyribosomes / Polysomes / Ergosomes.
11. The formation of t-RNA takes place from the heterochromatin part of DNA.

12. The formation of m-RNA takes place from the Euchromatin part of DNA.
13. m-RNA is least stable. It is continuosly formed and finished.
14. In cytoplasm, t-RNA is present in the form of soluble colloid.
15. **Nucleases -** These breaking enzyme of nucleic acids are of two types :
    (i) Endo - Nucleases - These break down the nucleic acids from the inside.
    (ii) Exo-nucleases - These break down the nucleic acids from the ends (terminals ends) These separate each nucleotide.
16. Tay-Sachs-diseases. This disease takes place due to excess storage of glycolipids
17. Excess storage of cerebrosides leads to Guacher's disease.

Some Inhibitors of Bacterial Protein Synthesis	
Antibiotic	**Effect**
Tetracycline	Inhibits binding of amino-acyl tRNA to ribosome
Streptomycin	Inhibits initiation of translation and causes misreading
Chloramphenicol	Inhibits peptidyl transferase and so formation of peptide bonds
Erythromycin	Inhibits translocation of ribosome along mRNA
Neomycin	Inhibits interaction between t-RNA and mRNA

18. **Spilt gene :** Discovered by **Sharp and Roberts** in Adenovirus 2 They were awarded by Nobel Prize in 1993. Gene which contains non functional part along with functional part is known as split gene. Non functional part is called **intron** and functional part is called **exon**. By transcription split gene produces a RNA which contains coding and non coding sequence and called **hn RNA (Hetero genous nuclear RNA)**. This hn RNA is unstable. Now 200 nucletides of adenylic acid are added to its 3' end, which is called **poly 'A' tail**. Now it becomes stable. 7 methyl guanosine is also added to its 5' end a cap like structure is formed. It is called **capping**. By the process of RNA splicing hn-RNA produces functional RNA that is exonic RNA. In RNA splicing non coding parts removed with the help of ribonuclease enzyme and coding part join together with the help of RNA ligase. Some specific proteins are also helpful in RNA-splicing called **'Small nuclear ribonucleoprotein'** or 'SnRNP' or 'Snurps'. These SnRNP proteins combine with some other proteins and SnRNA and form spliceosome complex. This spliceosome complex uses energy of ATP to cut the RNA, releases the non-coding part and joins the coding-part to produce functional RNA.

    Noncoding part of hn RNA remained inside the nucleus and not translated into protein. Only coding part moves from nucleus to cytoplasm and translated into protein.

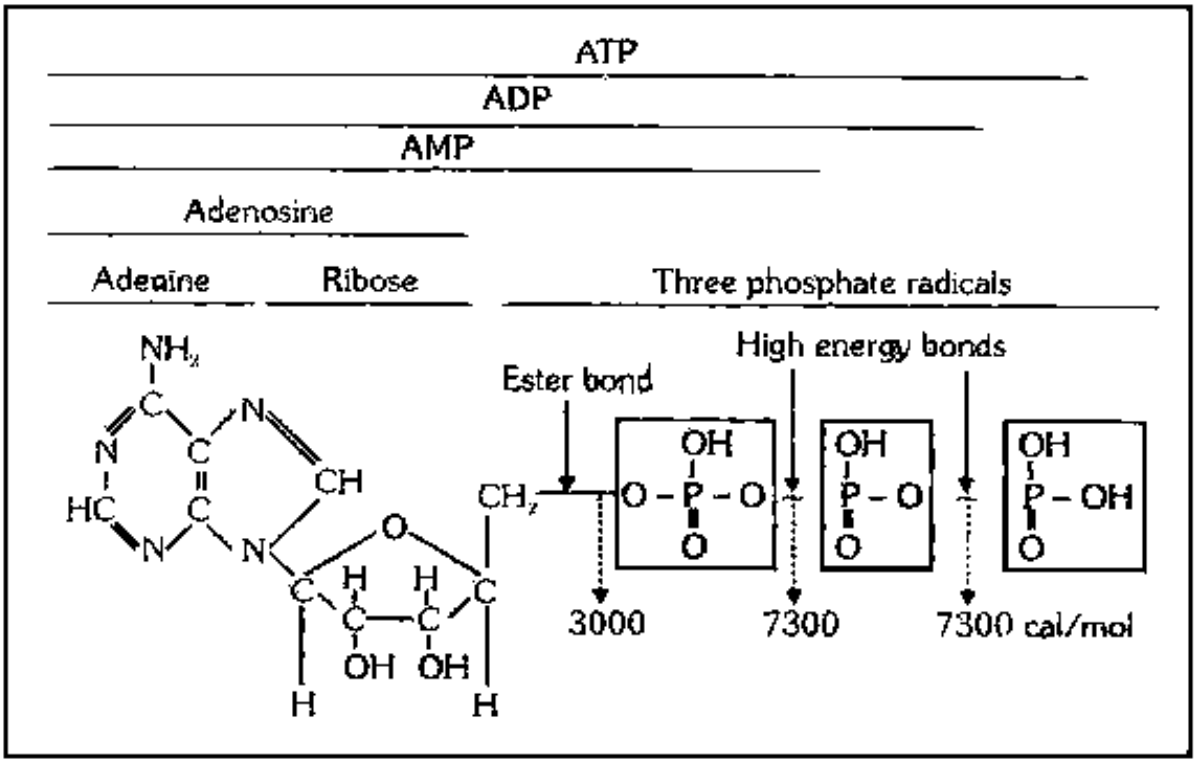
    Mostly prokaryotic genes are example of non split gene.

Special Points :

- In human mitochondria, 4 initiation codons present : AUG, AUA, AUU, AUC.
- **Mic RNA :** It is synthesized sometime on the sense of DNA which is complementary of Antisense strand which is used for mRNA synthesis. Such RNA is used for regulation of gene expression at the level of translation.

- **Higher Energy Nucleotide :** Nucleotides which contain more than one phosphate i.e. ATP, ADP.

ATP : Discover-Karl Lohmann. It is made up by Adenine, D-Ribose and three phosphate. It is a high energy compound that release energy when the bond between the phosphate is broken. In ATP two high energy bonds are present. ATP is also called **energy currency** of cell.



- **Iodine number :** It is the amount of iodine in gram absorbed by 100 gram fat. It is used to determine the degree of unsaturation of fat.
- **Second genetic code :** Interaction between specific t-RNA and amino acyl synthetase enzyme is known as **second genetic code**.

  GLUT-4 (Glucose transport 4) Proteins : It is a transport protein that allows glucose to enter a cell. GLUT-4 moves into the plasma membrane in response to insulin or muscle contraction. When amount of glucose increased in blood, more insulin is secreted GLUT-4 then responds to the presence of the insulin and enters the plasma membrane, allowing glucose to enter the cell.
- **DNA-quenching :** Rapid cooling of denatured DNA, fix it in permanently denatured from, it is called **DNA quenching**.
- $\phi \times 174$ bacteriophage has 5386 nucleotides, λ-bacteriophage has 48502 base pairs, Escherichia coli has 4.6×10^6 base pair and 6.6×10^6 base pairs in human (2n).
- 2-OH groups present at everynucleotide in RNA as reactive group and makes RNA labile and easily degradable and RNA also has catalytic function so it is more reactive. DNA is chemically less reactive and structurally more stable as compared to RNA.
- DNA is more stable so preferred for storage of genetic information but for the transmission of genetic information RNA is better.
- An mRNA also have some additional sequences that are not translated and are referred as untranslated regions (UTR). The UTRs are present at both 5'end (before start codon) and at 3' end (after stop codon).

- **RNA Interference :** It is a method of gene silencing. In this method a ds RNA is inserted in a cell and enzyme Dicer break this ds RNA into small ds fragments of 20-25 base pairs with a few unpaired overhang bases on each end. This short ds fragments are called small interfering RNA (si RNA). Now siRNA associated with specific protein to form a complex RISC (RNA induced silencing complex). Now RISC attached with targeted m-RNA and inhibit its translation.
- For RNA-interference in Caenorhabditis elegans Andrew fire and Craig C. Mello got Noble Prize in 2006 in physiology and medicine.

GENE EXPRESSION

The second important characteristic (first is transmission) of the gene is to store and express the genetic information that will contribute towards the phenotype.

DNA carries information for the synthesis of all proteins required for the function of a cell. A close relationship between genes and enzymes (or gene control the metabolism) was first discovered by a British physician **Archibald Garrod** in 1909 (Father of human biochemical genetics. Concept - **One mutant gene one metabolic block**). He observed that certain hereditary diseases in man such as **alkeptonuria** (black urine disease), **albinism** (absence of melanin pigment) **phenylketonuria** etc. are inborn errors of metabolism and are due to the defect in the enyme that catalyses the conservation of one metabolic substance to another. Thus, the inherited genetic defect is reflected in the deficiency of an enzyme.

Beadle and Tatum's Hypothesis (One gene one enzyme hypothesis)

The concept that genes have the information to produce enzymes, or gene metabolism relationship was experimentaly proved by **Beadle** and **Tatum** (1948), on the basis of experiments conducted on pink bread mould **(Neurospora crassa).** This mould can normally grow in a simple minimal medium containing salts and sugar, making all other chemicals such as amino acids, purines, pyrimidines etc. through enzyme catalysed reactions. This wild type of the mould is called '**protoroph**'. Beadle and Tatum exposed the pink bread mould to X-rays, which can bring about a change in the nucleotide sequence of DNA and thus causes mutation. They found that the mutants were unable to grow on a minimal medium. Each type of mutant required some extra nutrient in the minimal medium for it's normal growth. Such nutritional mutants are called '**auxotrophs**'. They obtained different nutritional mutants requiring amino acids ornithine or citrulline or arginine for growth. The mutants could be classified into three types:

Some could grow on ornithine -, or citrulline -, or arginine - containing medium,

Some could grow on citrulline - or arginine containing medium,

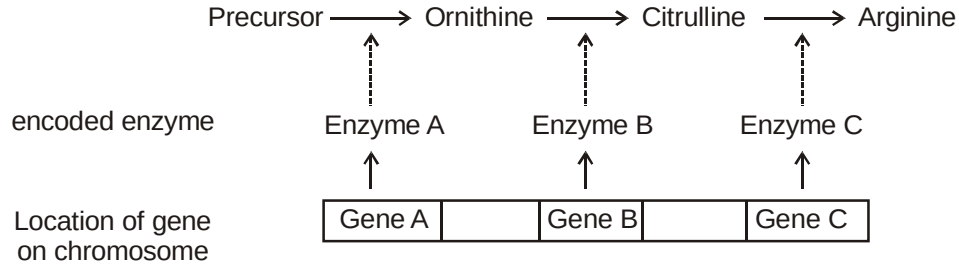
Some could grow on arginine supplemented medium

Effect of medium supplemnts on the growth of mutants Neurospora crassa

	Growth on Medium supplemented with		
Mutant Type	Ornithine	Citrulline	Arginine
I	+	+	+
II	–	+	+
III	–	–	+

+ = growth – = No grwoth

Biochemical Pathway



- This shows that all mutants could grow on arginine supplemented medium suggesting that arginine is the final product of this pathway.
- Since some mutants could not grow on ornithine, this compounds must be synthesized earlier than citrulline and or arginine.
- Beadle and Tatum taking clue from this growth behaviour of Neursopora and other experiments, proposed the **arginine biosynthetic pathway.** The precursor compound first gives rise to ornithine, ornithine then gives rise to citrulline and the latter is finally converted into arginine; each of these steps is mediated by an enzyme.
- The mutant of **class I**, could grow on ornithine, citrulline or arginine suggesting that they lack the capacity to synthesize ornithine, but beyond that they could complete the pathway.
- Similarly, mutants of **class II**, could not convert ornithine to citrulline, but if supplied circulline could Synthesize arginine.
- The last mutants of **class III** could not convert citrulline to arginine and had to be supplied Arginine for growth.
- Beadle and Tatum reasoned that these defects could arise due to defective enzymes in each mutant. Since such changes were mutational, they held that one gene controls one enzyme in a pathway leading to their famous '**One gene one enzyme hypothesis**".

  The hypothesis states that each gene controls synthesis of a specific enzyme or protein. Beadle and Tatum were awarded with Noble prize for this work in 1958. Their work founded the new science of '**biochemical genetics**'. Beadle and Tatum used **total isolation method** to detect the nutritional mutant of Neurospora. **Modification of Beadle and Tatum's Hypothesis** : One gene one enzyme hypothesis held that a gene has information to produce one enzyme. The enzymes are proteins, but all proteins are not enzymes. Recently some RNAs have also been found to mainfest enzyme activity. Proteins are complex molecules and may be composed of one or more polypetide chains. For example, haemoglobin consists of four polypetide chains - **2[redacted] and 2[redacted] chains**. Thus, more than one gene may control the synthesis of a protein. It is now held that one gene is responsible for the formation of one polypetide chain. Therefore, one gene one enzyme hypothesis has been replaced by '**one gene one polypetide hypothesis**' Further modification came when one gene was identified as a **functional unit** or **cistron** and the same was called '**one cistron-one polypeptide hypothesis**'.

REGULATION OF GENE EXPRESSION

- The mechanism which stimulates the expression of certain genes and inhibits other is called **regulation of gene expression.**
- It is possible only if the organism has a mechanism of regulating gene activity by allowing some to function and others to restrain their activity through switching on and switching off system. This means, the genes are turned 'on' or 'off' as per requirement.
- A set of genes is 'switched on' when enzymes are required to metabolise a new substrate. The enzymes produced by these genes metabolise the substrate.

- The molecules of metabolite the come to switch on of the genes are termed as **inducers** and the phenomenon is called **induction**.
- Similarly, certain genes which are in their 'switch on state, continue to synthesise a metabolite till the later is produced in amount more than required or, it is supplied to the cell from outside. In other words genes continue to express themselves till the end product inhibits or repress their expression Inhibition by end product is known as '**feed back repression**'.

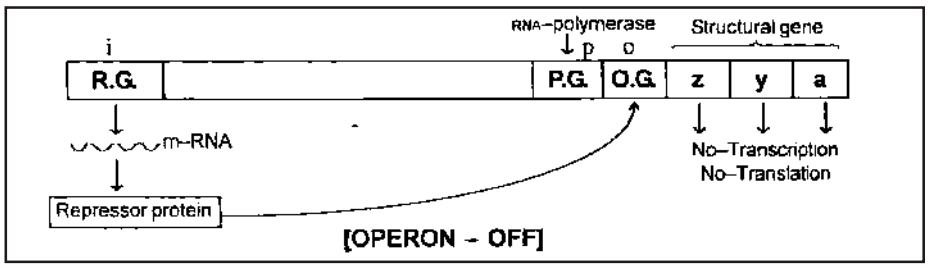
OPERON CONCEPT :

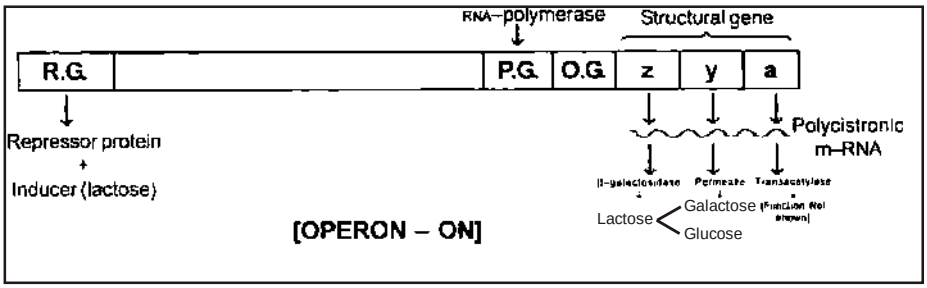
- In 1961, two French microbiologist **Francis Jocob** and **Jacques Monad** at the Pasteur Institute in paris, proposed a mechanism called **operon model** for the regulation of gene action in E. coli.
- An operon is a part of genetic matierial or DNA, which acts as a single regulated unit having one or more structural genes-an operator gene, a promoter gene, a regulator gene.
- Openon is **unit of Transcription.**
- Operons are of two types (i) **Inducible,** (ii) **Repressible.**

(i) Inducible System (Lac operon of E. Coli)

An inducible operon system normally remains in **switched off** condition and begins to work only when the substance to be metabolised (Inducer) by it is present in the cell. Inducible operon system generally occurs in catabolic pathways. e.g. Lac operon of E. coli.

Active repressor + inducer = inactive repressor





An inducible opeon system consists of four types of genes :

(a) Structural genes : These genes synthesise mRNAs, which in turn synthesis polypeptide or enzyme over the ribosomes. An operon may have one or more structural genes. Each structural gene of an operon is called cistron. The lac operon (lactose operon) of Escherichia coli contains three structural genes (z, y and a). These genes occur adjacent to each other and thus are linked. They transcribe a polycistronic mRNA molecule, that helps in the synthesis of three enzymes **β-galactosidase or Lactase**, **lactose permease** and **transacetylase**.

(b) Operator gene : It lies adjacent to the structural genes and directly controls the synthesis of mRNA over the structural genes. It is switched off by the presence of a repressor. An inducer can take away the repressor and switch on the gene that directs the structural genes to transcribe.

(c) Promoter gene : This gene is the site for initial binding of RNA polymerase. When the operator gene is turned on, the enzyme RNA polymerase moves over it and reaches the structural genes to perform transcription.

(d) Regulator gene : It produces a repressor that binds to operator gene and stops the working of the operator gene.

- **Repressor :** It is a protein, produced by the regulator gene. It binds to the operator gene so that the transcription of structural gene stops. Repressor has two allosteric site (1) operator gene (2) effective molecule (inducer / corepressor)
- **Inducer :** It is a chemical (substrate, hormone or some other metabolite) which after coming in contact with the repressor, forms an **inducer repressor complex**. This complex cannot bind with the operator gene, which is thus switched on.

  The inducer for lac operon of *Escherichia coli* is lactose. When the sugar lactose is added to the culture of E. coli, a few molecules of lactose gets into the bacterial cells by the action of the enzyme permease, a small amount of this enzyme is present in the cell even when the operon is not working. These few lactose molecules are then converted into an active form which acts as an inducer and binds to the repressor protein. (allolactose an isomer of lactose) **Allolacotse is real or true inducer of lac operon** The inducer repressor complex fails to join with the operator, which is turned on. The three genes are expressed as three enzymes to metabolise lactose. Gratuitous inducer → Some molecules resemble with natural inducer but are **not metabolize** by the enzyme. Example : **Isopropyl this galactoside (IPTG) :** This resembles lactose and thus have the property of induction. Such inducer which induces enzyme synthesis, without getting metabolized are called **gratuitous inducer.**

(ii) Repressible System (Triptophan operon of E. coli)

A repressible operon system is normally in it's **switch on** state and continue to synthesise a metabolite till this metabolite is produced in amount more than required, or else it becomes available to the cell from outside. Repressible operon system is commonly found in anabolic pathway. e.g. Tryptophan operon of E.coli.

[Inactive repressor + co-repressor = active repressor]

- **Trytophan operon** of Escherichia coli is an example of repressible system. It consists of the following:

(a) Structural operon These genes are meant for transcription of mRNA which in turn synthesis enzyme :Tryptophan operon has five structural genes E.D.C. B and A. They lie in continuation and synthesis enzymes for five steps of tryptophan synthesis.

(b) Operater gene (trp O) It lies adjacent to the structural genes and controls the functioning of the structural genes. Normally, it is kept switched on, because the apo-repressor produced by the regulator gene does not bind to it. The operator gene is switched off when a co-repressor is available alongwith apo-repressor.

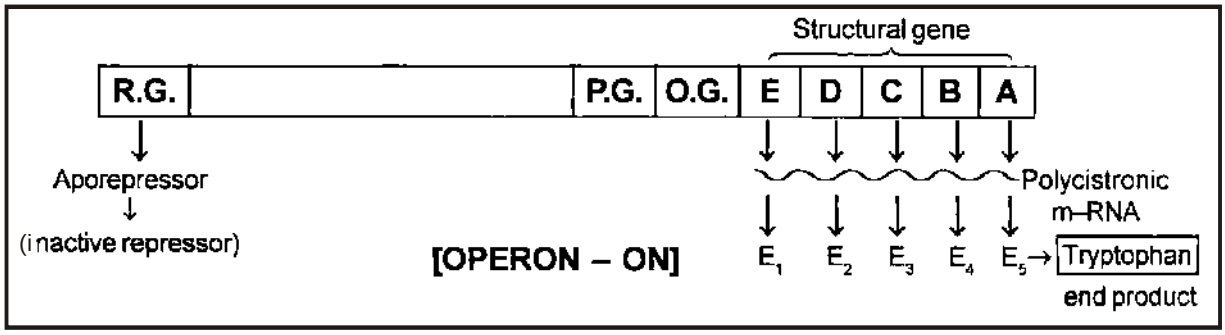
(c) Promoter gene (trp P). It marks the site at which the RNA polymerase enzyme binds. When the operator gene is switched on, it moes from promotor gene to structural genes for transcription.

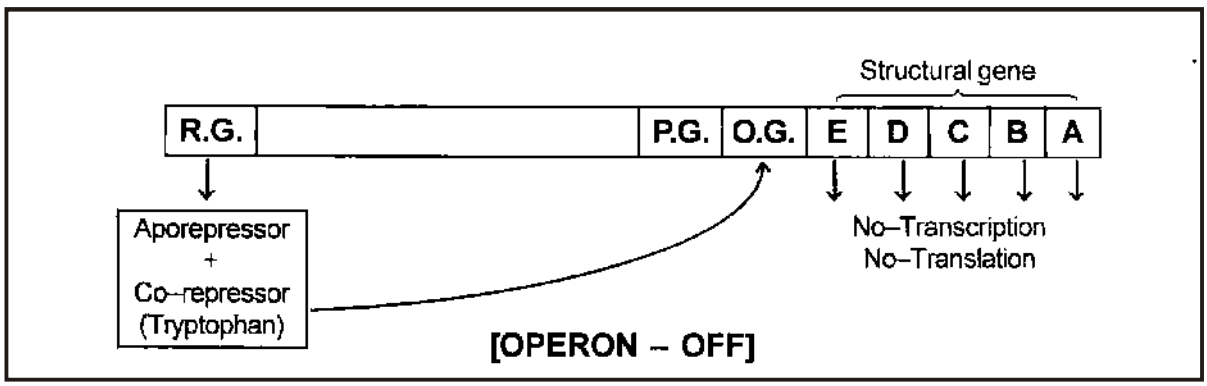
(d) Regulator gene (trp R). It produces a regulatory protein called apo-repressor for (Inactive repressor) blocking the activity of operator gene.

(e) Apo-repressor. (Inactive repressor) It is a regulatory protein synthesised by regulator gene. When a co-repressor substance is available in the cell, the apo-repressor combines with the co-repressor to form a apo-repressor co-repressor complex. This complex binds with the operator gene and switches it off. Presence of apo-repressor alone, the operator gene is kept **switched on** because, by itself the apo-repressor-is unable to back the working of operator gene.

Co-repressor – It is an end product of reaction by enzyme produced by the structure gens. In the presence of tryphoton some molecules of tryptopham acts as co-repessor, co repressor bind with inactive

repressor, inactive repressor. **co-repressor complex** bind with operator region and prevent the binding of RNA polymerase to the promoter, the trp-operon is off.





Differeces between Induction and Repression

Sr.No.	Induction		Repression
1	It is switching on of an operon which is normally in switched off state (off-on).	1	It is switching-off an operon which is normally in switched on state (on-off).
2	It starts transcription and translation.	2	It stops transcription and translation.
3	It is caused by a new metabolite which needs enzymes to get metabolised.	3	It is caused by incresed formation or availability of a metabolite (Feedback repression).
4	It generally operates in a catabolic pathway.	4	It generally operates in an anabolic pathway.

The **repressor molecules has key role in regulation** of lac-operon. Repressor molecule active or inactive. Active repressor may be inactive by addition of an inducer while the inactive repressor can be made active by addition of a co-repressor.

Because the product of regulator gene the repressor act by shutting off the transcription of structural gene the operon model, as originally proposed by Jocob & Monab is referred as **negative** control system.

GENE EXPRESSION IN EUKARYOTES :

- Openon concept is not applicable for eukaryotes
- The most popular model is known as'**Britten-Davidson model**' or '**Gene-battery model**' proposed by **Britten** and **Davidson** in 1969.
- A set of structural genes controlled by one sensor site combindly called battery.
- Gene battery model assumes the presence of four class of sequences

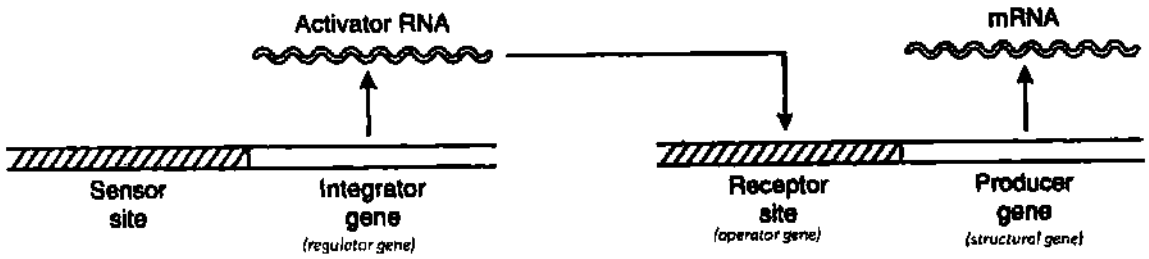
(a) Producer gene : A producer gene is comparable to structural gene of prokaryotic operon.

(b) Receptor site : A receptor site is comparable to **operater gene** of bacterial operon and one such receptor site is assumed to be present adjacent to each producer gene.

(c) Integrator gene : Integrator gene is comparable to **regulator gene** and is responsible for synthesis of an **activator RNA**. It activates the receptor site.

(d) Sensor site : A sensor site regulates the activity of integrator gene. Activator gene can be transcribed only when the sensor site is activated.

The sensor sites are recoginzed by agents which change the patterns of gene expression like hormones and proteins. When a transcription factor (protein, hormone) bind to the sensor site it cause the transcription of integrator.



Britten-Davidson model or Gene-battery model

TYPES OF GENE

All the genes do not play the same role nor all genes are active all the time. With regard to their role and activity, the genes are of following types :

(1) Jumping Genes :

It is a segment of DNA which moves from one chromosome to another chromosome within the genome of an indivisual. McClintock (1983) got nobel prize for the discoevery of jumping gene in maize. Two transposable controling elements (Ds) and activator (Ac), which can jump to any chromosome from their original location on chromosome 9. Also in bacteria plasmid transposone carry gene for antibiotic resistance (ampicilline).

Other Examples :

Transposable element (TE) in Drosophila - As much as 10% of the genome consist of transposons, most important of these are **copia like element, Fold back (FB)** (for eye colour), and **P** and **I** element (for sterlity). Ty elment in yeast.

(2) Overlapping Gene : A few genes in certain bacteria and animal viruses code for two different polypetides. These are called overlapping genes. For example – in $\phi \times 174$ virus, SV -40 virus.

(3) Constitutive genes (House keeping genes): These genes are expressed constantly, because their products are constant needed for cellular activity e.g. genes for glycolysis, gene of ATPase enzyme.

(4) Non-constitutive genes (Smart gene or Luxary gene) – These genes remain silent and are expressed only when the gene product is needed. They are switched 'on' or 'off' according to the requirement of cellular activities. Non-constitutive genes are of two types; **inducible and repressible**. The inducible

genes are switched on in presence of a chemical substance called **inducer**, required for the functioning of gene activity. The repressible genes continue to express themselves till a chemical, often an end product of the metabolism inhibits or represses their activity. Such type of inhibition is called **feed back inhibition** or **feed back repression.**

(5) Homeotic genes : Homeotic gene regulates the organ differentiation in embryo.

Homeobox : related to transcription of homeotic gene.

If mutation takes place in homoetic gene organ formation is disturbed.

(6) Pseudoallele : Allele which is located on non homologous chromosome or gene which is located on different locus on homologous chromosome produces identical phenotype called as pseudoallele. eg Duplicate gene

(7) Isoallele : If several allels exhibit same penotype then they are said to **Isoallele.** In Drosophila allele W^{+c} W^{+S} W^{+9} $\rightarrow$ produce red eye colour

(8) Hybrid vigour / Heterosis – Superiority of offsprings over it's parents is called as **Hybrid vigour** or **Heterosis**.

Hybrid vigour can be maintained for long time in vegetaively propagated crops.

Hybrid vigour can be lost by inbreeding (selfing) because inbreeding induces the Homozygosity and reduced hetrozygocity in offsprings. Loss of Hybrid vigour due to inbreeding, is called as **inbreeding depression**.

ORIGIN OF LIFE AND EVOLUTION

Big-Bang Theory :

This theory was proposed by **Abbe Lemaitre.** According to it, the universe originated about 15 billion years ago due to a thermonuclear explosion of a dense enetity. This thermonuclear explosion is called **Big-bang.**

About 4.6 billion years ago, the origin of our solar system took place by the gaseous clouds formed due to this explosion.

These gaseous clouds collapsed and converted into flat disc-like structure made up of atoms and small particles due to their own gravitational pull.

These flat-disc like structure is called **SOLAR-NEBULA.**

The very hot central part of this solar Nebula became still hotter & converted into the **sun.** Now, due to condensation of atoms & dust particles moving around the sun formation of the other planets took place **[Mercury, venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune]**.

The solid part of our planet earth was called Lithosphere & the gaseous part was known as atmosphere.

When the earth's surface cooled down and its temperature decreased to 100°C, water formed on it.

Ancient Theories for origin of life :

1. Theory of special creation –

The greatest supporter of this theory was **father Suarez** According to Bible life and everything was created by god in 6 days.

on first day : Earth and heaven

on second day : Sky and water

on third day : Land and plants

on forth day : Sun, moon and stars

on fifth day : Fishes and birds

on sixth day : Land animals and first man Adam and from his 12^{th} Rib first woman Eve.

According to **hindu mythology** the world was created by **God Brahma.** (The first man was **Manu** and the first woman was **Shraddha**)

According to it life has not changed ever since its origin.

Special creation theory lacks scientific evidences so is not accepted.

2. Theory of Spontaneous Generation (Abiogenesis or Autogenesis) –

This hypothesis was supported by ancient Greek philosophers like Thales, Anaximander, Xenophanes, Plato. Empedocles, Aristotle.

According to this theory life was originated from nonliving things spontaneously.

They believed that the mud of the **Nile** river could give rise to frogs, snakes, crocodiles.

Abiogenesis was strongly supported by **Von Helmont.** He claimed formation of mice in 21 days. If a sweat soaked dirty shirt is kept in wheat barn.

3. **Cosmozoic Theory –**

   Proposed by **Richter.**

   Protoplasm reached on earth in the form of **spores** or other simple particles from some unknown part of the universe with cosmic dust and they gave rise to various forms of life.

4. **Cosmic panspermia theory –**

   Proposed by **Arrhenius.**

   According to this theory organisms existed throughout the universe and their spores could freely travel through space from one star to the other.

5. **Theory of Eternity of Life –**

   Helmholz believed that life is **immortal.**

6. **Theory of Biogenesis –**

   Harvey (1651) and Huxley (1870) {Omnis vivum ex ovo or vivo.}

   New organisms can be originated on earth only by pre-existing life.

   This theory rejected the theory of Spontaneous generation but cannot explain origin of life.

   To prove Biogenesis and to disprove a biogenesis experiments were performed by –

- **Francesco Redi's Experiment (Italian 1668) –**

  He took cooked meat in three jars one was uncovered, the second was covered with parchment and the third was air tight.

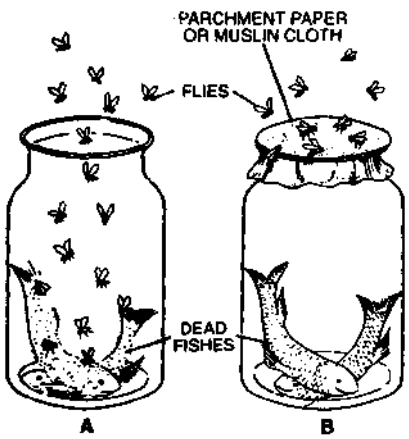
  He observed that maggots developed only in the uncovered jar while maggots could not developed in the meat in closed jars.

  This proved that larvae were formed from eggs laid by the flies in open jars. Since the meat in closed jars could not be visited by flies so no larvae could develop. Therefore life originated from pre existing life.

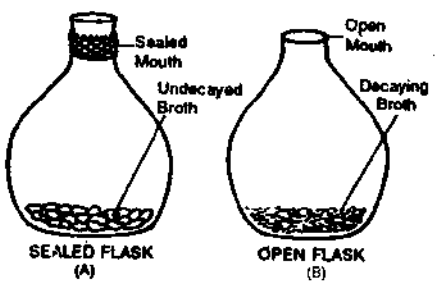
- **Lazzaro Spallanzani (Italian 1767) –**

  He boiled vegetables and meat to prepare a sterlized nutritive soup and he kept some of it in air sealed flasks and some in loosely corked flasks. He observed that the soup in sealed flask remained sterile while micro organisms appeared in the soup in loosely corked flasks.

  Thus even micro organisms were formed from pre existing ones in the air rather then spontaneously.



Francesco Redi's experiment



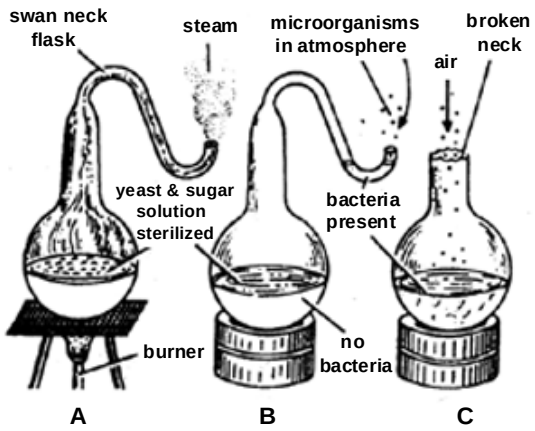
Spallanzani's experiment. A broth remained undecayed indefinitely in sealed jars. B, broth decayed in open jar.

Louis Pasteur (French 1862) –

Pasteur is popular for **Germ Theory of Diseases or Germ theory** and he disproved abiogenesis.

He prepared sterlized **syrup** of sugar and yeast by boiling them in flasks.

He took two flasks one of broken neck and another of curved neck (swan neck flask). No life appeared in swan neck flask because germ laden dust particles in the air were trapped by the curved neck which serves as filter while in broken neck flask colonies of microorganism were developed.



Louis Pasteur's Experiment

Modern theory of origin of life : (Oparin-Haldane theory of origin of life)

- **Naturalistic theory Or Theory of Chemical Evolution –**

  This theory was proposed by Russian Scientist **A.I. Oparin** and **J.B.S Haldane** (England born Indian scientist)

  Oparin's theory was published in his book 'ORIGIN OF LIFE'.

- **Important Points**

– According to this theory life originated by the composition of chemicals.

– Oparin's theory is based on Artificial Synthesis. So also called as **artificial synthetic theory.**

– Ist life originated in the water of oceans. So water is essential for origin of life.

– There is no life on moon due to absence of water.

– At the time of origin of life free O_2 was absent, so first life was **anaerobic.**

– In the primitive atmosphere free oxygen was present but complete oxygen consumed in composition so primitive atmosphere of earth was **reducing.**

– Oxygen was reproduced by photosynthesis and atmosphere converted in oxydising.

- **Chemical Evolution**

1. The atomic stage –

The earth was originated about 4.6 billion years ago. Early earth had free atoms of all elements which are essential for the formation of protoplasm.

The lightest atoms like **carbon, hydrogen, nitrogen and oxygen** formed the primitive atmosphere.

2. Molecular stage (Origin of molecules and simple Inorganic compounds) –

Free atoms combined to form molecules and simple inorganic compounds.

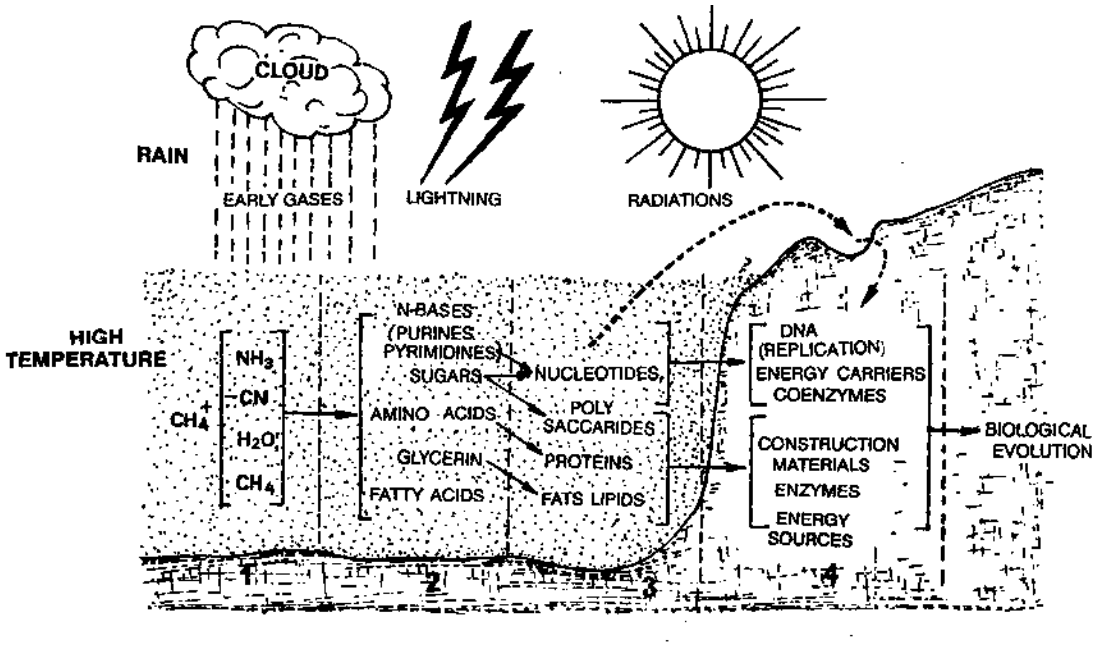
Due to presence of high temperature, active hydrogen atoms combined with all oxygen atoms to form water and leaving no free oxygen.

Thus the primitive atmosphere was **reducing** (without free oxygen) unlike present **oxidising** atmosphere (with free oxygen).

Hydrogen atoms also combined with nitrogen to from NH_3.

(The first molecular compounds formed were probably water and Ammonia).

These Lighter elements also formed CO_2, CO, N_2, H_2 etc.



Evolution of 'Biochemicals' in the origin of life.

3. Origin of early organic compounds –

The nitrogen and carbon of the atmosphere combined with metallic atoms forming nitrides and carbides. Water vapour and metallic carbides reacted to form to **first organic compound Methane (CH_4).** Later on **hydrogen cyanide (HCN)** was formed .

Water which formed on earth due to high temperature evaporated so **clouds** were formed.

Water vapour changed into rain drops and by the collection of water on earth primitive oceans were formed.

4. Origin of simple organic compounds –

Water of primitive oceans contained large amount methane, ammonia, hydrogen, cyanides, carbides, nitrides.

These early compounds interacted and formed simple organic compounds like, aldehyde, Ketones. Alcohols Pentose and hexose sugar, Amino Acids, Glycerol, Fatty Acids, Purines, Pyrimidines etc.

Energy was obtained from U.V. Rays of sunlight, cosmic rays and heat of volcanic eruptions.

5. Origin of complex organic compounds –

The small simple organic molecules combined to form large complex organic molecules, e.g –

- Amino acids Joined to form polypeptides and proteins, which were non-enzymatic.
- Simple sugar units combined to form polysaccharides.
- Fatty acids and glycerols united to form fats and lipids.
- Sugar, nitrogenous bases, phosphates combined into nucleotides which polymerized into nucleic acid, which unable to replicate.

These macromolecules forms main component of protoplasm hence the possibility of origin of life in primitive oceans could be established.

After long time the water of primitive oceans became rich mixture of organic compounds as a result of chemical evolution.

Haldane called this saturated water of oceans as prebiotic soup or hot dilute soup.

The major requirement for promoting polymerization is the availability of continuous source of energy and removal of water from the surface of reactants so that they can concentrate and prevent depolymerisation.

- **Experimental evidence for formation of simple organic compounds –**

  By Stanley Miller who was a student of **Harold Urey.**

  In this experiment Miller took the mixture of **methane, ammonia and hydrogen (ratio 2 : 1 : 2)** in a large flask and passed steam over it by boiling water and connecting it with a glass tube.

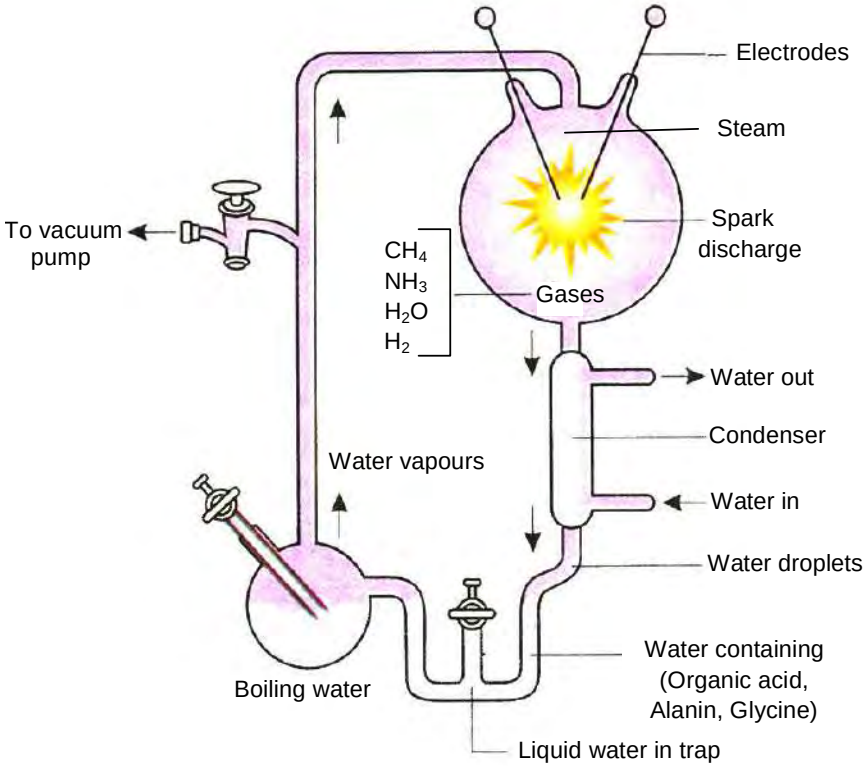
  Electric spark discharged in the mixture by using two tungsten electrodes as **source of energy.**

  After **18 days** this fluid was collected and analysed. This dark red fluid was found to contain.

  – Simple amino acids – glycine, alanine, aspartic acid.

  – Simple organic acids – formic, acetic, oxalic, lactic, succinic acids.

  – Pentose, hexose, aldehyde, ketone etc.



Diagrammatic representation of Miller's experiment

BIOLOGICAL EVOLUTION :

1. Origin of Protobionts and Nucleoprotein (Coacervates) :

Macromolecules which were synthesized abiotically in primitive ocean later came together and formed large colloidal drop like structures named as Protobionts **(Later called coacervates by oparin, Fox and called them Microsphere and Deamer called them vesicles).**

Each protobiont was **cluster** of macromolecule.

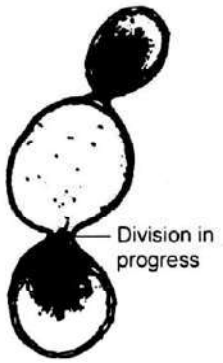
They contain proteins, nucleic acids, lipids, polysaccharides etc.

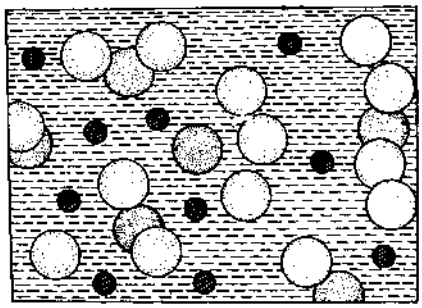
They grew by absorbing molecules from their environment.

They could divide by budding like bacteria, many chemical reactions including the decomposition of glucose took place inside the protobionts.

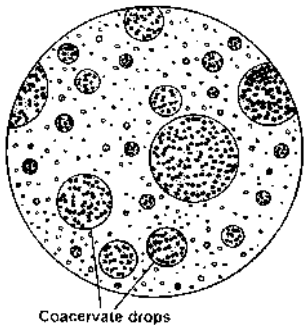
The sun provide energy for chemical reaction.

According to oparin **coacervates were the first sole living molecules** which gave rise to cell.





Fox Microspheres



Operin's Coacervates

Different type of Protobionts obtained by scientists

Oparin (1924) took a solution of carbohydrate and large protein. The solution was shaken. It caused separation of coacervates.

In coacervates higher concentration of protein, carbohydrate were present with small amount of water.

Oparin's coacervates could grow and exhibit simple form of metabolism. However a lipid membrane and reproduction was absent.

Fox (1957) obtain **microspheres** with a primitive membrane. He heated a dry mixture of Amino acids at 130° – 180° C. It formed **PROTEIDS/PROTENOIDS** (Polymer of amino acid).

When these proteids poured in Cool water along with lipids, microsphere get separated. (size 1-2 μ m) **Deamer** (1993) Microsphere and coacervates could fused to form protobionts having various type of chemicals like proteins, Nucleic acids, Carbohydrates etc. enclosed inside a lipid membrane. Deamer called them **vesicles.**

2. Origin of protocells [Eobiont :

The first living form named **protocell** originated in the primitive oceans.

The protocell were clusters of nucleo-proteins which formed by composition of nucleic acids and enzymetic proteins.

Nucleoproteins had the property of self duplication.

Nucleoproteins were first sign of life.

The protocell represented the beginning of life.

From protocells or eobionts few core of nucleoproteins gets separated free in oceans and became inactive but when they enter in another eobionts they became active so virus like structures were formed.

Origin of virus like structure is an example **retrogressive evolution** (complex to simple).

Important

Khorana (1970) artificially synthesized 77 nucleotide RNA molecule out side a living cell which suggests that probably RNA was the primordial genetic material rather than DNA.

Zaug, Thomas cech and Altman described that some RNA molecules have enzymatic activity hence probably the RNA enzymes called ribozymes were able to replicate the primordial RNA.

The discovery of RNA molecule working as enzyme has also changed our thinking about origin of life.

It is now believed that about 4 billion years ago earth was an 'RNA world' in which RNA molecule carried out all the process of life without the help of either protein or DNA,

By this discovery evolution is named as RNA world. ***[CBSE 2002]***

(1) It is estimated that life originated about 3.9 billion years ago as protocell (eobionts) in precrambian era which was anaerobic heterotrophic.

3. Origin of Prokaryotes –

As a result of mutation the protocells became more complex and efficient and used the materials available in the surrounding medium and condensed themselves into prokaryotic cells.

Thus the first living being were prokaryotic, like bacteria they were single celled and consisted of naked DNA. Nutritionally they were **chemoheterotrophs** (saprotrophs), respiration was **anaerobic.**

4. Origin of Autotrophism –

It includes the origin of **chemosynthesis** and **photosynthesis.**

(a) Origin of chemosynthesis :

Due to continue withdrawal of organic molecules by chemoheterotrophs organic material decreased in oceans.

Before the organic material disappeared in sea, new modes of Nutrition developed, one of them was **chemosynthesis**.

The organism which perform chemosynthesis are called as **chemoautotrophs.** They were anaerobic and synthesise organic molecules from inorganic material. The energy was obtained by oxidizing inorganic materials present in the sea.

Such mode of nutrition is found in Bacteria e.g. sulphur bacteria, nitrifying bacteria.

(b) Origin of Photosynthesis :

After some time bacteriochlrophyll developed in some autotrophic bacteria like organism.

They could absorb solar energy and convert it into chemical form these organism called **photoautotrophs.**

They utilize solar energy in synthesizing organic compounds. The process is called **photosynthesis.**
They were anaerobic and utilized hydrogen from sources other than water like H_2S.

Therefore, no oxygen was evolved and atmosphere remained reducing .

This stage of photosynthetic autotrophism is represented by planktonic sulphur bacteria of today.

$$6CO_2 + 12H_2S \xrightarrow{\text{Solar enery}} C_6H_{12}O_6 + 6H_2O + 12S$$

The Bacterio chlorophyll by molecular changes formed true chlorophyll.

Such organism which were bearing true chlorophyll are similar to today's **Cyanobacteria (B.G. Algae).**

They utilized water as hydrogen donor and evolved oxygen.

$$6CO_2 + 12H_2S \xrightarrow{\text{Solar enery}} C_6H_{12}O_6 + 6O_2 + 6H_2O$$

Oxygen revolution –

Liberation of free O_2 by blue green algae like prokaryotes due to photosynthesis was a revolutionary change in the history of earth. It is called **oxygen revolution.**

It includes important changes like –

(1) Atmosphere of earth changed from reducing to oxidising, hence possibilities of further chemical evolution and abiogenesis got over, because chemical evolution always take place in reducing environment.

(2) Free O_2 oxidized CH_4 and NH_3 to form gases like CO_2 , N_2 and H_2O.

(3) Accumulation of fee O_2 formed a layer of **O_3 (ozone)** above the atmosphere of earth. Which started absorbing most of the U.V. rays of sunlight.

- **Origin of Eukaryotic cell –**

About 2.7 billion years ago conditions become suitable for aerobic respiration with the release of free O_2 . Aerobic respiration yields about **20 times more energy** then anaerobic respiration hence the prokaryotes adapted themselves for aerobic mode of respiration.

Nucleus, mitochondria and other cell organelles developed in the cell and free living eukaryotic cell like organism originated about 1.5 billion years ago in the primitive ocean.

1. Free Atoms	H (Hydrogen), C(Carbon), N(Nitrogen)
↓	
2. Inorganic Molecules	H_2(Hydrogen), H_2O (Water), CH_4(Methane), NH_3(Ammonia), CO_2(Carbon Dioxide)
↓	
3. Simple organic Molecules	CH_4H_2O ⟶ Sugars, Fatty acids, Glycerol
	$CH_4.H_2O, NH_3$ ⟶ Amino Acids
	$CH_4.H_2O, NH_3$, HCN ⟶ Nitrogenous Bases (Purines, Pyrmidiens)
4. Complex organic Molecules	Sugar + Sugar ⟶ Polysaccharides
	Fatty Acids + Glycerol ⟶ Fats
	Amino acid + Amino Acid ⟶ Proteins
	Nitrogen Bases + Sugars + Phosphates ⟶ Nucleotides, Adenosine phosphates
	Nucleotides + Nucleotides ⟶ Nucleic a cids
5. Coacervates or Microspheres	Aggregates of large complex organic molecules capable of growth and d ivision
↓	
6. Eobionts	Nucleic Acid — Controlled coacervates
↓	
7. First primitive cells	Lipid – Protein membrane-bound units with enzyme-controlled metabolism and nucleic acid regulation without organised nucleus

Special Points :

1. Life originated in water.
2. Atmosphere of earth just before the origin of life consisted of CH_4, NH_3, H_2 and water vapours.
3. O_2 was absent in the atmosphere at the time of origin of life.
4. English scientist J.B.S. Haldane worked on origin of life and settled in India.
5. Gaseous mixture used by miller for synthesis of amino acids throught heat and electric discharge included CH_4, NH_3, H_2 and water vapours.
6. Moon does not posses life because it is without water.
7. The age of big bang is roughly 104 millions years.
8. Spontaneous generation theory of origin of life was disproved through experiment involving swan neck flasks by Louis Pastuer.
9. Experiment proof that some simple molecules like H_2, NH_3, CH_4 and H_2O gave rise to amino acids during origin of life was provided by stanley miller.
10. Oxygen was not present freely in the early atmosphere of the earth.

11. Rapid increases in world population in recent times is primerily due to decrease in death rate. (Mortality).
12. Earth originated in the past period of about 4.5 billion years.
13. Experiment to prove that synthesis of organic compounds formed the basis of life performed by stanley. miller.
14. Present population explosion is mainly due to better health care.
15. Indian population has growth rapidly in the present century because of more children reaching reproductive age.
16. The first organisms were chemoheterotrophs.
17. The scientist associated with formulation of modern theory of origin of life and having written "origin of life" was oparin [he was Russian Scientist].
18. World population has grown rapidly in the past 250 years because of industrial resolution.
19. Planet nearest to sun in "Mercury".
20. Ozone layer is important as it filters out ultra-violet radiations.
21. Under certain conditions, scientists have got cell like structures but without its true organisation. They are called "Coacervates".
22. The correct sequences during formation of chemicals on early earth is Ammonia, Proteins, Carbohydrate, Nucleic acid.
23. Biogenesis is the name of theory which states that life develops from life.
24. Saturn is a planet of our solar system which has nine moons.
25. An ideal agriculture should lay stress on "Permaculture".
26. Rising of mountain is due to aggregation.
27. N_2 gas is dissolved in blood but has no metabolic OR Chemical activity.
28. Rodents possess growing, Incisors.
29. Panther is the fastest land animal.
30. Coacervates were formed by polymerisation and aggregation.
31. Balance of nature is maintained by photosynthesis and respiration.
32. Our galaxy is milky-way.
33. Big-bang theory was proposed by "Lemaitre".
34. Tethys sea occured in the region of present day Anes.
35. Organic compounds first evolved on earth required for origin of life were protein and nucleic acids.
36. CH_4 was a compound who important in prebiotic evolution.
37. Approximate age of earth is 4600 million years.
38. Nucleic acids are the most essential for origin of life.
39. Chemical theory of origin of life was given by oparin and Haldane.
40. Oldest rock is dated 3.8 billion years.
41. Flow of energy in ecosystem is unidirectional.
42. Father Saurez was one of the greatest advocates of the theory of special creation.
43. Cyanobacteria - like organisms developed on earth 3600 billion years ago.
44. Presence of NaCl in fluid indicates that life originated in primitive ocean.
45. Theory of spontaneous creation was supported by Van helmont.
46. Protobiogenesis occured more than 3.5 billion years ago.

47. Evolution up to formation of coacervates termed as **chemical evolution,** in which complex organic compound were formed which were essential for formation of cellular structure.
48. Evolution from coacervates to simple cell structure known as **biological evolution.**
49. From simple cell to recent…..evolution is called **organic evolution,** in which organism developed structures and modified them by which they became more adaptive in their changing environment.
50. First protein which is formed during evolution in primitive oceans were not structural.
51. First nucleic acid which was formed in primitive oceans from combination of nucleotides, did not have power of replication. They obtained power of replication later by mutation.
52. Evolution term introduced by - **Herbert Spencer.**
53. **What is evolution ?**

    The word evolution means to unfold or unroll or to reveal hidden potentialities. Evolution simple means an orderly change from one condition to another.
54. **Stellar Evolution –**

    Changes in planets and stars from their origin to death.
55. **Inorganic evolution –** The matter, elements change in time called Inorganic evolution.
56. Evolution is a slow but continuous process which never stop-**Buffon.**
57. **Dollo's low –** it states that evolution is irreversible.
58. Accroding to **Theodosius Dobzhansky** (1973), nothing is biology makes sense except in the light of evolution.
59. **Scala nature or ladder of nature : –**

    Aristotle represented the evolution of complex organism from simple organism in the form of a ladder which is called **Scala Nature or Ladder of nature.**

    He kept simple organism at the bottom of ladder and complex organism at the top of this ladder.

    George cuvier studied the evolutionary history of organism by studying fossils and rejected Scala nature.
60. **The history of life actually comprises two events :**
    (i) The origin of life
    (ii) Evolution of life [the mechanism involved in the changes of living organisms through time]
61. Two great themes of evolutionary biology :
    (i) The diversity of life, including both the differences and similarities.
    (ii) The characteristics of organism, both adaptive and non-adaptive.
62. For origin of life, at least **three conditions** needed to have been fulfilled.
    (i) There must have been a supply of replicators i.e. self producing molecules.
    (ii) Copying of these replicators must have been subject to error via mutation.
    (iii) The system of replicators must have required a perpetual supply of free energy and partial isolation from the general environment.
63. Cosmology–Study of universe.
64. Biological evolution is also known as biogeny.
65. Unit of evolution is population.
66. Oparin's theory also known as primary abiogenesis.
67. Evolutionary biology-Study of history of life forms on earth.

ORGANIC EVOLUTION

1. Though life originated by chemical evolution on primitive earth, was later replaced by organic evolution.
2. Organic evolution states "Descent with modification". i.e. the present day complex organism have evolved from earlier simpler organism by small but gradual changes which have occurred over millions of years.
3. Though living organisms show diversity in size, structure, function, behaviour etc. they also show basically similar metabolic processes indicating **common ancestory.**
4. Concept of evolution was given by Empedocles. He is also called **founder of concept of evolution.** But Buffon explained the organic evolution properly & scientifically. Thus father of evolutionary concept is Buffon.

   Evolution can be of following types :

   (a) Progressive evolution : Evolution from simplicity to complexity

   (b) Retrogressive evolution : Evolution from complexity to simplicity

   Example :

   Virus : Virus was originated from bacteria which were intracellular obligate parasites.

   (c) Microevolution : Changes in variety or subspecies due to crossing over or Gene mutation Microevolution – changes below the species level.

   (d) Macroevolution – (Changes in Genus or Species) When there is a change in species or Genus due to evolution. In this there is a major change in chromosome number

   (e) Megaevolution : Changes in **Family** or **Order** or **Class** is called Megaevolution.

   (f) Convergent evolution : Same character in different groups of animals

   Example : (Analogous organ) Wings are present in insects, birds and bat but they all are from different groups

   (g) Divergent evolution : (Adaptive radiations) Development of different structure from same part of ancestors. **Example :** Homologous organ Limbs of horse, hands of man, wings of bat. They all have same origin.

   Development of different structure from same part of embryo. Only there is change in external morphology but internal morphology remains same.

EVIDENCES OF ORGANIC EVOLUTION

SOME IMPORTANT EVIDENCES

1. Palaeontological Evidences
2. Morphological and Anatomical Evidences
3. Evidences from vestigial organs
4. Evidences from connecting links
5. Evidences from Atavism (Reversion)
6. Evidence from physiology and biochemistry
7. Evidences from bio geographical distribution

8. Evidences from Embryology
9. Evidences from Taxonomy

1. Palaeontological Evidences –

The study of fossils is known as : **Palaeontology.**

Fossils word : **Taken from Fossilis/Fossolium**

Father of palaeontology : **Leonard da vinci**

Founder of modern palaeontlogy : **George cuvier**

Birbal Sahni is famous for Indian palaeonotology.

He is father of **Indian Palaeobotany**.

Birbal Sahni Institute of Palaeobotany (BSIP) situated in Lucknow.

Two branches of palaentology –

1. **Palaeobotany :** Study of plant fossils
2. **Palaeozoology :** Study of Animals fossils

Definition of Fossils was given by Charls Lyell "Impression of past found in Rocks called fossils" **fossils provide one of the most acceptable evidence in support of organic evolution.**

- **Types of Rocks –**

(a) Sedimentary Rocks –

These are formed at the bottom of ancient oceans by deposition of sediments of sand, lime, coal and minerals which slowly change into hard layers .

Sedimentry rocks are also called as stratified rocks. Eg. Lime Stone, Sand Stone.

Fossils are mostly found in sedimentary rocks.

(b) Igneous rocks –

Such rocks are formed by ancient volcanic deposits which slowly cooled down and hardened as rocks.

Fossiles are absent in it.

e.g. **Granite rocks.**

(c) Metamorphic rocks –

These are formed by change in chemical composition of sedimentary rock and igneous rocks or metamorphosis. Such metamorphosis may be caused by pressure heat and physical movements. e.g. Marble Slate rocks. Fossils are also absent in it – due to chemical changes in the fossils are destroyed.

- **Type of Fossils :**

(a) Unaltered Fossils :

In this type whole bodies of extinct organisms are found frozen in ice at the polar regions eg. Wooly mammoths (25000 yrs before extinct fossils were found from Siberian region)

(b) Petrified fossils – Most common type of fossil.

Replacement of organic part by mineral deposits is called **petrification.**

These fossils consists of only the hard parts e.g. bones, teeth, shells, wood etc. of extinct organisms.

In human body first fossilization occurs of teeth.

(c) Mould fossils –

Here no part of the original organism is present, only an impression of the external structure of body is preserved in wet soil.

(d) Cast fossils –

Sometimes minerals fills in the mould, resulting in cast fossils

(e) Print Fossils –

Foot print or prints of wings, skin, leaves, stems etc made in soft mud which subsequently become fossilized are a common type of fossils.

(f) Coprolites –

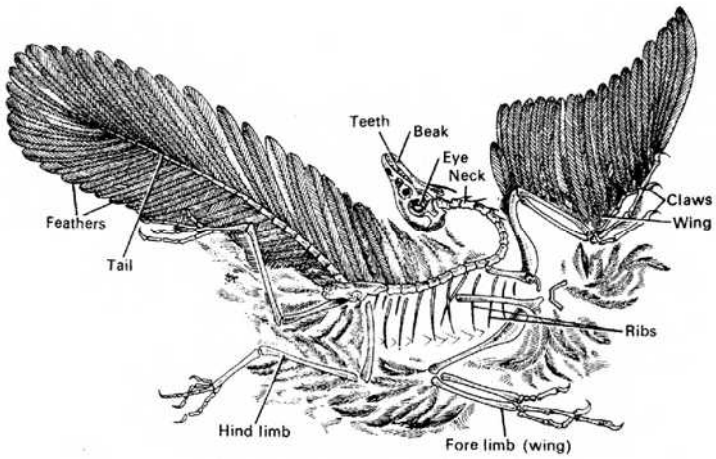
These fossils include the fossil preservation of contents of the intestine or excreta of many ancient animals including particularly the reptiles or fishes.

By studying fossils following facts about organic evolution are evident –

1. Fossils found in older rocks are of **simple type** and those found in newer rocks are of **complex types.**
2. In the beginning unicellular protozoans were formed from which multicellular animals evolved.
3. Some fossils represents connecting links between two groups
4. Angiosperms among plants and mammals among animals are highly developed and modern organism
5. By fossils, we can study the evolutionary pedigree of an animal like stages in evolution of horse, elephant and man etc.

- **Archaeopteryx –**

Fossil connective link between birds and reptiles. Fossil was discovered by **Andreas wagner** from **Bavaria** in Germany. It was found in the rocks of the **Jurassic period.**



Fossils of Archaecopteryx

- **Reptilian Characters :**

(a) Long tail is present
(b) Bones were not pneumatic.
(c) Presence of weak sternum.
(d) Presence of fee caudal vertebrae is found in Lizard.
(e) Teeth present in Jaws.

- **Avian Characters :**

(a) Presence of feathers on the body
(b) The two jaws were modified into beak
(c) The fore limbs were modified into wings
(d) The hind limbs were built in the typical avian plan.

"Age of Fossils" or "Dating of fossils" or "The clock of the Rock"

The fossils give valuable information about the history of organic evolution by giving information about the organisms which existed in the past.

This is possible only if the correct age of the fossils can be determined. Methods have been developed to find out the correct age of the fossils by determining the age of the rocks where the fossils are found.

Rocks have been found to contain certain radioactive elements which lose their radioactivity and change into other nonradioactive isotopes at a fixed rate irrespective of the environmental conditions prevalling at different times.

If the rate of this loss of radioactivity of an element is known, the relative proportions of the Quantities of radioactive and nonradioactive element in a given rock will enable us to find out the age of the rock.

This method is called **absolute dating.**

This will be illustrated with the help of four different methods.

(1) Lead method
(2) Radio-carbon method
(3) Potassium – Argon method
(4) Electron spin resonance method (ESR method)

$$\text{Potassium}^{40} \rightarrow \text{Argon}^{40}$$
$$\text{Carbon}^{14} \rightarrow \text{Nitrogen}^{14}$$
$$\text{Uranium}^{238} \rightarrow \text{Lead}^{207}$$
$$\text{Rubidium}^{87} \rightarrow \text{Strontium}^{87}$$
$$\text{Thorium}^{232} \rightarrow \text{Lead}^{206}$$

Fossils park of India –

1. Birbal sahni institute of palaeobotany, Lucknow.
2. 50 million year old fossil forests preserved in mandla district Madhya Pradesh.
3. 100 million year old fossil forest in rajmahal hills Bihar.
4. 260 milllion year old Coal forming forest in Orissa.

Important living fossils

1. *Peripatus* (Arthropoda)	2. *Limulus* (Arthropoda)
2. *Nautilus* (Mollusca)	4. *Neopilina* (Mollusca)
5. *Lingula* (Brachiopoda)	6. *Latimeria* (Coelacanth fish)
7. *Sphenodon* (Reptilia)	8. *Didelphis* (Opossum)

Geological Time Scale – Firstly given by Giovanni Avduina.

Chronological order of the history of organic evolution, which is presented in the form of geological time scale.

This time scale includes the history of earth itself ever since it was formed to formation of its crust from lava of ancient volcanic eruptions.

The period between the origin of gaseous clould (4.6 billion years ago) from which the earth was formed and the formation of earth's crust is called **Azoic Era** (era of no life).

The remaining period (about 4.0 billion years) is divided in to five Eras namely –

1. Archaeozoic 2. Proterozoic 3. Palaeozoic 4. Mesozoic
5. Coenozoic

The Archaeozoic Era had "**invisible life**" and the remaining four era had "**visible life**" **(Phanerozoic).** Archaeozoic and proterozoic eras are also grouped together as Precambrian because the first part of palaeozoic is Cambrian.

The three eras namely palaeozoic, mesozoic and coenozoic, each is further divided into smaller time spans called **Period** and the periods of coenzoic era are each further subdivided into **Epochs.**

It is also believed that each era of earth's history started with a **revolution or cataclysm** and ended with yet another revoluation.

These revolutions meant intense geological disturbances that occurred on earth, so that most of the pre-existing organisms perished in each revolution and the few remaining ones evolved into new and varied organisms.

The first great revolution is believed to have occurred between archaeozoic and proterozoic eras.

The second great revolution between proterozoic and palaeozoic eras.
Applachian revolution between palaeozoic and Mesozoic eras.
Finally the rocky mountain revolution between Mesozoic and coenozoic eras.

GEOLOGICAL TIME SCALE					
Era	**Period**	**Epochs**	**Duration**	**Animals sequence**	**Plant sequence (vegetation)**
COENOZOIC (AGE OF MAMMALS)	**QUATER-NARY**	Holocence of recent (Age of man)	Continuing Till date	Mental age, supremacy of man	Increase of herbaceous Plants evolution of monocots
		Pleistocene	7.0 lakh years	**Human appear, Appearance of social life of man** decline of giant mammals	Increase of herbs and grasses
	TERTEORY	Pliocene	1.32 crore years	**Apelike ancestor of human appeared**	Evolution of herbaceous plants
		Miocence (Golden age of Mammals)	1.1 crore years	Mammals at height of evolution evolution of man like apes and other mammals, like sheep, goat, dogs, elephant.	Land or terrestrial plants evolved.
		Oligocene	1.9 crore years	**Anthropoid apes evolved** from monkeys, crocodiles	Rise of monocots.
		Eocene	1.2 crore years	Evolution of diversified placentals, ancestors of hoofed carnivores marine mammals, and birds	Beginning of grassy plants flowering plants spread into forests.
		Palaeoene	8.0 lakh years	Evolution of insectivorous smaller mammals, carnivorous mammals.	Forests of angiosperm
				ROCKY MOUNTAIN REVOLUTION	
MESOZOIC (AGE OF PEPTILES)	**CRETACE-OUS**		7.1 crore years	**Extinction of dinosaurs and primitive birds. First modern birds appeared.** Primitive placental mammals like insectivorous shrews originated	Beginning the evolution of dicots. **Angiosperms appeared**
	JURASSIC		5.4 to 5.9 crore years	Giant reptiles like **dinosaurs were at peak, evolutionof toothed birds like Archaeopteryx**, marsupials evolved from prototherians.	Evolution of gymnosperins was at peak
	TRIASSIC		3.5 crore years	**Origin of first** oviparous **prototheria mammals, dinosaurs, flying reptiles.**	Forests of Conifers, cycades and other gymnosperms.
				APPLICATION REVOLUTION	
PALAEOZOIC	**PERMIAN**		5 crore years	extinction of trilobites, **origin of mammal like reptiles**	Among gymnosperms Evolution of comifer trees.
	CARBONI FEROUS		6.5 crore years	**Abundance of sharks, bony fishes** and **lung fishes. Appearance of first amphibians**	Ancestral gymnosperms & furns dominated bryophytes originated **Origin of first seed plant.**
	DEVONIAN (age of fishes)		5 crore years	**Origin** and evolution of **sharks, bony fishes** and **lung fishes. Appearance of first amphibians**	Giant clubmoss.
	SILURIAN		3 to 4 crore years	Evolution of arthropods, insects, jawless primitive fishes evolved.	Celophytes and land ferns were in large number. Origin of vascular plants.
	ORDO VICIAN		6 to 7 crore years	**Origin of jawless. fishes in fresh water.** Abundance of giant molluscs branchiopods, and trilobites Echinoderms. First vertebrates.	Plants reached fresh water. Marine plants abundant.
	CAMB RIAN		7 crore years	**Trilobites** and brachiopds were **dominant.** Echinodesms were also present. No life on land.	Marine bactes colonial, multicelluler filamentous algae evolved in occans.
				SECOND GREAT GEOLOGICAL REVOLUTION	
PROTE ROZOIC			1.93 billion years	Invertebrates like protozoa, coelenterate, sponges annelida and mollusca evolved.	Single celled bacteria and blue green algae evolved in sea .
ARCHAEO ZOIC			1.5 billion years	**Origin of life** in sea from organic materials **Prokaryotes (monera)** and **Eukaryotes** (Protista) evolved and diversified	Prokaryotic from of life formed **blue green algae originated.**
AZOIC			1.0 billion years	**No life. Only chemical evolution** took place.	

2. Morphological and Anatomical Evidences –

Different animals and plants show dissimilarities in their structure but in some characters they show similarities. These similarities are of two types.

1. Homology 2. Analogy

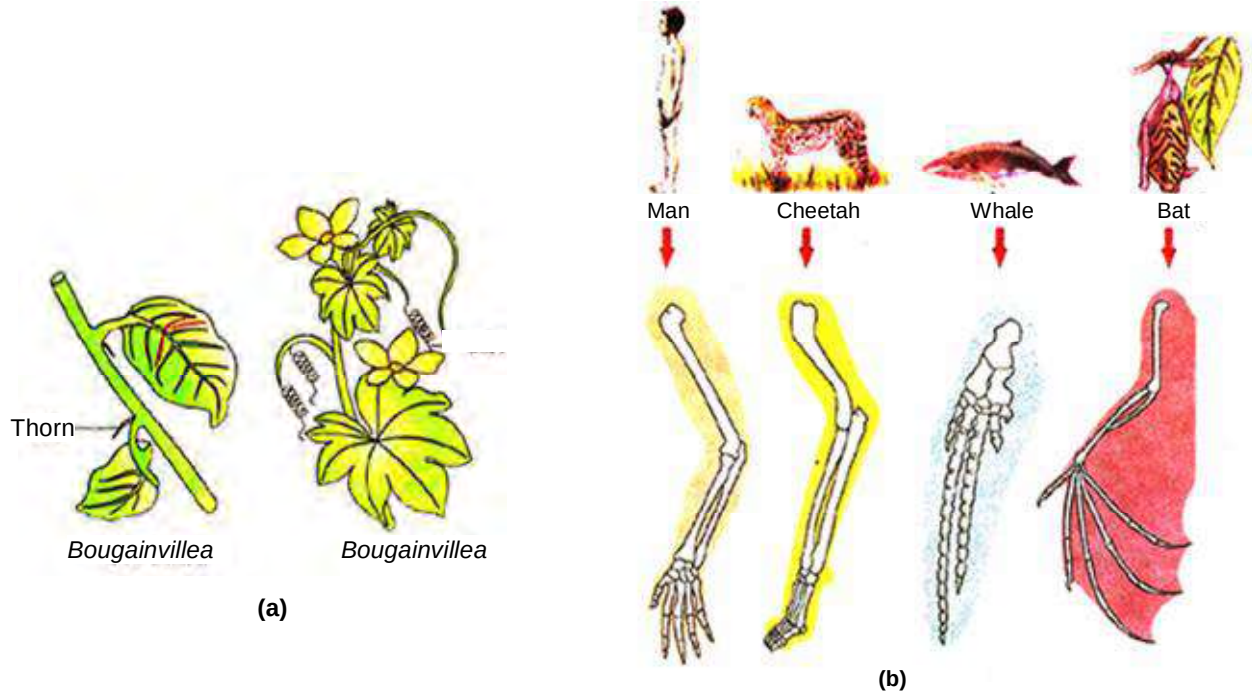
1. Homology –

The similarity based on common origin, similar basic plan of organization and embryonic development is called **homology.**

Similarity in appearance and function is not necessary.

The organs which have common origin, embryonic development and same basic structure but perform different functions are called **Homolgous organ. Homologous term given by Richard Owen.**

Examples of Homologous organs –



Example of homolgous organs in (a) Plants and (b) Animals

(i) Forelimbs of mammals –

	Horse	Bat	Whale	Seal	Man
Appearence	Foot	wings	Paddle	Flipper	Hard
Function	Running	Flying	Swimming	Swimming	Holding

In their fore limbs similar bones are present like – **humerus, radius, ulna, carplas, metacarpals and phalanges.**

(ii) Legs of invertebrates –

Cockroach	Honey bee
Walking	Collecting of pollens

But in both segmented legs are present are segments are same like **coxa, Trochanter, Femur, tibia, 1-5 jointed tarsus.**

(iii) Mouth parts of insects

Cockroach	Honey Bee	Mosquito
Biting and chewing	Chewing and lapping	Piercing and sucking

In each of these insects the mouth parts comprise **labrum, mandibles and maxillae.**

(iv) **Homology** is also seen in the skeleton, heart, blood vessels and excretory system of different vertebrates.

(v) **Thorn of Bougainvillea and tendril of cucurbita (Modification of axillary bud).**

(vi) Wings of sparrow and pectoral fins of fish.

(vii) Hind limb of mammals.

(viii) Potato & ginger.

(ix) Radish & Carrot

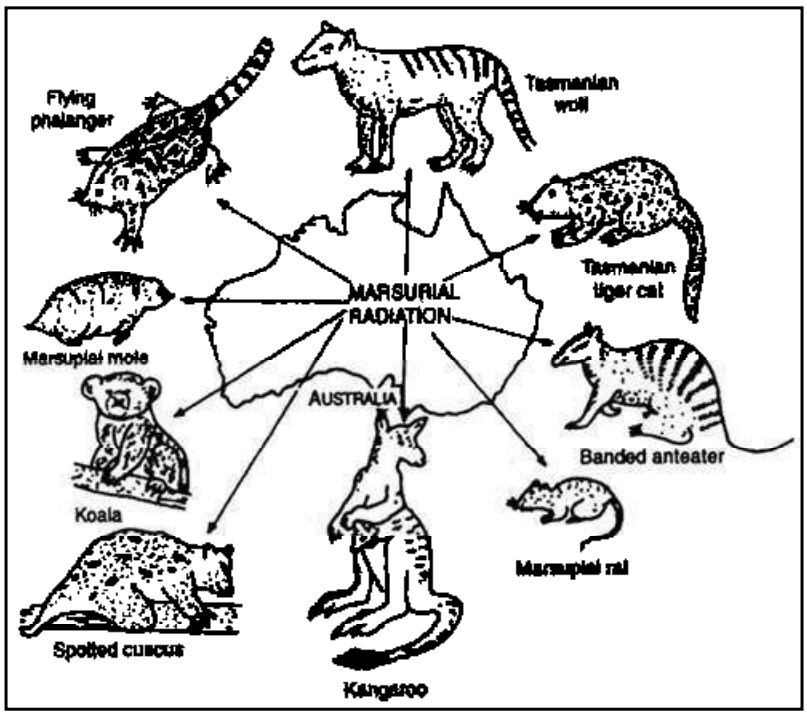
(x) Homology is also seen amongst the molecule. This is called **molecular homology.** For example the proteins found in the blood of man and apes are similar.

(xi) Testes in male and Ovaries in female develop from same embryonic tissue.

(xii) Pectoral fin of fish and flipper of seal.

(xiii) Flipper of penguin (bird) and dolphin (mammal)

Divergent evolution (adaptive divergence/adaption radiation)



Homology found in different animals indicate their evolution from common ancestors.

Species which have diverged after origin from common ancestor giving rise to new species adapted to new habitats and ways of life is called **adaptive radiation,** exhibit large number of homologous organs.

Homology shows **Divergent evolution.**

For Example Adaptive radiation gave rise to a varity of marsupials in Australia.

2. Analogy –

It is similarity in organs based on similar function.

Organs which have different origin and dissimilar fundamental structure but have similar function are called **Analogous organs.**

Examples of Analogous organs –

(i) Wings of bat & birds are analogous to wings of insects.

(ii) Pelvic fins of fish, flipper of seal

(iii) Sting of bee and scorpion.

(iv) Phylloclade of Ruscus and leaf

(v) Chloragogen cell of pheretima and liver of vertebrate

(vi) Hands of man and trunk of elephant
(vii) Potato and sweet potato.
(viii) Eyes of Octopus and eyes of mammals (different in their retinal position).
(ix) Dog fish and whale.

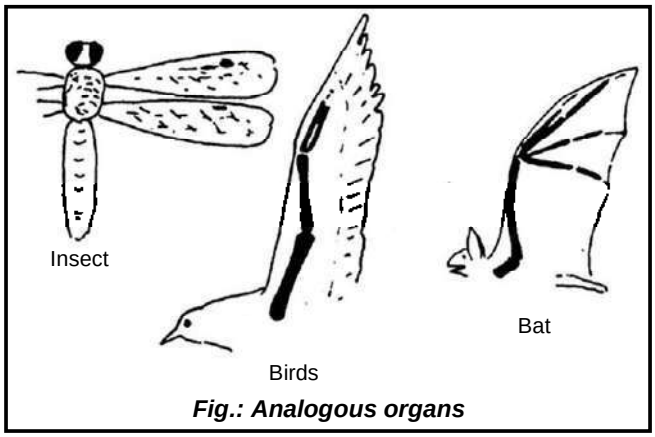


Fig.: Analogous organs

Convergent evolution (adaptive convergence/parallel evolution)

Development of similar adaptive functional structures in unrelated groups of organisms is called **convergent evolution.**

For Example : Some of the marsupials of Australia resemble equivalent placental mammals that live in similar habitats of other continents.

When adaptive convergence is found in closely related species, it is called **parallel evolution.**

Analogous organs do not show common ancestory but they show evolution.

Mole

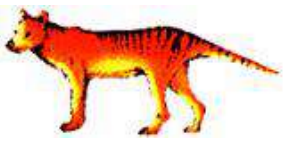
Wolf



Tasmanian wolf

Picture showing convergent evolution of Australian Marsupials and placental mammals

3. Evidences from vestigial organs –

The organs which are present in reduced form and donot perform any function in the body but correspond to the fully develop functional organs of related animals are called vestigial organs.

They are remanants of organs which were complete and functional in their ancestors.

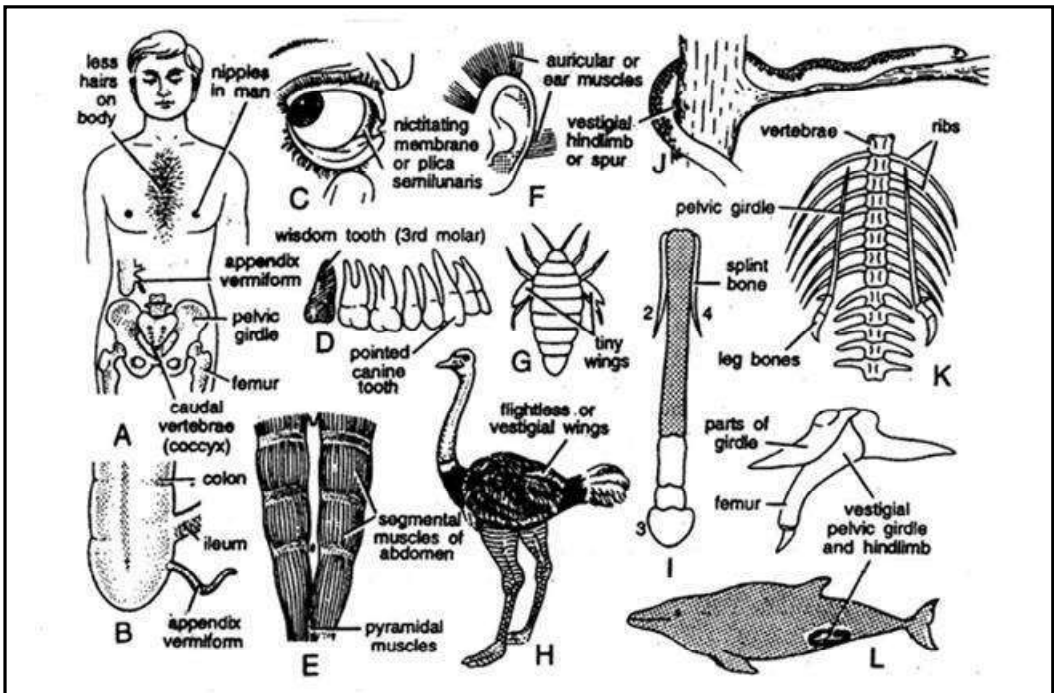
Vestigial organs in Human body –

Human body possess about 180 vestigial organs

eg.
a. nictitating membrane
b. muscles of pinna (auricular muscles)
c. vermiform appendix
d. coccyx
e. canine teeth
f. third molars (wisdom teeth)
g. segmental muscles of abdomen
h. caecum
i. body hairs
j. nipples in male
k. ear pinna

Vestigial organs in other animals –

- Hind limb and pelvic girdle of python
- wings of flightless birds such as ostrich, Emu, Kiwi, Dodo, Reha etc. (Dodo recentely extinct)
- Eyes of deep sea fishes
- splint bones in feet of horse [2nd and 4th finger]
- external ear in whale
- rudiment of reptilian jaw apparatus.
- Hindlimb and pelvic girdle of whale.



3. Vestigial organs. A—In man (i) Less body hair, (ii) Nipples in male, (iii) Coccyx, B—Vermiform ndix, C—Nictitating membrane, D—Wisdom teeth, E–Abdomen muscles, F—Muscles of pinna, G—Wings in le moth, H—Wings of Ostrich, I—Toes in forelimb of horse, J, K—Hind limbs and pelvic girdle of python, Hindlimbs and pelvic girdle of whale.

Vestigial organs in plants –

Scale leaves of Ruscus and various underground steams.

Vestigial organs are example of lamrckism (Theory of inheritance of acquired character)

4. Evidences from connecting links –

Some animals and plants possess characters of two separate groups. One being primitive and the other is advanced group.

These species as bridge between two taxonomic groups such organism are called **connecting** link. They provide good example of organic evolution of common ancestory.

(i) **Virus :** between living and non living

(ii) **Euglena :** Between plants and animals

(iii) **Proterospongia :** Between protozoa and porifera

(iv) **Neopilina :** Between mollusca and annelida

(v) **Peripatus :** Between Annelida and arthropoda

(vi) **Archaeopteryx :** Between reptiles and birds

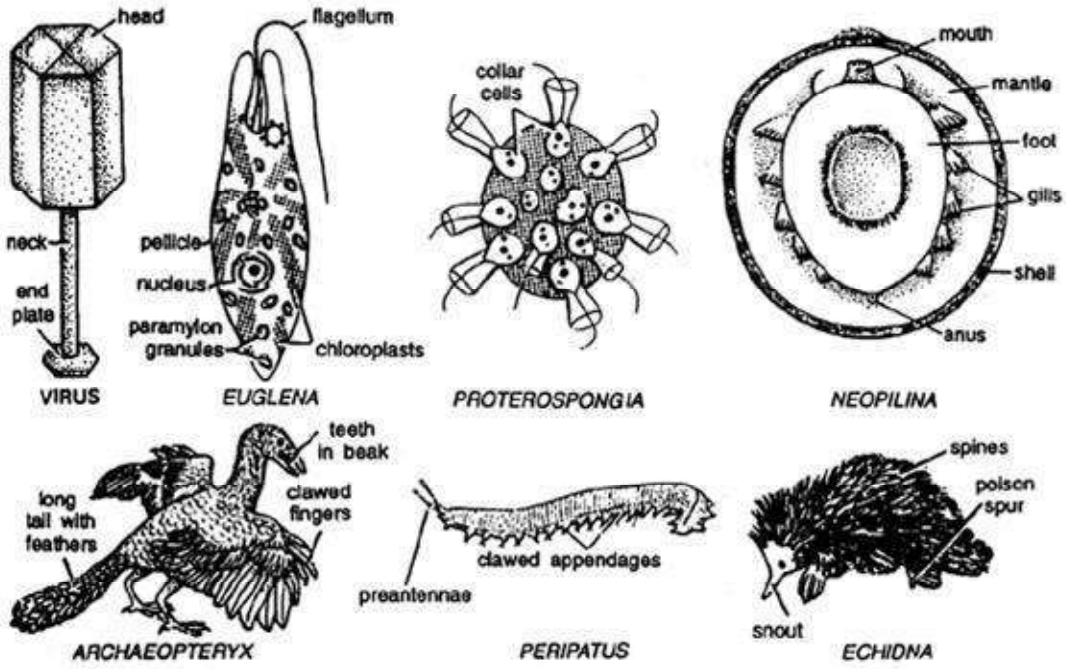
(vii) **Balanoglossus :** Between nonchordates and chordates

(viii) **Chimera :** Between cartilaginous fish and Boney fish

(ix) **Lung fish (Protopterus) :** Between fishes and amphibia

(x) **Platypus :** Between reptiles and mammals

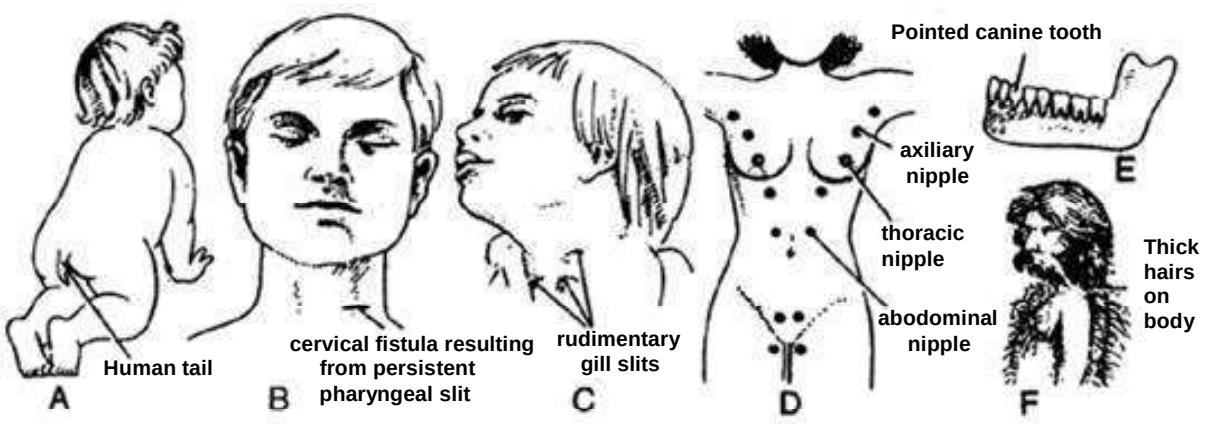
(xi) **Echidina :** Between reptiles and mammals.



5. Evidences from Atavism (Reversion) –

Sometimes in some individuals such characters suddenly appears which were supposed to be present in their ancestors but were lost during the course of development.

This phenomenon is known as **atavism or reversion.** Atavism proves that animals developing atavistic structure have evolved from such ancestors in which these structures were fully developed.



Some human atavistic characters. A–Human baby with tail, B,C–Cervical fistula or rudimentary gill-slits, D–Additional nipples, E–Pointed canine tooth, F–Thick hair on body.

Examples :

1. ***Human baby with tail***
2. ***Cervical fistula*** *– in some human babies an aperture is present on neck behind the ear called as cervical fistula. It represents pharyngeal gill slits which were present in aquatic vertebrate ancestors.*
3. ***Long and pointed canine teeth represented carnivorous ancestors.***
4. ***Large and thick body hair reflect our relationship with apes.***
5. ***Extra nipples (more than two)***

6. Evidence from physiology and biochemistry –

Different organism show similarities in physiology and biochemistry. Some clear examples are –

1. **Protoplasm :** Structure and chemical composition of protoplasm is same from protozoa to mammalia.
2. **Enzymes :** Enzymes perform same function in all animals like **Trypsin** digest protein from amoeba to man. **Amylase** digest starch from porifera to mammalia.
3. **Blood :** Chordates show almost same composition of blood.
4. **ATP :** This energy rich molecule is formed for biological oxidation in all animals.
5. **Hormones :** Secreted in different vertebrates performs same function.
6. **Hereditary material :** Hereditary material is DNA is all organism and its basic structure is same in all animals.
7. **Cytochrome C** is a respiration protein situated in the mitochondria of all organism. In this protein from 78-88 A.A. are identical in all organism, which show common ancestory.

Physiology and biochemistry thus prove that all animals have evolved from some common ancestor.

7. Evidences from bio geographical distribution –

The study of geographical distribution of animal and plant species in different parts of earth is called **Biogeography.**

Different animal species occurring in an area are called **Fauna** and those of plants are called **Flora.**

On the basis of fauna and flora **Alfred Russel Wallace** divided the whole world into six major biogeographical regions called **realms.**

Nearctic : North America fro Mexixan highlands to Arctic islands and Greenland.

Palaearctic : Europe, North Asia up to Himalayas and North Africa up to Sahara desert.

Neotropical : Central and South Amerial, Mexican lowlands and West Indies.

Oriental : Asia, South of Himalayas; India, Ceylon, Malay, Peninsula, Sumatra, Bornea, Java Celebes and Philippines.

Ethiopian : South Africa from Sahara Desert, Madagascar and Adjacent islands.

Fig.: Zoogeographicl realms

Australian : Austrialia, Tasmania, New Guinea, New Zealand and Oceanic islands of the pacific. It is believed that millions of years ago all the continents were present in the form of a single land mass called **Pangaea.**

Later on due to varies geological changes, these continents drifted fro one another.

As these continents moved away, they got separated from each other by the seas. As these continents had different environmental conditions so plants and animals evolved there were of different varieties. **(New species).**

Palaearctic and oriental realms are separated by high Himalayan Mountains.

CBSE 94

1. **Prototheria –**

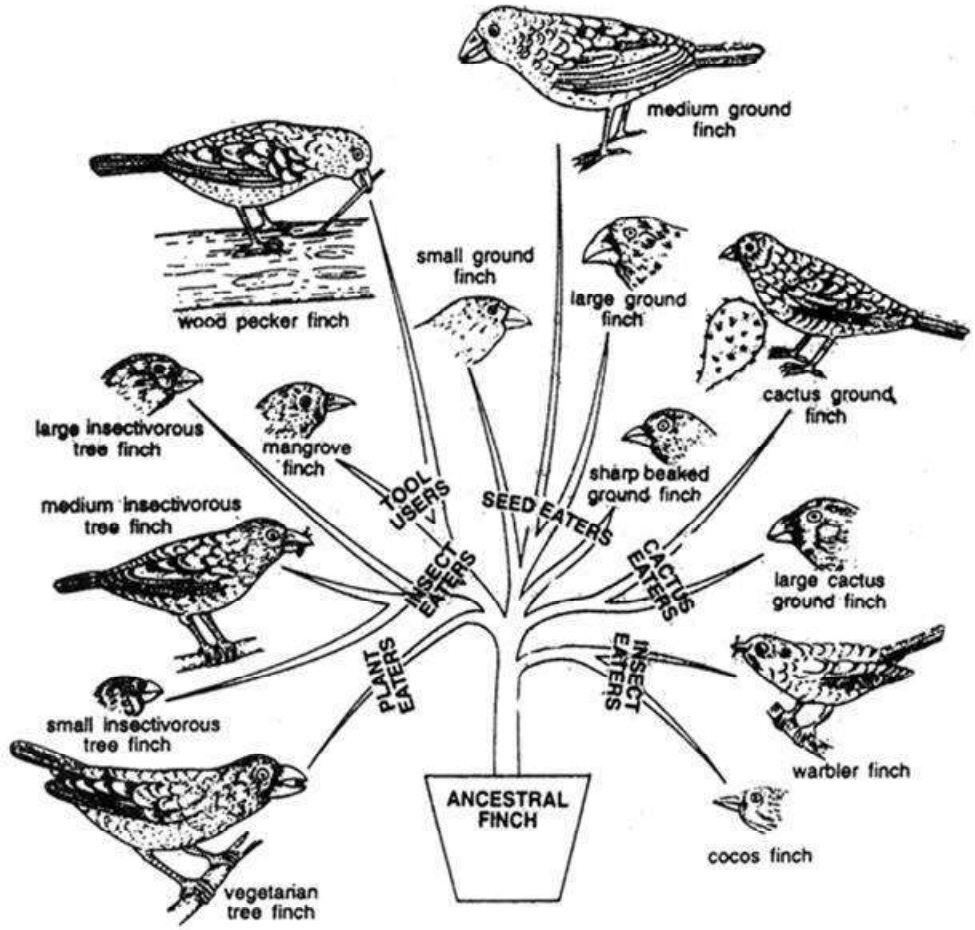
   This is sub class of mammalian, which includes egg laying mammals like **Platypus** and **Echidna** found in Australia.

   After the evolution of prototherians from reptiles Australia got seperated from mainland of Asia.

   Later on Eutherian mammals evolved in Asia, Due to their carnivorous nature they destroyed prototherians and metatherians from Asia.

   So these groups became extinct on the mainland but they survived in Australia due to absence of Eutherians.

   Today eutherians are also found in Australia **(they were later transported by man).**
2. **Marsupialia –** The subclass of class mammalian includes kangaroos and Opossum which are found only in Australia.
3. **Darwin's finches –** Darwin studied Fauna and Flora of Galapagos island situated near south America (consisted 22 islands). Here he saw 22 types of finches (birds) .



Darwin's finches

A related species of these birds were also present in South American continent.

Probably some member of this species migrated to Galapagos island where these birds evolved into different species as a result of adaptation to environment.

These birds are now known as **Darwin's Finches.**

Darwin described that a particular species is evolved in a particular area, progenies of this species migrate to different geographical areas and are gradually adapted to changing environmental conditions.

These adaptations gradually give rise to new species as a result of isolation.

Special Point :

- ***Darwin's finches are also an example of adaptive radiation (different shape of beak and claws due to their habitat)***
- ***Darwin's finches are example of allopatric speciation.***

4. Elephants and lions are mainly found in Africa and India.

5. Giraffe, Zebra and hippopotamus are found only in Africa.

6. Main land of human evolution in Africa.

Important Point :

Palaeontological and Biogeographical evidences are considered as best evidences in support of organic evolution.

8. Evidences from Embryology –

Baer's Law : An organism show its ancestor stages in embryonic development. In embryonic stage general characters appear first then specialized characters appear.

Muller : First to propose '**Recapitulation theory**'.

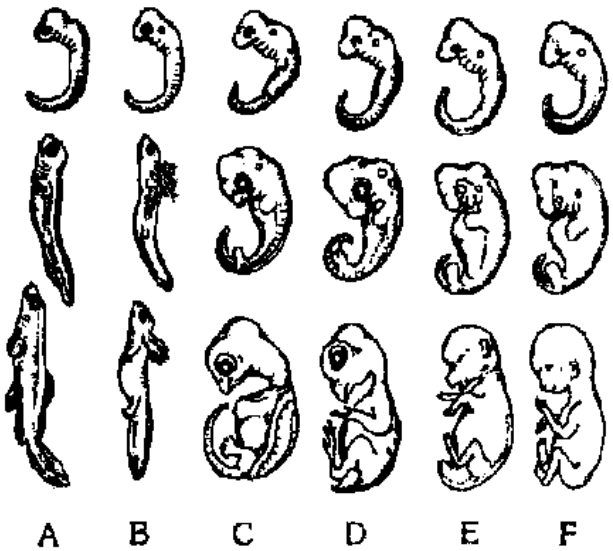
- According to it **'ontogeny recapitulate phylogeny'** it means any organism show its ancestral adult stages during its embryonic development.
  It shows that all organism evolved from a common ancestor.
- Ernest Haeckel explained it in detail and gave the name '**Biogenetic law**'

Examples : -

(a) The Zygotes from which the development of all metazoan bodies starts, are single-celled and quite comparable with the Bodies of simple protozoans.
This indicates the origin of **Metazoans from Protozoan Ancestors.**

(b) The early stages of Embryonic development, Viz. Morula, Blastula and gastrula are Basically similar in all metazoans, indicating a **Monophyletic Origin** of the latter.

(c) The Phylogenetically earliest metazoans i.e., the sponges and cnidarians, have retained early gastrula like double – layered (Diploblastic) structure of Body of Metazoans.



Comparison of stages in the development of vertebrate embryos. A. Fish, B. Salamander, C. Tortoise, D. Chick, E. Calf, F. Human

(d) In fishes, the young individual, developing from gastrula, is almost-like the adult, but the tadpole larvae of Amphibians bear more resemblance to the young once of fishes than to their own Adults. This indicates **Origin** of **Amphibians from fishes.**

(e) Even after gastrulation in the vertebrates, the early postgastrula stages are quite similar in members of all the different classes, Viz, fishes, amphibians, reptiles, birds and mammals.
The differentiation of class characters appear in later stages, moreover, the embryo of phylogenetically higher vertebrates pass through the adult stages of lower vertebrates before finally attaining the characters of their respective classes.
This proves that **All Vertebrates** have evolved from common fish like Ancestors and also that both Birds and mammals have evolved from reptiles.

(f) When the heart develops in the embryos of Amphibians, reptiles, Birds and Mammals, it is 2-chambered same as in the embryos and Adults of fishes. In later stages of Embryonic development in Amphibians, reptiles, the heart become, 3-chambered. In Birds and Mammals the heart is 4-chambered in the last embryonic stages to continue as such in the Adults.

(g) Modern Scientists have discovered "Biochemical recapitulation" also.
For example, fishes mainly excrete Ammonia. Adult Amphibians Excrete urea, but their tadpoles excrete Ammonia like the fishes.

Birds excrete uric acid, but their embryos excrete first Ammonia and then urea during earlier stages.

(i) In embryonic stage birds showed tooth buds for some time, which became extinct later. It show that birds evolved from toothed reptile like ancestors.

9. Evidences from Taxonomy –

Plants and Animals show a great diversity of form. They also show some similarities among themselves. It is on account of these differences and resemblances that the taxonomists have been to arrange the living things in to smaller and larger groups.

This the taxonomists have recognized that there are about 250,000 different kinds of plants. These different kinds are called species.

The members of each species recognized by their close resemblance to one another, their differences being of a minor type.

Amongst species also there are differences and resemblance of varying degree. Some species resemble one another more closely than they resemble others and form a closely related group.

Similarly, there are other groups of closely resembling species.

The members of each group resemble each other more closely than they resemble the members of other groups.

Each such group of species is called a genus. Genera also show different degrees of resemblances amongst themselves.

Those that resembles one another more closely than others are placed in a large group called a family.

Families are grouped in to larger units called orders, orders into classes and classes in to Phyla.

Evolution has a ready explanation for this system of grouping or classifying plants and animals in groups indicates relationship.

Special points : -

1. The aquatic mammals [eg. **Dolphins, Whales, Seals, Porpoises** etc.] don't have gill slits-**because their adaptation to aquatic life is secondary.**
2. In Acacia tree well developed compound leaves are found. But seedling has simple leaves like those found in all stages of development of its ancesters. This provide a good example of –

   Recapitulation
3. Modern day Oaks of southern United State of America retain their foliage throughout the year where as the oaks of northern United States are **deciduous** and shed their leaves during water. The southern species, on the basis of this character of leaves are considered to be more primitive than the northern oaks. However, the seedling of northern species are generally seen to retain their leaves during winter. This provide a good example of – **Recapitulation**.
4. **Evolutionary trend :** The continuous change of a character within an evolving lineage is termed as **evolutionary trend.**
5. Archaeopteryx is a connecting link between reptiles and birds.
6. Correct order of age is Paleozoic $\rightarrow$ Mesozoic $\rightarrow$ Coenozoic.
7. The scientist to propose recapitulation theory was "Haeckel".
8. Evolution is history and development of race along with variations.

9. Homologous organs are similar origin with similar or dissimilar functions.
10. Vastigeal organ of python is “Hind limbs”.
11. Process of evolution is **continuous**.
12. Haeckal’s biogenetic law or recapitulation theory states that life history of an animal reflects evolutionary history of the same.
13. “Golden age of Dinosaurs”/Age of reptiles was “Mesozoic”.
14. Humming birds and Hawk illustrate adaptive radiation.
15. Birds and mammals evolved during Jurassic.
16. Mammals are believed to have evolved from reptiles in “Triassic”.
17. Parallelism is adaptive convergence of closely related groups.
18. Some homogoies organ are “Paddle of whale”, front legs of horse and arms of humans/legs of duck, hind limbs of kangaroo.
19. Analogous organs are different origin but similar functions.
20. Upper strata younger and lower older will be true in sedimentary rocks.
21. Vermiform appedix, wisdom teeth, body hair are the vestigial organs in humans.
22. Palaeozoic era is the era of fishes.
23. Pinna muscles is a vestigial organ in humans.
24. Examples of homologous organs are wings of pigeon and arms of humans.
25. Coccyx is a vestigial organ of human body.
26. Haeckel’s recapitulation theory states “Ontogeny repeats phylogeny”.
27. Fossilisation is animals buried by natural process.
28. Homologous and analogous, homologous and vestigial organs analogous and vestigial organs are a set of evolution.
29. Dinosaurs were dominant during **Jurassic**.
30. Wings of birds and wings of butter fly are analogous.
31. Angiosperm flourished during **Coenozoic**.
32. Mammoth (Animal) has become extinct recently.
33. Body hair is a vestigial organ in human body.
34. Fossil reptile having mammalian traits was “Pelycosaurus”.
35. Origin of first mammals occurred 220 million years.
36. Basic principle of embryonic development were pronouced by “Van Bear”.
37. Age of mammals and birds is coenozoic.
38. Dinosaurs disappeared during “Cretaceous”.
39. Fossil x is older than fossil y because fossil x was found in deeper sedimentation.
40. Carboniferous period of coal deposition was 300 million years ago.
41. Fossils indicate the evolution of **“Horse”**.
42. Fossils are not indicate the evolution of monkey, man and dinosaurs etc.

43. Biogenetic law was pronouced by **"Van bear and haekel"**.
44. Dinosaurs were dominant in Mesozoic.
45. Existence of coal/pteroleum can be known from study of **"Palaeobotny"**.
46. Fossils are dated by **"Radioactive carbon content"**.
47. The earliest fossil from in the phylogeny of horse is **"Eohippus"**.
48. Fossil remains of Archaeopteryx indicates that reptiles given rise to birds during jurassic.
49. Palaenontology provides direct and solid evidence in favour of organic evolution through ages.
50. Study of the fossils comes under "Palaeontology".
51. By "Allen's law" animals of cold countries have shorter ears.
52. Mammals occur on land, air and water. It is adaptive radiation Not adaptation.
53. Wings of mosquito, Bat and bird show evolution called "Convergent".
54. Presence of gill slits in the embryos of all vertebrates supports the theory of "Recapitulation".
55. Birbal sahni was the famous palaeotologist/palaeobotanist of India.
56. Two geographical regions separated by high mountains are palaerctic and oriental.
57. Organisms present at different places without any traces in between show "Discontinous distribution".
58. Nictitating membrane is a vestigial organ in human.
59. Branch of botany dealing with distribution of plants is **"Phytogengraphy"**.
60. In azoic era had life not originated.
61. Birbal sahni institute of palaebotany is located in Lucknow.
62. Phylogeny is evolutionary history.
63. Exsitence of marsupials in australia and newzealand proves continental drift and geological period.
64. Human hand, wing of bat and flipper of whale represents homologous organs.
65. The statement "nothing in biology makes sense except in the light of evolution" was given by "Dobchansky".
66. "Genetics and the origin of life" Book had wrritten by "Dobzhansky".
67. Animals of cold area have shorter and smaller extremities. This is allen's law.
68. Coal has been mainly formed by pteridophytes/pteridosperms.
69. Vestigial pelvic girdle and bone remnants of hind limbs are characteristic of "Whale".
70. Organic evolution is change in major portion of popultion.
71. Archeopteryx is a bird with teeth.
72. Darwin's friches provide evidence of evolution from "Biogeography".
73. Living organism with oldest fossil history is "Horse".
74. Adaptive similarites in animals of the same habitat consititute. "Convergent evolution".
75. Homologous organs show " Divergent evolution".
76. Identical to those of man are monkey and some lower groups certain blood groups.

THEORIES OF ORGANIC EVOLUTION

LAMARCKISM :

First theory of evolution was proposed by

Jean Bapttiste de Lamarck (17-44 - 1829)

Book : **Philosophie Zoologique (1809)**

Lamarck coined the terms – **Invertebrates, Annelida**.

The term **Biology** was given by **Lamarck & Treviranus**.

Theory of Inheritance of Acquired Character–

Basic Concept of Lamarckism–

(i) Internal Vital Forces :

Some internal forces are present in all organisms. By the presence of these forces organism have the tendency to increase the size of their organs or entire body.

(ii) Effect of environment and new needs:

Environment influences all type of organisms. Changing environment gives rise to new needs. New needs or desires produce new structures and change habit of the organism.

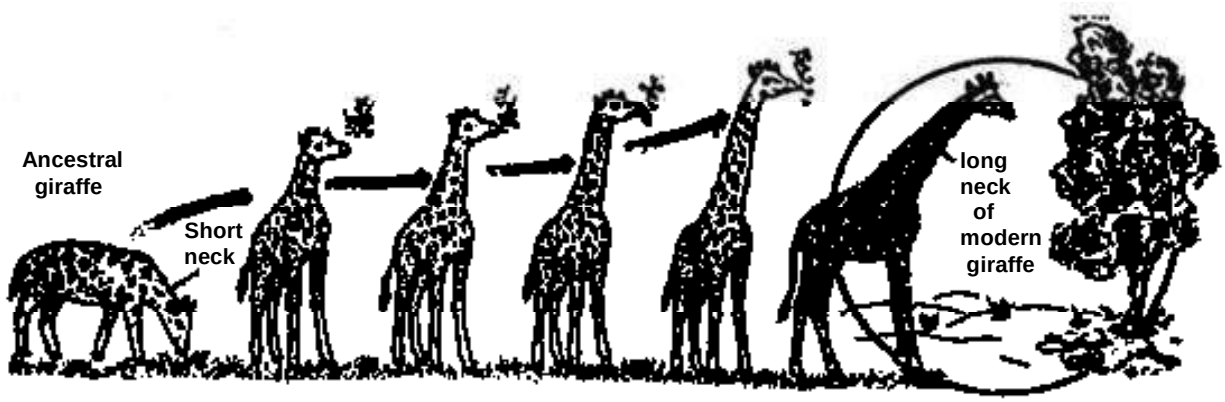
(iii) Use and disuse of organs:

If an organ is constantly used, it would be better developed whereas disuse of organ result in its degeneration.

(iv) Inheritance of acquired character:

During the life of an organism new character develop due to internal vital forces, effect of environment, new needs and use and disuse of organs.

These acquired character are inherited from one generation to another. By continuous inheritance through many generation these acquired characters tend to make new generation quite different from its Ancestors resulting in the formation of new species.



Example in support of Lamarckism :

1. Long neck and high fore limb of Giraffe.
2. Aquatic birds stretched their toes and developed web.
3. Snakes lost their legs.
4. Deers became good runners by the development of strong limbs and streamlined body.
5. Retractile claws of carnivorous animals.

Criticism of Lamarckism -

1. According to first concept organism tends to increase their size but it is not universally true.

   For Example among angiosperm the trees seem to be primitive and the shrubs, herbs and grasses have evolved from trees but the size was reduced during evolution.
2. Second concept is false. Can we sprout wings wishing to fly like birds.
3. The third concept is some what true like the well developed biceps muscles of blacksmith and less developed wings in flight less birds.

   But this concept also have many objections like the eyes of a student/reader do not increase in size and power with increasing age, the constantly beating heart maintains a constant size through generation.
4. Fourth concept is completely false because acquired characters are not inherited.

Weismann –

Weismann cut off the tails of rats for about 22 genrations but there was no reduction in the size of tail on the basis of this experiment Weismann proposed **the theory of continuity of germplasm.**

According to Weismann.

(i) Two types of matters are present in organism, **somatoplasm and germplasm.**

(ii) Sometoplasm in somatic cells and germplasm in **Germinal cell.**

(iii) Somatoplasm dies with the death of organism while germaplasm transfers into the next generation.

(iv) If any **variation** develops in germplasm, it is inherited , while if variation develop in somatoplasm it is not transmitted.

Pyane :

Pyane kept drosophila in dark up to **69 generation,** but there was no reduction in the size or sight of eyes

– Boring of ear and nose in Indians.

– Iron shoes of Chinese.

Neolamarckism-Term by Packard

Although Lamarckism remained controversial but some scientists gave the following evidences in favour of Lamarckism. The are known as **neo-lamarckians.**

According to neolamarckism environment effected the inheritance of acquired charater. According to it changing environment give rise some physical and chemical changes in organism, which effect their germplasm, and these acquired characters are definitely inherited.

1. Sumner's Experiment–

Sumner kept white rat in warn temperature resulting in elongation of body, large pinna and long tail. These features were inherited by the offspring.

2. Kammerer's Experiment–

Kammerer kept salamander in dark background. The black spots found on skin were widely spread. In lighter, background the skin became yellow with limited black spots. These character were inherited by the offspring.

3. Mac Dugal's Experiment-

Mac Dugal trained white rats to cross a tank of water following a definite route. These trained rats were mated and their offspring were again trained. It was observed that there was decrease in the number of errors by offsprings of white rats.

Difference between Lamarckism and Neo–Lamarckism

Lamarckism	*Neo–Lamarckism*
It is original theory by Lamarck.	It is a modification of the original theory of Lamarck in order to make it more suitable to modern knowledge.
The theory lays stress on internal force, appetency and use and disuse of organs.	Neo–Lamarckism does not give any importance to these factors.
It believes that changes in environment brings about a conscious reaction in animals.	The theory stresses on the direct effect of changed environment on the organisms.
According to Lamarckism the acquired characters passes on to the next generation.	Normally only those modification are transferred to next generation which influence germ cells or where somatic cells give rise to germ cells.

Special Points : -

1. **Allen's law :** The homoeothermic animals (Birds and Mammals) of colder region have shorter extremities, like pinna, toes etc., than their counter parts of warmer region.
2. **Bergman's law :** The warm blooded animals (Birds and mammals) of colder region are bigger or larger in size than their counter parts of warmer region.
3. **Cope's law :** The animals of a major adaptive group of region have a tendency of increase in size. For example, the dinosaurs formed the major adaptive group in Mesozoic era.
4. **Dollo's law :** The evolution is an irreversible process.
5. **Gause's law :** Two species with identical food habits or ecological needs can not occupy the same ecological niche for a very long time. Gause's principle was restated by Hardin (1960) as 'Competitive Exclusion Principle', which means that *complete competitors cannot co-exist*.
6. **Golger's law :** The homoeotherms of colder region, with low temperature and low humidity, have less melanin in their skin.
7. **Hardy-Weinberg's law :** This law was proposed in 1908 by G.H.Hardy, a British mathematician, and W.Weinberg, a German physician, and is related to the **Population genetics.** It states that :
   'If a population is at equalibrium then the gene frequency and the genotype frequency will remain constant generation after generation.'

- A population is said to be at equilibrium when there is :
  1. No Mutation
  2. No Natural or Artificial selection
  3. No Gene flow
  4. No Genetic drift

- This also means that sexual reproduction alone cannot bring a change in allele frequency. This law is applicable when above changes do not occur, hence no evolution takes place. (Such conditions can never be achieved in nature).
- The mathematical expression to calculate allele frequency can be given as

$$\boxed{p + q = 1}$$

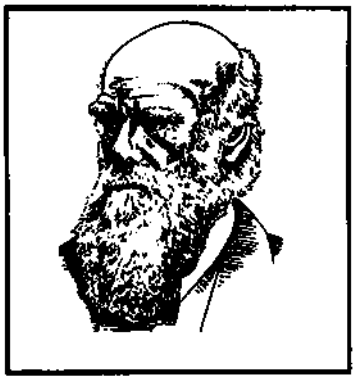
Where 'p' represents the frequency of dominant allele and 'q' represents the frequency of recessive allele. The binomial expression of Hardy Weinberg's law, to calculate genotype frequency is

$$\boxed{p^2 + 2pq + q^2 = 1}$$

Where p^2 = homozygous dominant (genotype) individuals, pq = heterozygous (genotype) individuals, and q^2 = homozygous recessive (genotype) individuals.

DARWINISM

Charles Robert Drawin was born on 12th feb. 1809 in England. Darwin traveled by **H.M.S. Beagle.**



The ship left on Dec. 27, 1831 and returned on Oct. 2, 1836. He travelled South America, **South Africa, Australia and Galapagos Islands.** Darwin was influenced by two books.

"Principles of population" of Malthus.

"Principles of Geology" of Charls Lyell.

Alfred Russel Wallace :

He travelled South eastern Asia and South America. The idea of natural selection striked in his mind. Wallace wrote an essay and sent it to Darwin. **"On the tendency of varieties to indefinitely from original type"**.

There was striking similarity between the view of Darwin and **Wallace.**

Wallance's chart : Wallace presented a chart to explain main points of theory of Darwin.

"Darwinism" or "The theory of Natural Selection" was proposed by both Charles Darwin and A.R. Wallace. This theory was later on explained by Darwin in his book **'On the origin of species by the means of Natural Selection' (1859).**

S. No.	Facts	Consequences (Conclusions)
1	(i) Enormous rate of reproduction among animals (ii) Constant number of animals of a species	Struggle for existence
2	(i) Struggle for existence (ii) Heritable variations	Suvival of the fittest or natural selection
3	(i) Survival of the fittest (ii) Continuous environmental changes	Continuous natural selection leading to evolution of new species

The main features of theory of Natural Selection are as follows –

(1) Over production : (High rate of Reproduction)

All organisms have capability to produce enormous number of offspring, organisms multiply in geometric ratio.

e.g. – Plants produce thousands of seeds.

– Insects lay hundreds of egg

– One pair elephant gives rise to about six offspring and if all survived in 750 year a single pair would produce about 19 million elephant. Thus some organisms produce more offspring and other produce fewer offspring This is called **differential reproduction.**

(2) Struggle for existence :

Every individual competes with other of the same and other species for basic necessities like. Space, shelther and food. It is called struggle for existence and it continues for the whole life from zygote stage to its natural death.

