

ALKANES

Introduction :

Q.1. What are alkanes?

Ans: Alkanes are saturated aliphatic hydrocarbons containing c-c single bond Alkanes are called paraffins (in Latin *parum* means