The struggle for existence is of three types –

(i) Intra-specific struggle : It is competition between the individuals of same species for same needs like food, shelter and breeding **(most acqute type of struggle).**

(ii) Inter-specific struggle : It is the struggle between the individuals of different species for food and shelter.

(iii) Environmental struggle : This struggle is between the organism and their environment. All organism struggle with cold, heat, wind, rain drought and flood etc.

(3) Variations and heredity :

Exept identical twins no two individuals are similar and their requirements are also not same. It mean there are differences among the individuals. These differences are called **variations.** Due to variations some individuals would be better adjusted towards the surroundings than the others.

According to Darwin the variations are continuous and those which are helpful in the adaptation of an organism towards its surroundings would be passed on to the next generation, while the others will disappear.

(4) Suvival of the fittest or natural selection :

The original idea of survival of fittest was proposed by Herbert Spencer.

According to Darwin most suitable and fit individuals are successful in struggle for existence. The individuals with most favourable adaptations are able to lead most successful life and are able to win over their mating partners. Darwin called I Sexual Selection.

In the struggle for existence only those members survive which posses useful variations means nature selects fit individuals. This was called Natural Selection. Fitness is the end result of the ability to adapt and get selected by nature.

(5) Origin of New Species :

Darwin explained that variations appearing due to environmental changes are transmitted to the next generation. So offspring become different from ancestors. In nest generation process of Natural selection repeats so after many generation a new species is formed.

Criticism of Darwinism –

1. Darwin does not explain the development of vestigial organs.
2. This theory has no satisfactory explanation for the cause, origin and inheritance of variation.
3. Darwin is unable to explain why in a population only a few individuals develop useful variation and others have harmful variations.
4. Criticism of Darwinism was based on sexual selection. Why only female selects the male for mating why not vice versa.
5. Darwin was unable to differentiate somatic and germinal variations.
6. This theory was unable to explain over-specialization of some organs like tusk of elephants, antelers of deer.
7. This theory only explain the survival of fittest but unable to explain **arrival of fittest**.
8. The main drawback of Darwinism was lack of the knowledge of **heredity**

Theory of pangenesis

According to this theory all organs of an individual produce Pangenes, which are minute particles carrying information about the organs.

The pangenes traveling through the blood stream will ultimately reach the gametes, so that each gamete will have pangenes for each of the different organs.

After zygote formation, the pangenes tend to form the same organs from which these pangenes were produced.

	L1 – short neck in ancestral stage of giraffe. Neck was stretched and used to feed on leaves of tall trees.	D1 – In ancestors of giraffe different length of neck was inheritable.	
	L2 – Neck in offsprings increased, this was also stretched and used to feed on leaves of tall trees.	D2 – As a result of struggle for existence giraffes with longer neck were better adapted. Due to natural selection offsprings with long neck increased in number, while those with short neck gradually disappeared.	
	L3 – Neck in the offsprings of gifaffe continued to increase in next generations resulting in the evolution of long neck in modern giraffe.	D3 – Due to above reasons giraffes with only longer neck survived.	

Difference between Darwinism and Neo–Darwinism

Darwinism (Natural Selection)	*Neo–Darwinism*
1. It is the original theory given by Charles Darwin (1859) to explain the origin of new species.	**1.** Neo–Darwin is a modification of the original theory of Darwin to remove its short–comings.
2. According to this theory accumulation of continuous variations causes changes in individuals to form new species.	**2.** Instead of continuos variations, mutations are believed to help form new species.
3. It believes in the selection of individuals on the basis of accumulation of variation.	**3.** Variations accumulate in the gene pool and not in the individuals.
4. Darwinism does not believe in isolation.	**4.** Neo–Darwinism incorporates isolation as an essential component of evolution.
5. It can explain the origin of new characters.	**5.** The theory can explain the occurrence of unchanged forms over millions of years.
6. Darwinism cannot explain the persistence of certain forms in the unchanged condition.	**6.** Normally only those modification are transferred to next generation which influence germ cells or where somatic cells give rise to germ cells.

NEODARWINISM :

NeoDarwinism is a modified form of Darwinism along with recent researches of **Weismann, Mendel, Devries, Huxley, Gates, Stabbins** ets. They performed many experiments to remove the objections against Darwin's theory.

The salient features of neodarwinism are as follows–

1. **Rapid multiplication :** All organism multiply in geometrical ratio.
2. **Limited food and space :** Food and space are limited.
3. **Struggle for existence :** It is of three types. Intraspecific, Interspecific and environmental.
4. **Genetic Variations :** They are inheritable variation which can occur due to the following reasons.
   - **(a) Mutation :** They are **discontinuous variations** which develop due to permanent changes in genotype. Mutations are of three types–
   - – **Genomatic mutations :** Change in number of chromosome.
   - – **Chromosomal Aberrations :** Changes in number of chromosome.
   - – **Gene Mutation :** Change in nucleotide.
   - **(b) Gene recombination :** They are new combination of genes which are usually caused by **crossing over.**
   - **(c) Hybridisation and gene migration :** It is crossing of organisms which are genetically different in one or more traits.
   - **(d) Genetic drift :** It is the elimination or addition of the genes of certain chartain characters when some animals in population migrate or dies or immigrate. It changes the gene frequency of remain population. Genetic drift operates only in **small population.**

     (Changes in frequency of genes in a gene pool is called **drift.)**

Founder Effect : Gene pool is the sum total of all the genes found in a population. Change in the frequency of gene in a gene pool is called genetic drift. Genetic drift always operates in small population. By genetic drift often the phenotype of this small population quickly become different from the parental population and some time form a new sp. Such an effect is called Founder Effect.

Bottleneck Effect : Death of several members of population due to natural calamities (Earthquake , Storm, Flood) also leads to genetic drift. The original size of population is then restored by mating among the survivor. The new population may lack the genes of certain. This may produce a new species after some time. The loss of a section of population by death an after sometime a new species is formed that effect is known as Bottleneck effect.

5. Natural Selection :

If differential reproduction (some individuals produce more, some only few and still others none) Continuous for many generations, genes of the individuals which produce more offspring will become predominant in the gene pool of the population. Thus natural selection occurs through differential reproduction in successive generations.

6. Isolation :

Isolation is a segregation of populations by some barriers which prevent interbreeding. The reproductive isolation between the populations due to certain barriers leads to the formation of **new species.**

Example of Natural Selection –

(1) Industrial Melanism :

This phenomenon was studied by **Barnard kettlewell.**

(a) (b)

Figure showing white – winged moth and dark – winged mouth (melanised) on a tree trunk (a) In unpolluted area (b) In polluted area

Before industrial revolution, the dull grey forms of prepared moth-**Biston betularia** – were dominant; the **Carbonaria** form (Black) was rare because it was susceptible to predation by birds. The reason was that it was **conspicuously** visible while resting on tree trunks.

The industrial revolution, resulted in large scale smoke which got deposited on tree trunks tuning them Black. Now grey varieties became susceptible – the black forms flourished. Replacement of coal by oil and Electricity reduced production of black moth so the frequency of grey moths increased again.

(2) Drug resistance :

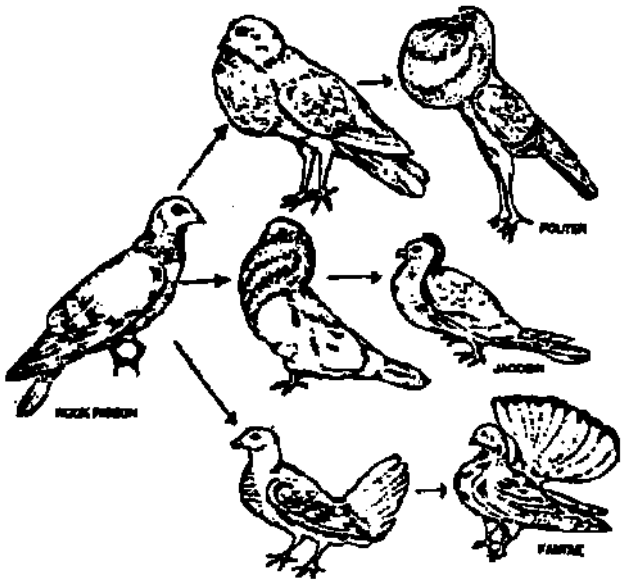
The drugs which eliminate pathogens become ineffective in the course of time because those individuals of pathogenic species which can tolerate them, survive, flourish to produce tolerant population.

(3) Sickle cell Anaemia and Malaria :

Individuals homozygous for sickle cell Anaemia die at an early age. In heterozygous individuals, the cells containing abnormal haemoglobin **Sickle** shaped. In fact, When an RBC becomes sickle-shaped, it kills Malarial parasite effectively so that these individual area able to cope with malaria infection much better than normal persons. The processs of natural selection thus maintains the abnormal form of haemoglobin along with the normal form in a region where Malaria is common.

(4) Malaria and G-6-PD deficiency :

Glucose 6- Phosphate dehydrogenase deficiency is a common abnormality in Negroids. Haemoglobin gets denatured and is deposited on cell membrane. **The disease is called favism.** In these RBC, the malarial parasite cannot complete It's cycle. Such persons get protection from Malaria.



Artificial Selection –

Man has been taking the advantage of genetic variations for improving the qualities of **domesticated plants and animals.** He selects the individuals with desired characters and separates them from those which do not have such characters. The selected individuals are interbred. This process is termed as **Artificial Selection**. This process is man made. If it is represented for many generations it produces a new breed with desired characters. By artificial selection animal breeders are able to produce improved varieties of domestic animals like **dogs, horse, pigeons,, poultry, cow, goats, sheep** and **pigs** from their wild ancestors. Similarly the plan breeders have obtained improved varieties of useful plants like wheat, rice, sugarcane, cotton, pulses vegetables fruits etc.

Artificial Selection is similar to natural selection except that the role of nature is taken over by man and the character selected are of human use.

Special points :

- The breeders have successfully produced the toy-like Shetland pony, the Dane dog, the sleek Arabian race horse by selection.
- Many crop plants like broccoli, kale cabbage, Cauliflower, Brussels sprouts and kohirabi have been produced through selective breeding.
- The various breeds of fowl ranging from the ceremonial cocks **(the Japanese onago-dori)** to the **broiler. leghorns** are all derived from a single jungle fowl **Gallus gallus.**

Reproductive Isolation –

Reproductive isolation is the prevention of inter breeding between the population of two different or closely related species.

It maintains the characters of the species but can lead to the origin of new species.

The mechanism the characters of the species but can lead to the origin of new species.

The mechanism of reproductive isolation is explained by **Stebbins** in his book **'Process of Organic Evolution'.**

Two main subtypes of reproductive isolation are–

1. **Premating or prezytotic isolation :**

   Prevent matting or formation of zygote.

   (1) Ecological isolation : Two species live in different habitats and do not meet. (One may be living in fresh water and the other in the sea).

   (2) Temporal isolation : Breeding seasons or flowering time may be different in the two species.

   (3) Behavioural isolation : The males of one animal species are unable to recognize the females of another species as potential mates.

   (4) Machanical isolation : The structural differences in genitalia of individuals belongings to different animal species interfere with mating.

   (5) Gametic isolation : The sperms and ova of different species of animals are unable to fuse. In plants, the pollen coming from a different species may be rejected by the stigma.

2. **Postzygotic Isolation :** A hybrid zygote is formed but it may not develop into a viable fertile adult.

   (1) Hybrid inviability : Hybrid zygotes fail to develop. In plants, embryos arising from interspecific crosses abort.

   (2) Hybrid sterlity : Hybrid adults do not produce functional gametes. (Mules and henny are common example) in mammals. Several hybrid ornamental plants are sterile.

   Exception :

   – Africal lioness + Asian tiger = tigon
     (panthera leo) (Panthera tigris)
   – Male lion + Female tiger = Liger
   – Mallard duck + pintail duck
   – Polar bear + Alaskan brown bear
   – Platy fish + Swordtail fish

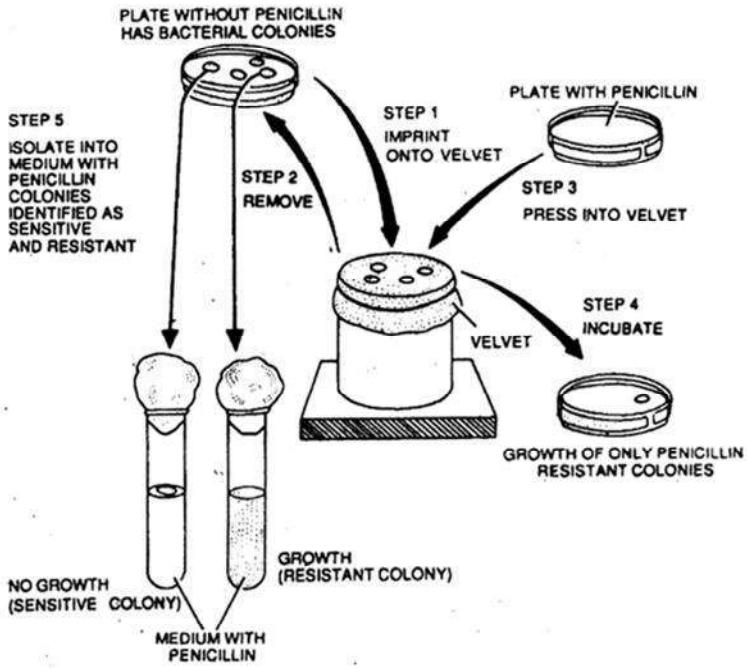
3. **Hybrid breakdown :** Sometime inter specific mating produce a hybrid, which give rise to next hybrid by back cross but they have reduced vigour or fertility or both.

GENETIC BASIS OF ADAPTATIONS :

Joshua Lederberg & Esther Lederberg shown genetic basis of adaptations by experimenting on bacteria. This experiment is known as Ledeberg's Replica plate experiment.

1. Lederberg cultured the bacterial cells on agar plate.
   Many bacterial colonies or groups grew on this agar plate.
   In this every colony is formed by the division of bacterial cells.
   Therefore its all cells were of same genetic structure.
   This type of group of cells is known as **clone.**
   This multi colony agar plate is known as **master plate.**

2. On this master plate one sterile velvet plate was pressed slightly so that some bacteria got stuck on velvet plate. In this way this becomes **replica of master plate.**



3. Now efforts of preparing replica had been made on those agar plates whose agar contains an antibiotic penicillin. It was seen that some bacteria failed to grow on penicillin agar plate while some bacteria were able to grow and developed new colony.

   It was concluded that those bacterial colonies were penicillin resistant. These bacteria have penicillin resistant mutant gene.

   ***Lamarckian view :** Penicillin induced a change in some bacterial cells enabling them to grow in medium containing penicillin (wrong concept).

   ****According to Darwin** some bacterias were penicillin resistant in bacterial suspension. In penicillin medium normal bacteria did not survive while mutant bacterias survived, as they are adapted, and form colony.

MODERN SYNTHETIC THEORY OF ORGANIC EVOLUTION :

This theory is the result of the work of a number of scientist namely **Dobzhansky, Fisher, Haldane, Swall wright, Mayr, Stebbins.**

Stebbins discussed this theory in his book **''Process of Organic Evolution''** and Dobzhansky explained it is his book **''Genetics and the origin of species''**.

According to this theory new species can not evolved by the presence of variable genotype in a population. Two factors are also required-natural selection and reproductive isolation. Natural selection guides different population in to different adaption direction and reproductive isolation between them due to geographical barriers leads these direction to the evolution of new species.

In this theory following factors are included –

(i) Gene mutation

(ii) change in chromosome number and structure

(iii) Genetic recombination

(iv) Natural selection

(v) Reproductive isolation.

Besides these factors there are two more processes which cause evolutionary changes. These are –

(i) Migration of individuals from one population to another.

(ii) Hybridisation among species and also related genera which causes genetic variation in the population undergoing process of evolution.

Mimicry :

- It is kind of adaptation.
- The term mimicry was given by Bateson (1862)
- The resemblance of one organism to another or to any natural object for the purpose of concealments, Protection or for some other advantages like attack.
- The organism which exhibits mimicry is called a **mimic** and the organism or object which is mimicked is called as **model.**

Types of mimicry :

(1) Protective (2) Aggressive (3) Conscious

1. Protective mimicry :

It is useful for an organism to protect itself from the predator.

It is of 2 types –

(a) Concealing - The organism resembles the surrounding, so it cannot be easily detected by predators. E.g Stick insect, Leaf insect.

(b) Warning type - The organism resembles a distasteful or poisonous organism. It is also known as **batesian mimicry.**

Eg. Viceroy butterfly

2. Aggressive mimicry :

It is generally used by the predator.

It is of 2 Types –

(a) concealing : In this type the predator cannot be noticed by the prey because it matches with the surroundings involving colour or body shape or both.

Eg. Yellow spider

(b) Alluring Type : The predator attracts the prey by resembling it self to any other object.

Eg. mouth corner of African lizard resembles a flower.

3. Conscious mimicry :

Some organism behave as a dead object to protect them from predator.

Eg. **Tenebrinoid beetles** become motionless and pebble like when in danger.

Mullerian mimicry :

When two or more inedible or unpalatable species each other this type of mimicry is called mullerian mimicry. Mullerian mimicry is done by two species for increasing warning effect to predators. For example ctenuchid moth resembles a wasp, where both of them are unpalatable.

It is also a kind of protective mimicry.

Mutation Theory

Proposed by Hugo-de-vries on the basis of his experiments on a plant Oenothera lamarckiana.

Main Point of mutation theory :

1. Mutation or discontinuous variation are the raw material of evolution.
2. Mutation appears suddenly and produced their effect immediately.
3. Mutants are different from the parents and there are no intermediate stages between the two.
4. The same type of mutation can appear in several individuals of a species.
5. Mutation can appear in all direction and all mutations are inheritable.
6. useful mutations are selected by nature an lethal mutations are eliminated.
7. Mutation are recurring so that the same mutant can appear again & again so change of selection by nature are increased and new species is formed.
8. Mutation is a jerky & discontinuous process. De-vries termed single step large mutation as **saltation.**
9. Mutations are random and directionless while Darwinism variations are small and directional.

Points in favour of mutation theory :

1. Mutations are actually the source of all variations and fountain head of evolution.
2. Mutation theory can explain both progressive & retrogressive evolution.
3. A number of mutations have appeared in nature and mutations are induced which have given rise all of sudden by mutation.
4. Oenothera lamarchiana is not normal plant but a complex heterozygous plant from with chromosomal aberration

Significance :

De-vries mutation theory generally accepted because the mutation were found to be inheritable. It was later through that evolution cannot occur by mutation alone, natural selection and isolation of mutants are also necessary for evolution.

Natural Selection & Polymorphism :

A population is called polymorphic for a character if two or more distinct form are present in this population.

Ex.: ABO Blood Group :

There are 4 types of blood group are present in human being A, B, AB. and O. They are due to the presence of different genotype.

Sickle cell anemia is also an example of polymorphism. In this disease on amino acid is changed in polypeptide chain due to change in one N_2 base. That's why the normal shape of RBC is changed into sickle shape.

The organism in which heterozygous condition is present for this characters, the RBC become sickle shaped. In this type of RBC malarial parasite can't have a normal growth that's why these individuals are resistant towards malaria.

The HbS, HbS, condition leads to the death of organism.

The organism with HbS, HbA condition are selected by nature because these are the fittest of all. The lose of HbS gene due to the death of organism having HbS, HbS is recovered & balanced by the reproduction of heterozygous condition (HbS, HbA).

This type of selection is called **balancing selection.**

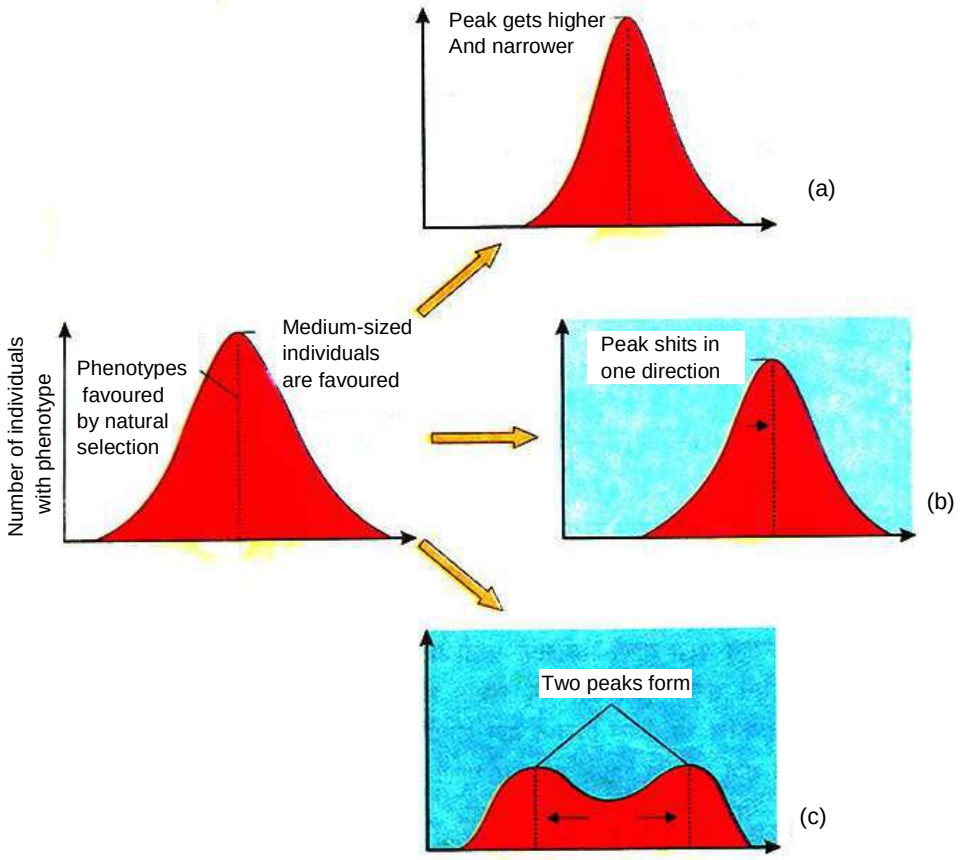
It means the preservation of genetic variability is maintained by the selection of hertozygotes which is called **'Balanced polymorphism'.**

But this kind of balancing selection is found very rarely in nature.

Difference Amongst Lamarckism, Darwinism and Mutation Theory

	Lamarckism	*Darwinism*	*Mutation Theory*
1. Vital force	The theory believes that every organism has an internal vital force that tends to increase its size upto a certain limit.	Darwinism does not believe in internal vital force.	No internal vital force is involved.
2. Conscious Reaction	Animals with well developed nervous system react consciously to any change in environments	Darwinism does not involve any conscious reaction.	No conscious reaction is believed to take part in the process of evolution.
3. Appentency	The theory considers appentency or desires on the part of animals an important force in the development of modifications.	It is not a constituent of the theory.	Appentency in not involved.
4. Use and Disuse	The organs put to more use are believed to develop more while organs not used begin to degenerate.	The theory is silent about use and disuse of organs.	The theory is silent about it.
5. Inheritance of Acquired Characters	The characters acquired by an organism during its life are believed to get transferred the next generation.	According to Darwin, all the living cells produce minute particles or pangenesis, which pass into germ cells for transmission to the offspring.	Only those variations are transferred to the offspring which originate in germ cells or in the cells which form germ cells.
6. Struggle for Existence	The theory does not clearly spell out struggle for existence in relation to high biotic potential.	Organisms produce more offspring than the available food and space so that a struggle for existence ensues amongst them.	The theory believes in the struggle for existence.
7. Origin of Variations	Variations appear in organisms in response to change in environment, conscious reaction, desire *r* use and disuse of organs.	Variations appear automatically.	Variations appear due to change in genetic make up.
8. Continuous Variations	The theory is silent about them though it believes in a continuous modification of organs in a particular direction.	It is based on the origin and selection of continuous variations.	The theory is based on discontinuous variations or mutations.
9. Natural Selection	The theory does not take into account natural selection or survival of the fittest.	Darwinism is based on natural selection or survival of the fittest.	Mutations theory believes in natural selection or survival of the fittest.
10. Progress of Evolution	Evolution is a continuous process which moves in a direction governed by environment and appentency.	Evolution is a continuous process, the direction of which is governed by nature.	Evolution is a jerky process, the direction of which is unpredictable though ultimately it is governed by nature.

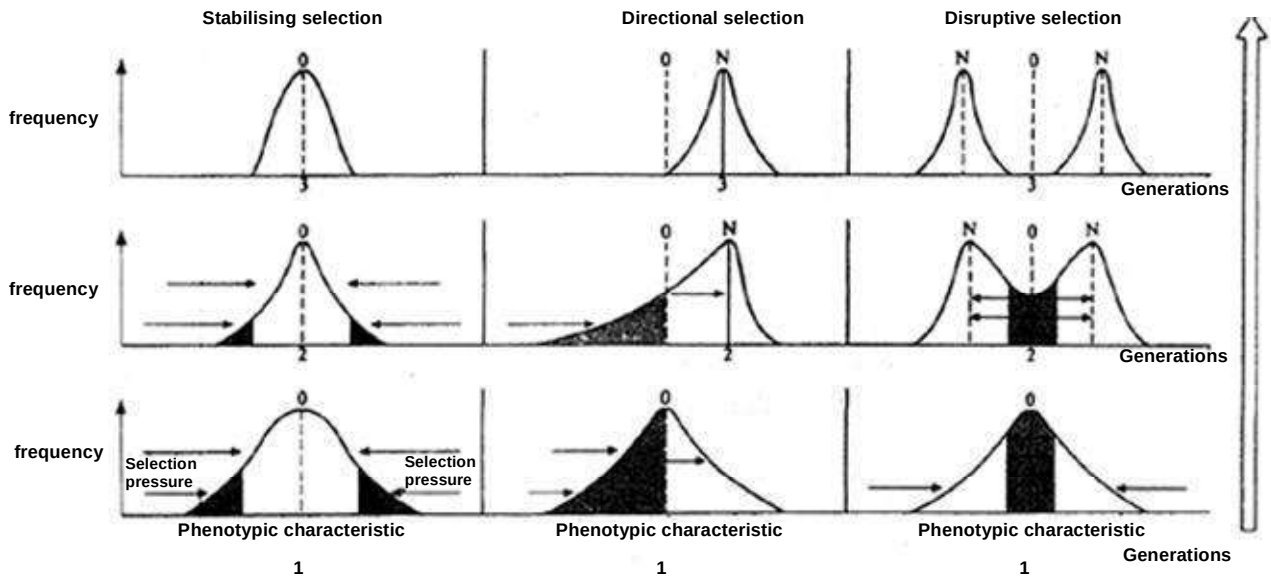
Types of Natural Selection :



Diagrammatic representation of the operation of natural selection on different on different traits : (a) Stabilising (b) Directional and (c) Disruptive

Based upon different organism – environment relationship. Following different kinds of natural selection have been recognised.

– Stabilising selection.
– Directional selection.
– Disruptive selection.



Diagrams showing the three types of selection operating within populations. 0 indicates the original coincidence between optimum and optimum environmental conditions; N indicates the new position of coincidence of optimum phenotype and optimum environmental conditions. Organisms possessing characteristics in the shaped portions of the normal distribution are at a selective disadvantage and are eliminated by selection pressure. (The number 1-3 indicate the order of generations.)

(1) Stabilising selection :

Stabilizing selection operates when phenotypic feature coincide with optimum environmental conditions and competition is not present.

It keeps a population genetically constant.

If favours the average or normal phenotypes and eliminate the extreme variants, that fall towards both ends of the bell-shaped curve of variability for the distribution of measurements of phenotypic traits.

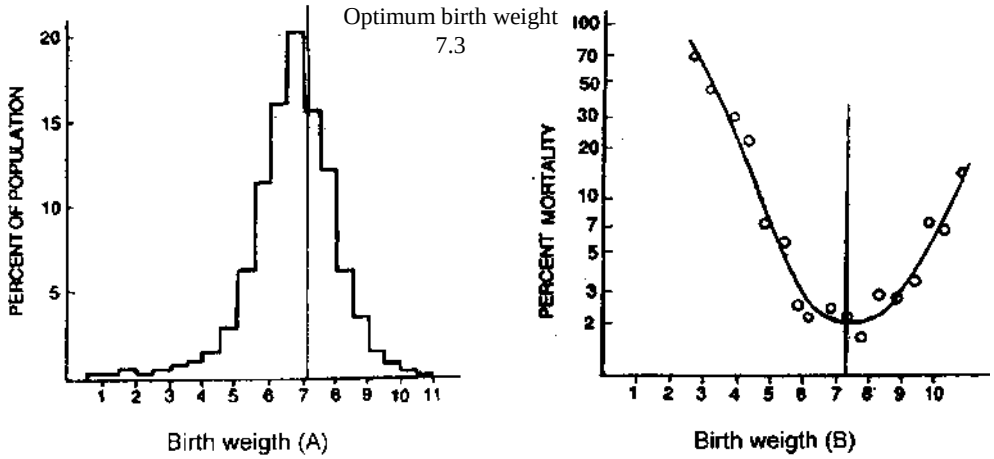
Due to continuous elimination of both extremes, the bell shaped curve tends to narrow.

Stabilising selection always operates in constant or unchanging environment.

Ex. Mortality in babies : The birth weight of human babies provides another example influenced by stabilizing selection.

The optimum birth weight favoured by stabilizing selection is 7.3 pounds.

New born infants less than 5.5 pounds and more than 10 pounds have the highest mortality rate. The curve for mortality is virtually the complement of the curve of survival.



The distribution of birth weight of human infants. A-Histogram showing the proportions of populations falling ionto various birth weight classes. B-Mortality curve in relation to birth weight of human infants

(2) Directional selection or Progressive selection :

Directional selection produce a regular change in a population in respect to certain traits.

This form of selection operates in response to gradual changes in environmental condition.

It favour individuals that change in response to the environmental change and become best adapted to new environmental condition. If favour the phenotype which is non average or extreme and then pushes the phenotype of the population in that direction.

Directional selection removes more individuals from one end of the normal curve of variability distribution and adds towards the other end and alters the mean value of the trait in the population in a particular direction.

So the mean moves in one direction. Directional selection operates when environment is changing in one direction.

Ex. (1) Biston betularia

(2) Resistance of insects to DDT.

(3) Disruptive selection :

This is probably the rerest form of selection but can be very important in bringing about evolutionary change.

Fluctuating conditions within an environment, say associated with season and climate may favour the presence of more than one phenotype in a population.

Selection pressure acting from within the population as a result increased competition may push the phenotype away from the population mean towards the extremes of the population.

This can split a population into two subpopulation.

If the gene flow between the subpopulation is prevented, each population may give rise to a new species. In some cases this form of selection can give rise to the appearance of different phenotype within a population, known as polymorphism.

Eg. Shell pattern in limpets : Shell patterns of limpets (marine mollusca) present a continuous, ranging from pure white to dark tan. These are either attached to white goose neck barnacles or to tan-coloured rocks. The white or light-coloured limpets camouflaged withy white barnacles and tanned ones were protected on the tan-coloured rocks. Limpets of intermediate shell patterns, being conspicuous are preyed by predatory shore birds, resulting in distruptive selection.

SPECIES

1. **Biological species concept :** species is a sexually interbreeding group of individuals separated from other species by the absence of genetic exchange.

   Member of a species are capable of breeding with one another and produce living, fertile offspring but are unable to breed with members of other species normally.

   Sibling species : Species which are morphologically similar but do not interbreed normally, are known as sibling species.

   Eg. **Drosophila pseudoobscura** & **Drosophila ersimillis.**

2. **Evolutionary species concept :** Proposed by **George Gaylord simpson.**

   Biological sp. Concept explained only sexually reproducing animals.

   Animals with asexual reproduction can not be explained like-prokaryotes, some protista, some fungi which kept in same sp. On the basis of same morphology & same biochemistry.

According to evolutionary sp. Concept species is defined on the basis of differences which are not base on sexual reproduction.

Supporter of this theory gave more importance to evolutionary isolation as compare to sexual isolation.

According to this concept a species is a lineage (an ancestor descendant sequence of population) which evolved separately from other species and have its own evolutionary role and tendencies.

This concept also include evolution. In this concept morphological, genetic, behavioural and ecological differences are include. But this concept is also not completely true.

3. **Typological concept :** According to this concept a fix pattern of characters is present in the species of every living organism and all the members of the species maximum resemblance with this pattern. **[The most acceptable concept].**

   According to this concept species are of 2 types :

   (A) Monotypic Sp. In the formation of this type of species main ancestor species do not divide in to small groups and modify into a new species. So the no. of species are not increased.

   (B) Polytypic. : In the formation of this type of species the main ancestor sp. Divided into two or more groups and each groups form a new species. So the no. of species will increased.

SPECIATION

Formation of one or more new species from an existing species is called **speciation.** Speciation are to 2 types.

1. **Divergent speciation :** Origin of one or more new species from an ancestor species is called **divergent speciation**.

   In this type of speciation ancestor sp. also continuous to exits with new species.

   In this type of speciation no. of species are increased.

   Demes : Local population of a particular area is called **demes.**

   The members of two different demes of same sp. Can interbreed normally.

   Race : Races are small groups of a species which are geographically isolated and have some genetical difference, which are controlled by genes.

   Divergent speciation are of two types –

(1) Allopatric Speciation : When a species split into two or more geographically isolated population and these population finally form a new species.

This mode of speciation is called allopatric speciation and these sp. are known as allopartic species.

Ex. : Finches of Darwin are example of **Allopatric speciation.**

(2) Sympatric species : In this type of speciation a sub population becomes reproductively isolated from its partental population.

Sympatric speciation is the formation of species without geographical isolation and these sp. are known as sympatric species.

Mainly present in plants due to polyploidy.

2. **Transformation speciation :** in this type of speciation an ancestor species change into a new sp. with time. In this process no. of species is not increased.

   Transformation speciation are of two types –

(1) Phyletic Evolution : When an ancestor sp. changed in to a new species by gradual change in thousand of years.

E.g. Eohippus → Mesohippus → Merychippus → Pliohippus → equus

(2) Quantum Species : In this process suddenly major changes appears in ancestor species and ancestor species immediately changed into new sp. No. connective links are present in this type of speciation. It is caused by major mutation.

Special point :

- **Micro evolution : -** Micro evolution is the occurrence of small-scale changes in gene frequencies in a population, over a few generations.

  It occurs at or below the species level. It often cause the formation of new subspecies.

  These changes may be due to several process-Natural selection, gene flow. mutation, recombination, genetic drift etc.

  eg. Formation of clines.

- **Micro evolution : -** Macro evolution is the evolution, which results is the production of new adaptive types through a process of population fragmentation and genetic divergence.

  It is the occurrence of large-scale changes in gene frequencies in a population, over a geological time period (consisting of lots of micro evolution).

  Macro evolution operates above the species level and results in the establishment of new genera, families and order.

  The changed in the organization occurs due to accumulation of large mutation (macro mutation).

  Macro evolution is the actually adaptive divergence.

  The divergent evolution of different reptilian group from initial reptile ancestor is example of macro evolution.

- **Mega evolution : -** The origin and evolution if new types of biological organization as a result of general adaptation from its predecessor resulting in the formation of new classes, phylum.

  Mega evolutionary changes are rare and have occurred only a few times in the evolutionary history of living beings.

  Ex. Origin of Amphibia from fishes, origin of reptiles from amphibian, origin of bird and mammal from reptile.

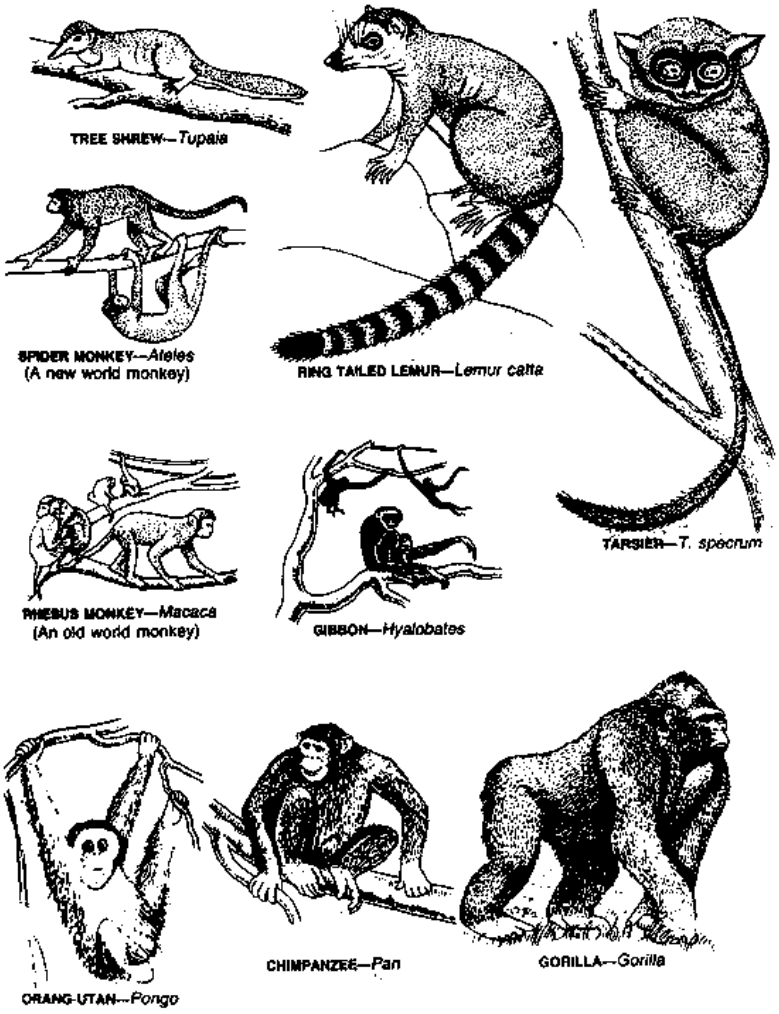
- **Anagenesis : -** It is the evolution of species involving a change in gene frequency in an antire population. It is also known as phyletic change. Anagenesis may also be reffered to as phyletic species or gradual species.

- **Cladogenesis : -** It is an evolutionary splitting event in which each branch and it's smaller branches form a ' clade' an evolutionary mechanism and a process of adaptive evolution that leads to the development of a greater variety of sister organism.

HUMAN EVOLUTION

Classification of **Man** : -

Phylum	-	Chordata
Subphylum	-	Vertebrata
Class	-	Mammalia
Subclass	-	Eutheria
Order	-	Primates
Suborder	-	Anthropoidea
Super family	-	Hominoidae
Family	-	Hominideae
Genus	-	Homo
Species	-	Sapiens



The primates include **Prosimians** (Lemurs, tarsiers and related forms) and **Anthropoids** (Monkeys, apes and Human). They are descended from small rodent like or insectivorous mammals that evolved about 80 million years ago.

- Carolus Linnaeus called human as **Homo sapiens wiseman.**
- Huxley explained origin of man in his book **The man's place in nature'.**
- Darwin explained ancestory of man in his book **'The descent of man'.**
- Human is a member of order primates of calls mammalia.
- Primates originates 80-100 million years ago in palaeocene epoch of coenozoic era.
- Primates originated from elephant shrews but they were not **real primates.**

Elephant Shrews : -

- Originated in late Mesozoic era means Cretaceous Period.
- They were not real primates because
  1. In their retina, only rods were present (cones absent).
  2. Nails absent and claws present
  3. Long snout
  4. V-shaped Jaw.
  5. By nature insectivorous.
  6. Two pairs mammary glands are present.

Tree Shrews : -

They were first real primates originated in **Palaeocene epoch.**

1. Both rods and cones are present in their retina.

2. Claws absent and nails presents on digits.
3. Shorter snout.
4. V-shaped jaw.
5. By nature insectivorous
6. Two pairs mammary glands are present.

- **Order primates divided into 2 sub orders.**

(A) Prosimians : -

Lemur - Evolved in Medagaskar — 3
Loris - Evolved in China — 2 **Closest relation to human**
Tarsiers - Evolved in Indonesia — 1

They are prosimian ancestors of human,

(B) Anthropoids : - Monkeys
Apes
Human

Monkeys : - 2 types

(1) Old world monkeys : - Rhesus (Macaca), Baboon (Old world = **Africa. Asia**)

(i) Tail short or long, non prehensile tail.
(ii) Narrow flat nose with downward direction of nostril.
(iii) U-shaped Jaw.
(iv) Dental formula same as human $\frac{2123}{2123} = 32$
(v) Menstruation cycle is present in female.

(2) New world monkeys : - spider monkey, marmosets (New world = **South & Middle America**)

(i) Long, prehensile tail
(ii) Protruding nose with upward direction of nostril
(iii) U-shaped jaw
(iv) Dental formula $\frac{2133}{2133} = 36$
(v) Menstruation cycle absent but estrous cycle is present.

So, Old world monkeys are more closer to human.

Apes : - 4 types

1. Chimpanzee → 400 c.c.
2. Gorilla → 500 c.c.
3. Oranguttan → 400 c.c.

Family - **Pongideae**

4. Gibbon → 100 c.c. — Family - **Hyalobatideae**

Human - Hominideae Family

Similarities between man and apes : -

(1) Tail absent
(2) Erect posture
(3) Grasping hands

(4) Hairs are present on body

(5) Larger head, more cranial capacity

(6) More intelligent than other animals

(7) Facial muscles are present for expression of surprise, pleasure.

(8) Menstruation cycle is present in female of both

(9) Blood group of AB series are present in both.

(10) Composition of Hb is same in both. Only one amino acid is different in human and goriall.

(11) **Chromosomal similarities : -**

(i) No. of chromosomes are approximately same in man and apes.

Apes = 48

Man = 46

(ii) DNA contents and DNA matching is same in both. This similarity is

100% with Chimpanzee

94% with Gibbon

88% with Rhesus monkey

(iii) Banding pattern of chromosome is same in both.

Banding pattern of ch. no. 3, 6 of human and chimpanzee is 100% similar.

Human Chromosomes

Somatic cells of human contain 46 chromosomes (44 Autosomes and 2-sex chromosomes).

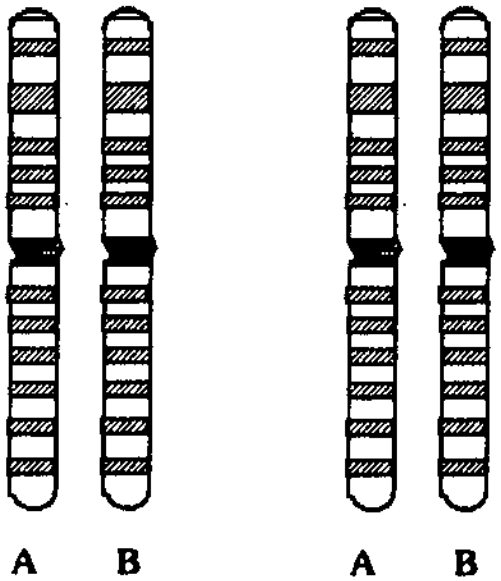
Human chromosomes are usually obtained by culturing certain types of white blood from the peripheral blood.

They can be treated with specific stains to produce characteristic bands along the length of each chromosome. The pattern of Banding so obtained is unique for each of chromosomes.

Banding techniques enable the identification of individual chromosomes and their parts.

The diploid number of chromosomes in Gorilla, chimpanzee and Oranguttan is 48.

Comparisons have been made between banded chromosomes of man and those of the great apes.



Diagrammatic representation and comparision of the banding Pattern in 3rd and 6th chromosomes of man (A) and chimpanzee (B)

The total amount of DNA in human diploid cells and that of the great apes are dissimilar.

Similarity in the fine structural organization of the chromosomes is understood only in terms of a common origin for man and chimpanzee.

All human races have the same chromosome number and gross morphology.

Differences : -

Apes	Human
1. Semi erect posture	1. Complete erect posture
2. Shorter neck and embedded.	2. Long and erect neck
3. Thick growth of hairs on complete body	3. Only on certain body part
4. Less cranial capacity (650 c.c.)	4. More cranial capacity (1300-1600 c.c.)
5. Less intelligent	5. More intelligent
6. Forelimbs longer than hind limbs	6. Forelims are shorter than hindlimb
7. 'U' shaped jaw	7. Semi circular jaw
8. Chin absent	8. Chin present
9. Thumb is parallel to palm	9. Thumb is opposable
10. Elongated pelvic girdle	10. Broad pelvic girdle
11. Less hair on body	11. More hairs on body

Human evolution :

(1) Propliopithecus : Origin & evolution in Oligocene epoch so called as Oligocene apes. Evolution about 30-35 million years ago.

(2) Agyptopithecus : Origin and evolution in late Oligocene and Miocene epoch so called as Miocene apes.

(3) Proconsul : - Its fossils were discovered by Leakey from East Africa near Victoria lake in Kenya from Miocene rocks. It walked on its four legs (considered as common ancestor of man and apes).

(4) Dryopithecus : - Evolution ≈ 15-20 million years ago.

- Direct ancestor of modern day apes.
- They were forest dwellers spending most of the time one the trees.
- Origin & evolution in **Miocene epoch.**
- Semi erect posture
- Quadra pedal locomotion, forlimbs longer than hind limbs.
- Thick growth of hair
- U shaped jaws
- Teeth larger and sharper
- By nature vegetarian, fruit eater

(5) Ramapithecus
(6) Shivapithecus } Fossils discovered by Lewis from Shivalik hills in India.

(7) Kenyapithecus]– Fossils discovered from **Kenya** by **Leakey.**

- Origin and evolution in **Pliocene epoch.**
- They are considered as ancestors of human but in characteristics same as Dryopithecus, but spending most of the time on the land.

(8) Australopithecus :- Prof. Raymond dart discovered a fossil of skull of 5-6 year old baby from the old Pliocene rocks of Tuang region (S. Africa). He named it Tuang baby, later on he renamed it **A. africanus.**

- About 3-2 million years ago it lived in East African grasslands.
- Evedences shows they hunted with stone.
- It was an apeman because it have many characters of man and apes so it is also considered as **connecting link between apes and man.**

Apes like characters :

- Less cranial capacity – 600 c.c.
- Thick growth of hair on body
- Jaw U shaped and prognathous.
- Teeth larger and sharper.
- Eyebrow present over eyes

Man like characters :

- Complete erect posture **(first man who stood erect)**
- Forelimb shorter than hindlimbs.
- **Bipedal locomotion (first man)**
- Dental formula same as human.
- Vertebral column with distinct lumber curve.
- Some other varities of Australopithecus were also discovered by some other scientist.
- A. boisei [zinjanthropus] by leakey from East Africa [Tanzania]
- A. afaransis [Lucy] by Donald Johanson from Ethiopea.

Prehistoric man : -

A number of other species of Homo appeared and became extinct from time on the evolutionary sense before the origin of homosapiens. These extinct species are called **prehistoric species of man.**

(1) Homo habilis : - The Tool maker man or Handy man.

- First human being like
- Its fossils were discovered by **Dr. Leakey** from 2 million years old rocks in Africa
- Lived in caves
- Cranial capacity - 650 – 800 c.c.
- Complete erect posture
- **Chin absent, dental formula same as human.**
- Jaw 'U' Shaped (Prognathous)
- **First man who made tools of stones for hunting animals.**
- By nature omnivorous, also show cannibalism

(2) Homo erectus : - direct ancestor of homo sapiens

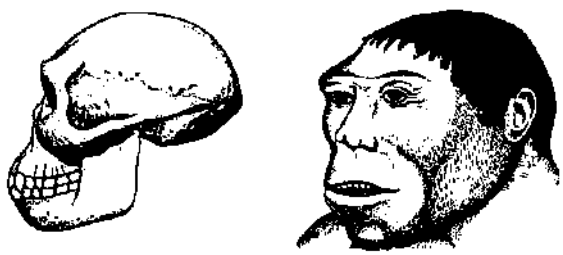
- Java man
- Peking man
- Heidelberg man (Branch from main line of Human evolution)

A. JAVA MAN :

Homo erectus erectus name given by **Mayer.**

or **Pithecanthropus erectus** given by **Dubois.**

- Fossil obtain from central java by **Eugene Dubois.**
- Lived in caves
- They used Tools of bones and stones
- Cranial capacity – 800 – 1000 c.c.
- **First man who used fire for hunting, protection and cooking**



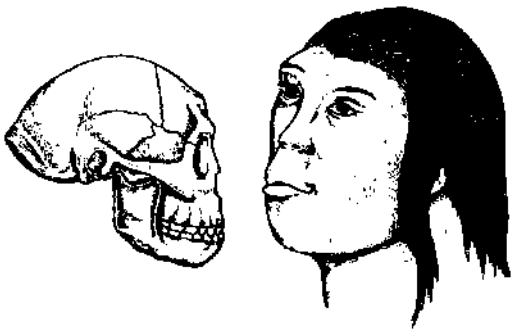
Java man

- Origin and evolution, 1.5 – 2million years ago.
- Chin absent, Jaw Prognathous
- Complete erect posture
- Complete erect posture
- Omnivorous, cannibalism have also found.
- **It is also known as erect ape man**

B. PEKING MAN : -

Homo erectus pekinensis name given by **Mayer**

Sinanthropus erectus name was given by **Davidson Black**.



Peking man

- **W.C. Pai** discovered the fossil of peking man from China.
- Origin & evolution before 6 lakh years
- Lived in caves
- Cranial capacity - 850 - 1300 c.c.
- Complete erect posture
- Chin absent, Jaw Prognathous
- Used sharp **chisel shaped tools** of stones, bones for cutting and killing animals.
- Omnivorous, cannibalism has been also found
- Used fire for cooking meat and for protection.

C. HEIDELBERG MAN : -

A fossil of lower jaw obtain from **Heidelberg in germany** it was discovered by **Ottoschotensack.**

- Mandible was large, tooth raw rounded
- Cranial capacity – 1300 c.c.
- Origin & evolution – in Pleistocene epoch. It is believed that this species was evolved as a branch from main line of evolution and got extinct after some time

(3) Homo sapiens : -

- Neanderthal man
- Cromagnon man - Direct ancestor of modern man
- Homo sapiens sapiens - **Modern man (Man of today)**

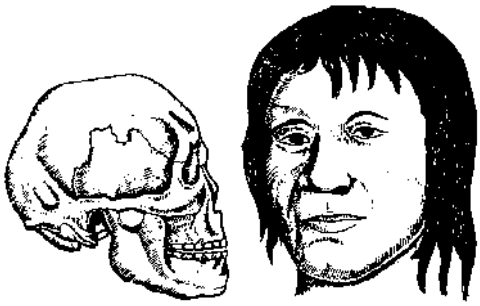
(i) Neanderthal man : - Homo sapiens neanderthalensis

Neanderthal man

- Origin & evolution before 40,000 – 1 lakh years
- Fossils were discovered by **C. fulhrott from Neanderthal velly of Germany.**
- They live in huts.
- Cranial capacity 1300 – 1600 c.c **(same as H. sapiens sapiens) Average** (1400 c.c.)
- Complete erect posture
- Semicircular jaw, Orthognathous
- Ceremonial burial of dead body
- Woar cloths of animals skin
- Less developed chin.
- Speech centre developed

– By nature – omnivorous.
– **First man believed in "immortality of soul"**

(ii) Cromagnon man : - Homo sapiens fossils



Cromagnon man

– Origin and evolution **10,000 - 50,000 years ago.**
– Fossils discovered by **Mac gregor from Cromagnon rocks of France**
– Lived in caves
– Cranial capacity - 1650 c.c. **(maximum)**
– Complete erect posture
– Larger forehead, well developed speech centre
– Semi circular jaw, well developed chin, orthognathous jaw.
– Woar cloth of animal skin.
– **This man was hunter and used domesticated dogs in hunting, so domestication of animals started by cromagnon man.**
– **They also painted beautiful painting on cave walls**
– **The cromagnon man is regarded as the direct ancestor of modern man.**
– By nature **carnivorous.**

(iii) Homo sapiens sapiens (Modern man) : - Man of today

– Origin and Distributed in whole world 10-100 thousand years ago.
– Cranial capacity - 1300 - 1600 c.c.
(Same as Neanderthal man)
– Complete erect body posture
– Semi circular jaw, orthognathous
– Well developed chin, well developed speech centre
– Smaller forehead, front eyes
– Less hairs on body as compared to fossil man
– By nature omnivorous.
– It is believed that modern man evolved in Africa, later its members to westwards, eastwards and south wards
– **Agriculture was also started by them.**

Special Point :

The course of cultural evolution is divided in to three age.

Palaeolithic – Age of tools of stones and bones.

Mesolithic – Age of animals husbandry, language, reading, writing.

Neolithic

(i) Bronze age – Age of agriculture, knowledge and use of clothes.

(ii) Iron age – Present age is also known as Iran age.

Man of future : - homo sapiens futuralis

– **Dr. Shapiro** named man of future as Homo futuralis
– Taller and hairless body
– Tomb like head and larger brain.
– With no fifth finger

Special Point : -

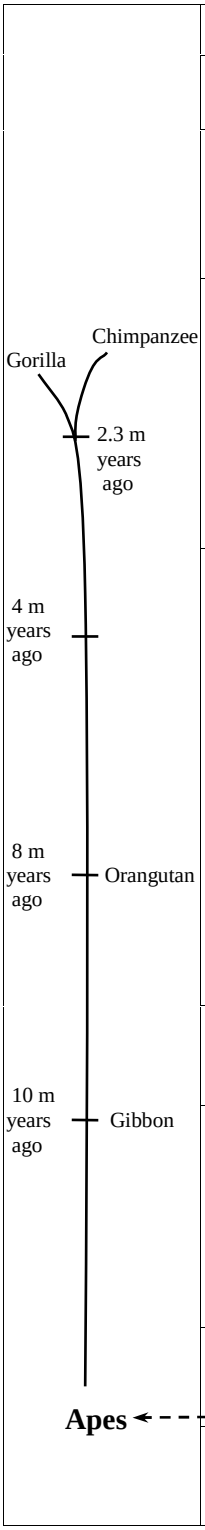
(1) **Anthropology :-** Study of evolutionary history of man.

(2) **Ethology : -** Study of animal babbits and behaviour.

(3) **Hylobates hoolock :-** (The Gibbon) is the only ape found in India (forests of Assam)

(4) **Races of human - 4 types - Caucasoid, Negroid, Mongoloid, Australoid.**

(5) **Hobit : -** Recently **Rechard Roberts** scientist discovered a **18,000 years** old fossil of a lady form **flors island situated near Australia.** He gave name it to **Hobit/Dwarf man/Homo florasiansis.**



Geological time scale	Name of fossil & cranial capacity	Distribution and Characteristics
Holocene (Epoch)	***Homo sapiens sapiens*** **(Modern man)** Cr. Cap. ~ 1500 cc.	Appeared about 10,000 years ago in central Asia.
Late Pleistocene	*Homo sapiens fossilis* (Cro-Magnon Man) Cr.Cap. 1450-1700cc	Discovered from Cro-Magnon valley (France), and later from Czech & Israel. 1st **Chin-man**, used bows and arrows. Had aesthetic sense and was a sculptor, artist and painter. He made articulated language and existed ~34,000 years ago. *Most recent or closest ancestor of present-day-man.
Late Pleistocene	***Homo sapiens neanderthelensis*** **(Neanderthal Man) Cr.Cap. ~1450 cc**	It was the 1st fossil man to be discovered (in 1856). It is the best known pre-historic man. Discovered from Neanderthal valley (Germany), so called Neanderthal man. It was a true man with Cranial capacity equal to that of Modern man. Distributed in Eurasia and Africa, and existed about 0.5 million years ago. He believed in 'Immortality of soul' and did *Ceremonial burial of the dead ones for the first time*, and was God-fearing man. He built huts and used animal hides as clothing. The well developed speech centre indicates that these could communicate with each other.
Middle Pleistocene	***Homo erectus*** Cr. Cap. 800 - 1200 cc.	**1. Java Man** (*Pithecanthropus erectus*) Discovered from Java (Asia), but distributed in Eurasia and Africa. Earlier named *H. erectus erectus*. Fossile described by **Eugene Dubois**. Use fire for the first time (?) Its cranial capacity was ~900cc. **2. Peking man** (*Sinanthropus pekinensis*) Discovered from China but distributed in Eurasia and Africa. Fossil described by **Davidson Black W.C. Pei.** Used fire for cooking. Its cranial capacity was ~1100cc. **3. Atlantic man** (*H. erectus mauritanicus*) Discovered from Algeria (in rocks near Ternifier) and commonly called Ternifier man. Its cranial capacity was ~1000 cc. All members of *Homo erectus* were migratory and existed ~1.7 million years ago.
Early Pleistocene	***Homo habilis*** **(Handy man)** Cr. Cap. ~600 - 700 cc.	Discovered from East Africa by Mrs. and Dr. Leakey. *1st tool maker* man, or nut-cracker man who made tools from stones. It existed about 2 million years ago and marked the beginning of human phase.
Early Pleistocene	***Australopithecus*** Cr. Cap. 350 - 450 cc. ***Ramapithecus*** Cr. Cap. 350 cc.	1st bipedal 'man' (walked erect) Omnivorous, and used bones for hunting. Discovered from Africa by **Raymond Dart**. Described from a child skull, discovered from Tuang valley. Commonly called **Tuang baby**, W.T. 1500 (male), Lucy (female) or **'African Ape man'**. Considered to be a pre-man or ape man, a *connecting link between man and apes*. It existed about 3-5 million years ago.
Late Pliocene		Discovered from Shivalik hills in H.P. (India), by **Dr. Lewis**. It was more ape-like than human-like. It was herbivorous. It existed about 15 million years ago.
Miocene (epoch)	***Dryopithecus*** Cr. Cap. - ~300 cc.	Common ancestor of apes and man. Discovered from Lake Victoria (Africa) by Mrs. and Dr. Leakey. It is also known as **Proconsul**. It appeared about 24 million years ago (24 × 10 years).

Fig. Progressive evolution of modern man through primitive apes, ape man and prehistoric man.

BRIEF REVIEW

Ancestory line of Human

Cromagion man

↓

Homo sapiens sapiens

- Tree shrews were first real primates.
- Old world monkeys are more closer to human as compared to new world monkeys.
- Chimpanzee is closest ape to human.
- Australopithecus firstly show bipedal locomotion.
- Homohabilis is also known as handy man or the tool maker man.
- Java man firstly used fire.
- W.C. Pai discovered the fossils of Peking man from China.
- Neanderthal man was first man who believed in 'immortality of soul.'
- Cromagnon man was a painter and regarded s the direct ancestor of modern man.
- Homosapiens sapiens is the man of today.

Evolution of Horse –

Evolution of horse was described by **C.marsh.**

The primitive fossil of the horse was found in North America named **Eohippus.**

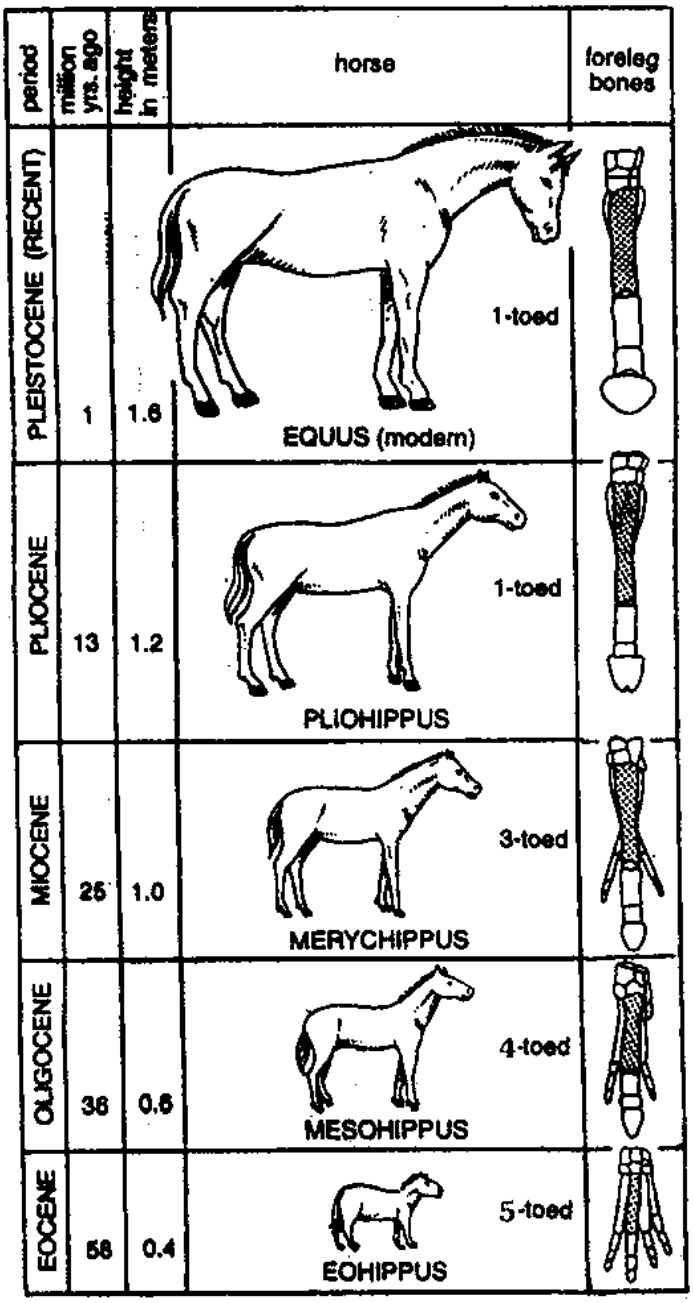
Changes during evolution of horse are as follows –

1. Increase in body height
2. Increase in the length of neck

3. Development of high crown on the surface of teeth and formation of cement.
4. There is gradual increase in the length of legs.
5. Number of toes or fingers in legs have reduced in modern horse. Only middle toe touches the ground, other toes reduced gradually.
6. Legs become more powerful for fast running
7. As new species were formed, previous ones becomes extinct.
8. Enlargement of brain size.

Fossils of important Ancestors of horse

1. **Eohippus or Hyracotherium –**
   It evolved in **Eocene** Epoch.
   It's size was like a **fox.**
   (**Orohippus :** It evolved in middle Eocene epoch.)
2. **Mesohippus –**
   It evolved from eohippus during **Oligocene** epoch.
   It's size was like a **sheep.**
   (**Miohippus :** In the late oigocene Mesohippus was replaced by another slightly advanced horse like form named miohippus. It was much like mesohippus in a appearance but some what large in size)
   (**Parachippus :** It evolved in early miocene).
3. **Merychippus –**
   It evolved in middle and upper miocene epoch. It's size was like a **donkey.**
4. **Pliohippus –**
   This horse evolved during **pliocene** epoch. It was of the size of modern pony.
5. **Equus –**
   This is modern horse which evolved from pliohippus during **pleistocene** epoch (height 60-64 inches).



EXERCISE - 1

Q.1 Who first proved that herdity is controlled by nucleus not by cytoplasm -
(1) Hershay and chase
(2) Strassburger
(3) Hammerling (4) Mendel

Q.2 Mendelism is genetics of -
(1) Haploids (2) Diploids
(3) Prokaryotes (4) All the above

Q.3 Which technique is used by Mendel for hybridisation -
(1) Emasculation (2) Bagging
(3) Protoplast fusion (4) 1 & 2 both

Q.4 The word ''Genetics'' coined by -
(1) Mendel (2) Johannsen
(3) Bateson (4) morgan

Q.5 Dihybrid plants form how many types of pollen grains -
(1) One (2) Two
(3) Four (4) Eight

Q.6 When flowers are unisexual then emasculation is done in -
(1) Female (2) male
(3) 1 & 2 both (4) None of these

Q.7 How many plants are dihybrid in F_2 generation of dihybrid cross -
(1) One (2) Two
(3) Four (4) Sixteen

Q.8 Mendel's conclusion first published in -
(1) Journal of plants breeding
(2) journal of genetics & plant breeding
(3) Nature forschender verein
(4) None

Q.9 When a plant have two alleles of contrasting characters it is called -
(1) Homozygous (2) Dioecious
(3) Heterozygous (4) Monoeious

Q.10 Phenotypic ratio 3:1 proves -
(1) Dominance
(2) Segregation
(3) Crossing-over
(4) Indepenent assortment

Q.11 What is the ratio of one pair of contrasting characters in F_2 of a dihybrid cross -
(1) 5:3 (2) 3:1
(3) 9:3:3:1 (4) 1:2:2:4:1:2:1:2:1

Q.12 What is ratio of homozygous and heterozygous individuals in F_2 of a monohybrid cross -
(1) 1:1 (2) 3:1
(3) 2:1 (4) 1:2

Q.13 What is ratio of homozygous plants for both dominant characters in F_2 of a dihybrid cross-
(1) 1/16 (2) 3/16
(3) 4/16 (4) 9/16

Q.14 Which is Mendelian ratio -
(1) 3:1 (2) 1:2:1
(3) 1:1 (4) 4:9:3:3:1

Q.15 Which of the following is significance of dominance -
(1) Organisms with dominant genes are more vital
(2) Harmful mutations are not expresed due to dominant gene
(3) Heterosis is due to dominant gene
(4) All the above

Q.16 An offspring of two homozygous parents differing from one another by alleles at only one gene locus is known as -
(1) Back cross (2) Monohybrid
(3) Dihybrid (4) Trihybrid

Q.17 From a single ear of con, a farmer planted 200 kernels which produced 140 tall & 40 short plants. The genotypes of these of springs are most likely -
(1) TT, Tt & tt (2) TT & tt
(3) TT & Tt (4) Tt & tt

Q.18 A useful process for determining whether an individual is homozygous or heterozygous is-
(1) Cross-breeding (2) Self fertilization
(3) Back-crossing (4) Test cross

Q.19 Genetic recombinations occur through -
(1) Mitosis & Fertilisation
(2) Mitosis & Meiosis
(3) Meiosis & Fertilisation
(4) None of the above

Q.20 Disease resistant verienties can be produced by -

(1) Crossing a plant with wild veriety

(2) Treating with colchicine

(3) Crossing with hormones

(4) Treating with low temperature

Q.21 Heterozygous tall plants were crossed with dwarf plants. What will be the ratio of dwarf plants in the progeny -

(1) 50% (2) 25%

(3) 75% (4) 100%

Q.22 A pure tall plant can be differentiated from a hybrid tall plant -

(1) By measuring length of plant

(2) By spraying gibberalins

(3) If all plants are tall after self-pollination

(4) If all plants are dwarf after self-pollination

Q.23 Which of the following is the unit of inheritance-

(1) Phenotype (2) Genotype

(3) Gene (4) None of these

Q.24 If the cell of an organism heterozygous for two pairs of genes represented by Aa,Bb, undergoes meiosis, then the possible genotypic combination of gametes will be -

(1) AB, Ab, aB, ab (2) AB, ab

(3) Aa, Bb (4) A, a, B, b

Q.25 Allele is the -

(1) Alternate triat of gene pair

(2) Total number of genes for a trait

(3) Total number of chromosomes of a haploid set

(4) Total number of genes present on a chromosome

Q.26 Sex linkage first observed by -

(1) Bateson (2) Corrense

(3) Morgan (4) Muller

Q.27 Types of genotypes in F_2 generation of dihybrid cross -

(1) 4 (2) 16

(3) 8 (4) 9

Q.28 A character which is expressed in a hybrid is called -

(1) Dominant (2) Recessive

(3) Co-dominant (4) Epistatic

Q.29 Cross AABb X aaBb yields AaBB : AaBb : Aabb : aabb of spring in the ratio of -

(1) 0:3:1:1 (2) 1:2:1:0

(3) 1:1:1:1 (4) 1:2:1:1

Q.30 Genetic constitution of an individual is represented by -

(1) Genome (2) Genotype

(3) Phenotype (4) Karyotype

Q.31 Genes do not occur in pairs in -

(1) Zygote (2) Somatic cell

(3) Endosperm cell (4) Gametes

Q.32 ''Like begets like'' an important and universal phenomenon of life, is due to -

(1) Eugenics (2) Inheritance

(3) dominance (4) Crossing-over

Q.33 The genes for same trait present on non-homologous chromosomes are -

(1) Alleles (2) Linked genes

(3) Multiple alleles (4) None of these

Q.34 Genotype-phenotype concept was first produced by -

(1) Bateson (2) Johannsen

(3) Sutton & Boveri (4) Punnet

Q.35 How many types of gametes are expected from the organism with genotype AABBCC-

(1) One (2) Two

(3) Four (4) Eight

Q.36 One of the following did not constitute the seven contrasting pairs of characters noticed by mendel -

(1) Height of the plants

(2) Shape of the leaves

(3) Shape of pod

(4) Colour of pod

Q.37 The scientist who worked on garden pea before mendel was -

(1) Goss (2) Kolreuter

(3) Bateson (4) Maupertius

Q.38 The plant which made Hugo-de vries famous is -

(1) Antirrhinum majas

(2) Lathyrus odoratus

(3) Oenathera lamarckina

(4) Pisum sativum

Q.39 If 3^n is the theoretically possible number of different genotypes (when n = the number of chromosome pairs with each carrying one pairs of heterozygous alleles). the different genotypes produced by pea plant is -

(1) 3^{10} (2) 3^{12}

(3) 3^{14} (4) 3^7

Q.40

		Male gametes			
Female gametes	?	AB	Ab	aB	ab
		AaBB	AaBb	aaBB	aaBb

In the Punnet square given above, the genotype of the female parents and male parents respecticley -

(1) AABB, AaBb (2) AaBB, AaBb

(3) aaBB, AaBb (4) AAbb, AaBb

Q.41 A trihybrid cross is made between two plants with genotyes A/a B/b C/c how many offspring of such cross will have a genotype a/a b/b c/c -

(1) 1/64 (2) 1/4 (3) 1/16 (4) 1/32

Q.42 How is the arrangement of Mendel's selected seven characters on four chromosomes -

(1) One in ch. no 1.4 in ch. no 4, one in ch. no. 5 and one in ch. no 7

(2) 2 in ch. no. 1,3 in ch. no. 4, one in ch. no. 5 and one in ch. no. 7

(3) 3 in ch. no. 1,1 in ch. no. 4,2 in ch. no 5 and one in ch. no.7

(4) 2 in ch. no. 1,3 in ch. no. 4, 1 in ch. no. 5 and 1 in ch. no. 7

Q.43 Out of three characters on chromosome no. 4, two characters indicate linkage and not mentioned by Mendel. These characters were -

(1) Pod form - stem length

(2) Pod form - pod position

(3) Pod form - pod colour

(4) Pod position - stem length

Q.44 Mrs. verma has a autosomal gene pair 'Bb' and she contain x-linked gene 'd' What is the percentage of gamete which contain 'bd' genes-

(1) 1/2 or 50% (2) 1/4 or 25%

(3) 3/4 or 75% (4) 1 or 100%

Q.45 When two different genotypes produce the same phenotype due to environmental difference, then each one is known as -

(1) Phenotype

(2) Phenocopy

(3) Progeny

(4) Independent offspring

Q.46 The Punnett square shown below represents the pattern of inheritance in dihybrid cross when yellow (Y) is dominant over white (y) and round (R) is dominant over wrinkled (r) seeds -

	YR	Yr	yR	yr
YR	F	J	N	R
Yr	G	K	O	S
yR	H	L	P	T
yr	I	M	Q	U

A plant of type 'H' will produce seeds with the genotype identical to seeds produced by the plants of -

(1) Type M (2) Type J

(3) Type P (4) Type N

Q.47 1:1:1:1 ratio shows -

(1) Monohybrid cross

(2) Dihybrid cross

(3) Back cross

(4) Dihybrid test cross

Q.48 If a heterozygous tall plant is crossed with a homozygous dwarf plant then what shall be the percentage of dwarf in offspring -

(1) 25% (2) 100%

(3) 75% (4) 50%

Q.49 If a homozygous tall plant is crossed with a dwarf plant, what shall be the ratio of plants in offsprings -

(1) All heterozygous tall

(2) Two tall & Two dwarf

(3) 1:2:1

(4) All homozygous dwarf

Q.50 In a plant gene 'A' is responsible for tallness and its recesive allele 'a' for dwarfness and 'B' is responsible for red colour it's recessive allele 'b' for white flower colour. A tall and red flowered plant with genotype AaBb crossed with dwarf and red flowered (aaBb). What is the percentage of dwarf-white flowered offspring of above cross -

(1) 50% (2) 6.25%

(3) 12.5% (4) 50%

Q.51 In rabbit black skin (B) is dominant over brown skin (b) and short (S) is dominant over long hair (s). If homozygous black-short haired male is crossed with homozygous brown-long haired female. All F_1 -offspring are heterozygous black-short haired. F_1 male crossed with F_1 -female. In F_2 generation what is the percentage of homozygous black-short haired off spring -

(1) 50% (2) 12.5%

(3) 6.25% (4) 18.75%

ANSWER KEY

EXERCISE- 1

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Ans.	3	2	4	3	3	4	3	3	3	2	2	1	1	1	2	2	1	4	3	1

Ans.	1	4	1	1	2	4	4	4	1	3	3									

EXERCISE- 2

Q.1 With increasing age the linkage becomes-

(1) Strong (2) Weak

(3) Terminates (4)Remains unchange

Q.2 Coupling and Repulsion theory produced by-

(1) Morgan (2) Bateson

(3) Muller (4) De vries

Q.3 In which type of inheritance the result are affected by reciprocal cross-

(1) Nuclear (2) Cytoplasmic

(3) Blending (4) All the above

Q.4 If there were only parental combinatios in F_2 of a dihybrid cross then mendel might have dicovered -

(1) Independant assortment

(2) Atavism

(3) Linkage

(4) Repulsion

Q.5 Plants similar to mother plant can be obtained from -

(1) Seeds (2) Stem cutting

(3) Both of these (4) None of these

Q.6 Linkage discovered in Drosophila by -

(1) Bateson (2) Morgan

(3) Muller (4) Correns

Q.7 Mendelian dihybrid and dihybrid with linkage are respectively realated with how many chromosomes -

(1) 1 pair & 2 pair (2) 2 pair & 1 pair

(3) 2 pair & 2 pair (4) 1 pair & 1 pair

Q.8 Incomplete dominance occurs in -

(1) Mirabilis (2) Antirrhinum

(3) Andulasion fowl (4) All of the above

Q.9 A dihybrid plant with incomplete linkage on test cross may prduce how many types of plants -

(1) 2 (2) 4

(3) 8 (4) 1

Q.10 How many linkage group are there in nucleoid of becteria -

(1) One (2) Two

(3) Four (4) None

Q.11 Which cross yields red, white & pink flowers variety of dog flower -

(1) RR X Rr (2) Rr X RR

(3) Rr X Rr (4) Rr X rr

Q.12 What shall be ratio in offspring when a roan cow is crosed with a white bull -

(1) 1:2:1 (2) 3:1

(3) 1:1 (4) All roan

Q.13 If distance between gene on chromosome is more, then gene shows -

(1) Weak linkage (2) Strong linkage

(3) Less crossing (4) 1 & 3 both

Q.14 Linked gene shows -

(1) Always parental combination

(2) Sometimes new combinations

(3) Always new combination

(4) New combination more

Q.15 The number of linkage groups in a cell having 10 pairs of chromosomes are -

(1) 5 (2) 10

(3) 15 (4) 20

Q.16 Cytology + genetics were marged into ''Cytogenetics'' by one of flowing -

(1) Bateson (2) Punnet

(3) Morgen (4) Muller

Q.17 Phenotypic ratio in codominance -

(1) 1:2:1 (2) 3:1

(3) 2:1 (4) 2:1:3

Q.18 Which of the following is exception to Mendel's laws -

(1) Linkage

(2) Incomplete dominance

(3) Co-dominance

(4) All of the above

Q.19 The association of parental characters combinations in the offsprings of a dihybrid is excess to non-parental combination is said to be due to -

(1) Co-dominance

(2) Blending inheritance

(3) Linkage

(4) Duplicate genes

Q.20 Complete linkage is found in -

(1) Birds

(2) Snakes

(3) Female-Drosophila

(4) Male-Drosophila

Q.21 A phenomenon which works opposite to the linkage is -

(1) Independent assortment

(2) Crossing-over

(3) Segregation

(4) Mutation

Q.22 The scientist who first discovered cytoplasmic inheritance was -

(1) Correns (2) Rhoades

(3) Mendel (4) Morgan

Q.23 Shell coiling in Limnaea (Snail) is an example of -

(1) Maternal inheritance

(2) Biparental inheritance

(3) Predetermination

(4) Dauermodification

Q.24 Kappa particles were discovered by -

(1) Correns (2) Sonneborn

(3) Rhoades (4) Bycott et.al.

Q.25 Kappa particles make an animal killer when thier number in an individual is -

(1) 6 (2) 60

(3) 400 (4) 150

Q.26 The killer chemical secreted by kappa particles is -

(1) Secretin (2) Paramecin

(3) Plasmon (4) Poky

Q.27 Which is not an example of cytoplasmic inheritance -

(1) Female sterility in maize

(2) Sigma particle inheritance

(3) Kappa particle inheritance

(4) Plastid inheritance

Q.28 Cytoplasmic male sterility is passed down-

(1) Throgh bacteriophages

(2) Paternally

(3) Maternally

(4) Biparentally

Q.29 The two eukaryotic organelles responsible for cytoplasmic inheritance are -

(1) Lysosome & Mitocondria

(2) Chloroplasts & Lysosomes

(3) Mitochondria & chloroplasts

(4) Mitochondria & Golgi-complex

Q.30 In a dihybrid cross, when one pair of alleles show incomplete dominance, genotypic ratio comes to -

(1) 3 : 6 : 3 : 1 : 2 : 1

(2) 1 : 2 : 2 : 4 : 1 : 2 : 1 : 2 : 1

(3) 9 : 3 : 3 : 1

(4) 1 : 2 : 1

Q.31 Which of the following is the example of codominance -

(1) $Hb^A\ Hb^A, l^A\ l^B$ (2) $Hb^s\ Hb^s, l^A\ l^B$

(3) $Hb^A\ Hb^s, l^A\ l^B$ (4) $Hb^s\ Hb^s, l^A\ l^A$

Q.32 Cross over value (COV) of gene A and B is 5% while COV of genes B and C is 15% the possible sequence of three genes on chromosome is -

(1) A-B-C (2) C-A-B

(3) B-C-A (4) Both (1) & (2)

Q.33 A test cross of F_1 files + a/+b produced the following offspring

++/ab = 9

ab/ab = 9

+b/ab = 41

a+/ab = 41

What will be distance between linked gene-

(1) 82 cm. (2) 18 cm. (cis)

(3) 20 cm. (4) 18 cm. (trans)

Q.34 Which of the following conditions represent a case of co-dominant genes -

(1) A gene expresses itself, suppressing the phenotypic effect of its alleles

(2) Genes that are similar in phenotypic effect when present separately, but when together interact to produce a different trait

(3) Allele, both of which interact to product a trait, which may resemble either of the parental type.

(4) Alleles, each of which produces an independent effect in heterozgous condition.

Q.35 A sinistral shelled female snail having Dd genotype cross with dextral shelled male having dd genotype. What type of shell will be present in the progeny -

(1) All dextral

(2) All sinistral

(3) 50% dextral, 50% sinistral

(4) None

Q.36 In female Drosophila the linked gene exhibit recombination during meiosis of gamete formation, but such a recombination does not occur during the formation of sperm in male Drosophila -

(1) Male Drosophila is sterile

(2) Male Drosophila is parthenogentic male

(3) No crossing over occur in male Drosophila

(4) Male Drosophila is haploid

Q.37 Hypertrichosis is -

(1) Holandric character

(2) X-Linked character

(3) Diagenic character

(4) Sex-influened character

Q.38 Organisms with two or more than two types of genotypes in their tissues are called -

(1) Wobble (2) Heterozygous

(3) Heterosis (4) Chimera

Q.39 Products of somatic hybridisation are -

(1) Hybridoma (2) Hybrid-vigour

(3) Heterosis (4) Super-hybrids

Q.40 In which of the following the inheritance takes place only by male -

(1) Nuclear

(2) Cytoplasmic

(3) co-dominance

(4) Holandric inheritance

Q.41 Which of the following is not a sex linked characters -

(1) Haemophilia (2) Colour bindness

(3) Hypertrichosis (4) Baldness

Q.42 A gene located on Y-chromosome and therefore, transmitted from father to son is known as -

(1) Supplementry gene

(2) Complementry gene

(3) Duplicate gene

(4) Holandric gene

Q.43 The condition in which only one allele of a pair is present is known as -

(1) Homozygous

(2) Heterozgous

(3) Hemizygous

(4) Incomplete dominance

Q.44 Colourblindness is a -

(1) Sex limited character

(2) Sex linked character

(3) Sex influenced character

(4) None

Q.45 What is the effect of sexual reproduction -

(1) Offspring is weak

(2) Offspring is like the parent

(3) Offspring is more vigorous

(4) Offspring is diseased

Q.46 Blue eye colour in human is recessive to brown eye coloue. The expected children of a marriage between a blue eyed woman and a brown eyed man who had a blue eyed mother will be -

(1) All black eyed (2) All blue eyed

(3) All brown eyed

(4) One blue eyed and one brown eyed

Q.47 Baldness in man is a -
(1) Autosomal chracter
(2) Sex linked character
(3) Sex influenced character
(4) 1 and 2 both

Q.48 A colourblind man marries a daughter of colourblind father, then in the offspring -
(1) All sons are colourblind
(2) All daughters are colourblind
(3) Half sons are colourblind
(4) No daughter is colourblind

Q.49 A woman with normal vision marries a man with normal vision and gives birth to a colourblind son. Her husband dies and the marries a colourblind man. what is the probability of her children having the abnormality -
(1) 50% colourblind sons + 50% colourblind daughters
(2) All sons colourblind & daughter carrier
(3) All daughter colourblind & sons normal
(4) 50% sons colourblind and all daughters normal

Q.50 A hybrid is generally more vigours than either of the parents, this is due to -
(1) Homozgosity
(2) Heterozygosity
(3) Superior gens in hybrid
(4) Mixing of cytoplasm

Q.51 Albinism is determined by a recessive gene in man the pressence of albinism in 50% children born to a couple proves that -
(1) Both parents are heterozygous for albinism
(2) Father is homozygous normal and mother is heterozygous
(3) Father is homozygous for albinism but mother is heterozygous
(4) Both are homozygous

Q.52 Epistatic gene differs from dominant gene in-
(1) Epistatic gene in non-allelic
(2) Epistatic gene never express it self independently
(3) Epistatic and hypostatic genes are present at different loci
(4) All the above

Q.53 A dihybrid ratio of 1:4:6:4:1 is obtained instead of 9:3:3:1 This is an example of -
(1) Complementary gene
(2) Supplementary gene
(3) Polygenic inheritance
(4) Incomplete dominance

Q.54 A gene that shows it's effect on more than one character is -
(1) Polygene (2) Pleotropic gene
(3) Multifactor gene (4) Multiple gene

Q.55 In multiple allele system a gamete prossesses-
(1) Two alleles (2) Three alleles
(3) One allele (4) Several alleles

Q.56 An example of the quantitative trait in man is-
(1) Hair colour (2) Colour of eye
(3) Skin colour (4) Shape of nose

Q.57 Polygenic inheritance was first noted by -
(1) Devenport (2) Galton
(3) Mendel (4) Kolreuter

Q.58 A single recessive trial which can express its effect should occur on -
(1) Any autosome
(2) Any-chromosome
(3) X-chromosome of male
(4) X-chromosome of male

Q.59 Sex-linked chracters are generally -
(1) Lethal (2) Recessive
(3) Dominant (4) Not inherited

Q.60 The technique of the production of monoclonal antibodies was initially developed by -
(1) Stewards & skoog
(2) Lister & Koch
(3) Arber & Haberlandt
(4) Kohler & milstern

Q.61 In a lymphocyte - myeloma type of hybridoma the antibody forming ability is derived from -
(1) Myelomas only
(2) Lymphocytes only
(3) Partly from lymphocyte and partly from myelomas
(4) Myelomas to greater extent and lymphocytes to a lesser extent

Q.62 If dominant C and P genes are essential for the development of purple colour in sweet pea flowers, what would be the ratio of white and purple colour in a cross between CcPpxCcpp-

(1) 5 : 3 (2) 9 : 7

(3) 2 : 6 (4) 6 : 2

Q.63 Blood grouping in humans is controlled by -

(1) 4 alleles in which 1^A is dominant

(2) 3 alleles in which 1^A and I^B are dominant

(3) 2 alleles in which none is domainant

(4) 3 alleles in which 1^A is recessive

Q.64 In Drosophila crossing over occurs in female but not in male. Gene A and B are 10 map unit apart on chromosome. A female Drosophila with genotype $\frac{AB}{ab}$. and male Drosophila with genotype $\frac{AB}{ab}$. How many type of gametes are produced by female and male Drosophila respectivel -

(1) 4 types : 2 type

(2) 2 types : 2 types

(3) 4 types : 4 type

(4) 4 types : one types

Q.65 In polygenic inheritance triat which controlled by three pairs of genes. Two individuals which are heterozygous for three alleles, Crossed each other. Such type of cross produced phenotypic ratio in what ratio-

(1) 1 : 2 : 1 (2) 9 : 3 : 3 : 1

(3) 1 : 4 : 6 : 4 : 1

(4) 1 : 6 : 15 : 20 : 15 : 6 : 1

Q.66 In jersey hog, the coat colour is dependant on two pairs of alleles, R and r or S and s. Any genotype containing at least one R-gene and at least one S-gene result in red coat colour. The double recessive genotype results in white coat colour. All other genotypes results in sandy coat colour. If one hog with genotype ''RrSs'' mated with another hog will be prduced by above cross-

(1) 9 red : 6-sandy : 1 white

(2) 9 red : 3-sandy : 4 white

(3) 12 red : 3-sandy : 1 white

(4) 1 red : 2-sandy : 1 white

Q.67 Multiple alleles are present -

(1) In different chromosomes

(2) At different loci on chromosome

(3) At the same locus on homologous chromosomes

(4) At the non homologous chromosomes

Q.68 A scientist performed the gene mapping experiments in maize. He mapped the genes on chromosomes on the basis of % crossing over between different genes. One map unit corresponds to one% crossing over or recombination. The genes showing more than 50% recombination were not supposed to be linked on same chromosome. In crossing over studies on maize, scientist observed the following % crossing over between genes A, B,C,D- between. A and D 10% between A and D 10% between genes A and B 5% and between genes C and B 8% On the basis of above observation find out the correct sequecne of genes A, B, C and D on chromosmes -

(1) BCDA (2) ABCD

(3) BACD (4) DACB

Q.69 In a cross between individuals homozygous for (a, b) and wild type (++) In this cross 700 out of 1000 individuals were of parental type. Then the distacne between a and b is-

(1) 70 map unit (2) 35 map unit

(3) 30 map unit (4) 15 map unit

Q.70 In maize coloured endosperm (C) is dominant over colourless (c) and full endosperm (R) is dominant over shrunken (r). When a dihybrid of F_1 generation was test crossed it produced four phenotype in the following percentage -

Coloured and Full = 45%

Coloured - Shrunken = 5%

Colourless - Full = 4%

Colourless - Shrunken = 46%

From these data what would be distacne between the two allelic genes -

(1) 48 unit (2) 9 unit

(3) 4 unit (4) 12 unit

Q.71 Which of the following show linkage group in coupling phase -

(1) 
(2) 
(3) 
(4) 
Q.72 In a family, father has a blood group 'A' and mother has a blood group 'B'. Their children show 50% probility for a blood group 'AB' idicating that -

(1) Father is heterozygous

(2) Mother is heterozygous

(3) Either of parent is heterozgous

(4) Mother is homozygous

Q.73 In a plant three dominant independently assorting gene A. B and C are essential for production of purple pigment. If any of the genes or all three genes are present in recessive condition then flower is colourless

Raw material $\xrightarrow{A}$ X $\xrightarrow{B}$ Y $\xrightarrow{C}$ Z pigment

A purple plant with genotype AABBCC crossed with a colourless plant with genotype aabbcc gives purple F_1 hybrid. On selfing of F_1 - what proportion of coloured offspring in F_2 -

(1) $\frac{27}{64}$ (2) $\frac{1}{64}$

(3) $\frac{9}{64}$ (4) $\frac{37}{64}$

Q.74 When a red grain veriety of wheat is crossed with another white grain variety a F_1 - hybrid is produced. On selfing of this F_1 hybrid, how many offsprings of F_2 -generation resemble phenotypically to it's parents (let grain colour of wheat controlled by three gene pairs)

(1) 2/16 (2) 20/64

(3) 15/64 (4) 2/64

Q.75 Epistasis differs from dominance because-

(1) In epistasis one gene pair mask the expression of another pair of genes

(2) Epistasis is an allelic interaction

(3) Many genes collectively controls a particular phenotype

(4) One gene pair independendenly controls a particuar phenotype

Q.76 In a plant flower colour is the example of polygenic trait and controlled by one gene pair. How many plants show parental phenotype in F_2 generation -

(1) $\frac{2}{16}$ (2) $\frac{2}{4}$

(3) $\frac{2}{64}$ (4) $\frac{2}{256}$

Q.77 In Drosophila several alleles exhibit same phenotype for eg. W^{+s},W^{+c},W^{+g} exhibit eye colour these alleles are called -

(1) Psudoalleles (2) Iso alleles

(3) Multiple alleles (4) All of above

Q.78 (a) Pleiotropic genes have multiple phenotypic effect

(b) Muliple alleles exhibit same phenotypic expression.

(c) Polygenes exhibit continous variation

(1) Statement (a), (b) and (c) are correct

(2) Statement (a), (c) correct and (b) is incorrect

(3) Statement (a), (b) and (c) are incorrect

(4) Statement (a) and (c) are correct and (a) is incorrect

Q.79 Which is not correctly matched :

(1) Agrobacterium $\Rightarrow$Ti-plasmid

(2) Cosmid $\Rightarrow$Vector DNA

(3) Rhizobium $\Rightarrow$ Asymbiotic N_2 -fixer

(4) Albinism $\Rightarrow$ Autosomal recessive gene

Q.80 In Drosophila a set of homeiotic genes which controls body plan at the time of organ differentiaion known as -

(1) TATA-box (2) Homeobox

(3) Pribnow box (4) All the above

Q.81 The longer the chromosome of an orgasnism, the more genetic variability its gets from -

(1) Independent assortment

(2) Linkage

(3) Crossing over (4) Mutation

Q.82 Which statement is incorrect about linkage-

(1) It helps in maintaining the valuable traits of new varieties

(2) It helps in forming new recombinants

(3) Knowledge of linkage helps the breeder to combine all desirable traits in a single variety

(4) It helps in locating genes on chromosome

Q.83 The concept of sudden genetic change which breeds true in an organism is visualized as:-

(1) Natural selection

(2) Inheritance of acquired characters

(3) Mutation

(4) Independent assortment

Q.84 Term 'sport' was used for the sudden appearance of heritable trait by-

(1) Morgan (2) Muller

(3) Darwin (4) De Vries

Q.85 Who coined the term mutation

(1) Morgan (2) Darwin

(3) Stadler (4) De Vries

Q.86 True mutation was first discovered by-

(1) Muller (2) Morgan

(3) Stadler (4) De Vries

Q.87 Mutation is-

(1) An abrupt or discontinuous change which is inherited

(2) A factor for plant growth

(3) A change which affects parents only and is never inherited

(4) A change which affects the offspring of F_2 generation

Q.88 Mostly mutations are-

(1) Heritable (2) Non-heritable

(3) Harmful (4) Benefical

Q.89 Abrupt and distinct changes in the structure of a gene is called-

(1) Point mutation (2) Forward mutation

(3) Backward mutation

(4) Chromosomal aberration

Q.90 Micromutations involve changes in-

(1) Satellite region of the chromosomes

(2) Mini-chromosomes

(3) Microsomes (4) Single gene

Q.91 The change of chromosomal parts between non homologous pairs of chromosome

(1) Crossing over/Transduction

(2) Translocation

(3) Inversion (4) Transition

Q.92 Which of the following can be called a mutation-

(1) The halfing of the chromosome number at meiosis

(2) The doubling of the chromosome after syngamy

(3) The possession of an additional chromosome

(4) All the above

Q.93 Mutation causes normally-

(1) Small changes (2) Negligible changes

(3) Large changes (4) No change

Q.94 Mutations are generally-

(1) Dominant (2) Recessive

(3) Codominant

(4) Incompeletely dominant

Q.95 The first mutant reported by Morgan on Drosophila was-

(1) Red eyed male (2) Red eyed female

(3) White eyed male (4) White eyed female

Q.96 The earliest record of point mutation is -

(1) Short legged sheep by Sneth Wright

(2) White eyed male Drosophila by Morgan

(3) Autotrophic mutants of Neurospora by Beadle and Tatum

(4) Mutants of Escherichia coli discovered by Joshua Lederberg

Q.97 Short-legged variety of sheep is an example of-
(1) Recessive germinal mutation
(2) Dominant germinal mutation
(3) Recessive somatic mutation
(4) Dominant somatic mutation

Q.98 Genetic mutations occur in -
(1) DNA
(2) RNA
(3) Protein
(4) RNA & protein both

Q.99 Which of the following undergoes change in mutation -
(1) Chromosome
(2) Structure of gene
(3) Sequence of gene
(4) Any of the above

Q.100 The locus of mutation is -
(1) Gene (2) Chromosome
(3) Centromere (4) Nucleus

Q.101 Gene mutation is caused -
(1) Due to reproduction
(2) Due to linkage
(3) Due to change in sequence of N_2 base
(4) Due to changes in sequence of genes in DNA

Q.102 The natural rate of mutation is -
(1) 1 × 10-10 (2) 1 × 10-6
(3) 1 × 105 (4) 1 × 1010

Q.103 Mutagenic nature of X-ray and UV-radiations was discovered by -
(1) Beadle and Tatum
(2) Madam Curie
(3) Muller (4) Hardy & Weinberg

Q.104 The title " Artificial transmutation by X-rays" was published by-
(1) Morgan (2) Muller
(3) Stadler (4) DeVries

Q.105 H.J. Muller received Noble Prize for-
(1) Discovering linked genes
(2) Discovering the mutations induced by X-rays
(3) His studies on the genetics of Drosophila
(4) Proving that DNA was a genetic material

Q.106 X-rays generally cause-
(1) Polyploidy
(2) Frame shift mutations
(3) Chromosomal aberrations
(4) Paramutations

Q.107 α & β rays do not cause mutations in human beings because:-
(1) They are non ionizing
(2) They do not react with DNA
(3) They do not penetrate through skin
(4) They are not un-natural

Q.108 Which of the following causes mutation (not polyploidy)
(1) Crossing-over (2) NaCl
(3) Colchicine (4) γ-rays

Q.109 Non-ionizing radiations commonly used for inducing mutations in organisms are
(1) UV-rays (2) Beta-rays
(3) X-rays (4) Gamma-rays

Q.110 The best mutagen for micro-organisms is-
(1) X-rays (2) UV-rays
(3) γ-rays (4) α-rays

Q.111 The sites in the gene at which the mutations occur with unusually high frequency are referred to as-
(1) Recons (2) Palindromes
(3) Hot spots (4) Mutons

Q.112 The smallest unit of genetic material which upon mutation produce a phenotypic effect is
(1) Sexual reproduction
(2) Meiosis
(3) Mutation
(4) Independent assortment

Q.113 Ultimate source of genetic variations is (OR) the process which provides raw material for evolution is
(1) Sexual reproduction
(2) Meiosis
(3) Mutation
(4) Independent assortment

Q.114 Continuous variations are due to
(1) Chromosomal aberrations
(2) Polyploidy
(3) Mutations (4) Crossing over

Q.115 Genetic mutation occurs in-
(1) DNA (2) RNA
(3) Chromosome (4) All

Q.116 To be evolutionary successful the mutation must occur in (OR) important mutations occur in-
(1) Somatoplasm
(2) Germplasm
(3) Karyolymph/Zygote
(4) Ergastoplasm

Q.117 Chemical mutagens are far more hazardous than radiations because
(1) The exposure to chemicals is more prevalent
(2) The organism possess protection for radiation but no protection for chemicals
(3) The chemically induced mutations are move deleterious
(4) The chemicals are synthetics

Q.118 Mutations involving a single base substitution are induced by
(1) Infra red rays
(2) Ultrasonic vibrations
(3) Violet rays
(4) X-rays

Q.119 Triticum durum is
(1) 8n (2) 4n
(3) 6n (4) 8n

Q.120 X-rays cause mutations by
(1) Breading spindle fibers
(2) Rupturing nuclear envelope
(3) Changing chromosome morphology
(4) Inhibiting chtokinesis

Q.121 Mutagens which are effective on replication DNA only are-
(1) Base analogues and Acridines
(2) Alkylating agents
(3) HNO_2
(4) α and β rays

Q.122 Which of the following is the most effective chemical mutagen which induce mutations
(1) Caffeine
(2) Guanine
(3) Methane
(4) Carbon-tetra-sulphide

Q.123 Which of the following agents cause mutation through deamination
(1) 2-Aminopurine
(2) 5-Bromo uracil & X-rays
(3) HNO_2 & UV
(4) Alkyl sulphonates & N_2 mustards

Q.124 The antibiotic commonly used in inducing the mutations in cytoplasmic genes is
(1) Tetramycin (2) Streptomycin
(3) Tetracycline (4) Cyclosporin

Q.125 Streptomycin, kenamycin & neomycin binds to smaller sub-unit of prokaryotic ribosomes and cuase-
(1) Inhibition of protein syntheis
(2) Mis reading of the genetic code
(3) Inhibition of translation
(4) Hydrolysis of peptide bonds

Q.126 Mutagenic effect of X-rays was discovered by-
(1) Muller (2) Luria
(3) Morgan (4) De Vires

Q.127 Most mutagens have more adverse effects on
(1) Diploids (2) Triploids
(3) Tetraploids (4) Haploids

Q.128 Induced mutations are very common in
(1) Lentils
(2) Millets
(3) Cereals
(4) Vegetatively propagated plants

Q.129 On which of the following crops, mutations studies havemore intensively been done.
(1) Wheat (2) Millets
(3) Legumes (4) Tube crops

Q.130 Which of the popular variety of wheat has been developed by mutation
(1) Triticale (2) Kalyan Sona
(3) Sonalika (4) Sharbati sonora

Q.131 A favourite material for the study of mutagenesis at the molecular level is-
(1) TMV
(2) E.coli
(3) Drosophila
(4) Isolated protoplasts of Arabiodopsis thaliana

Q.132 Haploids are preferred over diploids for mutation studies because:-

(1) Recessive mutation is expressed in F_1

(2) Recessive mutation is expressed in F_2

(3) Dominant phenotype is expressed

(4) Dominant phenotype is suppressed

Q.133 Type of gene mutation which involves replacement of purine with pyrimidine or vice vice versa (OR) The substitution of one type of base with another type of base is

(1) Transduction (2) Transversion

(3) Translocation (4) Transcription

Q.134 Replacement of a purine N_2 base with another purine base (OR) Replacement of a pyrimidine N2 base with another pyrimidine is termed as-

(1) Transition (2) Transversion

(3) Translocation (4) Transcription

Q.135 Mutations induced by 5-Bromo uracil are-

(1) Transversional mutations

(2) Transitional mutations

(3) Frame shift mutations

(4) Backward mutations

Q.136 A point mutation which involves change of A G, C T, C G and T A in DNA are:-

(1) Transition, Transition, Transversion Transversion

(2) Transition, Transversion, Transition transversion

(3) Transversion, Transition, Transversion, Transition

(4) None of the above

Q.137 Base substitution caused by base analogues is:

(1) Transition

(2) Transvesion

(3) Complementation

(4) None

Q.138 The minimum requirement for mutation is-

(1) Change of triplet codon

(2) Change in single nucleotide

(3) Change in whole DNA

(4) Change in single strand of DNA

Q.139 A segment of DNA has a base sequence: AAG, GAG, GAC, CAA, CCA-, Which one of the following sequence represents a frame shift mutation.

(1) AAG, GAG, GAC, CAA, CCA-

(2) AAG, AGG, ACC, AAC, CAA-

(3) ACG, GAG, GAC, CAG, CCA-

(4) AAG, GCG, GAC, CAG, CCA-

Q.140 If the DNA-codons are ATGATGATG and a cytosine base is inserted at the beginning which of the following would be the result-

(1) A non sense mutation

(2) CA, TGA, TGA, TG

(3) CAT, GAT, GAT, G

(4) C, ATG, ATG, ATG

Q.141 Which of the mutagen causes frame shift mutation

(1) 2 Aminopurine (2) Proflavine

(3) 5 Bromouracil

(4) Methane sulphonates

Q.142 Mutations are-

(1) Always useful (2) Mostly useful

(3) Never useful (4) Rarely useful

Q.143 If a mutation is not visible in successive generations it is called as a-

(1) Deletion (2) Dominant mutation

(3) Recessive mutation

(4) Segregation

Q.144 Which of the following is most difficult to detect-

(1) Auxotrophic mutation

(2) Lethal mutation

(3) Recessive non-lethal mutation

(4) Dominant mutation

Q.145 What is an auxotroph-

(1) A plant that responds by bending towards then sun

(2) A mutant (organism) which has lost its ability to synthesize one or more essential compounds

(3) An organism that depends on another organism for meeting its nutritional requirements

(4) A plant that is able to synthesize its own carbohydrates

Q.146 Recessive mutations are not lost from a gene pool, This is known as-

(1) Survival of the dominant

(2) Survival of the recessive

(3) Hardy-Weinberg's law

(4) Darwin's gene mutation law

Q.147 Blood cancer is known as-

(1) Leukemia (2) Thrombosis

(3) Haemophilia (4) Haemolysis

Q.148 When the mutation at one locus is neutralized by the mutation at another locus of same or different chromosome it is termed:-

(1) Gibberish mutation

(2) Backward mutation

(3) Crossing over

(4) Neutral mutation

Q.149 Mutation theory was proposed by-

(1) Hugo De Vries (2) J. G. Mendel

(3) Lamarck (4) Kolreuter

Q.150 Lethal mutations were first detected by-

(1) Morgan (2) Muller

(3) De Vries (4) Bateson

Q.151 Deamination of adenine and guanine by HNO_2 and UV rays produces-

(1) Cytosine and uracil

(2) Xanthine and hyproxanthine

(3) Hypoxanthine and xanthine

(4) Xanthine and uracil

Q.152 Who performed the popular "Replica Plating Experiment"-

(1) Nirenberg and Kornberg

(2) Kornberg and Lederberg

(3) Joshua Lederberg & Esther lederberg

(4) Holley, Khorana & Mathi

Q.153 Which of the following substance was used as a screening agent in Replica Plating Experiment-

(1) Vitamin B_{12}

(2) Cofactors & Streptomycin

(3) Amino acid Lysine

(4) Antibiotic streptonmycin

Q.154 Sickle cell anaemia is an example of-

(1) Frame shift mutation

(2) Point mutation

(3) Segmental mutation

(4) Gibberish mutation

Q.155 The most striking example of frame shift mutation was found in a disease called-

(1) Sickle cell anaemia

(2) Colour blindness

(3) Laesh-Nyhn Syndrome

(4) Thallesemia

Q.156 Thallesemia is an example of-

(1) Point mutation

(2) Frame-shift mutation

(3) Translocation and transition

(4) Transversion

Q.157 Change in sequence of nucleotide in DNA is called as-

(1) Mutagen (2) Mutation

(3) Recombination (4) Translation

Q.158 In a random mating population in equilibrium, which of the following brings about a change in gene frequency in a non-directional manner

(1) Mutation (2) Random drift

(3) Selection (4) Migration

Q.159 In a mutational event, when adenine is replaced by guanine, it is a case of -

(1) Transcription (2) Transition

(3) Transversion

(4) Frameshift mutation

Q.160 The most likely reason for the development of resistance against pesticides in insects damaging a crop a -

(1) Genetic recombination

(2) Directed mutation

(3) Acquired heritable changes

(4) Random mutations

Q.161 A nutritionally wild type organism, which does not require any additional growth supplement in known as -

(1) Holotype (2) Auxotroph

(3) Prototroph (4) Phenotype

Q.162 Using imprints from a plate from complete medium and carrying bacterial colonies, you can selected streptomycin resistant mutants and prove that such mutations do not originate as adaptation. These imprints need to be used -

(1) One plates with and without streptomycin

(2) Only on plates with streptomycin

(3) On plates with minimal medium

(4) Only on plates without streptomycin

Q.163 Which of the following in generally used for induced mutagenesis in crop plants -

(1) Gamma rays (from cobalt 60)

(2) Alpha particles

(3) X-rays

(4) UV (260 nm)

Q.164 There are two opposing views about origin of modern man. According to one view Homo erectus in Asia were the ancestors of modern man. A study of variation of DNA however suggested African origin of modern man. What kind of observation of DNA variation could suggest this -

(1) Greater variation in Asia thatn in Africa

(2) Similar variation in Africa and Asia

(3) Variation only in Asia and no variation in Africa

(4) Greater variation in Africa than Asia

Q.165 De Vries gave his mutation theory on organic evolution while working on -

(1) Oenothera lamarckiana

(2) Frosophila melanogaster

(3) Pisum sativum

(4) Althea rosea

Q.166 Cri-du-chat syndrome in humans is caused by the

(1) Fertilization of an XX egg by a normal Y-bearing sperm

(2) Loss of half of the short arm of chromosome 5

(3) Loss of half of the long arm of chromosme 5

(4) Trisomy of 21st chromosome

Q.167 Tricticle, the first man-made cereal crop, has been obtained by crossing wheat with -

(1) Rye (2) Pearl millet

(3) Sugarcane (4) Barley

Q.168 Sickle cell anemia has not been eliminated from the African population because -

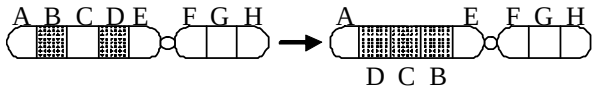
(1) It is controlled by recessive genes

(2) It is not a fatal disease

(3) It provided immunity against malaria

(4) It is controlled by dominant genes

Q.169 Given below is the representation of a kind of chromosomal mutation :



What is the kind of mutation represented

(1) Deletion (2) Duplication

(3) Inversion

(4) Reciprocal translocation

Q.170 Potato and sweet potato -

(1) Have edible parts which are homologous organs

(2) Have edible parts which are analogous organs

(3) Have been introduced in India from the same place

(4) Are two species of the same genus

Q.171 The "cri-du-chat" syndrome is caused by change in chromosome structure involving-

(1) Deletion (2) Duplication

(3) Inversion (4) Translocation

Q.172 Mutations occur in :

(1) Dominant genes (2) Recessive genes

(3) Lethal genes (4) Mendel's genes

Q.173 In the hexaploid wheat, the haploid (n) and basic (x) numbers of chromosomes are :

(1) n = 7 and x = 21 (2) n = 21 and x = 21

(3) n = 21 and x = 14 (4) n = 21 and x = 7

Q.174 Chromosome with genes abcdefg becoming abedcfg is :

(1) duplication (2) deletion

(3) translocation (4) inversion

Q.175 Haploids are more suitable for mutation studies than the diploids. This is because :

(1) haploids are more abundant in nature than diploids

(2) All mutations, whether dominant or recessive are expressed in haploids

(3) Haploids are reproductively more stable than diploids

(4) Mutagens penetrate in haploids more effectively than in diploids

Q.176 Which one of the following scientist's name is correctly matched with the theory put forth by him ?

(1) de Vries - Natural selection

(2) Mendel - Theory of pangenesis

(3) Weismann - Theory of continuity of Germplasm

(4) Pasteur - Inheritance of acquired characters

EXERCISE- 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Germplasm concept was proposed by : **[RPMT-93]**

(1) Mendel (2) De-vries

(3) Aristoltle (4) Weismann

Q.2 On which plant mendel had carried out his investigation :- **[RPMT-87,88]**

(1) Garden-pea (2) Wild pea

(3) Cow-pea (4) Pigeon pea

Q.3 Which of the following in non-heritable : **[AIPMT-95]**

(1) Point mutation

(2) Chromososmal mutation

(3) Gene mutation

(4) Somatic mutation

Q.4 The year 1900 AD is highly significant for geneticists due to the- **[RPMT-92,95]**

(1) Discovery of genes

(2) Principle of Linkage

(3) Mendelian rediscovery

(4) Chromosome theory of heredity

Q.5 During breeding the removal of anthers from a flower is called - **[MP PMT-95]**

(1) Anthesis (2) Pollination

(3) Emasculation (4) Vasectomy

Q.6 When a heterozygous tall pea plant of F_1 generation upon self fertilization produces tall and dwarf phenotypes it proves the principle of - **[RPMT-85,90]**

(1) Dominance

(2) Segregation

(3) Independant assortement

(4) Inheritance & purity of gametes

Q.7 Mendel formulated the law of purity of gametes on the basis of - **[RPMT-90]**

(1) Dihybrid cross (2) Monohybrid cross

(3) Back cross (4) Test cross

Q.8 Mendelian monohybrid ratio is - **[RPMT-93]**

(1) 1:2:1 (2) 3:1

(3) 9:3:1 (4) 9:3:4

Q.9 In a monohybrid cross the genotype ratio of the offspring is - **[MP PMT-96]**

(1) 3:1 (2) 1:2:1

(3) 1:1:1:1 (4) 4:0

Q.10 A cross between AaBB X aa BB yieldds a genotypic ratio of - **[AIPMT-90]**

(1) 1 AaBB: 1 aaBB

(2) 1 AaBB: 3 aaBB

(3) 3AaBB : 1 aa BB

(4) All AaBb

Q.11 In monohybrid cross what is the ratio of homozygous dominant and homozygous recessive individuals in F_2-generation - **[RPMT-89-92-93-96]**

(1) 1: 2:1 (2) 2:1/1:2

(3) 3:1/1:3 (4) 1:1

Q.12 Back cross is a cross between -**[RPMT-87]**

(1) $F_1 \times F_1$ (2) $F_1 \times$ Recessive

(3) $F_1 \times$ Dominant (4) $F_1 \times$ any parent

Q.13 The cross between recessive to it's hybrid or it's F_1 plant is called - **[RPMT-92,93,96]**

(1) Back cross (2) Test cross

(3) Monohybrid cross (4) Dihybrid cross

Q.14 What is the genotypic and phenotypic ratio of monohybrid test cross - **[RPMT-86]**

(1) 1:1 (2) 1:2

(3) 3:1 (4) 1:2:1

Q.15 What is the ratio of a progeny of cross between F_1 heterozygous and recessive - **[RPMT-87]**

(1) 3:1 (2) 1:2:1

(3) 1:1 (4) 2:1

Q.16 Dihybrid cross proves the law of - **[AIPMT-92]**

(1) Segregation

(2) Purity of gametes

(3) Dominance

(4) Independent assortment

Q.17 How many types & in what ratio the gametes are produced by a dihybrid heterozygous - **[AIPMT-92]**

(1) 4 types in the ratio of 9:3:3:1

(2) 2 types in the ratio of 3:1

(3) 3 types in the ratio of 1:2:1

(4) 4 types in the ratio of 1:1:1:1

Q.18 How many gametes are produced in F_1 generation of a trihybrid - **[MP PMT-88]**

(1) 3 (2) 4

(3) 8 (4) 16

Q.19 Which genotype represents a true dihybrid condition - **[AIPMT-91]**

(1) tt rr (2) Tt rr

(3) Tt Rt (4) TT Rt

Q.20 Mendel enunciated how many principles of inheritance - **[MP PMT-95]**

(1) One (2) Two

(3) Three (4) Four

Q.21 Mendelian ratio 9:3:3:1 is due to-**[RPMT-95]**

(1) Law of segregation

(2) Law of purity of gemetes

(3) Law of independent assortment

(4) Law of unit characters

Q.22 In a cross between a pure tall plant with green pod & a pure short plant with yellow pod. How many short plants are produced in F_2 generation out of 16 - **[AIPMT-94]**

(1) 1 (2) 3

(3) 4 (4) 9

Q.23 In a dihybrid cross between AABB and aabb the ratio of AABB, AABb, aaBb, aabb in F_2 generation is - **[AIPMT-92-94]**

(1) 9:3:3:1 (2) 1:1:1:1

(3) 1:2:2:1 (4) 1:1:2:2

Q.24 Branch of biology dealing with heredity and variation is called - **[MP PMT-98]**

(1) Palaentolozy (2) Evolution

(3) Genetics (4) Ecolozy

Q.25 A dihybrid ratio is - **[MP PMT-98]**

(1) 1:1:1:1 (2) 3:1

(3) 9:3:3:1 (4) 9:5:1:1

Q.26 AABbCc genotype forms how many types of gametes - **[AIPMT-98]**

(1) 4 (2) 8

(3) 2 (4) 6

Q.27 Who rediscovered the results of mendel's experiments - **[RPMT-97]**

(1) Devries, Tschemark, corrents

(2) Devries, Tschemark, Morgan

(3) Tschemark, Morgan, correns

(4) Tschemark, Bateson, Punnet

Q.28 Crossing AABB & aabb, the ratio of AaBb would be in F_2 generation - **[RPMT-97]**

(1) 1/16 (2) 2/16

(3) 8/16 (4) 4/16

Q.29 On crossing Black & while flowered plants the ratio of Black and white flowered plants in F_2 gen.was 120:40, then on selfing the heterozygous Black flowered plants, the offsprings would be - **[RPMT-97]**

(1) 144:48 (2) 40:60

(3) 52:48 (4) 84:16

Q.30 In mendel's experiments, colour of seed coat, nature of flower, position of flower, colour of pod, height of stem, are called - **[RPMT-97]**

(1) Alleles (2) Genotype

(3) Phenotype (4) All of the above

Q.31 120 Plants are produced on crossing pure red and pure white flowered pea plants, these ratio is- **[RPMT-96]**

(1) 90 Red : 30 White

(2) 30 Red : 90 White

(3) 60 Red : 60 White

(4) All Red

Q.32 According to Mendel's law of segregation the ratio of F_2 generation is - **[RPMT-96]**

(1) 1:2:1 (2) 3:1

(3) 1:1 (4) 2:1

Q.33 Mendel worked in - **[CPMT-80]**

(1) 17^{th} century (2) 18^{th} century

(3) 19^{th} century (4) 20^{th} century

Q.34 Pea plants were more suitable than cattle for Mendel's experiment because - **[CPMT-88]**

(1) There were no breeding records of cattles

(2) Pea plants can be self-fertilised

(3) Cattle are not easy to mantain

(4) All pea plants have 2X chromosomes and fewer gentetic traits

Q.35 An individal with two identical members of a pair of genetic factros is called -**[CPMT-81]**

(1) Heteromorphic (2) Heterozygote

(3) Homomorphic (4) Homozygote

Q.36 Two allelic genes are located on - **[AFMC-84]**

(1) The same chromosome

(2) Two homologous chromosomes

(3) Two-non-homologous chromosomes

(4) Any two chromossomes

Q.37 The percentage of ab gametes produced by Aa Bb parent will be - **[AIIMS-88]**

(1) 12.5 (2) 25

(3) 50 (4) 75

Q.38 Gregor Mendel was born in - **[CPMT-93]**

(1) Britain (2) Austria

(3) Russia (4) America

Q.39 Mendel's principles are related to - **[CPMT-95]**

(1) Evolution (2) Reproduction

(3) Variantions (4) Heredity

Q.40 Different forms of a gene are called - **[MP PMT-94]**

(1) Heterozygotes

(2) Alleles

(3) Complementary genes

(4) Supplementary genes

Q.41 How many character of pea pod were chosen by mendel - **[MP PMT-94]**

(1) 7 (2) 2

(3) 4 (4) 3

Q.42 Mendel chose character in pea -**[CPMT-94]**

(1) Three (2) Two

(3) One (4) Seven

Q.43 Mendel's law of segregation is based on separation of alleles during - **[MP PMT-93]**

(1) Gemete formation

(2) Seed formation

(3) Pollination

(4) Embryonic development

Q.44 In a cross 45 tall & 14 dwarf plants were obtained, genotype of parents was - **[BHU-93]**

(1) TT X TT (2) TT X Tt

(3) Tt X Tt (4) TT X tt

Q.45 First geneticist was - **[AIPMT-91]**

(1) De vries (2) Mendel

(3) Darwin (4) Morgan

Q.46 An organism with two identical alleles is - **[AIPMT-93]**

(1) Dominant (2) Hybrid

(3) heterozgous (4) Homozygous

Q.47 Gametes of AaBb individual can be - **[AIIMS-91]**

(1) Aa, Bb (2) AB, ab

(3) AB,ab,aB (4) AB,Ab,aB, ab

Q.48 Mendel did not propose - **[BHU-91,MPPMT-90]**

(1) Dominance

(2) Incomplete dominance

(3) Segregation

(4) Independent assortment

Q.49 When two hybrids Ttrr & Rrtt are crossed, the phenotypic ratio of offspring shell be - **[CPMT-90]**

(1) 3:1 (2) 1:1:1:1

(3) 1:1 (4) 9:3:3:1

Q.50 Body features are - **[MP PMT-88]**

(1) Phenotype (2) Genotype

(3) Sex of individual

(4) Controlled by atmosphere

Q.51 The allele which is unable to express its effect in the presence of another is called - **[AIPMT-91]**

(1) Co-dominant (2) Supplementary

(3) Complementry (4) Recessive

Q.52 Genotype is - **[BHU-83]**

(1) Genetic composition of many organisms

(2) Genetic composition of plastids

(3) Genetic composition of germ cells

(4) Genetic composition of an individual

Q.53 When AABBcc is corossed with Aa Bb Cc then the ratio of hybrid for all the three genes is - **[AIPMT-1999]**

(1) 1/8 (2) 1/4

(3) 1/16 (4) 1/32

Q.54 According to mendelism which character is showing dominance - **[AIPMT-2000]**

(1) Terminal position of flower

(2) Green colour in seed coat

(3) Wrinkled seeds

(4) Green pod colour

Q.55 Due to the cross between TTRr x ttrr the resultant progenies showed how many percent plants would be, tall, red flowered:- **[AIPMT-2000]**

(1) 50% (2) 75%

(3) 15% (4) 100%

Q.56 lrregularity is found in Drosophila during the organ differentiation for example-inplace of wing, long legs are formed. Which gene is responsible for - **[AIPMT-2000]**

(1) Double dominant gene

(2) Homeiotic gene

(3) Complimentary gene

(4) Plastid

Q.57 Mendel obtained wrinkled seeds in pea due to deposition of sugars instead of starch. It was due to which enzyme - **[AIPMT-2001]**

(1) Amylase (2) Invertase

(3) Diastase

(4) Absence of strach branching enzyme

Q.58 A gene said to be dominant if - **[AIPMT-2002]**

(1) It express it's effect only in homozygous stage

(2) It expressed only in heterozygous condition

(3) It expressed both in homozygous and heterozygous condition

(4) It never expressed in any condition

Q.59 A plant of F_1 generation with genotype ''AABbCC'' On selfing of this plant what is the phenotypic ratio in F_2 –generation- **[AIPMT-2002]**

(1) 3 : 1

(2) 1 : 1

(3) 9 : 3 : 3 : 1

(4) 27 : 9 : 9 : 9 : 3 : 3 : 3 : 1

Q.60 Which one of the following traits of garden pea studied by Mendel, was a recessive feature - **[AIPMT-2003]**

(1) Axial flower position

(2) Green seed colour

(3) Green pod colour

(4) Round seed shape

Q.61 In a plant, red fruit (R) is dominant over yellow fruit (r) and tallness (T) is dominant over shortness (t). If a plant with RRTt genotype is crossed with a plant that is rrtt - **[AIPMT-2004]**

(1) All the offsprings will be tall with red fruit

(2) 25% will be tall with red fruit

(3) 50% will be tall with red fruit

(4) 75% will be tall with red fruit

Q.62 When a red flower homozygous pea plant is crossed with a white flower plant what colour is produced in F_1 - **[RPMT-87]**

(1) Red (2) White

(3) Pink (4) Red + white

Q.63 How many different types of gametes can be formed by F_1 progeny, resulting from the following cross, : AA BB CC x aa bb cc - **[AIIMS-2004]**

(1) 3 (2) 8

(3) 27 (4) 64

Q.64 In order to find out the different types of gametes produced by a pea plant having the genotype AaBb, it should be crossed to a plant with the genotype - **[AIPMT-2005]**

(1) AaBb (2) aabb

(3) AABB (4) aaBB

Q.65 Gene word was coined by - **[RPMT-2005]**

(1) mendel (2) Hugo-de-vires

(3) Morgan (4) Johanson

Q.66 Discoverer of incomplete dominence - **[RPMT-2005]**

(1) Von Tschermak (2) Carl correns

(3) Hugo-de-vries (4) None of the above

Q.67 Test cross is - **[RPMT-2005]**

(1) Tt × Tt (2) Tt × TT

(3) TT × TT (4) Tt × tt

Q.68 Law of independent assortment of mendel was proved by - **[RPMT-2005]**

(1) Monohybrid cross

(2) Test cross

(3) Dihybrid (4) Back cross

Q.69 Mendel does not select which chracter in his experiment - **[RPMT-2005]**

(1) Plant height (2) Plant colour

(3) Pod shape (4) Pod colour

Q.70 In Mirabilis & Antirrhinum plant the apppearence of the pink hybrid (Rr) between cross of a red (RR) and white (rr) flower parent indicates - **[RPMT-88-89-90]**

(1) Incomplete dominance

(2) Segregation

(3) Dominance (4) Heterosis

Q.71 Exception to mendel's law is found in flower colour of - **[RPMT-96]**

(1) Mirabilis (2) Sweet-pea

(3) Garden-pea (4) Beans

Q.72 RR(red) is crossed with ww (white). All Rw off springs are pink. This indicates that R-gene is - **[CPMT-76-81-85]**

(1) Hybrid

(2) Incompletely dominant

(3) Recessive

(4) Mutant

Q.73 In case of incomplete dominance the monohybrid ratio of phenotype in F_2 generation is - **[RPMT-85]**

(1) 1:2:1 (2) 3:1:1

(3) 9:3:3:1 (4) 2:3:1

Q.74 A white flowered mirabils plant rr was crossed with red coloured RR, If 120 plants are produced in F_2 generation. the result would be- **[RPMT-96]**

(1) 90 uniformly coloured & 30 white

(2) 90 Non-uniformly coloured (Pink) & 30 white

(3) 60 Non-uniformly coloured (Pink) & 60 white

(4) All coloured & No white

Q.75 When the phenotypic and genotypic ratios resemble in the F_2 generation it is an example of - **[RPMT& DPMT-85]**

(1) Independant assortment

(2) Qualitative inheritance

(3) Segregation of factors

(4) Incomplete dominance

Q.76 Which one carries extra nuclear genetic material - **[BHU-87]**

(1) Plastids (2) Ribosomes

(3) Chromosomes (4) Golgi-complex

Q.77 When certain character is inherited only through the female parent, it probably repbably represents the case of - **[AIPMT-92]**

(1) Mendelian nuclear inheritance

(2) Multiple plastid inheritance

(3) Cytoplasmic inheritance

(4) Incomplete dominace

Q.78 Cytoplasmic male sterility is inherited - **[MP-PMT-86]**

(1) Maternally

(2) Paternally

(3) Both

(4) Bacteriophage multiplication

Q.79 Mendel did not include in his laws - **[RPMT-90]**

(1) Segregation (2) Dominance

(3) Purity of gametes (4) Linkage

Q.80 If mendel has chosen to study traits determined by linked genes he would not have discovered- **[AIIMS-87]**

(1) Law of segregation

(2) Law of dominance

(3) Law of independant assortment

(4) Law of unit character

Q.81 Which law would have been violated if mendel has chosen eight character in garden-pea- **[RPMT-90, AIPMT-90-96]**

(1) Law of dominance
(2) Law of segregation
(3) Principle of independant assortment
(4) Law of purity of gametes

Q.82 Mendel had a difficulity in explaining the linked character due to - **[AIPMT-90]**

(1) Law of dominance
(2) Law of segregation
(3) Law of independant assortment
(4) All the above

Q.83 In Mirabilis jalapa when homozygous red flowered and white flowered plants are crossed, all F_1 plants have pink coloured flowers. In F_2 produced by selfing of F_1 plants, red, pink, white flowered plants would appear respectivley in the ratio of - **[MP PMT-98]**

(1) 1:1:2 (2) 2:1:1
(3) 1:0:1 (4) 1:2:1

Q.84 The main aim of plant breeding is - **[MP PMT-98]**

(1) To produce improved varieties
(2) To make soil fertile
(3) To controle pollution
(4) To become more progessive

Q.85 Plants having similar genotypes produced by plant breeding are called - **[MP PMT-98]**

(1) Clone (2) Haploid
(3) Autopolyploid (4) Genome

Q.86 If mendel might have studies 7 pairs of characters in a plant with 12 chromosomes. instesd of 14, then - **[AIPMT-98]**

(1) He could not discover independant assortment
(2) He might have not discovered linkage
(3) He might have discovered crossing-over
(4) He might have not observed dominance

Q.87 Plant, which does not obeys Mendel's laws- **[RPMT-96]**

(1) Mirabilis jalapa (2) Pisum sativum
(3) Cicer auriethinum (4) lberies amara

Q.88 The first attempt to show linkage in plants was done - **[BHU-84]**

(1) Pisum sativim (2) Lathyrus odoratus
(3) Zea mays
(4) Oenothera lamarckiana

Q.89 In case of incomplete dominance, F_2 generation has - **[BHU-95]**

(1) Genotypic ratio equal to phenotypic ratio
(2) Genotypic ratio is 3:1
(3) Phenotypic ratio is 3:1
(4) None

Q.90 Genes controlling seven traits in pea studied by mendal were actually located on - **[BHU-94]**

(1) Seven chromosomes
(2) Six chromosomes
(3) Four chromosomes
(4) Five chromosomes

Q.91 Hybridoms is - **[AIPMT-1999]**

(1) Collection of DNA from DNA
(2) Collection of RNA from DNA
(3) A fusion of tumour sex cell with non tumour sex cell
(4) A fusion of tumour somatic cell with non tumor somatic cell

Q.92 When dominant and recessive alleles express itself together it is called - **[AIPMT-2001]**

(1) Co-dominance (2) Dominance
(3) Amphidominance
(4) Pseudo dominance

Q.93 Extranclear inheritacne occurs in - **[AIPMT-2001]**

(1) Killer paramecium (2) Killer Amoeba
(3) Euglena (4) Hydra

Q.94 Nucleus of a donor embryonal cell/somatic cell is transferred to an enucleated egg cell. Then after the formation of organism, what shell be true : **[AIPMT-2002]**

(1) Organism will have extranuclear genes of the donor cell.
(2) Organism will have extra nuclear genes of recipient cell.
(3) Organism will have extra nuclear genes of both donor and recipient cell.
(4) Organism will have nuclear genes of recipient cell.

Q.95 Genes for cytoplasmic male sterility in plants are generally located in - **[AIPMT-2003]**

(1) Chloroplast genome

(2) Mitochondrial genome

(3) Nuclear genome

(4) Cytosol

Q.96 Two crosses between the same pair of genotypes or phenotypes in which the source of the gametes are reversed in one cross, is known as - **[AIPMT-2003]**

(1) Test cross (2) Reciprocal cross

(3) Dihybrid cross (4) Reverse cross

Q.97 The genes controlling the seven pea characters studied by Mendel are known to be located on how many different chromosomes - **[AIPMT-2003]**

(1) Seven (2) Six

(3) Five (4) Four

Q.98 Extranuclear inheritance is a consequence of presence of genes in - **[AIPMT-2004]**

(1) Lysosomes and ribosomes

(2) Mitochondria and chloroplasts

(3) Endoplasmic reticulum and mitochondria

(4) Ribosomes and chloroplast

Q.99 Mendel observed the certain characters did not assort independently. Later researches, found it to be due to - **[MP PMT-98]**

(1) Amitosis (2) Linkage

(3) Dominance (4) Crossing over

Q.100 The phenomenon of incomplete dominance was observed by -

(1) De vries (2) Correns

(3) Tschermak (4) None

Q.101 Genes for cytoplasmic male sterility in plants are generally located in - **[AIPMT-2005]**

(1) Nuclear genome

(2) Chloroplast genome

(3) Cytosol

(4) Mitochondrial genome

Q.102 Sickle cell anemia is - **[AIPMT-2009]**

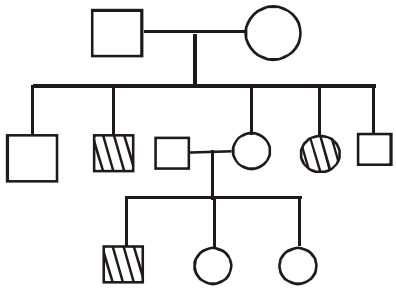
(1) Characterized by elongated sickle like RBCs with a nucleus

(2) An autosomal linked dominant trait

(3) Caused by substitution of valine by glutamic acid in the beta globin chain of haemoglobin

(4) Caused by a change in a single base pair of DNA

Q.103 Study the pedigree chart given below -



What does it show - **[AIPMT-2009]**

(1) Inheritance of a recessive sex-linked disease like haemophilia

(2) Inheritance of a sex-linked inborn error of metabolism like phenylketonuria

(3) Inheritance of a condition like phenylketonuria as an autosomal recessive trait

(4) The pedigree chart is wrong as this is not possible

Q.104 The most popularly known blood grouping is the ABO grouping. It is named ABO and not ABC, becouse ''O'' in it refers to haivng : **[AIPMT-2009]**

(1) No antigens A and B on RBCs

(2) Other antigens besides A and B on RBCs

(3) Overdominance of this type on the genes for A and B types

(4) One antibody only-either anti-A or anti-B on the RBCs

Q.105 Select the incorrect statement from the following - **[AIPMT-2009]**

(1) Baldness is a sex-limited trait

(2) Linkage is an exception to the principle of independent assortment in heredity

(3) Galactosemia is an inborn error of metabolism

(4) Small population size result in random genetic drift in a population

Q.106 Which one of the following is commonly used in transfer of foreign DNA into crop plants ? **[AIPMT-2009]**

(1) Penicillum expansum

(2) Trichoderma harzianum

(3) Meloidogyme incognita

(4) Agrobacterium tumefaciens

Q.107 The bacterium Bacillus thuringiensis is widely used in contemporary biology as - **[AIPMT-2009]**

(1) Source of industrial enzyme

(2) Indicator of water pollution

(3) Insecticide

(4) Agent for production of dairy products

Q.108 Polyethyene glycol method is used for - **[AIPMT-2009]**

(1) Energy production from sewage

(2) Gene transfer without a vector

(3) Biodiesel production

(4) Seedless fruit production

Q.109 Transgenic plants are the ones - **[AIPMT-2009]**

(1) Grown in artificial medium after hybridization in the field

(2) Production by a somatic embryo in artificial medium

(3) Generated by introducing foreign DNA in to a cell and regenerating a plant from that cell

(4) Produced after protoplast fusion in artificial medium

Q.110 What is true about Bt toxin? **[AIPMT-2009]**

(1) The connerned Bacillus has antitoxins

(2) The inactive protoxin gets converted into active form in the insect gut

(3) Bt protein exists as active toxin in the Bacillus

(4) The activated toxin enters the ovaries of the pest to sterlise it and thus prevent its multiplication

Q.111 The genetic defect-adenosine deaminase (ADA) deficiency may be cured permanently by - **[AIPMT-2009]**

(1) Enzyme replacement therapy

(2) Peridic infusion of genetically engineered lymphocytes having functional ADA cDNA

(3) Administering adenosine activators

(4) Introducing bone marrow cells producing ADA into cells at early embyonic stage

Q.112 Epistasis was discovered by - **[AIPMT-90]**

(1) Johanson (2) Shull

(3) Bateson (4) Mendel

Q.113 A normal woman whose father was albino, marries an albino man. what proportion of normal and albino are expected among their off springs - **[AIPMT-94]**

(1) All normal

(2) 2 normal : 1 Albino

(3) All albino

(4) 1 normal : 1 Albino

Q.114 What is the inheritance of colour bindness of both parents having a normal vision but mother has a recessive gene for colour blindness - **[AIPMT-90-96]**

	Son	**Daughter**
(1)	50%	Nil
(2)	100%	Nil
(3)	Nil	100%
(4)	Nil	Nil

Q.115 What would be the nature of children if a colour blind woman marries a normal man- **[AIPMT-95]**

(1) Colourblind daughter & normal sons

(2) Colourblind sons and carrier daughters

(3) Normal sons & carrier daughters

(4) Normal sons & Normal daughters

Q.116 A colourblind man marries a normal lady whose father was colour blind. If it produces two sons & two daughters. how many of them would be suffer - **[AIIMS-85,AFMS-88]**

(1) Both sons

(2) Both daughters

(3) One son & one daughter

(4) Both sons & both daughters

Q.117 Inheritance of skin colour in human beings is an example of - **[BHU-80]**

(1) Complementary gene

(2) Monogenic inheritance

(3) Polygenic inheritance

(4) Mendelian inheritance

Q.118 The phenomenon in which an allele of one gene suppresses the expression of an allele of another gene is known as - **[AIPMT-95]**

(1) Dominance (2) Inactivation

(3) Epistasis (4) Suppression

Q.119 When two independentaly assorting dominant genes interact with each other to produce perticular phenotype but when they present alone they did not produce phenotype they are called - **[AIPMT-96]**

(1) Complementary gene

(2) Supplementry gene

(3) Duplicate gene

(4) Inhibitory gene

Q.120 Polygenic genes show - **[AIPMT-96]**

(1) Identical phenotype

(2) Identical biochemistry

(3) Different phenotype

(4) Identical genotype

Q.121 AB-Blood group shows - **[AIPMT-89]**

(1) Co-dominance

(2) Complete dominance

(3) Mixed inheritance

(4) Composite inheritance

Q.122 ABO blood group is an example of - **[AIPMT-90]**

(1) Epistasis

(2) Multiple allelism

(3) Pleotropism

(4) Complementary genes

Q.123 A child is blood group is 'O' His parents blood group can not be - **[AIPMT-94]**

(1) B & O (2) A & O

(3) AB (4) A & B

Q.124 If selfing occurs in the plant having genotype RrYy, then ratio of given genotype will be- RRYY. RrYY. RRYy. RrYy **[RPMT-2006]**

(1) 1 : 2 : 2 : 4 (2) 1 : 2 : 2 : 1

(3) 1 : 1 : 1 : 1 (4) 2 : 2 : 2 : 1

Q.125 If one parent has blood group A and the other parent has blood group B. The offspring have which blood group - **[MP PMT-98]**

(1) AB (2) O

(3) BO (4) A, B, AB, O

Q.126 A colourbind daughter is born when - **[MP PMT-98]**

(1) Father is colourblind, mother is normal

(2) Mother is colourblind, father is normal

(3) Mother is carrier, father is normal

(4) Mother is carrier, father is colourblind

Q.127 The process of mating between closely related individuals is - **[AIPMT-94]**

(1) Out-breeding (2) Inbreeding

(3) Hybridisation (4) Heterosis

Q.128 Ratio 9:7 is due to - **[AMU-93]**

(1) Supplementary genes

(2) Lethal genes

(3) complementry genes

(4) Epistatic genes

Q.129 A man of A blood group marries a woman of AB blood group. which type of progeny would indicate that man is heterozygous A - **[AIPMT-93]**

(1) AB (2) A

(3) O (4) B

Q.130 A child of O blood group. has B-blood group father, the genotype of father would be - **[AIPMT-92]**

(1) I^0I^0 (2) I^BI^B

(3) I^AI^B (4) I^BI^0

Q.131 Marriages between close relatives should be avoided becouse it includes more - **[MP PMT-90]**

(1) Recessive alleles to come together

(2) Mutations

(3) Multiple births

(4) Blood group abnormalities

Q.132 What ratio is expected in off springs if father is colour blind and mother's father was colour blind - **[AIPMT-1999]**

(1) 50% daughter - colour blind

(2) All the sons are colour blind

(3) All the daughters colour blind

(4) All the sons are normal

Q.133 Independent assortment of genes does not take place when - **[AIPMT-2001]**

(1) Genes are located on homologous chromosomes

(2) Genes are linked and located on same chromosome

(3) Gnes are located on non-homologous chromosome

(4) All the above

Q.134 What is true for monoclonal antibodies - **[AIPMT-2001]**

(1) These antibodies obtained from one parent and for one antigen

(2) These obtained from different parents and for one antigen

(3) These obtained from one parents and for many antigen

(4) These obtained from many parents and for many antigen

Q.135 Ratio of complementry genes is - **[AIPMT-2001]**

(1) 9 : 3 : 4 (2) 12 : 3 : 1

(3) 9 : 3 : 3 : 4 (4) 9 : 7

Q.136 A and B genes are linked. What shall be genotype of progeny in a cross bet. AB/ab and ab/ab - **[AIPMT-2001]**

(1) AAbb and aabb (2) AaBb and aabb

(3) AABB and aabb (4) None

Q.137 Two nonallelic genes produces the new phenotype when present together but fail to do so independently then it is called - **[AIPMT-2001]**

(1) Epistatisis

(2) Polygen

(3) Non complimentry gene

(4) Complimenatry gene

Q.138 Male XX and female XY sometime occur due to - **[AIPMT-2001]**

(1) Deletion

(2) Transfer of segments in X and Y chromosomes

(3) Anneuploidy

(4) Hormonal imbalance

Q.139 Which of the following is the example of pleiotropic gene - **[AIPMT-2002]**

(1) Haemophilia

(2) Thalaessemea

(3) Sickle cell anaemia

(4) Colour blindness

Q.140 There are three genes a,b,c percentage of crossing over between a and b is 20% b and c is is 28% and a and c is 8% What is the sequence of genes on chromosome - **[AIPMT-2002]**

(1) b, a c (2) a, b, c

(3) a, c, b (4) None

Q.141 The linkage map of X-chromosome of fruitfly has 66 units, with yellow body gene (y) at one end and bodded hair (b) gene at the other end. The recombination frequecy between these two genes (y and b) should be- **[AIPMT-2003]**

(1) 60% (2) > 50%

(3) ≤ 50% (4) 100%

Q.142 Pattern baldness, moustaches and beard in human males are examples of - **[AIPMT-2003]**

(1) Sex linked traits

(2) Sex limited traits

(3) Sex differentiating traits

(4) Sex-determining

Q.143 When a cluster of genes show linkage behaviour they - **[AIPMT-2003]**

(1) Do not show a chromosome map

(2) Show recombination during meiosis

(3) Do not show independent assortment

(4) Induce cell division

Q.144 Genetic Map is one that - **[AIPMT-2003]**

(1) Establishes sites of the genes on a chromosome

(2) Establishes the various stage in gene evolution

(3) Shows the stage during the cell division

(4) Shows the distribution of various species in a region

Q.145 One of the genes present exclusively on the X-chromosome in humans is concerned with- **[AIPMT-2003]**

(1) Baldness

(2) Red green colour bindness

(3) Facial hair/Moustaches in males.

(4) Night blindness

Q.146 The recessive genes located on X-chromosome in humans are always - **[AIPMT-2004]**

(1) Expressed in females

(2) Lethal

(3) Sub-lethal

(4) Expressed in males

Q.147 Lack of independent assortment of two genes A and B in fruit fly **Drosophila** is due to - **[AIPMT-2004]**

(1) Crossing over (2) Repulsion

(3) Recombination (4) Linkage

Q.148 A normal woman, whose father was colour-blind is married to a normal man. The sons would be - **[AIPMT-2004]**

(1) All colour-blind (2) 75% colour-blind

(3) 50% colour-blind (4) All normal

Q.149 In totmto, genotype aabbcc produces 100g tomatoes and AABBCC produces 160g tomatoes. What is contribution of each polygene in the production of tomatoes -

(1) 10 g (2) 20 g

(3) 30 g (4) 40 g

Q.150 If father shows normal genotype and mother shows a carrier trait for haemophelia - **[OLYMPIAD-2004]**

(1) All the female children will be carrier

(2) A male child has 50% chances of active disease

(3) Female child has probability of 50% to active disease

(4) All the female children will be colourblind

Q.151 In a genetic cross having recessive epistais, F_2 phenotypic ratio would be - **[AIPMT-90]**

(1) 9 : 6 : 1 (2) 15 : 1

(3) 9 : 3 : 4 (4) 12 : 3 : 1

Q.152 Which of the following is not a hereditary disease - **[AIPMT-2005]**

(1) Haemophilia (2) Cretinism

(3) Cystic fibrosis (4) Thalassaemia

Q.153 A woman with normal vision, but whose father was colour blind, marries a colour blind man. Suppose that the fourth child of his couple was a boy. This boy - **[AIPMT-2005]**

(1) Must have normal colour vision

(2) May be colour blind or may be normal vision

(3) Will be partially colour blind since he is heterozygous for the colour blind mutant allele

(4) Must be colour blind

Q.154 Haemiphilia is more commonly seen in human males than in human females because- **[AIPMT-2005]**

(1) This disease is due to a Y-linked recessive mutation

(2) This disease is due to an X-linked recessive mutation

(3) This disease is due to an X-linked dominant mutation

(4) A greater proportion of girls die in infancy

Q.155 A man and a woman, who do not show any apparent signs of a certain inherted disease, have seven children (2 daughters and 5 sons). Three of the sons suffer from the given disease but none of the daughters are affected. Which of the following mode of inheritance do you suggest for this disease - **[AIPMT-2005]**

(1) Sex-limited recessive

(2) Autosomal dominant

(3) Sex-linked recessive

(4) Sex-linked dominant

Q.156 Grain colour in wheat is determined by three pairs of polygenes. Following cross AABBCC (dark colour) x aabbcc (light colour), in F_2 generation what proportion of the porgeny is linkely to resemble either parent ?

[AIIMS-2005]

(1) None (2) Less than 5 percent
(3) One third (4) Half

Q.157 The genotype of a plant showing the dominant phenotype can be determined by –

[CPMT - 2010]

(1) Test cross (2) Dihybrid cross
(3) Pedigree analysis (4) Back cross

Q.158 ABO blood groups in humans are controlled by the gene I. It has three alleles – IA, IB and i. Since there are three different alleles, six different genotypes are possible. How many phenotypes can occur – **[CPMT - 2010]**

(1) Three (2) One
(3) Four (4) Two

Q.159 Select the correct statement from the ones given below with respect to dihybrid cross –

[CPMT - 2010]

(1) Tightly linked genes on the same chromo some show higher recombinations
(2) Genes far apart on the same chromosome show very few recombinations
(3) Genes loosely linked on the same chromo some shwo similar recombinations as the tightly linked ones
(4) Tightly linked genes on the same chromo some show very few recombination

Q.160 Which one of the following palindromic base sequences in DNA can be easily cut at about the middle by some particular striction enzyme?

[CPMT - 2010]

(1) 5' _____ CG TTCG _____ 3'
3' _____ATGGTA _____5'

(2) 5'_____GATATG _____3'
3'_____CTACTA _____5'

(3) 5'_____GAATTC _____3'
3'_____CTTAAG_____5'

(4) 5'_____CACGTA_____3'
3' CTCAGT_____5'

Q.161 Hybrid breakdown is failure of

[AFMC 1997]

(1) Hybrid zygote to develop into offspring
(2) Hybrid adult to produce fertile offspring
(3) Fusion failure of ova and sperms of two species
(4) All the above

Q.162 Hexaploid wheat developed through

[AIIMS 1997]

(1) Hybridomas
(2) Chromosome doubling
(3) Hybridisation
(4) Hybridisatin and chromosome doubling

Q.163 Genetic drift in mendelian population takes place in- **[CPMT 1998]**

(1) Small population (2) Large population
(3) Oceanin population (4) Never occurs

Q.164 Industrial melanism is example of

[CPMT 1999]

(1) Natural selection (2) Mutation
(3) Racial difference (4) Predation

Q.165 Frequency of an allele in an isolated population may change due to **[CPMT 2001]**

(1) Genetic drift (2) Gene flow
(3) Mutation (4) Natural selection

Q.166 In lederberg's replica plating experiment what shall be used to obtain streptomycin resistant strain:

[CPMT 2001]

(1) Minimal medium and streptomycin
(2) Complete medium and streptomycin
(3) Only minimal medium
(4) Only complete medium

Q.167 Forecoming generations are less adaptive than their parental generation due to- **[CPMT 2001]**

(1) Natural selection (2) Mutation
(3) Genetic drift (4) Adaptation

Q.168 Some bacteria are able to grow in Streptomycin containing medium due to **[CPMT 2002]**

(1) Natural selection
(2) Induced mutation
(3) Reproductive isolation
(4) Genetic drift

Q.169 Genetic drift operates in- **[CPMT 2002]**

(1) Small isolated population
(2) Large isolated population
(3) Fast reproductive population
(4) Slow reproductive population

Q.170 Sequence of which of the following is used to know the phylogeny- **[CPMT 2002]**

(1) m-RNA (2) r-RNA

(3) t-RNA (4) DNA

Q.171 Random genetic drift in a population probably results from:- **[CPMT 2003]**

(1) Highly genetically variable individuals

(2) Interbreeding within this population

(3) Constant low mutation rate

(4) Large population size

Q.172 Industrial melanism is an example of- **[CPMT 2003]**

(1) Drug resistance

(2) Darkening of skin due to smoke from industries

(3) Protective resemblance with the surroundings

(4) Defensive adaptation of skin against ultraviolet radiations

Q.173 A class of mutation induced by addition of deletion of a nucleotide is called - **[AMU 2002]**

(1) Missense (2) Non-sense

(3) Substitution (4) Frame shift

Q.174 The number of chromosome present in the cells of the bread wheat (Triticum aestivum) suggests that it is - **[AMU 2003]**

(1) Hexaploid (2) Diploid

(3) Tetraploid (4) Pentaploid

Q.175 A gene mutation which does not result in phenotypic expression is termed -**[AMU 2004]**

(1) Nonsense mutation

(2) Silent mutation

(3) Missense mutation

(4) Frame shift mutation

Q.176 Breeding is possible between two member of - **[AMU 2005]**

(1) Genus (2) Family

(3) Order (4) Species

Q.177 In which one of the following combinations (1-4) of the number of chromosomes is the present day hexaploid wheat correctly represented **[AIIMS 2006]**

Combination	(1)	(2)	(3)	(4)
Monosomic	21	7	21	41
Haploid	28	28	7	21
Nullisomic	42	40	42	40
Trisomic	43	42	43	43

Q.178 Which of the following may be true to for RNA- **[RPMT - 96]**

(1) A = U ≠ G = C

(2) A ≠ U ≠ G ≠ C

(3) A = U = G = C

(4) Purines = Pyrimidines

Q.179 The enzyme which can cut molecules of DNA in to segments is known as - **[MP PMT-94]**

(1) DNA Polymerase (2) DNA Ligase

(3) Restriction enzyme (4) DNA Gyrase

Q.180 The genes concerned with the production of cancer are called - **[MP PMT-95]**

(1) Cancer genes (2) Carcino genes

(3) Carcinomas (4) Onco genes

Q.181 Quantity of nucleic acids in animal cells is - **[RPMT - 95]**

(1) 2% (2) 5%

(3) 10% (4) 15%

Q.182 Nucleic acids are made up of - **[RPMT - 95]**

(1) Amino acids (2) Pentose sugars

(3) Nucleosides (4) Nucleotide

Q.183 Nucleic acids are polymer of - **[RPMT - 94, 85 AIPMT 78, 81]**

(1) Nucleotides (2) Nucleosides

(3) Amino acids (4) Nitrogen bases

Q.184 Who proved DNA as genetic material- **[RPMT - 94]**

(1) Griffith (2) Bacteria

(3) PPLO (4) Hershey and chase

Q.185 Circular and double stranded DNA occurs in **[RPMT - 94]**

(1) Golgibody (2) Mitochondria

(3) Nucleus (4) Cytoplasm

Q.186 If there are 10,000 base pairs in DNA, then its length - **[RPMT - 94]**

(1) 340 nm (2) 3400 nm

(3) 34000 nm (4) 340000 nm

Q.187 Code in RNA corresponding to AGCT in DNA- **[RPMT - 94]**

(1) TACA (2) UCGA

(3) TCGA (4) AGUC

Q.188 Double helix model of DNA which was proposed by Watson and crick was of - **[RPMT - 93]**

(1) C-DNA (2) B-DNA

(3) D-DNA (4) Z-DNA

Q.189 Mitochondrial DNA is - **[RPMT - 93]**

(1) Naked (2) Circular

(3) Double stranded (4) All the above

Q.190 If there are 10,000 nitrogenous base pairs in a DNA then how many nucleotides are there - **[RPMT - 93]**

(1) 500 (2) 10,000

(3) 20,000 (4) 40,000

Q.191 The process of m RNA sythesis on a DNA is known as - **[RPMT - 92]**

(1) Translation (2) Transcription

(3) Transduction (4) ransformation

Q.192 Double helix model of DNA is proposed by - **[RPMT - 92, DElHI PMT' 92]**

(1) Watson and Crick

(2) Schleiden and schwann

(3) Singer and Nicholson

(4) Kornberg and Khurana

Q.193 Which of the following nitrogen base is not found in DNA - **[AIPMT 8; RPMT - 92]**

(1) Thymine (2) Cytosine

(3) Guanine (4) Uracil

Q.194 Back bone of structure of DNA molecule is made up of - **[RPMT - 91]**

(1) Pentose Sugar and phosphate

(2) Hexose sugar and phosphate

(3) Purine and pyrimidine

(4) Sugar and phosphate

Q.195 Which of the following is called adaptor molecule - **[RPMT - 91]**

(1) DNA (2) m-RNA

(3) t-RNA (4) RNA

Q.196 Substance common in DNA and RNA - **[RPMT - 90]**

(1) Hexose Sugar (2) Histamine

(3) Thymine (4) Phosphate groups

Q.197 Which of following base pair is wrong - **[RPMT - 88]**

(1) A-T (2) G-C

(3) A-C (4) A-U

Q.198 Which may be attached with Adenine base in RNA - **[RPMT - 88]**

(1) Guanine (2) Cytosine

(3) Uracil (4) Thymine

Q.199 Nucleotide is - **[RPMT - 88]**

(1) N_2-base, pentose sugar and phosphoric acid

(2) Nitrogen, Hexose sugar and phosphoric acid

(3) Nitrogen base, pentose sugar

(4) Nitrogen base, trioses and phosphoric acid

Q.200 DNA differs from RNA in - **[RPMT - 88]**

(1) Only Sugar

(2) Nitrogen base only

(3) Nitrogen base and sugar

(4) None

Q.201 Who propounded the theory one gene one enzyme one chemical reaction- **[BHU' - 82'83]**

(1) Watson & Crick

(2) George Beadle and Edward Tatum

(3) Abraham Trembley

(4) T.H. Morgan

Q.202 A codon in m-RNA has - **[BHU - 83]**

(1) 3-bases

(2) 2-bases

(3) 1- base

(4) Number of bases very

Q.203 Unit of nucleic acids are - **[NCERT - 76]**

(1) Phosphoric acid

(2) Nitrogenous bases

(3) Pentose Sugar

(4) Nucleotide

Q.204 Which element is not found in nitrogenous base- **[NCERT - 76]**

(1) Nitrogen (2) Hydrogen

(3) Carbon (4) Phosphorus

Q.205 The link between successive generation is provided by - **[AIPMT - 81,84]**

(1) Nucleus (2) Cytoplasm

(3) Chromosomes (4) Nucleic acid

Q.206 DNA was first discovered by - **[AIPMT - 76, 85]**

(1) Meischer (2) Robert Brown

(3) Flemming (4) Watson & Crick

Q.207 Nucleic acids are found in - **[AIPMT - 80]**

(1) Nucleus

(2) Cytoplasm

(3) Both nucleus & Cytoplasm

(4) Nucleus & ribosome

Q.208 DNA is found in - **[AIPMT' 78, 80, MP. PMT - 86]**

(1) ER & Ribosomes

(2) Mitochondria, Plastid & nucleolus

(3) Sphersome & Peroxysome

(4) Plasma membrane & lysosome

Q.209 Nucleic acids are found in - **[RPMT' 90, MP. PMT - 90]**

(1) Nucleus & nucleolus

(2) Spherosome & Plastid

(3) Mitocondria & plastid

(4) Chloroplast & Nucleosome

Q.210 The contribution of cytoplasmic DNA in the total DNA of a cell - **[DELHI PMT - 86]**

(1) 90-99% (2) 65-75%

(3) 5-15% (4) 1-5%

Q.211 DNA is not present in - **[DELHI PMT '83, RPMT' 89]**

(1) Mitochondria (2) Chloroplast

(3) Bacteriophage (4) TMV

Q.212 A nucleic acid contains thymine or methylated uracil then it should be - **[BHU' 81]**

(1) DNA

(2) RNA

(3) Either DNA or RNA

(4) RNA of bacteria

Q.213 Prokaryotic genetic system contains - **[RPMT' 85]**

(1) DNA & histones

(2) RNA & histones

(3) Either DNA or histones

(4) DNA but no histones

Q.214 DNA histone complex can be removed from chromosome by treatment with -**[JIPMER -85]**

(1) 6 M NaCl + Mg [OH]2

(2) 1 M , NaCl

(3) Mg [OH]2

(4) Non-Separable

Q.215 Genetic information is carried by the long chain molecules which are made up of- **[BANGALORE PMT' 85]**

(1) Amino acids (2) Nucleotides

(3) Chromosomes (4) Enzymes

Q.216 A N2-base together with pentose sugar and phosphate forms (or) building-block unit of nucleic acid is - **[MPPMT' 85; ALIGARH PMT' 86]**

(1) Nucleoside (2) Polypeptide

(3) Nucleotide (4) Aminoacid

Q.217 One of the characteristics of DNA is - **[DELHI PMT' 84]**

(1) Uracil (2) Deoxyribose sugar

(3) Single strandedness

(4) Ability of protein synthesis

Q.218 What replaces thymine in RNA - **[AIPMT' 81, ALLMS' 82, BHU' 85]**

(1) Guanine (2) Adenine

(3) Uracil (4) Water

Q.219 Purine bases of DNA are - **[AIPMT' 83, 89, RPMT' 92]**

(1) U & G (2) A & G

(3) A & C (4) None

Q.220 Which of the following N2 bases are pyrimidines **[RPMT' 89]**

(1) T & C (2) T & A

(3) A & C (4) G & T

Q.221 Which of the following is not a pyrimidine N_2 base - **[JIPMER' 85]**

(1) Thymine (2) Cytosine

(3) Guanine (4) Uracil

Q.222 The base sequence of nucleic acid is AGG, GGA, CGA, CCA from this it can be inferred that it is a segment of - **[RPMT' 90]**

(1) DNA (2) m-RNA

(3) t-RNA (4) Data insufficient

Q.223 Kinds of N2 bases in nucleic acids are - **[AIPMT' 81, 84, 90]**

(1) Three (2) Four

(3) Five (4) Eight

Q.224 The purine & pyrimidine pairs of complementry strands of DNA are held together by - **[AIPMT' 80]**

(1) H-bonds (2) Q-bonds

(3) C-bonds (4) N-bonds

Q.225 Which purine & pyrimidine bases are paired together by H-bonds in DNA- **[BHU' 85]**

(1) AC & GT (2) GC & AT

(3) GA & TC (4) None of the above

Q.226 Watson & crick proposed the model of DNA structure in - **[AIPMT' 85]**

(1) 1953 (2) 1943

(3) 1955 (4) 1963

Q.227 A single stranded DNA is present in - **[AIPMT 80; ALLM'86, MPPMT'90]**

(1) TMV (2) Salmonella

(3) Coliphage $\phi \times 174$ (4) Bacteria

Q.228 What is the nature of the 2 strands of a DNA duplex - **[MPPMT'90]**

(1) Identical & Complimentary

(2) Antiparallel & complimentary

(3) Dissimilar & non complimentary

(4) Antiparallel & none complimentary

Q.229 DNA Replication occurs at - **[RPMT' 85; MP PMT'85]**

(1) Go & G-1 (2) G2 -stage

(3) S-Stage (4) Mitotic phase

Q.230 RNA synthesis is controlled by - **[AIPMT-89]**

(1) Rho-factor (2) Sigma factor

(3) Endo-nuclease (4) RNA-polymerase

Q.231 Duplication of DNA is called -**[AFMC;82, 84]**

(1) Replication (2) Transduction

(3) Transcription (4) Translation

Q.232 DNA polymerase enzyme is required for the synthesis of - **[BHU 87]**

(1) DNA From DNA (2) DNA from RNA

(3) Both the above

(4) DNA from nucleosides

Q.233 Ligase enzyme is used for - **[BHU' 85]**

(1) Denaturation of DNA

(2) Spliting DNA into small bits

(3) Joining bits of DNA

(4) Digestion of lipids

Q.234 In the base sequence of one strand of DNA is GAT, TAG, CAT, GAC what shall be the sequence of its complementary stand - **[AIMPT-90; MP PMT'90]**

(1) CAT, CTG, ATC, GTA

(2) GTA, ATC, CTG, GTA

(3) ATC, GTA, CTG, GTA

(4) CTA, ATC, GTA, CTG

Q.235 In the base sequence of one starand of DNA is CAT, TAG, CAT, CAT, GAC what would be the base sequence of its complementary m-RNA- **[AFMC' 82]**

(1) GUA, GUA, CUG, AUC, CUG

(2) AUG, CUG, CUC, GUA, CUG

(3) GUA, AUC, GUA, GUA, CUG

(4) GUC, CUG, CUG CUA, CUU

Q.236 A DNA strand is directly involved in the synthesis of all the following except - **[AIIMS' 81,85]**

(1) Another DNA (2) t-RNA & m-RNA

(3) r-RNA (4) Protein

Q.237 Strongest evidence that DNA is genetic material comes from - **[AIPMT 85; MP.PMT 84]**

(1) Chromosomes contain DNA

(2) Transformation of bacterial cells

(3) DNA is present in nucleus

(4) DNA is not present in cytoplasm

Q.238 Genetic code was discovered by - **[BHU 87]**

(1) Nirenberg & Mathei

(2) Kornberg & Crick

(3) Khorana & Kornberg

(4) Gamow

Q.239 Genetic code was deciphered by chemically synthesizing the trinucleotides by - **[MP PMT 90]**

(1) Wastson & Crick (2) Beadle & Tatum

(3) Briggs & King (4) M.W. Nirenberg

Q.240 Nitrenberg synthesized an m-RNA containing 34 poly-Adenine (A-A-A-A-A-A…….) and found a polypeptide formed of 11 poly-lysine this proved that genetic code for lysine was - **[AIPMT-'90; RPMT'91]**

(1) one-adenine (2) A-A doublet
(3) A-A-A triplet (4) Many adenines

Q.241 64 Codons constitute genetic code because **[AIPMT 90]**

(1) There was 64 types of amino acid
(2) 64 types of t-RNA
(3) Genetic code is triplet
(4) There are 64 enzymes

Q.242 Degeneracy of genetic code was discovered by- **[BHU' 86]**

(1) Mc Clintock (2) Khorana
(3) Ochoa
(4) Baurnfield & Nirenberg

Q.243 Genetic code consists of - **[AIPMT' 88]**

(1) Adenine & Guanine
(2) Guanine & Cytosine
(3) Cytosine & uracil
(4) All

Q.244 Which codon gives signal for the start of polypeptide (protein) chain synthesis- **[AIIMS 86]**

(1) AUG (2) UGA
(3) GUA (4) UAG

Q.245 The function of non-sense codons is - **[AIIMS 85]**

(1) To release polypeptide chain from t-RNA
(2) To form an unspecified amino acid
(3) To terminate the massage of a gene controlled protein synthesis -
(4) To convert a sense DNA into non sense DNA

Q.246 Termination of chain growth in protein synthesis is brought about by - **[AIIMS' 83]**

(1) UUG, UGC, UCA (2) UCG, GCG, ACC
(3) UAA, UAG, UGA (4) UUG, UAG, UCG

Q.247 Genetic code determines - **[AIPMT' 83]**

(1) Structural pattern of an organism
(2) Sequence of amino acid in protein chain
(3) Variation in offsprings
(4) constancy of morphological trait

Q.248 Which of the following is employed in recombinant DNA technology - **[BHU' 87]**

(1) Plastids (2) Plasmids
(3) Ribosomes (4) Histones

Q.249 Fuelgen reaction is employed to establish the presence of - **[BHU' 83' AFMC'83'AIPMT'85]**

(1) DNA (2) RNA
(3) Protein (4) Lipids

Q.250 Chargaff 's' rule is given as - **[RPMT 1998]**

(1) Purines Pyrimidines
(2) A + G = T + C
(3) A + U = G + C
(4) A + T/G +C = Constant

Q.251 In RNA, Nucleotides are bonded by - **[RPMT 1998]**

(1) H - bonds
(2) Phospo diester bonds
(3) Ionic bonds
(4) Salt linkage

Q.252 m-RNA is attached with - **[RPMT 1997]**

(1) E.R. (2) Ribosome
(3) Nucleus (4) Lysosome

Q.253 DNA of E.COLI - **[AIPMT 1998]**

(1) ds circular (2) ss circular
(3) ds linear (4) ss linear

Q.254 Knife of DNA is - **[AIPMT 1998]**

(1) DNA ligase
(2) Restriction endonuclease
(3) Exonuclease (4) Peptidase

Q.255 Segments of DNA which can move in genome- **[AIPMT 1998]**

(1) Introns (2) Exons
(3) Transposons (4) Cistrons

Q.256 Transcription means synthesis of - **[MP PMT 1998]**

(1) DNA (2) Protein
(3) m-RNA (4) Enzyme

Q.257 A nucleoside differs from a nucleotide is not having - **[MP PMT 1998]**

(1) Phosphate (2) Sugar
(3) Phosphate & sugar (4) Nitrogen base

Q.258 Wilkins X-ray diffraction showed the diameter of the DNA helix is - **[MP PMT 1998]**

(1) 10 Å (2) 20 Å

(3) 30 Å (4) 40 Å

Q.259 DNA fingerprinting method is very useful for - **[MP PMT 1998]**

(1) DNA tests for identity & relation ships

(2) Forensic studies

(3) Polymorphism

(4) All of the above

Q.260 A sequence of three consecutive bases in a t-RNA molecule which specifically binds to a complementary codon sequence in m- RNA is known as - **[MP PMT 1998]**

(1) Triplet (2) Non - sense codon

(3) Anti codon (4) Termination codon

Q.261 Number of base pairs in human chromosomes - **[AIPMT -99]**

(1) 3×10^9 (2) 3×10^7

(3) 6×10^8 (4) 6×10^7

Q.262 Gene composed of - **[AIPMT -99]**

(1) Amino acids (2) Polynucleotide

(3) Fatty acid (4) Nitrogen bases

Q.263 Function of Nucleases - **[AIPMT - 99]**

(1) Break the polynucleotide chain by breaking the each terminal nucleotide

(2) Breaks phosphodiester bond

(3) Breaks peptide bonds

(4) Breaks ester bonds

Q.264 Molecular wight of DNA in yeast is - **[AIPMT - 99]**

(1) 2.56×10^9 (2) 0.5×10^9

(3) 7×10^7 (4) 6×10^6

Q.265 Similarity in DNA and RNA - **[AIPMT-2000]**

(1) Both are polymer of nucleotides

(2) Both have similar pyrimidine

(3) Both have similar sugar

(4) Both are genetic material

Q.266 Length of one loop of B-DNA- **[AIPMT - 2000]**

(1) 3.4 nm. (2) 0.34 nm.

(3) 20 nm. (4) 10 nm.

Q.267 ATP is - **[AIPMT - 2000]**

(1) Nucleotide (2) Nucleoside

(3) Nucleic acid (4) Vitamin

Q.268 In three dimensional view the molecule of t-RNA is - **[AIPMT - 2000]**

(1) L-shaped (2) S-shaped

(3) Y-shaped (4) E-shaped

Q.269 Which of the following is initiation codon - **[AIPMT - 2000]**

(1) UAG (2) AUC

(3) AUG (4) CCU

Q.270 Method of DNA replication in which two strands of DNA separates and synthesize new strands- **[AIPMT - 2000]**

(1) Dispersive (2) Conservative

(3) Semiconservative (4) Non conservative

Q.271 In which stage of cell cycle, DNA replication occurs- **[AIPMT - 2000]**

(1) G1 - phase (2) S - phase

(3) G2 - phase (4) M - phase

Q.272 Extranuclear DNA is found in - **[AIPMT - 2000]**

(1) Lysosome and chloroplast

(2) Chloroplast and mitochondria

(3) Mitochondria and lysosome

(4) Golgi body and E.R.

Q.273 Which one of the following triplet codes, is correctly matched with its specificity for an amino acid in protein synthesis or as start or stop codon - **[AIPMT - 2003]**

(1) UCG - Start (2) UUU - Stop

(3) UGU - Leusine (4) UAC - Tyrosine

Q.274 During translation initiation in prokaryotes, a GTP molecule is needed in - **[AIPMT - 2003]**

(1) Formation of formyl-met-tRNA

(2) Binding of 30 S subunit of ribosome with mRNA

(3) Association of 30 S-mRNA with formyl-met RNA

(4) Association of 50 S subunit of ribosome with initiation complex

Q.275 In recent years, DNA sequences (nucleotide sequence) of mt-DNA and Y chromosomes were considered for the study of human evolution because- **[AIPMT - 2003]**

(1) They are small, and therefore, easy to study

(2) They are uniparental in origin and do not take part in recombination

(3) Their structure is known in great detail

(4) They can be studied from the samples of fossil remains

Q.276 Degeneration of a genetic code is attributed to the - **[AIPMT - 2003]**

(1) First member of a codon

(2) Second member of a codon

(3) Entire codon

(4) Third member of a condon

Q.277 What would happen if in a gene encoding a polypeptide of 50 amino acids, 25th codon (UAU) is mutated to UAA- **[AIPMT - 2003]**

(1) A polypeptide of 24 amino acids will be formed

(2) Two polypeptides of 24 and 25 amino acids will be formed

(3) A polypeptides of 49 amino acids will be formed

(4) A polypeptide of 25 amino acids will be formed

Q.278 During transcription, the DNA site at which RNA polymerase binds is called - **[AIPMT - 2003]**

(1) Promoter (2) Regulator

(3) Receptor (4) Enhancer

Q.279 Which of the following structures represents the peptide chain? **[AIPMT - 2004]**

(1) 
(2) 
(3) 
(4) 
Q.280 Which one of the following is a chain growth polymer ? **[AIPMT - 2004]**

(1) Starch (2) Nucleic acid

(3) Polystyrene (4) Protein

Q.281 The correct statement in respect of protein haemoglobin is that it - **[AIPMT - 2004]**

(1) functions as a catalyst for biological reactions

(2) maintains blood sugar leval

(3) acts as an oxygen carrier in the blood

(4) forms antibodies and offers resistance to diseases.

Q.282 Number of chiral carbons in β-D-(+) - glucose is - **[AIPMT - 2004]**

(1) five (2) six

(3) three (4) four

Q.283 The helical structure of proteins is stabilized by- **[AIPMT - 2004]**

(1) dipeptide bonds (2) hydrogen bonds

(3) ether bonds (4) peptide bonds

Q.284 Chemically hormones are **[AIPMT - 2004]**

(1) Biogenic amines only

(2) Proteins, steroids and biogenic amines

(3) Proteins only

(4) Steroids only

Q.285 In a mutational event, when adenine is replaced by guanine, it is case of - **[AIPMT - 2004]**

(1) Frameshift mutation

(2) Transcription

(3) Transition (4) Transversion

Q.286 In which one of the following enzymes, is copper necessarily associated as an activator ? **[AIPMT - 2004]**

(1) Carbonic anhydrase

(2) Tryptophanase

(3) Lactic dehydrogenase

(4) Tyrosinase

Q.287 During transcription, if the nucleotide sequence of the DNA strand that is being coded is ATACG, then the nucleotide sequence in the mRNA would be - **[AIPMT - 2004]**

(1) TATGC (2) TCTGG

(3) UAUGC (4) UATGC

Q.288 Which one of the following hormones is a modified amino acid ? **[AIPMT - 2004]**

(1) Epinephrine (2) Progesterone

(3) Prostaglandin (4) Estrogen

Q.289 The most abundant element present in the plants is - **[AIPMT - 2004]**

(1) Carbon (2) Nitrogen

(3) Manganese (4) Iron

Q.290 The following ratio is generally constant for a given species - **[AIPMT - 2004]**

(1) A + G /C + T (2) T + C / G + A

(3) G + C /A + T (4) A +C / T + G

Q.291 Which form of RNA has a structure resembling clover leaf ? **[AIPMT - 2004]**

(1) rRNA (2) hnRNA

(3) mRNA (4) tRNA

Q.292 After a mutation at a genetic locus the character of an organism chages due to the change in - **[AIPMT - 2004]**

(1) protein structure (2) DNA replication

(3) protein synthesis pattern

(4) RNA transcription pattern

Q.293 During replication of a bacterial chromosome DNA synthesis starts from a replication origin site and - **[AIPMT - 2004]**

(1) RNA primers are involved

(2) is facilitated by telomerase

(3) moves in one direction of the site

(4) moves in bi-directional way

Q.294 A sequence of how many nucleotide in messenger RNA makes a codon for an amino acid ? **[AIPMT - 2004]**

(1) Three (2) Four

(3) One (4) Two

Q.295 Which one of the following pairs is correctly matched with regard to the codon and the amino acid coded by it - **[AIIMS - 2004]**

(1) UUU-Valine (2) AAA-Lysine

(3) AUG-Cysteine (4) CCC-Alanine

Q.296 DNA is present in - **[AIIMS - 2004]**

(1) Chromosomes and dictyosome

(2) Chloroplast and lysosomes

(3) Mitochondria and chloroplasts

(4) Mitochondria and endoplasmic reticulum.

Q.297 Which of the following is the simplest amino acid- **[AIPMT - 2005]**

(1) Alanine (2) Asparagine

(3) Glycine (4) Tyrosine

Q.298 Enzymes, vitamins and hormones can be classified into a single category of biological chemicals, because all of these - **[AIPMT - 2005]**

(1) Are exclusively synthesized in the body of a living organism as at present

(2) Enhance oxidative metabolism

(3) Are conjugated proteins

(4) Help in regulating metabolism

Q.299 Which one of the following makes use of RNA as a template to synthesize DNA - **[AIPMT - 2005]**

(1) DNA dependant RNA polymerase

(2) DNA polymerase

(3) Reverse transcriptase

(4) RNA polymerase

Q.300 Nuclotides are building blocks of nucleic acids. Each nucleotide is a composite molecule formed by - **[AIPMT - 2005]**

(1) Base-sugar-OH

(2) Base-sugar-phosphate

(3) Sugar-phosphate

(4) (Base-sugar-phosphate)

Q.301 Protein synthesis in an animal cell occurs- **[AIPMT - 2005]**

(1) On ribosomes present in cytoplasm as well as in mitochondria

(2) On ribosomes present in the nucleolus as well as in cytoplasm

(3) Only on ribosome attached to the nuclear envelope and endoplasmic reticulam

(4) Only on the ribosomes present in cytosol

Q.302 Which one of the following hydrolyses internal phosphodiester bonds in a polynucleotide chain- **[AIPMT - 2005]**

(1) Lipase (2) Protease

(3) Exonuclease (4) Endonuclease

Q.303 Carbohydrates, the most abundant biomolecules on earth, are produced by- **[AIPMT - 2005]**

(1) Some bacteria, algae and green plant cells

(2) All bacteria, fungi and algae

(3) Fungi, algae and green plants cells

(4) Viruses, fungi and bacteria

Q.304 Production of a human protein in bacteria by genetic engineering is possible because **[AIPMT - 2005]**

(1) Bacterial cell can carry out the RNA splicing reactions

(2) The mechanism of gene regulation is identical in humans and bacteria

(3) The human chromosome can replicate in bacterial cell

(4) The genetic code is universal

Q.305 During transcription holoenzyme RNA polymerase binds to a DNA sequence and the DNA assumes a saddle like structure at that point. What is that sequence called- **[AIPMT - 2005, 07]**

(1) CAAT box (2) GGTT box

(3) AAAT box (4) TATA box

Q.306 Which functional group participates in disulphide bond formation in proteins - **[AIPMT - 2005]**

(1) Thioether (2) Thiol

(3) Thioester (4) Thiolactone

Q.307 Physical basis of life is - **[RPMT - 2005]**

(1) Cytoplasm (2) Protoplasm

(3) Nucleoplasm (4) Endoplasm

Q.308 Ribosomes are sites of which reaction- **[RPMT - 2005]**

(1) Respiration (2) Photosynthesis

(3) Protein synthesis (4) Fat synthesis

Q.309 In DNA purine nitrogen bases are - **[RPMT - 2005]**

(1) Uracil and Guanine

(2) Guanine and Adenine

(3) Adenine and cytosine

(4) None

Q.310 Which of the following diasaccharide gives two molecules of glucose on hydrolysis - **[RPMT - 2005]**

(1) Maltose (2) Lactose

(3) (1) and (2) both (4) Sucrose

Q.311 Which of the following is the example of acidic amino acid - **[RPMT - 2005]**

(1) Lysine (2) Glutamic acid

(3) Aspartic acid (4) (2) and (3) both

Q.312 Specificity of protein is due to - **[RPMT - 2005]**

(1) Types of amino acid

(2) Sequence of amino acid

(3) Number of amino acid

(4) Quantity of amino acid

Q.313 Bond between phosphate and sugar in a nucleotide is - **[RPMT - 2005]**

(1) H-bond

(2) Covalent bond

(3) Phosphodiester bond

(4) Sulphide bond

Q.314 The other name for glucose is -**[RPMT - 2005]**

(1) Grape sugar (2) Cane sugar

(3) Fructose (4) Galactose

Q.315 Which of the following is formed in nucleolus - **[RPMT - 2005]**

(1) r RNA (2) t RNA

(3) m-RNA (4) DNA

Q.316 Ribosomes are composed of **[RPMT - 2005]**

(1) DNA + Protein (2) DNA

(3) RNA + Protein (4) RNA + DNA

Q.317 The chemical in ovum which attracts sperms **[RPMT - 2005]**

(1) Fertilizin (2) Antifertilizin

(3) Agglutinin (4) Thrombin

Q.318 DNA probes are copied from the messenger RNA molecules with the help of - **[AIIMS - 2005]**

(1) Restriction enzymes

(2) Reverse transcriptase

(3) DNA polymerase

(4) Adenosine deaminase

Q.319 Which of the following biomolecule is insoluble in water - **[AIIMS - 2005]**

(1) α-Keratin (2) Haemoglobin

(3) Ribonuclease (4) Adenine

Q.320 Which one of the following statement is true for protein synthesis (translation) - **[AIIMS - 2005]**

(1) Amino acids are directly recognized by m-RNA

(2) The third base of the codon is less specific

(3) Only one codon codes for an amino acid

(4) Every t-RNA molecule has more than one amino acid attachment site

Q.321 Which antibiotic inhibits interaction between tRNA and mRNA during bacterial protein synthesis ? **[AIPMT - 2006]**

(1) Erthromycin (2) Neomycin

(3) Streptomysin (4) Tetracycline

Q.322 Amino acid sequence, in protein synthesis is decided by the sequence of -**[AIPMT - 2006]**

(1) tRNA (2) mRNA

(3) cDNA (4) rRNA

Q.323 One gene-one enzyme hypothesis was postulated by - **[AIPMT - 2006]**

(1) R.Franklin (2) Hershay and Chase

(3) A.Garrod (4) Beadle and Tatum

Q.324 One turn of the helix in a B-form DNA is approximately - **[AIPMT - 2006]**

(1) 20 nm (2) 0.34 nm

(3) 3.4 nm (4) 2 nm

Q.325 Antiparallel strands of a DNA molecule means that - **[AIPMT - 2006]**

(1) one strand turns anti-clockwise

(2) the phosphate group of two DNA stands, at their ends, share the same position

(3) the phosphate groups at the start of two DNA stands are in opposite position (pole)

(4) one strand turns clockwise

Q.326 The causative agent of mad-cow disease is - **[AIPMT - 2006]**

(1) Bacterium (2) Prion

(3) Worm (4) Virus

Q.327 During protein synthesis in an organism, at one point the process comes to a halt. Select the group of the three codons from the following from which any one of the three could bring about this halt- **[AIIMS - 2006]**

(1) UUU, UCC, UAU

(2) UUC, UUA, UAC

(3) UAG, UGA, UAA

(4) UUG, UCA, UCG

Q.328 Thymine is - **[AIIMS - 2006]**

(1) 5-Methyl uracil (2) 4-Methyl uracil

(3) 3-Methyl uracil (4) 1-Methyl uracil

Q.329 Molecular basis of organ differentiation depends on the modulation in transcription by **[AIPMT - 2007]**

(1) RNA polymerase (2) Ribosome

(3) Transcription factor

(4) Anticodon

Q.330 The Okazaki fragments in DNA chain growth - **[AIPMT - 2007]**

(1) Result in transcription

(2) Polymerize in the 3"-to5' direction and froms replication fork

(3) Prove semi-conservative nature of DNA replication

(4) Polymerize in the 5' to 3' direction and explain 3'-to-5' DNA replication

Q.331 The two polynucleotide chains in DNA are **[AIPMT - 2007]**

(1) Parallel (2) Discontinuous

(3) Antiparallel (4) Semiconservative

Q.332 About 98 percent of the mass of every living organism is composed of just six elements including carbon, hydrogen, nitrogen, oxygen and- **[AIPMT - 2007]**

(1) Phosphrous and sulphur

(2) Sulphur and magnesium

(3) Magnesium and sodium

(4) Calcium and phoshorus

Q.333 A plant requires magnesium for - **[AIPMT - 2007]**

(1) Holding cells together

(2) Protein synthesis

(3) Chlorophyll synthesis

(4) Cell wall development

Q.334 Polysome is formed by - **[AIPMT - 2008]**

(1) A ribosome with several subunits

(2) Ribosomes attached to each other in a linear arrangement

(3) Several ribosomes attached to a single mRNA

(4) Many ribosomes attached to a strand of endoplasmic recticulum

Q.335 Which one of the following pairs of nitrogenous bases of nucleic acids, is wrongly matched with the category mentioned against it ?
[AIPMT - 2008]
(1) Guanine, Adenine-Purines
(2) Adenine, Thymine-Purines
(3) Thymine, Uracil-Pyrimidines
(4) Uracil, Cytosine-Pyrimidines

Q.336 In the DNA molecule - **[AIPMT - 2008]**
(1) the proportion of Adenine in relation to thymine varies with the organism
(2) there are two stands which run antiparallel one in 5', 3' direction and other in 3', 5'
(3) the total amount of purine nucleotide and pyrimidine nucleotides is not always equal
(4) there are two strands which run parallel in the 5', 3' direction

Q.337 Which one of the following pairs of codons is correctly matched with their function or the signal for the particular amino acid ?
[AIPMT - 2008]
(1) AUG, ACG-Start/Methionine
(2) UUA, UCA-Leucine
(3) GUU, GCU-Alanine
(4) UAG, UGA-Stop

Q.338 What is antisense technology?
[AIPMT - 2008]
(1) When a piece of RNA that is complementry in sequence is used to stop expression of a specific gene
(2) RNA polymerase producing DNA
(3) A cell displaying a foreign antigen used for synthesis of antigens
(4) Production of somaclonal variants in tissue cultures

Q.339 What is not true for genetic code -
[AIPMT - 2009]
(1) It is unambigouous
(2) A codon in m RNA is read in a non-contiguous fashion
(3) It is nearly universal
(4) It is degenerate

Q.340 Removal of introns and joining the exons in a defined order in a transcription unit is called ?
[AIPMT - 2009]
(1) Capping (2) Splicing
(3) Tailing (4) Transformation

Q.341 Semiconservative replication of DNA was first demonstrated in - **[AIPMT - 2009]**
(1) Salmonella typhimurium
(2) Dropsophila melanogaster
(3) Escherichia coli
(4) Streptococcus pneumoniae

Q.342 Whose experiments cracked the DNA and discovered unequivocally that a genetic code is a "triplet" - **[AIPMT - 2009]**
(1) Beadle and tatum
(2) Nirenberg and Mathaei
(3) Hershey and Chase
(4) Morgan and Sturtevant

Q.343 If one strand of DNA has the nitrogenous base sequence as ATCTG, what would be the compiementary RNA strand sequence ?
[AIPMT Pre 2012]
(1) UAGAC (2) AACTG
(3) ATCGU (4) TTAGU

Q.344 A normal-visioned man whose father was colour-blind, marries a woman whose father was also colour-blind. They have their first child as a daughter. What are the chances that this child would be colour-blind ? **[AIPMT Pre 2012]**
(1) zero percent (2) 25%
(3) 50% (4) 100%

Q.345 F_2 generation in a Mendelian cross showed that both genotypic and phenotypic rations are same as 1 : 2 : 1. It represents a case of :
[AIPMT Pre 2012]
(1) Dihybrid cross
(2) Monohybrid cross with complete dominance
(3) Monohybrid cross with incomplete dominance
(4) Co-dominance

Q.346 Removal of RNA polymerase III from nucleoplasm will affect the synthesis of :
[AIPMT Pre 2012]
(1) hn RNA (2) m RNA
(3) r RNA (4) t RNA

Q.347 Which one of the following is not a part of a transcription unit in DNA?
[AIPMT Pre 2012]
(1) A terminator (2) A promoter
(3) The structural gene (4) The inducer

Q.348 A certain road accident patient with unknown blood group needs immediate blood transfusion. His one doctor friend at once offers his blood. What was the blood group of the donor ?

[AIPMT Pre 2012]

(1) Blood group AB (2) Blood group O

(3) Blood group A (4) Blood group B

Q.349 Removal of introns and joining of exons in a defined order during transcription is called :

[AIPMT Pre 2012]

(1) Inducing (2) Slicing

(3) Splicing (4) Looping

Q.1 Which of the following terms represents a pair of contrasting factors of a character?
(1) Homozygous (2) Allele
(3) Heterozygous (4) Phenotypes

Q.2 Maize has ten pairs of chromosomes. How many linkage groups will be present, if all the genes are mapped?
(1) 20 (2) 5
(3) 40 (4) 10

Q.3 The complete set of chromOsome, inherited as a single unit from one parent, is known as
(1) Genome (2) Linkage
(3) Gene pool (4) Genotype

Q.4 Which of the following explains, how progeny can possess the combinations of traits that none of the parent possessed?
(1) Law of segregation
(2) Chromosome theory
(3) Law of independent assortment
(4) Polygenic inheritance

Q.5 The presence of continuous phenotypic variation in an F_2-generation suggests that a character is inherited by
(1) Gene linkage
(2) Epistasis
(3) Polygenic inheritance
(4) Recombination

Q.6 Colour blindness, in which all colours are perceived as gray, is termed as
(1) Monochromasia (2) Chromasia
(3) Dichromasia (4) All of these

Q.7 The daughters born to haemophilic father and normal mother could be
(1) Haemophilic (2) Normal
(3) Carrier (4) All of these

Q.8 Which of the following are famous for chromosome heredity?
(1) Morgan and Sutton
(2) Beadle and Tatum
(3) Bridges and Morgan
(4) Sutton and Boveri

Q.9 Polyploidy results in rapid formation of new species because of
(1) Isolation behaviour
(2) Genetic recombination
(3) Development of multiple sets of chromosomes
(4) Mutation therapy

Q.10 Cis-trans test is related with
(1) Crossing over (2) Mutation
(3) Genetic map (4) Heredity

Q.11 Which of the following is an example of sex-linked inheritance?
(1) Night-blindness (2) Anaemia
(3) Colour-blindness (4) Cretinism

Q.12 A pregnant woman, who has done amniocentesis test, finds an extra barr body in her embryo. The syndrome which is likely to be associated with embryo is
(1) Edward's syndrome
(2) Down's syndrome
(3) Klinefelter's syndrome
(4) Patau's syndrome

Q.13 Genes present on V-chromosome are called
(1) Polygenic gene (2) Basic gene
(3) Pleiotropic gene (4) Holandric gene

Q.14 The hexaploid wheat is obtained by
(1) Chromosomes map
(2) Hybridomas
(3) Hybridization (4) Both (2) & (3)

Q.15 In sweet peas, genes C and P are necessary for colour in flowers. The flowers are white in the absence of either or both the genes. What will be the percentage of coloured flowers in the offspring of the cross Ccpp × ccPp?
(1) 75% (2) 25%
(3) 100% (4) 50%

Q.16 Epistatic effect, in which the dihybrid cross 9 : 3 : 3 : 1 between AaBb × AaBb is modified as

(1) Interaction between two alleles of the same loci

(2) Dominance of one allete on another aHele of the same loci

(3) Interaction between two alleles of different loci

(4) Dominance of one allele on another allele of both loci

Q.17 When a tall and red flowered individual is crossed with a dwarf and white flowered individual, phenotype in the progeny is dwarf and white. What will be the genotype of tafl and red flowered individual?

(1) TtRr (2) TTrr

(3) TTRr (4) TtRR

Q.18 Distance between two linked genes upon a chromosome is measured in the unit as

(1) Ratio of crossing over between them

(2) Cross-over value

(3) Number of other genes between them

(4) Interferance value

Q.19 The genes, which are confined to differential region of V-chromosome only, are called

(1) Mutant (2) Autosomal

(3) Holandric (4) Sex-linked

Q.20 XO-chromosomal abnormality in human beings causes

(1) Turner's syndrome

(2) Down's syndrome

(3) Klinefelter's syndrome

(4) Jacob's syndrome

Q.21 The root cell of wheat plant has 42 chromosomes. What would be the number of chromosomes in the synergid cell?

(1) 21 (2) 7

(3) 28 (4) 14

Q.22 If a homozygous red-flowered plant is crossed with a homozygous white-flowered plant, the offsprings will be

(1) Half-white flowered

(2) Half red-flowered

(3) All white-flowered

(4) All red-flowered

Q.23 "Gametes are never hybrid". This is a statement of

(1) Law of dominance

(2) Law of independent assortment

(3) Law of segregation

(4) Law of random fertilisation

Q.24 Mendel was not able to say anything about recombination and crossing over because

(1) He did not have a large and strong microscope

(2) He chose only pure type

(3) Traits he chose, were not linked and present on different chromosomes or were far apart

(4) Traits he chose had no genes

Q.25 Albinism and phenylketonuria are disorders due to

(1) Recessive autosomal genes

(2) Dominant autosomal genes

(3) Recessive sex genes

(4) Dominant sex genes

Q.26 Which of the following is the best way to determine paternity?

(1) Protein analysis

(2) Chromosome counting

(3) DNA finger printing

(4) Gene counting

Q.27 A man has enlarged breasts, sparse hair on body and sex compliment as XXV. He then suffers from

(1) Down's syndrome

(2) Klinefelter's syndrome

(3) Edward's syndrome

(4) Turner's syndrome

Q.28 Gene which suppresses other gene's activity but does not lie on the same locus is called as

(1) Epistatic (2) Supplementary

(3) Hypostatic (4) Codominant

Q.29 Barr Body is found in the cytoplasm during

(1) Interphase in cell of female mammal

(2) Interphase in cell of male mammal

(3) Prophase in cell of female mammal

(4) Prophase in cell of male mammal

Q.30 The ratio in a dihybrid test cross between two individuals is given by

(1) 2: 1 (2) 1 : 2 : 1

(3) 3: 1 (4) 1 : 1 : 1 : 1

Q.31 A chromosome carrying the centromere at one of the ends is called

(1) Acentric (2) Acrocentric

(3) Telocentric (4) Metacentric

Q.32 One of the genes present exclusively on the X-chromosome in humans is concerned with .

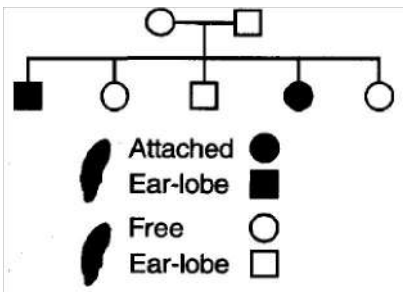
(1) Baldness

(2) Red-green colour blindness

(3) Facial hair/moustaches in males

(4) Night blindness

Q.33 Given below is a pedigree chart of a family with five children. It shows the inheritance of attached earlobes as opposed to the free ones. The squares represent the male individuals and circles the female individuals. Which one of the following conclusions drawn is correct?



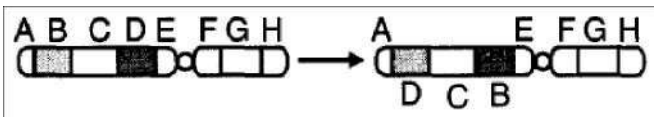
(1) The parents are homozygous recessive

(2) The trait is Y-linked

(3) The parents are homozygous dominant

(4) The parents are heterozygous

Q.34 Given below is a representation of a kind of chromosomal mutation. What is the kind of mutation represented?



(1) Deletion

(2) Duplication

(3) Inversion

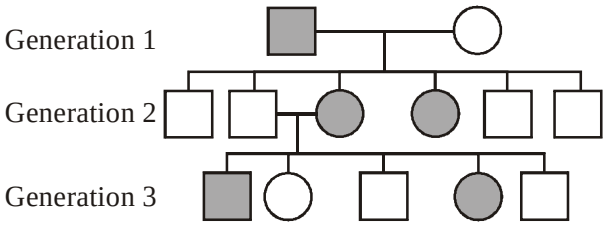
(4) Reciprocal translocation

Q.35 How many different types of gametes can be formed by F_1 progeny, resulting from the following cross : AA BB CC x aa bb cc?

(1) 3 (2) 8

(3) 27 (4) 64

Q.36 Given below is a pedigree chart showing the inheritance of a certain sex-linked trait in humans.



The trait traced in the above pedigree chart is

(1) Dominant X-linked

(2) Recessive X-linked

(3) Dominant V-linked

(4) Recessive V-linked

Q.37 Grain colour in wheat is determined by three pairs of polygenes. Following the cross AABBCC (dark colour) x aabbcc (light colour), in F_2 generation what proportion of the progeny is likely to resemble either parent?

(1) None

(2) Less than 5 percent

(3) One third (4) Half

Q.38 Primary source of allelic variation is

(1) Independent assortment

(2) Recombination

(3) Mutation (4) Polyploidy

Q.39 Which one of the following pair~ of features is a good example of polygenic inheritance?

(1) Human height and skin colour

(2) ABO blood group in humans and flower colour of Mirabi/is jalapa

(3) Hair pigment of mouse and tongue rolling in humans

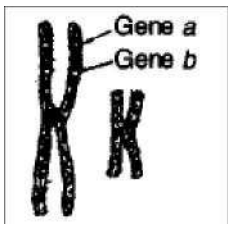
(4) Human eye colour and sickle cell anaemia

Q.40 Mating of an organism to a double recessive in order to determine whether it is homozygous or heterozygous for a character under consideration is called

(1) Reciprocal cross (2) Test cross

(3) Dihybrid cross (4) Back cross

Q.41 Given below is a highly simplified representation of the human sex chromosomes from a karyotype. The gene a and b could be of



(1) Colour blindness and body height

(2) Attached ear lobe and Rhesus blood group

(3) Haemophilia and red-green colour blindness

(4) Phenylketonuria and haemophilia

Q.42 Philadelphia chromosome is found in the patient suffering from

(1) Albinism

(2) Insomnia

(3) Myelocytic Leukaemia

(4) Hepatitis

Q.43 Nitrous acid causes mutation by

(1) Acting as a base analogue

(2) Addition of a base pair

(3) Hydrolysing base sugar linkage

(4) Removing amino group from the bases

Q.44 The "cri-du-char" syndrome is caused by change in chromosome structure involving

(1) Deletion (2) Duplication

(3) Inversion (4) Translocation

Q.45 Which one of the following combinations of the number of chromosomes is the correct representation of present day hexaploid wheat?

Combination	Monosomic		
Haploid	Nullisomic		
Trisomic			
(1) 21	28	42	43
(2) 7	28	40	42
(3) 21	7	42	43
(4) 41	21	40	43

Q.46 Which of the following are initiator codons?

(1) UGA and UAG (2) UUU and UUC

(3) AUG and GUG (4) UAA and UAG

Q.47 The jumping genes are called

(1) Cistrons (2) Mutons

(3) Transposons (4) Recons

Q.48 The new strand synthesised, in small pieces and then joined together during DNA replication, is called

(1) Dead strand (2) Lagging strand

(3) Leading stand (4) All of these

Q.49 Teminism is same as

(1) Transcription

(2) Translation

(3) Reverse transcription

(4) DNA synthesis

Q.50 Which of the following is not required for protein synthesis?

(1) t-RNA (2) r-RNA

(3) m-RNA (4) None of these

Q.51 Which of the following RNAs picks up specific amino acid from amino acid pool in the cytoplasm to ribosome during protein synthesis?

(1) t-RNA (2) m-RNA

(3) r-RNA (4) All of these

Q.52 If one strand of DNA has the nitrogenous base sequence ATGCTTGA, the sequence in the complementary strand will be

(1) TAGGTAGT (2) TACGTACT

(3) TACGAACT (4) TCCGAACT

Q.53 Restriction endonucleases are utilised in genetic engineering as
(1) Molecular scalpels for cutting DNA at specific sites
(2) Molecular builder of nucleotides
(3) Molecular degradation to DNA break up
(4) Molecular cement for combining DNA bits into long chains

Q.54 Extranuclear genes occurs in
(1) Plastids - and not inherited
(2) Plasmid - and not inherited
(3) Mitochondria - and inherited by female
(4) Mitochondria - and inherited by male

Q.55 In RNA thymine is replaced by
(1) Uracil (2) Adenine
(3) Methyl uracil (4) Guanine

Q.56 A point mutation comprising the substitution of a 63. purine by pyrimidine is called
(1) Transition (2) Translocation
(3) Deletion (4) Transversion

Q.57 Frameshift mutation occurs when
(1) Base is deleted
(2) Base is deleted or added
(3) Base is added
(4) Anticodons are not present

Q.58 Wobble hypothesis was given by
(1) R. W. Holley (2) M. Nirenberg
(3) H.G. Khorana (4) F.H.C. Crick

Q.59 Which one of the following pairs of terms / names mean one and the same thing?
(1) Gene pool - genome
(2) Codon - gene
(3) Cistron - triplet
(4) DNA fingerprinting - DNA profiling

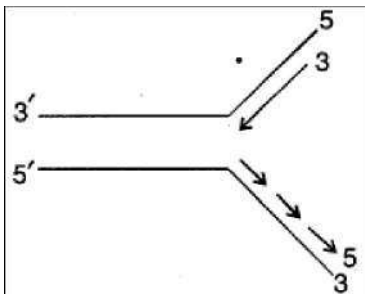
Q.60 What is false about tRNA?
(1) It binds with an amino acid at it 3' end
(2) It has double stranded regions
(3) It has a codon at one end which recognizes the anticodon on messenger RNA
(4) It looks like clover leaf in the two dimensional structure

Q.61 Which one of the following codons codes for the same information as UGC?
(1) UGU (2) UGA
(3) UAG (4) UGG

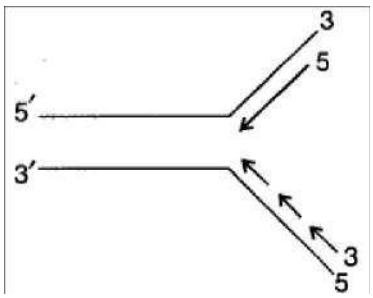
Q.62 The total number of nitrogenous bases in human genome is estimated to be about
(1) 3.5 million (2) 35 thousand
(3) 35 million (4) 3.1 billion

Q.63 Which one of the following correctly represents the manner of replication of DNA?

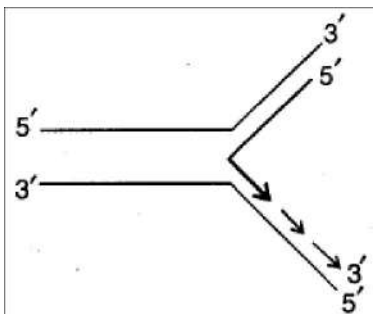
(1)



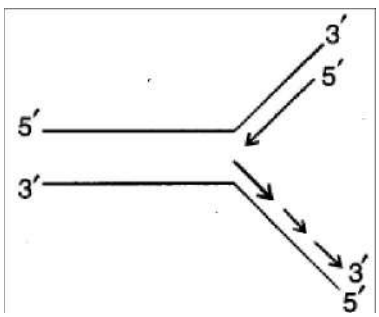
(2)



(3)



(4)



Q.64 What is the first step in the Southern Blot technique?
(1) Denaturation of DNA on the gel for hybridization with specific probe
(2) Production of a group of genetically identical cells
(3) Digestion of DNA by restriction enzyme
(4) Isolation of DNA from a nucleated cell such as the one from the scene of crime

Q.65 Which one of the following pairs is correctly matched with regard to the codon and the amino acid coded by it?

(1) UUA - valine (2) AAA - lysine

(3) AUG - cysteine (4) CCC - alanine

Q.66 cDNA probes are copied from the messenger RNA molecules with the help of

(1) Restriction enzymes

(2) Reverse transcriptase

(3) DNA polymerase

(4) Adenosine deaminase

Q.67 During protein synthesis in an organism at one point the process comes to a halt. Select the group of the three codons from the following, from which anyone of the three could bring about this halt,

(1) UUU, UCC, UAU

(2) UUC, UUA, UAC

(3) UAG, UGA, UAA

(4) UUG, UCA, UCG

Q.68 Which of the following correctly represents the flow of genetic information?

(1) DNA $\rightarrow$ RNA $\rightarrow$ protein

(2) RNA $\rightarrow$ DNA $\rightarrow$ protein

(3) RNA $\rightarrow$ protein $\rightarrow$ DNA

(4) Protein $\rightarrow$ RNA $\rightarrow$ DNA

INSTRUCTIONS FOR Q. NO. 69 TO 82

In the following questions (69 to 82), a statement of assertion (A) is followed by a statement of reason (R)

(1) If both Assertion & Reason are true and the reason is the correct explanation of the assertion, then mark (1).

(2) If both Assertion & Reason are true but the reason is not the correct explanation of the assertion, then mark (2).

(3) If Assertion is true statement but Reason is false, then mark (3).

(4) If both Assertion and Reason are false statements, then mark (4).

Q.69 **A :** Drosophila melanogaster is widely used in genetic research.

R : Drosophila melanogaster is readily available insect.

Q.70 **A :** In humans, the gamete contributed by the male determines whether the child produced will be male or female.

R : Sex in humans is a polygenic trait depending upon a cumulative effect of some genes on X-chromosome and some on Y-chromosome.

Q.71 **A :** A father may be a haemophilic only if his mother is carrier.

R : The father cannot pass on a sex-linked gene to his son.

Q.72 **A :** A single strand of m-RNA is capable of forming a number of polypeptide chains.

R : Tarmination codons occur in m-RNA.

Q.73 **A :** The non-allelic genes for red hair and freckles u) are usually inherited together.

R : The genes for red hair and freckles are located on same chromosome in close association.

Q.74 **A :** Chromosomal aberrations are caused by a break in the chromosome or itschromatid.

R : Duplication, deficiency, transversion and trans locations are the cause of chromosomal aberrations.

Q.75 **A :** 'Lac Operon Model' is applicable to E. coli.

R : E. coli. lacks a definite nucleus.

Q.76 **A :** Amber codon is a termination codon.

R : If in m-RNA, a termination codon is present, the protein synthesis stops abruptly whether the protein synthesis is completed or not.

Q.77 **A :** DNA codes are not copied in the synthesis of transfer RNA.

R : Transfer RNA move out of the nucleus and after attaching on the ribosomes, form the template.

Q.78 **A :** Watson and Crick provided experimental proof of semiconservative nature of DNA replication.

R : RNA polymerase binds nucleotides in replication.

Q.79 **A :** The mRNA attaches itself to the ribosome via its 3' and.

R : The mRNA has nucleotide and bases of lagging sequence.

Q.80 **A :** Replication and transcription occur in the nucleus but translation occurs in the cytoplasm.

R : mRNA is transferred from the nucleus into the cytoplasm where ribosomes and amino acids are available for protein synthesis.

Q.81 **A :** An organism with lethal mutation may not even develop beyond the zygote stage.

R : All types of gene mutations are lethal.

Q.82 **A :** Cancer cells are virtualy immortal untill the body in which they reside dies.

R : Cancer is caused by damage to genes regulating the cell division cycle.

ANSWER KEY

EXERCISE - 4

Ques.	81	82																		
Ans.	3	2																		

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first allempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

EXERCISE – 1

Q.1 Which of the following was not found in free state during origin of life-
(1) Ammonia (2) Methane
(3) Oxygen (4) Hydrogen

Q.2 Who gave experimental proof that hydrogen, methane, water and ammonia gave rise to amino acids-
(1) Stenley Miller (2) Charls Darwin
(3) Lamarck (4) Oparin

Q.3 Life originated in-
(1) Air (2) Earth
(3) Water (4) None of them

Q.4 Primitive atmosphere was made up of the mixture of-
(1) Oxygen, ammonia, methane, water
(2) Hydrogen, ammonia, methane, carbondioxide
(3) Hydrogen, steam, methane, ammonia
(4) Oxygen, methane, water, nickel

Q.5 Which compounds were formed in the direction of the origin of life-
(1) Urea, nucleic-acid (2) Urea, amino-acid
(3) Proteins, nucleic-acid
(4) Protein, amino-acid

Q.6 There was no life in-
(1) Mesozoic period (2) Cambrian period
(3) Palaeozoic period (4) Azoic period

Q.7 Pasteur gave-
(1) Cellular theory
(2) Recapitulation theory
(3) Germ theory of disease
(4) Germplasm theory

Q.8 Life originated-
(1) 8 billion years ago
(2) 6 billion years ago
(3) 3 billion years ago
(4) 1 billion years ago

Q.9 Stanley Miller synthesized in his experiment-
(1) Virus (2) Protein
(3) Amino acid (4) Cell

Q.10 What is found in bacteriophage-
(1) Nucleoprotein (2) DNA
(3) Carbon & nitrogen
(4) Protein

Q.11 Nucleoproteins gave first sign of-
(1) Species (2) Evolution
(3) Life (4) None

Q.12 What is most important for origin of life-
(1) Carbon (2) Oxygen
(3) Water (4) Nitrogen

Q.13 Miller synthesised simple amino-acid from-
(1) Methane, ammonia, oxygen, nitrogen
(2) Hydrogen, methane, ammonia, water
(3) Ammonia, methane, carbon dioxide, oxygen
(4) Hydrogen, oxygen, water, nitrogen

Q.14 Origin of life took place in which of the following period-
(1) Mesozoic (2) Proterozoic
(3) Precambrian (4) Devonian

Q.15 In which group one-celled animals and plants have been included-
(1) Protozoa (2) Monera
(3) Protista (4) Prokaryota

Q.16 Pasteur succeeded in disproving the theory of spontaneous generation because-
(1) The laboratory was clean
(2) He pulled out the neck of flask into a tube
(3) He was lucky
(4) Yeast used in flask were dead

Q.17 Spallanzani's experiment proved-
(1) Air is necessary for spontaneous generation
(2) Air from outside while entering the flasks carried small bacteria
(3) Air is unnecessary for spontaneous generation
(4) The contents of flask could not be boiled properly

Q.18 Believers of spontaneous generation theory believed that-
(1) Life originated from other similar organisms or spontaneously
(2) Life originated only spontaneously from non living material
(3) Life originated from similar organisms
(4) Life originated from air

Q.19 What it is necessary to boil instruments-
(1) For the comfort of patient
(2) To kill bacteria of operation theatre
(3) To kill bacteria on instruments
(4) For the comfort of doctor

Q.20 Life is not found on moon because of-
(1) Absence of carbon
(2) Absence of water
(3) Absence of nitrogen
(4) None of them

Q.21 Now the basis of origin of life is-
(1) Spontaneous generation
(2) God's desire
(3) Sunlight on garbage
(4) Chemical change

Q.22 Oxygen in atmosphere has been formed by-
(1) Evaporation of water
(2) Photosynthesis of plants
(3) Metabolism of microorganisms
(4) Decaying organisms

Q.23 Atmospheric carbon dioxide comes from-
(1) Action of microorganisms
(2) Smoke of industries
(3) Respiration of organisms
(4) Forest fire

Q.24 Primitive atmosphere was reducing because-
(1) Hydrogen atoms were few
(2) Hydrogen atoms were active and in greater numbers
(3) Nitrogen atoms were more
(4) Oxygen atoms were more

Q.25 Stage between living and non-living-
(1) Euglena (2) Bacteria
(3) Virus (4) Protista

Q.26 Who called larger colloidal particles of primitive sea as coacervates-
(1) Fox (2) Oparin
(3) Ampedocles (4) Haldane

Q.27 Who called water of primitive sea as pre biotic soup-
(1) Haldane (2) Oparin
(3) Fox (4) Huxley

Q.28 Who discovered virus-
(1) Stanley (2) Iwanovsky
(3) Fox (4) Ampedocles

Q.29 On the basis of karyon differentiation is carried out between-
(1) Protista and Monera
(2) Enaima and Anaima
(3) Prokaryota and Eukaryota
(4) None

Q.30 Oparin's Theory is based on-
(1) Artificial synthesis
(2) Spontaneous generation
(3) God's will
(4) All

Q.31 What is the basis of life-
(1) Proteins (2) Nucleic acids
(3) Nucleo proteins (4) Fatty acids

Q.32 Which biologist gave most logical biochemical theory of origin of life-
(1) Urey (2) Oparin
(3) Stanley Miller (4) Haeckal

Q.33 Which of the following set is the best evidence for organic evolution –
(1) Homologous & vestigial organs
(2) Analogous & vestigial organs
(3) Homologous & analogous organs
(4) All of them

Q.34 Kiwi is found in –
(1) India (2) England
(3) South America (4) Newzealand

Q.35 Which of the following structure is a solid proof of organic evolution –
(1) Wings of birds and bats
(2) Jointed legs in Arthropoda and mammals
(3) Gill clefts in vertebrate embryos
(4) Excretory organs of earthworm and cockroach

Q.36 Archaeopteryx is a connecting link because –
(1) It possessed characters of reptiles and aves
(2) It had characters of reptiles and mammals
(3) It was a reptile not a bird
(4) It had characters of nonchordates and chordates

Q.37 Which of the following set in man includes vestigial organs –
(1) Coccyx, vermiform appendix and ear muscles
(2) Body hair, atlas vertebra and ear muscles
(3) Coccyx, wisdom tooth and patella
(4) Body hair, cochlea and vermiform appendix

Q.38 Galapago islands are connected with which scientist –
(1) Wallace (2) Lamarck
(3) Malthus (4) Darwin

Q.39 According to recapitulation theory –
(1) Every animal begins as an egg
(2) Damaged body parts are formed new
(3) Offsprings are like parents
(4) Ontogeny repeats phylogeny

Q.40 Branch of biology which deals with fossils –
(1) Ethology (2) Ecology
(3) Paleontology (4) Ornithology

Q.41 Theory of evolution is best explanation for –
(1) Variation of animals and plant species
(2) Matter, energy and life
(3) Excessive multiplication rate in animals
(4) Environment

Q.42 Which animal has become extinct rather recently –
(1) Dinosaur (2) Pterodactyl
(3) Mammoth (4) Dodo

Q.43 Which of the organs in man is not likely to become extinct soon –
(1) Wisdom tooth (2) Blind spot
(3) Hair (4) Ear muscles

Q.44 Theory of evolution is mainly concerned with–
(1) Spontaneous generation
(2) Theory of special creation
(3) Gradual change
(4) Conditions of environment

Q.45 Peripatus is connecting link between –
(1) Mollusca and Arthropoda
(2) Flat worms and annelida
(3) Annelida and arthropoda
(4) Reptilia & Mammalia

Q.46 Prototheria have developed from –
(1) Birds (2) Eutheria
(3) Amphibia (4) Reptilia

Q.47 According to Haeckel's biogenetic law –
(1) Development of individual metazoa shows embryonic characters of ancestors
(2) Ontogeny repeats phylogeny
(3) Germplasm is immortal
(4) Every organism is produced by its parents

Q.48 Homologous organs have –
(1) Similar origin and similar or dissimilar functions
(2) Dissimilar origin and structure
(3) Dissimilar origin and function
(4) Dissimilar origin and similar functions

Q.49 Which of the following set has analogous organs –
(1) Hands of man, monkey and kangaroo
(2) Wings of insects, birds and bats
(3) Hind limbs of grasshopper, horse and bat
(4) Mouthparts of cockroach, mosquito and honey bee

Q.50 Which of the following set has homologous organs–
(1) Wings of bird and bat
(2) Wing of bat and hand of man
(3) Wings of insect and bird
(4) Wings of butterfly, bird and bat

Q.51 Who was the first to explain recapitulation theory –
(1) Weismann
(2) Von baer and Haeckel
(3) Darwin (4) Malthus

Q.52 Which theory explains 'ontogeny repeats phylogeny'–
(1) Mutation theory
(2) Heredity
(3) Recapitulation theory
(4) Theory of natural selection

Q.53 Analogous organs are –
(1) Similar in function
(2) Similar in structure
(3) Non functional
(4) Similar both in structure and function

Q.54 Connecting link between protozoa and one–celled plants is –
(1) Paramecium (2) Euglena
(3) Amoeba (4) Trypanosoma

Q.55 Which bird can not fly –
(1) Stark (2) Emu
(3) Duck (4) Peacock

Q.56 Connecting link between annelida and Mollusca–
(1) Cuttle fish (2) Octopus
(3) Neopilina (4) Nautilus

Q.57 Change with desent is the basis of which theory–
(1) Recapitulation theory
(2) Oparin's theory
(3) Theory of organic evolution
(4) Cell theory

Q.58 If a particular animal has shelled eggs, hair and teats on the body and has cloaca, it may be a connecting link between –
(1) Reptiles and birds
(2) Birds and mammals
(3) Reptiles and mammals
(4) None of them

Q.59 Which of the following sets do not have homologous organs –
(1) Wings of mosquito and butterfly
(2) Wings of butterfly and bird
(3) Mouth parts of cockroach and butterfly
(4) Forelegs of horse and paddles and butterfly

Q.60 Who attempted to solve mechanism of evolution for the first time –
(1) Darwin (2) Lamarck
(3) Haeckel (4) Oparin

Q.61 Evolution is defined as –
(1) Progressive history of race
(2) History and development of race, with variation's
(3) History of race
(4) Development of race

Q.62 Under which of the following conditions organic evolution could not have taken place –
(1) Acquired characters were not inherited
(2) Somatic variations were not inherited
(3) Individual in a population did not exhibit genetic virations
(4) All of them

Q.63 If a starfish possesses 6 arms instead of 5, it is an example of –
(1) Variation (2) Metamorphosis
(3) Biogenesis (4) Evolution

Q.64 Which represents a connecting link as an example of an evidence from comparative anatomy for organic evolution –
(1) Archaeopteryx between birds & mammals
(2) Java apeman between modern man and peking man
(3) Whale between fish and mammals
(4) Duck bill platypus between reptiles and mammals

Q.65 Life history of frog reflects evolution as shown by –
(1) Larva represents living fossil
(2) Phylogeny repeats ontogeny
(3) Ontogeny repeats natural selection
(4) Ontogeny repeats phylogeny

Q.66 Which of the following is the most primitive mammal–
(1) Spiny ant eater (2) Scaly ant eater
(3) Armadillo (4) All ancestors

Q.67 Primitive mammals providing evidence in organic evolution were found in —
(1) Africa (2) China
(3) India (4) Australia

Q.68 Fossilization can occur where –
(1) Animals are buried by natural process
(2) Animals are destroyed by scavangers
(3) Animals are eaten by predators
(4) Animals are destroyed by environmental conditions

Q.69 Why do we dig fossils and study them –
(1) To find new fossils that have not yet been recovered
(2) Fossil finding gives occupation to scientists
(3) Fossil fills the gaps in the evolution of animals of the post
(4) Fossils throw light on evolution of animals of the post

Q.70 Which of the following exhibit analogy –
(1) Paddles of whale and hands of man
(2) Wings of pigeon and wing of bat
(3) Wings of birds and wings of butterfly
(4) None

Q.71 Fossil X can be considered to have evolved earlier than fossil Y if –
(1) Y has vestigial structures that are homologous to functional structures in fossil X
(2) Y is structurally more complex than fossil X
(3) Y is in better state of preservation than X
(4) X is found in lower stratum of undisturbed sedimentary rock than Y

Q.72 Name of the scientist who gave Mutation theory-
(1) Wallace (2) Mathus
(3) Darwin (4) De Veries

Q.73 Darwin's Theory of Natural selection was based on-
(1) Inheritance of acquired characters
(2) Mutation
(3) Enormous rate of production in organism, struggle for existence and survival of the fittest
(4) Changes due to the use and disuse of organs

Q.74 What was the basic principle of Lamackism-
(1) Inheritance of acquired characters
(2) Survival of the fittest
(3) Natural selection
(4) Variations

Q.75 Book "Philosophie Zoologique" published in the year 1809 was written by-
(1) Darwin (2) Lamarck
(3) De Vries (4) Mendel

Q.76 Which scientist gave theory of continuity of Germplasm-
(1) Weismann (2) Mendel
(3) Lamarck (4) Darwin

Q.77 Which scientist gave the initial idea of survival of the fittest-
(1) Wallace (2) Spencer
(3) Darwin (4) Mendel

Q.78 For organic evolution which theory was given by Lamarck-
(1) Inheritance of acquired characters
(2) Inheritance of vestigial organs
(3) Inheritance of mutant characters
(4) Inheritance of characters from parents to offsprings

Q.79 New breeds of domestic dogs are developed by-
(1) Sexual selection (2) Natural selection
(3) Youth selection (4) Artificial selection

Q.80 Adaptation of organism is its-
(1) Moulting (2) Metamorphosis
(3) Inheritable trait (4) Acquired character

Q.81 Darwin explained origin of species through-
(1) Hybridization (2) Mutation
(3) Acquired characters (4) Natural selection

Q.82 The ship on which Darwin worked as naturalist was-
(1) Beagle (2) Century
(3) Seagel (4) Norway

Q.83 There would be no evolution if-
(1) The inheritance of acquired characters did not take place
(2) Somatic variation were not inheritable
(3) Genic variations were not found among members of population
(4) Somatic variations would not transforms into genic variations

Q.84 The book "Origin of Species" was published in the year-
(1) 1956 (2) 1809
(3) 1859 (4) 1844

Q.85 Who gave theory of Natural Selection-
(1) Charles Darwin (2) Lamarck
(3) Malthus (4) De Vries

Q.86 Which principle is associated with Darwin-
(1) Every cell is produced by a pre-exiting cell
(2) Survival of the fittest in the struggle for existence
(3) Inheritance of acquired characters
(4) Gamete receives only one of the contrasting characters

Q.87 If population of a species is transferred to more suitable environment then it will show-
(1) Protection against enemies
(2) More individuals would survive
(3) Rate of reproduction increases
(4) Unlimited food would be available

Q.88 The weakest point of Darwinism was that it had no explanation for-
(1) Struggle for existence
(2) Survival of the fittest
(3) Variations
(4) Enormous rate of production

Q.89 Snakes do not have legs because-
(1) Legs are lost during their entery in tunnels
(2) Legs are lost during evolution
(3) Ancestor of reptiles did not have legs
(4) There are no legs in lizards

Q.90 Which of the following facts develop suspicions in Lamarckism-
(1) Human female are not born with bored ear pinna although they have been bored thousand of years
(2) Giraffe has long neck to eat leaves of tall trees
(3) A stag can run fast to protect against the enemies
(4) None of them

Q.91 To be successful in evolution a mutation must occur in-
(1) Plasma proteins (2) Somatoplasm DNA
(3) Germplam DNA (4) RNA

Q.92 Of the following changes involved which one is irrelevant in the evolution of man-
(1) Change of diet form hard nuts and hard roots to soft food
(2) Loss of tail
(3) Perfection of hand for tool making
(4) Increase in the ability to communicate with other and develop community behavior

Q.93 One of the revolutionary concepts in biology was Charles Darwin's 'Origin of species' it deals with-
(1) Gene mutation
(2) Use and disuse of organs
(3) Germplasm theory
(4) Natural selection leading to the survival of the fittest

Q.94 Initiating force of evolution is-
(1) Natural selection (2) Mutation
(3) Adaptation (4) None of them

Q.95 What is the ultimate source of organic evolution-
(1) Mutation
(2) Sexual selection
(3) Natural selection
(4) Inheritance of acquired characters

Q.96 While explaining theory of Natural selection, Darwin was influenced by-
(1) Essay on population by Malthus
(2) Cell theory
(3) Mendel's Laws of inheritance
(4) None of them

Q.97 The concept of sudden genetic change which breeds true in a species is represented as-
(1) Inheritance of acquired characters
(2) Natural selection
(3) Laws of inheritance
(4) Mutation

Q.98 Mutations are mainly responsible for-
(1) Increasing population rate
(2) Maintaining genetic continuity
(3) Variation in organisms
(4) Extinction of organisms

Q.99 Mutations can be artificially induced by-
(1) Radiations (2) Chemical
(3) None of them (4) Both of them

Q.100 Mutation rate can be increased by-
(1) Exposing the individuals to sun
(2) Exposing individual to X-rays
(3) Giving nutritional changes to indiduals
(4) Increasing rate of reproduction

Q.101 Most of the natural mutations are-
(1) Useful (2) Harmful
(3) Neutral (4) Semilethal

Q.102 Mutation develops due to-
(1) Nutritional factor
(2) Infection of micro-organism
(3) Drugs
(4) Abrupt changes in genes

Q.103 Cause of mutation-
(1) Changes in DNA
(2) Changes in chromosomes
(3) Changes in gene (4) All of them

Q.104 Mutations are-
(1) Inheritable changes
(2) Changes which are not inheritable
(3) Changes acquired during life time of an individual
(4) Changes which may or may not be inheritable

Q.105 In the population of a species chances of the spreading of a mutant gene increases when it is-
(1) Recessive
(2) Natural selection occurs
(3) Dominant
(4) Neither dominant nor recessive

Q.106 We can not mutate particular gene because-
(1) Genes are very small and can not be seen under light microscope
(2) It is very expensive to do so
(3) Genes are situated on chromosomes
(4) We do not yet know how to exactly do it

Q.107 Which theory explains pure breeding and abrupt inheritable changes-
(1) Theory of inheritance of acquired characters
(2) Natural selection
(3) Mutation theory
(4) Theory of continuity of germplasm

Q.108 Discontinuous variations are-
(1) Acquired characters
(2) Essential factors
(3) Mutations
(4) Non essential factors

Q.109 Chances of inheritance and evolutionary changes are more in such species which reproduce by-
(1) Parthenogenesis
(2) Fission
(3) Sexual reproduction
(4) Asexual reproduction

Q.110 Mutation theory to explain mechanism of evolution was given by Hugo de Vries and he experiment on the-
(1) Garden pea (2) Fruit fly
(3) China rose (4) Evening primrose

Q.111 Which of the following is responsible for evolution according to Neo-Darwinism-
(1) Mutation
(2) Natural selection
(3) Mutation and Natural selection
(4) Either (1) or (2)

Q.112 A scientist kept 72 generations of Drosophila in darkness even after that the flies had normal eyes, this disproves the law of-
(1) Synthetic theory (2) Natural selection
(3) Use and disuse theory
(4) Acquired characters are inherited

Q.113 The ultimate source of organic variation is-
(1) Mutation (2) Sexual reproduction
(3) Natural selection (4) Hormonal action

Q.114 Which is the most important factor for evolution of new species-
(1) Geographic isolation
(2) Extensive in breeding
(3) Extensive out breeding
(4) None

Q.115 Which is a correct match-
(1) Darlington - DNA replication
(2) Mendel - Mutation
(3) Morgan - Father of genetics
(4) De Varies - Oenothera Lamarckiana

Q.116 Theory of continuity of germplasm was given by-
(1) Darwin (2) Larmarck
(3) Weismann (4) De Vries

Q.117 Gene pool is-
(1) Genotype of an individual of a population
(2) Different genes of all individual of a species found in an area
(3) Pool of artificially synthesised genes
(4) Genes of a genus

Q.118 Which of the following evidences does not favour the Lamarckian concept-
(1) Absence of limbs in snakes
(2) Presence of webbed toes in aquatic birds
(3) Melanization in peppered moth in industrial area
(4) Lack of pigment in cave dwelling animals

Q.119 Who wrote the book 'Genetics and origin of species which deals with synthetic theory of evolution –
(1) Dobzhansky (2) Haldane
(3) Mayr (4) De Vries

Q.120 The evolution of any species can be considered as sum total of the species with adaptive changes preserved by –
(1) Inheritance of acquired characters
(2) Isolation
(3) Natural selection (4) Mass conservation

Q.121 For evolution the most important requirement is–
(1) Natural selection
(2) Adaptation of acquired traits
(3) Variations
(4) Continuity of germplasm

Q.122 Use of atomic bombs may lead to abnormalities even in coming generations because of –
(1) Bodily changes
(2) Air pollution
(3) Changed atoms in atmosphere
(4) Genetic mutation

Q.123 Occurrence of 4 horns instead of two in goat is an example of –
(1) Continuous variation
(2) Discontinuous variation
(3) Inheritable variation
(4) Acquired variation

Q.124 Discontinuous variations are –
(1) Acquired character (2) Mutation
(3) Essential character (4) None of them

Q.125 Golden age of Dinosaurs was during
(1) Coenozoic era (2) Palaeozoic era
(3) Archeozoic era (4) Mesozoic era

Q.126 One field in which zoology and geology are closely connected-
(1) Palaeontology (2) Archeology
(3) Zoogeography (4) Morphology

Q.127 Fossils are dated by-
(1) Amount of calcium residues
(2) Amount of radioactive carbon compound
(3) Association with other mammals
(4) Structure of bones

Q.128 There was no life in which era-
(1) Mesozoic era (2) Palaeozoic era
(3) Coenozoic era (4) Azoic era

Q.129 What is sequence in the evolution of man-
(1) Fish → amphibian → bird → man
(2) Insect → fish → bird → man
(3) Fish → amphibian → reptile → man
(4) Fish→amphibians→reptiles→bird→man

Q.130 What helped reptiles to rule the earth for 10 million years-
(1) Large teeth
(2) Shelled eggs
(3) Stiff lungs
(4) External protective skeleton

Q.131 Which animals developed characters of mammals for the first time –
(1) Synapsid reptiles (2) Anapsid reptile
(3) Marsupials (4) Eutherians

Q.132 The name carboniferous period has been given because –
(1) Carbon was freely available in atmosphere
(2) Forests were buried under swamps forming anthracite
(3) Animals and plants started origin in this period
(4) Carbon and ferrous compounds were found in plenty

Q.133 What is the 'Age of Man' –
(1) Proterozoic (2) Recent
(3) Mesozoic (4) 100 years

Q.134 Age of fishes is the name of –
(1) Devonian period (2) Ordovician period
(3) Mesozoic era (4) Coenozoic era

Q.135 Rock mountain revolution took place after –
(1) Coenozoic era (2) Mesozoic era
(3) Paleozoic era (4) Proterozoic era

Q.136 Dinosaurs are –
(1) Primitive amphibians
(2) Extinct reptiles
(3) Giant mammals
(4) Primitive mammals

Q.137 Evolution of birds and mammals occured in –
(1) Eocene and oligocene periods
(2) Silurian and devonian periods
(3) Carboniferous and permian epochs
(4) Jurassic period

Q.138 The mesozoic era of earth is called the –
(1) Age of amphibians
(2) Age of armoured fishes
(3) Age of primitive man
(4) Age of ruling reptiles

Q.139 Study of fossils is called –
(1) Taxonomy (2) Teratology
(3) Gerontology (4) Palaeontology

Q.140 Hoofed animals (horse like) originated in –
(1) Pleistocene epoch (2) Oligocene epoch
(3) Miocene epoch (4) Eocene epoch

Q.141 Dinosaurs originated –
(1) After evolution of mammals
(2) With mammals
(3) Much before mammals
(4) Before mammals and they formed them

Q.142 An era "age of birds and mammals" is –
(1) Mesozoic (2) Palaeozoic
(3) Coenozoic (4) Cretaceous

Q.143 Which geological era / period is regarded as age of reptiles –
(1) Silurian (2) Carboniferous
(3) Mesozoic (4) Proterozoic

Q.144 Earliest fossil form in the phylogeny of horse is–
(1) Mesohippus (2) Equus
(3) Eohippus (4) Merychippus

Q.145 Java man belongs to-
(1) Africa (2) China
(3) Java (4) Africa, China & Java

Q.146 Which primate is closest to man during organic evolution-
(1) Gibbon (2) Gorilla
(3) Sinanthropus (4) Orangutan

Q.147 The prehistoric man which lived on earth during late pleistocene period-
(1) Neanderthal man (2) Australopithecus
(3) Cromagnon (4) Atlantic man

Q.148 Which character applies to Homo sapiens-
(1) Opposable toe (2) Large canine
(3) Craninal capacity 1450 cc
(4) Chin prominence absent

Q.149 Fossils of pithecanthropus have been recovered from-
(1) China (2) Germany
(3) Java (4) Japan

Q.150 Ancestor of man which for the first time showed bipedal movement-
(1) Cro-magnon (2) Australopithecu
(3) Java apeman (4) Peking man

Q.151 Cro-magnon was-
(1) Omnivorous (2) Carnivorous
(3) Herbivorous (4) Frugivorous

Q.152 Homo erectus is biological name of-
(1) Solo man (2) Neaderthal man
(3) Java man (4) Peking and Java man

Q.153 Homo erectus differed from cro-magnon in having-
(1) Jaws protruding out
(2) Tool making
(3) Sloping jaws (4) Arts and Paintings

Q.154 The probable direct ancestor of modern man is-
(1) Java man (2) Peking man
(3) Cromagnon man (4) Neanderthal man

Q.155 The probable first prehistroic man was-
(1) Ramapithecus (2) Homo habilis
(3) Australopithecus (4) Zinjanthropus

Q.156 Which of the following statement is correct-
(1) Proconsul was ancestor of man and ape
(2) Proconsul was ancestor of man and not of ape
(3) Apes were ancestor of man anatomically
(4) None of them

Q.157 Scientific name of man is-
(1) Canis familiaris (2) Homo habilis
(3) Homo erectus (4) Homo sapiens

Q.158 The first ancestor of man whose fossils have been recovered was-
(1) Pithecanthropus (2) Zinjanthropus
(3) Australopithecus (4) Neanderthal man

Q.159 Which character is not in the direction of evolution of man-
(1) Prehensile tail
(2) Steroscopic vision
(3) Small jaws
(4) Raised eyebrow ridges

Q.160 On which continent maximum fossils of prehistoric man have been found-
(1) Africa (2) Europe
(3) Asia (4) America

Q.161 Evolution of man took place because ape-like ancestor had-
(1) Developed brain (2) Binocular vision
(3) Large cranial capacity
(4) Migratory

Q.162 Most recent man found as fossil was -
(1) Java man (2) Peking man
(3) Cro-magnon man (4) Hiedelberg man

Q.163 The fossil of primitive man recovered from shivalik hills in India-
(1) Oligopithecus (2) Paranthropus
(3) Ramapithecus (4) Pliopithecus

Q.164 What was the cranial capacity of Java man-
(1) 400 cc (2) 650 cc
(3) 900 cc (4) 1450 cc

Q.165 Who discovered Java ape man-
(1) Leakey (2) Mayr
(3) Davidson black (4) Dubois

Q.166 The proper burial of dead bodies for the time started with which prehistoric man-
(1) Peking man (2) Neanderthal man
(3) Java man (4) Cromagonon man

Q.167 Scientific name of Java man is -
(1) Homo habilis
(2) Pithecantrhopus erectus
(3) Homo erectus erectus
(4) 2 & 3 both

Q.168 Who formed the tools for the first time-
(1) Australopitherus (2) Pithecanthropu
(3) Sinanthropus (4) Ramapithecus

Q.169 Evolution of man was possible because our ape like ancestor-
(1) Showed bipedal movement in open land
(2) Used fire
(3) Felt difficulty in nutrition
(4) Developed community hunting

Q.170 What is the contribution of W.C. Pei-
(1) He discovered Cro-magnon man
(2) He discovered Peking man
(3) He discovered Java man
(4) None of them

Q.171 C. Fuhlrott made an important discovery in evolution-
(1) Neanderthal man
(2) Cro magnon man
(3) Classification of man
(4) Characters of modern apes

Q.172 Character of Tarsius in the direction of hominid evolution-
(1) Smaller head (2) Nose not flat
(3) Large eyes (4) All of them

Q.173 Character of primitive monkey which was in the direction of evolution of man-
(1) Thumb parallel to fingers
(2) 32 teeth
(3) Prehensible tail
(4) Flat nose

Q.174 Which of the following is not kept in the family of man-
(1) Pithecanthropus (2) Homo
(3) Peking man (4) Shivapithecus

Q.175 Character of man which is most significant from evolution point of view-
(1) Foramen magnum shifted forward
(2) Larger cranial capacity
(3) Face orthognathous
(4) All of them

Q.176 Greatest advantage of bipedal movement-
(1) Forearms becoming free for carrying out order of brain
(2) Greater speed
(3) Supports the body properly
(4) Loss of weight

Q.177 Which fossil man had cranial capacity almost equal to modern man-
(1) Austraopithecus (2) Java ape man
(3) Neanderthal man (4) Peking man

Q.178 Fire for protection and cooking was first used by-
(1) Neanderthal man (2) Cro-Magnon
(3) Java man (4) Peking man

Q.179 Coloured rock paintings were first done by-
(1) Cro-Magnon man (2) Java ape man
(3) Peking man (4) Neaderthal man

Q.180 Evolution of man took place in-
(1) America (2) Australia
(3) Central Africa (4) Central Asia

Q.181 Largest cranial capacity was found in-
(1) Peking man (2) Neanderthal man
(3) Java man (4) Cro-magnon man

Q.182 Which ancestor of man first of all stood erect-
(1) Java apeman (2) Australopithecus
(3) Peking man (4) Cro-magnon

Q.183 Closest relative of man is-
(1) Java man (2) Neanderthal man
(3) Peking man (4) Cro-magnon man

EXERCISE – 2

Q.1 Founder of Palaeontology is :
(1) Lamarck (2) Erasmus Darwin
(3) G. Cuvier (4) Empedocles

Q.2 Which of the following cannot be explained by Lamarckism ?
(1) Absence of lips in snakes
(2) Long neck of giraffe
(3) Degeneration of visual apparatus in cave dwellers
(4) Dull progeny of Noble Laureate

Q.3 The "use and disuse theory" was proposed by:
(1) Gregor Mendel (2) Konrad Lorenz
(3) Malthus (4) Jean B. Lamarck

Q.4 The ship in which Charles Darwin travelled was:
(1) H.M.S. Beagle (2) Royal Ship
(3) Victoria (4) None of these

Q.5 Organic compounds first evolved on earth and required for origin of life were :
(1) Urea and amino acid
(2) Protein & nucleic acid
(3) Protein and amino acid
(4) Urea and nucleic acid

Q.6 Speciation occurs when :
(1) Populations are isolated by geographical barrier
(2) Populations are reproductively isolated
(3) Both of these
(4) None of these

Q.7 Struggle for existence and survival of fittest are related to :
(1) Lamarckism (2) Darwinism
(3) Oparin's theory (4) Mendelism

Q.8 Lamarckism fails to explain :
(1) Long neck of giraffe
(2) Loss of limbs in snake
(3) Presence of tail in mouse
(4) Webbed feet in swimming birds

Q.9 Gene frequency in a population remains stable unless and until there is-
(1) Random drift (2) Random mating
(3) Selection (4) Mutation

Q.10 Which is most important in speciation :
(1) Geographical isolation
(2) Reproductive isolation
(3) Ecological isolation
(4) Ethological isolation

Q.11 Darwin's explanation of the way in which evolution occurs is :
(1) God determines which species should evolve
(2) Progressive adaptations enable one species to leave more offsprings
(3) Certain species have 'built in' plans of evolution
(4) Those traits used most often persist longer

Q.12 Life cannot originate from inorganic materials upon the present earth because of
(1) High pollution
(2) Low temperature of earth
(3) Large amount of oxygen in atmosphere
(4) High temperature of earth

Q.13 Tectonic is the study of :
(1) Earth's crust (2) Earth quakes
(3) Volcanoes (4) Sand dunes

Q.14 Diversity in the type of beaks of finches adapted to different feeding habits on the Galapagos islands as observed by Darwin provides evidence for :
(1) Origin of species by natural selection
(2) Intraspecific variations
(3) Interspecific variations
(4) Interspecific competition

Q.15 Genetic drift operates only in :
(1) Island population (2) Smaller population
(3) Larger population (4)Mendalian population

Q.16 Successful adaptation simply means :
(1) An increase in fitness
(2) Producing offsprings
(3) Moving to a new place
(4) Evolving new characters

Q.17 Lamarck's theory is an evergreen superstition" was reported by :
(1) Charles Darwin (2) Darlington
(3) Hugo de Vries (4) Carlson

Q.18 Selecting the genetically improved domesticated plants and animals by man is-
(1) Natural selection (2) Artificial selection
(3) Hybrid selection (4) Any of above

Q.19 Theory of Pangenesis was proposed by :
(1) Lamarck (2) Darwin
(3) Hugo de Vries (4) Dobzhansky

Q.20 The phenomenon of Industrial melanism demonstrates :
(1) Natural selection
(2) Artificial selection
(3) Reproductive isolation
(4) Geographical isolation

Q.21 Who proposed germplasm theory against Lamarck's principle of '**use and disuse**'?
(1) Darwin (2) Nuttal
(3) Weismann (4) de Vries

Q.22 Birbal Sahani Institute of Palaeobotany is located at:
(1) New Delhi (2) Lucknow
(3) Kolkata (4) Kanpur

Q.23 What is evolution ?
(1) Development of organisms through time
(2) Development of a cell from chemicals
(3) Development of DNA nucleotides
(4) None of these

Q.24 Charles Darwin's theory of evolution was based on:
(1) Environment
(2) Mutations
(3) Chromosome pairing
(4) Natural selection

Q.25 The raw material for organic evolution is :
(1) Asexual reproduction
(2) Effect of hormones
(3) Nutritive substances
(4) Mutations

Q.26 Who proposed the mutation theory of evolution:
(1) Darwin (2) Hugo de Vries
(3) Lamarck (4) Huxley

Q.27 Chemical theory of origin of life was given by:
(1) Stanley Miller (2) Louis Pasteur
(3) Spallanzani (4) Oparin & Haldane

Q.28 Who did an experiment to prove that the organic compounds are the basis of life:
(1) K. Bahadur (2) Miller and Urey
(3) Melvin Calvin (4) Sydney Fox

Q.29 The book "Origin of Species" was written by :
(1) Darwin (2) Hugo de Vries
(3) Lamarck (4) Huxley

Q.30 Hugo de Vries worked on :
(1) Pisum (2) Lathyrus
(3) Oenothera (4) Mirabilis

Q.31 Industrial melanism is an example of :
(1) Natural selection
(2) Retrogressive evolution
(3) Adaptive convergence
(4) Artificial selection

Q.32 The first amphibians appeared during the period:
(1) Permian (2) Carboniferous
(3) Silurian (4) Devonian

Q.33 As evident from fossil records, which era had no life:
(1) Azoic (2) Proterozoic
(3) Palaeozoic (4) Coenozoic

Q.34 Who wrote the book "**Genetics and Origin of Species**" ?
(1) Hugo de Vries (2) Dobzhansky
(3) Huxley (4) R.A. Fischer

Q.35 Discontinuous variations were called '**sports**' by :
(1) De Vries (2) Lamarck
(3) Bateson (4) Darwin

Q.36 Book "Philosophic Zoologique" was written by:
(1) Lamarck (2) Darwin
(3) Hugo de Vries (4) Bateson

Q.37 Theory of "**Continuity of Germplasm**" was propounded by :
(1) August Weismann (2) Gregor Mendel
(3) Lamarck (4) Darwin

Q.38 Which of the following are homologous organs:
(1) Hand of man, wings of bat
(2) Eyes of man, eyes of squid
(3) gills of fish, lungs of man
(4) Leaf of moss, frond of fern

Q.39 Theory of spontaneous generation was given by

(1) Spallanzani (2) Von Helmont

(3) Redi (4) Pasteur

Q.40 Who disproved the theory of spontaneous generation ?

(1) Redi (2) Pauling

(3) Balkman (4) None of these

Q.41 Darwin's finches show which aspect of evolution ?

(1) Biogeographical (2) Industrial melanism

(3) Biochemical (4) Embryological

Q.42 The synthesis of first protein during the origin of the life was :

(1) from DNA

(2) from RNA

(3) from DNA & RNA both

(4) without nucleic acid and biocatalyst

Q.43 Darwin's theory states that :

(1) Characters are acquired through inheritance

(2) Nature selects species which can adapt

(3) Species changes morphologically with nature

(4) Effect of environment on evolution

Q.44 Similarities in organism with different genotype indicates :

(1) Microevolution

(2) Macroevolution

(3) Convergent evolution

(4) Divergent evolution

Q.45 Which of the following is closely related to man:

(1) Chimpanzee (2) Gorilla

(3) Orangutan (4) Gibbon

Q.46 Which of the following is correct order of the evolutionary history of man :

(1) Peking man,. Homo sapiens sapiens Neanderthal man, Cromagnon man

(2) Hedalberg , Peking man, Neanderthal man, Cromagnon man

(3) Peking man, Hedalberg man, Neanderthal man, Cromagnon man.

(4) Peking man, Neanderthal man, Homosapiens, Hedalberg man

Q.47 Which of the following was homologous organs-

(1) Wing of birds & Locust

(2) Wings of sparrow & wings of bat

(3) Wings of bat & butterfly

(4) Legs of frog and cockroach

Q.48 There is no life on moon due to the absence of:

(1) O_2 (2) Water

(3) Light (4) Temperature

Q.49 According to fossils which have been discovered up to present time, origin and evolution of man was started from which country -

(1) France (2) Java

(3) Africa (4) China

Q.50 The wings of bat, locust and pigeon are the examples of :

(1) Vestigeal organs

(2) Analogous organ

(3) Homologous organs

(4) Exoskeletal organs

Q.51 Convergent evolution is illustrated by-

(1) Rat and dog

(2) Bacterium and protozoan

(3) Starfish and cuttle fish

(4) Dogfish and whale

Q.52 Which one of the following sequences was proposed by Darwin and Wallace for organic evolution?

(1) Overproduction, variations, constancy of population size, natural selection

(2) Variations, constancy of population size, overproduction, natural selection

(3) Overproduction, constancy of population size, variations, natural selection

(4) Variations, natural selection, overproduction, constancy of population size

Q.53 Darwin in his "Natural Selection Theory" did **not** believe in any role of which one of the following in organic evolution ?

(1) Parasites and predators as natural enemies

(2) Survival of the fittest

(3) Struggle for existence

(4) Discontinuous variations

Q.54 Which one of the following describes correctly the homologus structures ?

(1) Organs with anatomical similarties, but performing different functions

(2) Organs with anatomical dissimilarities, but performing same functions

(3) Organs that have no function now, but had an important functions in ancestors

(4) Organs appearing only in embryonic stage and disappearing later in the adult

Q.55 What kind of evidence suggested that man is more closely related with chimpanzee than with other hominoid apes?

(1) Evidence from DNA from sex chromosomes only

(2) Comparion of chromosoems morphology only

(3) Evidence from fossil remains, and the fossile mitochondrial DNA alone

(4) Evidence from DNA extracted from sex chromosomes, autosomes and mitochondria

Q.56 Being all mammals, while dolphins, bat, monkey and horse have some common characters but they also show conspicuous differences. This is due to the phenomenon of-

(1) Normalisation (2) Genetic drift

(3) Divergence (4) Convergence

Q.57 Which one of the following was most likely absent in free form in the primordial atmosphere at the time of origin of life-

(1) Methane (2) Hydrogen

(3) Ammonia (4) Oxygen

Q.58 Initiating force of evolution is-

(1) Variation (2) Natural selection

(3) Adaptation (4) Competition

Q.59 Which one of the following experiments suggests that simplest living organisms could not have originated spontaneously from non-living matter-

(1) Larvae could appear in decaying organic matter

(2) Microbes did not appear in stored meat

(3) Microbes appeared from unsterilized organic matter

(4) Meat was not spoiled, when the heated and kept sealed in a vessel

Q.60 De Vries gave his mutation theory on organic evolution while working on-

(1) *Pisum sativum*

(2) *Drosophila melanogaster*

(3) *Oenothera lamarckiana*

(4) *Althea rosea*

Q.61 There are two opposing views about origin of modern man. According to one view Homo erectus in Asia were the ancestors of modern man. A study of variation of DNA however suggested African origin of modern man. What kind of observation of DNA variation could suggest this-

(1) Greater variation in Asia than in Africa

(2) Greater variation in Africa than in Asia

(3) Similar variation in Africa and Asia

(4) Variation only in Asia and no variation in Africa

Q.62 Which one of the following phenomena supports Darwin's concept of natural selection in organic evolution ?

(1) Development of transgenic animals

(2) Production of Dolly the sheep by cloning

(3) Prevalence of pesticide resistance insects

(4) Development of organs from stem cells for organ transplantation

Q.63 Which of the following is the relatively most accurate method for dating of fossils ?

(1) Radio-carbon method

(2) Potassium-argon method

(3) Electron spin resonance method of amino acid

(4) Uranium lead method

Q.64 Set which includes only analogous organs is-

(1) Wings of butterfly, housefly and bat

(2) Hindlegs of horse, grasshopper and bat

(3) Wings of butterfly and wingspread of bat and birds

(4) Mandibles of cockroach, mosquito and honey bee

Q.65 'Convergent Evolution' is shown by-

(1) Homologous organs

(2) Analogous organs

(3) Vestigial organs

(4) All of the above

Q.66 Example of analogous organs is-

(1) Wings of bird and insect

(2) Forelimbs of horse and man

(3) Teeth of elephant and man

(4) None of the above

Q.67 Which extinct animal shows evidences of evolution-

(1) *Peripatus* (2) *Neopilina*

(3) *Echidna* (4) *Archaeopteryx*

Q.68 The classical example of adaptive radiation in development of new species is-

(1) Darwin finches

(2) Marsupials of Australia

(3) Giant turtle (4) All of these

Q.69 Two organs which are similar in structure and origin, but not necessarily in function are called-

(1) Homologous (2) Analogous

(3) Apocrine (4) None of these

Q.70 Which one of the following amino acids was not found to be synthesized in Miller's experiment ?

(1) Alanine (2) Glycine

(3) Aspartic acid (4) Glutamic acid

Q.71 Jurassic period of the meosozoic era is characterised by-

(1) Flowering plants and first dinosaurs appear

(2) Gymnosperm are dominant plants and first birds appears

(3) Radiation of reptiles and origin of mammals -like reptiles

(4) Dinosaurs become extinct and angiosperms appear

Q.72 Which one of the following is not a living fossil?

(1) Peripatus (2) King Crab

(3) Sphenodon (4) Archaeopteryx

Q.73 Which one is correct.

(1) Wings of birds and insects are homologous

(2) Caecum and appendix in Rabbit and Man are analogous

(3) Paired fins of fish and flippers of whale are analogous

(4) Archaeopteryx lithographica is missing link between birds and mammals.

Q.74 The unit of natural selection is.

(1) A genus (2) A population

(3) An individual (4) Oxygen

Q.75 Which is the correct Aristotle's ladder of nature?

(1) Inanimate matter → lower plants → higher plants → zoophyta → entoma → ostracoderma→ malacia → malacostraca → fish → oviparous → quadrupeds → cetacea → birds → viviparous quadrupeds → humans.

(2) Inanimate matter → lower plants → higher → plants → zoophyta → entoma → malacia → malacostraca → ostracoderma → fish → oviparous quadrupeds → cetacea → birds → viviparous quadrupeds → humans .

(3) Inanimate matter → lower plats → higher → plants → zoophyta → malacia → malacostrace → ostracoderma → fish → oviparous quadrupeds → humans.

(4) Inanimate matter → lower plants → higher plants → zoophyta → entoma → ostracoderma → malacostraca → malacia → fish → cetacea → oviparous → quadrupeds → birds → viviparous quadrupesa → humans.

Q.76 Among the human ancestors the brain size was more than 1000 CC in-

(1) Homo erectus

(2) Ramapithecus

(3) Homo habilis

(4) Homo neanderthalensis

Q.77 Industrial melanism as observed in peppered moth proves that-

(1) The melanic form of the moth has no selective advantage over lighter form in industrial area

(2) The lighter form moth has no selective advantage either in polluted industrial area or non-polluted area

(3) Melanism is a pollution generated feature

(4) The true black melanic forms arise by a reocurring random mutation

Q.78 Select the correct statement from the following-

(1) Fitness is the end result of the ability to adapt and gets selected by nature

(2) All mammals except whales and camels have seven cervical vertebrae

(3) Mutation are random and directional

(4) Darwins variations are small and directionless

Q.79 What is common to whale , seal and shark ?

(1) Thick subcutaneous fat

(2) Convergent evolution

(3) Homiothermy

(4) Seasonal migration

Q.80 One of the important consequences of geographical isolation is-

(1) Preventing speciation

(2) Speciation through reproductive isolation

(3) Random creation of new species

(4) No change in the isolated fauna

ANSWER KEY

EXERCISE – 2

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

EXERCISE – 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Most advanced theory of origin of life is that of **[CET Chd. 2000]**

(1) Catastrophic (2) Haldane and Oparin

(3) Cosmozoic (4) Spontaneous.

Q.2 Possible early source of energy was **[AIIMS 2000]**

(1) Chlorophyll

(2) CO_2

(3) UV radiations and lightning

(4) Green plants.

Q.3 Swan-necked flask experiment was performed by **[KCET 2001]**

(1) Louis Pasteur (2) Robert Koch

(3) Francisco Redi (4) Aristotle.

Q.4 Spark discharge apparatus for testing chemical origin of life was designed by **[KCET 2001]**

(1) Urey and Miller

(2) Jacob and Monod

(3) Oparin and Haldane

(4) Dixon and Joly.

Q.5 Which is the most important for origin of life? **[Pb. PMT 2000]**

(1) Oxygen (2) Water

(3) Nitrogen (4) Carbon.

Q.6 Chemical theory for origin of life was given by **[Manipur 2006]**

(1) Stanley Miller (2) Oparin and Haldane

(3) Spallanzani (4) Louis Pasteur.

Q.7 Theory of spontaneous creaftion was supported by **[AFMC 2000]**

(1) Van Helmont (2) Redi

(3) Spallanzani (4) Pasteur.

Q.8 One of the greatest advocates of the theory of special creation was **[Pb. PMT 2000]**

(1) C. Darwin (2) Aristotle

(3) Father Saurez (4) Huxley.

Q.9 A compound important in prebiotic evolution was **[Har. PMT 2000]**

(1) SO_2 (2) CH_4

(3) SO_3 (4) NO

Q.10 Simple one-celled cyanobacteria-life organisms developed on earth **[Kerala 2000]**

(1) 5600 million years (2) 5000 million years

(3) 4600 million years (4) 3600 million years

(5) 3000 million years.

Q.11 Which ones are the most essential for origin of life ? **[AIIMS 2001]**

(1) Enzymes (2) Proteins

(3) Carbohydrates (4) Nucleic acids

Q.12 Approximate age of earth (in million years) is **[HPPMT 2001]**

(1) 3600 (2) 4600

(3) 7200 (4) 6000.

Q.13 According to theory of abiogenesis, life originates from **[Kerala 2002, DPMT 2009]**

(1) Non-living

(2) Spontaneously

(3) Chemicals

(4) Other planets.

Q.14 A biogenesis is **[CPMT 2002]**

(1) Origin of life from non-living organisms

(2) Origin of microbes from living organisms

(3) Spontaneous

(4) Origin of microbes and viruses.

Q.15 Experiment to prove chemical basis of origin of life carried out by Urey and Miller used NH_3 and **[Bihar PMT 2002]**

(1) H_2O and H_2 (2) H_2, CH_4 and H_2O

(3) CH_4 and H_2O (4) CH_4 and O_2

Q.16 Miller's experiment provided evidence for theory of **[Orissa 2002]**

(1) Special creation

(2) Biogenesis

(3) Abiogenesis

(4) Organic evolution.

Q.17 Experimental proof that organic compounds formed the basis of evolution was given by **[DPMT 2002]**

(1) Oparin (2) Pasteur

(3) Miller and Urey (4) Spallanzani.

Q.18 Which of the following has been basic to origin of life **[CET Chd. 2003]**

(1) Carbohydrates (2) Proteins

(3) Nucleic acids (4) Nucleoproteins.

Q.19 Theory of abiogenesis or spontaneous generation was finally disapproved by **[Kerala 2003]**

(1) Louis Pasteur (2) A.I. Oparin

(3) A.R. Wallace (4) Sidney Fox.

Q.20 Given below are assertion and reason. Point out if both are true with reason being correct explanation (A), both true but reason is not correct explantion (B), assertion true but reason is wrong (C), both are wrong (D). **Assertion.** Coacervates are believed to be precursors of life. **Reason.** Coacervates were self duplicating aggregates of proteins surrounded by lipid molecules. **[AIIMS 2004, 2008]**

(1) (2)

(3) (4)

Q.21 Coacervates were experimentally produced by **[KCET 2004]**

(1) Oparin and Sidney Fox

(2) Fischer and Huxley

(3) Jacob and Monod

(4) Urey and Miller.

Q.22 Who disapproved abiogenesis for the first time? **[Manipal 2004]**

(1) Lamarck (2) F. Redi

(3) Pasteur (4) Darwin.

Q.23 Which experiment suggests that simplest living organisms could not have originated spontaneously from non-living matter ? **[CBSE 2005]**

(1) Microbes did not appear in stored meat.

(2) Microbes appeared from unsterilised organic matter.

(3) Larvae could appear in decaying organic matter.

(4) Meat was not spoiled when heated and kept in sealed vessel.

Q.24 Origin of life from pre-existing life is propounded by **[JKCMEE 2005, Har PMT 2007]**

(1) Biogenesis theory

(2) Abiogenesis theory

(3) Special creation theory

(4) Extra terrestrial theory.

Q.25 Extra terrestrial origin of life was proposed by theory of **[DPMT 2005]**

(1) Catastrophism

(2) Spontaneous generation

(3) Special creation

(4) Panspermia.

Q.26 Stanley Miller's experiment supports+ **[Manipal 2005]**

(1) Abiogenesis (2) Biogenesis

(3) Pangenesis (4) Chemical theory.

Q.27 Cyanobacteria originated on earth about **[HPPMT 2005]**

(1) 4·3–4·8 billion years ago

(2) 3·3–3·8 billion years ago

(3) 2·3–2·8 billion years ago

(4) 1·3–1·8 billion years ago.

Q.28 Coacervates belong to the category of **[Pb. PMT 2005]**

(1) Protozoans

(2) Molecular aggregates

(3) Molecular aggregates surrounded by lipid membrane

(4) Cyanobacteria.

Q.29 The oldest fossil record of blue-green alga is 2.9 billion years old. It is **[Pb. PMT 2005]**

(1) Stromatolites (2) *Archaeopteryx*

(3) *Archaeopteroides* (4) *Chlamydomonas.*

Q.30 First life consisted of **[Pb. PMT 2005]**

(1) Provirus (2) Virus

(3) Bacteria (4) Protovirus.

Q.31 Which of the following amino acids was not found to be synthesised in Miller's experiment? **[CBSE 2006, AFMC 2008]**

(1) Alanine (2) Glycine

(3) Aspartic acid (4) Glutamic acid.

Q.32 Given below are assertion and reason. Point out if both are true with reason being correct explanation (A), both true but reason is not correct explantion (B), assertion true but reason is wrong (C), both are wrong (D).

Assertion. The earliest organisms that appeared on earth were nongreen and presumably anaerobes.

Reason. The first autotrophic organisms were the chemoautotrophs that never released oxygen **[AIIMS 2006, 2008]**

(1) (2)

(3) (4)

Q.33 Miller and Urey performed an experiment to prove the origin of life. They took gases ammonia and hydrogen alongwith **[AMU PMDC 2006, 2008]**

(1) N_2 and H_2O (2) CH_4 and N_2

(3) H_2O and CH_4 (4) CO_2 and NH_3

Q.34 The term hot dilute soup was given by **[HPPMT 2007, DPMT 2008]**

(1) Haldane (2) Urey

(3) Oparin (4) None of the above

Q.35 Coacervates are **[DPMT 2007]**

(1) Protein aggregates

(2) Protein and lipid aggregates

(3) Chemical aggregates

(4) Protobionts with polysaccharides, proteins and water.

Q.36 Concept of chemical evolution of life is based on **[CBSE 2007]**

(1) Effect of solar radiations on chemicals

(2) Interaction of water, air and clay under intense heat

(3) Combination of chemicals under hot moist environment coditions

(4) Crystallisation of chemicals.

Q.37 Select the wrong pair **[Keral 2007]**

(1) Haldane ..... Hot dilute soup

(2) Oparin ..... Protobionts

(3) Spallanzani ..... Abiogenesis

(4) Fox ..... Coacervates

(5) Redi ..... Biogenesis.

Q.38 The living form resulting from the final stage of chemical evolution of life is called **[COMED-K's 2007]**

(1) Prebiont (2) Protobiont

(3) Protenoid (4) Probiont.

Q.39 Scientists believe that life on earth originated by **[HPPMT 2007, Orissa 2010]**

(1) Spontaneous generation

(2) Chemical evolution/Abiogenesis

(3) Special creation

(4) Extraterrestrial transfer.

Q.40 Which of the following was formed in S. Miller's exeriment ? **[CPMT 2008]**

(1) Microspheres (2) Nucleic acids

(3) Amino acids (4) UV radiations.

Q.41 S.L. Miller's closed flask contained **[JKCMEE 2008]**

(1) CH_4

(2) NH_3 and water vapours

(3) H_2 (4) All the above

Q.42 Microspheres possessed a membrane of **[DPMT 2008]**

(1) Lipid and protein (2) Lipid

(3) Carbohydrates (4) Fats.

Q.43 Which is incorrect about protobionts in abiogenic origin of life ? **[CBSE 2008]**

(1) They were partially isolated from surroundings

(2) They could maintain an internal environment

(3) They were able to reproduce

(4) They could separate combination of molecules from the surroundings.

Q.44 Origin of life occurred in **[MPPMT 2009, 2010]**

(1) Precambrian (2) Coenozoic

(3) Palaeozoic (4) Mesozoic.

Q.45 In their experiment to prove origin of life, Miller and Urey took gases **[CPMT 2009]**

(1) Methane, ethane, hydrogen, ammonia

(2) Methane, ethane, ammonia, water vapours

(3) Methane, ethane, ammonia, water vapours

(4) Ammonia, water vapours, butane, hydrogen.

Q.46 Miller performed experiment to prove abiogenetic molecular evolution of life. Which molecule was not present in Miller's experiment **[CPMT 2010]**

(1) Water (2) Methane

(3) Oxygen (4) Ammonia.

Q.47 Which is incorrect **[CPMT 2010]**

(1) J.B.S Haldane – Law of continuity of germplasm

(2) Lauis Pasteur – Germ theory of disease and immunology

(3) De vries – Mutation theory

(4) Lemaitre – Big bang theory.

Q.48 In early earth, water and carbon dioxide were produced by the combination of O_2 with **[Kerala 2010]**

(1) Ammonia and methane

(2) Organic matter

(3) Hydrogen sulphide

(4) Hydrogen.

Q.49 Primitive atomosphere of earth contained water vapours, hydrogen, ammonia and **[HPPMT 2010]**

(1) CO_2 (2) O_2

(3) N_2 (4) Methane

Q.50 Oparin-Haldane's view on the origin of life was first experimentally proved by **[JKCMEE 2010]**

(1) Malthus (2) Plato

(3) Louis Pasteur (4) Stanley Miller

Q.51 Fossils are studied for **[CET Chd. 2000]**

(1) Tracing evolutionary history of organisms

(2) Studying extinct organisms

(3) Filling gaps in our study

(4) Providing jobs to scientists.

Q.52 Theory 'Ontogeny recapitulates Phylogeny' was proposed by **[AMU 2000]**

(1) Mendel (2) Haeckel

(3) Erasmus (4) Weismann.

Q.53 Monkeys and some lower groups have certain blood groups which are **[AMU 2000]**

(1) Identical to those of man

(2) Identical to those of anthropod apes

(3) Identical to those of anthropod apes

(4) Some what similar to white persons

(5) Not identical to those of man.

Q.54 Organic evolution is change in **[AMU 2000]**

(1) Single individual

(2) A few members of population

(3) Major portion of population

(4) Entire population.

Q.55 A bird with teeth is **[AMU 2000]**

(1) Kiwi (2)Ostrich/King Vulture

(3) Dodo (4) *Archaeopteryx*.

Q.56 Heart is four chambered in **[AMU 2000]**

(1) Amphibia (2) Fishes

(3) Mammals (4) Reptiles.

Q.57 Living organism with oldest fossil history is **[CPMT 2000, AMU 2000]**

(1) Dinosaur (2) *Archaeopteryx*

(3) Horse (4) Man.

Q.58 Homologus organs are **[AMU 2000]**

(1) Humna eyes and Squid eyes

(2) Gills of Fish and lungs of Man

(3) Hands of Man and wings of Bat

(4) Leaf of Moss and frond of Fern.

Q.59 Coal has been mainly formed by **[AFMC 2000]**

(1) Bryophytes

(2) Pteridophytes/pteridosperms

(3) Angiosperms

(4) Algae.

Q.60 Darwin's finches provide evidence evolution from **[CBSE 2000, AFMC 2007]**

(1) Anatomy (2) Morphology

(3) Biogeography (4) All the above.

Q.61 Which one is not vestigial in humans ? **[CBSE 2000, AFMC 2007]**

(1) Third molar

(2) Coccyx

(3) Segmental abdominal muscles

(4) Finger nails.

Q.62 Vestigial pelvic girdle and bone remnants of hind limbs are characteristic of **[Har. PMT 2000]**

(1) Whale (2) Dolphin

(3) Shark (4) Seal.

Q.63 The statement "nothing in biology makes sense except in the light of evolution" was given by **[Kerala 2000]**

(1) Dobzhansky (2) Darwin
(3) Oparin (4) Hooker
(5) Wallace.

Q.64 The sequence in evolution of horse was **[Kerala 2000]**

(1) *Equus, Eohippus, Mesohippus, Merychippus*
(2) *Eohippus, Mesohippus, Merychippus, Equus*
(3) *Mesohippus, Eohippus, Equus, Mesohippus*
(4) *Merychippus, Mesohippus, Eohippus, Equus.*

Q.65 Origin of life occurred in **[Kerala 2000]**

(1) Carboniferous (2) Cambrian
(3) Pre-cambrian (4) Ordovician
(5) Silurian.

Q.66 Evolution of a species or group can be studied through **[CET Chd. 2001]**

(1) Fossils (2) Carbon dating
(3) DNA analysis (4) All the above.

Q.67 Phenomenon of organisms having similar structure with a similar origin is **[Manipal 2001]**

(1) Mimicry (2) Analogy
(3) Homology (4) Both A and B

Q.68 Homologous organs indicate **[CPMT 2001]**

(1) Convergent evolution
(2) Parallel evolution
(3) Natural selection (4) Common descent

Q.69 Age of evolution of man is measured by **[CPMT 2001]**

(1) Electron microscope
(2) Chemical reaction
(3) Radioactive dating (4) Ultraviolet radiation.

Q.70 Modern birds rose in **[CPMT 2001]**

(1) Palaeozoic (2) Coenozoic
(3) Mesozoic (4) Archaeozoic.

Q.71 Tasmanian Wolf is a marsupial while Wolf is a placental mammal. This shows **[DPMT 2001]**

(1) Convergent evolution
(2) Divergent evolution
(3) Parallelism
(4) Inheritance of acquired characters.

Q.72 Ontogeny recapitulates phylogeny. This is **[MPPMT 2004, JKCMEE 2008]**

(1) Hardy Weinberg law
(2) Pauling law
(3) Biogenetic law
(4) Thomas law.

Q.73 Jurassic period belongs to era **[Kerala 2001]**

(1) Palaeozoic (2) Mesozoic
(3) Coenozoic (4) Proterozoic
(5) Archaeozoic.

Q.74 Pioneers in the field of organic evolutio were **[KCET 2001]**

(1) Darwin, Lamarck, Landsteiner and De Vries
(2) Darwin, De Vries, Lamarck, Huxley
(3) Lamarck, Landsteiner, Malthus, De Vries
(4) Lansteiner, De Vries, Malthus, Darwin.

Q.75 Occurrence of higher number of endemic species in South America and Australia is due to **[CBSE 2001, AFMC 2007]**

(1) Retrogressive evolution
(2) Continental separation
(3) These species have become extinct from other regions
(4) Absence of terrestrial links between these places.

Q.76 Similarities between organisms of different genotypes is due to **[CBSE 2001]**

(1) Convergent evolution
(2) Divergent evolution
(3) Microevolution
(4) Macroevolution.

Q.77 Half life of ^{14}C is **[CBSE 2001]**

(1) 50 years (2) 500 years
(3) 5000 years (4) 5×10^4 years.

Q.78 Which of the following is not atavistic in humans ? **[CPMT 2001]**

(1) Tail in some babies
(2) Enlarged canines
(3) Six fingers
(4) Dense body hair.

Q.79 Which are not homologous ? **[CPMT 2001]**

(1) Fore arm of humans and fins of fishes

(2) Wings of bat and insects

(3) Fins of fishes and flippers of Whales

(4) Human fore arms, Bat's wings and flippers of Whale.

Q.80 Presence of two chambered heart and gills in tadpole is example of **[Har. PMT 2001]**

(1) Neo-Darwinism (2) Gause's law

(3) Chargaff's law (4) Biogenetic law

Q.81 Presence of tail and coarse hair in human baby is **[Pb. PMT 2007, MPPMT 2007]**

(1) Radiation (2) Atavism

(3) Mutation (4) Crossing over.

Q.82 Unit of evolution is **[MHTCET 2001, Orissa 2008]**

(1) Population (2) Species

(3) Individual (4) Subspecies.

Q.83 Possibility of occurrence of coal in an area is determined by study of **[BHU 2002]**

(1) Microfossils

(2) Ecology

(3) Economic Botany

(4) Mining contents.

Q.84 Darwin's finches occur in **[Wardha 2002, Orissa 2007]**

(1) Australia (2) Galapagos islands

(3) Siberia (4) India.

Q.85 Covolution does not occur in case of **[BHU 2002]**

(1) Parasitism (2) Mutualism

(3) Both A and B (4) Commensalism.

Q.86 Ancestral amphibians were tetrapods that evolved during **[BHU 2002]**

(1) Carboniferous period

(2) Cretaceous period

(3) Jurassic period

(4) Devonian period.

Q.87 Evidences for evolution from fossils belong to the domain of **[JKCMEE 2002, 2010]**

(1) Biogeography (2) Embryology

(3) Palaeontology (4) Anatomy.

Q.88 Dinosaurs were dominant features during the period of **[JKCMEE 2002]**

(1) Jurassic (2) Cretaceous

(3) Triassic (4) Palaeocene.

Q.89 Which of the following is not correctly paired **[Orissa 2002]**

(1) Mesozoic–Age of mammals

(2) Study of fossils–Palaeontology

(3) Mulation theory–Hugo de Vries

(4) Origin of Species–Charles Darwin.

Q.90 Study of plant fossils is **[RPMT 2002]**

(1) Paedology (2) Palynology

(3) Palaeoinsectology (4) Palaeobotany.

Q.91 Interacting populations are **[AMU 2002]**

(1) Symbiotic (2) Mutualistic

(3) Parasitic (4) Coevolved.

Q.92 *Archaeopteryx*, toothed fossil bird occurred during **[AMU 2002, MPPMT 2002]**

(1) Jurassic (2) Triassic

(3) Cretaceous (4) Permian.

Q.93 Mesozoic era is known as golden age of **[Kerala 2003, MPPMT 2007]**

(1) Fishes (2) Amphibians

(3) Reptiles (4) Molluscs.

Q.94 Continental drift explains **[AMU 2002]**

(1) Mass extinctions

(2) Distribution of fossils on earth

(3) Geographical upheavals

(4) All the above.

Q.95 Reptilian feature of *Archaeopteryx* is **[EAMCET 2002]**

(1) U-shaped furcula (2) Beak

(3) Abdominal ribs (4) Feathers.

Q.96 *Archaeopteryx* is connecting link between **[CPMT 2007, MHTCET 2007]**

(1) Fishes and amphibians

(2) Amphibians and birds

(3) Amphibians and reptiles

(4) Reptiles and birds.

Q.97 Which is not vestigial in man ?

[Kerala 2002, BHU 2008]

(1) Tail vertebrae

(2) Nails

(3) Nicttitating membrane

(4) Vermiform appendix

Q.98 Development of adaptations along parallel lines in unrelated groups of animals is

[MPPMT 2002]

(1) Adaptive convergence

(2) Adaptive radiation

(3) Adaptive divergence

(4) Adaptive induction.

Q.99 Which of the following is vestigial in humans

[AFMC 2002]

(1) Mammary glands in males

(2) Knee bones

(3) Nictitating membrane

(4) Ear pinna.

Q.100 Which is a pair of vestigial organs ?

[AIIMS 2002]

(1) Coccyx and intercostal muscles

(2) Coccyx and auricular muscles

(3) Facial hairs in ladies

(4) Coccyx and premolars.

Q.101 Which one is used for dating archaeological specimens like bones, shells and wood ?

[JIPMER 2002]

(1) 3 H (2) 14 C

(3) 121 I (4) 32 P

Q.102 Which is sequenced during study of phylogeny? **[CBSE 2002]**

(1) m-RNA (2) r-RNA

(3) t-RNA (4) DNA

Q.103 Convergent evolution is illustrated by

[CBSE 2003]

(1) Rat and Dog

(2) Bacterium and Protozoan

(3) Starfish and Cuttle fish

(4) Dogfish and Whale.

Q.104 Which one correctly describes homologous structures **[CBSE 2003, Pb. PMT 2003]**

(1) Organs with anatomical similarities but performing different functions

(2) Organs with anatomical similarities but performing different functions

(3) Organs that have no function now but had an important function in ancestors

(4) Organs appearing only in embryonic stage and disappearing later in the adult.

Q.105 The early stage human embryo distinctly possesses **[AIIMS 2003]**

(1) Gills

(2) Gill slits

(3) External ear (pinna)

(4) Eye brows.

Q.106 Mesozoic era was dominated by **[CPMT 2003]**

(1) Birds (2) Fishes

(3) Reptiles (4) Mammals.

Q.107 Law of embryonic development was proposed by **[CPMT 2003]**

(1) Darwin (2) Von Baer

(3) Haeckel (4) Mendel.

Q.108 Wings of bird and bat are **[Kerala 2003]**

(1) Homologous with no analogy

(2) Analogous with no homology

(3) Neither homologous nor analogous

(4) Both homologous and analogous

Q.109 Which is not a vestigial organ **[Kerala 2003]**

(1) Flipper of Seal (2) Coccyx of man

(3) Pelvic of Python (4) Wings of Kiwi.

Q.110 Organs related through common descent but now functionally different are

[CPMT 2004, JKCMEE 2005]

(1) Analogous (2) Homologous

(3) Divergent organs (4) Parallel organs.

Q.111 Which one is incorrect **[Orissa 2004]**

(1) Wings of insects and birds are analogous

(2) Wings of bat and birds are homologous

(3) Wings of insects and bat are analogous

(4) Wings of insects and birds are homologous.

Q.112 Age of fossils was previously determined by redioactive elements. More precise recent method which has led to revision of evolutionary periods is

[CBSE 2004, AIIMS 2007]

(1) Study of carbohydrate and protein in fossils

(2) Study of conditions of fossilisation

(3) Electron spin resonance and fossil DNA

(4) Presence of carbohydrate and protein in rocks

Q.113 Flippers of Seal are modified **[AFMC 2004]**

(1) Hind limbs (2) Fore limbs

(3) Fins (4) Gills.

Q.114 Potato and Sweet Potato have edible parts which are **[AIIMS 2004, DPMT 2008]**

(1) Homologous

(2) Analogous

(3) Recent introductions

(4) Two species of the same genus.

Q.115 Given below are assertion and reason. Point out if both are true with reason being correct explanation (A), both true but reason is not correct explanation (B), assertion true but reason is wrong (C), both are wrong (D). **Assertion.** Natural selection is the outcome of difference in survival and reproduction among individual that show variation in one or more traits.

Reason. Adaptive forms of a given trait tend to become more common. Less adaptive ones become less common or disappear.

[AIIMS 2004]

(1) (2)

(3) (4)

Q.116 Organs having similar functions but different orgin and development are known as

[JKCMEE 2004, Har. PMT 2005]

(1) Homologous organs

(2) Analogous organs

(3) Metalogous organs (4) Vestigial organs.

Q.117 The classical example of adaptive radiation during formation of new species is

[CPMT 2004]

(1) Marsupials of Australia

(2) Darwin's finches

(3) Giant Tortoise (4) All the above.

Q.118 Mammals like Whale, Dolphin, Bat, Monkey and Horse have some common characters but also show conspicuous differences. This is due to phenomenon of **[MPPMT 2004]**

(1) Divergence (2) Convergence

(3) Genetic drift (4) Normalisation.

Q.119 Which of the following pairs of structures is homologous ? **[MPPMT 2004]**

(1) Wings of Grasshopper and forelimbs of Flying Squirrel

(2) Tentacles of *Hydra* and *arms* of Starfish

(3) Forelimbs of a Bat and forelegs of a Horse.

(4) Wings of a bird and wings of a Moth.

Q.120 According to Darwinism, fossils of organisms found in South America resemble fossils of

[Orissa 2004]

(1) North America (2) Africa

(3) Australia (4) Both B and C.

Q.121 The biogenetic law of Haeckel is

[BHU 2005, CPMT 2009]

(1) *Omnis vivum e vivum*

(2) *Omnis cellula e cellula*

(3) Ontogeny repeats phylogeny

(4) Phylogeny repeats ontogeny.

Q.122 Given below are assertion and reason Point out if both are true with reason being correct explanation (A), both true but reason is not true explanation (B), assertion true but reason is wrong (C), both are wrong (D).

Assertion. Comparative biochemistry provides a strong evidence in favour of common ancestry of living beings.

Reason. Genetic code is universal.

[AIIMS 2005]

(1) (2)

(3) (4)

Q.123 Which is relatively most accurate method of dating of fossils ? **[CBSE 2005]**

(1) Radiocarbon method

(2) Potassium–Argon method

(3) Electron spin–resonance method

(4) Uranium–lead method.

Q.124 Dinosaurs were presnet during the **[JKCMEE 2005]**

(1) Palaeozoic era (2) Coenozoic era

(3) Mesozoic era (4) Precambrian era.

Q.125 Which is correct ? **[Orissa 2005]**

(1) 99% of existed species are extinct

(2) 65% of existed species are extinct

(3) 40% of existed species are extinct

(4) 30% of existed species are extinct.

Q.126 What is correct arrangement of periods of palaeozoic era in ascending order in geological time scale ? **[EAMCET 2005]**

(1) Cambrian → Devonian → Ordovician → Silurian → Carboniferous → Permian

(2) Cambrian → Ordovician → Silurian → Devonian → Carboniferous → Permian

(3) Cambrian → Ordovician → Devonian → Silurian → Carboniferous → Permian

(4) Silurian → Devonian → Cambrian → Ordovician→ Permian → Carboniferous.

Q.127 An important evidence in favour of oranic evolution is the occurrence of **[CBSE 2006, DPMT 2008]**

(1) Homologous and analogous organs

(2) Homologous and vestigial organs

(3) Analogous and vestigial organs

(4) Homologous organs only.

Q.128 Jurassic period of mesozoic era is characterised by **[CBSE 2006]**

(1) Flowering plants and first dinosaurs appear

(2) Gymnosperms are dominant plants and first birds appear

(3) Radiation of reptiles and angiosperms appear

(4) Dinosaurs become extinct and angiosperms appear.

Q.129 Evolutionary history of an organism is known as **[CBSE 2006, AFMC 2008]**

(1) Ontogeny (2) Phylogeny

(3) Ancestry (4) Palaeontology

Q.130 Which is correct Aristotle's ladder of nature? **[Kerala 2006]**

(1) Inanimate matter → Lower plants → Higher plants → Zoophyta → Entoma → Ostracoderma → Malacia → Malacostraca → Fish → Oviparous quadrupeds → Cetacea → Birds → Viviparous quadrupeds → Humans

(2) Inanimate matter → Lower plants → Higher plants → Zoophyta → Entoma → Malacia → Malacostraca → Ostracoderma → Fish → Oviparous quadrupeds → Cetacea → Birds → Viviparous quadrupeds → Humans

(3) Inanimate matter → Lower plants → Higher plants → Zoophyta → Malacia → Entoma → Malacostraca → Ostracoderma → Fish → Oviparous quadrupeds → Cetacea → Birds → Viviparous quadrupeds → Humans

(4) Inanimate matter → Lower plants → Higher plants → Zoophyta → Entoma → Ostracoderma → Malacostraca → Malacia → Fish → Cetacea → Oviparous quadrupeds → Birds → Viviparous quadrupeds → Humans

(5) Inanimate matter → Lower plants → Higher plants → Zoophyta → Entoma → Ostracoderma → Malacia → Malacostraca → Fish → Cetacea → Birds → Oviparous quadrupeds → Viviparous quadrupeds → Humans.

Q.131 Major radiation of mammals, birds and pollinating insects took place in the epoch **[Kerala 2006]**

(1) Oligocene (2) Palaeocene

(3) Pliocene (4) Eocene

(5) Miocene.

Q.132 Which is correct **[CET Chd. 2006]**

(1) Wings of birds and insects are homologous

(2) *Archaeopteryx lithographica* is missing link between birds and mammals

(3) Paired fins of fish and flippers of whale are analogous

(4) Caecum and appendix in Rabbit and man are analogous.

Q.133 First mammals are found in era-period **[CPMT 2007]**

(1) Permian ..... Palaeozoic

(2) Triassic ..... Mesozoic

(3) Tertiary ..... Coenozoic

(4) None of these.

Q.134 Most of the fossils occur in rocks **[Orissa 2007]**

(1) Sedimentary (2) Metamorphic

(3) Igneous (4) None of the above.

Q.135 Duck-billed Platypus is connecting link between **[Orissa 2007, AFMC 2009]**

(1) Echinodermata and chordata

(2) Arthropoda and mollusca

(3) Reptilia and mammalia

(4) Reptilia and aves.

Q.136 Plants and animals of Galapogos islands resemble plants and animals of main land in **[Orissa 2007]**

(1) North Africa (2) South Africa

(3) North America (4) South America.

Q.137 Fossils found in Mandla district of M.P. is **[MPPMT 2007]**

(1) 260 million years old

(2) 100 million years old

(3) 50 million years old

(4) 20 million years old.

Q.138 Tendrils of *Cucurbita* and thorns of *Bougainvillea* are **[DPMT 2007, CBSE 2008]**

(1) Homologous organs

(2) Analogous organs

(3) Vestigial organs (4) Atavistic divergance.

Q.139 Parallism is due to **[DPMT 2007]**

(1) Adaptive divergence

(2) Adaptive convergence

(3) Adaptive convergence of unrelated species

(4) Adaptive convergence of closely ralated species.

Q.140 Which one is correct **[CBSE 2007]**

(1) There is no evidence of presence of gills in mammalian embryos

(2) Ontogeny repeats phylogeny

(3) All plant and animal cells are totipotent

(4) Stem cells are specialised cells.

Q.141 Finches of Galapogos provide evidence for **[CBSE 2007]**

(1) Retrogressive evolution

(2) Special creation

(3) Biogeographical evolution

(4) Evolution due to mutation.

Q.142 Two species of different geneology show resemblance due to similar adaptation. The phenomenon is **[CBSE 2007]**

(1) Convergent evolution

(2) Divergent evolution

(3) Micro-evolution (4) Co-evolution

Q.143 Adaptive radiation is **[CBSE 2007]**

(1) Evolution of different species from a common ancestor

(2) Adaptation due to geographical isolation

(3) Migration of members of a species to different geographical areas

(4) Power of adaptation of an individual to a variety of environments.

Q.144 What is common to Whale, Seal and Shark **[CBSE 2007]**

(1) Homoiothermy (2) Seasonal migration

(3) Thick subcutaneous fat

(4) Convergent evolution.

Q.145 Which ones are not analogous organs **[Kerala 2007, CPMT 2009]**

(1) Wings of birds and wings of butterfly

(2) Eye of *Octopus* and eye of mammals

(3) Flippers of penguins and fippers of Dolphi

(4) Thorns of *Bongainvillea* and tendril of *Cucurbita*

(5) Tuberous root of Sweat Potato and stem tuber of Potato.

Q.146 Descendent of fossil Protylopus is **[MHTCET 2007]**

(1) Giraafe (2) Camel

(3) Elephant (4) Cow

Q.147 Vestigial organs provide evidence of organic evolution in the category **[JKCMEE 2007]**

(1) Anatomical (2) Embryological

(3) Morphological (4) Palaeontological.

Q.148 Life has existed on earth for the last **[HPPMT 2007]**

(1) 2·3 billion years (2) 3·9 billion years

(3) 4·3 billion years (4) 5.0 billion years

Q.149 Darwin's finches show **[HPPMT 2007, CBSE 2008, 2010]**

(1) Adaptive radiation

(2) Parallel evolution

(3) Homology (4) Natural selection.

Q.150 Connecting link between annelida mollusca is **[BHU 2007, AFMC 2010]**

(1) *Nautilus* (2) *Neopilina*

(3) Glochidium (4) Veliger larva.

Q.151 Which one is the earliest era ? **[Orissa 2008]**

(1) Coenozoic (2) Mesozoic

(3) Palaeozoic (4) Pre-cambrian.

Q.152 Wings of birds and fore-limbs of horse are **[Orissa 2008]**

(1) Vestigial (2) Analogous

(3) Homologous (4) None of the above

Q.153 Closely related species with different traits exhibit **[Orissa 2008]**

(1) Convergent evolution

(2) Divergent evolution

(3) Parallel evolution (4) None of the above.

Q.154 Which isotope is used in finding age of fossil of more than 4500 years ? **[DPMT 2008]**

(1) 238U (2) 235U

(3) 235Po (4) 12C.

Q.155 Which period is largely associated with extinction of dinosaurs, increase in flowering plants and reptiles ? **[DPMT 2009]**

(1) Triassic (2) Jurassic

(3) Cretaceous (4) Permian.

Q.156 Mass extinction at the end of mesozoic era was probably caused by **[DPMT 2009]**

(1) Continental drift (2) Massive glaciation

(3) Collision of earth with large meteorite

(4) Change in earth's orbit.

Q.157 *Tachyglossus* is connecting link between **[DPMT 2009]**

(1) Reptiles and mammals

(2) Reptiles and birds

(3) Amphibians and reptiles

(4) Birds and mammals.

Q.158 Phylogeny is **[CET Chd. 2009]**

(1) Evolutionary history

(2) Life history

(3) Group of phyla

(4) Genetics of animals.

Q.159 Relatedness of two species is tested through **[Orissa 2009]**

(1) RNA and proteins

(2) DNA and proteins

(3) Antibodies and transposons

(4) None of the above.

Q.160 As per Allen's rule, mammals of cold regions conserve body heat through **[AMU 2009]**

(1) Larger body mass

(2) Small body mass

(3) Longer extremities

(4) Smaller extremities.

Q.161 *Peripatus* is connecting link between **[CBSE 2009]**

(1) Porifera and coelenterata

(2) Ctenophora and platyhelminthes

(3) Mollusca and echinodermata

(4) Annelida and arthropoda.

Q.162 Origin of first toothed birds and gymnosperms occurred during **[CPMT 2009]**

(1) Cretaceous (2) Jurassic

(3) Triassic (4) Permian.

Q.163 A living connecting link that provides evidence of organic evolution is **[CPMT 2009]**

(1) *Sphenodon* between reptiles and birds

(2) *Archaeopteryx* between reptiles and birds

(3) Lung fishes between pisces and reptiles

(4) Duck-billed *Platypus* between reptiles and mammals.

Q.164 After the industrial revolution, melanic moths survived because **[COMED-K's 2010]**

(1) They had black colour

(2) They had grey body colour

(3) They shifted to different habitat

(4) They reproduced vigorously.

Q.165 In evolution of horse, two most important anatomical and morphological changes brought about are **[CET Chd. 2010]**

(1) Limbs and tail (2) Limbs and teeth

(3) Teeth and tail (4) Limbs and height.

Q.166 Vesitiges of girdles are found in **[AMU 2010]**

(1) Rattle snake (2) Krait

(3) Cobra (4) Python.

Q.167 An evolutionary pattern characterised by a rapid increase in number of kinds of closely related species is called **[AMU 2010]**

(1) Divergent evolution

(2) Convergent evolution

(3) Adaptive radiation

(4) Parallel evolution.

Q.168 The first seed plants appeared in **[MPPMT 2010]**

(1) Cretaceous era (2) Carboniferous era

(3) Devonian era (4) Silurian era.

Q.169 Which was the biggest land dinosaur **[HPPMT 2010]**

(1) *Protoceratops*

(2) *Amptosaurus*

(3) *Tyrannosaurus rex*

(4) *Ichthyosaurus.*

Q.170 Organs that perform same function but are not similar in structural details and origin are called **[JKCEE 2010]**

(1) Analogous organs

(2) Homologous organs

(3) Vestigial organs

(4) None of these.

Q.171 Homologous organs have **[AFMC 2010]**

(1) Similar morphology

(2) Similar anatomy

(3) Different anatomy

(4) All the above.

Q.172 Given below are four statements (a–d) with one or two blanks. Select the option which fills up the blanks in two statements.

(a) Wings of butterfly and birds look alike and are the result of ....(i).... evolution

(b) Miller showed that CH4, H2, NH3 and ....(i).... when exposed to electric discharge in a flask resulted in formation of ....(ii) evidence of evolution

(c) Vermiform appendix is a ....(i)....organ and ....(ii)....

(d) According to Darwin evolution took place due to ....(i).... and ....(ii).... of the fittest **[CBSE Mains 2010]**

(1) d – (i) small variations, (ii) survival, a – (i) convergent

(2) a – (i) convergent, b – (i) oxygen, (ii) nucleolides

(3) b – (i) water vapours (ii) amino acids c – (i) rudimentary (ii) anatomical

(4) c – (i) vestigial (ii) anatomical, d – (i) mutations (ii) multiplication.

Q.173 What was the most significant trend in the evolution of moden man (Homo spiens) from his ancestors ? **[AIPMT Pre 2012]**

(1) Binocular vision

(2) Increasing cranial capacity

(3) Upright posture

(4) Shortening of jaws

Q.174 Which one of the following options gives one correct example each of convergent evolution and divergent evolution? **[AIPMT Pre 2012]**

	Convergent evolution	**Divergent evolution**
(1)	Thorns of Bougainvillia and tendrils of *Cucurbita*	Wings of butterflies and birds
(2)	Bones of forelimbs of vertebrates	Wings of butterfly and birds
(3)	Thorns of Bougainvillia and tendrils of *Cucurbita*	Eyes of Octopus and mammals
(4)	Eyes of octopus and mammals	Bones of forelimbs of vertebrates

Q.175 The extinct human who lived 1,00,000 to 40,000 years ago, in Europe, Asia and parts of Africa, with short stature, heavy eye brows, retreating fore heads, large jaws with heavy teeth, stocky bodies, a lumbering gait and stooped posture was : **[AIPMT Pre 2012]**

(1) Neanderthal human

(2) Cro-magnan humans

(3) *Ramapithecus*

(4) *Homo habilis*

Q.176 Evolution of different species in a given area starting from a point and speading to other geographical areas is known as : **[AIPMT Pre 2012]**

(1) Naturation

(2) Migration

(3) Divergent evolution

(4) Adaptive radiation

ANSWER KEY

EXERCISE – 3

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Ans.	2	3	1	1	2	2	1	3	2	4	4	2	1	3	2	4	3	3	1	4

Ans.	4	3	4	1	2	4	3	2	3	1	2	1	2	4	1	4				

These questions consist of two statements each, printed as Assertion and Reason. While answering to choose any one of the following four responses.

(1) If both Assertion & Reason are True & the reason is correct explanation of the Assertion.

(2) If both Assertion & Reason are True but Reason is not a correct explanation of the Assertion.

(3) If Assertion is True but the Reason is False.

(4) If both Assertion & Reason are false.

Q.1 **A :** Tnhere is no life on moon.

R : Water is absent on moon.

Q.2 **A :** The first living organism on earth were autotrophs.

R : They were capable to performing chemosynthesis.

Q.3 **A :** Base analogous induced transition.

R : Base analogous performs forbiddan pairing.

Q.4 **A :** Sympatric species are geographically isolated.

R : Sympatric species are reproductively isolated.

Q.5 **A :** Somatic mutations are sometime inheritable.

R : Some organism show vegetative propagation.

Q.6 **A :** Plant having odd number of sets of chromosomes are fertile.

R : Plant having even number of sets of chromosomes are sterile.

Q.7 **A :** Colchicine induces polyploidy.

R : Colchicine causes disjunction of chromosomes.

Q.8 **A :** Change in structure of chromosome is called chromosomal aberration.

R : Substitution is an example of chromosomal aberration.

Q.9 **A :** First life originated in water.

R : Conditions were favourable for origin of life in water.

Q.10 **A :** A single mutation may produce a new species.

R : Mutation may cause major variation in genetic material and these are inheritable.

Q.11 **A :** Evolution is not occuring at present.

R : Evolution take a very long time to occur.

Q.12 **A :** Analogous organs show common ancestory.

R : Analogous organ show evolution.

Q.13 **A :** Lung fish is a connective link between fishes and amphibia.

R : Lung fish show characters of both fishes and amphibia.

Q.14 **A :** Bird's embryo show tooth bud's for some time.

R : Ontogeny repeats phylogeny.

Q.15 **A :** Liger in a hybrid animal.

R : Liger is fertile.

Q.16 **A :** Jurrasic period is considered the age of reptiles.

R : Reptiles dominated in all habitats during jurassic period.

Q.17 **A :** Muscles of external ears are fully developed in humans.

R : Ear muscles close the ears during excessive noise.

Q.18 **A :** Human and apes have a common ancestry.

R : Man and chimpanzee have similar banding pattern of chromosome.

Q.19 **A :** Homologous organs suggest same origin.

R : Organs which are similar in function and dissimilar in internal morphology called as Homologous organs.

Q.20 **A :** Presence of tail in children is a vestigial character.

R : This happens due to the phenomenon called atavism.

Q.21 **A :** In mammals the forelimbs perform, different functions.

R : The forelimbs in different mammals consist of different sets of bones.

Q.22 **A :** There is no scientific explanation to organic evolution.

R : Evolution is a discontinuous process.

Q.23 **A :** Analogous organs suggest same origin.

R : Fore legs of horse and hand of human are analogous organs.

Q.24 **A :** Mammals have evolved from egg laying species.

R : Prototherians are oviparous.

Q.25 **A :** Missing links are most important to study evolutionary history.

R : They fill the gaps of closely related groups

Q.26 **A :** Ear muscles of external ear in man are vestigial.

R : These muscles in man are useful which move external ear freely to detect sound efficiently.

Q.27 **A :** Vestigeal organs are those parts of body which are greatly reduced and are useless.

R : These are the ramnants of once fully developed organs which are gradually lost as there were no longer necessary.

Q.28 **A :** Snakes lost their legs. They donot have use of legs.

R : All the living organism can reduced or increase the organ with the help of internal vital force.

Q.29 **A :** Translocation is a illigal crossing over.

R : Translocation is exchange of chromosomal segments between nonhomologous chromosomes.

Q.30 **A :** Chemical mutagens are more harmful then substitution or point mutation.

R : Acredine and proflavin induces frame shift mutation.

Q.31 **A :** Chemical mutagens are more harmful then radiations.

R : Chromosomal mutagens are cause more variations.

Q.32 **A :** Substitution or point mutations are more harmful as compared to frame shift mutation.

R : Substitution cause major change in structure of protein.

Q.33 **A :** Chromosomal abbreation are more harmful as compared to gene mutation.

R : Substitution are less harmful as compare to frame shift mutation.

Q.34 **A :** In sickle cell anaemia disease Hbs gene is presented in the population.

R : The lose of Hbs gene is balanced by balancing selection.

Q.35 **A :** Australopithecus was first ancestor of man who show bipedal locomotion.

R : Mutation are raw material for evolution.

Q.36 **A :** Reducing atmosphere was essential for origin of life on earth.

R : The early proteins and nucleic acids are formed by non enzymetic process.

Q.37 **A :** Probably DNA evolved after the RNA.

R : RNA has both catalytic and genetic information transfer function.

Q.38 **A :** Electron spin resonance method is used to determine the age of fossils.

R : Fossils mainly present in igenous rocks.

Q.39 **A :** Life originated about 3.9 billion years ago.

R : Life originated in pre cambrian era.

Q.40 **A :** A.R. Wallace divide whole world into six major realms.

R : India is present in oriental realm.

Q.41 **A :** Mimicry is a kind of adaptation.

R : Mullarian mimicry is an example of aggressive mimicry.

Q.42 **A :** Evolution occurs with in populations.

R : Relative frequencies of different variations of DNA change over time.

Q.43 **A :** Duckbilled platypus and spiny anteaters lay egg's like birds (Cleidoic egg) but they are mammals.

R : Presence of cleiodic egg in prototherism show reptilian ancestory of mammals.

Q.44 **A :** Nucleoprotein were first sign of life.

R : The protocell represented the beginning of life.

Q.45 **A :** Origin of virus like structure is an example of retrograssive evolution.

R : "Descent with modification" is a fundamental concept of evolution.

Q.46 **A :** Sedimentry rocks are also called as slate rocks.

R : Rocky mountain revolution took place after paleozoic era.

Q.47 **A :** When the two species are morphologically similar but do not normally interbreed, such species are called sibling species.

R : Stabilising selection reduces variation but does not change the mean value.

Q.48 **A :** Lamarck published the theory of evolution in 1809 the year Charles Darwin was born.

R : According to Lamarckism if an organ in used constantly, it will tend to become developed, whereas disuse result in degeneration.

Q.49 **A :** The aquatic mammals like dolphins whales etc. do not contain gills slits.

R : Their adaptation to aquatic life is secondary.

Q.50 **A :** Unaltered fossils are mostly found in ice-laden areas.

R : These fossils consist of only the hard parts of organisms.

Q.51 **A :** Dinosaurs disappeared due to mass extinction.

R : Mass extinction occurred due to spread of epidermic.

Q.52 **A :** The homologous organs show convergent evolution.

R : The analogous organs show divergent evolution.

Q.53 **A :** Intraspecific struggle occurs between the individuals of different species.

R : Lobester culture in aquarium is an example of interspecifc struggle.

Q.54 **A :** Without variations, evolution is impossible.

R : Only useful variations are transmitted to the next generation.

Q.55 **A :** *Australopithecus* is called African ape-man.

R : It had both human as well as ape characters.

Q.56 **A :** *Homo habilis* was the first tool maker.

R : He was cave-dweller.

Bansal Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first attempt	**Good / Important questions**
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

Ramdeo Misra
(Father of Indian Ecology)

ORGANISM AND ENVIRONMENT

INTRODUCTION :

(i) The term ecology was coined and described by – **E.Haeckel.**

(ii) The term ecology was first authentically used by – **Reiter**

(iii) Father of ecology – **Reiter**

(iv) The term Ethology for ecology was used by – **Geoffroy Hilaire**

(v) The term Hexicology for ecology was used by – **G.H. Mivart**

(vi) Study of ecology was initiated in India by – **W. Dudgeon**

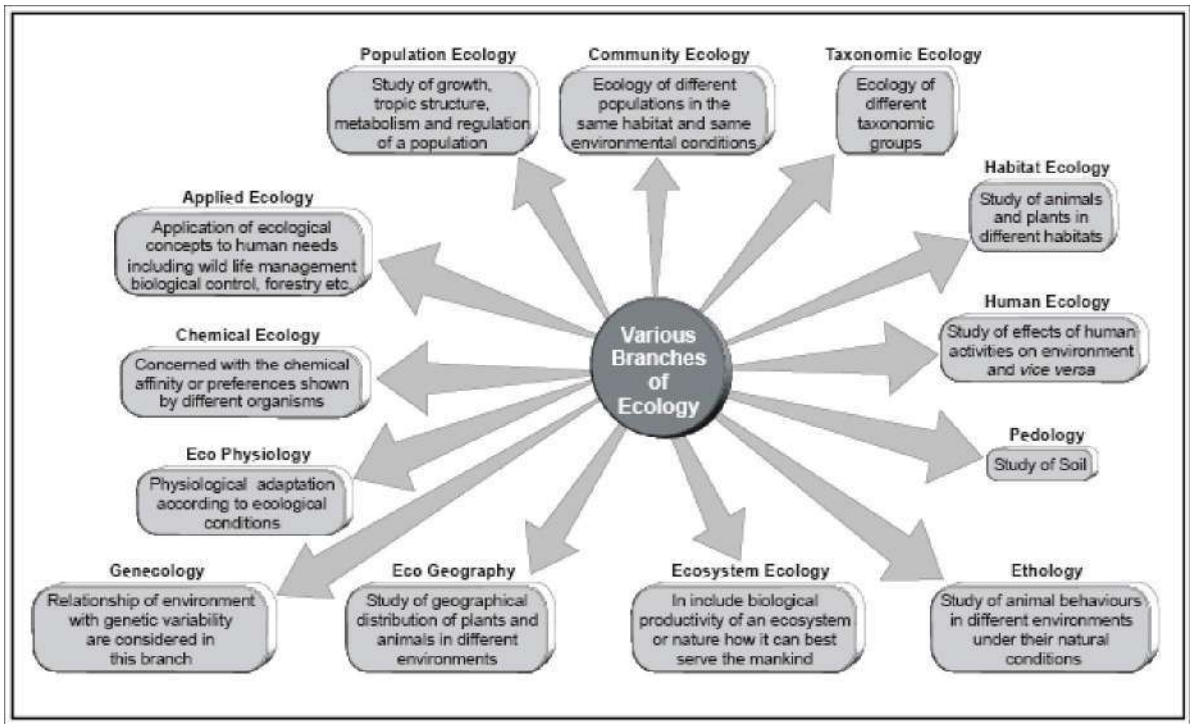
(vii) Father of Indian Ecology – **Prof. Ram Deo Misra**

(viii) First of all term ecology was employed for plants by – **Warming**

(ix) Organism and environment are always interdependent, inter related or mutually reactive.

Branches of Ecology – It is based on organism level

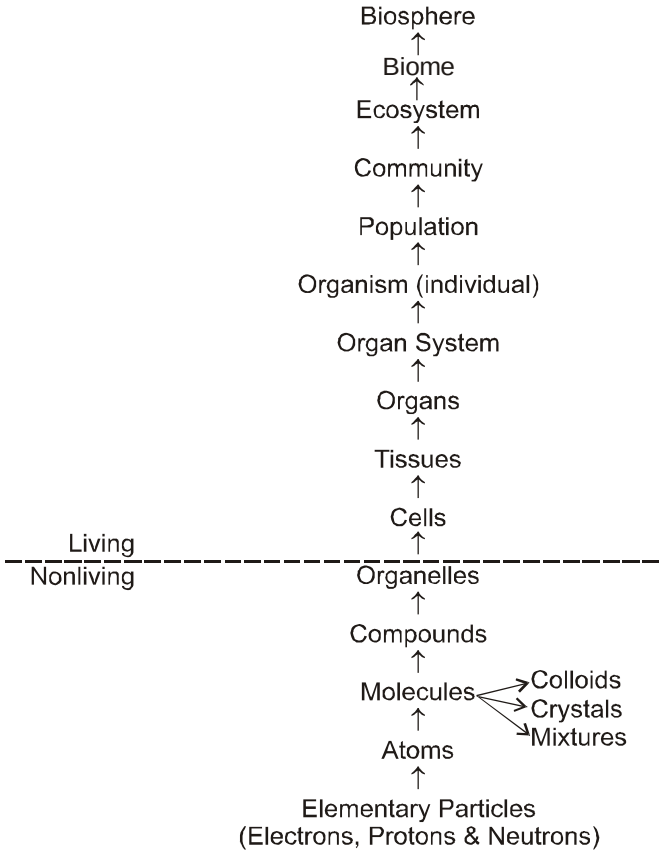
1. **Autecology or species ecology –** Study of the relation of a species or population with its environment is known as autecolocy
2. **Synecology or Biocoenology or Community ecology –** Study of the relation of the group of different species with their environment

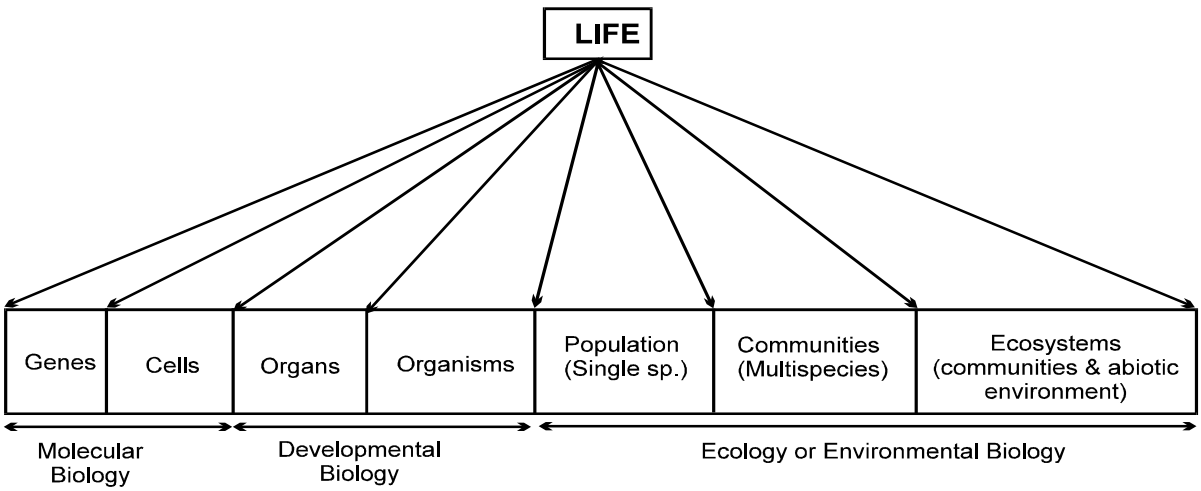


AIMS & SCOPE :

The main aim of ecology is to study the interrelationship between organisms. i.e., Plants, animals and environment. Studies like pollution, soil conservation, soil erosion, proper use of land, afforestation, control on deforestation, regulation of overgrazing, flood control, maintenance of soil fertility etc., are also done in the ecology.

ECOLOGICAL HIERARCHY :





1. ENVIRONMENT :

A. Environment is the sum total of all biotic (living) and abiotic (non-living) factors that surround and potentially influence an organism. Some components of the environment serve as resources, while other act as a regulatory factor.

B. The different components of the environment are interlinked and interdependent. The environment can be understood both at large and global climatic patterns, as well as the local climatic conditions, the microclimate.

Spatial and Time scale of Environment :

Most organisms interact with their environment at several spatial and time scales. For example a single bacterium in soil, interacts with air and water within a fraction of a cubic centimeter space.

On the other hand, a tree in soil interacts, with a large volume of air, water. The activities of organism influence the hydrosphere, the lower atmosphere and the near-surface part of the lithosphere, through exchanges of matter and energy.

Organisms have to cope with the external environment over a range of time scales, varying from few minutes to days, seasons or over a much longer period of geological time scale. For example, phytoplankton populations may change within a few days with the change in light conditions in aquatic systems. On the other hand, the variations in lithosphere occur very slowly over a long period of time.

2. CLIMATE :

A. The short-term properties of the atmosphere (such as temperature, pressure, humidity, rainfall, sun-shine, cloud cover and wind), at a given place and time, is called as **weather**. **Climate** is the average **weather of an area,** including general patterns of atmospheric conditions, seasonal variations and weather extremes averaged over a long period.

B. Weather reflects the hourly, daily or weekly chages in the above properties, climate entails longer periods, such as seasons or years. **Temperature** and **rainfall** are the two most important factors which determine the climate of an area.

C. Global variations of temperature and rainfall result from differential **input of solar radiation** in different region and from the redistribution of heat energy by winds and ocean currents. Variations in temperature, rainfall and humidity in different regions of the globe form global climate patterns, which govern all life on earth.

D. On the basis of variation in mean temperature along latitude, the main climatic regions are-

(i) Tropical (0º - 20º latittude)

(ii) Subtropical (20º - 40º latitude)

(iii) Temperate (40º - 60º latitude)

(iv) Arctic and Antarctic (60º - 80º latitude)

E. The mean temperature declines as we move from tropical to arctic region. A similar climatic zonation occurs with increasing altitude in the mountains. A mountain located in a tropical region will successively have tropical, subtropical, temperate and alpine zones with increasing altitude. Similarly, in temperate zone, the high altitudes will have alpine climatic conditions.

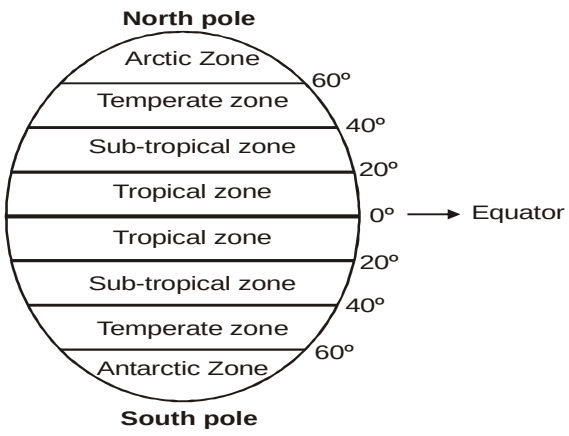
F. Within each temperature-based climatic zone, the annual precipitation (rainfall and/or snowfall) varies considerably. These two factors, temperature and precipitation, together determine the vegetation and soil type.

G. Altitude is height above the sea surface of any place. and Latitude is the distance of any place from the equator.

Note :

The temperature and light values are maximum at the equator, decreases gradually towards the pole. Effect of altitude and latitude are almost same on temperature.

The types of vegetation from sea level to increasing altitude are similar to increasing latitude (distance from equator).



H. **Microclimate :-** The microclimate represents the climatic conditions that prevail at a local scale, or in areas of limited size, such as the immediate surroundings of plants and animals. Microclimate generally differs from the prevailing regional climatic conditions. For example, in a forest, dense foliage reduces the amount of light reaching the ground. This also results in a changed air temperature profile. The day-time air temperature inside the forest is lower than outside. Also, the interior of a forest may be more humid than a nearby non-forested area.

3. HABITAT AND NICHE :

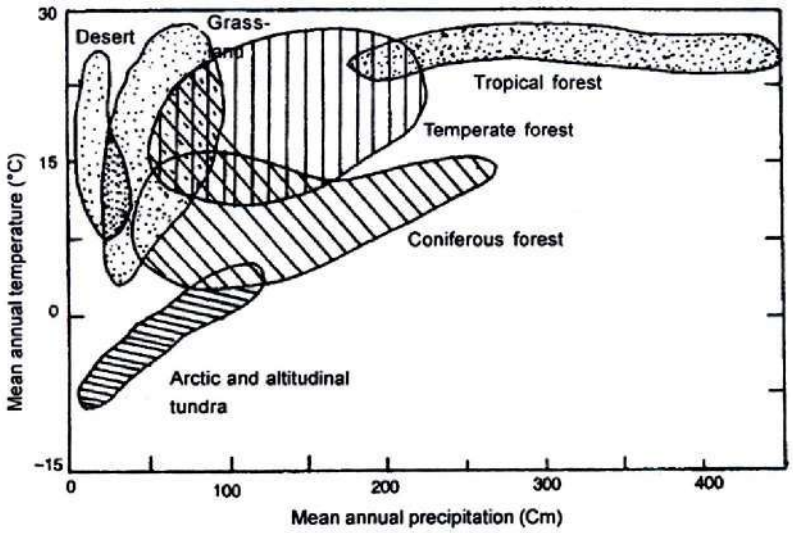
The place where an organism lives is called its habitat. Habitat are characterised by conspicuous physical features, which may include the dominant forms of plant and animal life. We may also understand that habitat may refer to the place occupied by an entire bilogical community. For example, a large number of species are found in a forest habitat.

A. Plants and animals, as influenced by the environmental conditions of a particular habitat, indicate some specific traits. For example, plants growing on saline soils have several characteristics not found in plants growing on normal non-saline soils.

B. A habitat can contain many ecological niches and support a variety of species. The ecological niche of an organism represents the rage of conditions that it can tolerate, the resource it utilises, and its functional role in the ecological system. Each species has a distinct niche, and no two species are believed to occupy exactly the same niche.

4. BIOME

Large ecosystem is called biome, mainly large aquatic and terrestrical ecosystem are called biomes. Altitude and latitude determine the boundary of biome.



Types of world biome : From the poles towards the equators.

(i) Tundra Biome : 60-80ºN latitude.

(ii) Northern coniferous forest or Needle leaf forest : 40-60ºN latitude (Taiga or North wood)

(iii) Temperate Deciduous forest : 40-60ºN latitude or Temperate broad leaf forest.

(iv) Tropical Rain forest : 20-40ºN latitude.

(v) Tropical deciduous forest : 20-40ºN latitude.

(vi) Chaparral (Mediterranean scrub forest) Biome

(vii) Tropical Savanna Biome

(viii) Grassland Biome

(ix) Desert Biome

Major Grasslands are :

Prairies - North America

Pampas - South America

Steppes - Europe and Asia

Tussocks - New zealand

Veldts - Africa

Main desert biomes are :

Sahara - North Africa

Tibet, Gobi, Thar - Asia

Major forest Biomes of India :

(i) Tropical Rain Forest Biome : Western Ghat and North-Eastern Himalaya.

(ii) Tropical Deciduous Forest : In Northern and Southern parts in plain and hilly areas.

(iii) Temperate Broad leaf forest : Western Himalaya.

(iv) Temperate Needle leaf or Coniferous forest : Himalaya.

Forest type	Mean annual temperature (ºC)	Mean annual rainfall (mm)	Dry months during the year*
Tropical rain forest	23-27	2000-35000	2-3
Tropical deciduous forest	22-32	900-1600	6-8
Temperate broad-leaf forest	6-20	1000-2500	3-5
Temperate needle-leaf forest	6-15	500-1700	3-5

Month in which rainfall is < 50 mm.

	Biome	Latitude	Altitude	Vegetation
1	Tundra	Above 60º North	3600 meter height of Himalaya	**Lichen, Moss, Grass** **Note :** * This biome is tree less and also known as arctic desert or alpine tundra. * Timber line - Line beyond which trees are not found. * Perma forst - In this region soil is covered by snow or ice.
2	Northern coniferous or Needle leaf or temperate forest	40º - 60º	1700 to 3000 meter	**Pine (Pinus), Deodar (Cedrus), Cypress (Cupressus torulosa), Spruce(Picea smithiana), Silverfir (Abies pindrow)** **Note :** * Coniferous forest posses needle like leaves * This forest also known as Taiga.
3	Temperate decidous or broad leaf forest	40º - 60º	1500 to 2400 meter	**Oak (Quercus)** **Note :** * Trees shed their leaves in autumn and bear again in spring.

4	Tropical Rain Forest	Tropical rain forest are found at equational region around the earth. In India tropical rain frest are distributed mainly along western Ghat and Eastern Himalaya (Assam, W.Bengal, Andman, Manipur)	**Depterocarpus and Hopea are most common tree species in India. Lianas are also found.**
5	Tropical deciduous forest	Occur widely in the Northern and Southern part of our country in plain and low hilly area.	**Sal (Shorea robusta), Teak (Tectona Grandis), Tendu, Chiraungi, Khair** **Note :** * Leaves of most of the tree fall before summer.
6	Chaparral (Mediterranean scrub forest)	These forest are found pacific coast of North America and South coast of Australia	Draught resistant and fire resistant plant species are found. eg. Small tree, Shrub (sage)
7	Tropical Savanna biome (Thorn forest)	Tropical Savanna biome are found in South America and Aurstralia.	**Coase grass - Dichanthium, Sechima, Phragmites** **Trees - Acacia, Eucalyptus, Zizuphus, Capparis** **Note :** * In this biome grass are found with scattered tree. * This biome also known as tropical grass land.
8	Grass Land Biome		**Name of Grasslands** → **Place** Prairies → North America Pampas → South America Steppes → Europe and Asia Tussocks → Newzealand Veldts → Africa
9	Desert Biome		**Note :** * Gobi desert is cold desert. * Sahara and Thar are hot desert. **Name of Desert** → **Place/Area** Sahara → North Africa Tibbat, Gobi, Thar → Asia

5. BIOSPHERE

All the living and non living (Biotic + Abiotic) components of the earth (biomes) combine together to consitute a big eccosystem called Biospher. Biosphere is also called **Ecosphere**. The term **ecosphere** for biosphere was used by **Cok**. Biosphere (space ship or earth) is closd system for minerals and biosphere is an open system for energy. **Noo-Sphere** (Noo-mind, Sphere-domain) is because of development of human civilisation biosphere is changed in to human dominating environment called noo sphere.

A. Lithosphere – The living components and non-living components present on the earth surface consititutes the lithosphere.

B. Hydrosphere – All living components and non living components present in water consitutes the hydrosphere.

C. Atmosphere – All livign components and non living compoments of air consituted the atmosphere. Atmosphere may be defined as a transparent gaseous envelope surrounding the earth. The vertical profile

of the atmosphere shows several concentric layers. These layers vary in density, temperature, composition and properties. The density is highest near the earth's surface and decreases with altitude. The thin layer from the surface of the earth upwards are :

(i) Troposphere (ii) Stratosphere

(iii) Mesosphere (iv) Thermosphere (v) Exosphere

(i) Troposphere :

A. This is the region up to 8-16 km. height from the earth surface. Therefore wind's clouds, dust particales, spores and pollen and more than 90% of gases of atmosphere are present here.

B. Temperature decrease with increasing of height upto tropopause (Top of troposphere).

C. The temperature average 15ºC near the soil surface and lower down to –57ºC at tropopause, which make transistion to the stratosphere.

(ii) Stratosphere :

A. The region lies up to 16-50 km. from the earth above the trophosphere. There is absence of large convectional current's (wind) so it is excellent region for air travel.

B. Ozone layer is present in the stratosphere which protect us from the harmful U.V. radiations from the sun.

C. Stratopause is transist layer between stratosphere and mesosphere.

(iii) Mesosphere :

A. The region lies up to 50-80 km. from the earth above the stratosphere.

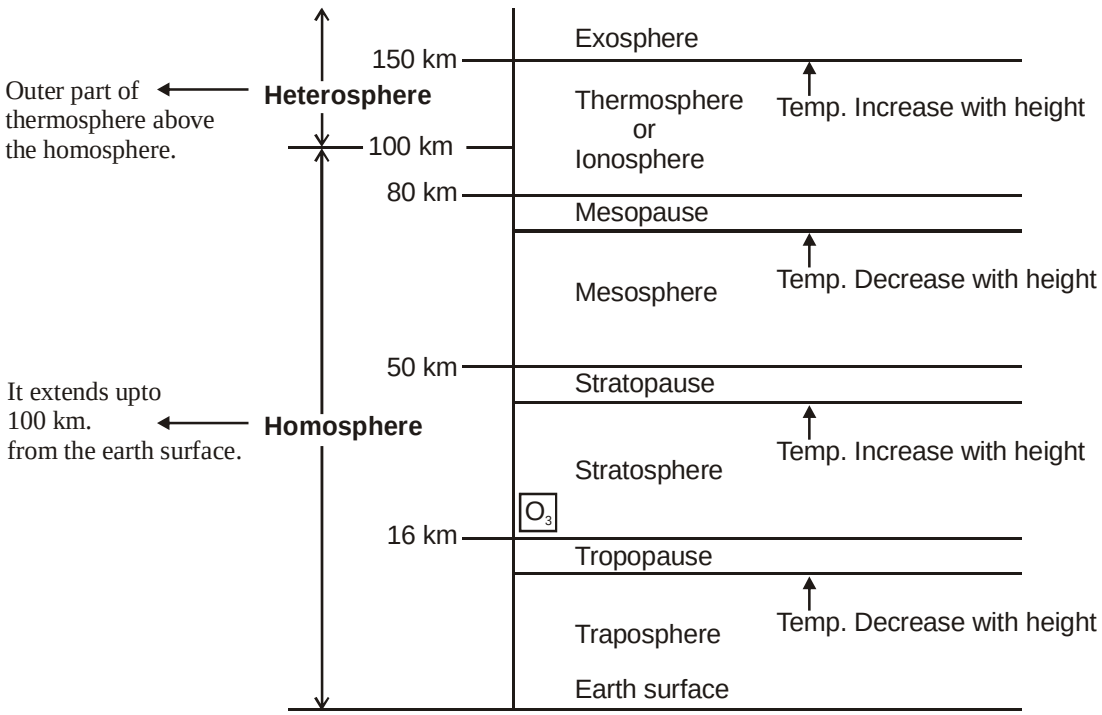
B. It show decrease in temperature with height.

(iv) Thermosphere :

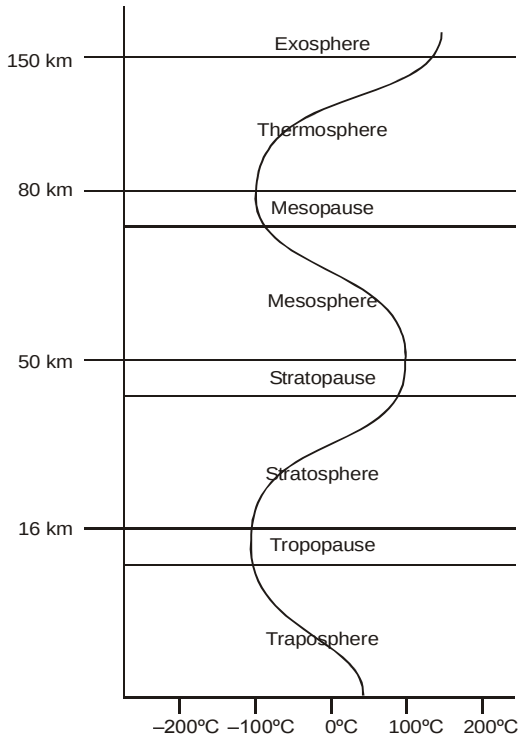
This region lies up to 80-150 km. from the earth above the mesosphere is thermosphere, which contains free electrons and ions. All the communication, satellites are launched only in this layer, because ions and electrons transmits or reflects radio waves (Signals) from the surface of earth.

(v) Exosphere :

The outer fringe of the atmosphere known as the exosphere is extremely rarefied and gradually merges with the outer space. So above the thermosphere is exosphere.



Lapse rate : In troposphere, temperature decreases with increase in altitude. The vertical temperature gradient over earths surface is called lapse rate, it is 6.5ºC per 1000m.



6. ATMOSPHERIC AIR – Atmospheric air contain these gases -

a. $N_2 \rightarrow$ 78.8% b. $O_2 \rightarrow$ 20.92%

c. $CO_2 \rightarrow$ 0.033% d. Argon $\rightarrow$ 0.93% e. Trace components $\rightarrow$ 0.04%

7. LIGHT – Atmosphere get enosmous sun light in the form of electro megnetic speater

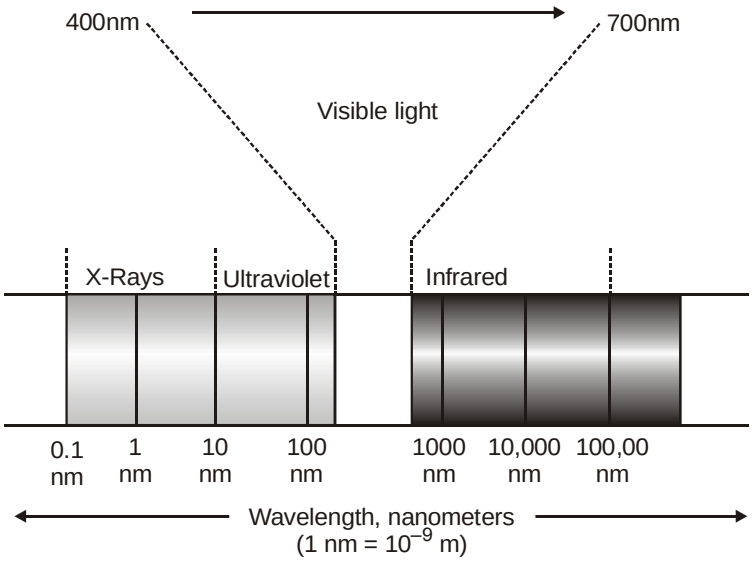


Diagram-I : Showing the electromagnetic spectrum of solar radiation

(i) Solar Constant : Light is measured by **luxmeter or photometer.** Solar radiation before entering the atmosphere carries energy at a constant rate i.e., 2 cal cm^{-2} min^{-1} known as the **solar constant**. In solar radiation wavelength (λ) of light or visible spectrum is **400-700 nm**, it is also called photosynthetically active radiation **(PAR) -**

The U.V. radiation distinguished in

U.V. - C ➡ 100 to 280 nm (Lethial)

U.V. - B ➡ 280 to 320 nm (Quite harmful)

U.V. - A ➡ 320 to 400 nm (Moderatialy harmful)

(ii) Albido value -

The ability of a surface to reflect the incoming radiation is called albido value (AV) it is 80% for fresh snow, 20-30% for sand, 5-10% for the forest.

Out of the total sun light only 1-5% is utilised in photosynthesis.

Only 2-10% of PAR is utilised by plant in photosynthesis.

(iii) Effect of light -

(a) **Photokinesis -** Regulation of speed of locomotion due to light is called photokinesis. **eg.,** Larvae of mussel crab move faster if light intensity increases.

(b) Photomorphogenesis in plants. Photoperiodism, seed germination, plant movements and distribution of plants.

(c) Distribution of plants as heliophytes and sciophytes.

(d) **Phenology -** Timing of seasonal activities of plants in relation to change in environmental condition (Flowering in particular season, leaf abscission etc.) Distribution of animals in aquatic ecosystem - Lake, Pond, Ocean. Light also affects the seasonal and diurenal activities of animals like foraging, reproductive and migratory activities. Light affects distribution of plants and animals in aquatic ecosystem. Light is limiting factor for plants in deep water. The different stratification is observed in lake, pond, oceanic ecosystems due to distribution of light.

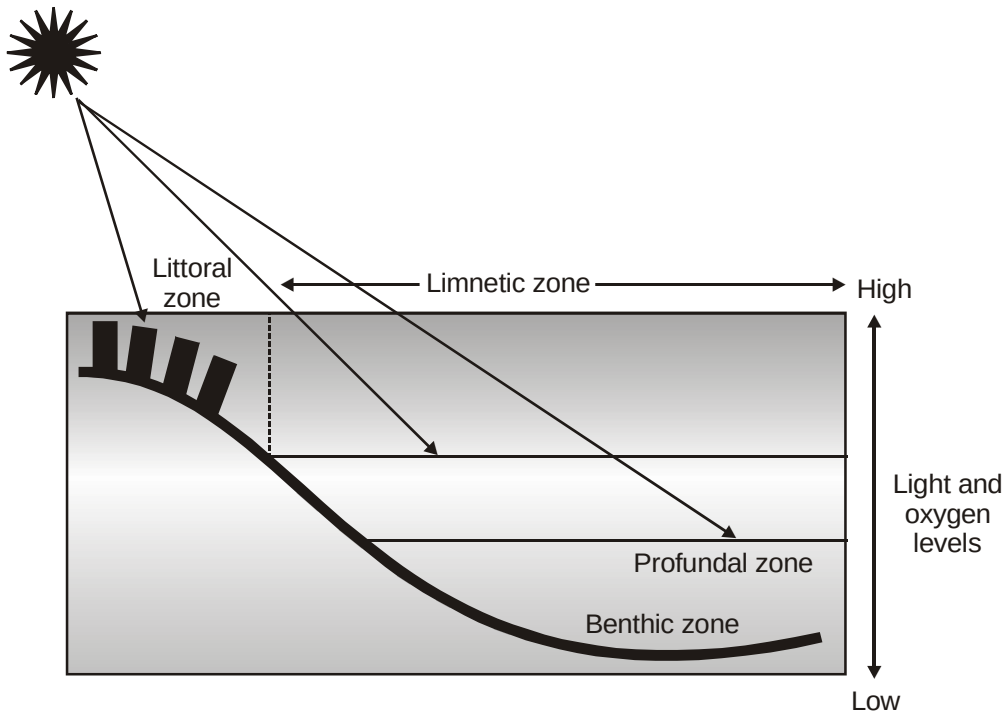
(iv) Stratification in lake on the basic of light :

In deep lake, zonation or stratification may be according to the need of **light**. There are three types of zones differentiated in a deep lake.

A. Littoral Zone - This zone is found at bank of lake with very shallow water or marshy bank is present. Rooted vegetation is found in this zone.

B. Limnetic zone - This is the zone of lake water, where light reaches in sufficient amount to entire surface area. It means this is not too deep. In this region different types of floating plants **(phytoplanktons)**, suspended and submerged plants are present.

C. Profundal zone - It is very deep area of the lake where light does not reach properly up to the bottom. Only **heterotrophs** are present in this zone.



(v) Stratification in Ocean on the basic of light :

All the ocean basins are roughly of the shape of a wash basin or an inverted hat.

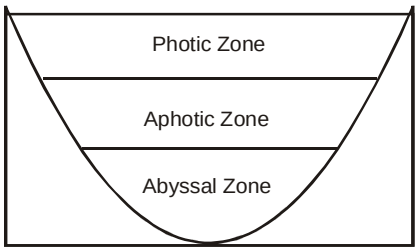
(a) Type-I – On the basis of structure :

From the coast line a gradually sloping region extends for about **160 km** into the sea. This zone is called **continental shelf** and has a depth of **8-200 meters.** The angle of the slopes then abruptly steepens to form the **continental slope.** The continental slope levels off into a more or less horizontal **ocean floor.** The depth of the ocean floor is in the range of several thousand meters.

(b) Type-II – On the basis of availability of light :

The vertical zones of the ocean are determined by the availability or penetration of light for photosynthesis that is-

1. **Photic or Euphotic zone -** It is upper lighted zone up to a depth of about 200 meters.
2. **Aphotic zone -** Middle region where diffused light penetrate which is insufficient for photosynthesis. It extends up to the depth of 200-2000 meters.
3. **Abyssal zone -** It is deeper part where light do not reach below 2000 meter, is the area of perpetual darkness.



(c) Type -III – On the basis of environment :

Three major environment may be recognised in the **ocean basin.**

1. **The Littoral zone -** Comprising the sea floor from the shore to the edge of the continental shelf.
2. **The benthonic zone -** Formed of sea floor along with the continental slope and the aphotic and abyssal zone.
3. **The pelagic zone -** Constituting the water of the ocean basin.

Note :

(A) The shallow shore region of a marine area is called **neritic zone.**

(B) The part have been cut off from river is called **ox-bow-lake.**

(C) Estuaries - The region where, river enter the ocean are known as **estuaries.**

8. TEMPERATURE

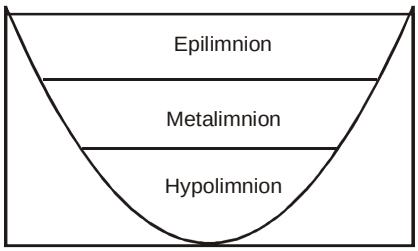
Temperature is the degree of hotness or coldness of a substance. Factors which affects the temperature are latitude, altitude, topography, vegetation and slope. The vertical temperature gradient over earth's surface is called **lapse rate.** And it's value is 6.5ºC per 1000m elevation. Temperature has significant effect on climatic conditions, growth responces of plants, activities of organisms. Plants are affected by temperature like vernalization, thermoperiodism (effect of day-night temperature on various activities) etc. Temperature also affects plant, animal distribution in aquatic ecosystems like in lake.

(i) Thermal stratification in lakes :

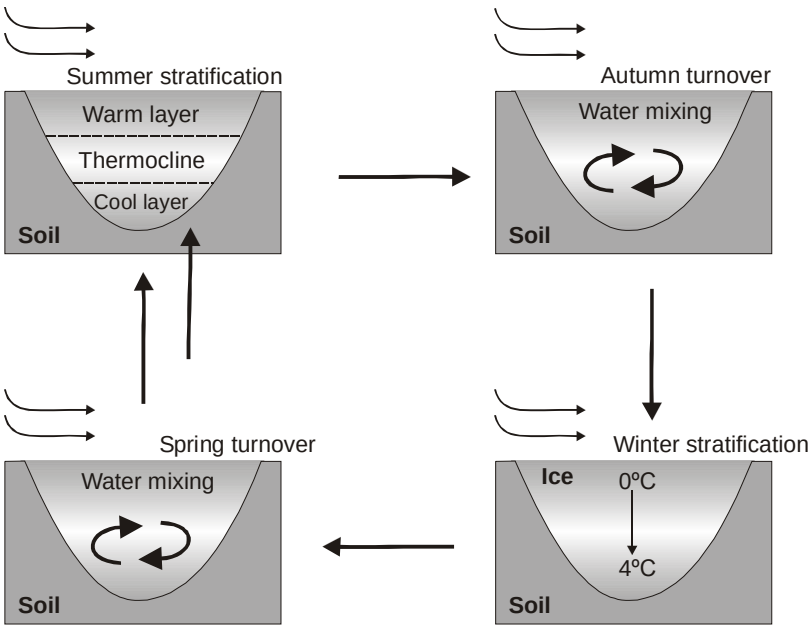
Thermal stratification occurs in deep water body because of difference in temperature of water at different depth. Mainly three layer or zone occurs in water-

1. **Epiliminion -** The top layer gains warmth.

2. **Metalimnion/thermocline -** Middle region where steady decline in temperature or a gradual change in temperature.
3. **Hypolimnion -** Bottom which is not affected by temperature.



4. During summer, temperature is higher on the surface water, whereas in lower layer temperature is low. During winter in a temprate lake, water is at freezing temperature on the surface, whereas in the lower layer temperature is about 4ºC. The surface water is cooled during autumn, and warmed in spring. This results in a free mixing of water in the whole water body, also known as **autumn** and **spring turnover**. During spring and autumn due to turnover of water oxygen and nutrients are redistributed, resulting in a bloom of phytoplankton growth while during winter and summer, **growth of phytoplankon** is low due to low nutrients and oxygen availability.



(ii) Type of plants and animals on the basis of temperature :

(a) On the basis of temperature vegetation is divided into four groups

1. **Megatherms :** The plants growings in high temperature througout the year eg., Tropical rain forest.
2. **Mesotherms :** The plants growing in alternate high and low temperature. eg., Deciduous tropical forest.
3. **Microtherms :** Plants growing in low temperature. eg., Coniferous forest
4. **Hekistotherms :** Plant growing in very low temperature. eg., alpine vegetation

(b) On the basis of temperature animals divide into two groups

1. **Eurythermous or Homeothermal/endothermal/warm blooded -** Animals which are able to tolerate wide variation of temperature. eg., Birds, Man, etc.

   They regulates their internal body temperature by physiological mean, even the outside temperature fluctuates

   Maintainance of relatively constant internal environment under variable environment is called **Homeostasis.**

2. **Stenothermous or Poikilothermal/ectothermal/cold blooded -** Animals which are unable to tolerate wide variation in temperature. eg., Arctic fishes, Reptiles, Amphibians.

   Their body temperature tends to match with environment in which they live. So they control their body temperature by physical mean like move in shade. Some ectotherms are nocturnal and feed during night.

Effect of Temperature on animal :

Temperature affect the absolute size of an animal and its body parts.

1. **Bergman rule -** Birds and mammals attain greater body size in cold region and lesser in warm region.
2. **Allens rule -** The tail, ears, limbs, eyes, snout and hair of mammals are smaller in colder region and larger in warm region.
3. **Jorden's rule -** Fishes in cold water posses more vertebrae than those living in warm water.
4. **Gloger rule -** Warm blooded animals in hot and humid area (tropical region) are more darker in colour (heavily pigmented) than cold area.
5. **Renschs rule -** Birds in cold region have narrow wings and in warm region have broader wings.

9. WATER

The only inorganic liquid occuring on earth which can functions as a resource, condition and habitat. Water regulates the climate through it's role in **rainfall distribution** and **temperature modification**. It also affects vegetation type and it's composition**.** Water presence in soil is of various kinds.

(a) Holard – The total amount of water present in the soil is called holard.

(b) Hygroscopic water : A thin layer of water attached tightly to soil particles due to forces of cohesion or adhesion. This is not available to plants.

(c) Gravitational water : The water that moves downwards due to gravity, it is non available to plants.

(d) Capillary water : Inter particle spaces or porous spaces act as minute capillaries and some amount of water is present in these capillaries due to surface tension. This is capillary water. It is the only form of soil water which is available to plant.

(e) Chemically Combined water - The water which is present as hydroxides of iron, aluminium, silicon, etc. is called combined water.

Some Terminology :

(a) Field capacity - When soil hold all the water except gravitational water, it is known as field capacity. It is upper limit of water availability.

Field capacity = Holard – Gravitational water,

or

Field capacity = Capillary water + Hygroscopic water + Chemically combined water.

(b) Water holding capacity (Storage capacity) - Amount of capillary water retained by any soil. **W.H.C. =** Holard – (Hygroscopic water + Combined water + Gravitational water)

(c) Permanant Wilting Percent (PWP)/Wilting point : The lower limit of water availability of a soil is called wilting point. It is generally hygroscopic and combined water.

Note :

(i) The water potential of soil water at field capacity is **(–0.01 Mpa) [Mpa = Mega pascal]**

(ii) The water potential of soil water at wilting point is **(–1.5 Mpa)**

(iii) Amount of water in soil measured by **tensiometer.**

10. SOIL

Soil is the upper most weathered layer of earth's crust. It composed on minerals and partially decomposed organic matter. Soil is formed when rock are weathered are deposited by water and wind erosion. It is formed due to interaction among parent rock, climate, living organism, time and topography.

Soil Profile :

(a) O - layer - This is made up of **litter.**

(b) A - layer / Top soil - This layer consists of mainly humus. Minerals are also found here. Most of microfauna and micro flora are present in this layer of soil. Four feet thick top soil is essential for growth of plants. The destruction of 'A' layer is called **soil erosion**. A-layer is divided in two parts - A_1, A_2

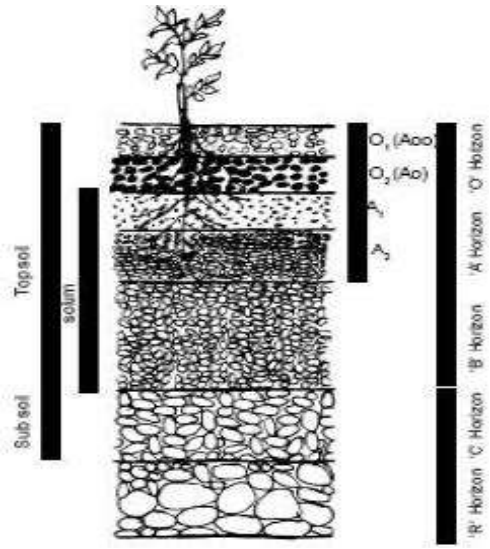
1. **A_1 -** The upper part of A layer (A_1) is also called humic or melanized zone because dark black humus is present.
2. **A_2 -** The lower part of A layer (A_2) is known, as podosolic or eluvial zone or zone of leaching. It is light coloured region because of little amount of organic matter.

(c) B - layer or subsoil - This layer is made up of big soil particles or minerals. This layer has less amount of humus, it contains compounds of iron, aluminium and maganese in higher amount, it is also known as illuvial zone. It is second mineral layer in which the material leached from A_2 zone accumulate. So also called as zone of illuviation or accumulation.

(d) C - layer - This layer is composed of incompletely weathered rock materials.

(e) R - layer - This layer is present in unweathered parental rocks.

A Horizon + B Horizon = **Solum**



Soil Profile

Type of soil on the basis of the mode of their formation -

(a) Residual soil - The soil in which soil formation i.e., weathering and pedogenesis, occurs at same place.

(b) Transported soil - Soil in which weathering process occurs at one place and pedogenesis occurs at another place.

1. **Colluvial soil** ➡ It is brought by gravity.
2. **Alluvial soil** ➡ It is brought through water, it is highly fertile soil.
3. **Glacial soil** ➡ Soil is brought by ice.
4. **Eolian soil** ➡ This soil is brought through wind.

Some Terminology Related to soil

(a) Literization :

In the **tropical area** due to high temperature, high rainfall, litter is decomposed very rapidly in A-layer. Due to mineralization of **Al** and **Fe** are liberated in the upper layer (A-layer) of soil, colour of this soil becomes **redish-brown,** this process is known as laterization and soil is **literite.**

(b) Podsolization :

In **temperate area** temperature is low and high humidity occurs. Humus and minerals contents dissolve and percolate with water and are leached from A layer to B layer. Due to loss of chemicals the colour of soil of A-layer (horizon) turns to **light ash** colour. This process is known as podosolization and soil is known as **podosols.**

(c) Gleization :

In **tundra** region due to low temperature and humid condition humus is formed in less quantity and moves slowly in B-layer. So colour of B-layer becomes **blue-grey** due to deposition of **Fe** salt. This process is known as gleization and soil is known as **gleys**.

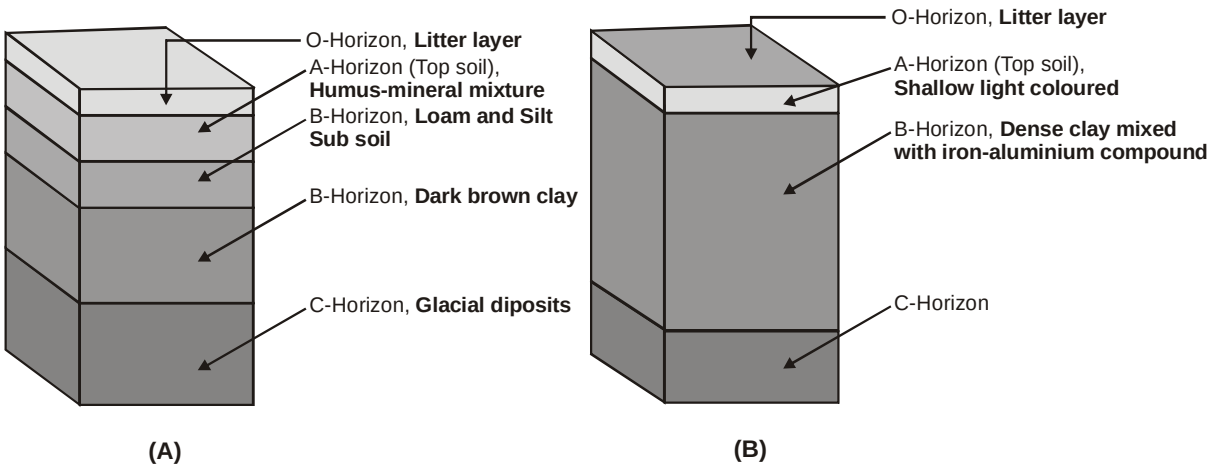


Fig.: Comparison of soil profile (A) temperate deciduous forests, (B) tropical rain-forest.

(d) Soil Organic Matter :

The dead organic matter present in soil is called humus, which is formed by decomposition of plant and animal remains. Freshly fallen plant and animal material called **detritus** or **litter,** partially decomposed litter is called **duff.** Fully decomposed litter is called **Humus.**

Detritus/Litter ➡ Duff ➡ Humus

(e) Soil mineral matter :

Minerals 45% + Water 25% + Air 25% + Organic matter (Living + Non living) **5%**

Soil formation is slow process 1 inch soil is formed in 500-1000 years.

Pedogenesis – Development of soil or soil formation.

Pedology (Edaphology) – Study of soil.

Type of Soil

(a) As a result of weathering the mineral particles of different size are formed. The soil is divided into five types on the basis of **size of soil particles.**

Soil Type	Size of particles
Clay	Less than 0.002 mm
Silt	0.002 – 0.02 mm
Fine sand	0.02 – 0.20
Coarse sand	0.20 – 2.0
Gravel or Grit	2 mm – 5 mm
Coarse Gravel	Above 5.00

Sandy soil	=	85% sand + 15% clay or silt or both
Loamy soil	=	70% sand + 30% clay or slit or both
Silt soil	=	90% silt + 10% sand

(b) Loam soil is the **best soil for growing of crops,** it has high water holding capacity, high aeration and high root penetration.

(c) On the basis of the soil condition there are seven ecological group of plant.

Halophytes – Plants grow in saline soils.

Psamophytes – Plants grow in sand.

Lithophytes – Plants grown on rock surface.

Chasmophytes – Plants grow in rock crevices.

Chersophytes – Plant grow in waste land.

Eremophytes – Plant grow in dry area.

Cryophytes or Psychrophytes – Plant grow in low temperature or cold soil.

11. OTHER ABIOTIC COMPONENT

(i) Precipitation - It is a source of soil water. The hydrological cycle is the movement of water between earth, air and atmosphere.

Forms of precipitation -

(1) Drizzle – Minute drops of water floating in air.

(2) Rain – Large drops of water.

(3) Snow – Water in solid form.

(4) Sleet – Ice in minute granular form.

(5) Hails – Large balls of ice.

(ii) Humidity – Atmospheric moisture in the form of invisible vapour is known as humidity. It is expressed in terms of relative humidity (RH) and it is the amount of moisture in air as percentage of the amount which the air can hold at saturation at the existing temperature.

If temperature ↑ RH ↓

R.H. is measured by **Psychrometer** and Wind speed is measured with the help of **anemometer.**

(iii) Topography –

It includes the physical features of the earth like **altitude**, slope, **exposure**, **mountain chains, valleys, plants**. It affects distribution of organism by influencing the climatic factor like light, wind, rainfall etc.

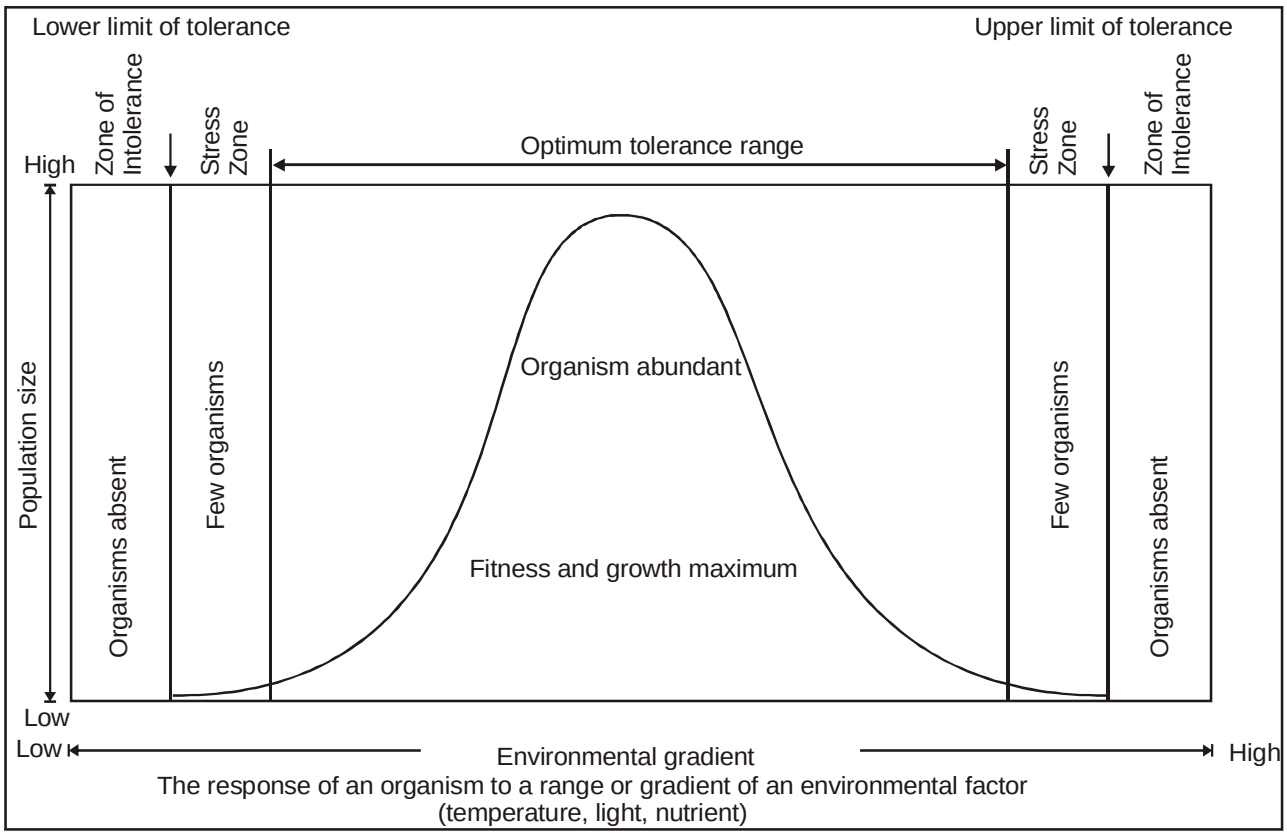
RESPONCE TO ABIOTIC FACTORS :

(i) Adaptations :

The environmental conditions of a habitat are not always constant but change with time. The organisms show various kinds of Adaptations to cope with changed abiotic or environmental conditions. Acclimatisation is a gradual physiological adjustment of the organism to the slowly changing new environmental condition. If there is a shift in some environmental factor beyond the tolerance range of an organism the latter can come to the resting stage or migrate or can undergo acclimatisation.

(ii) Shelford law of tolerance -

(a) Every organism has minimum and maximum limit of tolerance **(ecological amplitude)** with respect to the environmental factor like temperature, sunlight or nutrient concentration. In between these limits the central optimum range is found in which organisms are abundant this is known as **optimum zone of tolerance.**



(b) The organisms have ability to maintain the internal body environment suitable for all biochemical and physiological function to proceed with maximal effeciency and increase the fitness of the species.

(c) It could be in terms of optional body temperature and osmotic concentration of body fluid.

(d) Organisms are of four types on the basis of regulation of internal body environment with changing external environment.

1. Regulators / Regulates 2. Conformers/Conforms 3. Migration 4. Suspend

1. Regulators / Regulates :

(a) Organims which can maintains homeostatasis by **physiological** (Sometime behavioral/physical also) **means** and maintains constant body temperature.

(b) All **birds** and **mammals**, some **lower invertebrates** and **vertebrates.** For example, human beings or mammals maintains their constant body temperature 37ºC in summer by sweat results in cooling and in winter by shivering. Which produce heat and raise body temperature.

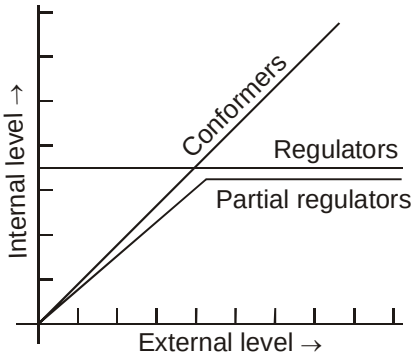
(c) Plants can not show homeostasis so in different climatic zones different plants species are successfully survive.

2. Conforms :

(a) Organisms which are not able to maintains their internal environment (Temperature, osmotic concentration). It means their body temperature change with change in temperature.

(b) About 99% of animals and plants are conforms. For example in small animals like shrews and humming birds, the heat loss or heat gain is function of surface area. So they have to expand much energy to generate body heat through metabolism. Thats why small animals are rarely found in polar region or animals are large in size, in polar region.

(c) Some species have evolved the ability to regulate, but over a limited range at environmental conditions, beyond which they are conform and they are called **partial regulaters.**



3. Migration :

(a) If stressfull external conditions are localized or remain only for a short duration then some organisms show migration and suspension.

(b) The organisms can move away temporarily from stressful habitat to more suitable area and returns when streessful period is over.

(c) For example, birds migration. **Keoladev National Park** of Bharatpur Rajasthan hosts thousands of migratory birds coming from **Siberia** and other extremely cold northern regions.

Some Examples of Migration

Type of migration	Examples	Activities
Long-distance	Arctic tern	Nests close to north pole in summer. Flies from North (Arctic) to Antarctica in autumn and returns to North pole again each spring.
Short-distance	Caribou, Elk and whale	Migrates in search of food each winter to warmer place.
Periodic	Locust (Tiddi)	Large population migrate in search of feeding grounds.

Note : Thermal Migration - Thermal migration has been seen in birds (siberian cranes, arctic tern), mammals (Bison, caribou), fishes (salmon) etc.

4. Suspend ;

(a) In bacteria, fungi, lower plants, various kind of thick walled spores are formed which helps them to survive unfavorable condition and germinate on return of favorable condition.

(b) In higher plants seeds show suspended stage of plant life.

(c) In animals **hibernation** (winter sleep) shown by bears, frogs, during winter. While **aestivation** (summer sleep) shown by some fishes & snails in summer which is mode of time escape or suspension.

(d) In unfavorable conditions many zooplanktons species in lakes and ponds enter in stage of suspended development called **diapause.**

ADAPTATIONS IN ANIMALS :

In the polar sea aquatic mammals like **seals** have a **thick layer** of fat (blubber) below their skin that acts as an **insulator** and **reduces loss of body heat.** Some organisms posses adaptations that are physiological which allow them to respond quickly to a stressul situation. If you had ever been go any high altitude place you must have experienced what is called **altitude sickness.** Its symptoms include nausea, fatigue and heart palpitation. This due to the low atmospheric pressure at high altitudes, body does not get proper oxygen. In human beings the body compensates low oxygen availability by increasing red blood cells (RBC) production, decreasing the binding capacity of haemoglobin and by increasing breathing rate.

(i) Aestivation and Hibernation

In **very cold** or **dry environments**, animals incapable of migration shift to a physiological dormant state. Spending winter in dormant condition is called **hibernation.** On the other hand, spending the dry-hot period in an inactive state is known as **aestivation**. (Examples are shown in table)

Type	Examples	Processes and activities
Hibernation	Northern ground squirrels	True hibernators go into sleep during winter; body temperature drops; breathing and heartbeat become slow.
Aestivation	Ground squirrels in south-west deserts	Avoids heat by spending dry-hot period in a torpid state into burrows.
Cryptic appearance (camouflage)	Leaf-like grasshopper (*Arantia rectifolia*) Paraying mantis (*Phyllocrania paradoxa*)	Grasshopper resembles the complete leaf or appears to be a part of leaf. Mimics a dead leaf and resembles background vegetation.
Batesian mimicry	Monarch butterfly and the mimic viceroy butterfly	Monarch butterfly (contains toxins in the body) and mimicked by viceroy butterfly (contains no toxins).
Mullerian mimicry	Monarch butterfly and the mimic queen butterfly	Both butterfly species look similar and are also distasteful.
Echolocation	Horseshoe bat	Produce high frequency sounds; detect the presence of the echoes produced from the objects on the same principle of sonar.

(ii) Camouflage

In some animals, the capcity to blend with surroundings or camouflage is a common adaptation. Some of them change their bodies, which make difficult to distinguish them from shadows and branches, or from other members of the group.

(iii) Mimicry

Two species resemble each other closely, one speceis, called **mimic**, is palatable to its predator, but resembles

another species, called the **model**, which is distasteful to the predator. In ***Batesian* mimicry,** the mimic is defenseless, but has anti-predatory marks, like the model which has a defense against predators; hence, the mimic is able to protect itself from the attack of the predator. Similarly, the monarch butterfly (containing poison, toxic to predator) is mimicked by the vicerory butterfly (containing no poison). ***Mullerian mimicry*** is the process when the mimic shares the same defensive mechanism as the model.

(iv) Adaptations to Water Scarcity :

(a) Two types of adaptations are prominent in animals living in arid regions. viz. lowering of water loss as much as possible and adapting to arid conditions.

(b) For example, the kangaroo rat conserves water by excreting solid urin, and can live from birth to death without even drinking water. The camels show unique adjustments to desert conditions, being very economical in water use, tolerant to wide fluctuations in body temperature, and are able to maintain blood stream moisture even during extreme heat stress.

(v) Adaptations of Cold :

(a) Sessile animals, such as barnacles and molluscs, living in very cold inter-tidal zones of northern shores, and several insects and spiders resist the effect of cold spells by a process known as cold hardening.

(b) The freeze tolerant organisms have ice nucleating proteins, which induce ice formation in the extracellular spaces at very low sub zero temperatures.

(c) Some freeze-avoiding animals can tolerate environmental temperatures below 0ºC by accumulating glycerol or antifreeze proteins that lower freezing point of their body fluids. Presence of such antifreeze compounds allows the fish in Antarctica region to remain active in sea water.

ADAPTATIONS IN PLANTS :

The plants which are found on the earth, posses some specific characters in order to survive, successfully. Plant develops various types adaptation to protect itself from these adverse factors. Warming, classified plants into three groups on the basis of availability of water.

1. **Hydrophytes :** Plants found in places where excess of water is present are called hydrophyte.
2. **Xerophyte :** Plants found in places where very insignificant amount of water is present are called xerophyte.
3. **Mesophyte :** Places where is neither too much water nor less availability of water. Their habitats is having relative amount of sufficient water.

Note : Ecological adaptations are found in xerophyte and hydrophytes.

1. **Hydrophytes :** Hydrophytes are divided into five groups

(a) Free floating hydrophyte :

This group includes such type of plants which remains floating at water surface which are not in contact with soil of water reservoir from their roots. e.g. ***Lemna, Wolffia, Salvinia, Eichhornia***

Eichhornia is "water hyacinth" and sorrow/terror of Bengal. It is aquatic weed, inhabitant of America.

(b) Suspended hydrophyte :

These plants are suspended in water but not fixed with their root. This do not have contact with the substratum of water body. e.g. ***Najas, Utricularia, Hydrilla***

Utricultria is also known as 'Bladder wort'. This is root less insectivorous plant. The apparatus for catching the insect is formed by the modification of leaf in plant.

(c) Submerged hydrophytes :

These plants entirely submerged under the water and into the mud with their roots. e.g. ***Potamogeton, Vallisneria, Ceratophyllum, Eloidea***

(d) Fixed floating hydrophyte :

This group include such type of plants in which their root are fixed in the mud and leaves are floating on the surface of the water. e.g. ***Nymphaea, Nelumbium*** (Lotus), ***Victoria regia, Trapa***

(e) Emergent hydrophyte :

The basal part of such plants are embedded in water and remaining part floats upon the surface of water such plants grows both type of characteristic as aquatic and terrestrial. So, they are known as **amphibious plants**. e.g. **Typh*a, Juncus, Jussiaea, Sagittaria, Ranunculus aquatlis*** **and** ***Cryptostegia*** **etc.**

Adaptation of hydrophytic plants :

(a) Osmotic Pressure - The osmotic pressure of cells of aquatic plants is very less, so plants do not absorption unwanted water due to low osmotic pressure.

Note : But, osmotic pressure of cells is high in those plants which live in salty water as in sea and sambhar of Rajasthan because it can reduce the loss of water.

(b) Mucilage - Mucilage is found on the surface of aquatic plants. Mucilage protects the plants from the action of bacteria and fungus.

(c) Cuticle - Cuticle is absent on the surface of aquatic plants. These plants exchanged gases through the general body surface. But cuticle and wax is present on the floating leaves, so it become hydrophobic.

(d) Aerenchyma - Aerenchyma is present in hydrophytes which provide buoyancy to the plants and store oxygen which is produce in photosynthesis.

(e) Chlorenchyma - The chlorenchyma tissue of these plants in well developed. The intensity of light is the limiting factor in photosynthesis of aquatic plants. The intensity of light decreases in the deep water so, absorption of more light takes place through well developed chlorenchyma. The whole plant is green excluding roots.

Note : Photosynthetic green roots are present in Trapa.

(f) Epidermis - The epidermis of aquatic plants bear chloroplast.

(g) Mechanical tissue - Mechanical tissue is less developed in hydrophytes. Sclerechyma is either absent or reduced. So, aquatic plants are soft.

(h) Conducting tissues - Conducting tissues [xylem & phloem are poorly developed in hydrophytes]

Xylem of these plants is not differentiated completely. Tracheids and vessels less devoleped. Water is absorbed by the whole surface of aquatic plants so the need of conducting tissue is less.

Phloem is also less developed because whole plants prepare its own food.

(i) Roots - The root system of hydrophytes are either absent [Wolffia and Utricularia] or reduced [Trapa and Eichhornia].

Note : Root cap is absent in Eichhornia. In place of root cap, root pocket is present which is filled by air.

(j) Leaf - The leaves of suspended and submerged hydrophytes are either dissected [Hydrilla and Ceratophyllum] or long, soft and ribbon like [Vallisnaria]. Dissected and ribbon's like leaves do not produce resistance to current so that, protected from destruction.

Usually heterophylly is present in emergent hydrophytes. Two types of leaves are found in these plants. The emerged leaves are dissected and aerial leaves are large and complete. But leaves of floating hydrophyte are long, broad and strong, astrosclereids and trichosclereids are present in these leaves. The leaves becomes solid due to presence of these sclereids. The leaves of Victoria are strongest and highest in diameter. Their diameter is approximately 1 meter.

Astomatic - The leaves of suspended and submerged plants are astomatic. In their leaves stomata are either absent or reduced. These plants exchange gases through the general surface of the body.

Epistomatic - Floating leaves are epistomatic, it means stomata are present only on upper surface of the leaf the lower surface remains in contact of water, therefore stomata are absent on the lower surface.

(k) Reproduction : Hydrophytes reproduce vegatatively and sexual reproduction is found less. Sexual reproduction only takes place in adverse climatic conditions.

Note : The vegetative reproduction takes place vigorously so that these plants becomes a weeds.

2. Xerophytes :

These plants live in deficiency of water. This deficiency of water may be of two types.

(a) Physical dryness - In desert and the slopes of hills where only 20 cm rain fall or less than this condition are present called physical dryness. These plants grow in that region which have very less amount of water is called physical dryness.

(b) Physiological dryness - Sometimes water is present in the habitat but due to some reasons plant can not absorb this water, is called physiological dryness. High concentration of salt water, and low temperature habitat is a type of physiological dryness habitat.

Xerophytic plants are of many types on the basis of Habitat
1. Halophyte - Those plant which grow in saline habitat known as halophyte. Such soil is called marshy soil. Such type of land is unfertile and barren.
2. Epiphyte - Such type of autotrophic plant which grows on other plants are called epiphytes.
3. Psychrophyte - Those plants which grow in cold soil such as plants grown on high range of Himalaya.
4. Chasmophyte - These plants are grow in the crevices of rocks.
5. Psamophyte - Such plants which grow in sandy soil are called psamophyte.
6. Lithophyte - These plants are grown on either rocks or sedimentary soil. Plants grown on the slope of Aravali hill.

1. Xerophytes are divided into three groups by Kerney and Shantz on the basis of their habit -

(a) **Drought Escapers or Ephermerals -** Such type of plants usually grown in desert. These plants complete their life cycle in favourable moisture (humid) season. They leave their mature seed and degenerates before unfavourable condition. These plants are not facing the scarcity of water, so they are **not true (real) xerophytic** plants.

Adapatation : These plants do not have xerophytic adaptation. Spines are found on the surface of these plant, which protect them from the grazing animals. e.g. *Argemone mexicana* (Yellow kanteli) *Solanum xanthocarpum* (Blue or violet kanteli)

(b) **Drought Resistant or Succulent Xerophytes -** These plants absorb water in moist season and stored in plant organs. They stored maximum amount of water and they continue their life processes on this stored water during the drought, so, these plants are not facing the drought. Therefore, they are also **not true xerophytes**. They are the most successful plants in places where deficient water supply. The most of the plants of this group are lithophytes.

Adapatation : The specific type of adaptation are found on these plants for absorption of higher amount of water and to avoid the loss of water.

(i) **Mucilage -** Mucilage is present in the plant organs. It is a colloidal substance. Colloids have a great capacity of imbibition of water. Colloids can absorb more water than its weight. These plants becomes succelent due to presence of mucilage and absorption of water.

(ii) **Stomata - Scotoactive stomata** are found in these plants. Such type of stomats remains close during the days and opens at night. The possibility of transpiration is more during the day. They mainly exchange gases during the night.

All the plants of Cactaceae and Crassulaceae families are succulent plants. Most of the plants of Eurphobiaceae family are succulent.

(c) **Drought Endurers or Non Succulent Xerophytes -**

Psamophytes are included in it. The plants which are found in desert are perennial. They do not store water in their plants organs. However the plant continues to be alive during the drought. Therefore, they are **true xerophytes**.

Adapatation :

(a) Root System - The root system is very long and penetrate the soil to great depth and is well developed. The shoot is less developed (Hight root-shoot ratio) as compared to the root, so that it reduces the transpiration.

(b) Leaves - The maximum adaptations are related with the leaves. The leaves are pinnately compound in most of the plant of this group. A thick layer of the cuticle and wax is present on the upper surface of leaf.

(c) Rolling leaves : Rolling leaves are found in some of the xerophytic plants. The leaves of these plant fold during the mid day. For example : *Ammophila, Emptera, Poa* etc.

(d) Stipules - The stipules of xerophytic plants are modified into spines. These spines protect the plant from the grazing animals e.g. Acacia (Babool).

(e) Stomata - The stomata are present only on the lower surface of the leaf i.e. leaves are hypostomatic. Stomata are sunken type. A cavity is present out side the stomata which is called hypostomatic cavity.

These stomata are surrounded by hairs. Such type of stomata prevent the loss of water. The presence of hair on the leaves are called trichophilly.

(f) Mechanical tissue and vascular tissue - The mechanical tissue and vascular tissue are well developed in these plants. The intercellular spaces are absent, so that cells are tightly arranged. e.g.

(i) *Calotropis* - This plant is most successful in the desert. This is a sand-bounded plant and prevent soil erosion. The leaves of calotropis are simple, but maximum amount of wax is present on it.

(ii) *Caparis aphylla* - The leaves are completely absent in this plant.

(iii) *Nerium* is a typical xerophytic plant. The maximum adaptation are found in this plant such as follows.

(a) The epidermis of the both surfaces are multilayered. A sclerenchymatous hypodermis is present below the epidermis.

(b) Palisade tissue is found on both the surfaces. Vascular bundles are surrounded by sclerenchymatous endodermis.

(c) All the adaptations are only to check the transpiration. Thick cuticle is found in Nerium and wax is present on it.

STUDY OF SOME SPECIAL XEROPHYTES

(i) Halophytes : The plants which grow in salty soils or saline soils are called halophyte. Physiological dryness is found in halophytes.

Adaptation :

1. Osmotic Pressure : The osmotic pressure of cell sap is highest of these plants. The osmotic pressure of cell sap reaches 30 mm of Hg - (atmosphere pressure).

2. **Chalk Glands :** Chalk glands are found on the leaves and roots in some plants of halophytes, which secretes lime. e.g. Atriplex, (maximum)

3. **Mangrove Vegetation :** This is a special group of halophyte. They are found in saline marshy areas of sea-shores and near estuaries. Mangrove vegetation is found in Sunder-bans [W. Bengal] in India. Marshy places are physiologically dry due to the presence of salts. Specially, seed of these plants can not geminates in swampy land.

   The following adaptations are found in mangrove plants.

(i) **Pneumatophores :** Some special type of respiratory roots are found in Magrove vegetation called the **pneumatophore**, they are negative geotropic. Pores are present at the apex of the pneumatophore, they exchange gases through the pores from the atmosphere.

(ii) **Vivipary :** The germination of seed takes place inside the fruit while it is attached to the parent plant that juvenile plant is present in fruit, falls on the marshy soil.

   e.g. *Rhizophora, Sonneratia, Avisinia, Salicornia, Salsola, Heritiera*

(ii) Epipihytes :

Epiphytes are extensively distributed in trophical rain forest. Such type of rain forest lies on the equatorial region around that earth. The main feature of this biome is the good amount of annual rain fall which is more than at lest 140 cm. per year. Such type of forests are found in Assam, W.Bengal, Meghalaya and Andaman Nicobar in India.

Epiphyte are those autotrophic plants which grows on other plants. They do not get water and food from them. Their roots are not present in soil. They absorb atmospheric moisture. Therefore epiphytes are only growing in moistened places. Epiphyte never grows in Rajasthan.

Adaptations

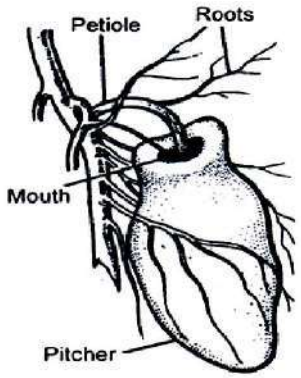
Heterorhizy : These plants are heterorhizomous ie., two type, of roots are found in these plants.

(i) **Clasping Roots :** Their function is only to provide support (fix) the plant.

(ii) **Hanging Roots :** These roots hang in the air these roots have special epidermis which is **multilayered** and made up of thick walled cells, this type of epidermis of root is known as **velamen**. So velamen is an epidermal tissue **Velamen** tissue is is **hygroscopic** in nature. It adsorbs atmospheric moisture.

Note :

1. The plants of Orchidaceae family are known as orchids.
   Orchids are epiphytes. e.g. *Vanda*.
2. **Dischidia** is known as pitcher plant. The leaves modified
   into a pitcher in this plants. Rainy water is collected in the pitcher.



Dischidia

(iii) Physchrophytes :

They are also known as hekistotherms. These plants are grown in cold soil (land). Psychrophytes are found in north and south polar regions. The plants grown at 11000 feet or above are only psychrophytes. They known as Alpines. Such plants are grown on Himalaya.

Cold lands are represent physiologically dry condition. Plants are unable to absorb water because temperature of soil is very less, other reasons are as follows -

1. The viscosity of the water increase due to decrease in temperature.
2. Water potential of water decreases due to low temperature.
3. The permeability of plasma membrane decreases at low temperature.
4. The true characters of xerophytes are found in these plants, such as small leaves, thick cuticle and very deep root system. e.g. *Rhododendron, Delphinium, Anemone, Primula, Sexifraga.*

DIFFERENCES BETWEEN HYDROPHYTES, MESOPHYTES, XEROPHYTES & HALOPHYTES

S.No	Hydrophytes	Mesophytes	Xerophytes	Halophytes
1.	Roots absent or poorly developed.	Fibrous as well as tap root present. Root hair also present.	Long, dense & well developed roots. They are many times longer than sooot.	Roots not completely developed. Pneumatophores & stilt root more developed.
2.	Stem aerial, soft & f1exible. Underground stem more developed.	Stem hard, rigid &stout.	Stem well developed branched & bush like sometime modified into phylioclade.	Stem aerial & well developed.
3.	Leaves thin, narrow, dissected & hairy.	Leaves long, thin have cuticle on outer surface.	Leaves fleshly & leathery. Sometime it is absent or modified into spines.	Leaves thick, leathery & large.
4.	Aerenchymas present	Aerenchyma absent.	Aerenchyma absent.	Aerenchyma some time present.
5.	Cuticle present on outer surface of stem.	Cuticle may be present on outer surface of stem.	Stem outer surface is covered with cuticle or wax.	Outer surface covered with wax.
6.	Stomate absent, if present than very less & only on upper epidermis of leaf.	Stomata are present on both sides of leaves.	Stomata less & sunken, only at lower surface of leaf.	Stomata present but only on lower side of leaves.
7.	Mesophyll not differe-ntiated into palisade cells and spongy parenchyma.	Mesophyll well differe-ntiated into palisade cells & spongy parenchyma.	Mesophyll differentia-ted but palisade more & on both side of leaves.	Mesophyll differentiated, but palisade more than spongy parenchyma.
8.	Growth of plant is slow.	Growth of plant is normal.	Growth of plant is slow.	Growth normal but have viviparous germination.
9.	Mechanical tissues are poorly developed.	Mechanical tissue present & developed.	They are very well developed.	They are developed but lignin is absent.

10.	Transpiration less but Guttation is more.	Transpiration is normal.	Transpiration is reduced by sunken stomata & cuticle layer.	Transpiration very less and Guttation is absent.
11.	Gaseous exchange occur at air spaces.	Gaseous exchange is through stomata.	Gaseous exchange is through stomata.	Gaseouse xchange is through pnematophores.

SPECIAL POINT :

Life Forms : According to Raunkiaer's life forms are of following types. It is bases on the position and the degree of protection to perennating organs (bud) during adverse season,

1. **Phanerophytes -** The bud are located much above the surface of the earth. Such type of plants are found more in tropics. Epiphytes are included in phanerophytes.
2. **Chamaeophytes -** The buds are situated very close/near to the ground surface. Such type of plants are found in cold places or high altitudes.
3. **Hemicryptophytes -** The bud present just below or just above the surface of ground. Such plants are found in temperate climate.
4. **Cryptophytes -** The buds lie very deep in the ground.
5. **Therophytes -** Those plants which are passing the unfavourable climate through their seeds.

Note :

- **Black cotton** – Soil of Maharashtra are commonly known as regur soil.
- **Sierozen** – Light coloured soil of arid region.
- **Bog soil** – Soil of marshed and swamps.
- **Solnetz/Solansltz** – Black alkaline soil.
- **Peat soil** – In which 90% humus in present.
- **Solonchak** – White alkaline & Saline soil.
- Many tribes live in high altitude of Himalaya have high RBC's than people living in the plains. Many xerophytes may accumulate proline (an amino acid) in their cells to maintain osmotic and water potential in their leaves.
- The heat shock protein (chaperonins) provide physiological adaptations to plants to high temperature. This protein helps other proteins to maintain their structure and prevent denaturation at high temperature.
- *Dunaliella* species (green and halophytic algae found in hyper saline lakes) can tolerate saline conditions by accumulating glycerol in the cells, which helps in osmoregulation. The main source of CO_2 for aquatic plants are Carbonates and bicarbonates.

SOME ECOLOGICAL TERMS

1. **Aestivation (Summer sleep) -** Escape from heat of sun
   e.g. Lung fishes, Snails, Goround squirrels in south-west desert
2. **Arboreta -** Botanical graden where specific trees and shrubs species are cultivated.
3. **Benthonic -** The sedentary organisms of sea are called benthonic. e.g. Crabs, Snails, Star fishes
4. **Biodiversity -** The term biodiversity refers to the totality of genes, species and ecosystem of a region.
   (a) Species diversity : Variety of species within a region.
   (b) Species richness : The number of species in per unit area.

5. **Biological (phyto-climatic) spectrum -** The ratio or percentage distribution of different life forms in any plant community is called biological spectrum.

6. **Biome :** Large regional unit or ecosystem characterised by major vegetation type (flora) and associated founa in a specific climatic zone.

7. **Biosphere :** All the earth's terrestrial biomes and aquatic systems constitute biosphere. It includes lower atmosphere the land and the oceans, rivers and lakes, where living beings are found.

8. **Biotic potential (Reproductive potential or potential ability) -** The term biotic potential was first used by Chapmann. Under most favourable environmental conditions the maximum reproductive capacity of an species is known as biotic potential.

9. **Botanochemicals -** Plants can also be used for the manufacture of innumerable synthetic products called botanochemicals.

10. **Calcarious soil** – Soil having excess of calcium carbonate.

11. **Calcifuge Plants** – Those plants which can grow in little amount of calcium in soil (pH - 3.8 to 4.0) eg., Rhododendron, Rumax etc.

12. **Community :** Assemblage of different populations in an area, interacting with each other.

13. **Competitive release -** A species whose distribution is restricted to a small geographical area because of the presence of a comparatively superior species.

14. **Cyclomorphosis -** Change in body shape with the change in temperature
    e.g. Daphnia, Cladocera

15. **Ecocline -** Offsprings of ecotypes are called "Ecocline".

16. **Ecological Equivalents -** Organism that occupy the same or similar ecological niche in different geographical regions are known as Ecological equivalents. e.g. **(a)** Arctic fox and African Jackel, both are scavengers. **(b)** Grazers of North America and Kangaroo's of Australia.

17. **Ecosystem :** Biological communities intergrated with it's physical environment through the exchange of energy and recycling of nutrients.

18. **Ecotone -** The transition zone in between two communities is called ecotone or tension zone. It has greater number of species and density or it is a transition zone between two communities where one type of community is modified into another type of community is known as ecotone.

19. **Edge effect -** Species which occur most abundantly and spend their time in ecotone are called edge species. The tendency to increase variety and density of some organism at the community border is known as edge effect.

20. **Gause's competitive exclusion principle -** This principle state that two closely related species competing for the same resourse cannot co-exist indefinitely and the competitively inferior will be eliminated eventually. This is true if resources are limiting but not otherwise.

21. **Guild -** Organism of same trophic level is known as guild (e.g. Cow, Goat, Rabbit).

22. **Hibernation - Winter sleep** or period of dormancy
    (i) Cold blooded animals
    e.g. Amphibians, reptiles
    (ii) Hot blooded animals
    e.g. Polar bear, North ground squirrels

23. **Land scape :** A unit of land with natural boundary having a mosaic of patches, which represents different ecosystems.

24. **Nektons -** Those aquatic plants and animals which are capacble of swimming actively are called nektons. They have well developed locomotory organs. It includes -

(i) Phytonektons - usually flagella are present in these plants.

e.g. Chlamydomonas and Dinoflagellates

(ii) Zoo Nektons (animals) - Jelly fishes, sharks, fishes, frog, cuttle fishes.

25. **Organism :** Basic unit of study of ecology.

26. **Periphyton -** Organism which lives on hydrophytes like. Vorticella, Hydra, Rotifers

27. **Phenotypic Plasticity**

The phenotype is the physical expression of the interaction between genotype of an organism and its environment. The phenotypes show variations due to difference in the environment conditions with in the local habitat such type of variatons are known as phenotypic plasticity.

28. **Planktons -** Planktons are free floating and small organisms which swim to water currents. They lack locomotory organs or the locomotory organs may be reduced. It includes –

(i) Phytoplankton - Microscopic, floating plants e.g. Diatoms

(ii) Zooplankton - Microscopic, floating animals e.g. Protozoans, Crustaceans, Larvae.

29. **Population :** Group of individuals of a plant or animal species inhabiting a given area or group of individuals of a species.

30. **Resource partitioning -** If two species compete for the same resource, they could avoid competition by choosing alternatives. For instance different item for feeding or different foraging patterns.

31. **Species :** Similar organisms having the potential for interbreeding and producing fertile offspring.

32. **Vitality -** Capacity of normal growth and reproduction for survival of a species. It depends upon weight of plant, stem height, root length,leaf number etc.

COMMUNITY AND INTERACTIONS

SPECIES

Is a basic unit of classification, defined as the group of living organism similar in structure, function and behaviour and produced by similar parents, have common gene pool, can interbreed under natural conditions and reproductively isolated from other group of organism.

(i) Endemic Species or Endemism :

A species which is found only in a particular area is known as endemic species. e.g. Meta sequoia is found only in valley of China, Kangaroo in Australia.

(ii) Key-stone Species :

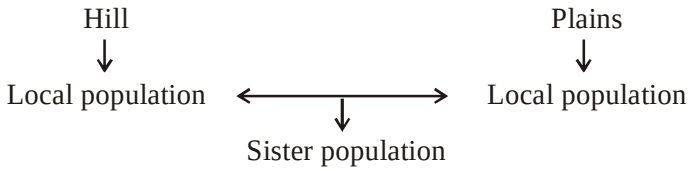
The species which have great influence on the community's characteristics relative to their low aboundance or biomass are called key-stone species. The activities of key-stone species determine the structure of the community. e.g. Lion in forest, Kangaroo rat in desert

(iii) Critical Link Species :

The species which establishes an essential link with other species to help the latter in some vital activity is called link species. e.g. Mycorrhizal fungi, many insect species which works as pollinators of flowers.

POPULATION

A group of individuals (members) of same species living at one place (specific geographical area) constitute a population. Local Population or demes (Sub groups of population) is population of organism inhabiting a particular area. e.g. *Homo sapiens* inhabiting hills, plains. Sister population is different population of same kind of organisms which are found in different places are known as sister population.



Meta population – A set of local population which are interconnected by dispersing individuals.

CHARACTERISTICS OF POPULATION

(i) Birth rate and Death rate :

Population have many features that features are different from a individual. Like individuals have birth and death, while population has birth rate (Natality) and death rate (Mortality). In a poulation these rates are called as per capita birth and death. It can be calculated as for example In a pond 20 lotus plants in last year, 8 new plants are added means current population is 28.

So birth rate of population is $\frac{8}{20} = 0.4$

If out of 20 lotus plants 4 are died then death rate of populations is $\frac{4}{20} = 0.2$

(ii) Sex ratio :

An individual is either male or female, but a population has **sex ratio**. i.e., ratio of male and female like 60% of population are female and 40% are male.

(iii) Age pyramid :

(a) A population at any given time is composed of individuals of different ages. If the age distribution (percent individuals of a given age or age group) is plotted for the population. the resulting structure is called Age pyramid. For human population, the age pyramid generally show age distribution of males and females in a combined digram.

(b) Age pyramid reflects the growth status of the population. i.e.,
(A) Growing (B) Stable (C) Declining

(c) Various age groups in a population determine it's reproductive status. In a population three ages i.e.,Prereproductive, Reproductive and Post reproductive are considered as ecological ages. Distribution of age groups influence the population growth.

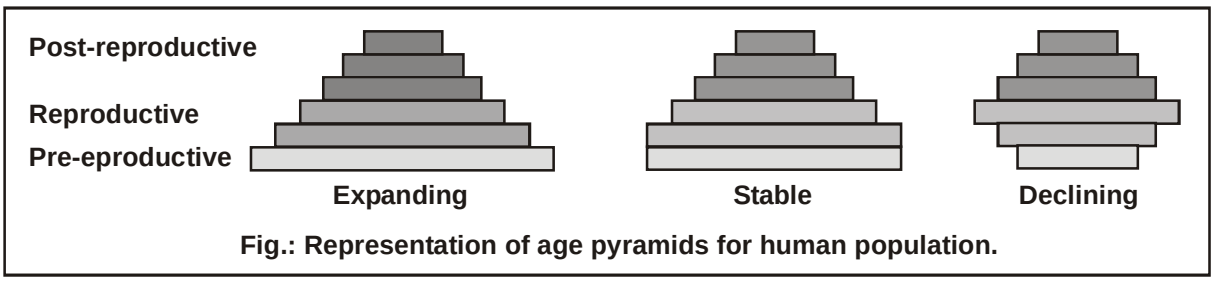


Fig.: Representation of age pyramids for human population.

(iv) Population Density or Population size :

(a) Population density is total number of individuals present per unit area or volume at a given time. For example 50 individuals of tree species grown per hectare and 70 individuals of grass cynodon per square meter. The size of the population is represented by population density.

(b) Census or Counting of human population done every ten year.

(v) Biotic potential and Environmental resistance :

Biotic potential : The inherent maximum capacity of an organism to reproduce or increase in number. Biotic potential (symbol '**r**') can be realised only when environmental conditions are most favourable. So that natality rate is maximum and mortality rate is minimum. In this condition population size increase at maximum rate.

Environmental Resistance : The environmental control on population size, on it's biotic potential. Nature keeps a check on expression of biotic potential. With increase in population size, the environmental resistance (against population) increase.

Environmental resistance do not allow organisms to attain their biotic potential and keep the population size at much lower level.

(vi) Population Growth Forms :

Population have characteristics patterns of growth with time known as population growth form**.** The growth or size of a population of a species is not a static parameter, but it keep changing time to time, due to change in biotic (Food avalability, predation pressure) factors and abiotic factors (water, nutrients, space, weather). But main cause of change in population density in a given habitat during a given period of time is due to change in four basic processes.

1. Natality 2. Mortality 3. Immigration 4. Emigration

1. Natality :

(a) The increase in number of individuals in a population under given environmental conditions is called Natality.

(b) Birth, Hatching, Germination, Vegetative propogation cause increase in number of individuals of population.

(c) The increase in number of individuals in per unit time is called **Natality rate** or **Birth rate.**

2. Mortality :

(a) The loss of individuals due to death in a population under given environmental conditions is called mortality.

(b) Number of individuals of population on dying over a unit time is called **Mortality rate.**

3. Immigration :

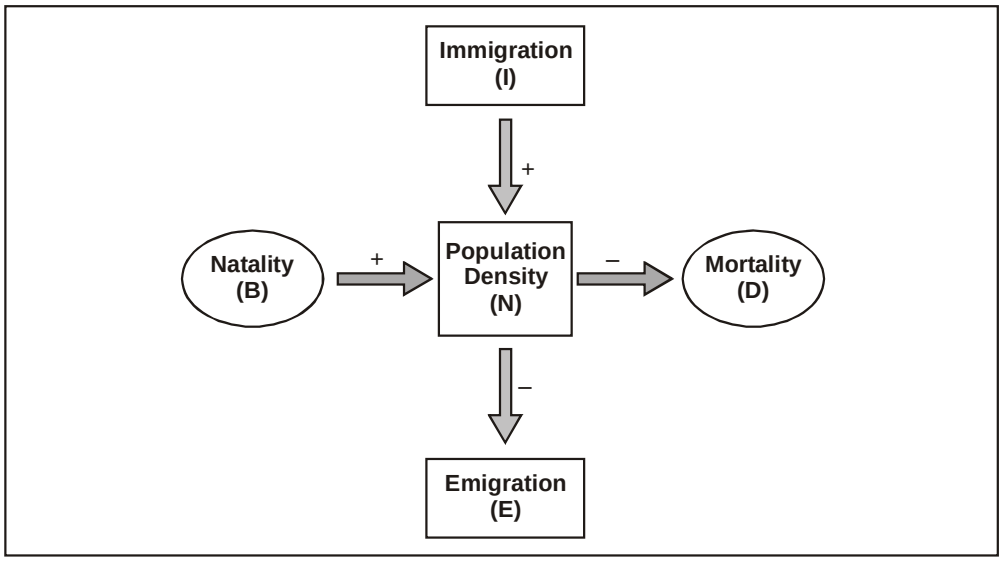
The number of individuals of some species that have come into habitat from elsewhere during given period of time.

4. Emigration :

(a) The number of individuals of population who left the habitat and gone elsewhere during given time period.

(b) So if **'N'** is population density at time **'t'** then at time **t + 1**. It's density is :

$$N_{t+1} = N_t + [(B + I) - (D + E)]$$



The population growth forms (Characteristic pattern of growth in unit time) is of two types.

(i) **J-shaped or Exponential or Geometric Growth Form**

(ii) **S-shaped or Sigmoid or Logistic or Verhulst-Pearl Logistic Grwoth Form**

1. J-shaped growth : In the case of **J-shaped growth** from, the population grows exponentially, and after attaining the peak value, the population may abruptly crash. The exponential growth cannot be sustained infinitely because not only environment is ever changing, food and space are also limited. For example, many insect populations show explosive increase in numbers during the rainy season, followed by their disappearance at the end of the season. The J-shaped growth form is represented by the following exponential equation :

$$\frac{dN}{dt} = rN$$

Where, **dN/dt** is the rate of change in population size, **'r'** is the **biotic potential,** and **'N'** is the **population size**

2. S-shaped or sigmoid growth form shows an initial gradual increase in population size, followed by an exponential increase and then a gradual decline to a near-constant level. This slow-down following

the exponential phase, occurs due to increasing environmental resistance. In such cases, plotting of the rate of increase of population over time gives an **S-shaped** or **sigmoid curve**.

Generally, the population size stabilieses with time, with minor fluctuations around this upper limit. The maximum number of individuals of a population that can be sustained indefinitely in a given habitat, represents its **carrying capacity (K).** The S-shaped sigmoid growth from is represented by the following equation, which includes an expression for environmental resistance:

$$\frac{dN}{dt} = rN\left(\frac{K-N}{K}\right) = rN\left(1-\frac{N}{K}\right)$$

Where, dN/dt, r and N are the same as in the equation for J-shaped growth form, and (K – N)/K or (1– N/K) stands for environmental resistance.

COMMUNITY :

Biotic community is the organization of populations of different species which are interdependent and interact with each other in a habitat. Large number of biotic communities are found in nature due to Existance of diverse habitat with characterstic environmental conditions and co-occurence of different species whose tolerance range overlap with environmental conditions obtained in that habitat.

When similar conditions are repeated at another location the same biotic community established over there. Each biotic community have ecological characteristics which differentiate it from another community.

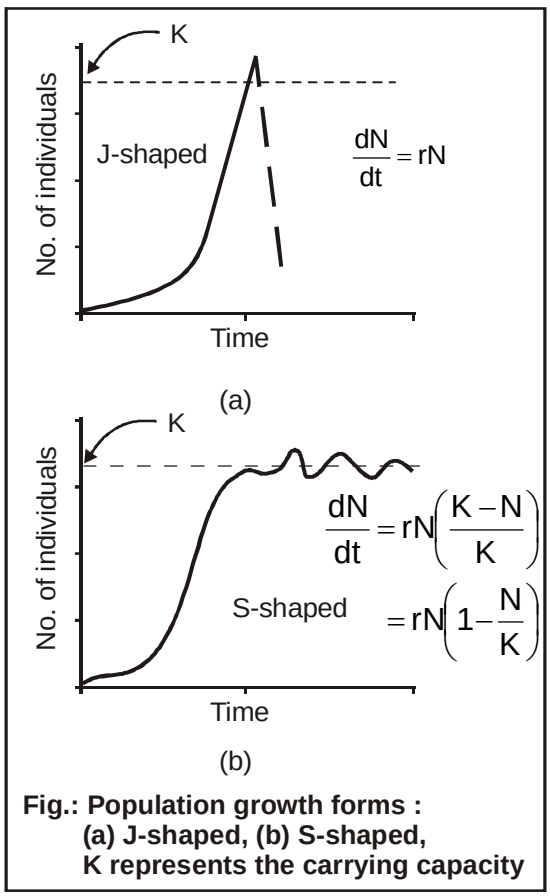


Fig.: Population growth forms : (a) J-shaped, (b) S-shaped, K represents the carrying capacity

Characteristics of Biotic community :

(i) **Species composition -** The kinds of species (Plant and Animals) present in a community represents it's species composition. Species composition are different in different biotic communities even in same community, species composition may be different.

(ii) **Species Dominance / Dominance -** The highest number of organisms of a species present in a community (in terms of number and biomass) is called **dominant species**.

(a) Communities are generally named after their dominant species. For example, forest community with dominance of pine trees is called **Pine forest, grassland community** represents dominance of grasses.

(b) Communities are also named after important environmental factors like **desert community** with dry conditions, **marine community** due to saline conditions of ocean.

(iii) **Physiognomy and Stratification :**

(a) Physiognomy is external appearance or look of a community.

(b) A community is first noticed by it's Physiognomy.

(c) The 'look' or external appearence is the total effect created by the combination of vertical structure and architecture of dominant species of vegetation. For example, high physiognamy of a forest differ from low physiognomy of a grassland.

(d) Several communities may have similar physiognomy, yet they differ sharply on basis of species composition and dominants. For example different forest communities or forest type.

(e) **Stratification-** It represent the vertical layering of vegetation or different layers occupies by different species. The vertical stratification provides physical structure to the plant community, in which many life forms of plants and animals live in.

e.g., stratification in Forest Ecosystem -

Upper most **forest canopy** formed by **large trees** then **understorey tree** layer then **Shrub** layer then lower most **herb** layer.

In a Pond Community upper **surface dwellers** then lower / **bottom dwellers**.

Significance of stratification - Vertical stratification leads increase in number of species and leads to effecient use of resources of a habitat by different types of plants. In aquatic ecosystems, the stratification from surface to bottom is determined by light **penetration, temperature profile** and **oxygen profile.**

(iv) Species Diversity :

(a) More the productive habitat more the diversity of species in a community. For example, **coral reef** and **tropical rain forest** show **high species diversity** while desert community show low species diversity.

(b) The species diversity includes the total number of species present in community and the relative abundence of these species.

(c) Species diversity is the most **important functional property** of a community. (Food chain, Food web)

SUCCESSION

The successive replacement of communities in an area over a period of time is known as succession. Both biotic and abiotic components are involved in successional changes. Succession is a community controlled phenomenon, which results due to action and co-action of living organisms. Physical environment also determines the nature, direction, rate and optimal limit of change during succession. During succession changes occurs in both plant and animal communities.

Type of Succession :

1. **Primary succession -** Occurs in the barren area where there was no vegetation previously, e.g. volcanic lava, esturine soil, mud bank, igoneous rock, sand dunes.
   Note : It requires 1000(s) of years.
2. **Secondary succession :** This type of succession occur where vegetation was present previously but vegetation was destroyed due to natural or artificial causes i.e. fire, flood, sudden changes in climate, land slide.
   Note : This succession is comparatively more rapid, required 50-100 years for grass land and 100-200 years for forest.

Some other type of succession :

(A) On the basis of Replacement :

(i) **Autogenic succession -** During this succession, the community reacts with the environment and changes it. This community is replaced by new community. This is known as autogenic succession.

(ii) Allogenic succession - Community is replaced due to external conditions or forces not by existing vegetation itself. This kind of succession in known as allogenic succession. **e.g.** Fire, Flood.

(B) On the basis of changes in nutritional and energy contents :

(i) Autotrophic succession - This is succession of plants communities.

(ii) Heterotrophic succession - This is succession of animal communities.

Note : Sometimes succession is in retrogressive direction - **e.g.** Forest to grass.

Terms :

- Succession in fresh water → **Hydrosere**
- Succession in salty water → **Halosere**
- Succession in acidic water → **Oxalosere**
- Succession at dry Region → **Xerosere**
- Succession on rocks → **Lithosere**
- Succession on sand → **Psamosere**
- Succession at moistened region → **Mesosere**
- Succession of microbes on decomposed matters → **Serula**

Characteristics :

(A) Continuous change in communities towards a state of stability or climax.

(B) Increases species-diversity, biomass, niche specialization, humus content.

(C) Decreases - net community productivity or annual yield.

(D) Future seral communities can be predicated as it is a directional process.

Community Structure	Seral Stage	Climax
Size of Individual	Small	Large
Ecological Niche	Few	Many
Community organisation	Simple	Complex
Community diversity	Low	High
Community Structure		
Food chain & Food web	Simple	Complex
Effeciency & energy use	Low	High
Nutrient conservation (nutrient cycling & Storage)	Low	High
Heterotrophs	Few	Low
Competition & Predation	Low	High
Net community Productivity	High	Low
r & k - selection	'r'-strategist	k-strategist

Causes of Succession :

1. **Biotic factors -** The action of each seral community (interaction with it's enviroment) makes the less favourable for itself and more favourbale for next seral community in the succession.
2. **Physiographic factors -** These include climatic and other physical factors like soil erosion, soil, landslide, volcanic lava. These all factors makes an area barren.

(a) Plant Formation/Formation ➡ A well developed plant community in any climate is called formation. Ex.: Tropical forest.

(b) Plant Association/Association ➡ A sub unit of formation. A smaller community of plant formation with its two or more dominant species is known as association. A formation has many association.

(c) Consociation ➡ Sub unit of association, means a community with a single dominant species.

Process of Succession

The whole process of succession is actually completed through a number of sequential steps, which follow one another. These steps in sequence are as follows :

1. Nudation –

Formation of bare (nude) areas by natural or artificial causes is called nudation. It is produced through several agencies or natural calamities such as erosion, deposition, wind, water, gravity, slipping of glaciers, fire, lightening, volcanic activity, grazing, diseases and by destructive activities of human beings.

2. Migration –

(a) The seeds, spores or other propagules reach the bare area. This process is known as migration, is generally brought about by air, water and other factors.

(b) The plant structures carried by water are often designated as **disseminules**.

(c) The reproductive structures remaining attached to plant and propagating through the soil are called as **propagules**.

(d) The first arrivals in a bare area are called **pioneers** or **pioneer colonisers**.

3. Ecesis –

(a) After migration the species establish themselves. The process by which the migrants or disseminules establish in a new place is called ecesis.

(b) In plants, after migration, seeds, spores and propagules germinate, seedlings grow and adult start to reproduce.

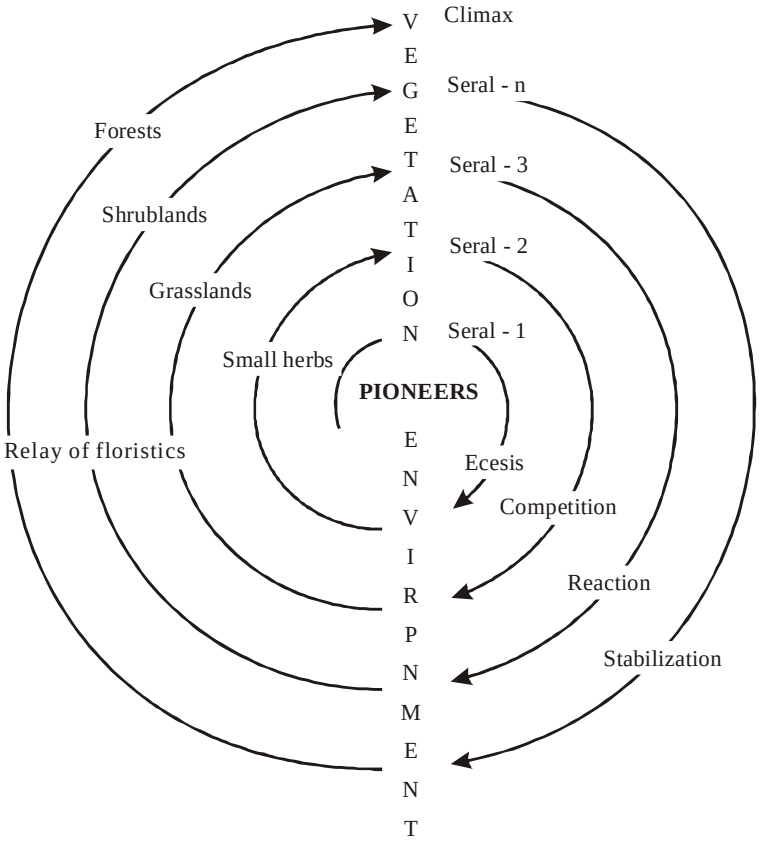
4. Aggregation –

(a) After ecesis as a result of reproduction, the individuals of the species increases in number and they come close to each other. This is known as aggregation.

(b) The three phenomenon i.e. **migration, ecesis** and **aggregation** are sometimes collectively called as **invasion**.

5. Competition and coaction –

(a) After aggregation of a large number of individuals of the species at the limited space, there develops competition. The competition may be for food, space, light or other physical factors. It may occur between individuals of the same species (intraspecific) or different species (interspecific).



(b) Individuals of a species affect each others life in various ways and this is called **coaction**.

6. Reaction –

(a) This is the most important stage in succession. The organisms living in a locality bring about a change in the physical environment and this phenomenon is called as reaction.

(b) As a result of reaction, changes take place in soil, water, light conditions, temperature etc. of the environment. Due to all these the environment is modified, become unsuitable for the existing community which sooner or later is replaced by another community (seral community).

7. Stabilization –

(a) It is the achivement of complete stability of the dominant species.

(b) In this stage the organisms in the community establish a complete harmony with the climate of the area and the community structure remains more or less unchanged. At this stage, there is a perfect equilibrium between abiotic and biotic components of the area.

(c) The final community of dominant species is not replaced by any other group of plants known as **climax community** and the stage as **climax stage**.

IMPORTANT SUCCESSION

(i)Hydrosere :

1.Hydrarch and Hydrosere :

The **ecological succession in water** (pond, lake and saline water) is called as hydrarch and the stages though which it occurs collectively, constitute the hydrosere (in pond or lake) or halosere (in saline water).

The various seral stage of hydrosere are as follows –

(i) Plankton stage : It is the **pioneer stage** of the hydrosere. It consists of a large number of phytoplanktons like **diatoms**, **green algae**, **blue green** algae etc. The phytoplankton are consumed by certain zooplanktons. When planktons die and decompose, they form a very thin layer of humus at the bottom of the pond or lake.

Pioneer community	Seral communities					Climax community
1 Phytoplanity stage	2 Rooted submerged stage	3 Floating stage	4 Read-swamp stage	5 Sedge-meadow stage	6 Woodland stage	7 Forest stage
Blue-green algae, Green algae, Diatoms Bacteria etc.	*Myriophyllum* *Elodea* *Hydrilla* *Potamogeton* *Vallisneria* *Utricularia*	*Nelumbo* *Nymphaea* *Limnanthemum* *Aponogeton* *Trapa* *Monochoria* *Azolla* *Lemna* *Spiodella* *Azolla* *Spirodella* *Wolffia* *Pistia* *Salvinia*	*Scirpus* *Typha* *Sagittaria* *Phragmites*	*Carex* *Juncus* *Cyperus* *Eleocharis*	*Salix* *curmus* *Populus* *Alnus*	*Ulmus* *Acer* *Quercus* Tropical Rain Tropical Deciduous
	General trend of succession →					

(ii) **Submerged stage** – The humus formed by the decomposition of planktons paves way for the arrival of a new community comprising plants eg. ***Hydrilla***, ***Potamogeton***, ***Vallisnaria***, ***Utricularia***, ***Najas***, ***Ceratophyllum*** etc. As a result of decay of these plants more humus is collected at the bottom of the pond or lake.

(iii) **Floating stage**

(a) As more humus and soil is accumulated at the bottom of the pond or lake, it favours introduction of a new community of plants comprising floating forms. There may be plants **rooted in the bottom** soil with floating leaves eg. ***Nymphaea, Nelumbo, Victoria, Trapa, Ranunculus*** *etc*. At places free floating plants also appear eg. ***Azolla, Wolffia, Lemna, Eichhornia, Salvinia, Pistia*** etc.

(b) These plants completely cover the water surface so the submerged plants do not get sunlight and gradually disappear raising the bottom of water body, so the depth of the water is much reduced which disfavours floating plants and thus floating plants also disappear. When these plants decompose, a better substratum is built up.

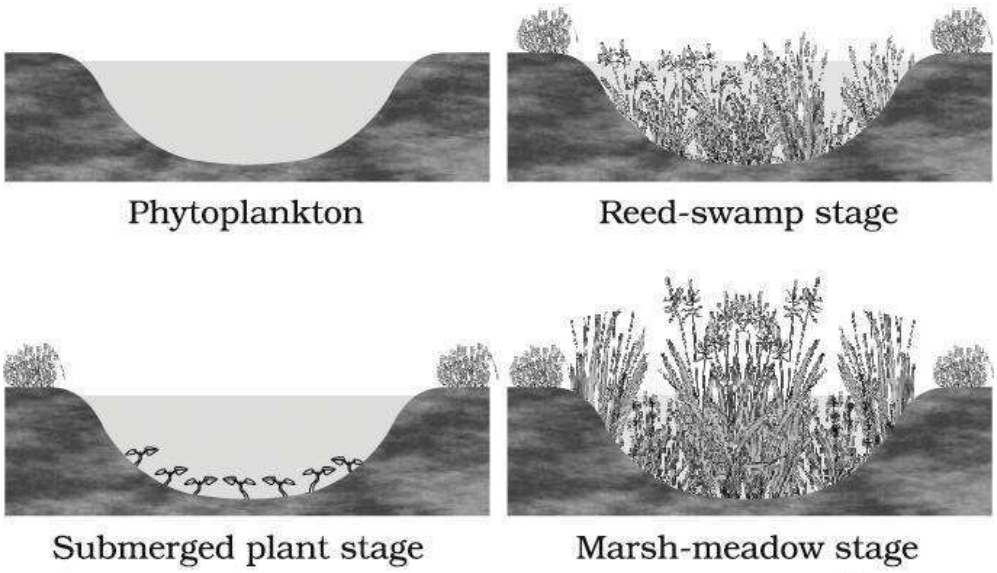
(iv) **Reed swamp stage (Amphibious stage)** – In shallower water **amphibian plants** begin to grow. eg. ***Scirpus, Sagittaria, Typha, Phragmites***. These plants transpire huge quantities of water. They add more silt and humus at the bottom. The water depth is further decreased which favours the next stage.

(v) **Sedge/Marsh meadow stage** – Due to loss of huge amount of water through the amphibious plants accompanied by accumulation of more soil and organic matter, the pond/lake depth reduces further. As a result, a new community invades comprising plants like ***Cymbopogon, Carex*** *(sedge),* ***Cyperus, Juncus***. These plants transpire large quantity of water making the soil too dry for the water loving plants (hydrophytes) to survive. The amount of humus also increases which paves way for the arrival of another plant community.

(vi) **Woodland stage** – **Rhizome bearing shrubs** and **small trees** capable of tolerating excessive light and water logged conditions appear on the edge of sedge/marsh meadow eg. ***Populus*** *(cottonwood),* ***Salix*** *(willow),* ***Cephalanthus, Alnus, Terminalia, Cornus*** *(Bogwood)*

(vii) **Forest stage or climax forest** – This is the final and **climax community.** The woodland community is rapidly invaded by well adapted, self maintaining and uniform plant community consisting of several **woody trees.**

The nature of the **climax** is dependent upon the **climate of the region**. In **tropical regions** with heavy rainfall, there develop **tropical rain forests** but in **temperate regions mixed forests** are formed. They comprise plants like ***Quercus, Acer, Ulmus, Abies, Picea, Taxus*** etc.



Xerarch or Xerosere :

The **ecological succession taking place in a dry area** is called as xerarch. The stages through which it occurs on a bare rock constitute the **lithosere** or on a sand-dune constitute the **psamosere**. Here we will discuss only the lithosere.

The various seral stage of lithosere are as follows :

(i) Crustose lichen stage –

(a) Bare rocks are completely devoid of moisture and nutrients. So in such extremely dry habitats only **crustose lichens** make their foot hold as **pioneers**. The introduction of these plants takes place through the spores or soridia.

(b) Some common crustose lichens are ***Rhizocarpon, Lecanora, Graphis, Rhinodina*** *etc***.** These lichens produce carbonic acid which corrodes the rock forming fine mineral particles (soil particles).

(c) The dead remains of these lichens get mixed with the rock particles. This invites another community to invade upon the rock replacing the previous community.

(d) In tropics, blue green algae are pioneers instead of lichens.

(ii) Foliose lichen stage –

(a) Slowly the foliose lichens begin to colonise upon the rock previously pioneered by crustose lichens. These are leaf like, covering more areas on the rocks. They secrete more acids which enhance soil formation and a thin layer of soil over the rock surface is formed.

(b) The common foliose lichens are ***Parmelia, Umbilicaria, Dermatocarpon*** *etc*. These lichens causes introduction of an other community.

(iii) **Moss stage –** The formation of thin layer of soil on the rocks favours the growth of certain xerophytic mosses like ***Polytrichum, Funaria, Tortula, Barbula, Grimmia*** etc. These erect moss plants accumulate more humus rich soil. Some fruticose lichens like *Cladonia, Usnea* etc. may also grow with the mosses.

(iv) **Annual grass stage –** Annual hardy grasses and herbs invade the humus rich moss dominated rock surface, e.g. ***Aristida, Poa.*** etc. Their roots cause fragmentation of the rock, creating more soil, humus and moisture.

(v) **Perrenial grass stage –** Perrenial grasses invade the annual grass dominated surface, eg. ***Cymbopogon, Heteropogon*** etc. Besides, ferns like ***Adiantum, Asplenium, Actinopteris*** also appear. By further weathering of the rock, more soil is formed. The decomposition of plant material builds up a better layer of substratum that invites yet another plant community to colonise the rock.

(vi) **Shrub stage –** Enough soil is formed in the herbaceous stage (grass stage) which support the growth of woody shrubs, which migrate with the help of seeds etc. from the adjoining areas. eg. ***Fragaria, Rubus, Rhus, Capparis, Zizyphus*** etc. These plants can tolerate bright sunlight. They increase soil and humus content besides moisture.

(vii) **Forest stage or climax forest –** Initially hardy, light demanding small xerophytic trees invade the area. They make the habitat shadier and more moist. The xerophytic trees are gradually dominated by mesophytic trees. The dominant trees of wet temperate area include **conifers, oaks, birches** and **maples**. The warmer areas show dominance of plants like ***Acacia, Prosopis, Balanites, Boswellia*** etc. They represent the climax vegetation which is not replaced.

Pioneer community	Seral communities				Climax community
1 Crustose lichen stage	2 Foliose lichen stage	3 Moss stage	4 Herb stage	5 Shrub stage	6 Forest stage
Rhizocarpon *Rinodina* *Lecanora*	*Parmelia* *Dermato-carpon*	*Polytrichum* *Tortula* *Grimmia*	*Aristida* *Festuca* *Poa*	*Rhus* *Phyto-Carpus*	Mesophytic trees

General trend of succession →

ECOLOGICAL INTERDEPENDENCE AND ECOLOGICAL INTERACTIONS

Ecological Interdependence : Members of biotic community in an area are dependent on one another mainly for **food, space, reproduction** and **protection**. These interaction are important for survival of different species and the community.

(1) **Positive or beneficial interaction -** One or both the interacting species are benefitted but niether is harmed.

(2) **Negative interaction -** One or both interacting species is harmed.

(1) **Positive or Beneficial Interactions :-** It is wide spread phenomenon, it includes → **mutualism**, **commensalism**, **protocooperation**

(A) **Mutualism (+/+) or Symbiosis : (co-evolution)**

Positive interspecific interation in which members of two different species completely depend on each

other for growth and survival, **physcial contact** is present in between both the interacting species. It is obligatory relationship. Both are benifited.

(i) **Mutualism between animal and animal - e.g.** Termites and Flagellates (Trichonympha)

(ii) **Mutualism between plant and animal - e.g.** (a) Zoochlorella and Hydra, (b) Yucca plant folwers and Pronuba insects - Pollination of yucca plant by pronuba (Female yucca moth)

(iii) **Mutualism between plant and becteria - e.g.** legume plant and Rhizobium

(vi) **Mutualism between algae and higher plant - e.g.** Nostoc, Anabaena with **Anthoceros, Azolla** and **coralloid root** of cycas plant.

(v) **Mutualism between algae and fungi - e.g.** 'Lichens', This association is known as Helotism. In this association two organism behaves as a master and slave.

(vi) **Mutualism between fungi and higher plants - e.g.** Mycorrihizal association - *Boletus* in roots of pinus.

(vii) **Fig tree and wasp species.**

In many species of fig trees, the female wasp uses the fruit not only as an **oviosition (egg-laying)** site but uses the developing seeds with in the fruit for nourishing its larval. The wasp pollinates the fig inflorescence while searching for suitable egg-laying sites. In return for the favour of pollination the fig offers the wasp some of its developoing seeds, as food for the developing wasp larvae.

(viii) **Bees and orchid flower.**

The mediterrranean orchid **Ophrys** employs ‘’sexual deceit’’ to get pollination done by a species of bee. One petal of its flower resemblance to the female of the bee in size, colour and markings. The male bee is attaracted to what it perceives as a female, **pseudocopulates** with the flower and during that process is dusted with pollen from the flower, it transfers pollen to it and thus, pollinates the flower.

(B) Proto-cooperation (+/+) - Association in which both organisms are benefited but can live separately. It is a facultative or optional or occuasional association also called as non-obligatory relationship. e.g.

(i) Hermit crab and Sea anemone

(ii) Tick bird (Red-biled or yellow biled) and Rhinoceros

(iii) Crocodile and Bird

(iv) **Scavening -** Association in which one partner called scavenger or saprobiont, eats the dead boides of other animals, which have naturally or killed by another animal. e.g. Jackal, Vulture, Ant, Crow

(C) Commensalism (+ / 0) -

Association between members of two species in which one is benefitted while other is almost unaffected.

(i) **Lianas -** are woody plnats. Their roots are present in soil but their stem use other plant or object for support to get better light. They are found in dense forest. No nutritional relationship. Lianas are the speciality of tropical rain forest. e.g. Bauhinia, Tinospora

(ii) **Epiphytes -** Small plants grow on other plnats in tropical rain forest. They utilise only the space of host plant for light and humidity. e.g. Orchids, Hanging mosses

(iii) **Epizones -** Those animals which depends on plants or other animals.

Sucker fish (Echeneis)	-	Shark
Pilot fish	-	Shark
E. coli becteria	-	Intestine of man
Clown fish	-	Whale
Barnacles	-	Whale
Cattle egret birds	-	Cattle

(2) Negative Interaction (Antagonism)/Detrimental

Two type of negative ineraction are following

(A) Exploitation (B) Amensalism

(A) Exploitation - One species harms the other by making its direct or indirect use for support, shelter or food.It is of three types :

1. Competition 2. Parasitism 3. Predation

1. Competition (–, –) ➡ Interaction in which the fitness of one species is significantly lowers in the presence of another species. According to Darwin the struggle for existence and survival of the fittest in nature, shown that interspecific competition is a potent force in organic evolution.

Cheracteristion of Competition :-

(a) It is generally believed that competition occur when closely related species compete for the same resources that are limiting, but this is not entirely true because totally **unrelated species** could also compete for the same resource e.g. in some shallow South America lakes *flamingoes* and resident fishes compete for their common food.

Resources need not be limiting for competition to occur; in interference competition, the feeding efficiency of one species might be reduced due to the interfering and inhibitory presence of the other species, even if resources (Food and Space) are abundant.

(b) Competition is best defined as a **process in which the fitness of one species** (measured in term of its 'r' the intrinsic rate of increase) **is significantly lower in the presence of another species.**

(c) Strong and persuasive circumstantial evidence does exist, however in some cases. The Abingdon tortoise in Galapagos Island exinct within a decade after goats were introduced on the island, apparently due to the greater browsing efficiency of the goats. This is called **'competitive release'.**

(d) A species whose distribution is restricted to a small geographical area because of the presence of a competitively superior species, is found to expand its distributional range dramatically when the competing species is experimentally removed.

(e) Connell's elegant field experiments showed that on the rocky sea coasts of Scotland, the larger and competitively superior barnacle ***Barlanus*** dominates the intertidal area, and excludes the smaller barnacle ***Chathamalus*** from that zone. In general, herbivores and plants appear to be more adversely affected by competition than carnivores.

(f) **Guase's 'Competitive Exclusion Principle'** states that two closely related species competing for the same resources cannot co-exist indefinitely and the competitively inferior one will be eliminated eventually. This may be true if resources are limiting but not otherwise. More recent studies do not support such gross generalisation about competition.

(g) While they do not rule out the occurence of interspecific competition in nature, they point out that species facing competition might evovle mechanisms that promote co-existence rather than exclusion.

(h) One such mechanism is **'resource partitioning'.** If two species compete for the same resource, they could avoid competetion by choosing, for instance, different times for feeding or different foraging patterns.

(i) MacArthur showed that five closely related species of warbler living on the same tree were able to compete and co-exist due to behavioural difference in their foraging activities.

2. Parasitism (+ / –) ➡ This association involves individuals of two species of different size in which smaller (Parasite) is benefitted and larger (host) is harmed. The parasite gets nourishment and shelter from host but does not kill the host.

Type of Parasite :

(a) **Ectoparasite** ➡ lives on the body of host

(i) **Ectozooparasite -** Leech on cattle, ticks on dogs, copepods on marine fish and lice, mospquitoes, sandfly live on man

(ii) **Ectophytoparasite -** Amphids, Lac insects, Red cotton bug

(b) **Endoparasites** ➡ live in the body of host

(i) **Tapweorm, Taenia, Ascaris, Entamoeba** ➡ live in intestine of man.

(ii) **Plasmodium** ➡ **live in R.B.C.** of human.

(iii) **Hyper parasitism** ➡ A parasite living on another parasite. e.g. plasmodium on female anopheles mosquito, Bacteriophages on bacteria.

(vi) **Brood parasitism** ➡ Parasitism in which the parasitic bird (cuckoo) lays its eggs in the nest of its **host (crow)** and lets the host incubate them, this relation is known as brood parasitism.

(v) **Holo parasitism** ➡ Parasite which are totally dependent upon the host for their requirement **e.g.** *Rofflesia***, (Total root parasite),** *Cuscuta* **(Total stem parasite)**

(vi) **Hemiparasite** ➡ Parasite which partially depend on the host.

e.g. 1. Viscum – on oak
2. Laranthus – on mango
} both are partial stem parasite.

3. Santualum – partial root parasite.

Note : Arceuthobium is the smallest parasite.

3. Predation (+ / –) : A free living organism which catches and kills another species for food.

1. **Insectivores fungi -** Dactylella, Dactylaria, Arthorobotrys, Feeds upon small insects and protozoans.
2. **Carnivoroes animals -** Lion, snake
3. **Insectivores plants -** Drosera, Utricularia, Nepenthes

Significance of predators :

(a) Predators acting as conduits for energy transfer across tropic levels, they keep prey populations under control The **prickly pear cactus** introduced into Australia in the early 1920's caused havoc by spreading rapidly into millions of hectacres of rangeland. Finally, the invasive cactus was brought under control only after a cactus feeding predator (a moth) from its natural habitat was introduced into the country.

(b) **Pest control** are based on the ability of the predator to regulate prey population. Predator also help in maintaining species diversity in community, when all the **starfish** were removed from an enclosed intertidal area, more than 10 species of invertebrates became extinct within a year because of inerspecific competition.

(c) If a predator is too efficient and overexploits its prey, then the prey might become extinct and the predator will also become extinct due to lack of food. This is reason why predators in nature are 'prudent'. The **Monarch butterfly** is highly distasteful to it's predator birds because of a special chemical presents in its body. The butterfly acquires this chemical during its caterpillar stage by feeding on poisonous weed.

(d) About 25% of all insects are **phytophagous** (feeding on plant parts and plant sap) are predators. Plants have specific adaptations or morphological and chemical defence against herbivores.

(i) Throns - in *Acacia,* Cactus.

(ii) Many plant produce and store chemicals that can make herbivore sick or inhibits feeding or distrupt digestion reproduction or even kill.

(e) **Calotropis** produces highly poisonous cardiac glycosides and that is why you never see any cattle or goats browsing on this plant. A wide variety of chemical substances that we extract from plants on a commercial scale (nicotine, caffeine, quinin, strychnine, opium, etc....,) are produced by them actually as defences against grazers and browsers.

(B) Amensalism (– / 0) : In this interaction one species is inhibited by toxic secretion of another spcies. Inhibitor is neither benefitted nor harmed. There are two type of Amensalism,
1. Antibiosis & 2. Allelopathy.

1. **Antibiosis -** Serection of antibiotics -

(a) **Penicillium fungi secretes penicillin** which inhibits growth of *Staphylococcus* bacteria.

(b) **Chlorella algae secretes bacteriocytes** which not only kill but also inhibit growth of the bacteria.

(c) **Microcystis (BGA) secretes hydroxyl amine**, this causes the death of fishes.

2. **Allelopathy -** Trans cinnamic acid is secreted by *Parthenium* which inhibits the growth of some plants like Cassia tora and Vinca regia. This pnenomenon is known as **allelopathy,** e.g *Sunflower*, *Barley*, *Sorguhm*, *Occimum* also show allelopathy. Chemicals which kill or inhibit the growth of other organism. That chemical known as **Depressants**. e.g. *Parthenium*

Population Interactions		
Species A	**Species B**	**Name of Interaction**
+	+	*Mutualism*
–	–	*Competition*
+	–	*Predation*
+	–	*Parasitism*
+	0	*Commensalism*
–	0	*Amensalism*

SPECIAL POINT

(A) **Sliver oak shows autopathy -** It destroys own seed.

(B) **Allochemics -** Chemicals secreted by a species are knwon as allochemics.

Types of allochemics

1. **Allamon -** Chemicals which repel other enemies is called allamon
e.g. Cuttle fish (Sepia)

2. **Kairmons** - the chemicals secreted by one organism benefits the another organism
e.g. Nematodes in soil → stimulate growth of fungi.

(C) **Cannabalism** ➡ organisms eaten by own species.
e.g. cockroach, termites

EXERCISE – 1

Q.1 Competition for nutrients, food, light and space is more severe between two –
(1) Unrelated species occupying different niches
(2) Unrelated species occupying the same niche
(3) Closely related species occupying different niches
(4) Closely related species occupying the same niche

Q.2 In commensalism –
(1) Both partners are harmed
(2) Both partners are benefited
(3) None of the partners benefited
(4) Weaker partner is benefited

Q.3 Symbiosis means –
(1) Living apart with benefit to one and harm to another partner
(2) Living together with benefit to both partners
(3) Living together with benefit to one partner
(4) Living together without harm

Q.4 When one organism inhibits another organism without a significant gain (OR) Antagonism between two organism through gases or allochemicals is called –
(1) Parasitism (2) Mutalism
(3) Amensalism (4) Commensalism

Q.5 The relationship between the alga *Microcystis* and the surrounding fauna corresponds to –
(1) Exploitation (2) Parasitism
(3) Amensalism (4) Predation

Q.6 A component produced by one organism which inhibit the growth of another organism is–
(1) Antiallergic (2) Anticoagulant
(3) Antibiotic (4) Antiseptic

Q.7 *Mycorrhizae* is a symbiotic association between–
(1) Fungi and roots of higher plants
(2) Algae and roots of gymnosperms
(3) Algae and bryophytes
(4) Algae and fungi

Q.8 Carrot grass/ congress grass (*Parthenium*) exhibit allelopathy by virtue of the production of –
(1) Alkaloids and glycosides
(2) Abscisic acid
(3) Protocaterchuic acid
(4) Hydrocynic acid and transcinnamic acid

Q.9 Mark the hyperparasite –
(1) Bacterio phage (2) Bird
(3) Tape worm (4) Man

Q.10 Occurrence of zoochlorellae in the body wall of Hydra is an example of –
(1) Predation
(2) Mutualism or symbiosis
(3) Commensalism
(4) Food chain involving a parasite

Q.11 Relationship between nitrogen fixing bacteria and a legume plant is described as –
(1) Parasitic (2) Saprophytic
(3) Commensal (4) Mutualistic

Q.12 Zone of transition, presenting a situation of special ecological interest between two types of communities is called as -
(1) Ecad (2) Ecotype
(3) Ecotone (4) None of these

Q.13 The interspecific competition is also called as–
(1) Synnectrosis (2) Allelopathy
(3) Scramble competition
(4) Interference competition

Q.14 The following relationship does not correspond to mutualism –
(1) Mycorrhiza (2) Epiphytism
(3) Zoochory (4) Zoophily

Q.15 The relationship between a climber and the host corresponds to –
(1) Mutualism (2) Parasitism
(3) Neutralism (4) Commensalism

Q.16 The protoco-operation is also called as –
(1) Facultative predation
(2) Facultative parasitism
(3) Non-obligatory mutualism
(4) Non-commensalism

Q.17 When food is obtained by killing of host in which the stronger partner is benefitted and host is damaged such an interaction is said to be –
(1) Competition (2) Antibiosis
(3) Predation (4) Parasitism

Q.18 Secondary succession occurs on –
(1) Burnt lands (2) Humus rich soil
(3) Cut wood lands (4) All of these

Q.19 Plant succession is a .....process –
(1) Unimportant (2) Haphazard
(3) Definite (4) None of these

Q.20 The term succession was coined by –
(1) Hult (2) Tansley
(3) Kormondy (4) Hodges

Q.21 The natural process by which different groups or communities colonize the same area over a period of time in a definite sequence is called–
(1) Succession (2) Adaptation
(3) Biological rhythm (4) Variation

Q.22 In any lithosere the pioneer community is –
(1) Blue green algae (2) Crustose lichen
(3) Foliose lichens (4) Mosses

Q.23 Due to modification of the environment by the plant community itself, when one community is replaced by another suitable community, the succession is called as –
(1) Induced (2) Autogenic
(3) Migration (4) Allogenic

Q.24 Serule is –
(1) Hydrosere
(2) Microbial succession
(3) Biosere
(4) Lithosere

Q.25 In a hydrosere, the submerged stage is followed by –
(1) Sedges (2) Reed-swamps
(3) Floating plants (4) Phytoplanktons

Q.26 Overlapping zone between two biomes is-
(1) Ecotone (2) Ecosphere
(3) Ecosystem (4) Ecotype

Q.27 Which of the biomes exhibit distinct stratification into stories-
(1) Temperate biome
(2) Chapparal biome
(3) Tundra biome
(4) Tropical rainforest biome

Q.28 Which is a predacious fungai
(1) Arthrobotrys (2) Rhizopus
(3) Pyronema (4) Polyporus

Q.29 Congress Grass produce an acid which inhibit growth of other plant is
(1) HCN
(2) Trans cinnamic acid
(3) Oxalic acid
(4) Indole aceteic acid

Q.30 Brood parasitism is shown by
(1) Koel (2) Crow
(3) Koel & Crow both (4) Crocodile

Q.31 Complete the following equation by putting one of the following option respectively. For constant size population : Birth + ... = Death + ...
(1) emigration, immigration,
(2) immigration, emigration
(3) emigration, population density
(4) immigration, population density

Q.32 A total parasite is nutritionally
(1) A photoautotroph
(2) A chemoautotroph
(3) A photoheterotroph
(4) A chemoheterotrophs

Q.33 Which of the following does not show commensalism
(1) Epiphytes growing on a tree
(2) Rhizobium in Soyabean
(3) Small fish surviving on the excrets of large fish
(4) E.coli residing in the intestine of human

Q.34 Which of the following ecological relationship between pairs of organism is different from the other pairs
(1) Fish - Algae (2) Cow - Grass
(3) Fungus - Wheat (4) Giraffe - Shrub

Q.35 An algae is often seen growing on the shell of turtle this type of relationship is called
(1) Mutualism (2) Commensalism
(3) Parasitism (4) Predation

Q.36 Which of the following set of value would result in a population with a grwoth rate of zero
b = birth d = death
i = immigration e = emigration
(1) b = 1000 d = 500 i = 750 e = 1000
(2) b = 1000 d = 500 i = 1000 e = 1000
(3) b = 1000 d = 500 i = 1500 e = 1000
(4) b = 1000 d = 500 i = 500 e = 1000

Q.37 Which of the following is least likely to result in density dependent effects on growth of natural population

(1) Interspecific competition

(2) Parasitism

(3) Disease

(4) Increased rain fall

Q.38 Maximum parental care is present in

(1) Tadpole (2) Primates

(3) Koel (4) Crow

Q.39 Probiosis (Both benifitted) includes-

(1) Mutualism

(2) Proto co-operation

(3) Commensalism

(4) 1 & 2 Both

Q.40 Biological contraol of weeds and pests is largely based on

(1) Pray predator interaction

(2) Host parasite interaction

(3) Antibiosis (4) Allelopathy

Q.41 Which of the following chemical compound help in transmitting the massage to other member of same species -

(1) Hormone (2) Ptyalin

(3) Pheromones (4) None

Q.42 Genetically adaptive population to a particular habitat is

(1) Ecotone (2) Ecotype

(3) Ecosphere (4) Ecology

Q.43 Which one of the following is protective device

(1) Camouflage (2) Competition

(3) Symbiosis (4) Commensalism

Q.44 A smoother crop is which

(1) Does not require much irrigation

(2) Is easier to harvest

(3) Is immune to most of pathogen

(4) Does not allow to grow weed

Q.45 The number of individual of a species in particular habitat remain constant at a given time due to

(1) Man (2) Predator

(3) Parasite (4) Available food

Q.46 What will form a new species

(1) differential reproduction

(2) Inbreeding

(3) Variation (4) None of the above

Q.47 Alturistic behaviour is found in

(1) Spotted dear (2) Honey Bee

(3) Termite (4) All of the above

Q.48 Crow also incubates the eggs of

(1) Pigeon (2) Dove

(3) Koel (4) Weaver bird

Q.49 The population of a place tends to increase when

(1) Predation increases

(2) Emigration occur

(3) Immigration occur

(4) Reproductivity decrease

Q.50 Two different species can not live for long duration in the same niche or habitat. This law is called

(1) Allen's law (2) Gause's law

(3) Jorden's law (4) Weisman's theory

Q.51 Which of the following are characterstic feature of population

(1) Birth rate (2) Death rate

(3) Sex ratio (4) All of the above

Q.52 Inhibitation of growth of plants by release of certain chemicals by higher plants is called

(1) Antibiosis (2) Allelopathy

(3) Predation (4) None of these

Q.53 Species present in only one community is known as

(1) Ubiquitous species (2) Exclusive species

(3) Dominat species (4) None of the above

Q.54 Species which is present in many communities is called

(1) ubiquitous species (2) endemic species

(3) exclusive species (4) dominant species

Q.55 Negative interaction is also known as

(1) Allelopathy (2) Antagonism

(3) Antibiosis (4) Competition

Q.56 Chemical which is secreted by walnut and inhibit growth of apple is

(1) HCN (2) Juglon

(3) Trans cinnemic acid

(4) Walnum

Q.57 Bee dance is a mode of

(1) Mating (2) Grouping

(3) reproduction (4) Communications

Q.58 The carrying capacity of a population mean -

(1) The rate at which the density of individual increase over time

(2) The maximum number of individual which can be supported in a given environment

(3) The proportion of individual which are most responsible for population growth

(4) The minimum number of individual necessary to avoid extinction

Q.59 Which of the following intercation is not a positive interaction

(1) Flower and pollinator

(2) Plant & herbivore

(3) Legume plant and N_2 fixing organism

(4) Lichen

Q.60 The most important factor regulating seasonal migration is

(1) Change in air temperatue

(2) Change in day length

(3) Reduced availability of food

(4) Increased predator pressure

Q.61 The actual rate of growth of population is the difference between the

(1) Number of adult and number of new born

(2) Size last year and size this year

(3) Number of breeding and non breeding individual

(4) Birth rate & Death rate

Q.62 Which equation shows logistic growth

(1) $dN/dt = rN\left(\frac{K-N}{K}\right)$

(2) $dN/dt = rN$

(3) $dN/dt = rN(1+N/K)$ (4) $Nt = N_0e^{rt}$

Q.63 The number of individual in reproductive age is more than prereproductive phase in

(1) Declining population

(2) Stable population

(3) Expanding population

(4) None

Q.64 Which of the following is not an example of predation

(1) Browsing by goats

(2) Killing of deer by lion

(3) Killing of small fish by shark

(4) Ticks on dogs

Q.65 Which equation shows exponetial growth

(1) $dN/dt = -rN$ (2) $dN/dt = rN$

(3) $dN/dt = rN\left(\frac{K-N}{K}\right)$

(4) $dN/dt = rN\left(\frac{K+N}{K}\right)$

Q.66 J shaped curve is formed in

(1) Logistic growth (2) Exponetial growth

(3) Limited growth (4) 2 & 3 Both

Q.67 S shaped growth curve is obtained in

(1) Logistic growth (2) Exponetial growth

(3) Limited growth (4) 1 & 2 Both

Q.68 Among the following a partial parasite is

(1) Bacteria (2) Fungi

(3) Viscum (4) 1 & 2 Both

Q.69 Which of the following counter acts biotic potential

(1) Limitation of food suply

(2) Predation

(3) Competiton

(4) All of the above

Q.70 Parasite can be best explained as an organism which depends on

(1) others for food

(2) others for shelter

(3) others for food & shelter

(4) others for reproduction

Q.71 What is the most important factor for success for population

(1) Natality

(2) Unlimited food

(3) Adaptabiltiy

(4) Interspecific competition

Q.72 Proportion of young individual is heighest in

(1) Declining population

(2) Stable population

(3) 1 & 2 Both

(4) Expanding population

Q.73 When a population reches upto carrying capacity of environment than
(1) Mortality rate = Birth rate
(2) Mortality rate > Birth rate
(3) Mortality rate < Birth rate
(4) None of the above

Q.74 Some frogs are cryptically coloured to aviod
(1) Competition (2) Antibiosis
(3) Predation (4) Amensalism

Q.75 Variety of different life forms in shallow pond constitute
(1) Ecosystem (2) Community
(3) Population (4) Biome

Q.76 Higher root : shoot ratio is found in -
(1) Epiphytes (2) Hydrophytes
(3) Halophytes (4) Psammophytes

Q.77 In xerophytes, longer root system are found because -
(1) Roots grow deeper to absorb water from deep water tables
(2) They give mechanical support to the plant
(3) Low temperature at night encourages root growth
(4) Hight temperature of soils encourages root growth

Q.78 Vegetation of Sunder bans is -
(1) Desert type
(2) Temperate evergreen
(3) Mangrove type
(4) Monsoon type

Q.79 Which of the following are xerophytes ?
(1) Psammophytes (2) Lithophytes
(3) Halophytes (4) All the above

Q.80 Which of the plants have no leaves but green stems -
(1) Hydrophytes (2) Xerophytes
(3) Mesophytes (4)Epiphytes parasites

Q.81 In *Opuntia* the leaves are modified into-
(1) Scales (2) Spines
(3) Stolons (4) Phylloclades

Q.82 Water storage tissue & succulent nature is characteristics of -
(1) Hydrophytes (2) Halophytes
(3) Mesophytes (4) Xerophytes

Q.83 Which group of plants has to face physiological dryness -
(1) Hydrophytes (2) Epiphytes
(3) Lithophytes (4) Halophytes

Q.84 Which type of plants possess aerenchyma like those of hydrophytes; thick leathery leaves with cutinized epidermis & presence of resin & tannin in cortical cells like those of xerophytes and cells with high osmotic pressure like those of succulents -
(1) Desert xerophytes (2) Lithophytes
(3) Succulents (4) Mangroves

Q.85 *Hydrilla* is a or *Vallisneria* and *Hydrilla* are example of –
(1) Floating and anchored
(2) Suspended hydrophyte
(3) Submerged hydrophyte
(4) A free floating hydrophyte

Q.86 Which among the following could be deviod of roots -
(1) Epiphyte (2) Parasite
(3) Hydrophyte (4) Mesophyte

Q.87 In which of the following plants, the metabolism would be hindered if the leaves are coated with wax or vaseline on thier upper surface -
(1) *Trapa* (2) *Vallisneria*
(3) *Hydrilla* (4) *Lotus*

Q.88 Wax coating on leaves is a characteristic of-
(1) Floating hydrophyte
(2) Mesophyte
(3) Xerophyte
(4) submerged hydrophytes

Q.89 Glazed and shining leathery leaf surface and the presence of sclerenchymatous hypodermis in leaves is the characteristic feature of -
(1) Epiphytes (2) Cold xerophytes
(3) Mesophytes (4) Hot xerophytes

Q.90 Plants growing near sea shore will usually have xerophytic characters like thick leaves because-
(1) Light available to the plants is not sufficient
(2) There is plenty of water in the soil
(3) There is too high concentration of salts for the plants to absorb sufficient water from soil
(4) The soil is muddy

Q.91 Mangrove vegetation is found in -
(1) Western Ghats (2) Sunderbans
(3) Kullu valley (4) Dehradun valley

Q.92 A plant that completes its life cycle before the onset of dry conditions fall into which of the following categories -
(1) Short day plants
(2) Mangroves
(3) Drought escaping
(4) Amphibious hydrophyte

Q.93 In general, a plant most likely to survive in areas where temperature is high, relative humidity is low and wind prevalent, would have-
(1) Small and narrow leaves
(2) Large and broad leaves
(3) Large intercellular spaces
(4) Reduced palisade tissue

Q.94 Pneumatophores and viviparous germination are found in -
(1) *Opuntia* (2) *Jussiaea*
(3) *Rhizophora* (4) *Eichhornia*

Q.95 Desert grasses often roll their leaves to -
(1) Check loss of water by transpiration
(2) Protect growing apex
(3) Reduce respiration
(4) Expose to light more chlorenchymatous tissue present near the lower epidermis

Q.96 Presence of lacunate cortex, spicules, sclereids, oil cells and water storage tissue are characteristic of -
(1) Hydrophyte (2) Halophyte
(3) Xerophyte (4) Heliophyte

Q.97 Photosynthetic and respiratory gaseous exchange in hydrophytes occure through -
(1) Lenticels (2) Stomata
(3) Epidermis (4) Hydathodes

Q.98 Root is feebly developed and stem is soft and buoyant in -
(1) Sciophytes (2) Halophytes
(3) Hydrophytes (4) Heliophytes

Q.99 The cells for rolling down of lamina in grasses to reduce transpiration are -
(1) Sunken stomata (2) Subsidiary cells
(3) Bulliform cells (4) Guard cells

Q.100 Which is halophyte of saline soil of Haryana and Rajasthan -
(1) *Salicornia* (2) *Suada*
(3) *Salsola* (4) All of the above

Q.101 Which one of the following sets consists only of xerophytic plants
(1) Subabool, teak, *Eucalyptus*, mango
(2) Banyan, *Acacia*, *Zizyphus*, Teak
(3) Safflower, *Eucalyptus*, *Asparagus*, *Acaci*
(4) *Acacia*, *Prosopis*, *Zizyphus*, *Opuntia*

Q.102 Root cap is absent in
(1) Halophytes (2) Hydrophytes
(3) Mangrooves (4) Mesophytes

Q.103 Which of the following is a hydrophyte-
(1) *Mimosa* (2) *Neptunia oleracea*
(3) *Trapa* (4) *Albizzia julibrissin*

Q.104 Which of the following is amphibious in nature?
(1) *Ranunculus* (2) *Hydrilla*
(3) *Vallisneria* (4) *Trapa*

Q.105 Which of the following is not a water plant or hydrophyte-
(1) *Bladderwort* (2) Water melon
(3) *Vallisneria* (4) *Trapa*

Q.106 Root less insectivorous plants is -
(1) *Dionaea* (2) *Cuscuta*
(3) *Drosera* (4) *Utricularia*

Q.107 Heterophyllous plants are common among -
(1) Free floating hydrophytes
(2) Submerged hydrophytes
(3) Amphibious or emergent rooted hydrophytes
(4) Suspended hydrophytes

Q.108 What type of leaves are present in *Ranunculus aquatilis* -
(1) Simple (2) Heterophyllous
(3) Homophyllous (4) Pinnately compound

Q.109 In true (submerged) hydrophytes stomata are present on -
(1) Upper epidermis
(2) Lower epidermis
(3) Not present on any part
(4) Present on both sides of leaf

Q.110 The vascular plants which are devoid of stomata and hydathodes -
(1) Pteridophytes (2) Gymnosperms
(3) Spermatophytes (4) Hydrophytes

Q.111 Water plants usually have a well developed-
(1) Root system (2) Aerenchyma
(3) Vascular system (4) Stomatal system

Q.112 Swollen petiole of *Eichhornia* is made up of-
(1) Parenchyma (2) Chlorenchyma
(3) Aerenchyma (4) Collenchyma

Q.113 Which hydrophytes have a well developed roots, vascular tissues & stomata -
(1) Submerged types (2) Suspended types
(3) Amphibious types (4) Free floating types

Q.114 Which of the following is an amphibious plant and bear dimorphic leaves-
(1) *Chlorella* (2) *Hydrilla*
(3) *Vallisneria* (4) *Ranunculus*

Q.115 Grasses & many crop plants which possess hydathodes & exhibit guttation are -
(1) Hydrophytes (2) Mesophytes
(3) Xerophytes (4) Halophytes

Q.116 Plants growing in hot climate in nonsaline loose soil are -
(1) Xerophytes (2) Halophytes
(3) Mesophytes (4) Lithophytes

Q.117 In high mountains, there is a lot of moisture and water yet the plants are xerophytes because -
(1) Water turns into snow on mountains
(2) Water runs away due to the presence of slopes and cannot be used by plants
(3) Rocks of mountains cannot absorb water
(4) None of these

Q.118 Desert plants are generally -
(1) Less chlorophyllous (2) Heterophyllous
(3) Herbaceous (4) Succulents

Q.119 Plants growing in xerophytic conditions have
(1) Extensive development of shoot
(2) Extensively developed roots and small & thick leaves
(3) Extensive development of air spaces
(4) Large flowers

Q.120 Cladode, phylloclade & phyllode are the characterstic of -
(1) Mesophytes (2) Xerophytes
(3) Epiphytes (4) Hydrophytes

Q.121 Sunken stomata & multiple epidermis is found in the leaves of -
(1) *Nelumbium* (2) *Nerium*
(3) Neem (4) Maize

Q.122 Reduced leaves, thick cuticle & sunken stomata protected by hairs are the characteristics of -
(1) Xerophytes (2) Mesophytes
(3) Hydrophytes (4) Halophytes

Q.123 The characteristics of water storage tissue is-
(1) Large sized cells
(2) Cell walls thin
(3) Presence of mucilage
(4) Presence of vacuoles

Q.124 Which plant tolerates salinity -
(1) Hydrophte (2) Halophyte
(3) Mesophyte (4) Xerophyte

Q.125 Which group of plants grow in saline situations and face physiological dryness -
(1) Lithophytes (2) Halophytes
(3) Hydrophytes (4) Epiphytes

Q.126 Which of the following is an efficient sand binder of Rajasthan desert -
(1) *Dalbergia latifolia* (2) *Prosopis*
(3) *Tectona grandis* (4) *Cassia fistula*

Q.127 Which of the following are plants of one group-
(1) *Mangifera & Rhizophora*
(2) *Rhizophora & Avicinia*
(3) *Rhizophora & Balanophora*
(4) *Balanophora & Avicinia*

Q.128 Upper part of Sea/aquatic ecosystem contains
(1) Nekton (2) Benthos
(3) Plankton
(4) Plankton and nekton

Q.129 The upper vertical zone of ocean upto the depth of 200 meters is known as-
(1) Aphotic zone (2) Abyssal zone
(3) Photic zone (4) None of these

Q.130 In an aqueous environment, microscopic animals and plants are collectively known as-
(1) Herbivore (2) Commensals
(3) Flora and fauna (4) Plankton

Q.131 Which of the following can be recognised as a major environment in the ocean basin -
(1) Pelagic zone (2) Littoral zone
(3) Benthonic zone (4) All of these

Q.132 Shallow lakes with abundant organic matter are-
(1) Eutrophic (2) Heterotrophic
(3) Oligotrophic (4) Saprotrophic

Q.133 Nutrient enrichment of lakes is called-
(1) Biochemical oxygen demand
(2) Green house effect
(3) Eutrophication
(4) Biomagnification

Q.134 Endemic plants -
(1) Cosmopolitan
(2) Occur in a particular area
(3) Occur at high altitudes
(4) Occur on north pole

Q.135 Ecology name proposed by -
(1) Tansley (2) Reiter
(3) Carl (4) Sukhachev

Q.136 The study of interaction between living organisms and environment is called -
(1) Ecosystem (2) Phytology
(3) Ecosystem (4) Ecology

Q.137 Father of Indian ecology is -
(1) Prof. R Mishra (2) G.S. Puri
(3) S.C. Pandeys (4) Prof. N. Dudgeon

Q.138 Species ecology is -
(1) Autecology (2) Synecology
(3) Palaeo ecology (4) Forest ecology

Q.139 The term Autecology is refers to study of -
(1) Plant community (2) Individual organism
(3) Environment (4) Soil form

Q.140 The science dealing with soil is called -
(1) Pedology (2) Acarology
(3) Geology (4) Palaeantology

Q.141 Water logged soils are -
(1) Physiologically dry
(2) Physiologically wet
(3) With great amount of water
(4) With less amount of water

Q.142 The major source of water to the soil is -
(1) Ground water (2) Capillary water
(3) Precipitation (4) Flood water

Q.143 A soil is said to be fertile when -
(1) It is rich in organic matter
(2) It has capacity to hold water
(3) It has a capacity to hold nutrients
(4) It holds water & all essential nutrients in a definite proportion

Q.144 What is the best pH of the soil for cultivation of plants -
(1) 3.4 – 5.4 (2) 6.5 – 7.5
(3) 4.5 – 8.5 (4) 5.5 – 6.5

Q.145 Forests near equator region are called -
(1) Deciduous
(2) Tropical rain forests
(3) Coniferous forests
(4) Temperate forests

Q.146 Animals of desert are -
(1) Arboreal (2) Fassoiral
(3) Crepuscular (4) Nocturnal

Q.147 Insectivorous plants grow in the soil which is deficient in -
(1) Mg (2) Ca
(3) P (4) N

Q.148 Maximum photosynthesis take place by -
(1) Phytoplankton
(2) Zooplankton
(3) Marsh plants
(4) Woody plants

Q.149 Pneumatophores are found in -
(1) The vegetation which is found in marshy and salin lake
(2) the vegetation which found in saline soil
(3) Xerophytes
(4) Epiphytes

Q.150 In which of the following plant sunken stomata are found -
(1) Nerium (2) Hydrilla
(3) Mango (4) Guava

ANSWER KEY

EXERCISE – 1

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

EXERCISE – 2

Q.1 Ecology take into account
(1) Environmental factors only
(2) Plant adaptaions only
(3) Effect of plants on environment
(4) Relationships between organisms and their enviornment

Q.2 The term ecology was proposed by-
(1) Haeckel (2) Odum
(3) Daubenmire (4) Reiter

Q.3 Who defined ecology as the study of structure and function of nature ?
(1) Haeckel (2) E.P. Odum
(3) R. Misra (4) Taylor

Q.4 Who defined ecology as "The reciprocal relationship of organisms and their environments"?
(1) Misra (2) Haeckel
(3) Odum (4) Lamarck

Q.5 Autecology means the study of -
(1) Effect of temperature on vegetation
(2) Effect of soil on vegetation
(3) Ecology of individual organism
(4) Effect of precipitation on vegetation

Q.6 Synecology is the study of -
(1) Environment (2) Plant community
(3) Individual (4) None

Q.7 The transitional zone where two different communities meet is called -
(1) Niche (2) Ecotone
(3) Ecad (4) Ecotype

Q.8 Science which deals with the management of plants, animals, soil, water and minerals is -
(1) Autecology
(2) Synecology
(3) Phytosociology
(4) Resource ecology

Q.9 What ecological factors are most strong determinants of various biomes –
(1) Soil and wind
(2) Light and wind
(3) Temperature and precipitation
(4) pH and humidity

Q.10 Plants are killed in winter by frost –
(1) Because respiration ceases at such a low temperature
(2) Because there is no transpiration.
(3) Because no photosynthesis takes place at such a low temperature
(4) Because of desiccation and mechanical damage to the tissues

Q.11 Which of the following is direct dominant ecological factor which affects the vegetation of a place
(1) Temperature (2) Altitude
(3) Soil (4) Wind

Q.12 Major characteristics of the vegetation of a locality are controlled –
(1) Mainly by climate
(2) By animals only
(3) By altitude of a place only
(4) By man only

Q.13 Ecological factors work –
(1) Together
(2) In complex combinations
(3) Only indirectly
(4) Singly

Q.14 The hydrologic factor refers to –
(1) Gravitational water
(2) Snow
(3) Water
(4) Atmosphere

Q.15 Most dense layer of atmosphere vulnerable to pollution (OR) Life supporting zone of atmosphere is –
(1) Ionosphere (2) Mesosphere
(3) Troposphere (4) Stratosphere

Q.16 Plant groups growing in zones where high temperature alternates with low temperature are called as –
(1) Mesotherms (2) Megatherms
(3) Hekistotherms (4) Microtherms

Q.17 At what height in atmosphere the concentration of ozone is maximum –
(1) At 25 km (2) At 50 km
(3) At 100 km (4) At 10 km

Q.18 The alpine forests are classed under the plant group called –
(1) Hekistotherms (2) Megatherms
(3) Mesotherms (4) Microtherms

Q.19 Biological rhythms of the majority of organisms are modulated by –
(1) Soil factors (2) Light
(3) Temperature (4) Wind

Q.20 When a plant of hot climate is transferred to colder regions, it gets an injury called –
(1) Thermal death (2) Chilling
(3) Freezing (4) Desiccation

Q.21 'Flag trees' are formed due to –
(1) Erosion and depression
(2) Slat spray
(3) Lodging
(4) Unidirectional winds

Q.22 Which is the least porous soil –
(1) Clay (2) Loam
(3) Sand (4) Peat/Silt

Q.23 In coarse textured soils –
(1) Pore frequency is low
(2) Pore space is narrow
(3) There is no soil air (4) Water retaining capacity is high

Q.24 Which of the following does not occur in loam soil –
(1) Sand (2) Silt
(3) Chalk (4) Sand

Q.25 Soils transported by air are called as –
(1) Residual (2) Colluvial
(3) Eolian (4) Aerial

Q.26 Edaphic factors are concerned with –
(1) Soil and their Characteristics
(2) Rainfall
(3) Grazing by animals
(4) Competition among different species of plants

Q.27 Soil formation is initiated by the phenomenon of –
(1) Pedogenesis (2) Laterization
(3) Weathering (4) Gleization

Q.28 Which soil is best for plant growth –
(1) Clay soil (2) Loamy soil
(3) Sandy soil (4) Gravel

Q.29 The term sub-soil generally refers to –
(1) Horizon - R (2) Horizon - B
(3) Horizon - A (4) Horizon - C

Q.30 Pedology is the study of –
(1) Locomotion of animals
(2) Soil erosion
(3) Soil formation
(4) Rock formation

Q.31 The Biological weathering occurs due to the action of –
(1) Carbon dioxide (2) Oxygen
(3) Alkalies (4) Acids

Q.32 Water logging occurs in –
(1) Clay soil (2) Gravel soil
(3) Sandy soil (4) Loam soil

Q.33 Plants absorb from the soil –
(1) Capillary water
(2) Gravitational water
(3) Both capillary water and gravitational water
(4) Hygroscopic water

Q.34 Water held tightly in the form of a thin film on the surface of soil particle is known as –
(1) Hygroscopic water (2) Gravitational water
(3) Capillary water (4)Run away water

Q.35 The term 'chesard' refers to –
(1) Gravitational water
(2) Capillary water
(3) Water vapour
(4) Run off water

Q.36 Humus is important for plant growth because–
(1) It is partially decomposed
(2) It is derived from leaves
(3) It is made up of dead organic matter
(4) It is rich in nutrients and increases the water holding capacity

Q.37 Plants growing on rocks are called as –
(1) Sciophytes (2) Halophytes
(3) Lithophytes (4) Psychrophytes

Q.38 Storage capacity of the soil is the extent to which it can hold –
(1) Hygroscopic + Bound water
(2) Capillary + Hygroscopic water
(3) Capillary water
(4) Gravitational water

Q.39 Plants growing on sand and gravel are called as –

(1) Psammophytes (2) Psilophytes

(3) Oxylophytes (4) Eremophytes

Q.40 A soil is said to be physiologically dry when–

(1) There is plenty of water in the soil

(2) Concentration of salt is very high in the soil

(3) Light available to plants is not sufficient

(4) Both (1) and (2) together

Q.41 Plants growing on cold soil are called as –

(1) Psychrophytes (2) Psammophytes

(3) Oxylophytes (4) Sciophytes

Q.42 Ecology takes into account -

(1) Effect of plants on environment

(2) Plant adaptation only

(3) Environmental factors only

(4) All the above

Q.43 Who started ecological studies in India ?

(1) Saxton (2) Dudgeon

(3) R. Mishra (4) Agharkar

Q.44 Ecotype is -

(1) Transitional zone

(2) Genetically adapted ecological races of an area

(3) Genetically different individuals with same phenotype

(4) Genetically identical individual with same phenotype

Q.45 A plant or animal form produced in response to a habitat, the adaptations not being heritable is called -

(1) Ecad (2) Ecophene

(3) Life form (4) Ecotype

Q.46 How many horizons are present in a fully developed soil profile –

(1) Five (2) Eleven

(3) Three (4) One

Q.47 Plants growing on burnt soil are called as-

(1) Pyriform (2) Pyrophilous

(3) Hydrophilous (4) Heliophilous

Q.48 The soil containing particles between 0.002–0.02 mm is –

(1) Clay (2) Fine sand

(3) Gravel (4) Silt

Q.49 Soil texture depends upon –

(1) Quantity of microbes

(2) Size of particles

(3) Quantity of humus

(4) Amount of water in soil

Q.50 Which of the following factors cannot be regarded as belonging to a non living environment –

(1) Rainfall

(2) Light

(3) Temperature

(4) Interspecific competition

Q.51 Factors which relate to form and behaviour of the earth's surface are called -

(1) Biotic (2) Edaphic

(3) Topographic (4) Climatic

Q.52 Which of the following habitats would be ideally suited to sciophytes –

(1) Desert

(2) Ponds and lakes

(3) Dry and sunny place

(4) Moist and shady place

Q.53 Laterite soil is rich in –

(1) Mg (2) Ca

(3) Al (4) Fe

Q.54 Flowering is induced if germinating seeds are exposed to –

(1) High temperature

(2) Low temperature

(3) Temperature below freezing

(4) Temperature above 45° C

Q.55 Mark the correct relationship –

(1) Chesard – Ecard = Holard

(2) Holard–Chesard = Ecard

(3) Ecard – Chesard = Holard

(4) Holard + Ecard = Chesard

Q.56 Humus is an example of –

(1) Crystalloids (2) Organic colloids

(3) Soil structure (4) None of them

Q.57 'Solum' includes –

(1) Horizons A and B

(2) Horizons A_2 and B only

(3) Horizon A only

(4) Horizons A_1 and A_2 only

Q.58 A good soil is that which allows –
(1) Rapid percolation of water
(2) Selective percolation of salt
(3) No percolation of water and salt
(4) Slow percolation of water

Q.59 The term 'ecard' refers to –
(1) Unavailable water
(2) Run off water
(3) Total atmosphere precipitation
(4) Available water

Q.60 Percentage of water left in the soil when a plant wilts is known as –
(1) Wilting coefficient
(2) Field capacity
(3) Water retaining power of the soil
(4) Turgidity

Q.61 The soil near the surface is usually darker than the soil about one meter down. This is because the top soil is –
(1) Richer in organic matter
(2) Richer in Ca and Mg
(3) Dry
(4) Young and wet

Q.62 'Chalky soil' is a term used for –
(1) Sandy soil
(2) Carbonate rich soil
(3) Saline soil (4) Clay soil

Q.63 Vegetation of any place is primarily determined by –
(1) Rainfall
(2) Amount of soil water
(3) Soil type
(4) Amount of light

Q.64 Biotic factors are –
(1) All the living organisms which influence other organisms
(2) Factors of atmosphere which affect life
(3) Chemical factors of soil which affect life
(4) Physical factors of soil which affect life

Q.65 The instrument which measures wind velocity is –
(1) Hydrometer (2) Photometer
(3) Lactometer (4) Anemometer

Q.66 Hydrophytes have –
(1) Less mechanical system as well as feebly developed vaculature system
(2) Well developed stomata
(3) Well developed roots
(4) None

Q.67 An aquatic plant with floating leaves –
(1) Have stomata only on upper surface
(2) Have stomata on lower surface
(3) Have stomata on leaf surface
(4) Have stomata

Q.68 In hydrophytes the finely dissected leaves are found generally in –
(1) Emerged plants
(2) Free floating plants
(3) Submerged plants
(4) Rooted floating plants

Q.69 The basis of classification of hydrophyte, mesophyte and xerophyte is –
(1) Tolerance to light
(2) Availability of water
(3) Tolerance to temperature
(4) Tolerance to frost and rain

Q.70 Useful adaptation for hydrophytes is -
(1) Increase in aerenchyma
(2) Decrease in mechanical tissues
(3) Large leaves
(4) Large mechanical tissues

Q.71 The classification of plants in hydrophytes, mesophytes and xerophytes was suggested by-
(1) Warming (2) Odum
(3) Mishra (4) Weaver

Q.72 Heterophylly is common in -
(1) Emergents
(2) Free floating hydrophytes
(3) Submerged hydrophytes
(4) Rooted floating hydrophytes

Q.73 Plants with well developed spongy tissues in its leaves & exhibit temporary wilting in noon hours are -
(1) Halophytes
(2) Floating hydrophytes
(3) Mesophytes
(4) Succulents

Q.74 Plants growing in aerated sand of a river bank are -
(1) Psammophytes
(2) Physical xerophytes
(3) Physiological xerophytes
(4) Mesophytes

Q.75 Vivipary is characteristic feature of –
(1) Halophytes (2) Mesophytes
(3) Xerophytes (4) Hydrophytes

Q.76 Biotic potential refers to
(1) Increase of population under optimum condition
(2) Increase of population under given condition
(3) Increase of population under natural condition
(4) None of the above

Q.77 Specilized roots that penetrates the stem of the host estiblishing relationship with its conducting elements are called
(1) Haustoria (2) Rhizoid
(3) Rhizoplane (4) Rhizopore

Q.78 Which of the following is least likely to be true for ecological succession
(1) The species composition of the community change regularly
(2) The total number of species rises initially than stabilises
(3) The total nonliving material is increases
(4) Total biomass is decline after initial stage

Q.79 The traditional concept of succession includes the idea of an equilibrium states called a climax community. Ecologist now think that there may be no such thing as climax community because
(1) Disturbance is on going in ecosystem
(2) All organism eventually die
(3) Species diversity generally increases
(4) Each succession is different from other

Q.80 An area was cleared for road. Road was not constructed and the land was left to overgrow. The process by which the vegetation reestablished is called
(1) Primary succession
(2) Secondary succession
(3) Tertiary succession
(4) Regenerative succession

Q.81 Long term stability of a community depends on
(1) type of its abiotic component
(2) resource partitioning
(3) Biodiversity
(4) Successio

Q.82 External appearance of community is known as
(1) Stratification (2) Physionomy
(3) Physiognomy (4) Diversity

Q.83 Which of the following is a synthetic character of community
(1) Biomass (2) Diversity
(3) Stratification (4) Value index

Q.84 Which is not a character of climex community
(1) Large size
(2) Mesophytic
(3) Simple food chain
(4) Complex organisation

Q.85 Term ecosystem development to ecological succession was given by
(1) Odum (2) Elements
(3) R.D. Mishra (4) Blackman

Q.86 When the vegetation of any region reaches at climatic climax it is
(1) Lithophytic (2) Xerophytic
(3) Mesophytic (4) Hydrophytic

Q.87 The sequence : BGA $\rightarrow$ crustose lichen $\rightarrow$ foliage lichen $\rightarrow$ masses $\rightarrow$ shrubs $\rightarrow$ dicot plant represent
(1) Phylogenetic trend
(2) Food pyramid
(3) Ecological succession trend
(4) Genetic drift

Q.88 If the vegetation of a place is burnt the first one to appear will be
(1) Mosses (2) Lichen
(3) Liver wort (4) Fern

Q.89 Name the term used to describe a single dominant species that dictate community structure
(1) Pioneer species
(2) Exogenous species
(3) Keystone species
(4) Edge species

Q.90 In succession complexities in structure -
(1) Increase
(2) Decrease
(3) Remain constant
(4) Intially increase than decrease

Q.91 In plant succession when climax is reached the net productivity
(1) Continue to increase
(2) Become half
(3) Become zero
(4) Become 10%

Q.92 Which of the following is the keystone species in tropical rain forest
(1) Fig (2) Pinus
(3) Cycas (4) Fungi

Q.93 Climax community is
(1) Ist stable community
(2) unstable community
(3) Intermediate community
(4) Last stable community

Q.94 Primary succession on rocks starts with
(1) Herbs (2) Animals
(3) Lichen (4) Trees

Q.95 If a piece of land which had a plant community becomes barren due to some external thrust, the succession taking place here is called as
(1) Induced (2) Deflated
(3) Autonomic (4) All the above

Q.96 The direction of succession
(1) Predictable (2) Unpredictable
(3) Haphazard (4) Always changing

Q.97 The ultimate serel community appear in an area as a result of
(1) Ecesis (2) Nudation
(3) Invasion (4) Reaction

Q.98 In a hydrosere the submerged stage is followed by
(1) Phytoplenktons (2) Reed swamp
(3) Sedges (4) Floating plant

Q.99 The pioneer in a hydrosere
(1) Diatoms (2) Sedges
(3) wolffia (4) Lemna

Q.100 According to polyclimax theory the climax stage is controlled by
(1) Eadaphic factor (2) Biotic factor
(3) Topographic factor (4) All of these

Q.101 The invasion of a new community in a bore area is initiated by
(1) Migration (2) Ecesis
(3) Aggregation (4) All

Q.102 The effects of individual of same species upon each other is called as
(1) Reaction (2) Competition
(3) Coaction (4) Ecesis

Q.103 No. of species is more at ecotone, this phenomenon is known as
(1) Ecotone effect (2) Edge effect
(3) Diversity effect (4) All of the above

Q.104 Species which are present at ecotone is known as
(1) Ecotone species (2) Keystone species
(3) Link species (4) Edge species

Q.105 Synecology and plant sociology are the words equivalent to
(1) Community ecology
(2) Population ecology
(3) Gene ecology
(4) Auto ecology

Q.106 Pioneer community is xerosere is
(1) Foliaose lichen (2) Moss
(3) Crustose lichen (4) Fern

Q.107 The invasion of a community in succession involves
(1) Ecesis, aggregation competition
(2) Migration, aggregation and competition
(3) Aggregation, competition and coaction
(4) Migration, ecesis and aggregation

Q.108 Mark the climatic cause for the initiation of succession
(1) Depletion (2) Drought
(3) Deposition (4) Micro-organism

Q.109 The physiographic factor responsible for the initiation of succession in
(1) Erosion (2) Fire
(3) Hail (4) Wind

Q.110 Formation of bare land for initiation of succession is
(1) Migration (2) Ecesis
(3) Nudation (4) Coaction

Q.111 The successive developmental stage in succession is known as

(1) Pioneer (2) Climax

(3) Sere (4) All of the above

Q.112 Increase of population under optimum conditions is termed -

(1) Reproductive ability

(2) Secondary production

(3) Biotic potential

(4) Biomass

Q.113 In a population unrestricted reproductive capacity is called as -

(1) Biotic potential (2) Fertility

(3) Carrying capacity (4) Birth rate

Q.114 What is true for individuals of same species -

(1) Live in same niche

(2) Live in same habitat

(3) Interbreeding

(4) Live in different habitat

Q.115 When the two ecosystems overlap each other the area is called -

(1) Ecotone (2) Niche

(3) Edge effect (4) Ecotypes

Q.116 The community which starts succession at a place is termed -

(1) Climax community

(2) Seral community

(3) Pioneer community

(4) Primary community

Q.117 Earliest settlers on barren lands or the farmers of nature are -

(1) Diatoms (2) Lichens

(3) Moss & grasses (4) Ferns

Q.118 In plant succession last community is called -

(1) Ecotone

(2) Climax community

(3) Seral community

(4) Ecosystem

Q.119 Group of two or more than two plant species is called as -

(1) Plant community (2) Animal ecosystem

(3) Plant ecosystem (4) Ecological niche

Q.120 Plant and animals living in a particular area constitute -

(1) Flora and fauna (2) Community

(3) Ecosystem (4) Ecology

Q.121 Stable plant community formed during succession is called -

(1) Sere community

(2) Climax community

(3) Dominant community

(4) Ecotone

Q.122 Succession in a water body leads to formation of -

(1) Mesophytic vegetation

(2) Xerophytic vegetation

(3) Halophytic vegetation

(4) Epiphytic vegetation

Q.123 Competition for food, light and space is most severe in -

(1) Closely related species growing in the same area (in the same niche)

(2) Closely related species growing in different habitat

(3) Distantly related species growing in the same habitat

(4) Distantly related species growing in different habitat

Q.124 Most successful parasites are those which do not-

(1) grow free

(2) Kill their host

(3) Reproduce sexually

(4) Survive in soil

Q.125 Of the following which is the smallest parasite-

(1) Lemna

(2) Arceuthobium

(3) Spirodella

(4) Wolffia

Q.126 Two different species can not live for long duration in the same niche or habitat. This law is -

(1) Allen's law

(2) Gauss's law

(3) Jorden's principal

(4) Weiseman's theory

Q.127 Capacity to blend with surroundings is called

(1) Hibernation (2) Mimicry

(3) Camouflage (4) Aestivation

Q.128 A behavioural strategy of adaptation called echolocation is found in

(1) Bats

(2) Monarch butterfly

(3) Praying mantis

(4) Arctic tern

Q.129 Natality under actual conditions is called

(1) Biotic potential

(2) Maximum natality

(3) Ecological natality

(4) Reproductive potential

Q.130 An Urn shaped population age pyramid represent

(1) Growing population

(2) Static population

(3) Decling population

(4) Threatened population

Q.131 Ability of an environment to support a population is called its

(1) Biotic potential

(2) Purifying capacity

(3) Carrying capacity

(4) Environmental resistance

Q.132 The equation for J-shaped population growth curve

(1) $\frac{dN}{dt} = rN$

(2) $\frac{dN}{dt} = rN\left(\frac{K-N}{K}\right)$

(3) $N_t = N_0 + B + I - D - E$

(4) $D = \frac{N}{S}$

Q.133 In the equation for S-shaped population growth $\frac{dN}{dt} = rN\left(\frac{K-N}{K}\right)$, r represents

(1) Carrying capacity

(2) Environmental resistance

(3) Biotic potential

(4) Population size

Q.134 Which is not true for J-shaped growth curve?

(1) Exponential phase is prolonged

(2) Population never grows beyond carrying capacity

(3) Population crash occur

(4) Population seldom reaches equilibriumx

Q.135 The exponential increase in insect populations during rains is finally controlled by

(1) Environmental resistance

(2) Reporductive potential

(3) Growth rate

(4) Carrying capacity

Q.136 Which statement is not related to S-shaped populations curve ?

(1) Environmental resistance suddenly become effective

(2) Exponential phase is followed by decline phase

(3) Mass mortality and population crash occurs

(4) Both (1) & (3)

Q.137 The periodic departure and return is known as

(1) Migration (2) Immigration

(3) Emigration (4) Mutation

Q.138 When an animal group is centred around a dominant female, it is called

(1) Patriarchy (2) Matriarchy

(3) Swarm (4) Flock

Q.139 Altruistic behaviour is not found in

(1) White ants (2) Spotted deer

(3) Honey bees (4) Bitch

Q.140 Territory is defended against

(1) Predator

(2) Any intruder

(3) Intruder of another species

(4) Intruder of same species

Q.141 Inability of different organisms to interbreed is called

(1) Streility

(2) Parasitism

(3) Reproductive Isoloation

(4) Monogamy

Q.142 The increased number and density of species in region of ecotone is called

(1) Edge effect

(2) Sympatric speciation

(3) Dominance

(4) Abundance

Q.143 Which of the following association is not an example os symbiosis ?

(1) Lichen (2) Mycorrhiza

(3) Root nodules (4) Epiphytes

Q.144 Which is not an effect of competition ?

(1) Regulation of population size

(2) Generalization of niche

(3) Establishment of social hierarchy

(4) Help in speciation

Q.145 Competitive exclusion principle was given by

(1) J. Grinnel (2) Gause

(3) Lindeman (4) Bates

Q.146 Which of the following shows biologicl antagonism or allellopathy

(1) Amensalis (2) Protocooperation

(3) Competition (4) Parasitism

Q.147 The interaction between two living organism of different species which is beneficial to both but is not obligatory because they can live without each other is known as

(1) Proto-cooperation

(2) Mutualism or symbiosis

(3) Commensalism

(4) Amensalism

Q.148 Find the odd one out

(1) Lianas in tropical rain forest

(2) E. coli in large intestine of man

(3) Pilot fish Remora and shark

(4) Rafflesia on roots of forest tree

Q.149 Find the odd one out

(1) Mating (2) Competition

(3) Aggregation (4) Altruism

Q.150 Toxic chemical against nematode is secreted by

(1) Tagetes (2) Black walnut

(3) Pencillium (4) Grevillea robusta

EXERCISE – 3 PREVIOUS YEAR'S QUESTION

Q.1 Ethology is the study of - **[UTTARANCHAL 2004]**

(1) Behaviour of animals
(2) Past life of organism
(3) Disease causing pathogens
(4) None of these

Q.2 Humus is - **[UTTRANCHAL 2005]**

(1) Dead and decayed organic matter
(2) Living matter
(3) Fertilizers
(4) Living animal / plants / microbes

Q.3 Name the famous plant ecologist - **[C.G. PMT 2005]**

(1) Jagdish chandra bose
(2) Birbal Shani
(3) Ramdeva Misra
(4) Charles Darwin

Q.4 Correct percentage of CO_2 in atmosphere is - **[C.G. PMT 2005]**

(1) 0.03 % (2) 0.3 %
(3) 1 % (4) 1.1. %

Q.5 In an quatic environment, microscopic animals and plants are collectively known as - **[C.G. PMT 2006]**

(1) Commensals (2) Herbivores
(3) Fauna and Flora (4) Planktons

Q.6 5^{th} June is - **[C.G. PMT 2006]**

(1) World Environment Day
(2) Wold AIDS Day
(3) World Womens Day
(4) Worlds Polio Day

Q.7 Plants developing in dry condition are - **[BIHAR 2004]**

(1) Xerophytes (2) Mesophytes
(3) Lithophytes (4) Hydrophytes

Q.8 Soil carried by gravity is - **[BIHAR 2002]**

(1) Alluvial (2) Colluvial
(3) Elluvial (4) Glacial

Q.9 Velamen tissue is found in - **[BIHAR 2001]**

(1) Mesophytes (2) Epiphytes
(3) Hydrophytes (4) Xerophytes

Q.10 Pneumatophores are characteristic feature of - **[BIHAR 2001]**

(1) Hydrilla (2) Rhizophora
(3) Typha (4) None of these

Q.11 Factors relating to form and behaviour of the earth's surface are called - **[BIHAR 2001]**

(1) Edaphic (2) Topographic
(3) Climatic (4) Biotic

Q.12 Aerenchyma is helpful in plants by - **[BIHAR 2006]**

(1) Providing buoyancy in hydrophytes
(2) Absorption in stilt roots
(3) Giving mechanical strength to plants
(4) Giving flexibility to plants

Q.13 Plants growing in saline soil are called - **[UP CPMT 2002]**

(1) Xerophyte (2) Hydrophyte
(3) Halophyte (4) Heliophyte

Q.14 Which one of the following is well-developed tissue present in hydrophytes? **[UP CPMT 2002]**

(1) Aerenchyma (2) Collenchyma
(3) Stomata (4) Root system

Q.15 Penumetophores are found in - **[RPMT 2000]**

(1) Orchid (2) Piper
(3) Ficus (4) Rhizophora

Q.16 The term Autecology refers to study of - **[RPMT 2000]**

(1) Plant community (2) Individual organism
(3) Environment (4) Soil form

Q.17 Autoecology refers to - **[RPMT 2001]**

(1) Plant ecology
(2) Animal ecology
(3) Ecological study of individual species
(4) Ecological study of group of species, which is grown together

Q.18 Which part of the pond ecosystem does not affect by the temperature - **[RPMT 2001]**

(1) Epilimnion (2) Metalimnion
(3) Hypolimnion (4) All

Q.19 Root cap is absent in - **[RPMT 2002]**

(1) Mesophytes (2) Hydrophytes
(3) Epiphytes (4) Xerophytes

Q.20 Which of the following have sunken stomata - **[RPMT 2002]**

(1) *Nerium* (2) *Mangifera*

(3) *Hydrilla* (4) *Zea mays*

Q.21 Velamen & spongy tissue is found in - **[RPMT 2002]**

(1) Breathing roots (2) Parasitic roots

(3) Tuberous roots (4) Epiphytic roots

Q.22 Root cap is absent in - **[RPMT 2005]**

(1) Lithophytes (2) Xerophytes

(3) Hydrophytes (4) Mesophytes

Q.23 Which of the following is the example of xerophytes - **[RPMT 2005]**

(1) ***Brassica*** (2) ***Cuscuta***

(3) ***Capparis*** (4) ***Hydrilla***

Q.24 The organisms inhabiting a common environment belongs to the same - **[UTTARANCHAL 2004]**

(1) Species (2) Genus

(3) Population (4) Community

Q.25 Insectivorous plants usually survive in - **[JHARKHAND 2005]**

(1) Water rich soil

(2) N_2 deficient soil

(3) N_2 rich soil

(4) Sugar deficient medium

Q.26 Group of two or more than two plants species is called as - **[JHARKHAND 2003]**

(1) Plant community

(2) Animal ecosystem

(3) Plant ecosystem

(4) Ecological niche

Q.27 The two vegetations of ecosystem are separated by - **[UP CPMT 2001]**

(1) Ecotone (2) Ecoline

(3) Ecosytem (4) Ecesis

Q.28 In plant succession last community is called - **[RPMT 2000]**

(1) Ecotone (2) Climax community

(3) Seral community (4) Ecocystem

Q.29 In which one of the following habitats does the diurnal temperature of soil surface vary most ? **[AIPMT 2004]**

(1) Forest (2) Desert

(3) Grassland (4) Shrub land

Q.30 People who have migrated from the planes to an area adjoining Rohtang Pass about six months back : **[AIPMT Pre 2012]**

(1) are not physically fit to play games like football.

(2) suffer from altitude sickness with symptoms like nausea, fatigue, etc.

(3) have the usual RBC count but their haemoglobin has very high binding affinuty to O_2.

(4) have more RBCs and their haemoglobin has a lower binding affinity to O_2.

Q.81 Sacred groves are specially useful in : **[AIPMT Mains 2012]**

(1) generating environmental awareness

(2) preventing soil erosion

(3) year-round flow of water in rivers

(4) conserving rare and threatened species

Q.84 The second stage of hydrosere is occupied by plants like : **[AIPMT Mains 2012]**

(1) *Azolla* (2) *Typha*

(3) *Salix* (4) *Vallisneria*

These questions consist of two statements each, printed as "ASSERTION" and "REASON". While answering these Questions you are required to choose any one of the following responses.

(1) If both Assertion and Reason are True and the Reason is a correct explanation of the Assertion.

(2) If both Assertion and Reason are True but Reason is not correct explanation of the Assertion

(3) If Assertion is True but the Reason is False.

(4) If both Assertion and Reason are false.

Q.1 **Assertion :** Drought resistant plants are not true xerophytes.
Reason : Drought resistant plants always have physiological dryness.

Q.2 **Assertion :** In winter and summer season growth of phytoplantkton is low in any lake.
Reason : Amount of nutrients and oxygen is less in lake during summer and winter.

Q.3 **Assertion :** Chemical which repel other animals called allomones.
Reason : These are beneficial substances for others.

Q.4 **Assertion :** In mangrove plants, negatively geotropic roots come out of the mud called pneumatophores.
Reason : Mangrove plants grow in water-logged marshy conditions so there is problem of aeration in roots of these plants.

Q.5 **Assertion :** Loam soils are ideal for vegetation.
Reason : Loam soils have clay but no sand.

Q.6 **Assertion :** Mangroves have breathing roots.
Reason : Soil air is almost negligible in swamps.

Q.7 **Assertion :** Profundal zone of a lake harbours have only heterotrophs.
Reason : Autotrophs fail to grow in deep water due to lack of light.

Q.8 **Assertion :** Ecads appear different.
Reason : They lives in different environmental conditions.

Q.9 **Assertion :** Heliophytes are shade loving plant. They requires poor light intensity.
Reason : They are found in lower level of stratification.

Q.10 **Assertion :** Epiphytes can be absorb atmospheric humidity.
Reason : Velamen tissue presents in thier hanging roots.

Q.11 **Assertion :** Well developed chlorenchyma is present in aquatic plants
Reason : Photosynthetic root are present in **Trapa** plant.

Q.12 **Assertion :** Water holding capacity of the soil depends upon structure of soil.
Reason : Water holding capacity of sandy soil is best.

Q.13 **Assertion :** Human regulated environment is called noosphere.
Reason : Human is the main cause for pollution in our cosystem due to exploitation of natural resources.

Q.14 **Assertion :** Ephiphytes are completely autotrophic plants which grow on other plants.
Reason : Epiphytes are found in Sariska national park.

Q.15 **Assertion :** Psychrophytes are also known as hekistotherms plants.
Reason : Cold soil is physiologically dry habitat.

Q.16 **Assertion :** Photosynthesis process is absent in aphotic zone of ocean.
Reason : Aphotic zone is the deepest zone of ocean without oxygen.

Q.17 **Assertion :** Solar energy is the best pollution free form of energy.
Reason : It can be produced in a nuclear reactor in large amout from a tiny amount.

Q.18 **Assertion :** Planktons are free floating organism on the surfaces of water.
Reason : All Planktons belongs to animal kingdom.

Q.19 **Assertion :** Hygroscopic water is hold by soil colloids.
Reason : It can be utilized by plants.

Q.20 **Assertion :** Undifferentiated and living xylem is found in aquatic plants (suspended).

Reason : Phloem is less developed in aquatic plants.

Q.21 **Assertion :** Drought resistant plant are also known as succulent xerophytes.

Reason : They complete their life cycle during the favourable season.

Q.22 **Assertion :** Soil water available to plant is chresard.

Reason : Capillary water is only form of soil water which is available to plants.

Q.23 **Assertion :** Alluvial soil is a transported soil.

Reason : It is brought through the wind.

Q.24 **Assertion :** Solar energy is conventional energy sources.

Reason : It is widely used.

Q.25 **Assertion :** In Aquatic ecosystem most of the food chain depends on light.

Reason : In aquatic ecosystem parasitic food chain starts from phytoplankton

Q.26 **Assertion :** Home range of different groups can overlap.

Reason : Territory of different groups can not overlap.

Q.27 **Assertion :** Epiphytes are included in phanerophytes.

Reason : The buds are located at much above from surface of earth.

Q.28 **Assertion :** Temperature is gradually decreasing towards the pole.

Reason : Effect to latitude and altitude are almost same for temperature.

Q.29 **Assertion :** Stratosphere is suitable for aviation.

Reason : Moisture content is low and large convection currents are lacking in the stratosphere.

Q.30 **Assertion :** In hydrophytes, photosynthesis takes place through whole plant body.

Reason : Light is the limiting factor for photosynthesis in aquatic plants.

Q.31 **Assertion :** In mutalism both organisms are benefitted.

Reason : Both are benefitted but they are not dependent on each other.

Q.32 **Assertion :** Intraspecific competetion is most sever.

Reason : Organisms of same species have same basic requirements.

Q.33 **Assertion :** In protocoopertion both organism are benefitted.

Reason : Both are benefitted as well dependent on each other.

Q.34 **Assertion :** Due to growth of Penicillium, bacteria become less in soil.

Reason : It shows ammensalism.

Q.35 **Assertion :** All predators are carnivorous.

Reason : They kill and eat the producer.

Q.36 **Assertion :** Biotic potential of any one species is high in maximum favourable conditions.

Reason : Number of species increases in area under favourable conditions.

Q.37 **Assertion :** Mesophytes are climax community in hydrosere.

Reason : No biotic community is stable in ecosystem.

Q.38 **Assertion :** Ecotone have maximum diversity.

Reason : Ecotone is transition zone of two communities.

Q.39 **Assertion :** In population, dominance is subordination behaviour.

Reason : Dominance is a negative interaction in population.

Q.40 **Assertion :** Territory is defended against members of same species.

Reason : It reduces the competetion for the basic need.

Q.41 **Assertion :** Group of African elephants is patriarchy.

Reason : In this group the group leader is male.

Q.42 **Assertion :** In most favourable environmental condition organism have maximum biotic potential.

Reason : Biotic potential is maximum reproduction capacity of organism.

Q.43 **Assertion :** The competition for the basic needs get reduced in territory.

Reason : Territory is defended against members of same species.

Q.44 **Assertion :** Arctic fox and African Jackal are cological equivalent.
Reason : They have same niche in different habitats.

Q.45 **Assertion :** Zone of transition between two type of communities is called ecotone.
Reason : Esturay is an ecotone between marine and fresh water communities.

Q.46 **Assertion :** Interspecific competition are more strongest as compair to Intra specific competition.
Reason : Members of different species have same requirement.

Q.47 **Assertion :** Key-stone species determine the structure of the community.
Reason : These species have great influence on community

Q.48 **Assertion :** Biomass is a analytical character.
Reason : "Growth of plant" is synthetic character which are derieved from biomass.

Q.49 **Assertion :** Ecosystem is made up by biotic and abiotic componants.
Reason : It is the smallest structural and functional.

Q.50 **Assertion :** Biotic community is never stable in nature.
Reason : Climax community is more stable in succession.

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first allempt	Good / Important questions
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

ECOSYSTEM

INTRODUCTION

(A) A.G.Tansley - The term **"Ecosystem"** coined by A.G. Tansley. According to Tansley Ecosystem is symbol of structure and function of nature.

(B) E.P.Odum - Father of ecosystem ecology. **According to E.P.Odum** Ecosystem is the smallest structural and functional unit of nature or environment.

(C) Karl Mobius - Used term **Biocoenosis** for ecosystem.

(D) Thienmann - Used term **Biosystem** for ecosystem.

(E) Sukhachov - Used term **Biogeocoenosis** for ecology.

(F) Misra - Used term **Ecosom** for ecosystem.

(G) Forbes - Used term **Microsom** for ecosystem.

ECOSYSTEM –

Total living (biotic) and non living (aboitic) componants of the environment present in a particular area is called ecosystem.

Characteristics :

(1) In any ecosystem, communities or living organisms interact with their physical environment in such a way that there is a well defined flow of energy forming clear **trophic** (food) **levels** and **material cycles** within this ecosystem.

(2) Ecosystem is normally an open system because there is a continuous and variable entry and loss of **energy** and **materials**.

(3) An ecosystem may be small like a drop (microsystem) of water and as large as sea or tract of forest.

(4) An ecosystem may be temporary as a fresh water pool or a field or permanent like a forest or sea.

(5) Thus any area of nature that includes living organisms and nonliving substances interacting, so that a **flow of energy** leads to characteristic **trophic structures** and **cycling of materials** makes the ecosystem.

(6) There is an energy source for all living organisms in an ecosystem.

(7) Adequate amount of food and essential nutritional element should be present for living organisms in an ecosystem.

(8) There should be a continuous cyclic flow of energy and materials in form of food chains between organisms and environment.

(9) There are regular changes in the climatic conditions (temperature, humidity, light etc.) in an ecosystem.

(10) Ecosystem is also self maintainable and self regulatory system, it means an ecosystem maintains a balance in between different trophic levels.

(11) Each trophic level control the other trophic level in an ecosystem. If any change take place in any trophic level of ecosystem, the other trophic levels of this ecosystem may react according to it. So ecosystem always remain in equilibrium. This feature of system is known as **Homeostasis.**

(12) A science of self control as (homeostasis) in an ecosystem is called cybernetics.

(13) The boundaries of ecosystem are indistinct and have a overlapping character over each other.

(14) Ecosystem is the smallest structural and functional unit of nature or environment. It is a **self regulatory** and **self sustaining unit.**

TYPE OF ECOSYSTEM

(A) Natural Ecosystem **(B) Artificial Ecosystem**

(A) Natural Ecosystem -

1. **Terrestrial Ecosystem -** eg. forest, grassland, tree, desert ecosystems.
2. **Aquatic Ecosystem -** Aquatic ecosystem is again of two type
   (i) Lentic ecosystem - Stagnant fresh water, lake, pond, swamp.
   (ii) Lotic - Running fresh water ecosystem. eg., rivers

(B) Artificial Ecosystem - Man made ecosystem eg., cropland, Gardens etc.

On the basis of size, type of ecosystem :

(i) Mega ecosystem - Ocean/Sea (ii) Macroecosystem - Forest
(iii) Microecosystem - Pond (iv) Nanoecosystem - Drop of water.

COMPONENTS OF ECOSYSTEM

(A) Abiotic component (B) Biotic component

(A) Abiotic component

(i) Temperature (ii) Light (iii) Soil (iv) Climate
(v) Rainfall etc.

(B) Biotic component

Formed by living things. eg., plants, animals, microbes.

Type of Biotic Components :

1. **Producers -**

(i) All the autotrophs of ecosystem are called producers. They prepare their own food. The green plants are the main producers. In the process of photosynthesis, producers absorb solar energy and convert it into chemical energy so producers are also called **transducers** or **converters.**

(ii) Energy enters into the ecosystem through the producers. The **solar energy** is the only ultimate source of energy in ecosystem. This energy is available for the remaining living organisms. Other example of producers are **Chemoautotrophs** eg. iron bacteria, sulphur bacteria, nitrifying bacteria and phytoplankton.

2. **Consumer -**

All the heterotrophs of the ecosystem are known as consumers. They directly (herbivores) or indirectly (Carnivores) depend on the producers for food.

Type of consumer

(i) Macro consumers (ii) Micro consumers

(i) Macro consumers (Phagotrophs or holozoic) : They digest their food inside the body. ie., first ingestion then digestion. Macro consumers are of following types –

(a) **Primary consumers -** Such living organisms which obtain food directly from producers or plants are known as primary consumers. eg., **herbivores** of ecosystem, Cow, Grazing Cattle, Rabbit. They are also known as **secondary producers** as they synthesize complex materials in the cells, by the digestion of food which is obtained from the plant.

(b) **Secondary consumers or primary cornivores -** Animals which feed upon primary consumers and obtain food. Those cornivores which kill and eat the herbivores, are called **predator**. eg., Dog, Cat, Snake

(i) The organism which completely depends on **dead animals** are not example of predators but they are the **scavangers** or **detrivores**. eg., Vulture, Crow, Fox.

(ii) All predators are carnivores but all carnivores are not predators.

(c) Top Consumers - Those animals which kill other animals and eat them, but they are **not killed** & and **eaten** by other animal in the nature. eg., Lion, Man, Hawk, Peacock.

(ii) Micro Consumers/Decomposers or Saprotrophs/osmotrophs-

Those living organisms which decompose the dead body of producers and consumers are known as decomposer or reducers or transformer or osmotrophs.

Characterstics :

(i) The main decomposers in ecosystem are **bacteria** and **fungi**. In Bacteria and fungi, process of decomposition completely takes place outside the body. They release enzymes from their body on dead remains and decompose it into simpler organic substance and then absorb it so these are called as **osmotrophs (absorptive).**

(ii) Decomposers play a significant role in **mineral cycle.**

(iii) In aquatic system **whale** is **secondary consumer**. It is an example of **filter feeder** because it feeds on plankton.

(iv) **Vulture** is a **scavenger not predator** because it never kills any animal. Vulture is also a decomposer. In Vulture, the break down of the food material takes place inside the body and then released into the soil in the form of waste material and minerals.

(v) **Plant parasites** are known as **primary consumers** while **animals parasites** (E.coli bateria, Entamoeba hisotlitica, liver fluke, tapeworm) are known as **secondary consumers.**

(vi) **All the insectivorous** plants play the **double role** i.e., **producer** as well as **secondary consumer** because they sythesise their own food through photosynthesis and they eat insects simultaneously.

(vii) **Man and peacock** are **omnivores.**

(viii) Organisms which use milk or curd are known as **secondary consumer.**

(ix) **Inorganic material** (CO_2, H_2O, Light), autotrophs **(Producers)** and **decomposers** are **essential** in ecosystem but, **macro consumers** are **non essential.**

STRUCTURE AND FUNCTION OF ECOSYSTEM :

(A) Structure of Ecosystem :

Biotic and abiotic components are physically organized to provide characteristic structure to a ecosystem It is species composition and stratification (lake stratification, forest stratification, ocean stratification).

(1) Another way to represent the structure of ecosystem is through food relationship of producers and consumers constituting the **Standing Crop.**

(2) The nutrients necessary for growth of living organisms, accumulated in biomass and in abiotic componants like soil called **Standing State.**

(B) Function of Ecosystem :

Ecosystem posses a natural tendency to persist, which is due to it's variety of functions (activities under taken to ensure persistance).

For example 1. Leaves carryout photosynthesis, root absorb nutrients from soil, 2. Herbivores utilize plant production and decomposers carryout decompositions and product used by producers. So key aspect of function of ecosystem are -

1. Productivity
2. Decomposition
3. Energy flow
4. Nutrient cycling

1.Productivity :

(i) Primary productivity -

Primary production is defined as the amount of biomass or organic matter produced per unit area over a time period by plants during photosynthesis. It is expressed in term of weight (g^{-2}) or energy (Kcal m^{-2}). The rate of biomass production is called productivity. It is expressed in term of $g^{-2}yr^{-1}$ or (Kcal m^{-2}) yr^{-1} to compare the productivity of different ecosystem. It can be divided into **GPP** and **NPP**.

(a) Gross primary productivity (G.P.P.) - It is the total amount of energy fixed (organic food) in an ecosystem (in producers) in unit time is called G.P.P. including the organic matter used up in respiration during the measurement period. It is also known as **total (Gross) photosynthesis.** A considerable amount of GPP is utilised by plants in respiration.

(b) Net primary productivity (N.P.P.) - It is the amount of stored organic matter in plant tissues after respiration utilisation.

NPP = GPP – R (R = Respiration + Metabolic activities)

or

GPP = NPP + R

NPP is the available biomass for the consumption of heterotroph.

(ii) Secondary productivity - Secondary productivity is the rate of formation of new organic matter by consumers.

(a) The annual net primary productivity of the whole biosphere is approximately 170 billion tons (dry weight) of the organic matter, productivity of the ocean are only 55 billion tons.

(b) In per unit area maximum productivity found in tropical rain forest.

(c) In water, least productive ecosystem is very deep lakes and highly productive ecosystem is coral reef.

(d) Nitrogen is the limiting factor in ocean and phosphorus is the limiting factor in lake productivity.

(e) In land highest productivity notice in Tropical rain forest (5 kg/msq/year). Lowest productivity is notice in Deserts and tundra.

(f) Most productive Agro-ecosystem is Sugarcane and rice ecosystem (3-4 kg./msq/year).

2.Decomposition :

Decomposition (Formation of Humas) : Decomposers break down comlex organic matter into inorganic substance like carbon dioxide, water and nutrients and the process is called decomposition. Dead plant remains such as leaves, bark, flower and dead remains of animals, including fecal matter, constitute **detritus**, which is the raw material for decomposition. The important steps in the process of decomposition are

1. Fragmentation, 2. Leaching, 3. Catabolism, 4. Humification and 5. Mineralisation.

1. Fragmentation : Detritivores (eg., earthworm) break down detritus into smaller particles. This process is called fragmentation.

2. Leaching : By the process of leaching, water soluble inorganic nutrients go down into the soil horizon and get precipitated as unavilable salts.

3. Catabolism : Bacterial and fungal enzymes degrade detritus into simple inorganic substance. This process is called as catabolism.

4. **Humification :** Humification leads to accumulation of a dark coloured amorphous substance called **humus** that is highly resistant to microbial action and undergoes decomposition at an extremely slow rate. Being colloidal in nature it serves as a reservoir of nutrients.

Types of Humus -

(i) **Mor** (Coarse terxtured humus)- It is raw humus and is formed in acidic soil (PH - 3.8 – 4.0) in which decomposition of litter is slow because it has less number of decomposer organism.

(ii) **Mull –** This is completely decomposed litter. i.e., humus because rate of decomposition is fast due to high PH of soil. (Best PH of the soil 5.5 to 6.5)

5. **Mineralisation :** The humus is further degraded by some microbes and release of inorganic nutrients occur by the process known as mineralisation.

Characteristics of Decomposition :

1. It is important to not that all the decomposition steps operate simultaneously on the detrius. Humification and mineralisation occur during decomposition in the soil.
2. It is largely an oxygen-requiring process. The rate of decomposition is controlled by chemical composition of detritus and climatic factors. In a particular climatic condition, decomposition rate is slower if detrius is rich in lignin and chitin and quicker, if detritus is rich in nitrogen and water-soluble substances like sugars.
3. Temperature and soil moisture are the most important climatic factors that regulate decomposition through their effects on the activities of soil microbes. Warm and moist environment favour decomposition where low temperature (< 10ºC) and an anaerobiosis inhibit decomposition resulting in build up of organic materials.
4. Decomposition requires years at very high altitude or lattitudes. Rate of decomposition is low in prolonged dry soil like in tropical desert.
5. The actual rate of decomposition depands on environmental conditions and detritus quality.
6. **Nutrient Immobilisation -** In the process of decomposition, some nutrients get tied up with the biomass of microbes and become temporarily unavailable to other organisms. Such incorporation of nutrients in living microbes (bacteria and fungi) is called nutrient immobilisation**.** This immobilization check or prevents the wash out of nutrients from ecosystem.

3.Energy Flow :

(i) Energy flow is the key function of ecosystem. The storage and expenditure of energy in ecosystem is based on the two basic laws of **thermodynamics.**

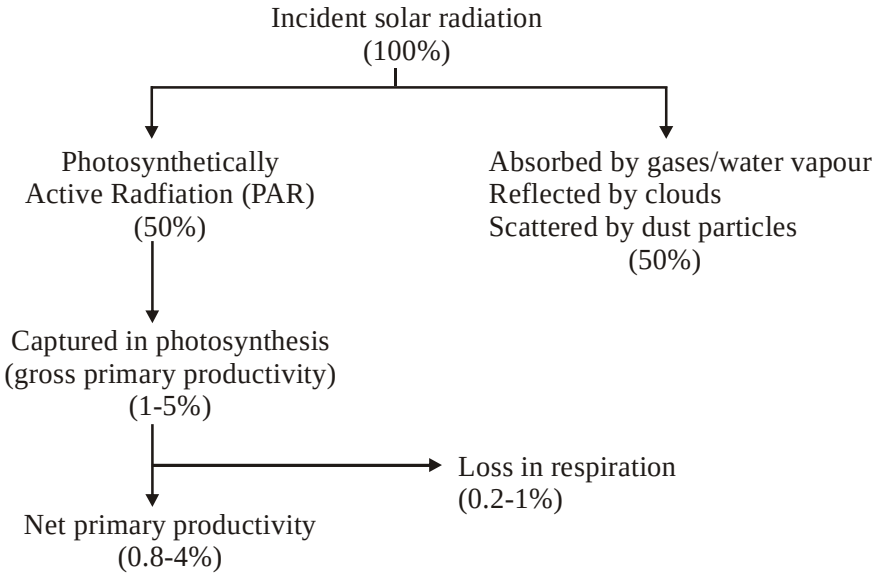
(a) Energy is neither created nor destroyed but only transformed from one state to another state.

(b) The law of entropy - The transfer of food energy from one to another organisms leads to loss of energy as heat due to metabolic activity.

(ii) Energy in food is in concentrated form, heat energy is highly dispersed. It must be understood that all changes in energy forms can be accounted for energy flow in any system.

(iii) It is useful to examine the relationship between incident radiant energy and the energy captured by the producers in the food they menufacture. Only the visible light, or the **photosysnthetically active radiation (PAR),** which carries about 50 percent of the energy of total incident solar radiation, is available to producers for absorption.

(iv) Under favourable environmental conditions, only about 1-5 percent energy of incident radiation or 2-10 percent of PAR is actually captured by the photosynthetic process (gross primary productivity), and the remaining portion is dissipated. Since the simultaneously occuring respiratory processes are energy consuming and use up the part of the photosynthetic gain, the net capture of energy (Net primary productivity) is reduced to only 0.8-4 percent of the incident total radiation, or 1.6-8 percent of PAR. Only the energy captured can be used by other trophic levels.



Food Flow Model :

1. A simplified representation of energy flow through ecosystem has been made in figure presented. Two aspects with respect to energy flow in ecosystem need careful consideration. First, **the energy flows one ways**, i.e., form producers to herbivores to carnivores; it cannot be transferred in the reverse direction.
2. Second, the **amount of energy flow decreases with successive trophic levels.** Producers capture only a small fraction of solar energy flow decreases with successive trophic levels. Producers capture only a small fraction of solar energy (1-5 percent of total solar radiation), and the bulk of unutilised energy is dissipated mostly as heat. Part of the energy capture in gross production their standing crop (respiration) and for providing food to herbivores (herbivory). The unutilised net primary production is ultimately converted to detritus, which serves as energy source to decomposers.
3. Thus, energy actually used by the herbivore trophic level is only a small fraction of the energy captured at the producer level. On an average, in different ecosystems, the herbivore assimilation or productivity approximates 10 percent of gross productivity of producers.
4. The enrgy assimilated by the herbivores is used in respiration and a fraction of unassimilated energy is transferred to decomposers (eg., Faecal matter). The remaining herbivore level energy available at carnivore trophic level is again partitioned leaving a very small fraction to support the next trophic level (top carnivore).
5. The respiration cost also increases sharply along successive higher trophic levels. On an average, respiration in producer consumes about 20 percent of its gross productivity. Herbivores consume about 30 percent of assimilated energy in respiration. The proportion of assimilated energy consumed in respiration rises to about 60 percent in carnivores. Because of this tremendous loss of energy at successive higher trophic levels, the residual energy is decreased to such an extent that no further trophic level can be supported. Therefore, the **length of food chains in an ecosystem** is generally **limited to 3-4 trophic levels.**

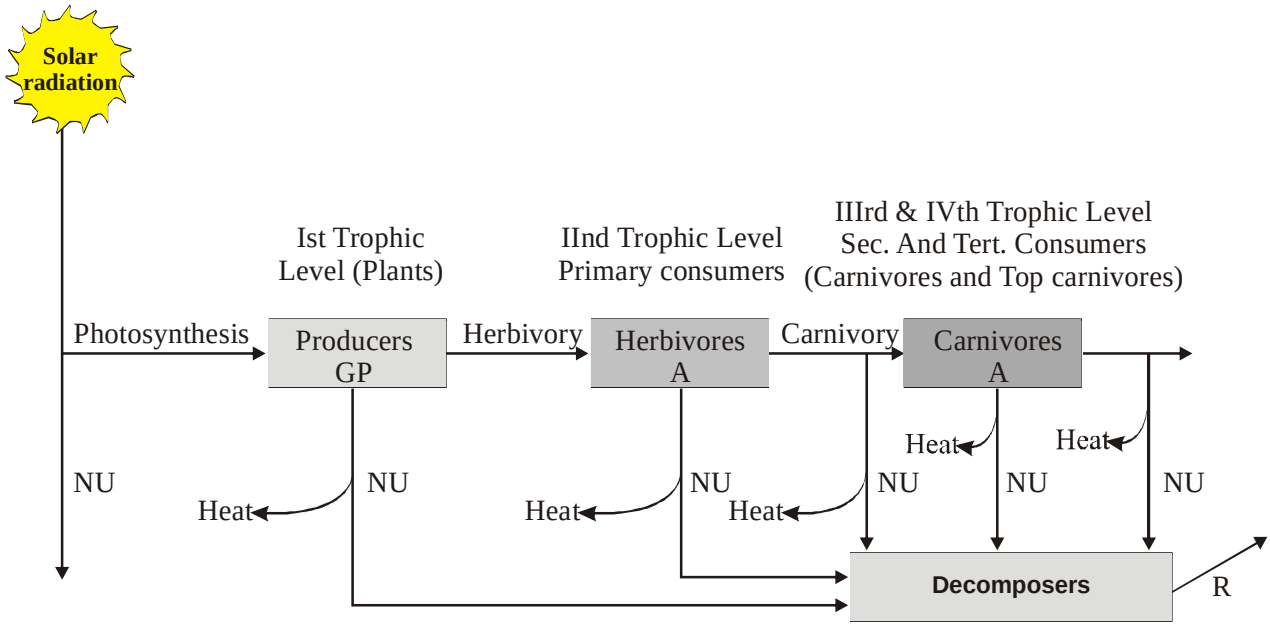


Fig.: A generalized energy flow model of ecosystem : Boxes represent biotic components and the arrows show the pathways of energy transfer; SR-Solar radiation: GP-Gross primary productivity ; A-Assimilation; R-Respiration; NU-Not utilised; NA, Not assimilated

Food Chain :

1. In ecosystem every organism depends on other organism for food material and all organism are (herbivores to carnivores) arranged in a series in which food energy is transferred through repeated eating and being eaten. It is called food chain. In food chain, energy flow is in the form of food.
2. In a food chain, food material or food energy is transfer from one trophic level to next trophic level.
3. Four trophic levels are present in the ecosystem, because level of energy decreases during the flow of energy from one trophic to the another trophic level.

   First trophic level **[T_1]** = Producers

   Second trophic level **[T_2]** = Primary consumers

   Third trophic level **[T_3]** = Secondary consumers

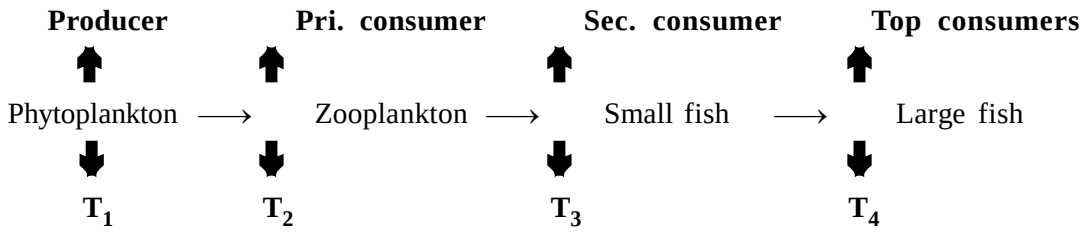
   Fourth trophic level **[T_4]** = Top consumers
4. **Five trophic levels** found in highly complex ecosystem in which tertiary consumer is present in between the secondary consumers and top consumer. Then the fifth trophic level (T_5) is formed by the top consumer.
5. In food chain energy flow is **unidirectional** (preducers to herbivores).
6. Shorter food chains will provide greater energy.
7. Generally the decomposers (Bacteria and Fungi) are not included in the food chain but when included then included as the last trophic level.

Type of Food Chains :

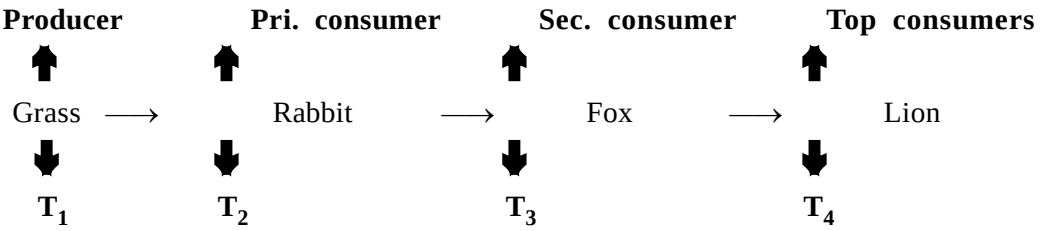
1. **In nature three type of food chain are present-**

(a) **Grazing food chains or Predatory food chain -** Most of food chain in nature are of this type. This food chain begins with Producers (plants) and in successive order it goes from small organism to big organism.

(i) Aquatic ecosystem :



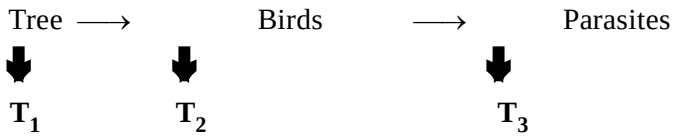
(ii) Grass land ecosystem :



2. Parasitic food chain - This food chain also starts from producers but in successive order it goes from big organism to the smaller organisms.

eg.,

Tree ecosystem



Note : Both above food chains are directly dependent on **solar radiation** (as a primary source of energy) and have **rapid energy flow.**

3. Detritus food chain or Saprophytic food chain - This food chain begins with decomposition of dead organic matter by **decomposers** so it is also known as saprophytic food chain. In this food chain primary consumers are bacteria and fungi.

Dead organic matter → Bacteria, fungi

Note :

(i) In mangrove vegetation this food chain goes up to big organism.

(ii) Dead mangroves leave → Bacteria & fungi → Amphipds, molluscs, crabs, nematodes → small fishes → fish eating birds.

(iii) In detritus food chain **energy flow** is rather very **slow** yet **magnitude of energy is great** because vast number of decomposers are involved.

(iv) It does not depends on **light.**

(v) In an aquatic ecosystem, GFC(Grazing Food Chain) is the major conduit (source) of energy flow. As against this, in a terrestrial ecosystem, a much larger energy flow through the detritus food chain (as it is small) than through the grazing food chain.

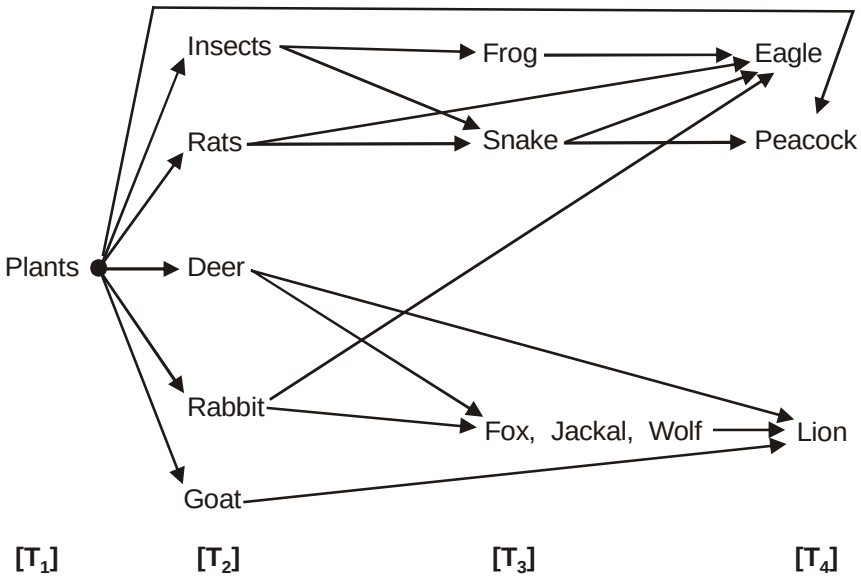
(vi) In Sunderbans, Tigers feed on the fishes and crab in the absence of their natural prey.

Food Web :

1. In big ecosystem many food chains are interlinked together on different trophic levels to form food web. In food web transfer of food energy is unidirectional but from many different alternative pathways.

2. In food web members of a particular trophic level obtain their food according to their choice and taste but that type of facility is not present in food chain. It means they have **more than one option or alternative for getting food.**

3. **As mush as food web is complex that ecosystem is more permanent or stable,** such type of ecosystem is not destroyed naturally and continues for long time. This ecosystme is not affected by loss of any organism of any particular trophic level. **Those ecosystems which have simple food web are not very stable** it means that they can be finished at any time, if there is a change in any particular trophic level.



Pyramids of Ecosystem :

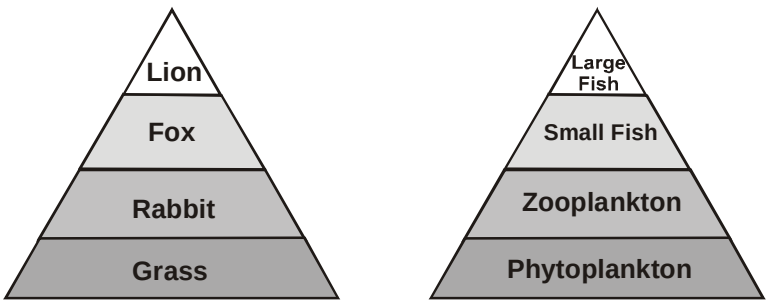
Graphical representation of ecological parameters at different trophic levels and trophic structure in ecosystem is called pyramids. These parameters are **Number**, **Biomass** and **Energy**. First of all, pyramid was formed by **Charis Elton;** So we called it **Eltonian pyramids.**

These Pyramid are of three types

(1) Pyramids of number, (2) Pyramids of energy, (3) Pyramids of biomass.

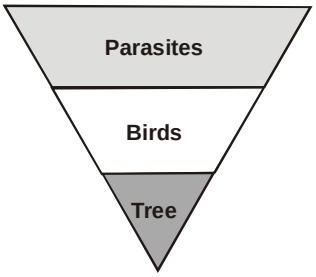
(1) Pyramids of number -

(a) In this type of pyramid the number of individual organism in various trophic level is shown. These pyramid are mostly upright, because number of producers [T_1] is maximum and number of herbivores and carnivores decrease towards apex or at successive trophic levels, such as **Grassland ecosystem** and **aquatic ecosystem.**



Grass land Ecosystem Aquatic Ecosystem

(b) But in a **tree ecosystem** the **pyramid of numbers is inverted.** This is called parasitic ecosystem. Because birds (herbivores) depend on the tree (producer) and parasites (consumer) like bugs, lices depend on birds, therefore with increase in the number of trophic levels, the number of the organisms increase sequentially.



Tree Ecosystem

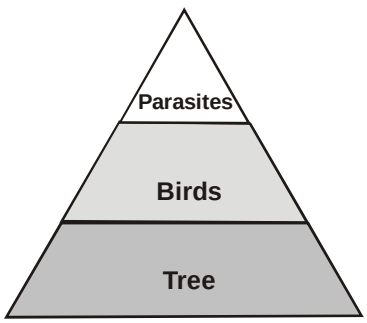
Note :

(i) Maximum number of producers are present in aquatic ecosystem. **The number of organism at any trophic level depends upon the availability of organisms which are used as food** on lower level so **availability of food is main factor.**

(ii) Pyramid of number shows **biotic potential** of a ecosystem. The number of members of any particular species in favourable conditions is called their biotic potential. When the numbers of the members of any species increases over the limit then it is called **population explosion.** Because of this existence of the species comes in danger. Human population is also near this condition at present.

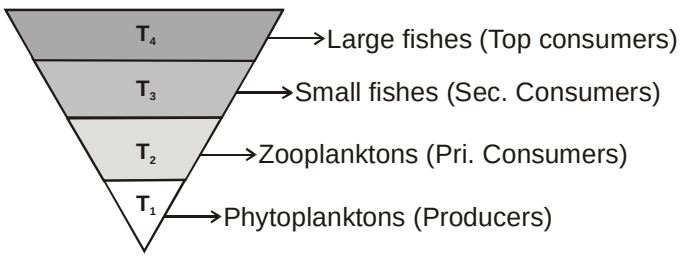
(2) Pyramid of Biomass -

(a) Pyramids of biomass represent the total amount of biomass of each trophic level of ecosystem, mostly these pyramids are also upright (erect) eg., tree ecosystem, forest ecosystem.

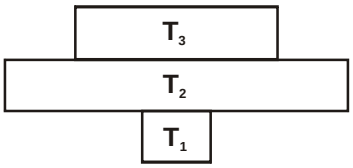


Pyramid of biomass in Tree ecosystem

(b) Pyramid of biomass in **aquatic ecosystem** is **inverted** because in it producers are micro-organism and their biomass is very less.



Note : Pyramid of lake on the basis of biomass-



(3) Pyramids of energy -

(a) It represent amount of energy at different trophic levels, energy pyramids are **always upright or erect** because there is a gradual decrease in energy at successive trophic levels. According to the **10% law of Lindeman,** the 90% part of obtained energy of each organism is utilized in their various metabolic activites and heat and only 10% energy is transferred to the next trophic level. So 90% energy is lost at each trophic level, therefore **top consumers like lion etc. are ecologically weakest** but physically they are strong.

Note : Pyramids of energy represent the **productivity of ecosystem** as well as transfer of production in ecosystem.

Ecosystem	Shape of Pyramid
Pyramid of Number	
Grassland	Uprigint
Forest	Inverted
Aquatic	Upright
Pyramid of Biomass	
Grassland	Upright
Forest	Upright
Aquatic (Lake)	Inverted
Pyramid of Energy	
All ecosystems	Upright

4. Nutrient Cycling / Biogeochemical Cycle :

Bio – Living organism

Geo – Rock, Soil, Water

Chemcial – Material or Nutrients

(a) All the types of material required by ecosystem in addition of energy, are available continuously to ecosystem through recyling. Thus there is a constant exhcange of materials between the living organism and their abiotic environment through the recyling of materials. This phenomenon is called Biogeochemical cycle.

(b) The mineral elements taken up from the enviroment (soil as well as air) by the green plant, (the producers), are again returned to the environment through consumers and decomposers.

(c) The following types of cycles are found in an ecosystem

(i) Gaseous Cycle - C, H, N, O cycle. Reservior is in the atmosphere (air) or in **Hydrosphere**(water).

(ii) Sedimentary cycle - P, S, Ca cycles reservoirs are in earth's crust (lithosphere)

(iii) In these cycles, the bulk material remains in the inactive reservoir on earth crust like sediment of sea or water bodies.

(iv) Nutrient cycles can be conveniently considered under the following three aspects as shown in above figure.

(v) **Input of Nutrients :** Ecosystem receives nutrients form external sources and stores them for further used though biological processes. For example, nutrients in dissolved state are gained from rainfall **(wet deposition)**, or in particular state from dust fall **(dry deposition)**. Symbiotic biological fixation of nitrogen in soil also represents an input. Weathering of soil parent materials, which releases available nutrients from their fixed state, is another example of input.

(vi) **Output of Nutrients :** Nutrients are moved out of an ecosystem and many become input to another ecosystem. For example, considered loss of nutrients like calcium and magnesium (from soil particle) occurs through runoff water, or through soil erosion. Significant amount of nitrogen may be lost in gaseous form by the denitrification process in soil. Harvesting of agricultural crops or transportation of logs from forest, represent nutrient loss from these ecosystems.

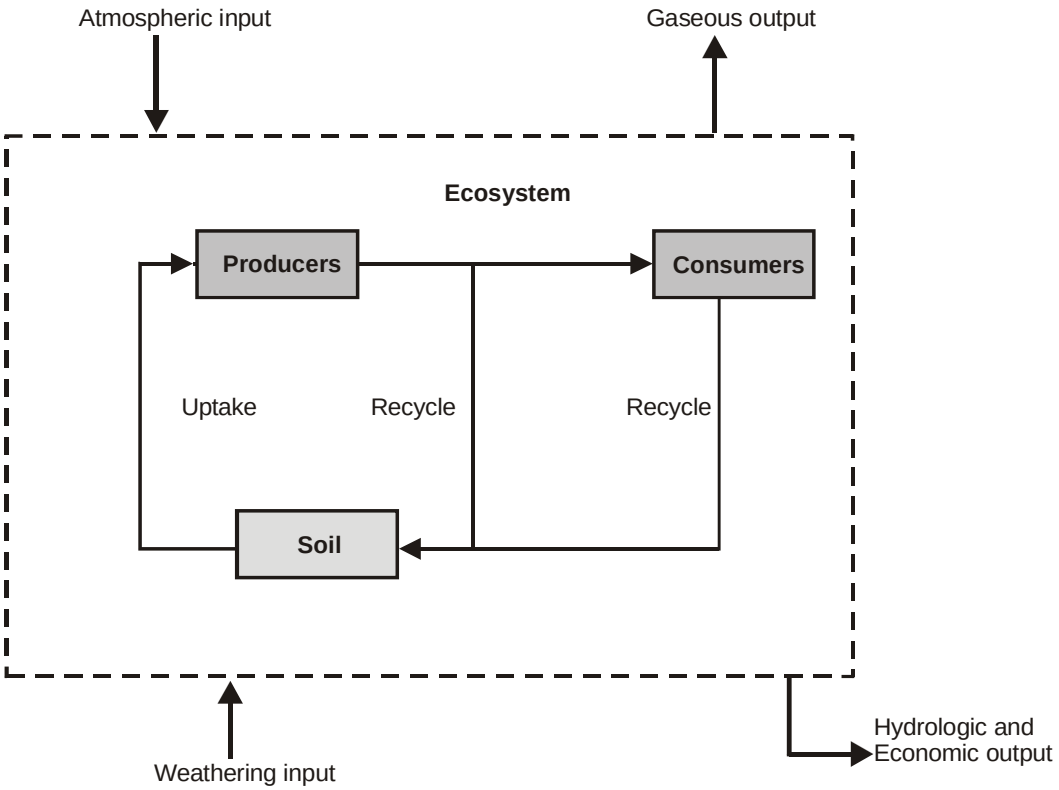


Fig.: A generalised model of ecosystem nutrient cycling : Nutrients are brought in (input), moved out (output), and cycled internally in the ecosystem. Boxes represent ecosystem components and arrows show the pathways of nutrients transfers.

(vi) In an **undisturbed ecosystem**, (ie., an ecosystem in which human activities are absent or nearly so) the **input of nutrients** may approximately **equal the output of nutrients,** rendering the nutrient cycle more or less balanced.

(vii) Generally, the absolute amounts of nutrient moving in (input) and moving out (output) of the ecosystem are much less than the amount of nutrients cycled within (amongst different components) the ecosystem. Sever disturbances in the ecosystem (e.g., Tree felling, insect outbreak, fire, soil erosion, etc.) may make the nutrient cycles unbalanced and the ecosystem unstable. The soil can be lost rapidly by erosion after removal of natural vegetation.

(viii) **Internal Nutrient Cycling :** Plants absorb varying amounts of nutrients from the soil. Due to decomposition of dead organic matter, nutrients are continuously regenerated and strored in soil and available to the plant. A dynamic state exists in soil, with nutrient regeneration and absorption occuring simultaneously.

(ix) The transfer of nutrients form the soil to plants by the process of nutrient absorption is known as **uptake.** The absorbed nutrients are metabolically incorporated in plants during growth. Periodically, nutrients are recycled i.e., brought back to soil through **litter fall** from vegetation, animal remains and faecal matter, etc. The overground, as well as root detritus decompose to regenerate the nutrients.

(x) Eventually, nutrients contained in the detritus on soil surface and within, are regenerated by decomposition in plant-available forms.

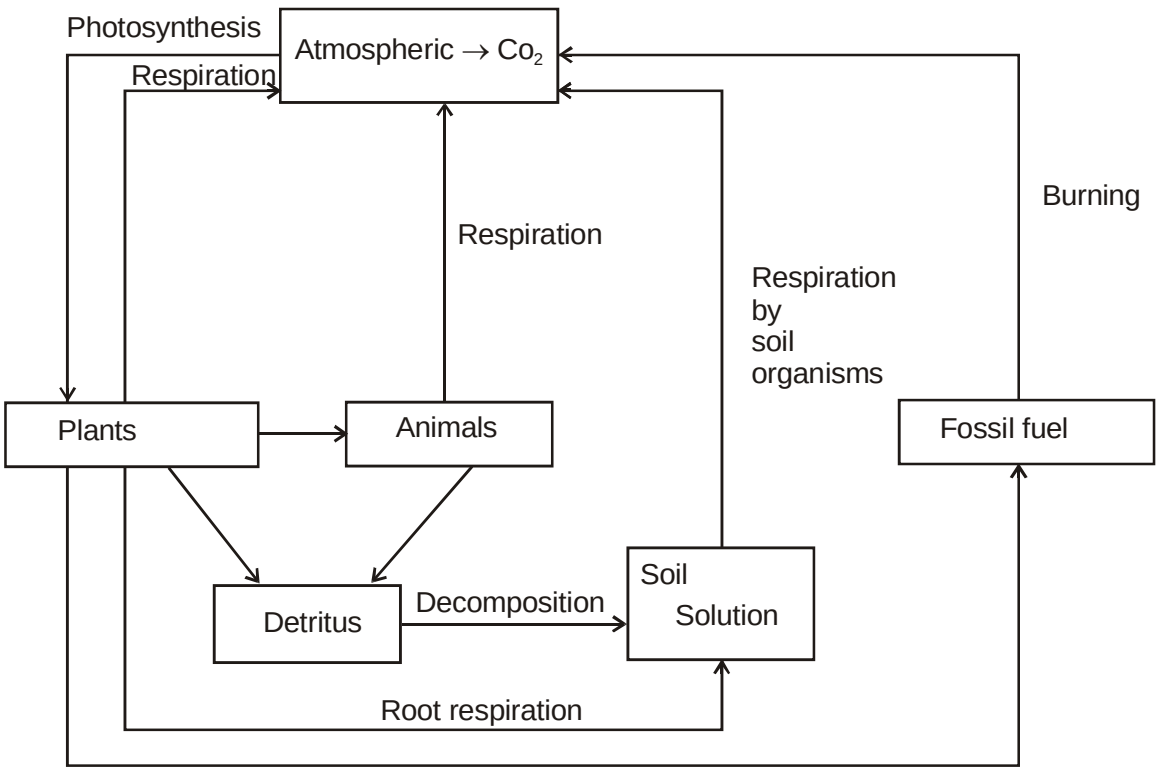
(xi) When the uptake of nutrient exceeds the amount recycled (e.g., as in the case of a young growing forest), a fraction of the uptake is retained in the standing crop. This **retension** of balance nutrients in the standing crop leads to increase in nutrients content of the ecosystem. Thus, in a nutrient cycle:

Retention = Uptake – Recycle.

(xii) Rates of nutrient uptake, recycle and retention vary widely in different ecosystems. A large number of chemical methods are available for determining the amounts of different nutrients per unit weight of biomass of soil. By determining changes in the nutrient concentrations and biomass with time, the nutrient budget of the ecosystems can be computed.

Carbon Cycle :

The main source of carbon is **atmosphere** and in **hydrosphere** it is **rocks of carbonates.** Carbon present in lithosphere in the form of coal and petroleum. The carbon released from them is present in the atmosphere in the form of carbodioxide. The green autotrophs utilize CO_2 from the air to synthesize food materials which is obtained by other organisms as food. Carnivors obtain their organic food from the herbivores. These carbonic matter produce CO_2 through the oxidation or respiration which dissolve in air or water and again utilized by the plants.



Nitrogen Cycle :

Atomsphere is the only source of nitrogen 78% nitrogen is present in atmospheric air. Plants absorb nitrogen in the form of **nitrate** ions mainly.

Nitrogen cycle is completed in following steps

1. Nitrogen fixation -

(a) In this process first of all some bacteria and blue green algae converts atmospheric nitrogen in to nitrogenous, compounds viz ammonia, amino acid or nitrate salts.

e.g.

Bacteria – ***Rhizohbium, Aerorhizobium, Azospirillum***
Frankia, Clostridium, Azotobacter

Blue green algae – ***Oscillatoria, Anabaena, Aulosira, Nostoc*** $\rightarrow$ In flooded rice field in tropics

Note :

(1) Azotobacter is aerobic bacteria

(2) Clostridium is anaerobic bacteria

(3) Symbiotic relationship where the nitrogen fixing bacteria does not penetrate deep into host tissue, known as **associative symbiosis.** Azospirillum with grass paspalum notatum.

2. Nitrification –

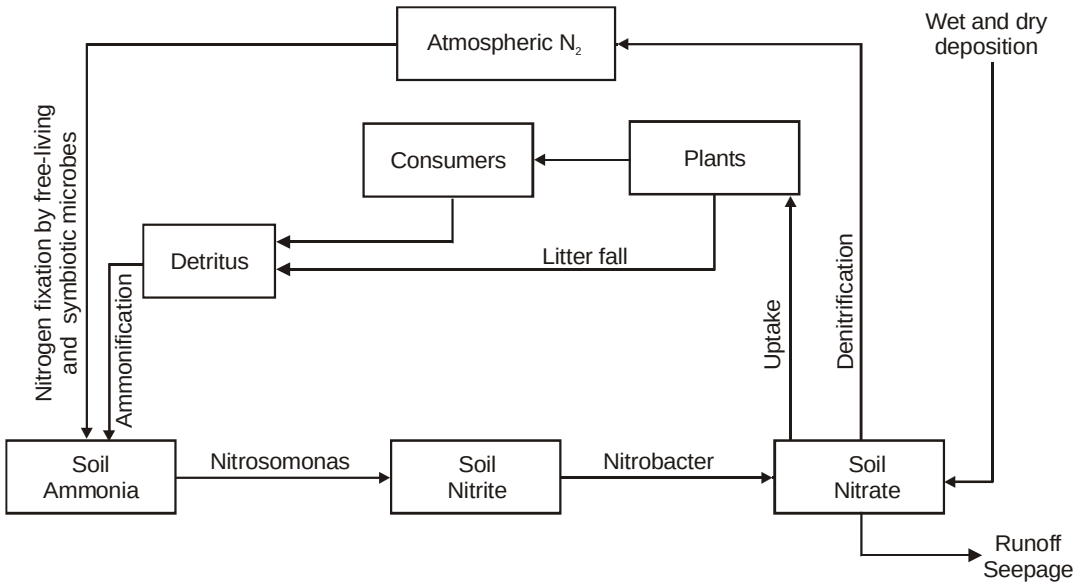
(a) Conversion of ammonia into nitrate is called nitrification.

Nitrification process complete in two steps.

$$NH_3 \xrightarrow{\text{Nitrosomonas}} NO_2^- \xrightarrow{\text{Nitrobacter}} NO_3^-$$

(b) Few quantity of nitrate comes in soil by electrochemical or photochemical process or physical N_2 fixation.

(c) Now few quantity of this nitrate absorb by plants from soil.



3. Nitrogen assimilation –

Plants absorb nitrate from the soil and form protein. When consumers eat these plant proteins is transferred into consumer.

4. **Ammonification –**

   Protein present in litter, is converted into ammonia by some ammonifying bacteria. **e.g.** ***Bacillus vulgaris, Bacillus mycoides, Bacillus ramosus***

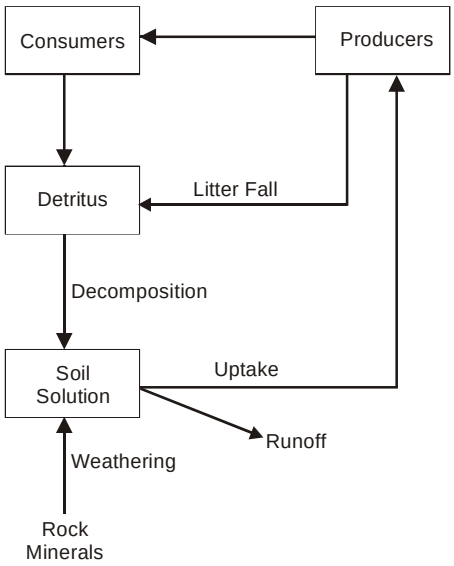
5. **Denitrification –**

   Some quantity of nitrate which is not used by plants is converted into nitrogen by denitrifying bacteria. **e.g.** ***Thiobacillus denitrificans, Pseudomonas denitrificans***

   Note : some nitrate washed out from the ecosystem through seepage.

Phosphorus Cycle

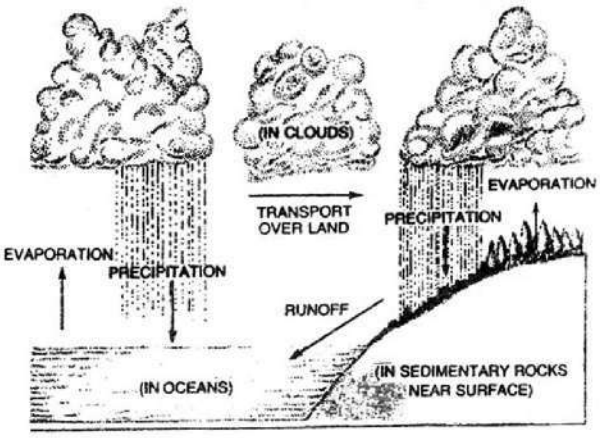
1. Phosphorus is the main constituent of protoplasm, plasma membrane, bones and teeth. Main source of phosphorus is **rocks.** If comes from the weathering of phosphorus containing rock in the soil. Plants absorb this phosphrous from the soil and transfer this phosphate to animals and after the death of animals it is released again into the lithosphere by the action of decmposers.
2. **Sometime** some of the elements like phosphorus and calcium reach into the sea through water, from where they transform into rocks. They separate from the cycle for a long time so it is also known as **sedimentary cycle.**
3. But when these rocks break after sometime then this phosphorus is again made available to the sea plant or sea weeds, which pass into fish and sea birds. The excretory materials of birds on the rocks of sea shore is called **Guano** and and it is a source of phosphorus.
4. **Plants absorb phosphate from the soil in the form of orthophosphate (Po_4^{3-})**
5. Phosphorous cycle differ from nitrogen and carbon cycle in atmospheric input of phosphorous through rainfall is much smaller and gaseous exchange of phosphorous between organism and environment is negligeble, which both are considerable in Nitrogen and Carbon cycle.



Water Cycle :

1. Water is indispensable for life. Sea is the main source of water on earth. Water is always present in the atmosphere in the form of water vapour. Water is also evaporated from other places from where it reaches into the atmosphere. These vapours form clouds in the atmosphere, condensation of water vapour forms clouds, moist, fog and ice at high altitudes. It comes again on he earth in above forms.

2. Water cycle plays a significant role on the earth. Plants and animals receive water or absorb water. Water participates in various metabolic activites of the body of organisms and again it is formed. Water is converted into food through the photosynthesis in plants. Water is also present in protoplasm of all organisms. This water again comes into the atmosphere through transpiration from the plants and evaporation and sweating from the animals. Thus this cycle goes on continuously. The oxygen cycle and hydrogen cycle is also found in the ecosystem as above cycles.



Note :

(i) Water cycle is diectly operated by solar radiation and it is under the control of forests.

(ii) The term ''Cycle'' is used for the movement of matter and the term ''Flow '' is used for the movement of energy.

SPECIAL POINT :

(i) Ecological efficiency - The percentage of energy transferred from one trophic level to the next is called ecological efficiency or food chain efficiency.

$$E.E = \frac{\text{Energy in biomass production at a trophic level}}{\text{Energy in biomass production at previous trophic level}} \times 100$$

(ii) Assimilation efficiency - It is the production of consumed energy that is assimilated.

$$A.E. = \frac{\text{Food energy assimilated}}{\text{Food energy ingested}} \times 100$$

(iii) Net production efficiency -

$$N.P.E. = \frac{\text{Net pri. productivity}}{\text{G.P.P.}} \times 100$$

(iv) Photosynthetic efficiency -

$$P.E. = \frac{\text{G.P.P.}}{\text{Inciden total solar radiation}} \times 100$$

$\Rightarrow$ Detritus —(Environmental Conditions: Fragmentation, Leaching catabolism)→ Humus (Humification) / Co_2, H_2O, Nutrients (Mineralisation)

EXERCISE - 1

Q.1 Eltonian pyramids of numbers are upright in one of the following ecosystem -
(1) Grassland (2) Tree
(3) Pond (4) Both (1) and (3)

Q.2 The type of food chain in which organic matter decomposed is converted into energy rich compounds is called -
(1) Detritus food chain (2) Grazing food chain
(3) Cybernetics (4) None above

Q.3 One of Eltonian pyramids have to be upright always -
(1) Biomass (2) Energy
(3) Number (4) All of these

Q.4 Word 'ecosystem' was coined by -
(1) Elton (2) Tansley
(3) Odum (4) Billing

Q.5 Biotic components include -
(1) producers only
(2) consumers only
(3) producers and consumers only
(4) producers, consumers and decomposers

Q.6 The last organisms of the food chain are generally-
(1) photosynthetic plants
(2) herbivores
(3) carnivores
(4) decomposers

Q.7 In an ecosystem, the population of -
(1) primary producers is larger than primary consumers
(2) secondary consumers is largest
(3) primary consumers out numbers primary producers
(4) primary consumers are least dependent upon primary producers

Q.8 An aquatic ecosystem consists of -
(1) biotic factors
(2) biotic and abiotic factors
(3) consumers only
(4) producers only

Q.9 The best arrangement of an energy system consisting of hawks, snakes, mice and grasses is -
(1) Grass $\rightarrow$ mice $\rightarrow$ snake $\rightarrow$ hawks
(2) Grass $\rightarrow$ snake $\rightarrow$ mice $\rightarrow$ hawks
(3) Grass $\rightarrow$ mice $\rightarrow$ hawks $\rightarrow$ snakes
(4) Mice $\rightarrow$ snake $\rightarrow$ hawks $\rightarrow$ grass

Q.10 If a big fish eats small fish which eats Hydra who in turn eats water fleas ; water fleas in turn eat phytoplankton. In this chain, water fleas will be -
(1) Producers
(2) Primary consumers
(3) Secondary consumers
(4) Top consumer

Q.11 The graphic representation of trophic level is represented by a pyramid. Which of the following pyramid is always a true pyramid unlike the others ?
(1) Pyramid of number
(2) Pyramid of biomass
(3) Pyramid of energy
(4) Both (1) and (3)

Q.12 Which of the following constitutes the structure of an ecosystem ?
(1) Ecological community
(2) Quantity and distribution of abiotic materials
(3) Range of physical conditions
(4) All the above

Q.13 Ecosystem comprises both abiotic and biotic components. Biotic component of an ecosystem consists of -
(1) Producers (2) Consumers
(3) Decomposers (4) All the above

Q.14 Autotrophic organisms (green plants), which capture solar energy to synthesise organic food are called -
(1) Producers (2) Consumers
(3) Decomposers (4) None of the above

Q.15 In a pyramid of numbers representing an ecosystem of a large freshwater pond the number of primary consumers is -

(1) More than the secondary consumers

(2) Less than the secondary consumers

(3) Less than the producers

(4) Less than the tertiary consumers

Q.16 Food chain refers to -

(1) A number of human beings forming a chain for food

(2) The transfer of food energy from producers to consumers

(3) Animals near a source of food

(4) None of the above

Q.17 The sequence of species through which the organic molecules in community pass is called is -

(1) Food web (2) Food chain

(3) Nutrient cycle (4) Pyramid of energy

Q.18 A group of interconnected food chains is called-

(1) Pyramid of energy (2) Food web

(3) Food cycle (4) Complex food chain

Q.19 The energy which is utilized by the living world is primarily -

(1) Heat (2) Electricity

(3) Light (4) Kinetic

Q.20 Energy flow in ecosystem is -

(1) Unidirectional (2) Bidirectional

(3) Multidirectional (4) None of the above

Q.21 The rate at which new tissues are formed in producers is the ecosystem's -

(1) Net primary productivity

(2) Gross primary productivity

(3) Net secondary productivity

(4) Gross secondary productivity

Q.22 How much amount of light is used in the production process by plants ?

(1) 1 to 5% (2) 5% to 10%

(3) 20 to 40% (4) more than 70%

Q.23 The importance of ecosystem maintenance lies in -

(1) Cycling of materials

(2) Flow of energy

(3) Both of the above

(4) None of these

Q.24 The amount of energy, utilized by herbivores from the plants is -

(1) 5 % (2) 10 %

(3) 50 % (4) 90 %

Q.25 The percentage of net primary production of total light intake is -

(1) 10 % (2) 0.8 – 4 %

(3) 10 – 20 % (4) 15 %

Q.26 The flow of materials and energy in an ecosystem is respectively -

(1) Cyclic only (2) Linear only

(3) Linear and cyclic (4) Cyclic and linear

Q.27 Mark the incorrect statement with reference to carbon cycle -

(1) Lime rocks contribute to CO_2 of water

(2) Atmospheric CO_2 gets dissolved in water

(3) CO_2 is returned by combustion of fuel

(4) 75% of total carbon lies in geological component

Q.28 The sulphate rocks are formed in ocean by leaching of -

(1) FeS and Fe_2S_3

(2) Organic sulphates and -SH

(3) Soluble inorganic sulphates

(4) All of these

Q.29 Biogeochemical cycling means -

(1) Cycling of nutrients in an ecosystem

(2) Cycling of water

(3) Cycling of energy in an ecosystem

(4) Cycling of gases between plants and the atmosphere

Q.30 The least productive ecosystem is -

(1) Coastal seas (2) Very deep lakes

(3) Grasslands (4) Moist forests

Q.31 One of the following is sedimentary cycle ?
(1) Carbon (2) Hydrogen
(3) Nitrogen (4) Phosphorus

Q.32 The primary consumers in a pond ecosystem is-
(1) Phytoplankton (2) Zooplankton
(3) Fishes (4) Bacteria

Q.33 The number of primary producers within a specified area would be minimum in -
(1) Grassland (2) Pond ecosystem
(3) Desert (4) Forest ecosystem

Q.34 The river mouth ecosystem is called as -
(1) Estuarine (2) Lotic
(3) Lentic (4) None of these

Q.35 In a natural ecosystem, decomposers include-
(1) Bacteria and fungi (2) Parasitic algae
(3) Macroscopic animals
(4) All the above

Q.36 Which of the following is not true for man made ecosytems ?
(1) They are highly efficient
(2) They lack the diversity of natural ecosystems
(3) They mainly comprise seasonal vegetation or one chosen crop.
(4) Parks and aquaria are not man-made ecosystems.

Q.37 Lotic ecosystem refers to -
(1) Ecosystem of estuary water
(2) Deep marine-water ecosystem
(3) Ecosystem of flowing water
(4) Static-water ecosystem

Q.38 The ecosystem of a pond is referred to as-
(1) Lentic (2) Lotic
(3) Xeric (4) Benthic

Q.39 The correct sequence of components through which energy may pass from initial source, through an ecosystem is -
(1) Sun – autotrophs-heterotrophs– environment – space
(2) Space – environment – heterotrophs – autotrophs – sun
(3) Sun – space – environment – heterotrophs – autotrophs
(4) Sun – space – environment – autotrophs – heterotrophs

Q.40 Which of the following does not contribute directly to the recycling pathways of trophics ?
(1) Bacteria and fungi feeders
(2) Plants
(3) Carnivores (4) Herbivores

Q.41 Efficiency of any ecosystem is best depicted by pyramid of -
(1) Energy (2) Number
(3) Biomass (4) Volume

Q.42 The correct match is -
(1) Producers-act upon the decomposed substances and transform them into different forms of inorganic and organic substances
(2) Consumers-are autotrophic members of ecosystem
(3) Decomposers-feed upon dead decaying living organisms and break them into simpler compounds fit for use of producers
(4) None of these

Q.43 The first trophic level in any kind of food chain is always a green plant because -
(1) Of their wide distribution
(2) They alone have a capacity to fix atmospheric CO_2, in the presence/absence of sunlight
(3) Of their richness in chlorophyll
(4) Of their capacity to convert light energy to chemical energy

Q.44 The creating force of an any ecosystem is-
(1) Organic fuels, carbohydrates
(2) Biomass
(3) Solar energy
(4) Producers

Q.45 When frog eats grasshopper which thrives on green plants, the frog is -
(1) Primary producer (2) Herbivore
(3) Primary carnivore (4) Top consumer

Q.46 The largest ecosystem in the world is contributed by -
(1) Forests (2) Rivers
(3) Oceans (4) Grasslands

Q.47 If the primary producers are absent from any ecosystem which of the following will occur ?
(1) Herbivores will not survive
(2) Carnivores will not survive
(3) Both will be disintegrated because of food absence
(4) No change will take place

Q.48 Grasshopper in grassland is a -
(1) Producer (2) Herbivore
(3) Carnivore (4) None of these

Q.49 The pyramid of number for forest ecosystem is-
(1) Upright (2) Inverted
(3) Both of above (4) None of above

Q.50 They can be put in the category of primary consumers -
(1) Eagles and tigers (2) Fishes and whales
(3) Snakes and frogs (4) insects and cattles

Q.51 The study of fresh water ecology is -
(1) Hydrology (2) Ecology
(3) Limnology (4) Geology

Q.52 The place where fresh water joins the salt water is called as -
(1) Island (2) Lagoon
(3) Beach (4) Estuary

Q.53 The word standing crop in ecosystem refers to-
(1) Living components
(2) Non-living components
(3) Both living and non-living components
(4) None of the above

Q.54 The pyramid of energy in any ecosystem is-
(1) Always upright
(2) May be upright
(3) Always inverted
(4) None of the above

Q.55 Which of the following organisms can convert ammonium or nitrates into amino acids ?
(1) Scavengers
(2) Producers
(3) Primary consumers
(4) Primary detritivores

Q.56 One of the following is a true micro-ecosystem
(1) One litre of water from a pond kept in an air tight flask
(2) One litre of tap water in a flask covered over by cotton plug
(3) Ten litre of boiled pond water covered over by a lid
(4) One litre of pond water closed with a cork having gas exchange tube.

Q.57 The decomposers in an ecosystem constitute the following trophic level -
(1) T_1 (2) T_3
(3) T_5 (4) T_4

Q.58 If all the green plants were to disappear from the earth -
(1) All the animal will die
(2) Only the herbivores will die
(3) Only the carnivores will die
(4) It will not matter to any one because chemosynthetic bacteria will produce food for all

Q.59 The bacteria which attack the dead animals are-
(1) First link of the food chain and are known as primary producers
(2) Second link of the food chain and are herbivorous
(3) Third link of the food chain and are tertiary consumers
(4) The end of the food chain and are decomposers

Q.60 The number of producers and consumers in an ecosystem is mutually controlled by a -
(1) Feed back mechanism
(2) Food chain mechanism
(3) Productivity control
(4) Any of these

Q.61 The non-green plants are as important as the green plants because they -
(1) Cause human disease
(2) Cause diseases of other plants
(3) Are useful in several industries
(4) Bring about decomposition of dead animals and plant remains

Q.62 The ecosystem of earth is known as -

(1) Biome (2) Community

(3) Biosphere (4) Association

Q.63 In any given ecosystem, the number of individuals of a species remain more or less constant over a period of time. This constancy of numbers is maintained by -

(1) Parasites (2) Predators

(3) Human beings (4) Available food

Q.64 The ecosystem exists in a state of 'balance'. Supposing one of the heterotrophs, says the rabbit, multiplies and increases in number suddenly then -

(1) The balance will be permanently upset because the rabbits will eat the grass in the system and die of starvation.

(2) The 'balance' will be restored by an increase in the wolf population

(3) Epidemics will break out in the rabbits and kill all of them

(4) Rabbits will starts eating each other

Q.65 Which of the following terms is not a synonym literally for ecosystem ?

(1) Ecosom (2) Ecosphere

(3) Microcosm (4) Holocoene

Q.66 The amount of living matter present in a component population of a particular trophic level is called as -

(1) Standing crop (2) Standing quality

(3) Both of these (4) Standing state

Q.67 Which of the following is the smallest unit?

(1) Biosphere (2) Ecosphere

(3) Ecosystem (4) Biome

Q.68 The term reducer is applied to -

(1) Decomposers (2) Detrivores

(3) Both of these (4) Heterotrophs

Q.69 In a parasitic food chain which trophic level is represented by bugs and lices ?

(1) T_4 (2) T_3

(3) T_2 (4) T_1

Q.70 The pyramid of number in a forest ecosystem is -

(1) Rhomboidal (2) Upright

(3) Inverted (4) Linear

Q.71 The pyramid of biomass in a parasitic ecosystem is -

(1) Upright (2) Inverted

(3) Linear (4) Rhomboidal

Q.72 The pyramid of biomass in a shallow pond ecosystem is -

(1) Inverted (2) Upright

(3) Rhomboidal (4) Linear

Q.73 The cybernetic of an ecosystem refers to -

(1) Harvest index

(2) A feed back mechanism

(3) Regulation of equilibrium

(4) Reverse energy flow

Q.74 The gross production minus losses respiration in an ecosystem is indicated as-

(1) Net production

(2) Secondary production

(3) Net storage

(4) Net primary production

Q.75 The biotic and abiotic components of the ecosystem are connected through -

(1) Standing quality

(2) Climatic regime

(3) Transducers

(4) Humification and mineralization

Q.76 The rate of storage at consumer level is -

(1) Secondary productivity

(2) Tertiary productivity

(3) Both of these

(4) Net productivity

Q.77 The SO_2 is returned to the atmosphere by-

(1) Metabolism of producers

(2) Metabolism of consumers

(3) Both of these

(4) Combustion of fuel

Q.78 A group of interacting living things and all the environmental factors with which they interact are together called -

(1) Ecosystem (2) Succession

(3) Producers (4) Ecological niche

Q.79 An ecosystem does not normally alter because it is in a state of -

(1) Deficient light

(2) Imbalance

(3) Homeostasis

(4) Deficient components

Q.80 The immediate surroundings of an ecosystem are called -

(1) Macroenvironment (2) Microenvironment

(3) Biosphere (4) Both (1) and (2)

Q.81 Raymond Lindmann (1942) used the term trophic level. Trophic levels are formed by-

(1) Animals only

(2) Plants only

(3) Organisms linked in food chains

(4) Top consumers in food chain

Q.82 Organisms which acquire energy and nutrients by digesting the organic molecules of living organisms are called -

(1) Producers (2) Consumers

(3) Detritivores (4) None of the above

Q.83 Which of the following is the trophic level of man in an ecosystem ?

(1) Omnivore (2) Carnivore

(3) Herbivore (4) Producer

Q.84 The rate at which new tissues are formed in producers is called the primary net productivity of the ecosystem. About how much of the net primary productivity of a terrestrial ecosystem is eaten and digested by herbivores ?

(1) 2 % (2) 10 %

(3) 50 % (4) 85 %

Q.85 Net community productivity (NCP) is the -

(1) Total rate of photosynthesis

(2) Chemical energy left after utilization by plants

(3) Rate of storage of organic matter not used by heterotrophs

(4) Energy wasted by carnivores

EXERCISE - 2

Q.1 A food chain consists of -
(1) Producers, carnivores and decomposers
(2) Producers, herbivores and carnivores
(3) Producers and primary consumers
(4) Producers, consumers and decomposers

Q.2 The herbivores that feed directly on producers are called -
(1) Primary consumers
(2) Secondary consumers
(3) Tertiary consumers
(4) Quarternary consumers

Q.3 Within the ecosystem, energy is transferred from organism to organism in the form of -
(1) Light (2) Heat
(3) Chemicals (4) None of the above

Q.4 The rate at which light energy is converted to chemical energy of organic molecules is the ecosystem's -
(1) Net primary productivity
(2) Net secondary productivity
(3) Gross primary productivity
(4) Gross secondary productivity

Q.5 Producers in an ecosystem are -
(1) Green organisms which fix solar energy by photosynthesis
(2) Aanimals which cause an increase in biomass
(3) Organisms which can be used as manure
(4) Animals in the food chain which produce more energy than they consume

Q.6 The dominant second trophic level in a lake ecosystem is -
(1) Phytoplankton (2) Zooplankton
(3) Benthos (4) Nekton

Q.7 Which of the following animals is dominant in desert ecosystem?
(1) Leopard (2) Lizard
(3) Hyla (4) Tiger

Q.8 Pyramid of numbers is upright in which of the ecosystems ?
(1) Pond ecosystem
(2) Tree ecosystem
(3) Grassland ecosystem
(4) None of these

Q.9 The total amount of living material at various levels of a food chain is depicted by -
(1) Pyramid of numbers
(2) Pyramid of energy
(3) Pyramid of biomass
(4) All the above

Q.10 In the diagram, different pyramids are shown. Which one is the pyramid of numbers in a temperate forest ?

(1)  (2) 
(3)  (4) 
Q.11 Which of these is the food chain which runs from larger to smaller organisms ?
(1) Grazing food chain
(2) Predator food chain
(3) Saprophytic food chain
(4) Parasitic food chain

Q.12 The type of food chain in which decomposed organic matter is converted into energy -rich compounds is called -
(1) Cybernetics
(2) Detritus food chain
(3) Grazing food chain
(4) None of these

Q.13 Biological equilibrium is equilibrium amongst-
(1) Consumers and decomposers
(2) Producers and consumers
(3) Producers and decomposers
(4) Producers, consumers and decomposers

Q.14 If we completely remove the decomposers from an ecosystem, the ecosystem functioning will be adversely affected because-
(1) Energy flow will be blocked
(2) Rate of decomposition of other components will be very high
(3) Herbivores will not receive solar energy
(4) Mineral movement will be blocked

Q.15 Zooplankton includes -

(1) Ciliates (2) Flagellates

(3) Small crustaceans (4) All the above

Q.16 Energy and nutrients enter in a community by way of the -

(1) Detritivores (2) Producers

(3) Scavengers (4) Consumers

Q.17 Food webs are 3-D web of interrelations in which several food chains are interlinked. It helps to provide -

(1) Alternate pathways for flow of energy

(2) More variety and quality of food at each trophic level

(3) Stability to ecosystem

(4) All of these

Q.18 Which food chain is directly dependent upon solar radiations -

(1) Grazing (2) Parasitic

(3) Detritus (4) All of these

Q.19 The most productive ecosystem is -

(1) Temperate forest (2) Coral reef

(3) Estuary (4) Sugarcane field

Q.20 All ecosystems have no boundary because-

(1) They require minerals for their functioning

(2) They cannot occur in isolation

(3) The are large in size

(4) They require light from all sources

Q.21 A ecological pyramid, devised by C. Elton 1927; is a graphic diagram that shows relationship between -

(1) Transfer of food through food chains

(2) Organisms

(3) Various trophic levels of a food chain

(4) Populations and communities within an ecosystem

Q.22 The denitrifying bacteria are -

(1) *Micrococcus denitrificans*

(2) *Pseudomonas*

(3) *Thiobacillus*

(4) All of the above

Q.23 In nitrogen cycle, which of the following plays an important role ?

(1) *Rhizopus* (2) *Nitrobacter*

(3) *Mucor* (4) All green algae

Q.24 Denitrification is -

(1) Reduction of NO_2 to ammonia by bacteria in the soil

(2) Conversion of ammonia to amino acids

(3) Conversion of ammonia and nitrates to gaseous nitrogen

(4) Oxidation of ammonia to nitrate

Q.25 Nitrogen cycle involves bacteria capable of changing proteins to ammonia called as -

(1) Bacteria of decay

(2) Denitrifying bacteria

(3) Nitrogen fixing bacteria

(4) Ammonifying bacteria

Q.26 Ruthless exploitation and pollution of the environment has increased the magnitude of waste materials which has disturbed the operations of all important-

(1) Biomes

(2) Ecosystems

(3) Bio-geo-chemical cycles

(4) All of the above

Q.27 Carbon is available to crop plants in the form of-

(1) Amino acids (2) Carbon dioxide

(3) Elemental carbon (4) Carbonates

Q.28 Which of the following contribute to the carbon cycle ?

(1) Photosynthesis

(2) Respiration

(3) Fossil fuel combustion

(4) All of the above

Q.29 Of more immediate concern regarding carbon cycle is -

(1) Output rate of carbon locked in deposits of coal, petroleum and natural gas

(2) Green house gases

(3) Increase in the total mass of carbon in earth's atmosphere by 12-14%

(4) All of the above

Q.30 The organisms which participate most actively in nitrogen cycle in nature are -

(1) Saprophytic angiosperms

(2) Parasitic fungi

(3) Bacteria (4) Legumes

Q.31 Biogeochemical cycles can be traced in -
(1) Ecosystems (2) Biomes
(3) Only water (4) Both (1) and (2)

Q.32 Hydrological cycle comprises of two overlapping cycles -
(1) Surface waters and atstmospheric cycles
(2) Oceanic and fresh water cycles
(3) Ground water and atmospheric cycles
(4) Global and smaller cycles

Q.33 The phosphorus cycle differs from those of carbon and nitrogen as well as those of sulphur, oxygen and hydrogen in that it lacks-
(1) Water (2) Dust particles
(3) Gaesous phase (4) All above

Q.34 Cycling of elements in any ecosystem is called-
(1) Chemical cycle
(2) Geochemical cycle
(3) Biogeochemical cycle
(4) Geological cycle

Q.35 In India, coniferous forests are found in –
(1) Rajasthan
(2) Satpura Hills
(3) Himalayan region
(4) Madhya Pradesh

Q.36 Grassland with scattered trees is called –
(1) Rain forests
(2) Evergreen forest
(3) Savannah
(4) Deciduous forests

Q.37 Life forms are used in the preparation of -
(1) Food chain
(2) Ecological pyramids
(3) Biological spectrum
(4) Quardats & transects

Q.38 In an ecosystem -
(1) Primary producers are more than primary consumers
(2) Primary consumers are larger than primary producers
(3) Secondary consumers are larger than primary producers
(4) Primary consumers are least depend on primary producers

Q.39 Ecosystem term coined by -
(1) Odum (2) Mishra
(3) Reiter (4) Tensley

Q.40 Large ecosystems are called -
(1) Biomes (2) Ecotone
(3) Ecads (4) Biocoenosis

Q.41 "Biocoenosis" name proposed by -
(1) Tensley (2) Reiter
(3) Haeckel (4) Carl Mobius

Q.42 Vultures in an ecosystem are -
(1) Predators (2) Scavangers
(3) Consumers (4) Top carnivores

Q.43 The maximum energy is stored at following tropical level in any ecosystem -
(1) Producers (2) Herbvores
(3) Carnivores (4) Top carnivores

Q.44 The source of energy in an ecosystem is -
(1) Sunlight (2) DNA
(3) ATP (4) RNA

Q.45 Ecosystem may be defined as -
(1) A localized association of several plants and animals
(2) Different communities of plants, animals and microbes together with their physico-chemical environment
(3) Different communities of plants microbes plus their physico-chemical environment
(4) none of the above

Q.46 Ecosytem is -
(1) Any functional unit that includes the whole community in a given area interacting with the abiotic factors
(2) A group of green plants
(3) A group of animals interacting with environment
(4) Man and pets living together

Q.47 In any given ecosystem, number of individuals in a species remains more or less constant over a period of time. This constancy of number is maintained by -
(1) Parasites (2) Predators
(3) Man (4) Available food

Q.48 Who proposed that ecosystem is symbol of structure & function of nature -
(1) Gardener (2) Odum
(3) Tansley (4) Reiter

Q.49 Largest ecosystem of the world are -
(1) Forests (2) Grass lands
(3) Great lakes (4) Oceans

Q.50 Which of the following is a man made artificial ecosystem -
(1) Grassland ecosystem
(2) Forest ecosystem
(3) Ecosystem of artificial lakes & dams
(4) None of these

Q.51 Green plants in a forest ecosystem are -
(1) Suppliers of food & O_2
(2) Consumers of nutritive materials
(3) Consumers of animal proteins
(4) Suppliers of timber

Q.52 Nepenthes (Insectivorous pitcher plant) is -
(1) Producer (2) Consumer
(3) Both 1 & 2 (4) None of these

Q.53 Which one is omnivorous -
(1) Frog (2) Lion
(3) Deer (4) Man

Q.54 Trophic levels are formed by -
(1) Only plants
(2) Only carnivores
(3) Only animals
(4) Organisms linked in food chain

Q.55 In a forest ecosystem green plants are -
(1) Primary producers
(2) Consumers
(3) Primary consumers
(4) Decomposers

Q.56 In an ecosystem the function of the producers is to -
(1) Convert organic compounds into inorganic compounds
(2) Trap solar energy and convert it into chemical energy
(3) Utilize chemical energy
(4) Release energy

Q.57 With regard to ecological food chain, man is a -
(1) Consumer
(2) Producer
(3) Both consumer & producer
(4) decomposer

Q.58 A plant, being eaten by a herbivore which in turn is eaten by a carnivore makes -
(1) Food chain (2) Web of food
(3) Omnivores (4) Interdependence

Q.59 When peacock, eats snake which eats insects depends on green plants, the peacock is -
(1) a primary consumer
(2) a primary decomposer
(3) a final decomposer of plants
(4) the apex of the food pyramid

Q.60 If we completely remove decomposers from from an ecosystem, the ecosystem functioning will be adversely affected because -
(1) Mineral movement will be blocked
(2) Herviores will not receive solar energy
(3) Energy flow will be blocked
(4) Rate of decomposition of other components will be very high

Q.61 Science of self control in an ecosystem is called -
(1) Synecology (2) Autecology
(3) Cybenetics (4) Edaphology

Q.62 Pyramids of energy are -
(1) Always upright (2) Always inverted
(3) Mostly upright (4) Mostly inverted

Q.63 The ecological pyramid of numbers in pond ecosystem is -
(1) Upright (2) inverted
(3) May upright or Inverted
(4) First upright then inversed

Q.64 An ecosystem resists change because it is in a state of -
(1) Homeostasis (2) Regular Illumination
(3) Static Imbalance (4) Food accumilation

Q.65 What is true about any ecosystem -
(1) It is self regulatory
(2) It is self sustained
(3) Top carnivores have climax tropic level position
(4) All

Q.66 The Pyramid of numbers in grassland ecosystem will be -
(1) Up right (2) Inverted
(3) Irregular (4) Linear

Q.67 Pyramid of number is inverted in case of -
(1) Pond ecosystem
(2) Desert ecosystems
(3) Grassland ecosystem
(4) Forest ecosystem

Q.68 Which ecosystem has maximum number of producers in an unit area -
(1) Pond (2) Grassland
(3) Forest (4) Tundra

Q.69 The storage of energy of consumer level is known as -
(1) Grass primary production
(2) Secondary productivity
(3) Net primary productivity
(4) Net productivity

Q.70 Gross primary productivity is -
(1) Rate at which organic molecules are formed in an autotroph
(2) Rate at which organic molecules are used up by an autotroph
(3) Storage of organic molecules in the body of an autotroph
(4) Rate at which organic molecules are transferred to next higher trophic level

Q.71 The flow of materials from non living components to living components and back to the non living components in a more or less cyclic manner is called a -
(1) Gaseous cycle
(2) Sedimentary cycle
(3) Biogeochemical cycle
(4) Hydrologic cycle

Q.72 The plant parts when fully decomposed by microogranism & mixed in the soil is called -
(1) Litter (2) Duff
(3) Mull (4) All

Q.73 Temperate evergreen forests in India found in-
(1) Himalaya (2) W. Bengal
(3) Andman (4) Rajasthan

Q.74 Which biome refers to artic desert -
(1) Tundra (2) Taiga
(3) Savannah (4) Thar desert

Q.75 Which biome is most rich in fauna and flora -
(1) Deciduous forests
(2) Chaparral
(3) Tropical rain forests
(4) Taiga

Q.76 Autumn colouration of leaves appear only in-
(1) Tropical regions
(2) Evergreen plants
(3) Temperate decidous plants
(4) deserts

Q.77 What determines the limits of a biome
(1) Temperature & rain fall
(2) Type of soil & presence of barrier
(3) Altitude & latitude
(4) All the above

Q.78 Which of the biomes axhibit distinct stratification into stories -
(1) Tundra biome
(2) Temperate biome
(3) Tropical rain forest biome
(4) Chapparal biome

Q.79 Veldts of Africa & Pampas of south America are -
(1) Rain forest biomes
(2) Chaparral biomes
(3) Temperate biomes
(4) Grassland biomes

Q.80 All the living organisms and non-living factors of the earth constitute -
(1) Biosphere (2) Community
(3) Biome (4) Association

Q.81 The term biosphere is used for the zone of the earth where life exists -
(1) On the lithospere
(2) In the hydrosphere
(3) In the lithosphere and hydropshere
(4) In the lithosphere, hydrosphere and atmosphere

Q.82 When Biosphere turns into human dominated evironment it is called -
(1) Noosphere (2) Troposphere
(3) Mesophere (4) Man sphere

Q.83 A biosphere is composed of -

(1) Living organisms

(2) Living organisms + Lithosphere

(3) Living organisms + lithosphere + atmosphere

(4) Living organisms + lithosphere + atmosphere + hydrosphere

Q.84 Rhododendron is characteristic vegetation of-

(1) Tropical region (2) Mangrove

(3) Alpine (4) Epiphytes

Q.85 Bacteria are essential in carbon cycle as -

(1) Decomposer (2) Synthesizer

(3) Consumer (4) Pri. Producer

EXERCISE - 3 PREVIOUS YEAR'S QUESTIONS

Q.1 Pond is an example of ..... ecosystem - **[UTTRANCHAL 2005]**

(1) Artifical (2) Natural

(3) Forest (4) Grassland

Q.2 Which of the following is the most productive ecosystem? **[WEST BANGAL JEE 2007]**

(1) Estuary (2) Open sea

(3) Desert (4) Mountain

Q.3 The pyramid of energy in a forest ecosystem is - **[C.G. PMT 2004]**

(1) Always upright

(2) Always inverted

(3) Both upright and inverted

(4) None of the above

Q.4 The importance of ecosystem is - **[C.G. PMT 2004]**

(1) Flow of energy (2) Cycling of materials

(3) Both of the above (4) None of the above

Q.5 Which is the correct path of energy flow in an eco system is - **[C.G. PMT 2004]**

(1) Producers → Carnivores → Herbivores → Decomposers

(2) Producers → Herbivores → Carnivores → Decomposers

(3) Herbivores → Carnivores → Producers → Decomposers

(4) Herbivores → Producers → Carnivores → Decomposers

Q.6 The number of primary producers within a specified area would be maximum in - **[C.G. PMT 2004]**

(1) Grassland ecosystem

(2) Forest ecosystem

(3) Pond ecosystem

(4) Deserts

Q.7 A food chain starts with - **[C.G. PMT 2004]**

(1) Nitrogen fixation organisms

(2) Phtosynthesising organisms

(3) Respiration

(4) Decomposers

Q.8 Nepenthes is a - **[C.G. PMT 2004]**

(1) Primary producer

(2) Consumer

(3) Both primary producer and consumer

(4) None of the above

Q.9 Biological equilibrium is found among the - **[C.G. PMT 2005]**

(1) Producers and consumers

(2) Producers and decomposers

(3) Producers, consumers and decomposers

(4) Producers and light

Q.10 The number of individuals of a species in a particular ecosystem at a given time remains constant due to - **[C.G. PMT 2005]**

(1) Man (2) Parasites

(3) Predators (4) Available food

Q.11 The two components of an ecosystem are - **[C.G. PMT 2005]**

(1) Biotic and abiotic

(2) Plants and animals

(3) Weeds and micro-organism

(4) Plants and light

Q.12 The pyramid of number in a grassland ecosystem is - **[C.G. PMT 2005]**

(1) Linear (2) Upright

(3) Irregular (4) Inverted

Q.13 The cycling of elements in an ecosystem is called- **[C.G. PMT 2006]**

(1) Chemical cycle

(2) Biogeochemical cycle

(3) Geological cycle

(4) Geochemical cycle

Q.14 Which of the following bacteria has potential for nitrogen fixation ? **[C.G. PMT 2006]**

(1) Nitrosomonas (2) Nitrobacter

(3) Nitrosococcus (4) Rhizobium

Q.15 Ecosystem has - **[JHARKHAND 2006]**

(1) Plant and animal

(2) Air and H_2O

(3) Soil and light

(4) Biotic and abiotic component

Q.16 Sal and teak are found in - **[JHARKHAND 2006]**

(1) Tropical rain forest

(2) Tropical deciduous forest

(3) Temperature board leaf forest

(4) Temperature needle leaf forest

Q.17 Decomposers are - **[JHARKHAND 2005]**

(1) Autrophs (2) Hetrotrophs

(3) Organotrophs (4) Autoheterotrophs

Q.18 During food chain the maximum energy is stored in - **[JHARKHAND 2005]**

(1) Producers (2) Decomposers

(3) Herbivores (4) Carnivores

Q.19 In the phosphorus cycle, weathering makes phosphate available first to - **[JHARKHAND 2005]**

(1) Decomposers (2) Consumers

(3) Producers (4) All the above

Q.20 In a food chain, the total amount of living material is depicted by -**[JHARKHAND 2005]**

(1) Pyramid of biomass

(2) Pyramid of energy

(3) Pyramid of number

(4) Trophic levels

Q.21 Nitrates are converted to nitrogen by - **[JHARKHAND 2005]**

(1) Nitrogen fixing bacteria

(2) ammonification bacteria

(3) Denitrifying bacteria

(4) Nitrifying bacteria

Q.22 In pond ecosystem, diatoms represent -

(1) Producers **[JHARKHAND 2004]**

(2) Primary consumers

(3) Secondary consumers

(4) Tertiary consumers

Q.23 Pyramids of biomass in pond ecosystem is - **[BIHAR 2005]**

(1) Inverted (2) Upright

(3) Linear (4) Irregular

Q.24 Lion is kept under in Etoplian pyramid as - **[BIHAR 2004]**

(1) Producer

(2) Primary consumer

(3) Seconary consumer

(4) Tertiary consumer

Q.25 Bacteria and fungi developing on dead decaying organisms are -

(1) Parasites (2) Commensals

(3) Saprophytes (4) Symbionts

Q.26 Phytoplanktons are important biotic comoponent of - **[BIHAR 2001]**

(1) Grassland (2) Pond ecosystem

(3) Forest ecosystem (4) None of these

Q.27 Which ecological pyramid can never occur in an inverted form ? **[BIHAR 2001]**

(1) Pyramid of number

(2) Pyramid of biomass

(3) Pyramid of energy

(4) Pyramid of species richess

Q.28 Peacock eats a snake and snake eats insect while insect eats green plant, then position of peacock is - **[UP CPMT 2002]**

(1) Primary producer

(2) Secondary producer

(3) Decomposer

(4) Top at the apex of food pyramid

Q.29 Source of energy in an ecosystem is - **[UP CPMT 2002]**

(1) Sun

(2) ATP

(3) Sugar made by plant

(4) Green plant

Q.30 Legume plants are important for atmosphere because they - **[UP CPMT 2002]**

(1) Help in NO_2 fixation

(2) Do not help in NO_2 fixation

(3) Incrase soil fertility

(4) All of these

Q.31 Tropical dense forest are due to - **[UP CPMT 2002]**

(1) Low rainfall and low temperature

(2) High rainfall and low temperature

(3) Low rainfall and high temperatrue

(4) High rainfall and high temperature

Q.32 Energy enters in food chain- **[UP CPMT 2003]**

(1) by producer
(2) by primary consumers
(3) by secondary consumers
(4) by tertiary consumers

Q.33 In an ecosystem - **[RPMT - 2000]**

(1) Primary producers are more than primary consumers
(2) Primary consumers are larger than primary producers
(3) Secondary consumers are larger than primary producers
(4) Primary consumers are least depend on primary producers

Q.34 In Which type of the forest, humus is formed by the dry and dead leaves - **[RPMT - 2001]**

(1) Coniferous forest (2) Decidous forest
(3) Tundra forest (4) Alpine

Q.35 A pond is a - **[RPMT - 2002]**

(1) Biome
(2) Natural ecosystem
(3) Artifical ecosystem
(4) Community of plants & animals

Q.36 The importance of ecosystem lies in - **[RPMT 2003]**

(1) Energy flow
(2) Cycling of materials
(3) Both (4) None

Q.37 Concept of Ecological pyramid was given by- **[RPMT - 2004]**

(1) Odum (2) Elton
(3) Darwin (4) Reiter

Q.38 Stratification is found in - **[RPMT - 2004]**

(1) Tundra (2) Tropical forest
(3) Deciduous forest (4) Desert

Q.39 Driving force of ecosystem is - **[RPMT - 2004]**

(1) Producers
(2) Plants with Carbohydrate
(3) Biomass
(4) Solar energy

Q.40 Ecosystem creates - **[RPMT - 2005]**

(1) Food chain (2) Food web
(3) Any of the two (4) None

Q.41 Ecosystem term coined by - **[RPMT - 2005]**

(1) P. Maheshwari (2) Tansley
(3) R. Mishra (4) P. Odum

Q.42 The importance of ecosystem lies in - **[CPMT 80]**

(1) Flow of energy (2) Cycling of materials
(3) Both the above (4) None of the above

Q.43 A pond is a - **[RPMT 2002]**

(1) Biome
(2) Natural ecosystem
(3) Artificial ecosystem
(4) Community of plants & animals

Q.44 Which biotic components mainly help in recycling of minerals - **[CPMT 80]**

(1) Producers (2) Consumers
(3) Decomposers (4) All the above

Q.45 Path of energy flow in a n ecosystem is - **[MPPMT 2002]**

(1) Herbivorous $\rightarrow$ producer $\rightarrow$ carnivorous $\rightarrow$ decomposer
(2) Herviorous $\rightarrow$ carnivorous $\rightarrow$ producer $\rightarrow$ decomposer
(3) Producer $\rightarrow$ carnivorous $\rightarrow$ herbivorous $\rightarrow$ decomposer
(4) Producer $\rightarrow$ herbivorous $\rightarrow$ carnivorous $\rightarrow$ decomposer

Q.46 The number of primary producers in a specified area would be maximum in - **[RPMT 85, CPMT 86, MP PMT 85, 95]**

(1) Pond ecosystem
(2) Grassland ecosystem
(3) Forest ecosystem
(4) Desert ecosystem

Q.47 Carbon cycle includes (the following is a logical sequence) - **[CPMT 79]**

(1) Producer – consumer – decomposer
(2) Decomposer – consumer – producer
(3) Producer – decomposer – consumer
(4) Consumer – producer – decomposer

Q.48 The bulk of nitrogen in nature is fixed by - **[CPMT 82]**

(1) Lightening

(2) Chemical industries

(3) Denitrifying bacteria

(4) Symbiotic bacteria

Q.49 Hydrological cycle is controlled by - **[RPMT 85]**

(1) Grasslands (2) Forests

(3) Planktons (4) Epiphytes

Q.50 In india the temperate evergreen type of vegetation is found mostly in - **[CPMT 76]**

(1) Western Himalayas above 3,500 Meter

(2) Estern and western Himalayas less than 3,500 Meter

(3) Rajasthan and South Punjab

(4) Western ghats and Assam

Q.51 Savannahs are - **[MPPMT 2002]**

(1) Tropical rain forest

(2) Desert

(3) Grassland with scattered trees

(4) Dense forest with close canopy

Q.52 Biosphere refers to - **[MP PMT 80]**

(1) Plants of the world

(2) Special plants

(3) Area occupied by living beings

(4) Plants of a particular area

Q.53 ***Acacia***, ***Prosopis*** and ***Caparis*** belongs to - **[AIPMT-1998]**

(1) Deciduous forest (2) Tropical forest

(3) Thorn forest (4) Evergreen forest

Q.54 Total amount of energy trapped by green plants in food is called - **[AIPMT-1998]**

(1) Gross primary production

(2) Net primary production

(3) Standing crop

(4) Standing state

Q.55 In which biome a new plant may adapt soon - **[AIPMT-1998]**

(1) Tropical rain forest

(2) Desert

(3) Mangrove (4) Sea island

Q.56 Percentage energy transferred to higher trophic level in food chain is - **[AIPMT-1999]**

(1) 1 % (2) 10 %

(3) 90 % (4) 100 %

Q.57 Which is the reason for highest biomass in aquatic ecosystem - **[AIPMT-2000]**

(1) Nano plankton, blue green algae, green algae

(2) Sea grass, and slime molds

(3) Benthonic and brown algae

(4) Diatoms

Q.58 Which of the following is a correct pair - **[AIPMT-2002]**

(1) Cuscuta - parasite

(2) Dischidia - insectivorous

(3) Opuntia - predator

(4) Capsella - hydrophyte

Q.59 Bamboo plant is growing in a far forest then what will be the tropic level of it - **[AIPMT-2002]**

(1) First trophic level (T_1)

(2) Second trophic level (T_2)

(3) Third trophic level (T_3)

(4) Fourth trophic level (T_4)

Q.60 Which of the following is expected to have the highest value ($gm/m^2/yr$) in a grassland ecoystem- **[AIPMT-2004]**

(1) Tertiary production

(2) Gross production (GP)

(3) Net production (NP)

(4) Secondary production

Q.61 An ecosystem which can be easily damaged but can recover after some time if damaging effect stops will having - **[AIPMT-2004]**

(1) High stability and low resilience

(2) Low stability and low resilience

(3) High stability and high resilience

(4) Low stability and high resilience

Q.62 Which one of the following pairs is mismatched- **[AIPMT-2005]**

(1) Savanna - acacia trees

(2) Coniferous forest - evergreen trees

(3) Tundra - permafrost

(4) Prairies - epiphytes

Q.63 Which one of the following is ***not*** used for construction of ecological pyramids ?
[AIPMT-2005]
(1) Rate of energy flow
(2) Fresh weight
(3) Dry weight
(4) Number of individuals

Q.64 Which one of the following ecosystem types has the highest annual net primary productivity-
[AIPMT-2007]
(1) Temperate deciduous forest
(2) Tropical rain forest
(3) Tropical deciduous forest
(4) Temperate evergreen forest

Q.65 Quercus species are the dominant component in-
[AIPMT-2008]
(1) Scrub forests
(2) Tropical rain forests
(3) Temperatre deciduous forests
(4) Alpine forests

Q.66 Consider the following statements concenrning food chain - **[AIPMT-2008]**
(a) Removal of 80 % tigers from an area resulted in greatly increased growth of vegetation
(b) Removal of most of the carnivores resulted in an increased population of deers
(c) The length of food chains is generally limited to 3-4 trophic levels due to energy loss
(d) The length offood chains may very from 2 to 8 trophic levels
Which two of the above statements are correct ?
(1) a, c (2) a, b
(3) b, c (4) c, d

Q.67 The slow rate of decomposition of fallen logs in nature is due to their - **[AIPMT-2003]**
(1) Anaerobic environment around them
(2) L:ow cellulose content
(3) Low moisture content
(4) Poor nitrogen content

Q.68 Which one of the following types of organisms occupy more than one trophic level in a pond ecosystem ? **[AIPMT-2009]**
(1) Frog (2) Phytoplankton
(3) Fish (4) Zooplankton

Q.69 Study the four statements (1-4) given below and select the two correct once out of them-
[AIPMT Pre 2010]
(A) A lion eating a deer and a sparrow feeding on grain are ecologically similar in being consumers
(B) Predator star fish helps in maintaining species diversity of some invertebrates
(C) Predators ultimately lead to the extinction of prey species
(D) Production of chemicals such as nicotine, strychnine by the plants are metabolic disorders
The two correct statements are :
(1) A and D (2) A and B
(3) B and C (4) C and D

Q.70 The biomass available for consumption by the herbivores and the decomposers is called-
[AIPMT Pre 2010]
(1) Net primary productivity
(2) Secondary productivity
(3) Standing crop
(4) Gross primary productivity

Q.71 Which one of the following is one of the characteristics of a biological community?
[AIPMT Pre 2010]
(1) Stratification (2) Natality
(3) Mortality (4) Sex-ratio

Q.72 Which of the following representations shows the pyramid of numbers in a forest ecosystem?
[AIPMT Mains 2010]
(1) (2) (3) (4) 
Q.73 Identify the possible link "A" in the following food chain :
Plant $\rightarrow$ insect $\rightarrow$ frog $\rightarrow$ "A" $\rightarrow$ Eagle
[AIPMT Pre 2012]
(1) Wolf (2) Cobra
(3) Parrot (4) Rabbit

Q.74 In an area where DDT had been used extensively, the population of birds declined significantly because : **[AIPMT Pre 2012]**

(1) earthworms in the area got eradicated

(2) cobras were feeding exclusively on birds

(3) many of the birds eggs laid, did not hatch

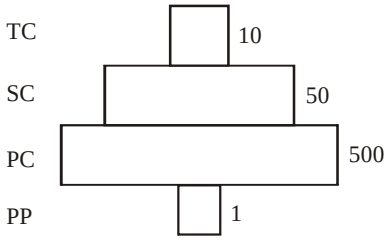
(4) birds stopped laying eggs

Q.75 The upright pyramid of number is absent in : **[AIPMT Pre 2012]**

(1) Forest (2) Lake

(3) Grassland (4) Pond

Q.76 Given below is an imaginary pyramid of numbers. What could be one of the possibilities about certain organisms at some of the different levels ? **[AIPMT Pre 2012]**



(1) Level PP is "phytoplanktons" in sea and "Whale" on top level TC

(2) Level one PP is "pipal trees" and the level SC is "sheep"

(3) Level PC is "rats" and level SC is "cats".

(4) Level PC is "insects" and levels SC is "small insectivorous birds".

Q.77 Which one of the following is not a functional unit of an ecosystem ? **[AIPMT Pre 2012]**

(1) Decomposition (2) Productivity

(3) Stratification (4) Energy flow

Q.78 Which one of the following is not a gaseous biogeochemical cycle in ecosystem ? **[AIPMT Pre 2012]**

(1) Phosphorus cycle (2) Nitrogen cycle

(3) Carbon cycle (4) Sulphur cycle

Q.79 The rate of formation of new organic matter by rabbit in a grassland, is called : **[AIPMT Mains 2012]**

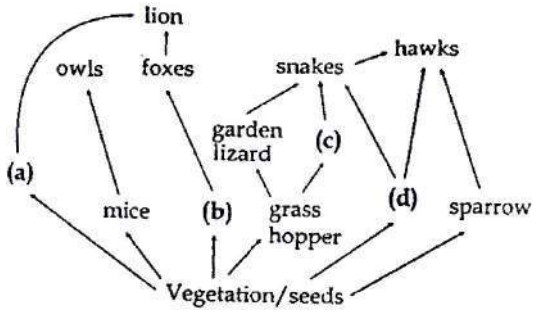
(1) Net productivity

(2) Secondary productivity

(3) Net primary productivity

(4) Gross primary productivity

Q.80 Identify the likely organisms (a), (b), (c) and (d) in the food web shown below : **[AIPMT Mains 2012]**



Options :

	(a)	(b)	(c)	(d)
(1)	deer	rabbit	frog	rat
(2)	dog	squirrel	bat	deer
(3)	rat	dog	tortoise	crow
(4)	squirrel	cat	rat	pigeon

ANSWER KEY

EXERCISE – 3

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

Ans.	4	4	2	2	3	3	3	3	2	1	1	2	2	3	1	4	3	1	2	1

These questions consist of two statements each, printed as "ASSERTION" and "REASON". While answering these Questions you are required to choose any one of the following responses.

(1) If both Assertion and Reason are True and the Reason is a correct explanation of the Assertion.

(2) If both Assertion and Reason are True but Reason is not correct explanation of the Assertion

(3) If Assertion is True but the Reason is False.

(4) If both Assertion and Reason are false.

Q.1 **Assertion :** The pyramid of biomass indicates the decrease in biomass in successive trophic levels.

Reason : In tree ecosystem pryamid of biomass is inverted.

Q.2 **Assertion :** Each ecosystem has two types of biotic components autorophs and heterotrophs.

Reason : Autrotrophs sysnthesize food materials while heterotrophs utilize and resynthesize it.

Q.3 **Assertion :** Detritus food chain depends upon light energy

Reason : In this food chain food starts with producers.

Q.4 **Assertion :** Tundra biome is most delicate fragile biome

Reason : Trees and shrubs are densly distributed in this biome.

Q.5 **Assertion :** In ecological pyramids, producers always occupy the base.

Reason : Pyramids of number and biomas are mostly upright but pyramid of energy always inverted.

Q.6 **Assertion :** Energy flow in ecosystem is bidirectional.

Reason : Amount of energy increase with each and every trophic levels.

Q.7 **Assertion :** Biotic and abiotic components constitute ecosystem.

Reason : Sun is the ultimate source of energy in ecosystem.

Q.8 **Assertion :** Predators directly depend on producers for food.

Reason : Tertiary consumers are green plants.

Q.9 **Assertion :** In predation, one organism is killed by other organism and used as food

Reason : In this type of association predator lives on interest.

Q.10 **Assertion :** In ecosystem, the function of producers is to convert organic compounds to inorganic compounds.

Reason : Consumers are directly dependent on solar energy.

Q.11 **Assertion :** Biosphere consist of hydrosphere, lithosphere and atmosphere.

Reason : Biosphere is formed of only nonliving matter.

Q.12 **Assertion :** Crop field is a natural ecosystem.

Reason : Complex food chain is found in this ecosystem.

Q.13 **Assertion :** Agroecosystem is man made and stable ecosystem.

Reason : it can be maintained by biological control.

Q.14 **Assertion :** Pyramid of biomass in aquatic ecosystem is inverted.

Reason : Number of phytoplanktons are maximum in aquatic ecosystem.

Q.15 **Assertion :** Lion is a ecologically weakest animal.

Reason : 90% energy is lost. When it transfered from one trophic level to another trophic level.

Q.16 **Assertion :** Earth is a closed system for minearl cycle.

Reason : Mineral cycle is take place between abiotic and biotic component of earth .

Q.17 **Assertion :** Pyramid of energy is always upright.

Reason : There is a gradual decrease in energy at successive trophic levels.

Q.18 **Assertion :** Ecological efficiency always decrease.

Reason : The percentage energy transferred one to another trophic level always increases.

Q.19 **Assertion :** In ecosystem energy flow is always unidirectional.

Reason : In food web energy flow from different pathway.

Q.20 **Assertion :** According to Lindeman in food chain only 90% of enegy transferred from one to next trophic level.

Reason : 10% energy is lost at each trophic level due to respirations & heat.

Q.21 **Assertion :** Those ecosystem which have complex food web are more stable.

Reason : In complex food web every organism have more than one option for getting food.

Q.22 **Assertion :** Decomposers play a significant role in mineral cycle.

Reason : Decomposers are not included in the food chain.

Q.23 **Assertion :** In ecosystem energy cycle runs between producers and consumers.

Reason : Energy goes to producers through decomposer.

Q.24 **Assertion :** Vulture is decomposer.

Reason : Vulture is scavenger not predator.

Q.25 **Assertion :** All predators are carnivores.

Reason : All carnivores are not predators.

Q.26 **Assertion :** Tundra biome is located above 60ºN latitude on polar ice.

Reason : Coniferous forests occur in this biome.

Q.27 **Assertion :** Consumers are not much essential for the formation of ecosystem.

Reason : Producers and reducers can maintain a balance in ecosystem.

Q.28 **Assertion :** Total amount of energy fixed in an producer is gross primary productivity.

Reason : It is the amount of storage organic matter in producer including respiratory untilsation.

Q.29 **Assertion :** Artifical ecosystem are mostly temporary.

Reason : They require energy from external environment.

Q.30 **Assertion :** Heliophytes are mainly occurs in Tundra region.

Reason : Maximum light intensity occurs in Tundra region.

Q.31 **Assertion :** Ecologically, animals are consumers.

Reason : Living organism are classified as followings Producers, Consumers, Decomposers.

Q.32 Mr. X is eating curd/yoghurt. For this food intake in a food chain he should be considered as occupying-

(1) First trophic level

(2) Second trophic level

(3) Third tropic level

(4) Fourth trophic level

Q.33 The Great Barrier Reef along the east coast of Australia can be categorized as -

(1) Population (2) Community

(3) Ecosystem (4) Biome

Q.34 Which one of the following correctly represents an organism and its ecological niche?

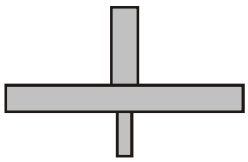
(1) ***Vallisneria*** and pond

(2) Desert locust ***(Schistocerca)*** and desert

(3) Plant lice (aphids) and leaf

(4) Vultures and dense forest

Q.35 Given below is one of the types of ecological pyramids. This type represents -



(1) Pyramid of numbers in a grassland

(2) Pyramid of biomass in a fallow land

(3) Pyramid of biomass in a lake

(4) Energy pyramid in a spring

Q.36 Which one of the following is correct matching of a plant, its habit and the forest type where it normally occurs?

(1) ***Prosopis***, tree, scrub

(2) ***Saccharum***, grass, forest

(3) ***Shorea robusta***, herb, tropical rain forest

(4) ***Acacia catechu***, tree, coniferous forest

Quick Review Table

Instruction to fill

(A) Write down the Question Number you are unable to solve in column A below, by Pen.

(B) After discussing the Questions written in column A with faculties, striks off them in the manner so that you can see at the time of Revision also, to solve these questions again.

(C) Write down the Question Number you feel are important or good in the column B.

EXERCISE NO.	COLUMN : A	COLUMN : B
	Question I am unable to solve in first allempt	**Good / Important questions**
Exercise # 1		
Exercise # 2		
Exercise # 3		
Exercise # 4		
Other Exercise		

Advantages

1. It is advised to the students that they should prepare a question bank for the revision as it is very difficult to solve all the questions at the time of revision.
2. Using above index you can prepare and maintain the questions for your revision.

BIODIVERSITY AND CONSERVATION

BIODIVERSITY

Term given by **Edward Wilson.** Combined diversity at all the levels of biological organization called Biidiversity. The biodiversity can be studied at three levels.

(1) Genetic diversity

(2) Species diversity

(3) Community and Ecosystem diversity

(1) Genetic diversity :

(a) A species show high diversity at **gene level** over it's distributional range. For ex. Medicinal plant ***Rauwolfia Vomitoria*** growing in himalayan range show diversity in synthesis of chemical **reserpine** in concentraction and potential.

(b) India has 50,000 genetically different spacies of rice and 1000 varieties of mangos.

(c) Each species, varying from bacteria to higher plants and animals, stores an immense amount of genetic infromation. For example, the number of genes is about 450-700 in Mycoplasma, 4000 in Escherichia coli, 13000 in Drosophila melanogaster, 32000-50000 in Oryza sativa and 35000 to 45000 in Homo sapiens.

(d) Genetic diversity refers to the variation of genes within species; the differences could be in allels (different variants of same genes), in entire genes (the traits determining particular characteristics) or in chromosomal structures.

(e) The genetic diversity enables a population to adapt to its environment and respond to natural selection. If a species has more genetic diversity, it can adapt better to the changed environmental conditions.

(f) Lower genetic diversity in a species leads to uniformity, as in the case of large monocultures of genetically similar crop plants. This has advantage when increased crop production is a consideration, but can be a problem when an insect or a fungal disease attacks the field and posses a threat to the whole crop.

(g) The amount of genetic variation is the basis of **speciation** (evolution of new species). It has a key role in the maintenance of diversity at species and community levels. The total genetic diversity of a community will be greater if there are many species, as compared to a situation where there are only a few species. Genetic diversity within a species often increases with environmental variability.

(2) Species diversity :

(a) Diversity at species level.

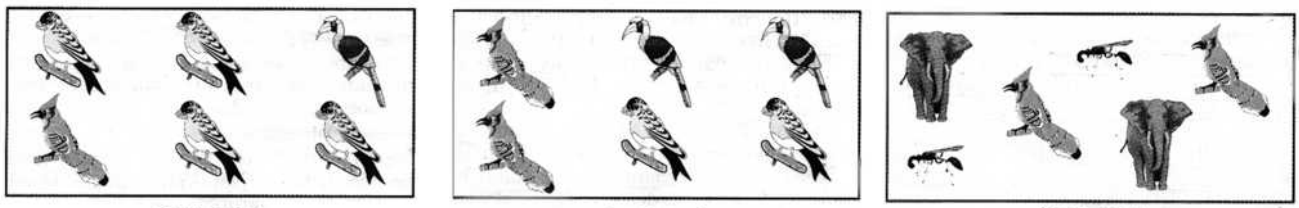
Ex.: Western Ghat have greater species diversity of amphibians than Eastern Ghat.

(b) Species are distinct units of diversity, each playing a specific role in an ecosystem. Therefore, loss of species has consequences for the ecosystem as a whole.

(c) Species diversity refer to the variety of species within a region. Simplest measure of species diversity is **species richness**, i.e., the number of species per unit area. The number of species increases per unit area of the site.

(d) Generally, greater the species richness, greater is the species diversity. However, number of individuals among the species may also vary, resulting into differences in **evenness** or **equitability** and **consequently** in diversity.

(e) Suppose, we are having three sample areas. In the sample area-I, there are three spacies of birds. Two species are represented by one individual each, while the third species has four individuals. In the sample area-2 that has the same three spacies, each spacies is represented by two individuals. This sample area show greater evenness, and there are equal chances for a species being represented in a sample. The sample area-2 will be considered more diverse than the first. In the sample area-3 the species are represented by an insect, a mammal and a birds. This sample area is most diverse as it comparises taxonomically unrelated species. In this example, we find equal number of spacies but varying number of individuals per species. In nature, both the number and kind of species, as well as the number of individuals per species vary, leading to greater diversity.



(3) Community and Ecosystem diversity :

Diversity at ecosystem and community level called Community and diversity. Ex. India have diverse kind of ecosystem like desert, rain forests, mangrovs, coral reefs, wetlands, estuaries and alpine meadows, than the Norway.

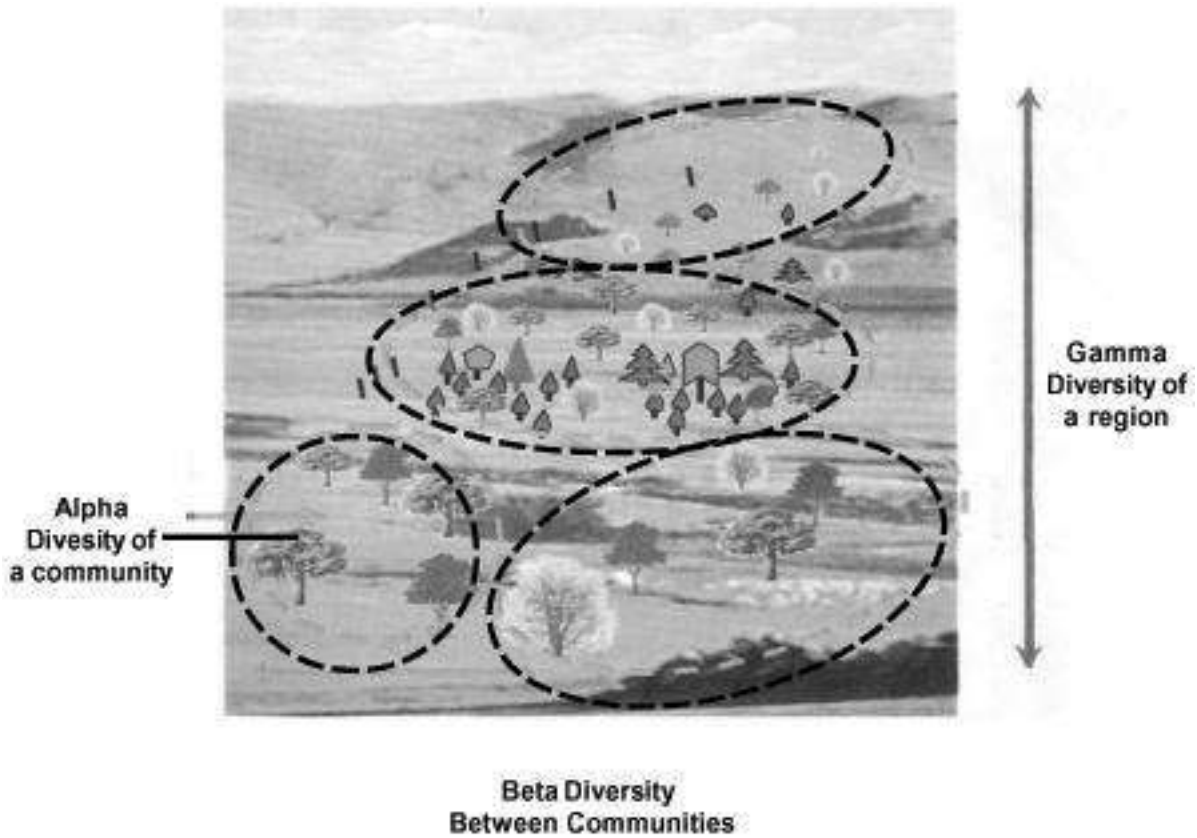


Fig.: Three perspectives of diversity : alpha, beta and gamma diversity.

(a) Diversity : Diversity at the level of community and ecosystem has three perspectives. **Alpha diversity** (within-community diversity) refers to the diversity of organisms sharing the same community/habitat.

(b) β-Diversity : A combination of species richness and equitability/evenness is used to represent diversity within a community or habitat. Species frequently change when habitat or community changes. The rate of replacement of specis along a gradient of habitats or communities is called **beta diversity** (between - community diversity). There are differences in species composition of communities along environmental gradients, eg., altitudinal gradient, moisture gradient, etc.

Higher the heterogenecity in the habitats in a region or greater the dissimilarity between communities, **higher is the beta diversity.**

(c) γ-Diversity : Diversity of the habitats over the total landscape or geographical area is called **gamma diversity.**

Ecosystem diversity describes the number of niches, trophic levels and various ecological processes that sustain energy flow, food webs and the recycling of nutrients. It has a focus on various biotic interactions and the role and function of keytone species. Studies in temperate grasslands have shown that **diverse communities** are functionally **more productive** and **stable** even under environmental stresses such as prolonged dry conditions.

Magnitude of Biodiversity in world and India

(a) According to IUCN (2010) the total number of species of plants and animals described so far are about **1.5 million**.

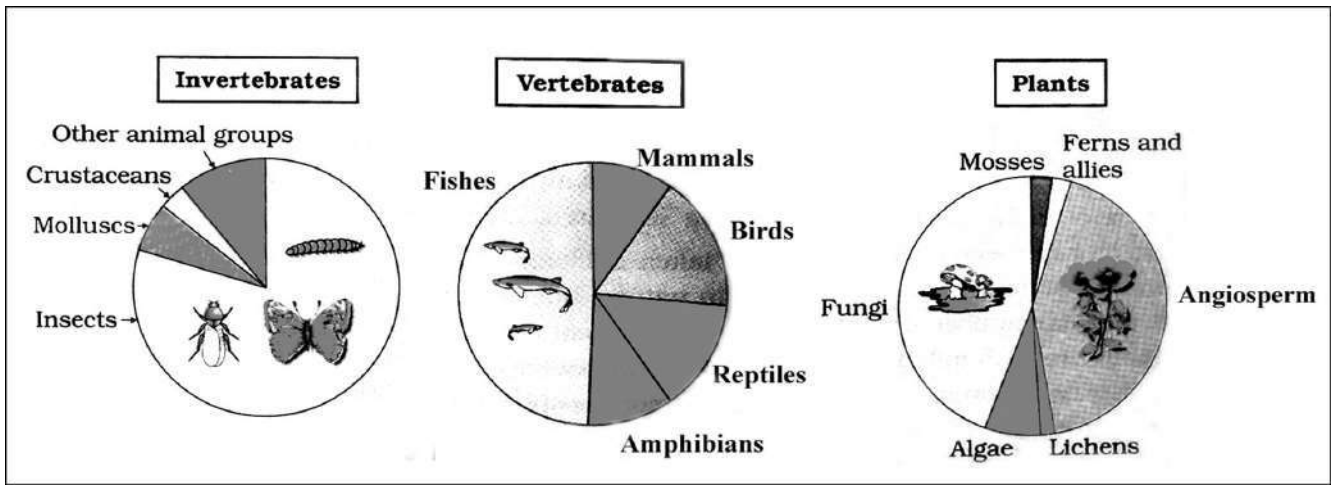
(b) According **Robert May** global species diversity is about 7 million.

(c) According to knowledge of earth's biodiversity-

70% of all species is of **animals.**

22% of all **plants species** (Algae, Bryophytes, Pteridophytes, Gymnosperms and Angiosperms)

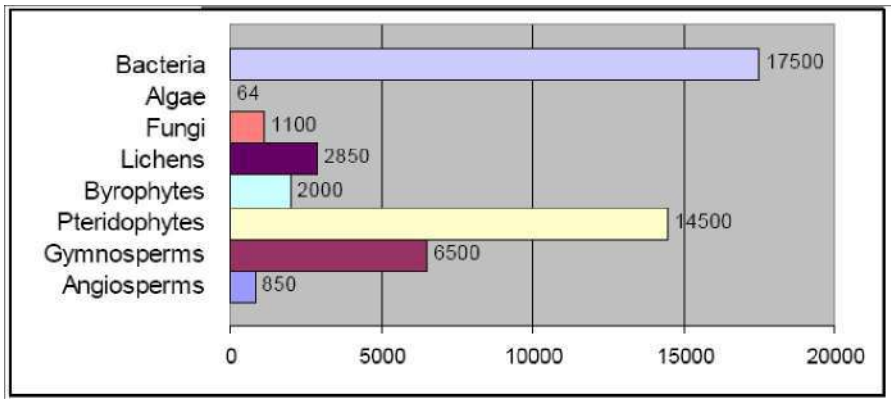
(d) Among animals, **insects** are **most species rich** (number of species) constituting **70% of total animal species**. ie., from every 10 animals, 7 are insects



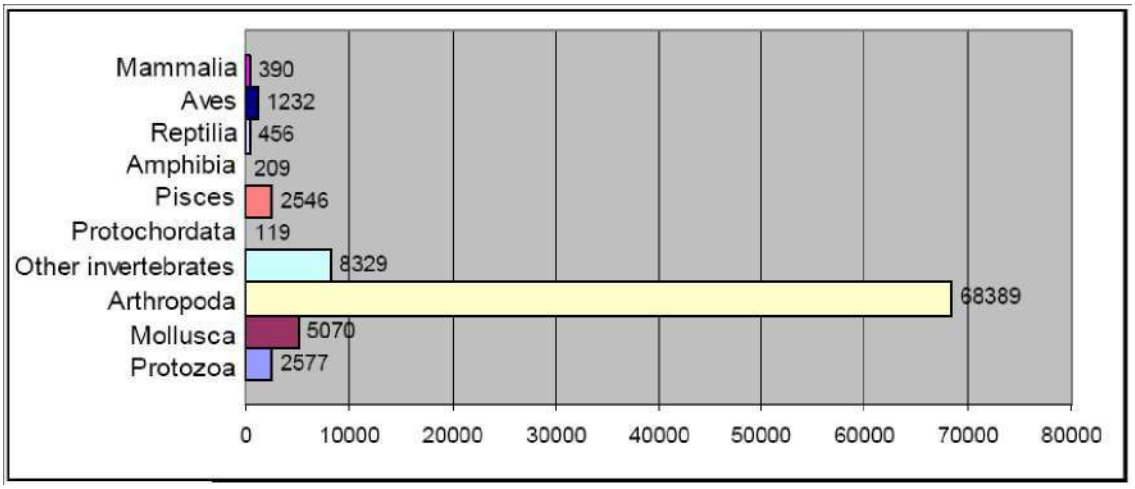
(e) Prokaryotes are not counted in global biodiversity as the number of prokaryotic species in not known, conventional toxonic methods are not suitable for them and many species are not cultrable under laboratory conditions.

- **India** share **2.1% of world land** area but **share global species diversity is 8.1%** which make India **one of the 12 mega diversity countries** of world. **India** has **45000 species of plants** and twice number of species of animals and many more yet to be identified and discovered.

- According to Robert Mays global estimates, only 22% of the total species have been recorded so far. Applying this proportion to India more than 1,00,000 plant and 3,00,000 animal species yet to be discovered and described.



Plants



Animals

Fig.: Number of plant and animal species in different groups reorded in India

Group	Number of species
Higher Plants	2,70,000
Algae	40,000
Fungi	72,000
Bacteria (including cyanobacteria)	4,000
Viruses	1,550
Mammals	4,650
Birds	9,700
Reptiles	7,150
Fish	26,959
Amphibians	4,780
Insects	10,25,000
Crustanceans	43,000
Molluscs	70,000
Nematodes and worms	25,000
Protozoa	40,000
Others	1,10,000

Approximate Numbers of Species which have been Described and Identified from all over the World

(a) India has **10 biogeographical regions** among them **Deccan Peninsula** has the **most extensive coverage of landmass (42%).**

(b) The **most biodiversity rich zone** are **Western Ghat** and **North East Himalaya** account for 4% and 5.2% of geographical area respectively.

(c) Each biogeographical area have several habitats, biotic communities and ecosystem .

(d) A large number of species (both plants and animals) are present in these zone which are endemic (exclusive to India).

(e) About **33% of flowering plants** are **endemic to India**.

(f) Among animals, out of recorded vertebrates, **53% - Fresh water fishes, 60% Amphibians, 36% Reptiles, 10% mammalian fuana** are **endemic to India** which are mainly distributed in North - East, Western Ghats and Nicobar Islands.

(g) A very high number of Amphibian species are endemic to western ghat.

(h) Biological diversity in ecosystems like deep oceans, wetlands, lakes and habitats like tree canopy and soil of tropical rain forest in India yet to be explored.

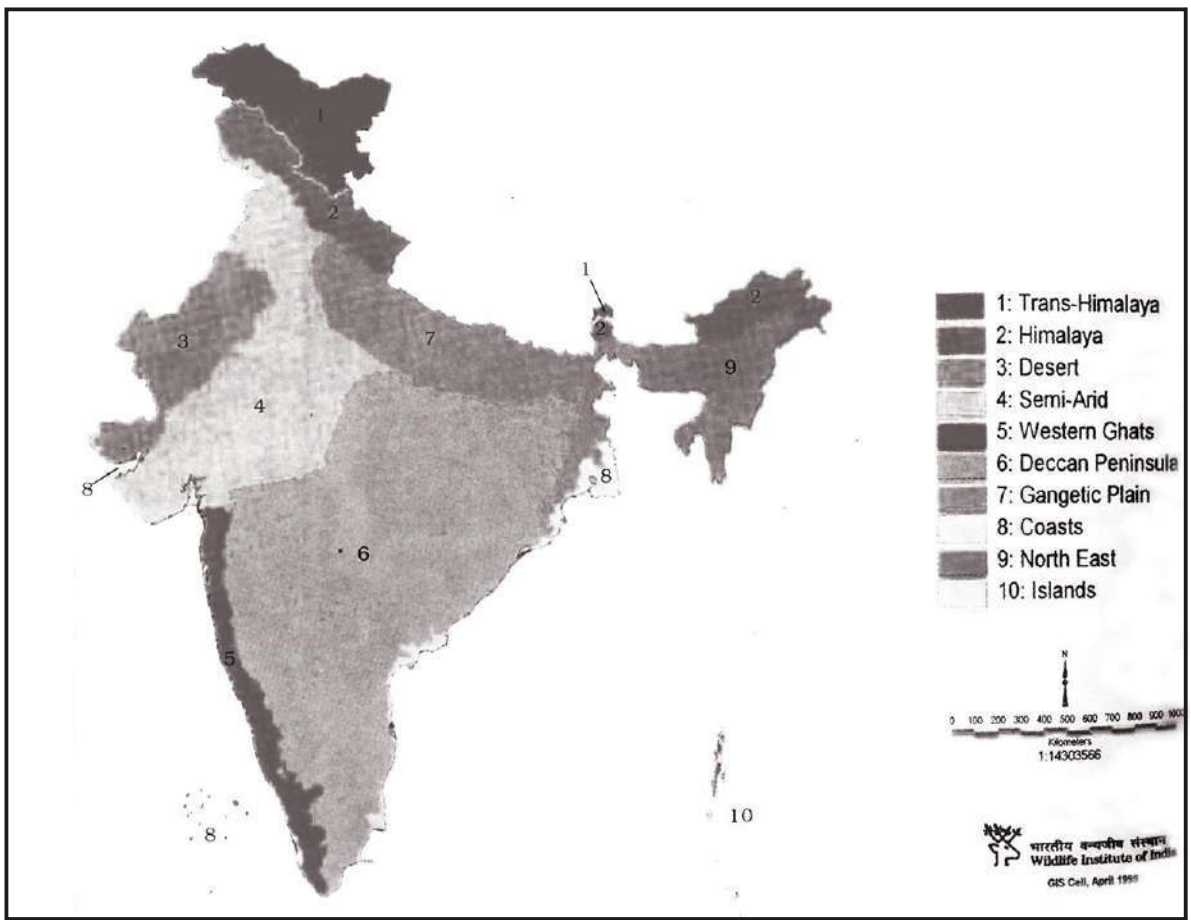


Fig.: Biogeographical regions of India.

Gradients / Pattern of Biodiverity :

(A) The pattern of biodiversity is decided by latitudes (Distance from equator), altitude (Height from sea level.

(a) As we move from high to low latitudes ie., from poles to the equator the biological diversity increases. ie., equator towards the pole for example, Tropics (latitudinal range of 23.5ºN to 23.5ºS) harbour more species

than temperate or polar areas. Colombia located near equator has about 1400 species of birds while Newyork at 41ºN has 105 species and greenland at 71ºN only 56 species and Greenland at 71°N only 56 species of birds.

(b) **India** located in tropical latitude has more than **1200 species of birds.**

(c) A forest in tropical region like Equator has 10 times more species of vascular plants than temperate region like midwest of USA.

(d) The largly **tropical Amazonian rain forest** in South America has **greatest biodiversity on earth.** It home to more than **40,000 species of plants, 3000 fishes, 1,300 birds, 427 mammals, 427 Amphibians, 378 reptiles and more than 1,25,000 invertebrates.**

(e) Tropics have very high biodiversity due to -

(i) Speciation (Formation of new species) is the function of time and unlike temperate regions which are subjected to frequent glaciations in past the tropical latitudes have remained undisturbed for millions of years. so have long evolutionary time for species diversification.

(ii) Tropical environment unlike temperate one are less seasonal, relatively more constant and predictable which promotes niche specialisation and leads to greater species diversity.

(iii) There is more solar energy available in tropics, which contributes to higher productivity and indirectly contribute to greater diversity.

(f) **Decrease in species at altitudes,** from **lower to higher altitude** on a mountain.

(g) **1000 m increase in altitude** results in **temperature drop of about 6.5ºC.** This drop in temperature and great seasonal variability at higher altitude are a major factor that reduce biodiversity.

(h) The **latitudinal** and **altitudinal gradients** of species **divesrity** are two master gradients.

(i) Also **more complex** and **heterogenous the physical envrironment, more complex and diverse** will be the **flora** and **fauna**.

Latitude and types of forest in world and India :

(a) In Northern hemisphere as we moves from equator north world to arctic region consecutive belts of coniferous.

Tropical rain forest	:	0 – 20º N
Tropical deciduous forest	:	20 – 40º N
Temperate deciduous / Temperate broad leaf forest	:	– 40 – 60º N
Temperate coniferous/ temperate needle leaf forest or Alpines	:	– 50 – 60º N
Tundra biome	:	60º N

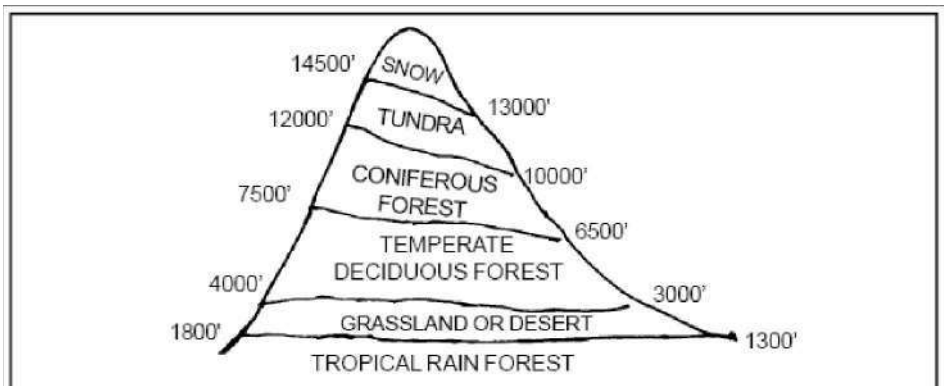

Fig. Different types of vegetation with increasing altitude on mountains (Altitudinal Zonation)

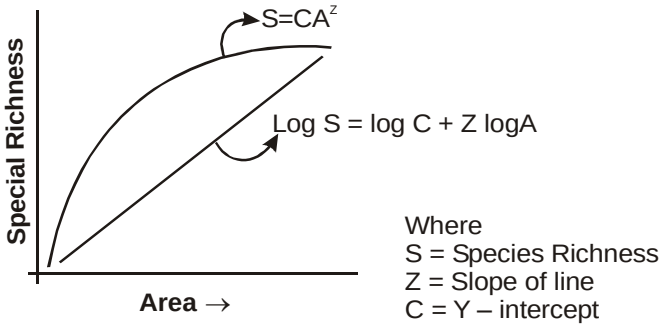
(B) Species Area Relationship

(i) German naturalist and geographer **Alexander Von Hemboldt** observed that within a region, species richness increased with increasing explored area, but only upto a limit.



(ii) Generally the value of Z-line is in range of 0.1 to 0.2 regard less of taxonomic group or region.

BIODIVERSITY CONSERVATION :

Uses of Biodiversity :

(A) Narrowly utilitarian

(B) Broadly Utilitarian / Ecosystem Services

(C) Ethical / Aesthetic and Cultural Benifits

(A) Narrowly utilitarian :

(a) As source of food, medicin, pharmaceutical drugs, fibers, rubber and timber.

(b) As source of food and improved varities. The biodiversity used in modern agriculture in three ways-

(i) As a source of new crops.

(ii) As a source of material for breeding improved varieties.

(iii) As a source of new biodegradable pesticides.

(c) Less than **20 plant species** are cultivated to **produce about 85% of world food. Wheat, Corn** and **Rice** are **three major carbohydrate crops** yield nearly 2/3 of food sustaning the human population.

(d) The commercialy domestiated species are cross breed with their wild relatives to improve their fruits.

(e) Genes of wild species are used to introduce new properties like **disease resistance** and **high yield**. for Example, **rice grown in Asia** is protected from four main disease by genes received from a single wild rice species (***oryza nivara***) **from India.**

(f) Drugs and Medicines - Biodiversity is rich source of substance with medicinal value.

Morphine - From *papaver sominiferum*

Quinine - From Cinchona

Taxol - From bark of yew tree (**Taxus *brevifolia***, *T.baccata*)

(g) 25% of drugs are derived from 120 species of plants.

(h) Botanochemicals - Plant chemicals used in preparation of synthetic products.

(B) Broadly Utilitarian :

(a) Diversity is essental for the maintenance and sustainable utilization of goods and services of ecosystem or individual species. The ecosystem services are -

(i) Gaseous exchange - **Amazon forest** is estimated to produce through photosynthesis. **20% of total oxygen of earth atmosphere.** So these forest are considerd as **"Lungs of Earth".**

(ii) Pollination by bees, bumblebees, birds, bats, ants and various insects.

(iii) Climate control by forest and oceanic ecosystem (Hydrological Cycles)

(iv) Natural pest control.

(v) Protection of soil

(vi) Conservation and purification of water.

(vii) Nutrient cycling.

(b) These ecosystem services have been valued in range of 16 to 54 trillion (10^{12}) (average 34 Trillion) US dollars per year. Robert Constanza and his colleagues recently tried to put price tag on nature's life support services, which is about 33 trillian US dollar on an average. Out of total cost of various ecosystem services the **soil formation accounts for - 50%, Recreation & nutrient cycling - < 10%, Climate regulation - 10%, Habitat for wild life - 6%.**

(C) Ethical / Aesthetic and Cultural Benifits -

(a) Ecotourism.

(b) Bird Watching

(c) Wild life

(d) Pet keeping, **Gardening**.

(e) Cultural and religious beliefs - like in India *Ocimum Sactum* (Tulsi), *Ficus religiosa* (Pipal), **Prosopis Cineanaria (Khejri)** and many more plants and animals like Rat (Lord Ganesha), Lion (Jai mata di), Owl (Laxmi ji), Swan (Saraswati ji), Peacock (Kartikaya ji) Snakes (Shiv Ji) are considered as scared and worshiped.

(g) The plants and animals are symbol of our cultural heritage and national pride.

(h) Philosophically and spiritually we need to realize that every species has an intrinsic value, even if it may not be of current or any economic value to us. It is our moral duty to care for their well being and pass on our biological legacy in good order of future generation. as we Indians belives in : **''सर्वेभवन्तु सुखिनः सर्वेःसन्तुः निरामया''**

Importance of species diversity to the Ecosystem :

(a) The number of species in a community is important for a ecosystem. It is belives that **communities with more species are more stable and with less species are less stable.**

(b) A stable community mean-

(i) Not show to much variation in productivity year to year.

(ii) It must be resistant to occasional disturbances (Natural or Man made).

(iii) It must be resistant to invasion by alien species.

(c) How these attributes are linked to species richness in a community?

According to David Tilman's by the long term ecosystem experiment using outdoor plots concluded that plots with more species shows less year to year variation in total biomass and increased diversity contributed to higher productivity.

(d) Rich biodiversity is not only essential for ecosystem health, but also necessory for survival of human race on this planet.

(e) How a species extinctintion anywhere on this planet affect the human race is explained by Stanford ecologist paul **Ehrlich** by **Rivet Popper Hypothesis.**

(f) He compare **aeroplane** as **ecosystem** joined togather by thousends of **rivets** as **species**. If passenger travelling in it starts popping a rivet to take home (causing species to become extinct) if may not affect flight safety (proper functioning of ecosystem) initially, but as more or more rivets are removed, the plane become dangerously weak over a period of time.

(g) The removal of rivat of fan is more dangerous than seat or wind rivets. The rivet of fan means dominant species of ecosystem.

LOSS OF BIODIVERSITY/THREATS TO BIODIVERSITY :

The loss in biodiversity in an region may leads to-

(a) Decline in plant production.

(b) Lowered the resistance to environmental changes like draught.

(c) Change the ecosystem processing like plant productivity, water use, pest and disease cycle.

Cause of biodiversity loss :

(a) Habitat loss and Fagmentation.

(b) Over exploitation

(c) Introduction of exotic species/ Alien species.

(d) Co-extinction

(a) Habitat loss and Fragmentation : This is the most important cause driving animals and plants to extinction. The most dramatic example of habitat loss come from torpical rian forests. Once covering more than 14 percent of the earth's land surface, these rain forests now over no more than 6 percent. they are being destroyed fast. By the time you finish reading this chapter, 1000 more hectares of rain forest would have been lost.

(i) The **Amazon rain forest** (It is so huge that it is called the **'Lungs of the planet'.**) harbouring probably millions of species is being cut and cleared for cultivating soya beans or for conversation to grassland for raising beef cattle.

(ii) Besides total loss, the degradation of many habitats by pollution also threatens the survival of many species. When large habitats are broken up into small fragments due to various human activities, mammals and birds requiring large territories and certain animals with migratory habits are badly affected, leading to population declines.

(b) Over-exploitation : Human have always depended on nature for **food** and **shelter**, but when **'need'** turns to **'greed'**, it leads to over-exploitation of natural resources. Many species extinctions in the last 500 years (**Stellr's sea cow, passenger pigeon**) were due to exploitation by humans. Presently many marine fish populations around the world are over harvested, endangering the continued existence of some commercially important species.

(c) Alien species invasions : When alien species are introduced unintentionally or deliberately for whatever purpose, some of them turn invasive, and cause decline or extinction of indigenous species.

(i) The **Nile perch introduced into Lake Victoria** in **east Africa** led eventually to the extinction of an ecologically unique assemblage of more than 200 species of **cichlid fish** in lake. You must be familiar with the environmental damage caused and threat posed to our native species by **invasive weed species** like **carrot grass (*Parthenium*)**, **Lantana** and **water hyacinth *(Eicchornia*).**

(ii) The recent illegal introduction of the **Africa Catfish *Clarias gariepinus*** for aquaculture purposes is posing a threat to the indigenous **catfishes** in our rivers.

(d) Co-extinctions : When a species becomes extinct, the plant and animal species associated with it in an obligatory way also become extinct even the assemblage of parasites also meets the same fate.

Another example is the case of a coevolved plant-pollinator mutualism where extinction of one invariably leads to the extinction of the other.

Type of Extinction of Species :

(a) Extinction is a natural process. Species have disappeared and new ones have evolved to take their places over the long geological history of the earth. It is useful to distinguished three types of extinction processes.

Natural Extinction : With the change in environmental conditions, some species diappear and others, which are more adapted to changed conditions, take their place. This loss of species which occured in the geological past at a very slow rate, is called **natural** or **background extinction.**

Mass extinction : There have been saveral periods in the earth's geological history when large number of species become extinct because of catastrophes. Mass extinctions occured in millions of years.

Anthropogenic extinction : An increasing number of species are disappearing from the face of the earth due to human activities. This man-made mass extinction represents a very severe depletion of biodiversity, particularly because it is occuring within a short period of time.

(b) The **World Conservation Monitoring Centre** has recorde that **533 animal species** (Mostly **vertebrates**) and **384 plant species** (Mostly **flowering plants**) have **become extinct since the year 1600.** More species have gone extinct from the islands than from the mainland or the oceans.

(c) The current rate of extinction is 1000 to 10000 time higher than the background rate of **extinction.** Some interesting observations about the current loss of species are :

(i) From ten high diversity localities in **tropical forests** covering 300,000 km^2, some 17,000 **endemic plant species** and **350,000 endemic animal species could be lost in near future.**

(ii) The **tropical forests alone are losing** roughly **14,000-40,000 species per year** (or 2-5 species per hour)

(iii) The **earth** may lose up to 50% of the species by the end of the 21^{st} century, if the current rate of loss continues.

Susceptibility to Extinction : The characteristics of species particularly susceptible to extinction are : **large body size (Bengal tiger, Lion and Elephant); small population size** and **low reproductive rate (Blue whale and Giant panda). Feeding at high tropic levels in the food chain** (Bengal tiger and Bald eagle), **fixed migratory routes** and **habitat (Blue whale and Whooping crane)** and **localised** and **narrow range of distribution (woodland caribou; many island species)** also make the species susceptibel to extinction.

The IUCN Red List Categoris :

(A) The IUCN Red List (which is started in **1963**) is a catalogue of taxa that are **facing the risk of exctinction.** It is important to understand that the Red List aims to impart information about the urgency and scale of conservation problems to the public and policy makers. The uses of the Red List are -

(i) Developing awarness about the importance of threatened biodiversity;

(ii) Identification and documentation of endangered species;

(iii) Providing a global index of the decline of biodiversity;

(iv) Defining conservation priorities at the local level and guiding conservation action.

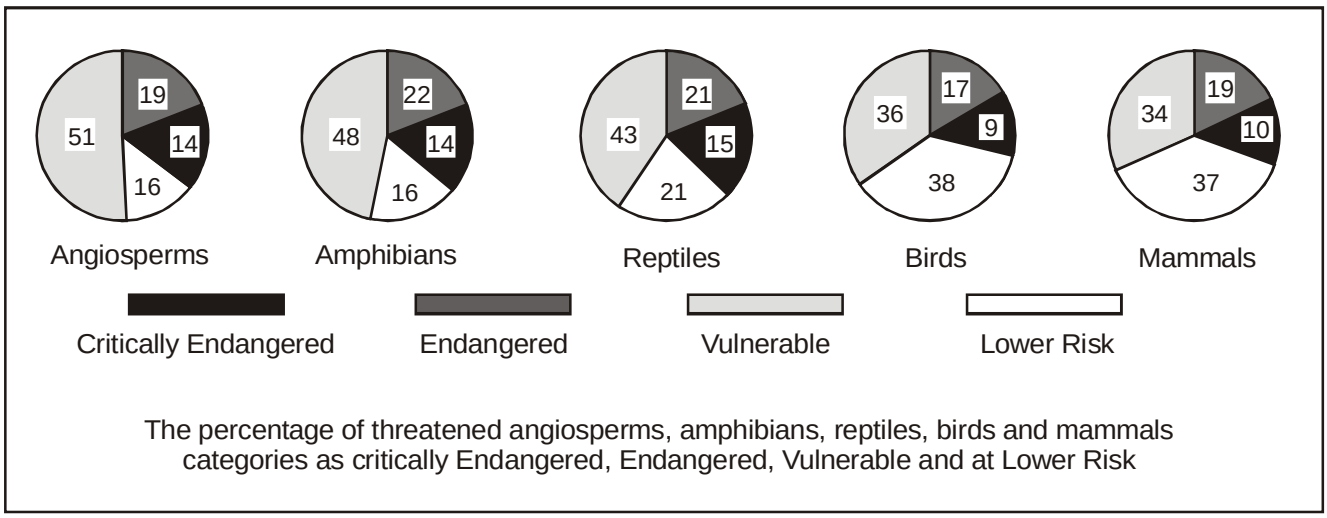
(B) The **World Conservation Union** (formerly known as International Union for the Conservation of Nature and Natural Resource, **IUCN**) has recognised **eight Red List Categories of species**; ***Extinct, Extinct in the wild, Critically endangered, Endangered, Vulnerable, Lower Risk, Data Deficient*** and ***Not Evaluated.*** These categories are difined in Table below.

Red List Category	Definition
Extinct	A taxon is Extinct when there is no reasonable doubt that the last individual has died.
Extinct in the wild	A taxon is Extinct in the wild when exhaustive surveys, in known and/or expected habitats, have failed to record an individual.
Critically Endangered	A taxon is Critically Endangered when it is facing an extremely high risk of extinction in the wild in the immediate future.
Endangered	A taxon is Endangered when it is not Critically Endangered, but facing a very high risk of extinction in the wild in the near future.
Vulnerable	A taxon is Vulnerable when it is not Critically Endangered or Endangered, but facing a high risk of extinction in the wild in the medium term future.
Lower Risk	A taxon is Lower risk when it has been evaluated and does not satisfy the criteria for Critically Endangered, Endangered or Vulnerable.
Data Deficient	A taxon is Data Deficient when there is inadequate information to make a direct or indirect, assessment of its risk of extinction.
Not Evaluated	A taxon is Not Evaluated when it has not yet been assessed against the above criteria.

(C) Threatened (T) : The term is used in context with conservation of the species which are in any one of the above 3 categores (E, V, R).

Threatened = Endagered + Vulnerable + Rare

1. **Endangered (E) :** Those species which are in the immediate danger of extinction and whose survival is unlikely whose number have been reduced to a critical level, if the casual factors continue to be operating.
2. **Vulnerable (V) :** The species likely to move into the endangered category in the near future if the casual factors continue to operate. Their population is still abundant but are under threat throughout their range.
3. **Rare (R) :** These are species with small population in the world. These are not at present endangerd and vulnerable, but are at risk due to their less number. These species are usually **localised within restricted geographical areas** or **habitals.**

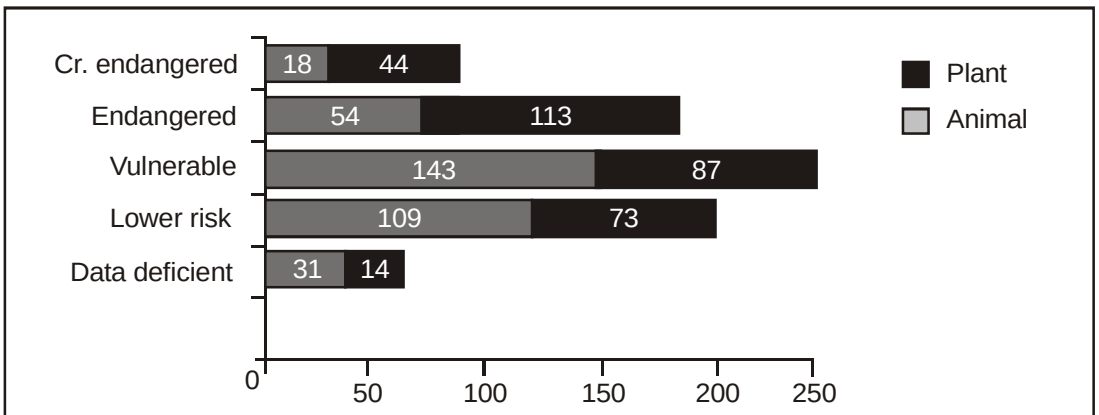


The percentage of threatened angiosperms, amphibians, reptiles, birds and mammals categories as critically Endangered, Endangered, Vulnerable and at Lower Risk

(D) The **IUCN Red List (2004)** documents the extinction of **784 species (including 338 vertebrates, 359 invertebrates and 87 plants)** in the last 500 years. Some examples of recent extinctions include the **dodo (Mauritius), quagga (Africa), thylacine (Australia), Steller's Sea Cow (Russia)** and **three subspecies (Bali, Javan, Caspian) of tiger.** The **last twenty years** alone have witnessed the **disappearance of 27 species.** Careful analysis of records shows that extinctions across taxa are not random; some groups like amphibians appear to be more vulnerable to extinction. Adding to the grim scenario of extinctions is the fact that **more than 15,500 species** world-wide are facing the threat of extinction.

(E) Presently, **12 per cent of all bird species, 23 per cent of all mammal species, 32 per cent of all amphibian species** and **31per cent of all gymnosperm species** in the world **face the threat of extinction.**From a study of the history of life on earth through fossil records, we learn that large-scale loss of species like the one we are currently witnessing have also happened earlier, even before humans appeared on the scene.

(F) During the long period (> 3 billion years) since the origin and diversification of life on earth there were **five episodes of mass extinction of species.** How is the **'Sixth Extinction' presently in progress** different from the previous episodes? The difference is in the rates; the current species extinction rates are estimated to be 100 to 1,000 times faster than in the pre-human times and our activities are responsible for the faster rates. Ecologists warn that if the present trends continue, nearly half of all the species on earth might be wiped out within the next 100 years.



The number of plant and animal species of various threat categories in India

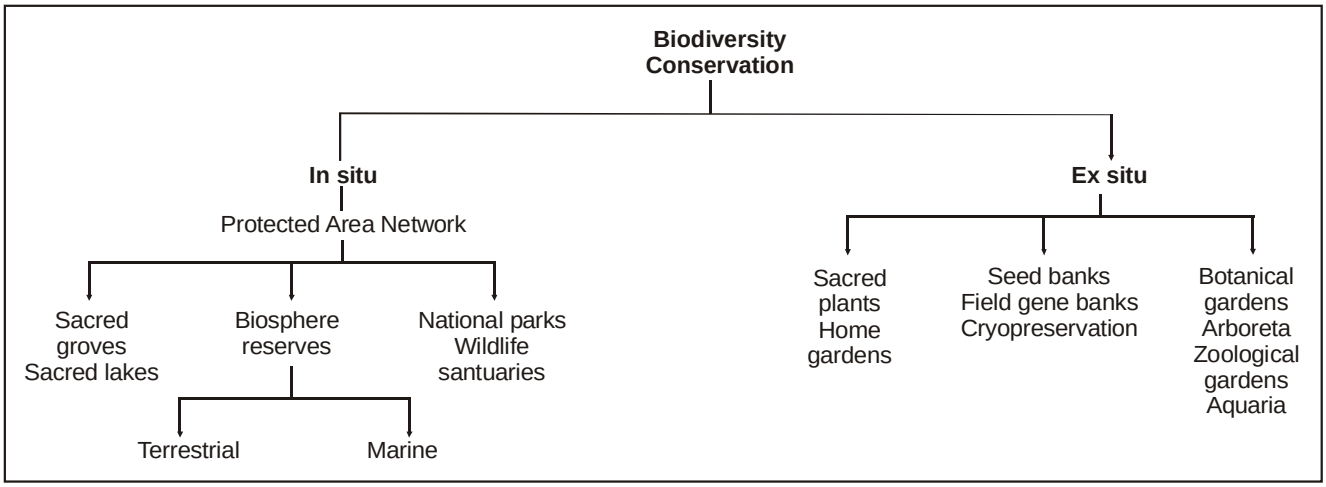
Some Important Examples of Threatened species in India

Category	Plants	Animals
(1) Critically endengered	Barberis nilghiriensis	Sus salvanius (Pigmyhog)
(2) Endangered	Bentinckia nicobarica	Ailurus fulgens (Red panda)
(3) Vulnerable	Cupressus cashmeriana	Antelope cervicapra (Black buck)

Note : Rauwolfia serpentiana (medicinal plant) is **endangered.**

BIODIVERSITY CONSERVATION :

It is of two types **In situ (On site)** and **Ex situ (Off site)** conservation.



In situ Conservation Strategies :

The in situ strategies emphasise protection of total ecosystems.The in Situ approach includes protection of a group of typical ecosystems through a network of protected areas.

(1) Protected Areas : These are areas of land and/or sea, especially dedicated to the protection and maintenance of biological diversity and of natural and associated cultural resources. These are managed throught leagal or other effective means. Examples of protected areas are **National Parks** and **Wildlife Sancturies**. The **earliest national parks**, the **Yellowstone in USA** and the **Royal** near **Sydney, Australia.**

Many similar areas throughout the world now protect rare species or wilderness areas. **World Conservation Monitoring Centre** has recognised 37,000 protected areas around the world. As of **September 2002, India has 581 protected areas** (**89 National Parks** and **492 Wildlife Santuries**), **covering 4.7% of the land** surface, as against 10% internationally suggested norm. The **Jim Corbett National Park** was the **first National Park established in India.**

Some of the main benefits of protected areas are :

(i) Maintaining viable populations of all native species and subspecies.

(ii) Maintaining the number and distribution of communities and habitats and conserving the genetic diveristy of all the present species.

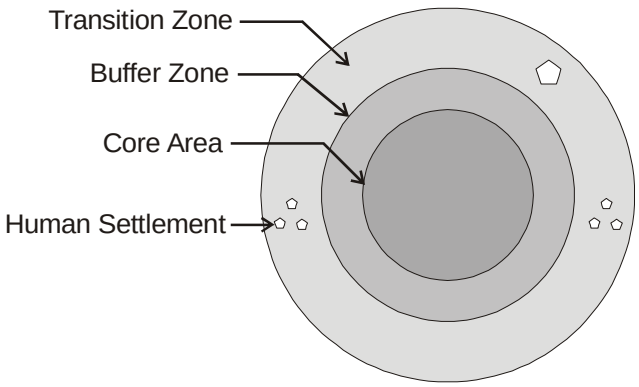
(iii) Preventing human caused introductions of alien spacies; and

(iv) Making it possible for species/habitats to shift in response to environmental changes.

(2) Biosphere Reserves : Biosphere reserves are special category of protected areas of land and/or coastal environments, where in **people are an integral component** of the system. These are representative examples of natural biomes and contain unique biological communities. The **concept of Biosphere Reserve was launched in 1975** as a part of **UNESCO's Man and Biosphere Programme (MAB)**, dealing with the conservation of ecosystems and the genetic resources contained therein. Till **May 2002**, there were **408 biosphere reserves** located in **94 countries**. There are **13 biosphere reserves** in **India** and are shown in figure below.

Diagram III : Showing the Biosphere Reserves in India

In India, Biosphere Reserve are also notified as **National Parks**. A Biosphere Reserve consists of **core, buffer** and **transition zones**. The **natural** or **core zone** comprises an **undisturbed** and **legally protected ecosystem.** The **buffer zone** surrounds the core area, and is managed to accomodate a greater variety of **resource use strategies** and **research** and **educational activities.**



The zonation in a terrestrial Biosphere Reserve

The **transition zone,** the outermost part of the Biosphere Reserve, is an **area of active cooperation between reserve management** and the **local people,** wherein activities like **settlements, cropping, forestry** and **recreation** and **other economic** uses continue in harmony with conservation goals. The main fucntions of biosphere reserves are :

(i) **Conservation :** To ensure the conservation of landscapes, ecosystems, encourages traditional resource use.

(ii) **Development :** To promote economic development which is culturally, socially and ecologically sustainable.

(iii) **Scientific research, monitoring and education :** The aim is to provide support for research, monitoring, education and information exchange related to local, national and global issues of conservation and development.

(3) **Sacred forests and sacred lakes :** A **traditional strategy** for the protection of biodiversity has been in practice in **India** and some other Asian countries in the form of **sacred forests.** These are forest patches of varying dimensions protected by tribal communities due to religious sanctity accorded to them.

The sacred forests represent islands of **pristine forests** (most undistributed forest without any human impact) and have been free from all disturbances; though these are frequently surrounded by highly degraded landscapes.

In India, sacred forests are located in several part, eg., **Karnataka. Maharashtra, Kerala, Meghalaya etc.,** and are **serving as refugia** for a number of rare, endangered and endemic taxa. Similarly, several water bodies (eg., **Khecheopalri lake in Sikkim**) have been declared sacred by the people, leading to protection of aquatic flora and fauna.

Ex-situ Conservation Strategies :

(A) The ex-situ conservation strategies include **botanical gardens, zoos, conservation stands** and **gene, pollen, seed, seedling, tissue culture** and **DNA banks**. Seed gene banks are the easiest way to store germplasm of wild and cultivated plants at low temperature in cold rooms. Preservation of genetic resources is carried out in field gene banks under normal growing conditions.

(B) In vitro conservation, especially by **cryopreservation** in **liquid nitrogen** at a **temperature of –196ºC,** is particularly useful for conserving vegetatively propagated crops like potato. Cryopreservation is the storage of material at ultra-low temperature either by very rapid cooling and simultaneous dehydration at low temperature (used for tissue culture). The material can be stored for a long period of time in compact, low maintenance refrigeration units.

(C) Conservation of biological diversity in botanical gardens is already in practice. There are more than **1500 botanical gardens** and **arbsoreta** (botanical gardens where specific tree and shrub species are cultivated) in the world **containing more than 80,000 species.** Many of these now have seed banks, tissue culture facilities and other ex situ technologies. Similarly, there are more than **800 professionally managed zoos around the world** with **about 3,000 species of mammals, birds, reptiles** and **amphibians.** Many of these zoos have well developed **captive breeding programmes.**

(D) The conservation of wild relative of crops plants and the off-site conservation of crop varieties or cultures of micro-organisms privdes breeders and genetic engineers with a ready source of genetic material. Plants and animals conserved in botanical gardens, aroboreta, zoos and aquaria can be **used to restore degraded land, reintroduce species into wild** and **restock depleted populations.**

Hot Spots of Biodiversity :

(A) Biodiversity is not uniformly distributed across the geographical regions of the earth. Certain regions of the world are mega diversity zones where a very large number of species are found. For example, **India accounts for only 2.4% of the land area of the world,** but it **contributes approximately 8% species to the global diversity.**

(B) **Norman Mayers** developed the **hot spots concept** in **1988** to designate priority areas **for in situ conservation.** the hot spots are the plant and animal life on earth. The key criteria for determining a hot spote are :

(i) **Number of endemic species**,ie., the species which are found nowhere else, and

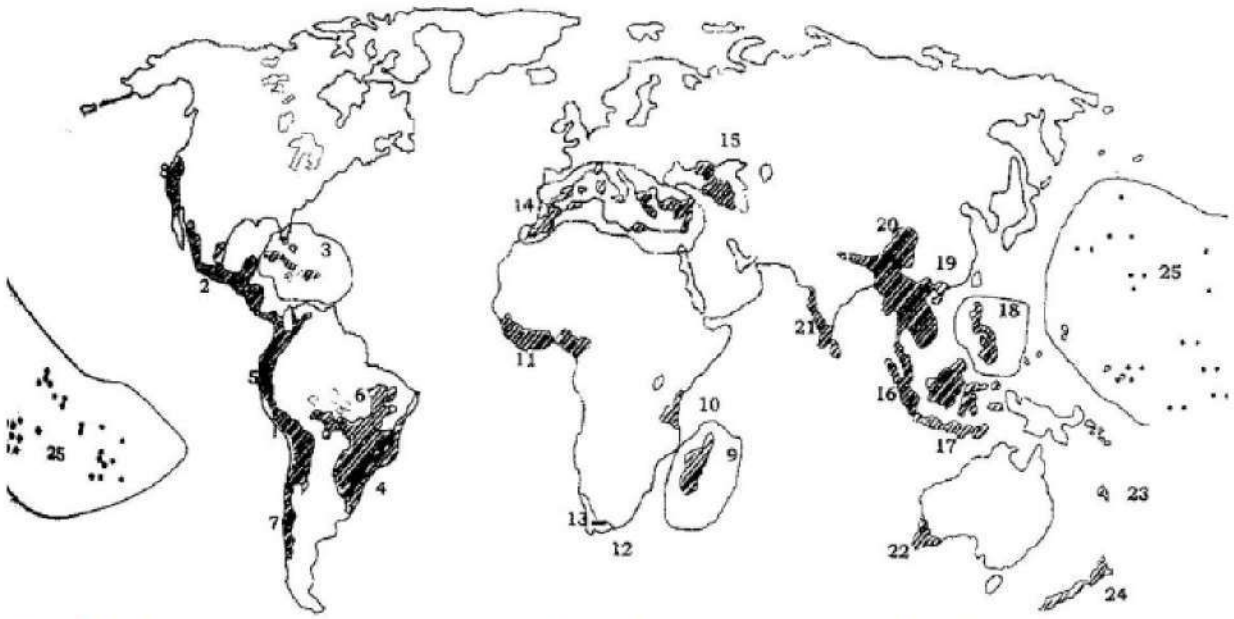
(ii) **Degree of threat**, which is measured in terms of habitat loss.

(C) **Twenty five terrestrial hot spots** for conservation of biodiversity have been identified worldwide. These hot spots together, now cover **1.4% of the earth's land area**. **Tropical forests** appear in **15 hot spots, Mediterranean** type **zones in 5**, and **9 hot spots** are completely made up of **islands**. As many as **16 hot spots** are in the **tropics**. About **20% of the human population** lives in the **hot-spot regions**. **Now total number of hot spots are 34.**

(D) Among the **34 hot spots of the world**, two (**Western Ghats and Eastern Himalayas**) are **found in India,** and these extend into the neighbouring countries also.Srilanka and **Indo-Burma** These areas are rich in flowering plants, also in **reptiles, amphibians, swallow-tailed butterflies and some mammals;** and also show a high degree of endemism.

(E) The eastern Himalayan hot spot exteds to the **north-eastern India** and **Bhutan**. the temperate forests are found at altitudes of 1780 to 3500 meters. Many deep and semi-isolated valleys found in this region are exceptionally rich in endemic plant species. Besides being an active centre of evolution and rich diversity of flowering plants, the numerous primitive angiosperm families (eg., ***Magnoliaceae*** and ***Winteraceae***) and primitive genera of plants, like ***Magnolia*** and ***Betula*** are found in **Eastern Himalaya.**

(F) The **Western Ghat** region lies parallel to the western coast of Indian peninsula for almost 1600 km, in **Maharashtra**, **Karnataka**, **Tamil Nadu** and **Kerala**. The forests at low elevation **(500m above means sea level)** are mostly **evergreen**, while those found at **500-1500 meter height** are generally **semi-evergreen forests.** The **Agasthyamalai hills,** the **Silent Valley** and the **new Amambalam Reserve**, are the **two main centres of diversity**.



1. Tropical Andes, 2. Mesoamerica, 3. Caribbean, 4. Brazils's Atlantic Forests, 5. Choco/Darien/Western Ecuador, 6. Brazil's Cerrado, 7. Central Chile, 8. California Floristic Province, 9. Madagascar, 10. Eastern Arc & Coastal Forests of Tanzania/Kenya, 11. West African Forests, 12. Cape Floristic Province, 13. Succulent Karoo, 14. Mediterranean Basin, 15. Caucasus, 16 Sundland, 17. WAllacea, 18. Phillippines, 19. Indo-Burma, 20. South-Central China, 21. Western Ghats/Sri Lanka, 22. Southwest Australia, 23. New Caledonia, 24. New Zealand, 25. Polynesia/Micronesia.

Fig. The terrestrial biodiversity hot spots.

International Efforts for Conserving Biodiversity :

(A) The **Earth Summit held in 1992** at **Rio de Janeiro** result into a **Convention on Biodiversity,** which came into force on **29 December, 1993.** The convention on has three key objectives:

(i) Conservation of biological diversity.

(ii) Sustainable use of biodiversity and

(iii) Fair and equitable sharing of benefits arising out of the utilisation of genetic resources.

The **World Conservation Union** and the **World Wide Fund for Nature (WWF)** support projects worldwide to promote conservation and appropriate development of **Biosphere Reserve.**

Biodiversity Conservation in India :

(B) Indian region has contributed significantly to the global biodiversity. India is a homeland of **167 cultivated species** and **320 wild relatives of crop plants**. It is the centre of diversity of animal species **(zebu, mithun, chicken, water, buffalo, camel); crop plants (rice, sugarcane, banana, jackfruit, cucurbits), edible diascoreas, alocasia, colocasia; spices and condiments (cardamom, black paper, ginger, turmeric);** and bamboos, brassicas, and tree cotton. **India** also represents a **secondary centre of domestication for some animals (horse, goat, sheep, cattle, yak and donkey)** and **plants (tobacco, potato and maize).**

(C) **In situ conservation** of biodiversity is being carried out through **Biosphere Reserves, National Parks, Wild Life Sancturies** and other **protected** areas by the **Ministry of Environment and Forests.**

(D) The **joint forest management systems** involve **forest departments** and **local communities.** This enables the tribles the tribal people and local communities to have access to non-wood forest products, and at the same time protect the forest resources.

(E) The **National Bureau of Plant, Animal and Fish Genetic Resources** has a number of programmes to collect and **conserve the germplasm of plants and animals in seed gene banks**, and **field gene banks** for in *vitro* conservation.

(F) Botanical and Zoological gardens have large collections of plant and animal species in different climatic regions of India.

(G) The land races and diverse food and medicinal plants are also being conserved successfully by the tribal people and women working individually, or with various non-governmental agencies. The women particularly have an important role in the conservation of agrobiodiversity.

(H) In India, a programme is underway to develop a system of community registers of local informal innovations related to the genetic resource, as well as natural resource management in general.

SPECIAL POINTS

(A) India is divided into 10 Biogeographical regions.

(i) Trans - Himalaya	(ii) Himalaya	(iii) Desert
(iv) Semi - Arid	(v) Western ghats	(vI) deccan peninsula
(viii) Gangetic plain	(viii) Coasts	(ix) North east
(x) Islands		

Note : Deccan peninsula has maxmum coverage of teh Indian land mass (42%), western ghats 4% and north-east 5.2%

(B) **Endemic Flowering Species of India -** 33% of flowering plants recorded in India are endemic.

(C) **Endemic fauna (Animals Species) of India -** Out of the recorded vertebrates, 60% amphibians, 53% fresh water fish, 36% reptiles and 10% mammalian.

(D) Maximum endemic amphibian species are found in western ghats.

(E) From ten high-diversity localities in tropical forest some 17,000 endemic plant species and 350,000 endemic animal species could be lost in near future.

(F) The tropical forests alone are losing roughly 14,000 - 40,000 speices per year (or 2-5 species per hour).

(G) The earth may lose up to 50 percent of the species by the end of the 21st century.

(H) According to IUCN (2004), total number of plant and animal species on the earth is 1.5 million.

(I) According to Robert May global species diversity is about 7 millioin.

(J) More than 70 percent of all species recorded are animals, while plants comprise no more than 22%

(K) Out of 10 animals on this planet 7 are insects.

(L) Indian share of the global spcies diversity is about 8.1 percent.

(M) Some examples of recent extinction include the **dodo (Mauritius), quagga (Africa), thylacine (Australia), stellars' sea cow (Russia)** and three subspecies (Bali, Javan, Caspian) of **tigers**.

(N) According to IUCN Red list (2004), 784 species were extinct in the last 500 year.

(O) The Amazon rain forest is so huge that is called **''Lungs of the Planet''.**

(P) **Biodiversity Day 22th May.**

(Q) **Year 2010** is declared as Biodiversity Conservation year by UNO.

THEREATENED ANIMALS OF INDIA :

T = Threatened, **R** = Rare ; **E** = Endangered ; **V** = Vulnerable

MAMMALS

1.	Macaca silenus (L.)	Lion-Tailed Macaque.	E
2.	Loris tardigradus (L.)	Slender Loris	T
3.	Hylobates hoolock (Harlan)	Hoolock Gibbon	E
4.	**Panthera tigris** (L.)	**Tiger**	T
5.	Panthera leo persica (Meyer)	Asiatic Lion	T
6.	Panthera Pardus (L.)	Leopard or Panther	T
7.	Felis bengalensis Kerr	Leopard Cat	V
8.	Felis temmincki : V	Horsfield Golder Cat	E
9.	Felis manual Pallas	Pallas's Cat	R
10.	Felis silverstris ornate Gray	Indian Desert Cat	R,E
11.	**Canis lupus** (L.)	**Wolf**	E
12.	Vulpes bengalensis (shaw)	Indian Fox	T
13.	Ailurus fulgens F.Cuvier	Red Panda	E
14.	Manis crassicaudata Gray	The Indian Pangolin	T
15.	**Elephas maximum** (L.)	**Asian Elephant**	E
16.	**Rhinoceros unicornis** (L.)	The great **one-horned Rhinoceros**	E
17.	**Asinus hemionus** khur (L.)	**Asiatic wild ass**	E
18.	Bos mutus (Przewalski)-	Wild Yak	R
19.	Bubalus bubalis (L.)	Wild Buffalo	E
20.	**Cervus elaphus hanglu** Wagner	**Hangul** or **Kashmir Stag**	E

21.	Antelope cervicarpra (L.)	Black buck	V
22.	Maschus moschiferus L.	Musk Deer	E
23.	**Gazella Dorcas** (L.)	**Chinkara**	V

BIRDS

1.	**Choriotis nigriceps** (Vigors)	**Great Indian Busted**	E
2.	Grus leucogeranus Pallas	Siberian Crane	T
3.	Grus nigricollis Przeyalski	Blacknecked Crane	E

REPTILES

1.	Chelonia mydas (L.)	Green Sea Turtle	T
2.	Gavialis gangeticus (Gmelin)	Gharial	R,T
3.	Crocodylus porosus Schneider	Estuarine Crocodile	T
4.	Crocodylus palustris (Lesson)	Mugger	T
5.	Varanus bengalensis (Daudin)	Common Indian Monitor	E
6.	Varanus griseus Monitor	Indian Desert Monitor	T
7.	Python molurus *(L.)	Indian Rock Python	E
8.	Python reticulatus (Scheider)	Reticulated Python	E

AMPHIBIANS

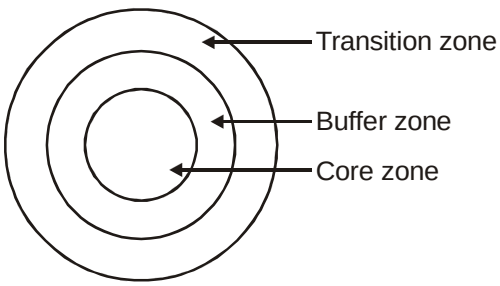
1.	Tylototriton verrucosus Anderson	Himalyan	R

BIOSPHERE RESERVES :

It is a specified protected area in which multiple use of the land is permited.

There are 3 zones of Biosphere Reserve.

1. **Core Zone :** It lies at the centre where no human activity is allowed.
2. **The Buffer zone :** Where limited human activity is allosed.
3. **Manipulating zone or Transition zone :** Where a large number of human activites would go on.



Note : 408 Biosphere reserves are located in **94 countries.** In **India** following **14 sites** have been identified as potential biosphere reserves together with their locations :

	Biosphere Reserve	**State(s)**
1.	Nanda Devi	Uttranchal
2.	Nokrek	Maghalaya
3.	Manas	Assam
4.	Dibru Saikhowa	Assam

5.	Dehang Debang	Arunachal Pradesh
6.	Sunderban	West Bengal
7.	Gulf of Mannar	Tamil Nadu
8.	Nigiri	Kerala, Karnataka and Tamil Nadu
9.	Great Nicobar	Andaman and Nicobar
10.	Simlipal	Orissa
11.	Kanchanjunga	Sikkim
12.	Pachmarhi	Madhya Pradesh
13.	Agasthyamalai	Kerala
14.	Achankamar	Madhya pradesh, Chattisgarh

NATIONAL PARKS AND MAIN SANCTUARIES IN INDIA :

National Parks :

In national parks both plants and animals are protected. There are **90 National Parks** (in 2004) which occupy about **4.7% of the country's total geographical area.**

Sanctuaries -

The are **448 wildlife Sanctuaries** (as on Sept. 2004) which occupy about **3.2% of the country's total geographical area.**

ANDAMAN AND NICOBAR ISLANDS

1. Marine National Park
2. North Button Island National Park (Andaman)
3. Saddle Peak National Park (Andaman)
4. South Button Island National Park (Andaman)
5. Narcondum Sancutrary (Bay of Bengal)
6. North Reef Island Sanctuary (Bay of Bengal)
7. South Sentinel Island Sanctuary (Bay of Bengal)

ANDHRA PRADESH

1. Coringa Sanctuary (East Godavari)
2. Nagarijunasagar Srisailam Sanctuary (Guntur, Kurnool) [Largest tiger reserve]
3. Pakhal Sanctuary (Warangal)
4. Papikonda Sanctuary (East and West Goddavari)

ARUNACHAL PRADESH

1. Namdapha National Park
2. Pakhui Sanctuary

ASSAM

1. **Kaziranga National Park** (Sibsagar and Nowgong)
2. **Manas National Park** (Barpeta)
3. Garampani Sanctuary

JHARKHAND

1. Palamau National Park (Dalton Ganj)

CHANDIGARH

1. Sukhna Sanctuary

DELHI

1. Indira Priyadarshini Sanctuary

GOA

1. Cotigao Sanctuary

GUJARAT

1. **Gir National Park** (Junagarh)
2. Nalsarovar Sanctuary (Ahmedabad)

HARYANA

1. Bhindawas Sanctuary
2. Chotala Sanctuary
3. Sultanpur Sanctuary (Gurgaon)

HIMACHAL PRADESH

1. Great Himalayan National Park
2. Pin Valley National Park
3. Manali Sanctuary (Manali)

JAMMU AND KASHMIR

1. **Dachigam National Park** (Srinagar)
2. Salim Ali National Park
3. Karakoram Sanctuary

KARNATAKA

1. Bandipur National Park (Mysore)
2. Ghataprabha Sanctuary (Belgaun)

KERALA

1. Periyar National Park (Idukki)
2. **Silent Valley National Park** (Palghat)
3. Idikki Sanctuary (Idikki)

MADHYA PRADESH

1. **Bandhavagarh National Park** (Shadol)
2. Fossil National Park
3. **Kanha National Park** (Mandla and Balaghat)
4. **Panna National Park** (Panna)
5. Ghatigao-Great Indian Bustard Sanctuary
6. Singhori Sanctuary

MAHARASHTRA

1. Chandoli Sanctuary
2. Chaprala Sanctuary
3. Great Indian Bustard Sanctuary

4. Nagzira Sanctuary
5. Tansa Sanctuary

MEGHALAYA

1. Balphakram National Park
2. Nokrek National Park

MIZORAM

1. Dampa Sanctuary

NAGALAND

1. Fakim Sanctuary

ORISSA

1. Balukhand Sanctuary

PUNJAB

1. Harike Lake Sanctuary

RAJASTHAN

1. **Desert National Park** (Jaisalmer and Barmer)
2. **Keoladeo Ghana National Park** (Bharatpur)
3. **Ranthambore National Park**
   (Sawai Madhopur)
4. **Sariska National Park** (Alwar)
5. Sariska Sanctuary (Alwar)

SIKKIM

1. **Kanchanjunga National Park** (Gangtok)
2. Van Vihar Sanctuary

TAMIL NADU

1. Guindy National Park (Madras)
2. Marine National Park (Gulf of Mannar)

TRIPURA

1. Trishna Sanctuary

UTTRANCHAL AND U.P.

1. **Corbett National Park** (Nainital) (Uttaranchal)
2. Dudhwa National Park (Lakhimpur Kheri) U.P.
3. **Nanda Devi National Park** (Chamoli) (U.P.)
4. **Valley of Flowers National Park (**Chamoli)
5. National Chambal Sanctuary

WEST BENGAL

1. **Sunderban National Park** (24-Parganas)
2. Jaldapara Sanctuary (Jalpaiguri)
3. Senchal Sanctuary

SOME IMPORTANT NATIONAL PARKS OF INDIA :

Sr. No.	Name and Location	Area in Sq. Km.	Important Animals Found
1	Kaziranga National Park District Sibsagar (Assam)	430	**Rhinoceros,** elephant, wild buffalo, bison, tiger, leopard, sloth, bear, sambhar, swamp deer, barking deer, wild bear, gibbon, python and birds like pelican, stork and ringtailed fishing eagles. This is a famous National Park of famous one-horned rhinocero
2	Sundarbans (Tiger Reserve) 24-Pargana(West Bengal)	2585	**Tiger,** wild boar, deer, gangetic dophin, estuarine crocodile.
3	Hazaribagh National Park Hazaribagh Jharkhand	186	**Tiger,** leopard, hyaena, wild bear, gaur, sambhar, nilgai, chital, sloth, bear, peafowl
4	Corbett National Park District Nainital (Uttaranchal)	525	**Tiger,** elephat, panther, sloth bear, wild bear, nilgai, sambhar, chital, crocodile, python, king cobra, peafowl, partridge. This is the first National Park of India which is famous for tigers.
5	Gir National Park District Jungarh (Gujarat)	1412	**Asiatic lion,** panther, stripped hyaena, sambhar, nilgai, chital, 4-horned antelope, chinkara, wild bear, langur, python, crocodile, green pigeon, partridge. This National park is famous for the Asiatic loins.
6	Kanha National Park Mandla and Balaghat (M.P.)	940	**Tiger, panther, chital, chinkara,** barking deer, blue bull, **four horned deer,** langur, wild bear, black buck, nilgai, wild dog, sloth bear, sambhar, crocodile, grey horn bill, egret, pea-fowl.
7	Tandoba National Park Chandrapur (Maharashtra)	116	**Tiger** sambhar, sloth bear, bison, chital, chinkara, barking deer, blue bull, four horned deer, langur, pea-gowl, crocodile.
8	Bandipur National Park District Mysore (Karnataka)	874	**Elephant, tiger, leopard,** sloth bear, wild dog,chital, panther, barking deer, langur, porcupine, gaur, sambhar, malabar squirrel, green pigoen
9	Desert National Park Jaisalmer (Rajasthan)	3000	**Great Indian Bustard, Black buck,** chinara.

SOME IMPORTANT SANCUTARIES OF INDIA :

	Name of Location	Area in sq.km.	Important Animals
1.	Keoladeo Ghana Bird Sanctuary Bharatpur (Rajasthan) Famous for birds	29	**Siberian crane,** egrets, herons spoon bill etc.
2.	Annamalai Sanctuary Coimbatore (Tamil Nadu)	958	**Tiger, elephant,** gaur, spotted deer, wild dog, south bear, sambhar, panther.

3.	Jaldapara Sanctuary Madarihat (West Bengal)	1155	**Rhino, elephant, tiger,** leopard, deer, sambhar, and different kinds of birds.
4.	Sultanpur Lake Bird Sanctuary Gurgaon (Haryana)	12	**Crane, sarus, spotbill, duck, drake, green pigeon,** wild bear, crocodile, python.
5.	Bir Moti Bagh Wildlife Sanctuary Patiala (Punjab)	8.3	Nilgai, **wild boar, hog deer,** black buck, blue jackal, peafowl, partidge, sparrow, myna, pigeon, dove
6.	Shikari Devi Sanctuary Mandi (Himachal Pradesh)	213	**Black bear, snow leopard, flying fox,** barking deer, musk deer, chakor, partridge
7.	Dachigam Sanctuary Srinagar (Jammu and Kashmir)	89	**Hangul or Kashmir stag, musk deer,** snow leopard, black bear, brown bear
8.	Mudumalai Wildlife Sanctuary Nilgiri (Tamil Nadu)	520	**Elephant, gaur, sambhar, chital, barking deer,** mouse deer, **four horned antelope,** langur, gaint squirrel, flying squirrel, wild dog, wild cat, civet, sloth bear, porcupine, python, rat, snake, monitor lizard, flying lizard.
9.	Nagarjuna Sagar Sanctuary Guntur Kamool and Nalgonda (Andhra Pradesh)	3,568	**Tiger, panther,** wild bear, chital, nilgai, sambar, black buck, fox, jackal, wolf, crocodile.
10.	Periyar Sanctuary (Kerala)	777	**Elephats,** gaur, **leopard,** sloth bear, sambhar, bison, black langur, hornbill, egret. It is famous for elephants
11.	Chilka Lake Brid Sanctuary Balagaon (Orissa) (Largest brackish water lagoon in Asia)	900	An oasis of bir is like **water fowls, ducks, cranes,** Golder plovers, sand pipers, flamingoes
12.	Manas Wildlife Sanctuary Kamrup (Assam)		**Tiger, panther,** rhino, gaur, wild buffalo, sambhar, swamp deer, golden langur, wild dog wild bear.

INFORMATION RELATED TO NATIONAL PARKS AND SANCTUARIES :

India's Famous Tiger Reserve -

(a) Jim Corbett National Park - Nainital (Uttaranchal)
(b) Dudhwa National Park - Lakhimpur Kheri (U.P.)
(c) Kanha National Park - Mandala and Balghat (Madhya Pradesh)
(d) Indrawati National Park - (Chattishgarh)
(e) Simli National Park - (Orissa)

Some Special Animals -

(a) **Asiatic wild ass - (Endangered) -** Found in runn of Kutch and Pakistan
(b) **Red Panda - (Endangered) -** Found in Kanchanjunga (Sikkim)
(c) **Hangul - Kashmir Stag (Endangered) -** Found in Dachigam (Sri-Nagar - Jammu and Kashmir)
(d) **Siberian Crane - (Endangered) -** Found in Keoladeo (Ghana) National Park

(e) **The Great Indian Bustard** is a huge ground bird with a long and long bare legs. It is an inhabitant of the semi-arid areas of Rajasthan, Gujarat and Maharashtra. Hunting for its flesh has reduced its population to over 800. It is a highly endangered bird.

(f) **''Ex-situ conservation''** is the protection of wild life in zoos and botanical gardens. Other e.g., of Ex-situ conservation are gene banks, germ plasm bank, seed bank. **''In situ coservation''** is the protection of species (wild life) in thier natural habitat or National parks.

1. **The world's first National Park (America) -** Yellow stone National Park
2. **India's first National Park -** Jim Corbett National Park - Nainital (Uttaranchal)
3. **Smallest tiger reserve in India -** Ranthambore National Park - Sawaimadhopur (Rajasthan). It is famous for Asiatic wild ass.
4. **Largest Tiger reserve in India -** Nagarjuna Sagar Saisailum Sanctuary - Guntoor - Andhra Pradesh.
5. **Nandan-Kanan zoo is known for -** White tiger.

   Note : Tahr and Sunderbans (W. Benal) is also famous for tigers.
6. **Periyar wild life Sanctuary (kerala) -** Famous for elephant and ohters.
7. **Valley of flower National Park -** It is situated at Chamoli-Garhwal (Uttaranchal)
8. **Flamingoes** are protected in Chilka lake Balagaon (Orissa)
9. **Rachel carson written a book ''Silent Spring'' -** concerned with awareness about "Nature conservation and Enviroment" - 1962.

   Note : In it was mentioned the effect of DDT on birds. The population of Lady bird bettle declined.
10. **The black buck** is one of the most graceful antelopes native of India. The male possesses a pair of spirally twisted horns. Once abundant in several parts of India. Its population had come untill the enforcement of the wild life (Protection) Act.

SOME IMPORTANT INFORMATIONS :

1. (i) **Natinal Forest Policy revised in - 1988.**

(ii) **Biodiversity act of India** was passed by the Parliament in the **year-2002.**

(iii) **Forest Act-1927.**

2. **Wild life protection act 1972 (Revised in 1991) :**

Objectives :

(1) Restriction and Prohibition on hunting of animals.

(2) Protection of specified plants.

(3) Setting up and managing Sanctuaries and National parks.

(4) Empowering zoo authority.

(5) Control of trade and commerce of wildlife.

3. **Chipko Movement** was born in **March-1973** at **Gopeshwar in Chamoli district.** The movement had two leaders - **Sundarlal Bahuguna** of **Silyara** in **Tehri and Chandi Prasad Bhatt of Gopeshwar.**

Appiko Movement - Similar type movement Appiko movement was under taken by **Poundurang hegde** in **south in 1983.**

SPECIAL WILDLIFE PROJECTS IN INDIA :

Project tiger - Running since 1 April 1973 - Central Government.

The Gir Lion Sanctuary Project - Running since 1972-Central Govt. and Gujrat Govt.

Himalayan Musk Deer Project - U.P. Govt. IUCN and Central Govt.

The Manipur Brow - Antlered Deer Project - Running since 1977

Project Hangul - Since 1970 - J. & K. Govt. IUCN, WWF.

Crocodile Bredding Project - Since 1975 UNDP, Central Govt.

Project Elephant - Recently started.

ABOUT WILDLIFE :

Red Data Book : This book contains a record of **animals and plants** which are known be in danger. This Book is maintained by the IUCN (International Union of Conservation of Nature and Natural Resources).

Green Data Book : A book containing a list of rare plants in a protected area like Botanical gardens.

Silent Valley : It is tropical evergreen forest in Kerela (Palghat) declared as National Reserve Forest. It is called silent valley because there is no noise in the forest during night, even that of cicadas, as they are not found there. It is related to conservation of forest.

Butterfly Park : India's first and only butterfly park was established in 1992 near **Gangtok (Sikkim)**

ENVIRONMENTAL POLLUTION, ISSUES AND NATURAL RESOURCES

POLLUTION :

"Any undesirable change in physical, chemical or biological characteristic of air, water and land which is harmful to the man directly or indirectly through the animals, plants industrial unit or raw materials is called **pollution**."

Pollutants : "Any material or product of man or nature which leads to pollution is called pollutants".

Type of Pollutat Usually Pollutants are Divided into Following Categories

1. **Nondegradable pollutants :** Many of such pollutants are usually not degraded or degraded partially in environment. Such as **aluminium pecks, Mercury compounds of phenols, Glass, D.D.T., Benzene, BHC pesticides,** etc.

   They are collected in the environment and cause polluton. These pollutants are harmful even in low concentration and harm increases with their increasing concentration. No treatment is found in the nature for their recycling. There are only two methods by which we can stop the pollution caused by pollutant.

   (i) Such type of substance should be banned by law.

   (ii) Use their alternative substance.

2. **Biodegradable pollutants -** The **domestic sewage papers, woods, garbage, live stock wastes,** etc. are easily **degraded completely by microorganisms,** it becomes useful. But if these materials enter the environment in such large quantities, that they can not be degraded completely then addition of these materials cause pollution in environment.

   1. **Primary pollutants -** These perists in the form in which they are added to the environment.
      eg., DDT, CO etc.
   2. **Secondary pollutants -** These are formed by chemical reaction amongst primary pollutants.
      eg., **Photochemical smog, London smog, PAN, O_3.**

   Synergism - Formation of secondary pollutants is known as synergism. Secondary pollutants are more toxic than primary pollutants.

1. **Quantitative pollutants -** These are the susbtance which occur in nature but become pollutant when their concentration reaches beyond a threshold value in the environment.
   eg., CO_2, Nitrogen oxide.
2. **Qualitative pollutants -** These are the substance which do not occur in the environment but are passed in through human activity.
   eg., Fungicides, Harbicides, DDT etc.

Other type of pollution :

1. **Natural pollution -** Caused by natural sources like, **CH_4 from paddy fields** and **cattle, marsh, forest fire.**
2. **Anthropogenic pollution -** Caused by **human activities.**

   Main sources of pollution :

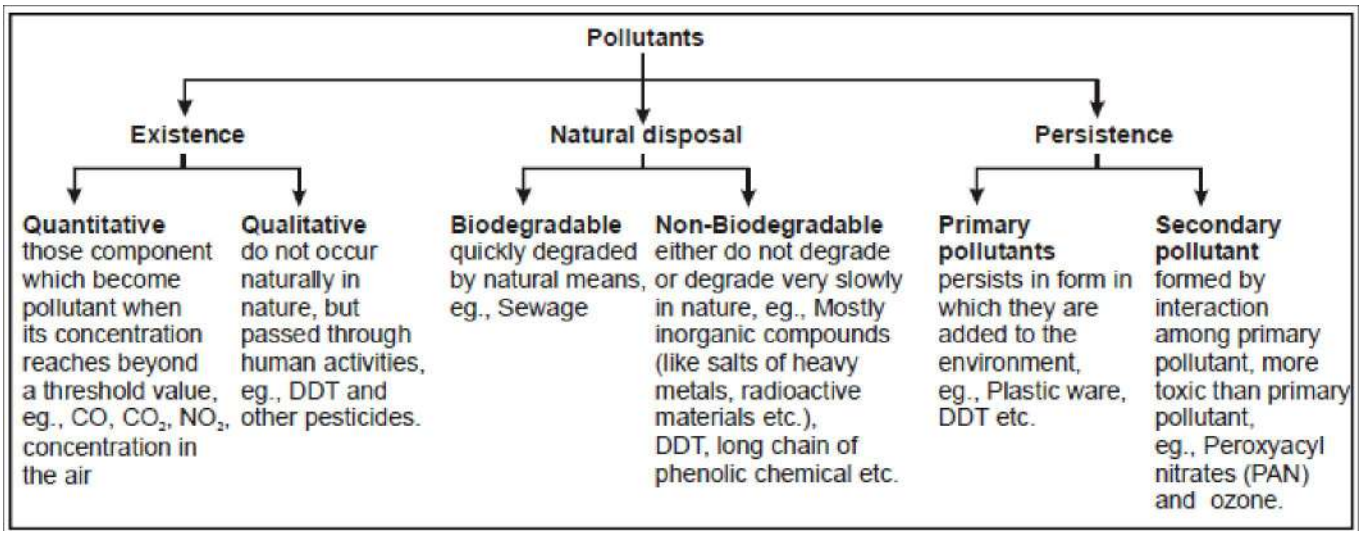
   (i) Point source pollution - Where the effluent discharge occur at a specific site.
   eg., factory outlet and Municipal sewage

   (ii) Line source pollution - It is passed along a narrow belt, Roads,
   eg., Rods, Railway tracks.

(iii) Diffuse source pollution - It is over a large area.

eg., sprayed fertilizer or pesticides through run off.

(iv) Area source pollution - Industrial estate and mining area.



AIR POLLUTION :

(A) The air pollution is caused due to addition of unwanted substances or gases. The atmospheric pollution is mainly caused by the activities of man and concentrated to the inhabited and the industrial complexes in cities.

(B) There are two main categories of air pollutants :

(i) Gases **(ii) Particulates**

(i) Gases

The gaseous materials include various gases and vapours of volatile substances or the compound with a boiling point below 200ºC.

Particulate matter :

(a) Particulate matter consist of solid particles or liquid droplets (aerosols) small enough to remain suspended in air. eg., soot, smoke, dust, asbestos, fibres, pesticides, some metals (including Hg, Pb, Cu and Fe) and also biological agent like tiny dust mites and flower pollen.

(b) Atmospheric particles having diameter > 10 μm, generally settle out in less than a day, whereas particles with diameters 1 μm or less can remain suspended in air for weeks.

(c) Suspended particulate matter in the lower atmosphere (troposphere) causes and aggravates human respiratory illness, like asthama, chronic bronchitis etc.

(d) According to **Central Pollution Control Board (CPCB) particulate size 2.5 micrometers** or less diameter (PM 2.5) are responsible for causing harm to human health as inhaled deep into lungs can cause breathing and respiratory symptoms, irritation, inflammations, damage to lungs & premature death.

MAJOR AIR POLLUTANTS AND THEIR EFFECTS

1. Carbon monoxide (CO) -

Source - It is the main air pollutant released from smoke of automobiles.

Effect - Carbon monoxide is highly toxic gas, it **combines with haemoglobin** of the blood and blocks the **transportation of oxygen.** Thus, it **impairs repsiration** and it causes **death due to asphyxia** when inhaled in large amount.

2. **Unburn Hydrocarbons - (3,4 Benzopyrine, CH_4, Benzene)**

Source - These are mainly released from **automobiles** and **burning of fossil fuel (coal, petrol, diesel). Methane** (CH_4) is the most abundent hydrocarbon in atmosphere and its main source is marshy area and paddy field.

Effect - Hydrocarbons cause **lungs cancer.**

Polynuclear hydrocarbon is major hydrocarbon pollutant which cause cancer.

3. **Ethylene -**

Source - It main sources are **automobiles, chimneys.**

Effect - Falling of leaves without particular reason, falling of **flowering bud before** time.

4. **Nitrogen oxide (NO, NO_2) -**

Source - Burning (combustion) of fossil fuel in automobiles.

Effect - These nitrogen oxide form **photochemical smog** in atmosphere and release ozone. Nitrogen oxide also responsible for **acid rain.** Entry of these nitrogen oxide causes respiratory trouble such as **emphysema, bronchitis, swelling of lungs** and **lungs cancer** etc.

5. **Sulphur oxide (SO_2, SO_3)**

Source - These are most harmful gaseous pollutants, main source of sulphur oxides are **coal burning, smelters, oil refineries.**

Effect - Lichen and mosses do not grow in SO_2 polluted areas, Lichen and mosses are indicator of SO_2 pollution. Oxides of sulphur produce **acid rain** and **smog** in atmosphere.

6. **Smoke - (SO_2, SO_3, NO_2, NO, CO, CO_2)**

SECONDARY POLLUTANTS :

A. Smog (Smoke + Fog) -

This word was given by **Desvoeux**. Smog/Smoke is measured by **Ringlmann method.**

(a) Los Angles Smog or Photochemical smog -

It was first observed in Los Angeles. In this process **smoke, fog, nitrogenoxide, hydrocarbons, oxygen, UV light** and **high temperature** are **essential**. These components react with each other and form reddish brown smog (PAN + O_3 + Nitrogen oxides) or brown haze/brown air. Los angeles smog i**s light induced smog.**

Effect -

(i) Due to smog elastic susbtances (rubber/tyres) also affected. Smog causes damage in rubbers. During smog **peroxyacetyl nitrate (PAN)** is formed. PAN stops or **inhibits the photolysis of water** in hill reaction of photosynthesis and inhibit the photosystem-II. PAN also **inhibit the chlorophyll formation in plants.**

(ii) In animals PAN cause **irritation in eyes** and **harms the lungs.**

(iii) Ozone causes harm to mucous membrane.

(b) London smog or sulphur smog -

It was first observed in London. In this process **coal, smoke, fog, sulphure oxide** and **low temperature** are involved**.** These components react with each other and form vapour (Fog) of H_2SO_4 which is known as London smog.

Effect -

Due to inhalation of H_2SO_4 vapour with fog **4000 people died in London in 1952.**

B. Acid rain-

This word was given by **Robert August.** NO_2 and SO_2 released from different sources in form of smoke and dissolved in atmospheric water vapour to form sulphuric acid and nitric acid (H_2SO_4 + HNO_3). These acids come down on earth with rain water, this is called acid rain.

Wet deposition :- If acid comes down on earth with **rain, fog** and **smog,** it is known as wet deposition.

Dry deposition :- If acid settled on earth surface through **solid dust particles** with **nitrate** or **sulphate**, this is called dry deposition.

Note :

(i) **The pH of acid rain is lesser than 5.6**

(ii) In acid rain the ratio of H_2SO_4 and HNO_3 is **7 : 3** (70% H_2SO_4 + 30% HNO_3)

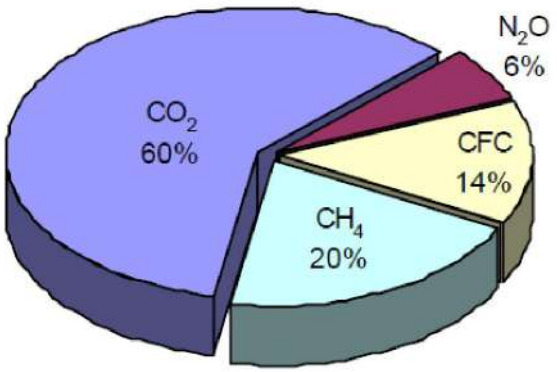
Effect -

(i) Due to acid rain acidity of soil and water increases.

(i) Acid rain also cause **damage historical monuments. eg., Taj Mahal, Red fort.**

GREEN HOUSE EFFECT

Usually carbon dioxide is not considered as pollutant, but its higher concentration forms a thick layer above the earth's surface, checks the radiation of the heat from the earth surface. Because of this, temperature of the earth's surface increases, this is called **"Greeen House Effect" or Global warming.**



The relative contribution of different green house gases

Main green house gases are **CO_2, CH_4, CFC, N_2O.** These are **radiation active gases,** Because they absorb long wave infra red radiations. SO_2, NO_2, O_3 **not** contribute in green house effect. Water vapour are also released from industries and agriculture which are responsible to increase the green house effect.

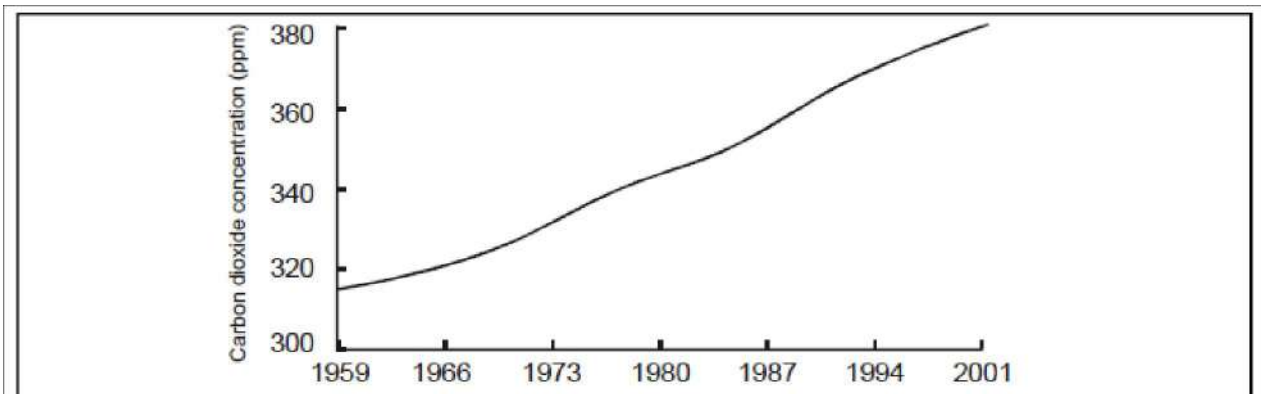


Diagram IV : Showing the increase in mean carbon dioxide concentration in the atmosphere from 1959 to 2001 based on a data from Maunaloa observatory, USA

☛ In this phenomenon cover of CO_2 layer around the earth, allow the short wavelength (U.V. rays) incoming solar radiation to come in but does not allow the long wavelength (IR) of out going heat radiation from warm surface of earth and surface keep to earth warm. The **consequent increase in the global mean temperature** is reffered to as a **global warming.**

Effects of Green House Gases :

1. It has been observed that in the recent past, the level of CO_2 in the atmosphere has increased from **280 ppm to 368 ppm in 1956 to 2002.** If present growth rate is continued then the amount of CO_2 will be doubled upto 2020 century. Even 2-3ºC rise in temperature will be lead to **melting of glaciers** and **ice caps of polar region** and consequently the **floods in rivers, rise in sea** level and **changes in cycle of rain.** Islands may be submerged in sea water. **CO_2 conc. in 2009-2010 is 385ppm.**
2. **Carbondioxide fertilisation effect -** Due to increased CO_2 concentration the rate of photosynthesis will increase (up to a few year). The response of the plants to elevated concentration of CO_2 is known as the CO_2 fertilization effect, if would be **shown by C_3 plant,** if rest of environment factors are optimum. The **stomatal conductance decrease (due to partial closure of stomata).** Thus **transpiration may be reduced** and **water use effeciency will increase.** It allows many species to grow successfully in regions of water scarcity.

   Under high CO_2 conc. **higher rate of photosynthesis** provide high amount of food to roots. This **greater root production** enhence mycorrhizal development and **N_2 fixation in root nodules** and enables the plant to grow in nutrient poor soil.

   But all these effects are possible only when the rest of environmental factors are optimum.
3. The **global mean temperature** has increased by **0.6ºC in 20th century.** Depletion of ozone layer in stratosphere.
4. **Sea level has been raised by 1 to 2 mm per year during 20th century.**

Control of Global Warming :

1. Reducing the green house gases emission by limiting uses of fossil fuel and developing alternative renewable sources of enenrgy (wind and solar energy).
2. Increasing the vegetative cover mainly forests for photosynthetic utilization of CO_2.
3. Minimizing the use of Nitrogen fertilizers in agriculture for reducing N_2O emission.
4. Developing substitute for CFC's.

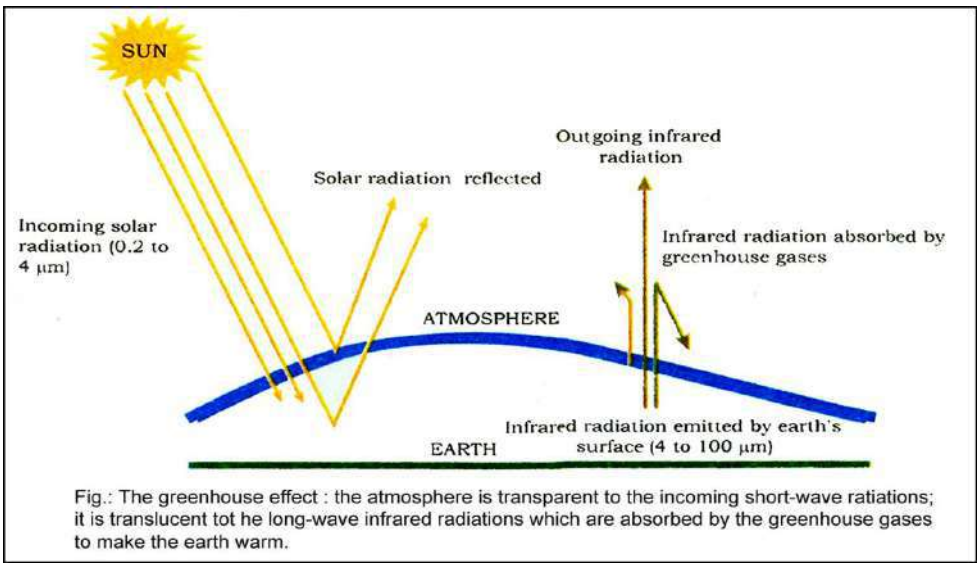

Fig.: The greenhouse effect : the atmosphere is transparent to the incoming short-wave ratiations; it is translucent tot he long-wave infrared radiations which are absorbed by the greenhouse gases to make the earth warm.

1. **Control of particulate matter -** Two devices are use to remove particulate air pollutants.
   (a) Arresters **(b) Scrubbers**

(a) ARRESTERS :

These are used to separate particulate matters from **contaminated air.**

Arresters are of different types :

(i) Cyclonic separators and Trajectory separators : These are commonly used to separate out particulate matters from **industrial emissions with minimum moisture content.** These separators work on the principle of **dust separation by centrifugal force.**

(ii) Electrostatic Precipitator : It is the **most efficient device** to remove fine particulate pollutants. Electrostatic precipitation device work on the principle of **electrical charging of the dust particles** and collecting it on a differently charged platform.

It can remove 99% of particulate matter present in exhaust form a **Thermal Power Plant.** It has **electrode wire (act as anode)** which maintained at several thausend volts, which **produce carona** and release **electrons.**

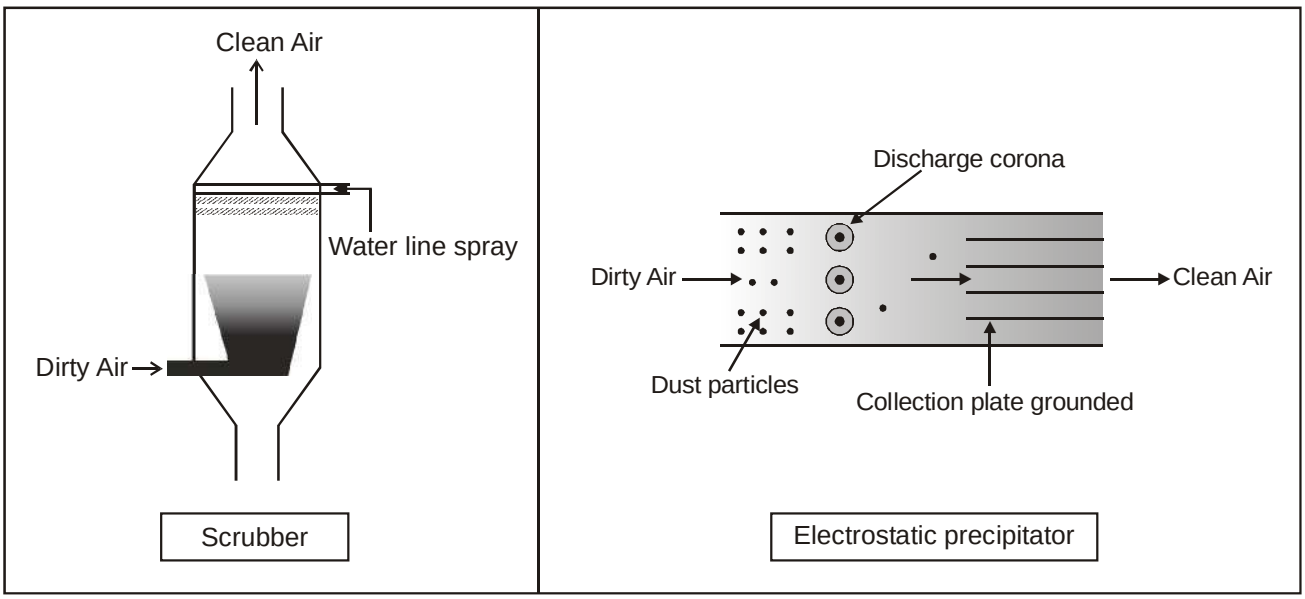
(a) These electrons attached to dust particles providing them negative charge. The base have **collecting plate (acts as cathod)** and attracts the charged dust particles.

(b) The low velocity air is provided between the plates which allow the dust to fall.

(b) SCRUBBERS:

(i) These are used to clean air for both dust and gases. Wet and dry two types of scrubbers are used for dust separation.

(ii) They can **remove gases like sulpher**. In scrubber the exhaust is passed through a sprey of water or lime.



2. **Control of gaseous pollutants : Combustion**, **absorption** and **adsorption technique** are used to control gaseous pollutants.

(a) Combustion - In combustion process, **oxidisable gaseous pollutants are completely burnt** at a high temperature. Petrochemical, fetilizer, paints and varnish industries used combustion control of gaseous pollutants.

(b) Absorption - In this technique, gaseous pollutants are absorbed in suitable **absorbent materials**.

(c) Adsorption - This technique is applied to control toxic gases, vapours and inflammable compounds that could not be efficiently removed or transferred by a fore said technique. Such air pollutants are adsorbed on large solid surface.

(d) Catalytic converters : Automobiles are a mojor cause for atmospheric pollution in the metro cities. Proper maintenance of automobiles along with use of lead free petrol or diesel can reduce the pollutants they emit. **Catalytic converters** having expensive metals **platinum, palladium** and **rhodium** as the catalysts, are fitted into automobiles for **reducing emission of poisonous gases.** As the exhaust passes they catalytic converter, **unburnt hydrocarbons are converted into CO_2** and **water**, **CO and nitric oxide are changed into CO_2 and nitrogen gas repectively.** Motor vehicles equipped with catalytic converter should **use unleaded petrol because lead in the petrol inactivates the catalyst.**

Some other Method -

1. Engines should not be kept started when vehicle is in rest condition.
2. **Barium compound mixed with petrol** reduce the smoke.
3. It is also very essential to check the quality of gases released from the factories.
4. Industries should not be established at one place.
5. The smoke should be released into the atmosphere after filtration and purification (by cyclone collector or electrostatic precipitators)
6. To seperate particles larger than 50 μm, gravity settling tanks or porous filters are being used.

Controlling Vechicular Air Pollution : (A case study of Delhi)

1. With its very large population of vehicular traffic, Delhi leads the country in its level of air-pollution- it has more cars than the state of Gujrat and West Bengal put together.
2. In the 1990s, Delhi ranked fourth among the 41 most polluted cities of the world. Air pollution problems in Delhi becomes so serious that a Public Interest Litigation (PIL) was filed in the Supreme Court of India. After being censured very strongly by the Supereme Court, under its directives, the government was asked to take, within a specified time period, appropriate measures, including switching over the entire fleet of public transport, i.e., buses, from diesel to **compressed natural gas (CNG).** All the buses of Delhi were converted to run on CNG by the end of 2002.
3. Why CNG is better than diesel. The answer is that **CNG burns most efficiently,** unlike petrol and diesel, in the automobiles and very little of it is left unburnt. Moreover **CNG is cheaper than petrol or diesel, cannot be siphoned off by thieves and adulterated like petrol or diesel.**
4. The main problem with sweitching over to CNG is the difficulty of laying down pipelines to deliver CNG through distribution point / pumps and ensuring uninterrupted supply.
5. Simultaneously parallel steps taken in Delhi for reducing vehicular pollution include **phasing out of old vehicles, use of unleaded petrol, use of low-sulphur petrol and diesel, use of catalytic converters in vehicles,** application of stringent pollution-level norms for vehicles, etc.
6. The Government of India through a new auto fuel policy has laid out a roadmap to cut down vehicular pollution in Indian cities. More stringent norms for fuels means **steadily reducing the sulphur and aromatic content in petrol and diesel fuels. Euro-II norm,** for example stipulate that **sulphur be controlled at 350 parts-per million (ppm) in diesel** and **150 ppm in petrol.**
7. Aromatic hydrocarbon are to be contained at 42% of the concerned fuel. The goal, accroding to the roadmap, is to **reduce sulphur to 50 ppm in petrol and diesel** and bring down the level of 35%. Corresponding to the fuel, vehicle engines will also need to be upgraded.
8. The **Bharat Stage-II (equivalent to Euro-II norms),** which currently in place in Delhi, Mumbai, Kolkata, Chennai, Banglore, Hyderaba, Ahmedabad, Pune, Surat, Kanpur and Agra, **will be applicable to all automobiles throughout the country from 1 April 2005.**
9. All automobiles and fuel-petrol and diesel- were to have met the **Euro-III emission specification** in **these 11 cities from 1 April 2005** and have to meet the **Euro-IV norms by 1 April 2010.** The rest of the country will have **Euro-III emission norm compliant automobiles and fuels by 2010.**

OZONE DEPLETION

1. Ozone is present in less quantity in atmosphere. But at height of **16 km to 25 km** on earth, concentration **of ozone is maximum in stratosphere.**
2. Naturally there is bad ozone and good ozone. 'Bad' ozone, formed in the lower atmosphere (troposphere) that harms plants and animals. There is 'Good' ozone also; this ozone is found in the upper part of the atmosphere called the **stratosphere,** and it acts as a shield absorbing ultraviolet radiation from the sun.
3. UV rays are highly injurious to living organisms since **DNA and proteins** of living organisms preferentially **absorb UV rays,** and its **high energy, breaks the chemical bonds within these molecules.** The thickness of the ozone in a column of air from the ground to the top of the atmosphere is measured in terms of **Dobson unit (DU).**
3. Ozone gas is continuously formed by the action of UV rays on molecular oxygen in the stratosphere. There should be a balance between production and degradation of ozone in the stratosphere. Of late, the balance has been disrupted due to enhancement of ozone degradation by **chlorofluorocarbons (CFC's), CH_4, N_2O.**
4. CFCs find wide use as refrigerants. CFCs. discharged in the lower part of atmosphere move upward and reach stratosphere. In stratosphere, UV rays act on them releasing Cl atoms. Cl degrades ozone releasing molecular oxygen, with these atoms acting merely as catalysts; Cl atoms are not consumed in the reaction.

(i) In this process **one chlorine atom** convert one each O_3 molecules into O_2 by photodissociation.

(ii) The life time of **CF_2Cl_2 (CFC-12)** is **139 year** while that for **$CFCl_3$ (CFC = 11)** is about **77 years**.

Chemical process of ozone depletion - chain reaction

$$CF_2Cl_2(g) + hv \longrightarrow Cl^{\cdot}(g) + {}^{\cdot}CF_2Cl(g)$$

$$Cl(g) + O_3(g) \longrightarrow ClO^{\cdot}(g) + O_2(g)$$

$$ClO^{\cdot}(g) + O(g) \longrightarrow Cl^{\cdot}(g) + O_2(g)$$

↑

Active chlorine

5. Hence, whatever CFCs are added to the stratosphere, they have permanent and continuing affects on Ozone levels. Although ozone depletion is occuring widely in the stratosphere, the depletion is particularly marked over the **Antarctic region**. This has resulted in formation of a large area of thinned ozone layer, commonly called as the **ozone hole**.
6. For making these discoveries related to ozone depletion or O_3 destructruction. **Sherwood Rowland, Mario Molina, Paul Curizen honoured with Nobel Prize for chemistry in 1995.**
7. U.V. radiation of wavelengths shorter than UV-B, are almost completely absorbed by Earth's atmosphere, given that the ozone layer is intact. But, **UV-B damages DNA and mutation** may occur. It causes **aging of skin, damage to skin cells** and **various types of skin cancers (Melanoma). In human eye, cornea absorbs UV-B radiation,** and a high dose of **UV-B causes inflammation of cornea,** called **snow blindness, cataract**, etc. Such exposure may **permanently damage the cornea.**
8. Recognising the deleterious affects of ozone depletion, and international treaty, known as the **Montreal Protocol,** was signed at **Montreal (Canada) in 1987 (effective in 1989) to control the emission of ozone depleting substances.**
9. Subsequently many more efforts have been made and protocols have laid down definite roadmaps, separately for developed and developing countries, for reducing the emission of CFC's and other ozone depleting chemicals.
10. At normal temperature and pressure thickness of ozone layere is **3 mm.** (But at poles thickness of ozone layer is **4 mm).**

11. **Ozone hole was first discovered in 1985 over Antarctica** by **Nimbus-7** satalite. It is also confirmed at **Arctic in 1990.**
12. The aerosols like C.F.C (Chloro flouro carbon) release into the atmosphere from the **refrigerators**, **air conditioners** and **jet planes** deplete or **reduce the ozone layer.** This is called ozone depletion and these substance are called **O.D.S. (ozone depleting substance).** This thin layer ozone is also known as ozone holes. (The decline in ozone thickness in spring time (Feb-April) is called ozone hole.)

$$O_3 \xrightarrow[\text{C.F.C.}]{\text{U.V.}} O_2 + O$$

13. Number of pollutants like **CFCs (14% of total depletion)**, Nitrogen oxide [3.5%], CH_4 and halogens (chlorine) cause depletion of ozone layer. **Maximum ODP** (ozone depleting potential) is of **CFCs due to release of chlorine.**

Some other Informations :

1. Thickness of ozone layer is measured by **Dobson unit** (1 DU = 1ppb)

Year	**Thickness of ozone layer**
1979	225 DU.
1985	136 DU.
1994	94 DU.

2. Ozone hole occurs mainly during (July - October) and lowest during spring time (Feb. - Apr). Means concentration of O_3 is highest in stratosphere in Feb.-April (spring season) and lowest during July-October (Full season).

SOUND POLLUTION / NOISE POLLUTION

1. Air (Preventation and Control of pollution) Act. 1981 amended in 1987 to include **noise as Air pollution. Noise is undesired high level of sound.**
2. Increase in the noise in the atmosphere is called noise pollution or sound pollution. Noise is a loud and unwanted or unpleasant sound. The common things which are responsible for noise pollution are- industries and mills, means of transportation, television, stereo, loud speakers and jet plane etc.

   Intensity : The intensity of sound is measured in **bel or decibel** [1 bel = 10 decibel]. A man can hear at **0-decibel.** Normally at 25 decibel, the atmosphere may be peaceful. **Above 80 decibel intensity** of sound is called **noise pollution.**

   Effect : It causes **drousyness, irritation, weakness** and **130-140 decibel causes heart palpilation and pain.** Noice pollution **reduces the capacity of hearing** and result in **headache. Sudden excitation in skin, constriction of gastric muscles starts above the 90 decibel.** It also produces excitation in habit of man and anger. Noise pollution causes **ulcers, heart disease, high blood pressure, higher secretion of adrenal hormones** etc. Excluding these, high intensity of sound can also **break down the walls of the houses.**

   Control : Noise pollution can be control by the use of such type of apparatus which can decrease the intesity of sound at place or origin. Sound **absorbents** must be used to minimise the sound. Growing of more plants can also minimise the noise pollution, by **Muffling.**
3. Strict following of laws like delinitation of horn free zones around Hospitals, Schools, permissible sound level of crackers and loud speakers, timing after which loud speakers not played etc.

	Day time	**Night time**
Industrial	75 dB	70 dB
Commercial	65 dB	55 dB
Residential	55 dB	45 dB
Silence zone	50 dB	40 dB

Very Quiet	20-30 dB	Sound quiet place is - 20 dB, Motion Picture Studio, Broadcasting studio
Silence/Quiet	30/35 - 50 dB	Hospitals (30 - 35), Schools (45 - 50), Libraries (45 - 50), Offices (40 - 50)
Normal Voice	55 dB	
Conversational speech	60 dB	
Moderately Loud	70 dB - 90 dB	Factories (60 - 65 dB) Average traffic - 70 dB Heavy city traffic - 90 dB
Uncomfortable	above 100 dB	Air craft (120 dB)
Painful	above 130 dB	Rocket (180 dB) Jet plane (150 dB)

WATER POLLUTION

The water pollution is caused by the addition of organic and inorganic chemicals as well as the biological materials which change the physical and chemical properties of water. This harmful process is called **water pollution**.

The water pollution is caused by many sources such as **sewage matter, industrial wastage, agriculture wastage, domestic wastage, hot water of thermal plant and nuclear reactors etc.**

(i) Water having **D.O. (Dessolved Oxygen)** content below **8.0 mgL^{-1}** may be cosidered as **contaminated** and below **4.0 mgL^{-1} heavily polluted.**

(ii) D.O. is measured by **oximeter.**

1. Biochemical Oxygen Demand (B.O.D.) :

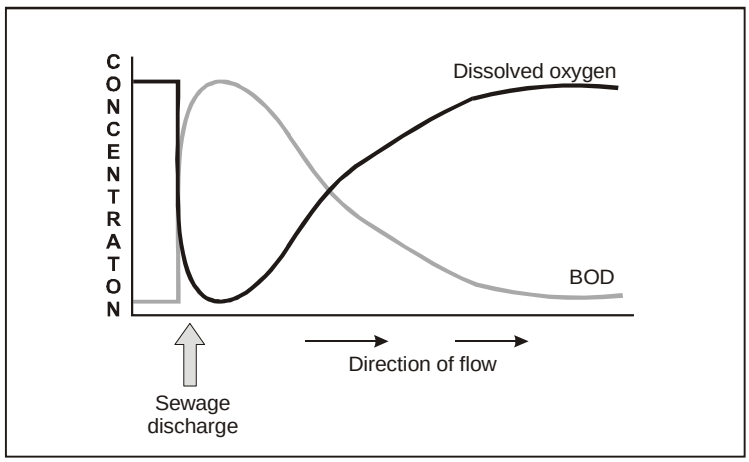
(i) The water pollution by organic wastes is measured in term of Biochemical oxygen demand. It is the amount of dissolved oxygen **(D.O. = Dissolved Oxygen)** needed by bacteria in decomposing the organic wastes present in water.

B.O.D. increased = water polluted B.O.D. $\propto$ input of organic wastes

(ii) If **B.O.D. is increased dissolved oxygen is decreased in water.** Higher amount of organic waste increase the rates of decomposition in water. O_2 is rapidly consumed by microbes, thereby causing drop in D.O. content in water.

(iii) **Dophnia** is the indicator of **B.O.D.**

(iv) Biochemical oxygen demand [BOD] is the amount of **oxygen taken up by the micro organisms present in water.** BOD is measured by keeping a sample of water containing known amount of oxygen for **5-days at 20ºC in the dark.** At end of this period the oxygen content is again measured. A high BOD indicates intense level of microbial pollution.



2. **Chemical Oxygen Demand (C.O.D.) :**

   It is the **oxygen requirement by chemicals for oxidation of total organic matter** (biodegradable + non biodegradable) in water.

   Note : C.O.D. value is always higher than B.O.D. value.

3. **Biological magnification :**

   (i) The non biodegradable heavy metals (Density > 5g/cm^3) pollutant like **Al, Hg, Fe, D.D.T., Pesticides, Phenolic compound ABS** (Alkyl benzene sulphonate) are not decomposed by micro-organisms.

   (ii) **They get accumulated in tissue in increasing concentration along the food chain at successive trophic levels is called biological magnification. The highest concentration occur's in top consumer.**

   (iii) It occurs as the toxic substances accumulated by organisms cannot be metabolised or excreted and pass on to next higher trophic level. The most common biomagnification is of Hg and DDT. The DDT concentration is starts from 0.003 ppb in water, it can ultimatly reach 25 ppm in fish eating birds through biomagnification.

   (iv) High concentration of **DDT** distrub **calcium metabolism** in birds, which causes **thinning of egg shell** and their **permature breaking,** eventually causing **decline in bird populations.**

4. **Eutrophication :**

   (i) The **process of nutrient enrichment of water and consequent loss of species diversity** (or death of aquatic animals) is reffered to as **eutrophication** and lake is known as **eutrophic lake**. In this process **presence of nutrients (Nitrogen and Phosphorous)** in lake stimulates **growth of algae (algal bloom)** increase organic loading and bring about reduction in the oxygen content of water causing death of aquatic animals.

   (ii) **Eutrophication is the natural aging of a lake by** biological enrichment of its water. Natural aging of a lake span thousands of years and lake finally converted into land due to deposition of silt. Pollutants from **man's activities like effluents from the industries and homes can radically accelerate the aging process,** this phenomenon is called **accelerated eutrophication.**

   (iii) In past century many lakes are eutrophicated by sewage and agricultural and industrial waste. The prime contaminations are **nitrate** and **phosphate**. Which acts as plant nutrients, which over stimulate the growth of algae causing unsightly scum & unpleasent order and depletes oxygen dissolved in water which harm aquatic life. The other pollutants flowing in lake may poison whole population of fishes, whose deposition also depletes dissolved oxygen and ultimately leads to death of lake.

   (iv) **B.O.D. of Eutrophic lake is very high.**

Water Pollution can be caused by the following man made sources

1. **Household Detergents :** The house hold detergents include the compounds of **phosphate, nitrate, ammonium** and **alkyl-benzene sulphonate** (ABS) etc. harmful substances which are gathered in water. **Alkyl benzene sulphonate** is non degradable, so its concentration increase which is harmful for aquatic life.

   Inorganic phosphorus and Nitrogen : The growth of algae is very fast due to presence of higher concentration of these susbtance. After the death of algae their carbonic material decomposed and deprived of oxygen, which causes death of aquatic organisms. The presence of large amount of organic material leads to eutrophication because of this, amount of oxygen in water decreases. Some of the algae also secrete toxic materials. The drinking of such polluted (toxic) water causes death of the cattles.

   For the control of this pollution, **lime ferric chloride**, etc. are used to precipitate the phosphate. **Zirconium** considered best for this purpose.

2. **Industial waste :** The wastes of industries are discharged into the running water of rivers and canals Industrial waste mainly contains inert **suspended particles such as dust, coal, toxins like acid, base phenol cyanides, mercury, zinc etc. inorganic reduced** material like-**ferrous salts sulphide, oil** and other residues of organic material and hot water. The water polluted by mercury, lead etc. metals when used which caused disorganisation of nervous system. It means it produces insanity. **The minamata disease was caused in Japan by eating of polluted fishes from the water polluted by mercury.** So, many humans died because of this disease.

   For the control of the industrial wastes and **toxic components should be purified before draining** into rivers lakes and ponds or sea. So the water pollutions by industrial effluents can be controlled by suitably treating the pollutants.

3. **Sewage :** Sewage contains highest amount of **carbonic materials** and **biological material,** as pollutants. These carbonic materials increase the number of decomposers like bacteria and fungus. The rate of reoxygenation is reduced as compared to deoxygenation in a water reserviors. The acceleration of microbial activity increases BOD of water. This indicates the essential amount of oxygen required for decomposition by bacteria.

Method of water purification :

Water (prevention and control of pollution) Act. 1974 passed by Government of India.

The industrial and municipal waste water are treated in "Effluent Treatment Plant" (ETP) Generally following treatments are given in ETP.

1. **Primary treatment :** This physical process involves the separation of large debris (particles), followed by sedimentation in tanks.
2. **Secondary treatment :** This is a biological process and is carried out **by microorganism.** In this process, the waste water is pumped in shallow stablisation or oxidation ponds or activated sludge chamber, where the microbes oxidise its organic matter. The process results in release CO_2 and this CO_2 is used by algae in photosynthesis. In photosynthesis process algae release O_2.
3. **Tertiary treatment :** This physiochemical process removes **turbidity** in waste water caused by the presence of nutrients (**Nitrogen**, **Phosphorus** etc.), **dissolved organic matter**, **metals, pathogens.**

(i) This step involves chemical **oxidation of waste** water by **strong oxidising agents**, such as **chlorine gas**, **perchlorate salts**, **ozone gas** and **UV radiations.**

(ii) After tertiary treatment, the wast-water can be discharged into natural water sources or used for irrigation.

Daphnia, trout fishes and larva of stone fly are sensitive to water pollution and show the intensity of water pollution.

A Case Study of Intergrated Waste Water Treatment :

(i) Waste water including sewage can be treated in an integrated manner, by utilising a mix of artificial and natural processes. An example of such an initiative is the **town of Arcata,** situated along the **northern coast of California.**

(ii) Calloborating with biologists from the **Humboldt State University,** the towns people created an **integrated waste water treatement process** within a natural system.

(iii) The cleaning occurs in two stages - (a) The **conventional sedimentation, filtering** and **chlorine treatements** are given. After this stage, lost of dangerous pollutants like dissolved heavy metals still remains. To combat this, an innovative approach was taken and (b) the biologists developed a series of **six connected marshes over 60 hectares of marshland.**

(iv) Appropriate plants, algae, fungai and bacteria were seeded into this area, which neutralise, absorb and assimilate the pollutants. Hence, as the water flows through the marshes, it gets purified naturally.

(v) The marshes also constitute a santuary, with a high level of biodiversity in the form of fishes, animals and birds that now reside there. A citizens group called **Friends of the Arcata Marsh (FOAM)** are responsible for the upkeep and safeguarding of this wonderful project.

(vi) All this time, we have assumed that removal of wastes requires water, i.e, the reaction of sewage. But what if water is not necessary to dispose off human waste, like excreta? Can you imagine the amount of water that one can save if one didn't have to flush the toilet? Well. This is already a reality. Ecological sanitation is a sustainable system for handling human excreta, using dry composting toilets.

(vii) This is a practical, hygienic, efficient and cost-effective solution to human waste disposal. The key point to note here is that with this compositing method, human excreta can be reycled into a resource (as natural fertiliser), which reduces the need for chemical fertilisers. There are working **'EcoSan'** toilets in many areas of **Kerala** and **Sri Lanka.**

RADIOACTIVE POLLUTIONS

The property of **sudden emmission of the different particles (charged) and radiation (rays) by the decay of atomic nuclei is called radioactivity** and the **elements** are called as **radiactive elements.** The radioactivity of the atmosphere is increased by Atomic power stations and Atomic tests. Radioactivity contributes to the **pollution of air, water** as well as soil and it proves extremely harmful to the organisms.

The various sources of radioactive materials as follows

(i) **Natural sources :** Cosmic rays, radiation from the earth such as Radium-224, Uranium-235, Uranium-238, Thorium-232, Radon-222, Potassium-40 and Carbon-14.

(ii) **Man made Radiation :** The radiations are released in the atmosphere during mining and purification of Thorium and Plutonium, and in producing nuclear weapons etc.

(iii) Nuclear reactor and nuclear fuel causes pollution by radioactive radiation. The nuclear fuel and coolants are the sources of radioactive radiation. Radioactive waste is also most important radio active pollutants because these wastes are not dumped at particular or right place.

(iv) **Other sources :** Some of the radioactive elements (isotops) are used in experimental laboratories for scientific researches which causes radio active pollution. X-rays are also proved to have harmful effects. In month of April 2010, 6 peoples at Delhi affected by such radioactive pollution by **coablt-60.**

Harmful radiation are divided into two categories

(a) Non ionising components : Non ionising components such as UV radiation. UV radiations are harmful for living beings. These radiations causes harm to the DNA, RNA and protein. Higher concentration of U.V. radiation can causes **xeroderma pigmentosum** disease. **UV radiations causes destruction of hydrogen bonds in DNA.**

(b) Ionising components : X-rays, α-particles, β-particles etc are ionising components. Ionising radiations are high energy radiations which release electrons from atoms and form a pair of negative and positive ions.

Ionising radiations cause **physical weakness** and **sudden death of living beings.** The effects like **hereditary changes, mutations**, **tumours**, **cancer** and developmental changes are seen due to radiations.

- Excluding these, **Iodine-131, Stronstium-90** are spreading in the environment through nuclear explosion and their effects remains for long duration. **Iodine-131** reaches in the human body through the food chain and causes harm to the **bone marrow, WBC, Lymph nodes** and **spleen**. Similarly, the lead to **skin cancer, sterility** and **poorer eye sight**. **Stronstium-90** leads to **bone cancer** and **degeneration of tissues.**

Control Measures : The competition of nuclear weapons should be completely banned to prevent radioactive pollution. An atomic bomb was first used in Hiroshima and then in Nagasaki in 1945 during

the second world war and due to that genetic disorders are present even today therefore, such type of atomic blast should be avoided. Leakage of nuclear reactions has been totally plugged. Transportation, use and disposal of the radioactive fuels and wastes has to be handled carefully.

SOIL POLLUTION

(A) Soil is also polluted through water and air. These pollutants are mixed into the soil through the rain water.

(B) Such as H_2SO_4 acid formed by mixing of SO_2 with rainy water in the air. The **fertilizers**, **pecticides** and **weedicides** are being sprayed over the crops. All these are mixed with soil to produce harmful effects. The **growth of plants is inhibitated or reduced** due to this type of pollution and sometime their death also take place.s Excluding these, soil pollution also caused by the disposal of house hold **detergent sewage, flowering oils, radio active substances and hot water etc.** The main pollutants of soil are **D.D.T.** and **weedicides [2, 4D** (2, 4 dichlorophenoxy acetic acid), **2, 4, 5-T** (2, 4, 5-Trichlorophenoxy acid.)**]**.

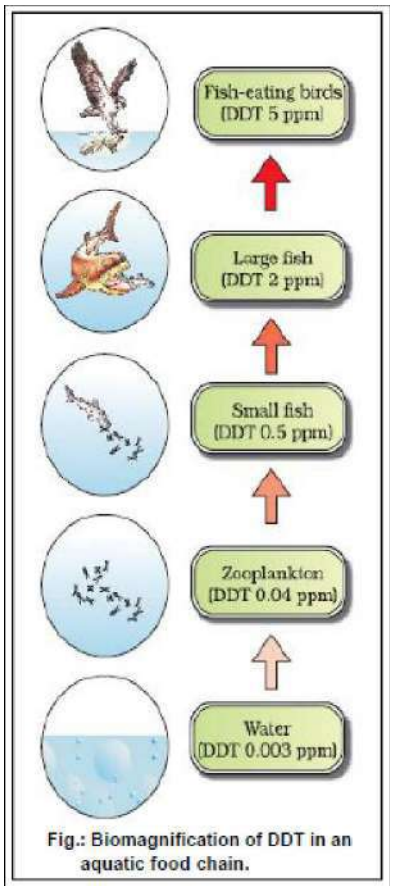


Fig.: Biomagnification of DDT in an aquatic food chain.

Case Study of Organic Farming

(a) Integrated organic farming is a cyclical, zero-waste procedure, where waste products from one process are cycled in as nutrients for other processes. This allows the maximum utilisation of resource and increases the efficiency of production.

(b) **Ramesh Chandra Dagar,** a farmer in **Sonipat, Haryana,** is doing just this. He includes **bee-keeping, dairy management, water harvesting, composting** and **agriculture** in a chain of processes, which support each other and allow an extremely economical and sustainable venture.

(c) There is no need to use chemical fertilisers for crops, as cattle excreta (dung) are used as manure. Crop waste is used to create compost, which can be used as a natural fertiliser or can be used to generate natural gas for satisfying the energy needs of the farm.

(d) Enthusiastic abut spreading infromtation and help on the practice of integrated organic farming. Dagar has created the **Haryana Kisan Welfare Club,** with a current memebership of **5000 farmers.**

(C) **Plant indicators :** "Such type of plants which give additional information about the environment or habitat are called plant indicators". eg., Growing of **Viola plants** indicates the presence of **Zinc in soil.**

(D) **Ocimum** shows presence of **copper in soil. Silene** (a plant) indicate presence of **cobalt**. The presence of **Lichens** shows that atmosphere is free from the pollutants like **CO** and **SO_2.**

SOLID WASTES

(A) Solid wastes means everything that goes out in trash. Muncipal solid wastes are waste from homes, offices, stores, schools, hospitals etc. which are collected and disposed by municipality. It comprise mainly paper, food waste, plastics, glass, metals, rubbers, leather, textiles etc.

(B) Generally, these wastes are burned. Sanitary landfills are adopted as the substitute for openbring dumps in which wastes are dumped in depression or trench and covered with dirt.

(C) But also cause harm as it cause danger of seepage of chemicals and cause pollution of underground water.

(D) Whole solid waste can be categorised as :

(1) Biodegradable (2) Recyclable (3) Non-biodegradable

(E) Plastic is non-biodegradable, so it use should be minimize by minimum use of plastic bag or use of ecofriendly packaging material.

(F) Electronic waste or e-waste are the irreparable computers, mobiles, electronic goods. E-waste are buried in landfills or incinerates.

(G) Over half of e-waste of developed world are exported to developing countries mainly China, India, Pakistan where metals like copper, iron, silicon, nickle and gold are recovered during recycling process.

(H) In these countries the peoples participate in recycling of e-waste are exposed to toxic substance present in e-waste.

(I) The ecofriendly recycling is only treatment of e-waste.

Case Study of Remedy for Plastic Waste :

(A) A plastic sack manufacturr in **Bangalore** has managed to find the ideal solution to the ever-increasing problem of accumulating plastic waste. **Ahmed Khan**, aged 57 years old, has been producing plastic sacks for 20 years. About 8 years ago, he realised that plastic waste was a real problem. **Polyblend**, a **fine powder of reycyled modified plastic,** was developed then by his company.

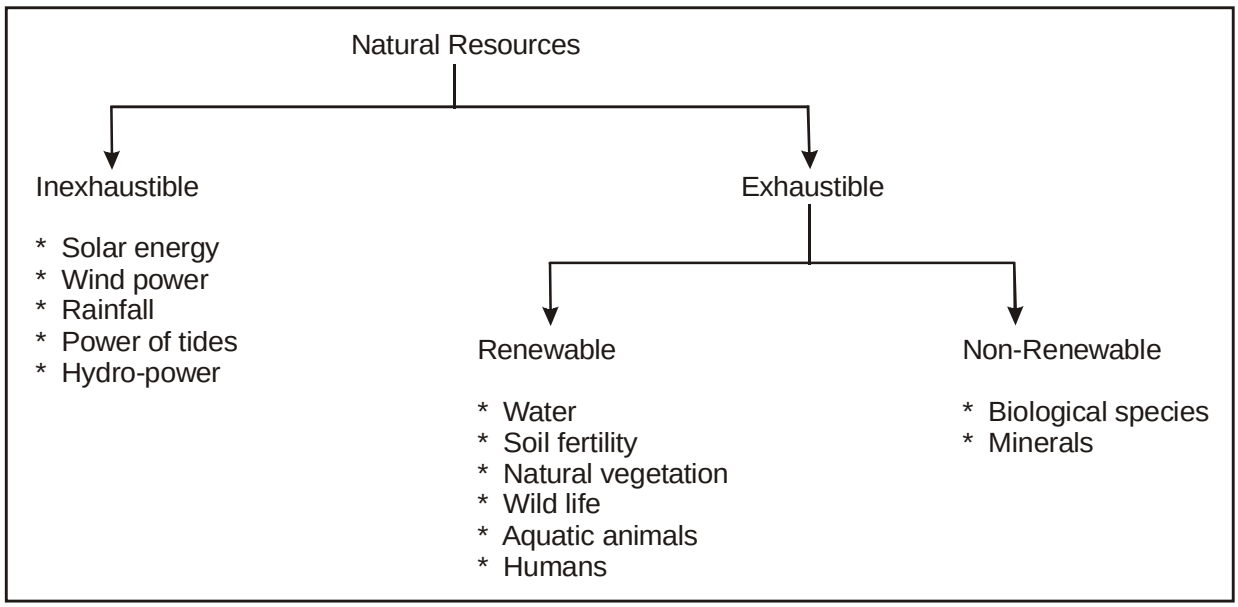
(B) This mixture is mixed with **betumen** that is used to lay roads. In collaboration with **R.V. Collage of Engineering and the Banglore City Corporateion**, Ahmed Khan proved that blends of **Polybend** and **betumen**, when used to lay roads, enhanced the bitumen's water repellant properties, and helped to increase road life by a factor of three.

(C) The raw material for creating Polyblend is any plastic film waste. So, against the price of Rs. 0.40 per kg that rag pickers had been getting for plastic waste, Khan now offers Rs. 6.

(D) Using Khan's technique, by the year 2002, more than 40 kms of road in Bangalore has already been laid. At this rate, Khan will soon be running short of plastic waste in Banglore, to produce Polyblend.

(E) Thanks to innovations like Polyblend, we might still avoid being smothered by plastic waste.

NATURAL RESOURCES AND THEIR CONSERVATION



The materials or any component, that can be utilised by man and are necessary for welfare of life, which is available in the natural environment in Atmosphere, Hydrosphere, Lithosphere is called natural resources.

e.g. O_2, Land, Soil water, Forest, Animals, Soil, microorganism.

Classification of natural resources :

1. **Inexhaustible resources :** Available in unlimited quantities, and the earth quantity may reamin unchanged by human impact.

   e.g. Solar Energy, Wind Power, Tidal power, Air, Geothermal Energy.

   Its quality can be affected due to continuous increase in human population. **e.g.** Air pollution

2. **Exhaustible resources :** These are likely to be finished by human use or unsustainable uses. **It is further divided in two groups**

   (i) Renewable resources : Those which are being continuously consumed by man but renewed continuously by nature, always available if managed in a proper way, otherwise they may even get totally exhausted.

   e.g. Biotic resources, forest, grazing animals, Rangeland, wild life, Agriculture crop system and fresh water yield, soil etc.

   (ii) Non renewable resources : They are not renewable after use and are not replaced by nature, can not be regained.

   e.g. Fossil fuel (Coal, Petroleum), Natural Gas, Nuclear energy, Biotic species, Minerals etc.

   Nuclear energy is non renewable and unlimited resources.

HYDROSPHERE OR WATER RESOURCES

1. Water is the major constituent of the hydrosphere and covers 3/4 of the earth's surface.
2. The total volume of water in the hydrosphere is 1.4 bilion cubic kilometer [Km^3], about **97.5 %** is the **ocean water**, unsuitable for human use. Only **2.5 %** is available as **fresh water.** About **1.97 %** is stored in **ice ocean** (Polar ice) and **glaciers** and **0.5 % is ground water** and **soil mositure (0.01 %).** The rest a [about **0.36 percent**] is distriuted in **lakes swamps, river** and **streams**.
3. About **84 %** of the total **global evaporation** occurs from **ocean surface** and **16 %** from land surface.
4. Kelps and a few marine animals are used as human food. Various chemicals are extracted as iodine and industrial gums from seaweeds. Agar-agar is produced from the **red algae-Gracilaria and Gelidium.** Alginin is derived from **Sargassum** and **Turbinaria species.**

LAND REOURCES

1. Earth's one-fourth area is formed by land.
2. About 4/5 of the land area is covered by soil.
3. At the beginning of 20th century, about 30 % of land in India was covered with forest but the end of the 20th century, the **forest cover reduced to 19.4 %.** Out of 19.4 %, only **12 % area covered by dense forest.**
   (i) Per capita forest area available in India is = **0.06 hec.**
   (ii) Per capita forest area avialble in world is = **0.64 hec.**
   (iii) In India **33 % forest area is recommended by national forest policy (1988).**

MINERAL RESOURCES :

Table - Some Important Mineral and some of their uses

1. **Metallic**

Minerals	**Uses**
Uranium	Nuclear bombs, electricity, tinting glass
Thorium	Nuclear bombs, electricity, gas mantles
Iron	Steel
Manganese	Alloy steels, disinfectants
Cobalt Alloy,	catalysts, radiography, therapeutics
Columbium	Stainless steel, nuclear reactors
Chromium	Metallurgy, refractory, chemicals
Molybdenum	Alloys steels
Nickel	Alloys
Tungsten	Alloy and chemicals
Vanadium	Alloys
Copper	Electrical products, alloys

Lead	Batteries, gasoline, paints, alloys
Tin	Tin plate, solder, chemicals
Zinc	Galanising, solder, die-materials, electrical wiring, utensils
Aluminium	Aircraft, rockts, building materials, electrical wiring, utensils
Magnesium	Structural refractories
Titanium	Pigments, aircraft, alloys
Zirocnium	Refractories, ceramics, metals, chemicals
Beryllium	Copper alloys, refractories, atomic energy field
Gold	Monetary purposes, jewellery,
Radium	Medical and industrial uses, radiography

2. Non-metallic Minerals

Minerals	Uses
Asbestos	Insulation, textiles, roofings, glass, ceramic, gasoline, solid propellants
Corundum	Abrasives
Feldspar	Ceramic flux, artificial teeth
Fluorspar	Flux, acid, refringerants, propellants
Phosphates	Fertilisers, chemicals
Salt	Chemicals, glass, metallurgy
Sulphur	Fertilisers, acid iron and steel industries

SOIL CONSERVATION

Soil is the mixture of living and nonliving materials. Soil is only responsible for anchorage and sustainance of the plants. The fertility of soil is reduced due to growing of plants again and again. Natural factors like water, air etc. are also responsible for transporting the top soil and decrease fertility. This is called soil erosion.

Soil Erosion

The structure of soil is different at the different depths of land. Its some upper part is called top soil. This region is very essential for the growth of the plants. Its thickness is about 15-20 cm. This **top soil** contains **humus** and **various micro-organisms** which increase the fertlity of the soil. When this **top soil** r**emoved by fast wind, fast rain, cyclone and running water** then it is called **soil erosion.** The following reasons are responsible to minimise the fertility power of soil in nature.

1. Shortage of mineral substance.
2. Leaching : The dissolved minerals go into the depth (lower layers) with water. Roots of the plants ususally remain in top soil so the minerals are not available to the plants.
3. Erosion is divided into the following types on the basis of erosing factors.

(A) Wind Erosion :- This type of erosion is carried by fast air, wind, cyclon etc. It is very harmful in dry places.

It is of three types

(a) Suspension : The air blows away the fine particles of soil in the form of dust in the atmosphere.

(b) Saltation : The medium size and medium weight particles of soil colliding with each other during the transfer through the air.

(c) Surface Creep : The heavy particles of soil screeping on the surface of the earth by the force of air.

(B) Water Erosion : The top soil transfer to the another place due to the fast water currents and heavy rains.

It is of three types

(a) Rill erosion : The net of groove are formed in the surface due to continuous irregular flow of water.

(b) Sheet erosion : A similar upper layer is removed on the surface through the water.

(c) Gully erosion : If the rill erosion takes place for long time then the groove are wider and deeper and are called gullies.

(C) Land Slides : Such type of erosion is found in such places where heavy rain takes place. Becuase of heavy rain, water flows in gullies which becomes more deeper and water is absorbed in higher amount. So that big pieces of land break off and slide. This type of erosion occurs in hilly areas.

(D) Stream bank or Riparian Erosion : The fast flow of water collides with the bank of river during the flood. So that soil is removed from the banks and by which the direction of flow of river may be changed.

(E) Overgrazing and Deforestation : Over grazing also removes the top soil and decrease the fertility of the soil. The formation of **desert in Rajasthan** has the main reason as **over grazing.** Simultaneously deforestation in the catchment areas in the hilly regions causes floods on the plain areas which destroys the useful part of the soil. Excluding all reasons, water fall erosion and soil pollution etc also reduce the fertility of soil.

Soil conservation

Some management measures are essential to check the soil erosion. Accordiing to this some principle are as follows :-

(i) To protect the soil form the drops of rainy water.

(ii) To stop the accumulation of water as well as stop the flow of water on the slopes.

(iii) To prevent the transportaion of soil particles.

(iv) To slow down the wind velocity on the surface of the earth.

Method of soil conservation :

Generally, two methods are used for soil conservation :-

(A) Biological Method : In which soil erosion is checked by the use of plants.

(B) Mechanical Method : These methods are also useful as biological methods in which soil erosion is prevented by dams, water reservoir etc.

(A) Biological Method : The following techniques are used in biological methods :

(i) Reforestation or Afforestation : Afforestation is the main measure to control the soil erosion, floods. Forest are very useful in dry places and deserts to prevent wind erosion. Plants are growing as wind breaker or wind barriers agains the direction wind currents. This **method is sucessful in Rajasthan** to prevent the spreading of desert in east direction. The plants used as wind breaks are as follows :-

Lawsonia alba (Mehandi), Oak, Calotropis gigantata, Agave americana,
Ber = Zizypus jujuba,
Kattha = *Acacia catechu*, Shisham = *Dalbergia sisso* and Mango = *Mangifera indica* etc.

(ii) Dry farming : This farming has been carried in low rain fall regions. Only few crops are grown in these places. Excluding this, grass land have also been developed for grazing of animals.

(iii) Contour farming : The ridges and furrows are formed in the field during the sowing of seed crops. Rain water accumulates in furrows which is absorbed by soil. The flow of water is minimised due to presence of ridges. Therefore soil erosion is checked.

(iv) Mulching : Stubble are left during the harvesting of crops in this method. These stubbles from a protective layer. The stalks of Maize, Bajara, Potatoes, Tobbaco are spreading in the field in the form of a layer, by which evaporation decrease and water holding capacity of soil increases. This method is **useful in both-wind erosion and water erosion.**

(v) Crop rotation : The repeated growing of the same crops in each year like Wheat and Maize, removes some of the specific (N_2) elements in the soil, so that this reduces its fertility. Changing of crops in each season is to maintain the fertility of soil. The **leguminous crop plants** increase content of nitrogen compounds, which improve the fertility of soil.

(vi) Strip cropping : The crops are grown in lines. These lines may be situated at 90º angle to the direction of wind or it may be parallel. The leaves of one type of plants stop the blowing of soil particles, such plants are known as erosion **checking plants.** The other line is having small plants which are unable to check the erosion are called **erosion permitting plants.** In this, alternation of two different type of leaves takes place.

(vii) Ley Farming : The grasses grow along with the crops in various season alternatively.

(viii) Growing of grass on land : The binding of soil particles is the main and special feature of grasses. So that the grasses becomes the permanent vegetation in grassland areas which minimise the erosion through the rains.

(B) Mechanical Methods : The following techniques are coming under the mechanical methodsd.

(i) Dam Building : THe dams are built to stop the fast flowing water which is used later on according to the needs.

(ii) To control the over grazing of animals.

(iii) Basin Listing : Small catchment area of water are formed for the collection of water during the rain.

(iv) Contour Terracing : The canals are formed along the terraces on the slopes of hills. This reduce the speed of higher amount of water and changes the direction of water.

(v) Gully Control : The bonds dams and canals formed to control the high speed of water and to prevent the soil erosion.

FOREST CONSERVATION

It is conducted by two methods

1. **Protection or conservation foresty :** By making national park and Biosphere Reserve.
2. **Production or commerical forestry : It is two types**

(a) Social forestry : To grow trees and shrubs on unused farmland, raod sides, rail sides, community land etc.

(b) Agro Forestry : woody species are grown in combination with herbaceous crops either at the same time or in time sequence.

Taungya system : Growing agricultural crops between rows of planted trees.

Shifting Cultivation or Jhum Cultivation : It is a major cause of deforestation. Many tribal communities practise slab and burn agriculture in tropical and subtropical regions of Asia. Africa and Oceania. This consists cutting down trees and setting them or fire and raising crops on the resulting ash called "Juming" in north estern India.

WET LANDS :

Low lying area's covered with shallow water are called wet land's. The wet lands are transitions, zones between terrestrial and aquatic area's. **6% of the world** land surface is occupied by wet lands.

(i) **Marshes :** Wetlands where grass - like plants dominate.

(ii) **Swamps :** Wetlands where trees or shrubs dominate.

(iii) **Reverine forest :** Periodically Flooded forest found in lowland along streams.

(iv) **Mangrove is saltly water swamp**

Siginificance of Wet lands :

(i) Wetland are higly productive, provide food and habitat.

(ii) Wetlands helps to control flooding by holding excess water.

(iii) Ground water recharging area.

(iv) Help to clean and purify water run-off.

(v) Provides sites for fishing, boating, nature study.

Weltands conservation measures :

(i) Preparation of wetland inventories.

(ii) Checking waste disposal in wetland.

(iii) Reduction of excessive inflow of nutrients and silt into wetlands.

Grassland management measures :

(i) Protection from grazing.

(ii) Use of rotational grazing.

(iii) Removal of woody bushes or shrubs and weeds.

(iv) Conservation of soild and water of grasslands.

(v) Use of controlled burning to promote recycling of nutrients.

Some Other Information related to Grass land -

(a) India has 16 recognised forest types, which represent a rich diversity.

(b) In **India,** the Grass cover area including fallow and waste land is **18% of total land** area.

(c) 37% of land are avaialable for grazing including forest.

(d) **Grassland** is also called **rangeland**.

(e) The conversion of grassland or forest to desert is called **desertification**.

(f) The average annual production of dry grass or hay in India is about 250 million tonnes.

Conservation and management of water :

Main approcaches for conservation of water are :

(i) Reducing agricultural water wastage by increasing efficiency of irrigation.

(ii) Reducing water wastage in industry by recycling the used water.

(iii) Reducing domestic water wastage by cnstructing waste water treatment.

(iv) Rainwater harvesting by employing practices to store rainwater and recharge ground water.

(v) Afforestation and protection of water sheds to improve water economy. Approaches to provide a sustainable supply of high quality water are :

(a) Construction of dams and reservoirs to ensure year-round supply of water, in addition, controlling flood and generating electricity.

(b) Desalinisation of sea water and saline ground water and making it fit for drinking and other purposes.

Forest Cover in India (1999 Estimate)		
Class	**Area (sq. km.)**	**% Geographic area**
Dense forest[1]	377358	11.5
Open forest[2]	255064	7.8
Mangrove[3]	4871	0.1
Sub-total	637293	19.4
Scrub[3]	5896	1.6
Non-forest (other land use)	2598074	69.0
Total	**3287263**	**100**
[1]Canopy cover >40 percent of land		
[2]Canopy cover 10-40 percent of land		
[3]Canopy cover <10 percent of land		

DEGRADATION BY IMPROPER RESOURCE UTILISATION AND MAINTENANCE

- The degradation of natural resources can occur, not just by the action of pollutants but also by improper resource utilisation practices.

(i) Soil erosion and desertification : The development of the fertile top-soil takes centuries. But, it can be removed very easiy due to human activities like over-cultivation, unrestricted grazing, deforestation and poor irrigation practices, resulting in arid patches of land. When large, barren patches extend and meet over time, a desert is created. Internationally, it particularly due to increased urbanisation.

(ii) Water logging and soil salinty : Irrigation without proper drainage of water leads to waterlogging in the soil. Besides affecting the crops, waterlogging draws salt to the surface of the soil. The salt then is deposited as a thin crust on the land surface or starts collecting at the roots of the plants. This increased salt content is inimical to the growth of crops and is extremely damaging to agriculture. Waterlogging and soil salinity are some of the problems that have come in the wake of the Green Revolution. This leads to **'sem'** problem in many canal irrigated areas of India.

Deforestation :

(A) Deforestation is the converstion of forested areas to non-forested ones. According to an estimate, almost 40% forests have been lost in the tropics, compared to only 1% in the temperate region. The present scenario of deforestation is particularly **grim in Inida.**

(B) At the beginning of the twentieth century, **forests covered about 30% of the land** of India. By the end of the century, it shrunk to 19.4%, whereas the National Forest Policy (1988) of India has recommended 33% forest cover for the plants and **67% for the hills.**

(C) How does deforestation occur? A number of human activities contribute to it. One of the major reasons is the conversion of forest to agricultural land so as to feed the growing human population. Trees are axes of timber, firewood, cattle ranching and for several other purposes.

(D) Slash and burn agriculture, commonly called as **Jhum cultivation** in the north-eastern state of India, has also contributed to deforestation. In slash and burn agriculture, the farmers cut down the trees of the forest and burn the plant remains.

(E) The ash is used as a fertiliser and the land is then used for farming or cattle grazing. After cultivation, the area is left for several years so as to allow its recovery. The farmers then move on to other areas and repeat this process. In earlier days. when **Jhum cultivation** was in prevalence, enough time-gap was given such that the land recovered from the effect of cultivation. With increasing population, and repeated cultivation, this recovery phase is done away with, resulting in deforestation.

(F) What are the consequences of deforestation? One of the major effects is enhanced carbon dioxide concentration in the atmosphere because trees that could hold a lot of carbon in their biomass are lost with deforestation. Deforestation also causes loss of biodiversity due to habitat destruction, disturbs hydrologic cycle, causes soil erosion, and may lead to desertification in extreme cases.

(G) Reforestation is the process of restoring a forest that once existed but was removed at some point of time in the past. Reforestation may occur naturally in a deforested area. However, we can speed it up by planting trees with due consideration to biodiversity that earlier existed in that area.

Case study of People's Participation in Conservation of Forest

(A) People's participation has a long history in India. In **1731,** the **king of Jodhpur in Rajasthan** asked one of his ministers to arrange wood for constructing a new place. The minister and workers went to a forest near a village, Khajadli inhabited by **Bishnois**, to cut down trees.

(B) The Bishnoi community is known for its peasful co-existance with nature. The effort to cut down trees by the kings was thwarted by the Bishnois.

(C) A Bishnoi women **Amrita Devi** showd examplary courage by hugging a tree and daring king's men to cut her first before cutting the tree. The tree mattered much more to her than her own life.

(D) Sadly, the king's men did not heared to her pleas, and cut down the tree along with **Amrita Devi**. Her three daughter and hundreds (total 363 peoples of other Bishnois followed her, and thus lost their lives saving trees.

(E) Nowhere in history do we find a commitment of this magnitude when human beings sacrificed their lives for the cause of the environment. The Government of Rajasthan has recently instituted the **Amrita Devi Bishnoi Wildlife Protection Award** for individuals or communities from rural areas that have shown extraordinary courage and dedication in protecting wildlife.

(F) Government of India in situated Indra **Gandhi Priydarshni; Vraksh Mitra Award** for forest conservation.

(G) You may have heard of the **Chipko Movement** of Garhwal Himalayas. In 1974, local women showed enormous bravery in protecting trees from the axe of contractors by hugging them. People all over the world have acclaimed the **Chipko movement**.

(H) Realising the siginificane of participation by local comunities, the **Government of India** in **1980s** has introduced the concept of **Joint Forest Management (JFM)** so as to work closely with the **local communities for protecting and managing forests.** In return for their services to the forest, the communities get benefit of various forest products (e.g., fruits, gum, rubber, medicine etc.) and thus the forest can be conserved in a sustainable manner.

SPECIAL POINTS

WILDLIFE ORGANISATIONS

I.U.C.N.	=	The Intenational Union for Conservation of Nature and Natural Resources. (Switzerland)
W.W.F.	=	The World Wildlife Fund.
I.B.W.L.	=	India Board for Wildlife.
B.N.H.S.	=	The Bombay Natural History Society.
W.P.S.I.	=	The Wildlife Preservation Society of India.
C.P.C.B.	=	Central Polution Control Board.
I.B.P.	=	International Biology Programme.
M.A.B.	=	Man and Biosphere Programme.
U.N.E.P.	=	United Nation Environment Programme.

B.S.I.	=	Botanical Survey of India.
C.A.Z.R.I.	=	Central Arid Zone Research Institute, Jodhpur.
C.I.T.E.S.	=	Convention and International Trade in Endangered Species of Wild Fauna and Flora.(1976)
F.R.I.	=	Forest Research Institute, Deharadun.
W.I.I.	=	Wild Life Institute of India, Deharadun.
U.N.E.S.C.O.	=	United Nations Educational Scientific and Cultural Organization.

28th February	-	Science Day
21st March	-	World Forest Day
22nd April	-	Earth Day
5th June	-	World Environment Day
7th July	-	Van Mahotsav Day
11th July	-	World Polulation Day
16th September	-	World Ozone Day
3rd October	-	World Animal Day
4th October	-	World Habitat Day
1st Week of October	-	Wild life week
2nd December	-	National Pollution prevention day or National environment day
3rd Decemebr	-	World Conservation Day
22th May	-	World Biodiversity Day

(A) **MIC Methyl Isocyanate]** was released in Bhopal gas tragedy on **3rd December 1984**. Which is used in the production of "Savin" insecticide in Union Carbide.

(i) Tetraethyl lead and tetramethyl lead are formed by combustion of petroleum. They are known to hamper haemoglobin formation.

(ii) The disease produced by use of lead polluted water is called as **plumbism.**

(iii) Lead caused nervousness anaemia in human beings. It also damages kidney.

(iv) Lead concentration in blood is considered alarming if it is 10 μg/500 ml.

(B) Common dust disease is known as **Pneumoconiosis.**

(i) Disease due to cotton dust in testile workers is - **Lung fibrosis or Byssinosis.**

(ii) Disease due to coal dust - **Anthracosis.**

(iii) Disease due to asbestos dust - **Asbestosis.**

(iv) In stone grinders disease due to silica dust - **Sillicosis.**

(v) In iron mill disease due to iron dust - **Siderosis.**

(vi) **Cadmium** causes anaemia, hypertension, damage to liver and kidneys. In Japan it caused bone softning or skeleton deformitcis called **Itai-Itai disease or Ouch-Ouch.**

(C) **Stone leprosy** is caused due to acid rain because due to acid rain outer surface of metals, marbels and stone destroyed.

(D) **Blue Baby disease :** This disease is caused by the high amount of **nitrate in water.** It is also known as **Methaemoglobinaemia** or **cyanosis.**

(E) **Hypertension and Uremia :** Caused by **Copper.**

(F) **Arsenic :** It causes **black-foot disease** and **poisoning in fodder plants** which are eaten by live stock and causes their death.

(G) **Fluorides :** The higher concentration of flouorides causes **chlorosis** or **necrosis** in tips and margin of leaf (leaf lamina). The compounds of fluorine reach in the animals through the fodder and causes abnormal calcification of teeth, this is called **Fluorosis.**

Note : The experts hold that the maximum level of fluoride which the human body can tolerate is **1.5 parts per million (ppm).** When ingested in excess over a long period of time causes "Fluorosis".

(H) **EL Nino effect :** It is the process in which water of Pacific ocean get warm, in this process warm water currect flow to equator & peru in between 5 to 8 year at christmas time. **Effect of EL Nino is flood,** drought and masnsoon damage in India.

(I) Cesium (Cs) accumulates in muscles and causes muscular pain.

(J) Strontium-90 is radioactive element which causes **Leukamia and bone cancer.**

(K) Iodine isotope-131[I^{131}] causes damage of RBC, bone marrow, Lymphnodes and Skin cancer.

(L) Tobacco and smoke contain seven poly cyclic hydrocarbon and Radio active Polonium-210, which is carcinogen and causes Lung cancer.

(M) Aldehydes produce irritation in the gastrointestinal and respiratory tract.

(N) Phenols caused damage to spleen, Kidney, liver and lungs.

(O) D.D.T. caused Cerebral haemorrhage and malfunctioning of sexual maturtity.

(P) Largest source of air pollution **(80%) caused by automobiles** in the cities i.e., **CO(77.2%). Nitrogen oxide (7.7%), Hydrocarbons (13.7%), SO_2, NH_3, Aldehyde and Lead** [in the form of $Pb(C_2H_5)_4$ and $Pb[(CH_3)_4$ as antiknocking agent]. Lead is an air pollutant. Automobiles also reduce atmosphereic O_2 which is utilised in oxidation.

(Q) Particulate pollutants [soot] are Carcinogenic [Cancer causing].

(R) The particulate matter released to the atmosphere by mechanical operations include a number of trace metals contained in the **flyash.** Some of harmful trace metals are Antimony, Arsenic, Beryllium, Cadmium, Germanium, Lead, Mercury, Nickel, Selenium, Vanadium and Yttrium.

ENVIRONMENT LAW FOR CONTROLLING POLLUTION

1. **The National Environment (Protection) Act (NEPA) 1986 :** This act clearly brings the protection of water and soil quality, and the control environmental pollutants.
2. **The insecticide Act, 1968 :** This act deals with the regulation of import, manufacture, sale, transport, distribution and use of insecticides with a view of preventing risk to human health and other organisms.
3. **The water (Prevention and control of pollution) Act. 1974 :** This act deals with the preservation of water quality and the control of water pollution with a concern for the detrimental effects of water pollutants on human health.
4. **The air (Prevention and Control of Pollution) Act. 1981 :** This act deals with the preservation of air quality and the control of air pollution with a concern for the detrimental effects of air pollutants on human health and also on the biological world.
5. In 1987, important amendments to the air Act.1981 were made and noise was recognised as an air pollutants.

(S) Conference on human environment in 1972 held at Stockholm.

(T) In 1987, 27 industrialised contries signed the **Montreal** protocol to protect **stratospheric ozone.** Till date more than 175 contries have signed the montreal protocol.

(U) UNCED (United Nations Conference on Enivronment and Development) **Earth Summit helt at Rio-de-Jenerio (Brazil) in 1992 for reducing green house gases** and **biodiversity conservation** and make **Agenda-21.**

(V) **Kyoto protocol** conference held in **Kyoto** (Japan) for **climate change** (1997). This protocol requires countries to take appropriate measures to **reduce** their overall **green house gas emisson** to a level at 5 percent below the 1990 level by the commitment period **2008-2012.**

(W) **Earth Summit** or **world summit** on sustainable development **(2002)** was held in Johanncsburg (S.Africa).

(X) International Biological Programme (IBP) 1967-74.

(Y) The united Nations, conference on desertification was held in Nairobi (Kenya) in 1977 under the United Nations Environment Programme (UNEP)

Type of Lakes -

(i) Eutrophic lake - They are shallow water lakes which contain **high amount of organic materials** and nutrients. They have little O_2 because decomposers rapidly use it up. Chironomous larva are commonly present in it.

eg., Dal lake of Kashmir

(ii) Oligotrophic lakes - These are deep lakes which have **less amount of organic materials and nutrient.**

(iii) Dystrophic lake - Maximum amount of **undecomposed organic matter** is present.

eg., Marshy lake.

(A) Third pollution or land scape pollution : To make Fertile-land barren by dumping wastes.

eg., ash, insustrial waste.

(B) Incineration : Solid wastes burning in presence of oxygen.

(C) Pyrolysis : Solid wastes burning (combution) in the absence of oxygen.

(D) Flu gas : Gas which release of from chimnies.

(E) Plume : Smoke which release from chimnies.

(F) Hydro thermal vents : These are hot water springs in the deep ocean having high concentration of H_2S, ocean water oxidizes H_2S producing energy which is used by bacteria, Filter-Feeders (clams) eat the bacteria so that this food chain based on chemical energy.

(G) Phytotrons : A such type of house where plants are grown in controlled environment.

(H) Hydrocarbon : Are also known as volatile organic carbons (VOC).

(I) Snow blindness : In human eye cornea absorbs U.V.-B radiation, and a high dose of U.V.-B radiations causes inflammation of cornea, called snow-blindness cataract.

(J) Electronic wastes is also called e-wastes.

(K) Ganga Action plan for controlling pollution in ganga (1985) included city : (i) Kolkata (ii) Kanpur.

(i) Maximum NO_2 polluiton in Ahmdabad.

(ii) Maximum SO_2 pollution in Kolkata.

(iii) Maximum SPM pollution in Kolkata.

(iv) Land of maximum wind mills - Netherland.

(v) Largest wind will complex in India, Lamba (Gujrat)

(L) At 50 ppm, CO converts 7.5% of haemoglobin in to carboxy haemoglobin with in 8 hours.

(M) Maximum grean house gas released by - USA

(N) Cotton dust is an important pollutant in Ahmedabad.

(i) **CEPHERI :** An institution established in India to check pollution i.e., "Central Environmental and Public Health Engineering Research Institute" (CEPHERI).

This institution submits the measures on the basis of results of detailed survey.

(ii) **NEERI :** National Environmental Engineering Research Institute - Nagpur.

(Environmental plannig organisation is related with NEERI)

(iii) **IPCC :** The "Intergovermental Panel on Climate Change".

(iv) **I.A.P. :** Index of atmospheric pollution prepared with the help of lichens.

(v) **I.W.P. :** Index of water pollution, prepared by Daphnia, E.coli, Trout.

(vi) **M.P.N. :** Most probable number of E.coli in water.

The increase in the concentrations of green house gases in the in the atmosphere as affected by human activities				
Green house gases	**Pre-industrial concentration ~ 1750 AD**	**Concentration in 2000 AD**	**Increase since ~ 1750 AD**	**Atmospheric life-time (years)**
Carbon dioxide (CO_2)	280 ppm	368 ppm	31	5 - 200
Methane (CH_4)	700 ppm	1750 ppb	151	12
Nitrous oxide (N_2O)	270 ppb	316 ppb	17	114
Chlorofluorocarbons (CFC - 11) + Hydroflurocarbons (HFC - 23)	0	282 ppt		45-260

EXERCISE - 1

Q.1 Which of the following would be a natural pollution –
(1) Occurence of NO_2 in atmosphere
(2) Forest fires
(3) Eutrophication
(4) Occurence of smog

Q.2 Freon is –
(1) Metal fluoride
(2) Iron containing polycyclic hydrocarbons
(3) Chlorofluorocarbon
(4) Ferrous sulphide pollutant

Q.3 In addition to SO_2, metals and textiles are damaged by –
(1) Fluorides (2) Carbon monoxide
(3) Aldehydes (4) Nitrogen oxides

Q.4 Pollutant of automobile exhausts that affects nervous system/produces mental diseases is-
(1) Sulphur oxide (2) Mercury
(3) Lead (4) Nitrogen oxide

Q.5 In what way, the fossil fuel burning is damaging–
(1) It generates lot of smoke and smog in atmosphere
(2) It causes depletion of fossil reserves
(3) It generates more CO_2 in atmosphere
(4) It causes green house effect and acid rain

Q.6 Pollution is –
(1) Release of toxic/undesirable materials in environment
(2) Conservation of energy
(3) Removal of top soil
(4) All the above

Q.7 Ozone layer is disturbed by –
(1) Large number of factories
(2) Supersonic jets
(3) Large number of automobiles
(4) None of above

Q.8 Air pollution is caused by –
(1) Smoke
(2) Automobile exhausts
(3) Thermal Power Exhaust
(4) All of the above

Q.9 Main air pollutant is –
(1) N_2 (2) CO
(3) Sulphur (4) CO_2

Q.10 The PAN blocks –
(1) ATP synthesis (2) Hill reaction
(3) Glycolysis (4) CO_2 fixation

Q.11 Which of the following is a photochemical reaction product –
(1) Fluorides (2) CO and CO_2
(3) SO_2 (4) O_3

Q.12 P.A.N. stands for –
(1) Peroxy acetyl nitrite
(2) Peroxy acetyl nitrate
(3) Peroxy aceto-nitrile
(4) Pyridine aceto-nitrite

Q.13 Which of the atmospheric pollutant cause general chlorosis i.e. destruction of chlorophyll–
(1) SO_2 (2) Hydrocarbons
(3) CO (4) CO_2

Q.14 The C.F.C. pollution sources include –
(1) Fire extinguishers and jet air crafts
(2) Refrigerators and jet air crafts
(3) Jet air crafts only
(4) All of these

Q.15 PAN (peroxyacetyl nitrate) is an important constituent of 'Photochemical smog, is a –
(1) Corollary pollutant
(2) Primary pollutant
(3) Natural pollutant
(4) Secondary pollutant

Q.16 Smog is produced due to –
(1) Smoke and fog
(2) Air and metal dust
(3) Water and nitrogen oxide
(4) None of above

Q.17 Which human disease becomes aggravated by atmospheric pollution –
(1) Bronchitis (2) Leucoderma
(3) Haemophilia (4) Rheumatism

Q.18 The gas released in Bhopal tragedy was –
(1) Phosgene (2) MIC
(3) $COCl_2$ (4) None of above

Q.19 Lichens are best indicators of –
(1) Water pollution
(2) Soil pollution
(3) SO_2 pollution
(4) All types of pollution

Q.20 Which of the following damages WBC, bone-marrows and lymph nodes –
(1) Ca^{40} (2) I^{131}
(3) Sr^{90} (4) Cs^{137}

Q.21 Spraying of DDT produces pollution of –
(1) Air and soil
(2) Air, water and soil
(3) Air
(4) Air and water

Q.22 Which of the following is extreme example of noise pollution –
(1) Sonic booms produced by aircraft
(2) Rock music
(3) Noise produced by industrial operations
(4) Noise produced by traffic

Q.23 Radioactive pollution along Kerala coast is due to –
(1) Zinc (2) Thorium
(3) Caesium (4) Plutonium

Q.24 Which disease in children is caused by the intensive use of nitrate fertilizers –
(1) Jaundice
(2) Septicaemia
(3) Mumps
(4) Methaemoglobinemia

Q.25 The noise created at the launching of space rocket measures around –
(1) 180 db (2) 240 db
(2) 120 db (4) 150 db

Q.26 Inadequate drainage in a soil will lead to –
(1) Salination (2) Floods
(3) Soil erosion (4) Aridity

Q.27 Leukaemia is caused by –
(1) Sr^{90} (2) Iodine
(3) Ca^{40} (4) Caesium

Q.28 Through food chain radioactive Sr (Sr^{90}) is deposited in which part of human body –
(1) Muscles (2) Thyroid
(3) Kidneys (4) Bones

Q.29 Atomic bomb was used during world war II in-
(1) 1939 (2) 1945
(3) 1941 (4) 1943

Q.30 The ultimate environmental hazard or the most outstanding danger for the survival of living beings on this planet is –
(1) Radiation hazard or nuclear pollution
(2) Glaciation
(3) Deforestation
(4) Desertification

Q.31 The first effect of noise is –
(1) Anxiety and stress reactions
(2) Increased heart beat
(3) Digestive spasm
(4) Constriction of blood vessels

Q.32 One of the most dangerous radioactive pollutant is –
(1) C^{14} (2) S^{35}
(3) Sr^{90} (4) P^{32}

Q.33 Which of the following is a rich source of energy but never causes atmospheric pollution–
(1) Solar energy
(2) Nuclear energy
(3) Coal
(4) Wood

Q.34 Noise pollution is measured in –
(1) Nanometres (2) Decibles
(3) Fathoms (4) Hertz

Q.35 Indiscriminate use of DDT is undesirable because –
(1) It is harmful
(2) It is degradable
(3) It causes mutation
(4) It is accumulated in food chain

Q.36 Chief source of water and soil pollution is–
(1) Thermal power plant
(2) Agroindustry
(3) Mining
(4) All the above

Q.37 Which of the following is a land pollution –
(1) Soil erosion
(2) Accumulation of litter
(3) Humus formation and accumulation
(4) Accumulation of animal waste

Q.38 Some reliable indicators of air pollutants (SO_2 and noxious gases) are –
(1) Lichens and mosses
(2) Ferns and Cycas
(3) 'Neem' tree and Eichhornia
(4) Green algae and aquatic liverworts

Q.39 Labours working in a cement factory suffers from –
(1) Cytosilicosis
(2) Bone marrow cancer
(3) Cardiac disease
(4) Asbestosis

Q.40 When DDT was applied in an orchard as a pesticide, the fruit production decreased . This happened because –
(1) DDT killed the pollinating insects along with the pests
(2) DDT inhibited flowering
(3) DDT is a growth retardant
(4) DDT disturbed hormonal balance essential for fruit setting

Q.41 Ozone is a secondary pollutant because –
(1) It is formed by the oxidation of O_2 of the atmosphere
(2) It is formed by the transformation of NO_x in sun light
(3) It is not primarily important
(4) It develops secondary effects on living organisms

Q.42 C.O.D. stands for –
(1) Chemical oxygen demand
(2) Control of diesel
(3) Caesium oxide deposition
(4) Chemistry of depositions

Q.43 The common refrigent chlorofluoro-methane(freon) and NO_x are serious pollutants because –
(1) Destroys haemoglobin
(2) Disrupts O_3 layer
(3) It lowers atmospheric temperature
(4) Prevents cloud condensation

Q.44 The Mathura refinery smoke is thought to reduce the shine of Tajmahal by –
(1) Increasing U.V radiations
(2) Acid rain
(3) 3, 4 benzpyrene
(4) All of these

Q.45 Lichens do not like to grow in cities because of the –
(1) SO_2 pollution
(2) Absence of the right type of algae and fungi
(3) Absence of natural habitats
(4) Lack of moisture

Q.46 In the polluted water, the values of –
(1) C.O.D. slightly higher than B.O.D(2) C.O.D. much higher than B.O.D.
(3) B.O.D. slightly higher than C.O.D.
(4) B.O.D. much higher than C.O.D.

Q.47 A very harmful fibrous component causing pollution and an inflicting disease of lungs in human beings is –
(1) Asbestos (2) Eichhornia roots
(3) ABS micelle (4) Grease

Q.48 A rapid growth of photosynthetic algae in water develops 'bloom'. How would it affect the environment of water –
(1) The environment become comfortable to all forms of life
(2) O_2 level is decreased (OR) BOD becomes high
(3) O_2 level of water is increased
(4) Fish production is increased

Q.49 When huge amount of CO_2 is dumped into a river the BOD will –
(1) Increase
(2) Slightly decrease
(3) Remain unchanged
(4) Decrease

Q.50 The atmospheric U.V. radiations are absorbed in the zone called –
(1) Stratosphere (2) Mesosphere
(3) Thermosphere (4) Troposphere

Q.51 Photochemical smog is also called as –
(1) California type smog
(2) Tokyo type smog
(3) Los Angeles type smog
(4) New York type smog

Q.52 Which of the following pollutant is released in larger quantity from the exhaust emission of a petrol/diesel automobile –

(1) CO_2

(2) NO_2 , SO_2 & Pb

(3) Hydrocarbons & Pb

(4) CO

Q.53 Which of the following air pollutant is carcinogenic –

(1) 3, 4 – Benzpyrene

(2) PAN

(3) Ethylene

(4) N_2O

Q.54 Which of the following are bio-pollutants –

(1) Spores and pollen grains

(2) Sewage and garbage

(3) Protozoans

(4) Dairy and poultry waste

Q.55 What immediate hazard is likely to occur if the temperature of the earth rises by 5°C –

(1) Increase in productivity

(2) Melting of polar ice

(3) Destruction of phytoplanktons

(4) Inundation of coastal towns

Q.56 For how long and at what temperature an experiment is run to determine the value of BOD of a water body –

(1) 10° C for 10 days

(2) 20°C for 5 days

(3) 50°C for 2 days

(4) 5°C for 20 days

Q.57 The automobile emission can be reduced by adding the following in the petrol –

(1) Barium salts (2) Calcium salts

(3) Cobalt salts (4) Silicon oil

Q.58 Which of the following could be used in purification of sewage –

(1) Fungi

(2) Blue-green algae

(3) Unicellular green algae

(4) All plants

Q.59 The main causative agent of Minamata disease is atmospheric pollution by alkyl mercury which comes from –

(1) Water contaminated with effluents of vinyl industries

(2) Piggery & poultry raised on open grasslands

(3) Chimney waste of plastic industries

(4) Exhaust emissions of automobiles

Q.60 Minamata disease was traced to atmospheric pollution caused by –

(1) Inorganic mercury compounds

(2) Metallic/elemental mercury

(3) Organic mercury compounds

(4) All the above together

Q.61 The 'Environment Protection Act' was promuglated in India in the year –

(1) 1981 (2) 1986

(3) 1988 (4) 1974

Q.62 The particulate matter dispersed in the atmosphere is –

(1) Non-gaseous

(2) Mainly non-gaseous

(3) Mainly gaseous

(4) Gaseous

Q.63 Major pollution causing agent is –

(1) Animals

(2) Hydrocarbon gases

(3) Man

(4) None of the above

Q.64 Ultra-violet light causes –

(1) Destruction of hydrogen bonds between complementary DNA strands

(2) Photodynamic action

(3) Sticky metaphases

(4) Formation of pyrimidines

Q.65 Effect of pollution is first marked on –

(1) Natural balance of the ecosystem

(2) Geological cycle

(3) Rainfall and climate

(4) Fauna of a place

Q.66 Addition of phosphates and nitrates/ fertilizers into water leads to –
(1) Increased algal growth
(2) Nutrient enrichment/eutrophication
(3) Increased growth of decomposers
(4) Reduced algal growth

Q.67 Jet air lines produce fluoro-carbons in the form of –
(1) Mist
(2) Fog
(3) Photochemical smog
(4) Aerosol

Q.68 Non-ionising radiations with specific biological effects are –
(1) Beta - rays (2) Gamma rays
(3) X-rays (4) UV radiations

Q.69 Which of the following statements is not true–
(1) Nitrogen and Magnesium are serious pollutants of our environment
(2) Lichens are affected by SO_2
(3) All pollutants are not waste
(4) Carbon monoxide is a serious pollutant

Q.70 Fluoride pollution produces necrosis or chlorosis of –
(1) Midrib
(2) Leaf margin and tip
(3) Stem
(4) Petiole but not lamina

Q.71 Which of the following does not contributes to "Green house effect" –
(1) Carbon dioxide
(2) Carbon monoxide
(3) Chloro-fluoro carbon and Methane
(4) Refrigerant freon

Q.72 SO_2 and NO_2 produce pollution by increasing–
(1) Acidity (2) Neutrality
(3) Buffer action (4) Alkalinity

Q.73 What is environmental consequence of 25% increase of CO_2 level in our atmosphere –
(1) Death of all animals
(2) Green house effect
(3) Direct pollution
(4) Death of all plants

Q.74 Ultraviolet radiations are lethal because of inactivation of –
(1) Minerals, air and water
(2) Water, carbon dioxide and oxygen
(3) Proteins, nucleic acids and pigments
(4) Carbohydrates, fats and vitamins

Q.75 Which of the following is the most dangerous environment hazard to mankind–
(1) Noise pollution
(2) Water pollution
(3) Nuclear waste
(4) Air pollutions

Q.76 The most polluted city of the world is –
(1) Mexico (2) Calcutta
(3) Tokyo (4) New York

Q.77 The gases which develop green house effect (OR) contributes to global warming are –
(1) N_2O, CH_4, CI, CFC, CO_2
(2) CH_4, CO_2, SO_2, NO_x, NH_3
(3) CFC, CO_2, SO_2 , NH_3,H_2S
(4) CO_2, CO, SO_2, N_2O, N_2

Q.78 Which is not a pollutant from exhaust of motor vehicle –
(1) SO_2 (2) CO
(3) Fly ash (4) Hydrocarbon gas

Q.79 What is the potential danger of 'Green House effect' –
(1) Poor photosynthesis
(2) Heavy rainfall
(3) Coastal flooding
(4) More humidity in environment

Q.80 Effect of to-day's radioactive fall out will be more on future children than children living to-day due to –
(1) Radiations have delayed effect
(2) Mutated genes are usually recessive
(3) Infant susceptibility to radiations
(4) Increase of susceptibility to radiations with age

Q.81 One of the effects of dust pollution is to cause–
(1) Yellowing of leaves
(2) Opening of stomata
(3) Closure of stomata
(4) Folding of leaves

Q.82 If water pollution continues at its present rate, it will eventually –
(1) Prevent precipitation
(2) Stop the water cycle
(3) Make oxygen molecules unavailable to aquatic life
(4) Make nitrates unavailable to aquatic life

Q.83 Which of the following enhances B.O.D. of water –
(1) Sugar mill effluents
(2) Algae
(3) Sand
(4) Moss

Q.84 Stiff back and fixed joint disease in human beings is due to –
(1) The use of fluoride contaminated water
(2) Bacterial infection
(3) Viral infection
(4) Mycoplasmal & fungal infection

Q.85 Major air pollutants in Bombay and Calcutta are –
(1) Hydrocarbons and hot air
(2) Ozone
(3) CO and oxides of sulphur
(4) Marsh gas and algal spores

Q.86 Only ape found in India is
(1) Gorilla (2) Chimpanzee
(3) Hoolock gibbon (4) Leaf monkey

Q.87 An endangered indian bird is
(1) Passenger pigeon
(2) Great Indian bustard
(3) Vulture
(4) Pink headed duck

Q.88 Smallest national tiger project National park is-
(1) Jim Corbett (2) Rajaji
(3) Ranthambhore (4) Sariska

Q.89 Animals and plant can be best protected in
(1) National Park (2) Zoo
(3) Botanical Garden (4) Sacred forest

Q.90 Which one of the following agriculatural practices is ecofriendly
(1) Organic farming (2) Jhum cultivation
(3) Monoculturing (4) 2 & 3 Both

Q.91 Silent velley is located in
(1) Kerala (2) Assam
(3) J & K (4) Rajasthan

Q.92 Tree hugging or chipko movement is associated with
(1) H.N. Bahuguna (2) S.L. Bahuguna
(3) Vinoba Bahave (4) None of these

Q.93 Approximately 1.5 million species have been identified. Which group contains the most species world wide
(1) Fungai (2) Vascular plant
(3) Insects (4) Mammals

Q.94 Domesticated crop plants rarely become aggresive weeds, because
(1) They are not grown in habitat favourable for rapid colonization
(2) Their high seed production is not adaptive for an invading species
(3) They possess traits with low survival value in wild
(4) They are genetically uniform

Q.95 One of the following is not a wild life conservation effors
(1) Project Kaiga (2) Project Tiger
(3) Project Hangul (4) Project elephant

Q.96 Introduction of Nile perch into lake victoria leads to extinction of
(1) Cat fish (2) Cichlid fish
(3) Shark fish (4) Doplhin

Q.97 Which of the following group of animal is the most vulnerable to extinction
(1) Amphibia (2) Aves
(3) Insect (4) Mammals

Q.98 Which of the following group of plants is the most vulnerable to extinction
(1) Angiosperm (2) Bryophytes
(3) Gymnosperm (4) Pteridophyta

Q.99 Which equation is correct for species area relationship
(1) $S = CA^Z$
(2) $A = SC^Z$
(3) $\log S = \log C + Z \log A$
(4) 1 & 3 Both

Q.100 Species area relationship equation was given by

(1) Mayer (2) Ehrlich

(3) Hemboldt (4) Wilson

Q.101 Rivet popper hypothesis was given by ..... to explain importance of biodiversity

(1) Mayer (2) Paul Eherlich

(3) Hemboldt (4) Wilson

Q.102 Total number of Biodiversity Hot spot in india are

(1) 1 (2) 2

(3) 3 (4) 4

Q.103 Total number of Biodiversity Hot spots in world are

(1) 25 (2) 9

(3) 34 (4) 32

Q.104 Silent valley of kerala is preserved because

(1) It contain rare species of animals and plants

(2) Soil is rich in minerals

(3) Land were use extensively for agricultural purpose

(4) It has pine tree

Q.105 Ramsar convention is related to conservation of

(1) Wetland biodiversity

(2) Terrestrial biodiversity

(3) Tiger & Elephant

(4) Plant

Q.106 Which bird is symbol of Bombay Natural History Society

(1) Hornbill (2) Spoonbill

(3) Egret (4) Sunbird

Q.107 Which year was annouced as year of Tiger conservation by WWF-

(1) 1998 (2) 1996

(3) 1991 (4) 2006

Q.108 State bird of Rajasthan is

(1) Parrot (2) Bustard

(3) Peacock (4) None

Q.109 Which of the following is narrow utility of biodiversity

(1) Fiber production

(2) Taxol production

(3) O_2 production

(4) 1 & 2 Both

Q.110 Who coined the term wild life

(1) Mayer (2) Humboldt

(3) Wilson (4) Hornday

Q.111 Which of the following is state animal of Rajasthan

(1) Gazella (2) Black buck

(3) Tiger (4) Red panda

Q.112 Gir National park is famous for

(1) Tiger (2) Lion

(3) Wid Ass (4) Elephant

Q.113 Who proposed hot spot concept for region of high ecological diversity

(1) IUCN (2) Mayer

(3) Odum (4) Cormandii

Q.114 Which of the following is a correct match of animal and its habitat

(1) Elephant - Ranthambhore

(2) Flamingo - Runn of Kutch

(3) Wild ass - Dachigam

(4) Indian tailor bird - Assam

Q.115 Which of the following bird is extinct recently

(1) Carollina parrokeit

(2) Parrot

(3) Siberian crane

(4) 1 & 3 Both

Q.116 Total biodiversity present in India is .....% of total world biodiversity

(1) 8.1% (2) 6.1%

(3) 2% (4) 16%

Q.117 Which of the following is present in green book

(1) List of endangered plant

(2) List of extinct plant

(3) List of rare plant grown in botanical garden

(4) List of plant group of an area

Q.118 Which of the following species is endangered

(1) Bustard (2) Rhinoceros

(3) Asiatic ass (4) All of the above

Q.119 India's Ist butterfly park is located in

(1) Sikkim (2) Rajasthan

(3) Nagaland (4) Assam

Q.120 Silent valley is a type of

(1) Tropical forest (2) Temperate forest

(3) Deciduous forest (4) All of the above

Q.121 Which of the following is a Ramsar site

(1) Chelka lake (2) Sukna lake

(3) Sariska (4) 1 & 2 Both

Q.122 The biodiversity of a given region is an outcome of

(1) Climate & topography

(2) Possibility for dispersal

(3) Evolutionary history

(4) All of the above

Q.123 More biodiversity on large island than small island at same distance from source, this effect is known as

(1) Jump effect (2) Distance effect

(3) Area effect (4) Edge effect

Q.124 Biological diversity day is celebrated on

(1) 3rd December (2) 22nd May

(3) 4th October (4) 3rd October

Q.125 Which of the following is a method of in-situ conservation

(1) National Park (2) Cryopreservation

(3) Botanical Garden (4) All

Q.126 Which of the following are parts of Biosphere reserves

(1) Transition zone (2) Buffer zone

(3) Core Zone (4) All of the above

Q.127 Which of the following plant species is critically endangered

(1) Podophyllum

(2) Barbexis nilghiriensis

(3) Both

(4) None

Q.128 Which of the following is thought to be an indicator of ecological balance

(1) Deer (2) Black Buck

(3) Elephant (4) Tiger

Q.129 Which of the following convention is related to conservation biodiversity

(1) Rio de Janeiro Convention

(2) Montreal protocol

(3) Kyoto protocal

(4) All

Q.130 Which of the following is an endangered species present in Rajasthan

(1) Guggal (2) Nepenthes

(3) A & B Both (4) None

EXERCISE - 2

Q.1 Sewage water can be purified for recycling with the action of –
(1) Micro-organisms (2) Aquatic plants
(3) Fishes (4) Penicillin

Q.2 National Environmental Planning Engineering Organisation at Nagpur is –
(1) ICAR (2) NEERI
(3) CSIR (4) CPHER

Q.3 Which of the following does not cause atmospheric pollution –
(1) Automobiles
(2) Nuclear power plants
(3) Hydroelectric power plants
(4) Thermal power plants

Q.4 Problem associated with nuclear power plants is –
(1) Emmission of hazardous radionucleides
(2) Disposal of radioactive waste
(3) Thermal pollution
(4) All the above

Q.5 The extent of darkness caused due to smoke can be determined by the help of –
(1) Horizontal microscopes
(2) Smoke filters
(3) Ringelmann's charts
(4) All of these

Q.6 The average conc of CO_2 in the atmosphere is –
(1) 100 ppm (2) 300 ppm
(3) 1000 ppm (4) 10 ppm

Q.7 The term smog was coined by –
(1) Des Voeux (2) Tansley
(3) Odum (4) Clements

Q.8 Increasing concentration of DDT in organisms of a food chain in higher trophic levels is known as –
(1) Biological chain
(2) Biotic potential
(3) Biological value
(4) Biological magnification

Q.9 Which of the following plants shows insecticidal properties –
(1) *Dalbergia sissoo*
(2) *Ocimum basilicum*
(3) *Azadirachta indica*
(4) Both (2) and (3)

Q.10 The classical smog was first observed in –
(1) London (2) Tokyo
(3) Paris (4) New York

Q.11 The light of cities is reduced in comparison to villages due to the presence of –
(1) Hydrocarbons
(2) Particulate matter
(3) SO_2 and SO_3
(4) SO_2 and oxides of nitrogen

Q.12 Plants are known to be purifiers of air due to–
(1) Nitrogen fixation
(2) Photo-transpiration
(3) Photorespiration
(4) Photosynthesis

Q.13 In human beings, anoxia is caused due to –
(1) CO_2 (2) N_2O
(3) SO_2 (4) CO

Q.14 Soil erosion means -
(1) Breaking up of rocks by water streams
(2) Deposition of new soil layers by rivers
(3) Removal of top soil layers by wind
(4) Decomposition of organic matter and development of the soil

Q.15 The cutting of trees from the forests of hill near a catchment area -
(1) Will have no effect on causing floods in plain
(2) May cause flood in plains in rainy season
(3) Will have no effect on climatic condition of that area
(4) Will benefit the mankind for more area for cultivation

Q.16 A slopy land on account of continued rainfall initially undergoes -
(1) Sheet erosion (2) Gully erosion
(3) Rill erosion (4) All of these

Q.17 The term riparian erosion is applied to -
(1) Gully erosion
(2) Slip erosion
(3) Wind erosion
(4) Stream bank erosion

Q.18 Which occurs under normal conditions -
(1) Geological erosion
(2) Surface creep
(3) Both of these
(4) Accelerated erosion

Q.19 Odum has described soil erosion as -
(1) Soil pollution
(2) Creeping death of soil
(3) Loss of living stratum
(4) Loss of feeding zone

Q.20 Soil erosion in plains consequent to rainfall is initiated by -
(1) Rill erosion (2) Sheet erosion
(3) Gully erosion (4) All of these

Q.21 The soil erosion on slopes proceeds in the following manner -
(1) Gully $\rightarrow$ Rill $\rightarrow$ Ravine
(2) Rill $\rightarrow$ Ravine $\rightarrow$ Gully
(3) Rill $\rightarrow$ Gully $\rightarrow$ Ravine
(4) Ravine $\rightarrow$ Rill $\rightarrow$ Gully

Q.22 Soil erosion can be prevented by -
(1) Allowing herbivorous animals to graze excessively
(2) Increasing fertility
(3) Making the land slopy
(4) Growing plants to form a soil cover

Q.23 Soil erosion on hills can be prevented by -
(1) Removal of vegetable cover
(2) Leaching
(3) Terrace cultivation
(4) Overgrazing

Q.24 Which of the following plants is used as wind break -
(1) *Delonix* (2) *Eucalyptus*
(3) *Mangifera* (4) *Prosopis*

Q.25 To prevent wind and water erosion, the crop is sometimes harvested in such a way that a basal stub of the plant is left behind. This technique is called as -
(1) Basin listing (2) Mulching
(3) Ley farming (4) Strip cropping

Q.26 Soil conservation is the process where -
(1) Sterile soil is converted into fertile soil
(2) Soil is protected against loss
(3) Soil erosion is allowed
(4) Soil is aerated

Q.27 The soil bindings is done in the best way by-
(1) Algae (2) Grasses
(3) Mycorrhizae (4) All of these

Q.28 An important agrostological technique to check soil erosion in the initial stages is -
(1) Land retirement (2) Ley farming
(3) Contour farming (4) Basin listing

Q.29 Which of the following functions performed by a forest helps most in controlling drought-
(1) Forests act as watersheds
(2) Forest prevents rainfall in monsoon
(3) Forests bring rainfall in monsoon
(4) Forests have lot of water plants

Q.30 One of the following is associated with the conservation of forests –
(1) Kaziranga (2) Bharatpur
(3) Silent valley (4) Gir

Q.31 Major forest types in India are -
(1) Tropical evergreen and tropical thorn
(2) Temperate mixed and tropical deciduous
(3) Tropical dry deciduous and tropical moist deciduous
(4) Tropical evergreen and tropical moist deciduous

Q.32 The main causes of deforestation are -
(1) Explosion of human and livestock
(2) Increased requirements of timber and fuel wood
(3) Expansion of cropland and overgrazing
(4) All of these

Q.33 "Chipko Movement" is world's most known eco development programme started by Sunder Lal Bahuguna (1973). It is related with -
(1) Conservation of Forests
(2) Afforestation
(3) Planting
(4) Population

Q.34 Percentage of land mass in India under forest cover is -
(1) 33% (2) 23% (3) 17% (4) 19%

Q.35 Afforestation with the purpose of environmental aesthetic and economic development is known as -

(1) Agroforestry

(2) Forest conservation

(3) Intergrated afforestation

(4) Social forestry

Q.36 Forests contribute to all the following except-

(1) Reduction in atmospheric pollution

(2) Increased amount of carbon dioxide

(3) Improvement of soil structure

(4) Prevention of soil erosion

Q.37 Shifting cultivation is being practised by some tribals in Assam and Europe. It is one of the cause of deforestation as a forest area is cleared by cutting and burning of trees for cultivation for 3-5 years and then a new forest area is cleared. The abandoned area invites erosion and wild vegetation. This cultivation is also called -

(1) Jhuming cultivation (2) Mulching

(3) Swidden cultivation (4) All of these

Q.38 Silent valley of Kerala is preserved as -

(1) It is reservoir of wild life

(2) It contains timber trees

(3) It represents tropical rain forests

(4) All of the above

Q.39 When was the National Forest Policy formulated -

(1) 1980 (2) 1964

(3) 1952 (4) 1948

Q.40 When was the Forest Conservation Act passed in India -

(1) 1960 (2) 1970

(3) 1950 (4) 1980

Q.41 The famous forest conservation movement in India is -

(1) Silent valley movement

(2) Chipko Andolan

(3) Both (1) and (2)

(4) MAB and IBP

Q.42 Forests called Nation's Green Gold, are important as -

(1) They prevent erosion of soil by binding soil particles and increasing the fertility and prevent pollution

(2) They provide timber and medicines

(3) They provide shelter to animals

(4) All of the above

Q.43 What is added to correct an alkaline and acidic soil –

(1) Limestone and dolomite powder

(2) Gypsum and sulphur powder

(3) Dolomite and charcoal

(4) Ammonium sulfate and sulphur powder

Q.44 Bloom occurs in -

(1) Oligotrophic lake (2) Eutrophic lake

(3) Fast flowing river (4) Rain water

Q.45 Which of the following plant has become a water weed in this country -

(1) Typha (2) Trapa

(3) Cyperus (4) Eichornia

Q.46 What is not useful to increase agriculture production -

(1) Mechanisation of agriculture

(2) Enhanced irrigation facilities

(3) Use of fertilizers

(4) Deforestattion

Q.47 Environmental Planning organisation is -

(1) CSIR (2) CPHERI

(3) ICAR (4) NEERI

Q.48 Which is normally not an air pollutant -

(1) CO (2) SO_2

(3) Hydrocarbons (4) CO_2

Q.49 Acidic rains are due to -

(1) O_3 (2) $SO_2 + NO_2$

(3) CO (4) CO_2

Q.50 What is found in photochemical smog -

(1) CO (2) NO_2

(3) Ozone (4) 2 and 3 both

Q.51 Lichens in a habitat indicates -

(1) Zinc in soil

(2) Copper in soil

(3) Carbon monoxide in air

(4) Lack of air pollution

Q.52 Green house effect mainly due to -
(1) SO_2 (2) CO_2
(3) CO (4) O_2

Q.53 Which pollutant exhibits biomagnification in food chain -
(1) DDT (2) SO_2
(3) CO (4) PAN

Q.54 Which will not cause any atmospheric pollution -
(1) Hydrogen (2) Sulphur dioxide
(3) Carbon dioxed (4) Carbon monoxide

Q.55 Which of the following is the main factor of water pollution -
(1) Smoke (2) Industrial waste
(3) Detergent (4) Ammonia

Q.56 Main air pollutant among the following is -
(1) CO (2) CO_2
(3) N_2 (4) Sulphure

Q.57 Pollution can be controlled by -
(1) Sewage treatment
(2) Checking atomic blasts
(3) Manufacturing electrically operated vehicles
(4) All the above

Q.58 In cities like Bombay and Calcutta the major air pollutants are -
(1) Ozone
(2) Carbon monoxide and oxides of Sulphur
(3) Hydrocarbons and not air
(4) Algal spores and march gas

Q.59 Recent reports of acid rains industrial cities are due to the effect of atmospheric pollution by -
(1) Excessive release of NO_2 and SO_2 by burning of fossil fuels
(2) Excessive release of CO_2 by burning of fuel like wood and charcoal, cutting of forests and increased animal population
(3) Excessive release of NH_3 by industrial plants and coal gas
(4) Excessive release of CO in atmosphere by incomplete combustion of coke, charcoal and other carbonaceous fuels is pancity of oxygen

Q.60 Which is the greatest air pollutant these days-
(1) factories
(2) Motor vehicles
(3) Domestic appliances
(4) animals

Q.61 Removal of the soil by the action of wind and water is known as -
(1) Erosion (2) Fossilization
(3) Leaching (4) Calcification

Q.62 Eutrophication refers to -
(1) High production in an aquatic ecosystem
(2) Low production in an aquatic ecosystem
(3) Low production in a terrestrial
(4) Stable production in a terrestrial ecosystem

Q.63 Photochemical smog was first observed in -
(1) London (2) Los Angeles
(3) Paris (4) Tokyo

Q.64 Domestic waste will lead to -
(1) Biodegradable pollution
(2) Nondegradable pollution
(3) Thermal pollution of soil
(4) Air pollution

Q.65 The major source of BOD in the river Ganga is-
(1) Leaf litter (2) Fishes
(3) Human waste (4) Auatic plants

Q.66 If a lake is contaminated with DDT, its highest concentration would be found in -
(1) Primary consumer
(2) Secondary consumer
(3) Tertiary consumer
(4) None of these

Q.67 The most harmful air pollutant produced by automobiles is -
(1) HNO_2 (2) NO (3) SO_2 (4) CO

Q.68 Major pollulant in jet plane emission is -
(1) SO_2 (2) CFC (3) CO (4) CCl_4

Q.69 It is said that Tajmahal may be destroyed due to -
(1) Flood in Yamuna river
(2) Air pollutants released from oil relinery of Mathura
(3) Decomposition of Marble as a result of high temperature
(4) All the above

Q.70 Melting of the ice caps might result from -
(1) Depletion of ozone layer
(2) Excess CFC in atmosphere
(3) Excess CO_2 in the atmosphere
(4) Excess water rain

Q.71 Cotton dust is an important pollutant in -
(1) Delhi (2) Ahmedabad
(3) Madras (4) Calcutta

Q.72 Some effects of SO_2 and its transformation products on plant include -
(1) Chlorophyll destruction
(2) Plasmolysis
(3) Golgi body destruction
(4) None

Q.73 Non ionising radiations damaging to DNA are-
(1) X-rays (2) U.V. rays
(3) Gamma rays (4) Beta rays

Q.74 Radiation is health hazard because it cause -
(1) Pneumonia (2) Leukaemia
(3) Hemophilla (4) Anaemia

Q.75 What is B.O.D. -
(1) The amount of O_2 utilised by organism in water
(2) The amount of O_2 utilized by micro organisms for decomposition
(3) The toal amount of O_2 present in water
(4) All of the above

Q.76 What is the intensity of sound in normal conversation -
(1) 10 - 20 decibal (2) 30 - 60 decibal
(3) 70 - 90 decibal (4) 120 - 150 decibal

Q.77 Which of the following is absent in polluted water -
(1) Hydrilla (2) Water hyacinth
(3) Larva of stone fly (4) Blue green algae

Q.78 Maximum green house gas relased by which country -
(1) India (2) France
(3) U.S.A. (4) Britain

Q.79 Ozone layer of upper atmosphere is being destroyed by -
(1) Sulphurdioxide
(2) Carbondioxide
(3) Chlorofluorocabon
(4) Smog

Q.80 Most hazardous metal pollutant of autombile exhaust is -
(1) Hg (2) Cd
(3) Pb (4) Cu

Q.81 B.O.D. is connected with -
(1) Hg (2) Cd
(3) Pb (4) Cu

Q.82 Soil erosion is greater when -
(1) No rain occurs
(2) Winds do not blow
(3) The rainfall is evenly distributed
(4) The Rainfall is received in heavy down pour

Q.83 Soil erosion can be prevented by -
(1) Over grazing
(2) Removal of vagetation
(3) Afforestationi (Plantation)
(4) Increasing bird population

Q.84 Soil conservation is the process where -
(1) Soil is aerated
(2) Soil erosion is allowed
(3) Soil is protected against loss
(4) Sterile soil is converted into fertile soil

Q.85 In hilly regions, erosion can be minimised by -
(1) Terracing (2) Ploughing effectively
(3) Manuring (4) Strip cropping

Q.86 Who is known as tiger man of Rajasthan
(1) Jim Corbett (2) Kailash Sankhla
(3) Salim Ali (4) Bahuguna

Q.87 Which of the following hot spots are present in India
(1) Western Ghat & SRI Lanka
(2) Indo-Burma
(3) Himalaya
(4) All of the above

Q.88 Which of the following are cause of biodiversity loss
(1) Habitat loss
(2) Over exploitation
(3) Alien species invasion
(4) All

Q.89 Which of the following become extinct due to over exploitation
(1) Passanger pegion (2) Steller's Sea cow
(3) Cichlid fish (4) 1 & 2 Both

Q.90 Out of more than 1.5 million known species insects are — of the total animals
(1) 70 % (2) 25 %
(3) 50 % (4) 75 %

Q.91 Which is not true regarding genetic dervesity?
(1) It enables a population to adapt to its environment
(2) It is also bais of speciation
(3) Ecotype formation
(4) Higher diversity increases uniformity

Q.92 Regional diversity is also called
(1) Alpha diversity
(2) Beta diversity
(3) Gamma diversity
(4) Ecosystem diversity

Q.93 Which of the following biogeographical regions in India has highest lnad coverage?
(1) Deccan peninsula (2) N.E. Himalayas
(3) Western ghats (4) Gangetic plains

Q.94 Which is not a reason of maximum diversity in tropics ?
(1) Higher pest pressure
(2) Evolutionary older zone
(3) High rate of out crossing
(4) Greater environmental variations

Q.95 Threats to biodiversity comes from
(1) Habitat loss
(2) Over exploitation
(3) Intensive agriculture
(4) All of these

Q.96 Disappearance of cheetah from India and its existence in other part of world is an example of
(1) Extinction
(2) Extirpation
(3) Back ground extinction
(4) Anthropogenic extinction

Q.97 Silent valley of Kerala is being preserved because it has
(1) Rare plants and animals
(2) Only natural forest of India
(3) Crostly timber plants
(4) Recreational value

Q.98 Anti-forest conservation is
(1) Selective felling
(2) Control of forest fire
(3) Large scale plantation
(4) Ban on hunting

Q.99 The species which are likely to be in danger of extinction in the medium term future if the factors threating their extinction continue are known as
(1) Threatened species
(2) Rare species
(3) Vulnerable species
(4) Endangered species

Q.100 In India, forests constitute about
(1) 19.4% of the land area
(2) 38.7% of the land area
(3) 33% of the land area
(4) 67% of the land area

Q.101 Select an incorrect statement w.r.t. biodiversity
(1) Moutain peaks are more diverse than foot hills
(2) Valley's are more diverse than mountain peaks
(3) Shade sides are more diverse than sun sides of mountains
(4) Western ghats are more diverse than eastern ghats

Q.102 85% of world's food comes from
(1) < 20 plant species
(2) < 50 plant species
(3) < 5 plant species
(4) < 100 plant species

Q.103 A population characteristic of a species susceptible to extinction is
(1) Low trophic level in food chain
(2) Inability to switch over to alternate food source
(3) Wide range of distribution
(4) High biotic potential

Q.104 Number of red list categories prepared by WCU (IUCN) is
(1) 6 (2) 7
(3) 8 (4) 9

Q.105 According to IUCN, when a taxon is facing an extremely high risk of extinction in the immediate future, it is
(1) Extinct in wild
(2) Endangered
(3) Critically endangered
(4) Vulnerable

Q.106 Protected areas are example of

(1) In-situ conservation

(2) Ex-situ conservation

(3) Cryopreservation

(4) Green Houses

Q.107 The zone of biosphere reserve where no human activity is permitted is known as

(1) Buffer zone (2) Core zone

(3) Manipulation zone (4) None of these

Q.108 Mark the tree recommended for social forestry purpose

(1) Prosopis juliflora

(2) Prosopis chilensis

(3) Capparis decidua

(4) Leucaena leucocephala

Q.109 The Indian rhinoceros is the most important protected species in

(1) Gir National Park

(2) Bandipur National Park

(3) Corbett National Park

(4) Kaziranga National Park

Q.110 Government of India has provided the private ownership rights in

(1) A national park

(2) A sancturay

(3) A biosphere reserve

(4) Zoo

Q.111 Wild populations of plants and animals and tradiational life styles of tribals are protected in

(1) Biosphere Reserve

(2) Sanctuary

(3) National Park

(4) None of these

Q.112 Man made mass extinction of species represent a very severe depletion of biodiversity called as

(1) Mass extinction

(2) Natural extinction

(3) Anthropogenic extinction

(4) Human extinction

Q.113 Which of the following exotic species has become menace to many water bodies in India?

(1) Lantana camara

(2) Eichhornia crassipes

(3) Panthenium hysterophorus

(4) Eupatorium odoratum

Q.114 Which is not a criteria used for determining hot spots

(1) Number of endemic species

(2) Degree of habitat destruction

(3) Having traditional strategy for protection of biodiversity

(4) Degree of exploitation

Q.115 Which anticancerous botano-chemical is obtained from a Gymnosperm ?

(1) Ephedrine (2) Strychnine

(3) Taxol (4) Reserpine

Q.116 Find odd one out w.r.t. endangered plants

(1) Berbesis nilghiriensis

(2) Bentinckia nicobarica

(3) Podophyllum

(4) Nepenthes khasiana

Q.117 A few years ago, the brown plant hopper (Nilaparvata lunges) threatened the cultivation of

(1) Wheat (2) Rice

(3) Maize (4) Millets

Q.118 An important international effort of convention for biodiversity conservation is

(1) UNESCO (2) WWF

(3) IBWL (4) NBPGR

Q.119 Find the odd one out (w.r.t. weed)

(1) Lantana camara

(2) Eichornia

(3) Parthenium argentatum

(4) Parthenium hysterophorus

Q.120 How many species became extinct in last 500 years

(1) 338 (2) 359

(3) 784 (4) 2000

Q.121 How many hot spots cover India's high biodiversity regions ?

(1) 25 (2) 3

(3) 34 (4) 2

Q.122 Overexploitations has resulted in the extinction of

(1) Steller's cow

(2) Lantana

(3) Passenger pigeon

(4) Both (1) & (3)

Q.123 Species diversity in an ecosystem mainly depends on -

(1) Light intensity (2) Temperature

(3) Rain fall (4) Soil type

Q.124 Red data book is famous for -

(1) Extinct plants and animals

(2) Extinct plants only

(3) Endangered plants and animals

(4) Extinct animals only

Q.125 Green book contains -

(1) The list of endangered plants

(2) The list of extinct plants

(3) The list of rare plants grown in botanical gardens

(4) Flora of certain area

Q.126 Of the followings plants which one would you consider an endangered plant, due to over exploitation -

(1) Dioscorea (2) Maize

(3) Wheat (4) Rice

Q.127 Among the following a plant species of medicinal value is endangered -

(1) ***Butea frondosa***

(2) ***Rauwolfia serpentina***

(3) ***Cocus nucifera***

(4) ***Mangifera land slides***

Q.128 The method by which endangered plant species are conserved in a botanical garden or in some controlled circumstances -

(1) Afforestation

(2) In situ conservation

(3) Ex situ conservation

(4) None of the above

Q.129 Which one of the following may be the reason for extinction of plant species due to human activities -

(1) Earthquakes

(2) Pollution

(3) Diseases

(4) Evolution

Q.130 The main aim of plant conservation is -

(1) To conserve the necessary ecological activities and life supporting systems

(2) To conserve species diversity and range of genetic meterial

(3) Both the above

(4) None of the above

ANSWER KEY

EXERCISE – 2

Ques.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Ans.	1	2	3	4	3	2	1	4	4	1	2	4	4	3	2	3	4	1	1	2

Ques.	121	122	123	124	125	126	127	128	129	130										
Ans.	2	4	3	3	3	1	2	3	2	3										

Q.1 Minerals, metals and fossil fuels are which type of resources of energy ?
[UTTARANCHAL 2004]
(1) Renewable (2) Non-renewable
(3) Biodegradable (4) Degradable

Q.2 Thermal pollution is caused by -
[UTTRANCHAL 2005]
(1) Power plants (2) Industries
(3) Automobiles (4) All the above

Q.3 The addition of any substance to water which leads to change in its physical and chemical characteristic it is defined as water pollution. It results in - **[UTTRANCHAL 2006]**
(1) Decrease turbidity
(2) Increase oxygenation
(3) Increase photosynthesis
(4) Increase turbidity dexoygenation

Q.4 Which of the following is not a green house gas ? **[WEST BANGAL JEE 2007]**
(1) CH_4 (2) N_2O
(3) H_2O (4) CO_2

Q.5 High BOD indicates -
[WEST BANGAL JEE 2007]
(1) Highly polluted water
(2) Less pollution in H_2O
(3) Less sewage
(4) Less microoganism

Q.6 Increasing concentration of accumulated pollutant along food chain is -
[WEST BANGAL JEE 2007]
(1) Biomagnification (2) Bioaccumulation
(3) Eutrophication (4) Biodiversity

Q.7 Which one of the following is a renewable source of energy ? **[C.G. PMT 2004]**
(1) Petroleum (2) Coal
(3) Nuclear fuel (4) Trees

Q.8 Spraying of DDT produces pollution of -
[C.G. PMT 2004]
(1) Air only (2) Air and soil only
(3) Air, soil and water
(4) Air and water only

Q.9 Sewage water is purified for recycling by the action of - **[C.G. PMT 2005]**
(1) Light (2) Micro-organisms
(3) Aquatic plants (4) Fishes

Q.10 Which one is not dangerous -
(1) Biopollutants (2) Ozone layer
(3) Nuclear blast (4) Deforestation

Q.11 Which of the following set is green house gases ? **[JHARKHAND 2006]**
(1) CFC, CH_4, CO_2, N_2O
(2) CO_2, CH_4,N_2, O_2
(3) CO_2, CH_4, N_2O_3
(4) CO_2, CFC, N_2, O_2

Q.12 Acid rain is due to the pollution by -
[JHARKHAND 2005]
(1) CO_2 (2) SO_2 and NO_2
(3) Dust particles (4) Automobiles

Q.13 Which of the following is biodegradable pollutant ?
(1) Sewage (2) Plastic
(3) Polythene (4) DDT

Q.14 Most hazardous metal pollutant of automobile exhaust is - **[JHARKHAND 2004]**
(1) Cadmium (2) Lead
(C Mercury (4) Copper

Q.15 Air quality indicator is - **[BIHAR 2005]**
(1) Lichen (2) Moss
(3) Algae (4) None of these

Q.16 Blood haemoglobin has high affinity for -
[BIHAR 2004]
(1) CO_2 (2) CO
(3) O_2 (4) H

Q.17 Minamata disease caused due to water pollution is due to - **[BIHAR 2003]**
(1) Lead poisoning
(2) Arsenic chloride poisoning
(3) Mercury poisoning
(4) Ammonia pollution

Q.18 Effect of pollution is first marked on - **[UP CPMT 2002]**

(1) Micro-organisms

(2) Green vegetation of an area

(3) Food crop

(4) None of these

Q.19 Pollution is not caused by - **[UP CPMT 2002]**

(1) Thermal power plant

(2) Automobile

(3) Radioactive power plant

(4) Hydroelctric power plant

Q.20 Taj Mahal marble is affected by - **[UP CPMT 2002]**

(1) SO_2 (2) O_2

(3) O_3 (4) NO_2

Q.21 Minimata disease first occurred in - **[UP CPMT 2002]**

(1) Japan (2) China

(3) Korea (4) Russia

Q.22 Increase in BOD of water reservior is due to- **[AIPMT-2004]**

(1) Algae (2) Soil

(3) Moss (4) Waste product

Q.23 Number of wild life is continuously decreasing. What is the main reason of this - **[CPMT 2002]**

(1) Predation

(2) Cutting down of forest

(3) Destruction of habital

(4) Hunting

Q.24 One of the following is associated with the conservation of forests - **[DPMT 87]**

(1) Kaziranga (2) Ghana

(3) Silent valley (4) Gir

Q.25 Which one of the following is a pair of endangered species - **[AIIMS 2004]**

(1) Garden lizard and Mexican poppy

(2) Rhesus monkey and Sal tree

(3) Indian peacock and carrot grass

(4) Hornbill and Indian Aconite

Q.26 If the Bengal 'Tiger becomes extinct - **[AIIMS 2004]**

(1) Hyanas and wolves will become scare

(2) The wild areas will be safe for man and domestic animals

(3) Its gene pool will be lost for ever

(4) The populations of beautiful animals like deers will get stabilized

Q.27 If high altitude birds become rare or extinct, the plants which may disappear along with them are- **[AIIMS 2004]**

(1) Pine (2) Oak

(3) Orchids (4) Rhododrons

Q.28 Which one of the following pairs of geographical areas show maximum biodiversity in our country- **[AIIMS 2005]**

(1) Sunderbans and Rann of Kutch

(2) Eastern Ghats and West Bengal

(3) Eastern Himalaya and Western Ghats

(4) Kerala and Punjab

Q.29 One of the **ex situ** conservation methods for endangered species is - **[AIIMS 2005]**

(1) Wildlife Sanctuaries

(2) Biosphere Reserves

(3) Cryopreservation

(4) National Parks

Q.30 Reason for elimination of wild life is - **[AIPMT 1998]**

(1) Deforestation (2) Forest fire

(3) Floods (4) Less Rain fall

Q.31 Main reason of disturbance of biological diversity- **[AIPMT 1998]**

(1) Green house effect

(2) Hunting

(3) Soil erosion

(4) Destruction of natural habitats

Q.32 Best method to preserve the wild relatives of plants - **[AIPMT 1999]**

(1) By growing them in natural habitats

(2) Gene library

(3) By storing seeds

(4) Cryopreservation

Q.33 Species diversity is maximum in - **[AIPMT 1999]**

(1) Tropical rain forest

(2) Temperate forest

(3) Deserts

(4) Hill slops

Q.34 According to forestory comission report-1997 the total forest cover fo India - **[AIPMT 1999]**

(1) 11 % (2) 19.5 %

(3) 17 % (4) 18.7 %

Q.35 What shall be the effect of destruction of wild life - **[AIPMT 2000]**

(1) Wild gene of disease resistance will not be obtained

(2) Soil erosion

(3) Floods

(4) Green house effect

Q.36 Occurence of endemic species in south america and Australia due to - **[AIPMT 2001]**

(1) There species has been extinct from other regions

(2) Continental separation

(3) There is no terrrestrial route to these places

(4) Restrogressive evolution

Q.37 In your opinion, which is the most effective way to conserve the plant diversity of an area- **[AIPMT 2004]**

(1) By creating biosphere reserve

(2) By creating botanical garden

(3) By developing seed bank

(4) By tissue culture method

Q.38 Biodiversity Act of India was passed by the Parliament in the year - **[AIPMT 2005]**

(1) 2002 (2) 1992

(3) 1996 (4) 2000

Q.39 According to IUCN Red List. What is the status of Red Panda (***Ailurus fulgens***) ? **[AIPMT 2005]**

(1) Critically species

(2) Vulnerable species

(3) Extinct species

(4) Endangered species

Q.40 One of the most important functions of botanical gardens is that - **[AIPMT 2005]**

(1) they provide a beautiful area for recreation

(2) one can observe tropical plants there

(3) they allow ex-situ conservation of germ plasm

(4) they provide the natural habitat for wild life

Q.41 Which of the following pairs of an animal and a plant represents endangered organisms in India ? **[AIPMT 2006]**

(1) Cinchona and Leopard

(2) Banyan and Black buck

(3) Bentinckia nicobarica and Red Panda

(4) Tamarind and Rhesus monkey

Q.42 Which one of the following is not included under in - situ conservation ? **[AIPMT 2006]**

(1) Biosphere reserve

(2) National park

(3) Sanctuary

(4) Botanical garden

Q.43 Which one of the following is the correctly matched pair of an endangered animal and a National Park ? **[AIPMT 2006]**

(1) Wild ass - Dudhwa National Park

(2) Great Indian Bustard - Keoladeo National Park

(3) Lion - Corbett National Park

(4) Rhinoceros - Kaziranga National Park

Q.44 Which of the following is considered a hot-spot of biodiversity in India ? **[AIPMT 2006]**

(1) Eastern Ghats (2) Aravalli Hills

(3) Western Ghats (4) Indo-Gangetic Plain

Q.45 Identify the odd combination of the habitat and the particular animal concerned - **[AIPMT 2007]**

(1) Rann of Kutch - Wild Ass

(2) Dachigam national - Snow Leopard Park

(3) Sunderbans - Bengal Tiger

(4) Periyar - Elephant

Q.46 Which one of the following pairs of organisms are exotic species introduced in India ? **[AIPMT 2007]**

(1) Nile perch, Ficus religiosa

(2) Ficus religiosa, Lantana camara

(3) Lantana camara, Water Hyacinth

(4) Water hyacinth, Prosopis cinereia

Q.47 Which one of the following is not observed in biodiversity hotspots ? **[AIPMT 2008]**

(1) Lesser inter-specific competition

(2) Species richness

(3) Endemism

(4) Accelerated species loss

Q.48 The table below gives the populations (in thousands) of ten species (A – J) in four areas (a – d) consisting of the number of habitats given within brackets against each. Study the table and answer the question which follows-

Area and Number of habitats	Species and their populations (in thousands) in the areas									
	A	B	C	D	E	F	G	H	I	J
a (11)	2.3	1.2	0.52	6	-	3.1	1.1	9	-	10.3
b (11)	10	-	0.62	-	1.5	3	-	8.2	1.1	11.2
c (13)	11	0.9	0.48	2.4	1.4	4.2	0.8	8.4	2.2	4.1
d (12)	3.2	10.2	11.1	4.8	0.4	3.3	0.8	7.3	11.3	2.1

Which area out of a tod shows maximum species diversity ? **[AIPMT 2008]**

(1) d (2) a

(3) b (4) c

Q.49 Tiger is not a resident in which one of the following national park ? **[AIPMT 2009]**

(1) Jim Corbett (2) Ranthambhor

(3) Sunderbans (4) Gir

Q.50 Which one of the following is an example of ex-situ conservation? **[AIPMT Pre 2010]**

(1) Wild life centurary

(2) Seed bank

(3) Sacred groves

(4) National Park

Q.51 The Indian Rhinoceros is a natural inhabitant of which one of the Indian states - **[AIPMT Pre 2010]**

(1) Uttar Pradesh (2) Himachal Pradesh

(3) Assam (4) Uttarakhand

Q.52 Which of the following is the non conventional source of energy - **[DPMT 86]**

(1) Coal

(2) Petroleum

(3) Electricity from nuclear power plants

(4) Solar radiations

Q.53 Petrolium resource is - **[CBSE PMT 92]**

(1) Renewable

(2) Non renewable

(3) Synthetic & biodegradable

(4) Infinite & unconventional

Q.54 Biological Oxygen Demand (BOD) is measure of - **[AIIMS 2003]**

(1) Industrial wastes poured into water bodies

(2) Extent to which water is polluted with organic compouds

(3) Amount of Carbon monoxide inseparably combined with haemoglobin

(4) Amount of oxygen needed by green plants during night

Q.55 In almost all Indian metropolitan cities like Delhi, the major atmospheric pollutant(s) is/are - **[AIIMS 2003]**

(1) Suspended particulate matter (SPM)

(2) Oxides of sulphur

(3) Carbon dioxide and carbon monoxide

(4) Oxides of nitrogen

Q.56 Nitrogen oxides produced from the emission of automobiles and power plants, are the source of fine air borne particles which lead to - **[AIIMS 2004]**

(1) Photochemical smog

(2) Dry acid depposition

(3) Industrial smog

(4) Wet acid deposition

Q.57 A lake with an inflow of domestic sewage rich in organic waste may result in - **[AIIMS 2004]**

(1) Drying of the lake very soon due to algal bloom

(2) An increased production of fish due to lot of nutrients

(3) Death of fish due to lack of oxygen

(4) Incrased population of aquatic food web organisms

Q.58 Minamata disease was caused due to the consumption of - **[AIIMS 2004]**

(1) Sea food containing lot of cadmium

(2) Fish contaminated with mercury

(3) Oysters with lot of pesticide

(4) Sea food contaminated with selenium

Q.59 Which one of the following statements pertaining to pollutants is correct - **[AIIMS 2005]**

(1) DDT is a non-biodegradable pollutant

(2) Excess fluoride in drinking water causes osteoporosis

(3) Excess cadmium in driking water causes black foot disease

(4) Methylmercury in water may cause "Itai Itai" disease

Q.60 If CO_2 is absent in atmosphere of earth then - **[AIPMT-1998]**

(1) Temperature will decrease

(2) Temperatuer will increase

(3) Plants will flourish well

(4) No effect

Q.61 CO is harmful because - **[AIPMT-1998]**

(1) It forms stable compound with haemoglobin

(2) It blocks mitosis

(3) It is mutagenic

(4) It causes defloation

Q.62 Beside CH_4 and CO_2 other green house gas from agriculture area - **[AIPMT-1998]**

(1) SO_2 (2) NH_3

(3) NO_2 (4) CFC

Q.63 Temperature variation in Pacific ocean in present time is called - **[AIPMT-1998]**

(1) Cyclone effect (2) Alnino effect

(3) Green houe effect (4) Gaudikov's effect

Q.64 Sewage purification is performed by - **[AIPMT-1998]**

(1) Microbes (2) Fertilisers

(3) Antibiotics (4) Antiseptics

Q.65 Best eocnomic method to harvest the solar energy- **[AIPMT-1999]**

(1) Solar cell

(2) Energy plantation

(3) Cultivation of sugar cane then energy obtain by burning it

(4) solar cooker

Q.66 Bhopal gas tragedy is related with - **[AIPMT-1999]**

(1) Methan

(2) Carban monooxide

(3) Methyl Iso cyanate (MIC)

(4) SO_2

Q.67 Concentration of DDT is highest in - **[AIPMT-1999]**

(1) Primary consumer

(2) Producers

(3) Top consumer

(4) Decomposers

Q.68 Lichens can be used as - **[AIPMT-1999]**

(1) Bio-indicator for water and air pollution

(2) Initial vegetation for waste lands

(3) Source of wood

(4) To check the air pollution

Q.69 What is phytotron - **[AIPMT-1999]**

(1) A device to grow the plants in controlled environment

(2) Growing plants in green house

(3) Radiation chamber to induce the mutations

(4) Apparatus to study the effect of light on plants

Q.70 Which of the following is secondary pollutant- **[AIPMT-1999]**

(1) PAN (2) CO

(3) NO_2 (4) SO_2

Q.71 Maximum DDT in birds feeding on - **[AIPMT-1999]**

(1) Fishes (2) Meat

(3) Insects (4) Seeds

Q.72 Which one is associated with occupational hazard is - **[AIPMT-1999]**

(1) Fluorosis (2) Pneumoconiosis

(3) Silicosis (4) Asthama

Q.73 Green house effect is - **[AIPMT-1999]**

(1) Garderning outside the house

(2) Global cooling

(3) Global warming

(4) Green colour house

Q.74 What is B.O.D. - **[AIPMT-2001]**

(1) The of O_2 utilised by organisms in water

(2) The amount of O_2 utilized by micro organisms for decomposition

(3) The toal amount of O_2 present in water

(4) All of the above

Q.75 What is the intensity of sound in normal conversation - **[AIPMT-2001]**

(1) 10 – 20 decibal (2) 30 – 60 decibal

(3) 70 – 90 decibal (4) 120 – 150 decibal

Q.76 Which of the following is absent in polluted water - **[AIPMT-2002]**

(1) Hydrilla (2) Water hyacinth

(3) Larva of stone fly (4) Blue green algae

Q.77 Maximum green house gas released by which country - **[AIPMT-2002]**

(1) India (2) France

(3) U.S.A. (4) Britain

Q.78 Lead concentration in blood is considered alarming if it is - **[AIPMT-2004]**

(1) 30 μg/ 100 ml (2) 4-6 μg/100 ml

(3)10 μg/100 ml (4) 20 μg/100ml

Q.79 In 1984, the Bhopal gas tragedy took place because methyl isocyanate - **[AIPMT-2001]**

(1) Reacted with ammonia

(2) Reacted with CO_2

(3) Reacted with water

(4) Reacted with DDT

Q.80 Blood analysis of a patient reveals an unusually high quantity of carboxyhaemoglobin content. Which of the following conclusion is most likely to be correct ? the patient has been inhaling polluted air containing unusually high content of- **[AIPMT-2004]**

(1) Carbon monoxide (2) Carbon disulphide

(3) Chloroform (4) Carbon dioxide

Q.81 Common indicator organism of water pollution is- **[AIPMT-2004]**

(1) Entamoeba histolytica

(2) Lemna pancicostata

(3) Eichhornia crassipes

(4) Escherichia coli

Q.82 Which one of the following pairs in mismatched- **[AIPMT-2005]**

(1) Nuclear power - radioactive wastes

(2) Solar energy - greenhouse effect

(3) Fossil fuel burning - release of CO_2

(4) Biomass burning - release of CO_2

Q.83 Identify the correctly matched pair - **[AIPMT-2005]**

(1) Kyoto Protocol - Climatic change

(2) Montreal Protocol - Global warming

(3) Basal Convention - Biodiversity Conservation

(4) Ramsar Convention - Ground water pollution

Q.84 Prolonged liberal irrigation of agricultural fields is likely to create the problem of - **[AIPMT-2005]**

(1) Acidity (2) Aridity

(3) Salinity (4) Metal toxicity

Q.85 Which of the following is **not** used for disinfection of drinking water - **[AIPMT-2005]**

(1) Chlorine (2) Ozone

(3) Chloramine (4) Phenyl

Q.86 Limit of BOD prescribed by Central Pollution Control Board for the discharge of industrial and municipal waste waters into natural surface waters, is - **[AIPMT-2006]**

(1) < 100 ppm (2) < 30 ppm

(3) < 3.0 ppm (4) < 10 ppm

Q.87 The 'blue baby' syndrome results form - **[AIPMT-2006]**

(1) excess of dissolved oxygen

(2) excess of TDS (total dissolved solids)

(3) excess of chloride

(4) methaemoglobinaemia

Q.88 Montreal Protocol which calls for appropriate action to protect the ozone layer from human activities was passed in the year - **[AIPMT-2001]**

(1) 1988 (2) 1985

(3) 1986 (4) 1987

Q.89 Photochemical smog pollution does not contain- **[AIPMT-2006]**

(1) Carbon dioxide

(2) PAN (peroxy acyl nitrate)

(3) Ozone

(4) Nitrogen dioxide

Q.90 In a coal fired power plant electrostatic precipitators are installed to control emission of- **[AIPMT-2007]**

(1) CO (2) SO_2

(3) NO_8 (4) SPM

Q.91 Which one of the following is not a bioindicator of water pollution ? **[AIPMT-2007]**

(1) Sewage fungus (2) Sludge - worms

(3) Blood-worms (4) Stone flies

Q.92 Which one of the following is the correct percentage of the two (out of the total of 4) green house gases that contribue tothe total global warming ? **[AIPMT-2008]**

(1) N_2O 6 %, CO_2 86 %

(2) Methane 20 %, N_2O 18 %

(3) CFCs 14 %, Methane 20 %

(4) CO_2 40 %, CFCs 30 %

Q.93 World summit on sustainable Development (2002) was held in - **[AIPMT-2008]**

(1) Argentina (2) South Africa

(3) Brazil (4) Sweden

Q.94 About 70 % of total global carbon if found in - **[AIPMT-2008]**

(1) Ocean (2) Forests

(3) Desert (4) Rain forest

Q.95 A lake near a village suffered heavy mortlity of fishes within a few days. Consider the following reasons for this ? **[AIPMT-2008]**

(a) Lots of urea and phosphate fertilizer wer used in the crops in the vicinity

(b) The area was sprayed with DDT by and aircraft

(c) The lake water turned green and stinky

(d) Phytoplankton populations in the lake declined initially thereby greatly reudcing photosynthesis

Which two of the above were the main cause of fish mortality in the lake ?

(1) a, c (2) a, b

(3) b, c (4) c, d

Q.96 According to Central Pollution Control Board (CPCB), which particulate size in diameter (in micrometers) of the air pollutants is resposible for greatest harm to human health ? **[AIPMT-2008]**

(1) 1.0 or less (2) 5.2 – 2.5

(3) 2.5 or less (4) 1.5 or less

Q.97 Montreal Protocol aims at - **[AIPMT-2009]**

(1) Control of CO_2 emission

(2) Reduction of ozone depleting substances

(3) Biodiversity conservation

(4) Control of water pollution

Q.98 Chipko movement was launched for the protection of - **[AIPMT-2009]**

(1) Wet lands (2) Grasslands

(3) Forests (4) Livestock

Q.99 Steps taken by the government of India to control air pollution include - **[AIPMT-2009]**

(1) Use of non-polluting Compressed Natural Gas (CNG) only as fuel by all buses and trucks

(2) Compulsory mixing of 20 % ethyl alcohol with petrol and 20 % biodisel with disesel

(3) Compulsory PUC (Pollution Under Control) certification of petrol driven vehicles which tests for carbon monoxide and hydrocarbons

(4) Permission to use only pure diesel with a maximum of 500 ppm sulphur as fuel for vehicles

Q.100 Biochemical Oxygen Demand (BOD) in a river water - **[AIPMT-2009]**

(1) Increases when sewage gets mixed with river water

(2) Remains unchanged when algal bloom occurs

(3) Has no relationship with concentration of oxygen in the water

(4) Gives a measure of salmonella in the water

Q.101 DDT residues are rapidly passed through food chain causing biomagnification because DDT is- **[AIPMT-2009]**

(1) Water soluble

(2) Fat soluble

(3) Moderately toxic

(4) Non-toxic to aquatic animals

Q.102 Global agreement in specific control strategies to reduce the release of ozone depleting substances, was adopted by - **[AIPMT-2009]**

(1) The Vienna Convention

(2) Rio Janerior Conference

(3) The Montreal Protocol

(4) The Koyoto Protocol

Q.103 Breeding of crops with high levels of minerals, vitamins and proteins is called- **[AIPMT Pre 2010]**

(1) Somatic hybridation (2) Biofortification

(3) Biomagnification (4) Micropropagation

Q.104 The two gases making highest relative contribution to the green house gases are-

[AIPMT Pre 2010]

(1) CO_2 and CH_4 (2) CH_4 and N_2O

(3) CFCs and N_2O (4) CO_2 and N_2O

Q.105 A renewable exhaustible natural resource is-

[AIPMT Pre 2010]

(1) Coal (2) Petroleum

(3) Minerals (4) Forest

Q.106 When domestic sewage mixes with river water-

[AIPMT Pre 2010]

(1) The increased microbial activity releases micro-nutrients such as iron

(2) The increased microbial activity used up dissolved oxygen

(3) The river water is still suitable for drinking as impurities are only about 0.1%

(4) Small animals like rats will die after drinking river water

Q.107 Measuring Biochemical Oxygen Demand (BOD) is a method used for : **[AIPMT Pre 2012]**

(1) working out the efficiency of oil driven automobile engines.

(2) measuring the activity of *Saccharomyces cerevisae* in producing curd on a commercial scale.

(3) working out the efficiency of R.B. Cs. about their capacity to carry oxygen.

(4) estimating the amount of organic matter in sewage water.

Q.108 Which one of the following is a wrong statement?

[AIPMT Pre 2012]

(1) Ozone in upper part of atmosphere is harmful to animals.

(2) Greenhouse effect is a natural phenomenon.

(3) Eutrophication is a natural phenomenon in fresh water bedies.

(4) Most of the forests have been lost in tropical areas.

Q.109 Which one of the following areas in India is a hotspot of biodiversity ?

[AIPMT Pre 2012]

(1) Gangetic Plan (2) Sunderbans

(3) Western Ghats (4) Eastern Ghats

Q.110 Select the correct statement about biodiversity :

[AIPMT Mains 2012]

(1) The desert areas of Rajasthan and Gujarat have a very high level of desert animal species as well as numerous rare animals.

(2) Large scale planting of Bt cottn has no adverse effect on biodiversity.

(3) Western Ghats have a very high degree of species richness and endemism.

(4) Conservation of biodiversity is just a fad pursued by the developed countries.

Ans.	2	3	2	1	4	2	4	1	3	3										

These questions consist of two statements each, printed as "ASSERTION" and "REASON". While answering these Questions you are required to choose any one of the following responses.

(1) If both Assertion and Reason are True and the Reason is a correct explanation of the Assertion.

(2) If both Assertion and Reason are True but Reason is not correct explanation of the Assertion

(3) If Assertion is True but the Reason is False.

(4) If both Assertion and Reason are false.

Q.1 **Assertion :** Degree of water pollution is measured in terms of BOD.

Reason : BOD value is low when water is highly polluted.

Q.2 **Assertion :** Rill erosion is caused by running water.

Reason : It is biological method of soil conservation.

Q.3 **Assertion :** Long chain phenolic compounds, glass and plastic etc. are persistent pollutants.

Reason : These pollutants are not decomposed naturally or by activity of micro-organisms thus are not recycled back into the environment.

Q.4 **Assertion :** D.D.T. is biologically magnified.

Reason : D.D.T. causes water, soil and air pollution.

Q.5 **Assertion :** In the presence of Chlorella in water, water become free from bacteria.

Reason : It shows protocooperation.

Q.6 **Assertion :** Natural gas is a pollution free source of energy.

Reason : In India natural gas is maximum utilised source.

Q.7 **Assertion :** B.O.D. value is low when water is highly polluted.

Reason : High amout of fertilizer found in oligotrophic lake.

Q.8 **Assertion :** PAN is secondary pollutant

Reason : PAN is formed by chemical reaction of secondary pollutants.

Q.9 **Assertion :** Oxygen is very less in amount in nutrient rich lake.

Reason : B.O.D. is high in such lakes.

Q.10 **Assertion :** Grazing animal are the renewable resources.

Reason : It is exhaustible resources.

Q.11 **Assertion :** Los Angles somg is a photochemical smog requires high temperature.

Reason : Los Angles smog occurs mainly due to sulphure oxide.

Q.12 **Assertion :** Plants and animals are renewable resources.

Reason : These are exhaustible resources.

Q.13 **Assertion :** The global mean temperature has increased by 0.6ºC during 20^{th} century.

Reason : There has been a progressive increased combustion of fossil feuls generating more green house gases.

Q.14 **Assertion :** Ozone protects the earth from U.V. radiations from sun.

Reason : Ozone is Tropospheric pollutant.

Q.15 **Assertion :** Ozone is the Tropospheric pollutnat.

Reason : Ozone protects us from the harmfull U.V. radiation.

Q.16 **Assertion :** Air pollutants are always gaseous.

Reason : Because it is always released from chimmeys.

Q.17 **Assertion** : Suspended particulate matter (SPM) is an important pollutant released by diesel vehicles.

Reason : Catalytic converters gretly reudce pollution caused by automobiles.

Q.18 **Assertion** : Presently, the global atmosphere is warming up.

Reason : The depletion of stratospheric ozone layer has resulted in increase in ultraviolet radiations reaching the earth.

Q.19 **Assertion :** In In-situ conservation speices are protected in botanical gardens

Reasaon : In-situ conservation also take place in zoos

Q.20 **Assertion :** Desert shows poor biodiversity and their productivity is minimum

Reasaon : Annual rain fall is very less in desert.

Q.21 **Assertion :** In India, Mangrove vegetation is found in Sunderban.

Reasaon : Marshy land of Sunderban is physically dry.

Q.22 **Assertion :** Sunderbans have mangrove community.

Reasaon : Only mangrove vegetation present in it.

Q.23 **Assertion :** Corals are responsbile to form rocks in the sea.

Reasaon : Coral reef is the best example of stable marine ecosystem.

Q.24 **Assertion :** There is no noise in the forest during night in silent valley.

Reasaon : Animals are not found there.

Q.25 **Assertion :** Seed, gene banks come under ex-situ conservation.

Reasaon : This is the conservation of plants outside their habitat.

Q.26 **Assertion :** The silent valley is so called because it is silent during the night.

Reasaon : There is no human activity is allowed in night time.

Q.27 **Assertion :** Alpha diversity is diversity with in a community.

Reasaon : Diversity depends upon the rate of replacement of species along a gradient of habitats.

Q.28 **Assertion :** In per unit area maximum productivity occur in tropical rain forest.

Reasaon : Maximum number of producers found in Tropical rain forest in per unit area.

Q.29 **Assertion :** Western ghats are included among the hot spots of biodiversity.

Reasaon : Western ghats have greater amphibain diversity than eastern ghats.

Q.30 **Assertion :** Tropical regions are more diversity rich in comparison to temperate areas.

Reasaon : Availability of more solar energy indirectly affects the presence of more species in these areas.

Q.31 **Assertion :** Process of extinction is random.

Reasaon : Any species not adapted to environmental conditions cannot survive.

Q.32 **Assertion :** Habitat distruction is the main reason of loss of biodiversity.

Reasaon : This actually cause the increase in edge area and reduction in core area.

Q.33 **Assertion :** Pristine forests are among in situ conservation strategies.

Reasaon : These are sacred grooves where biota is protected on site.
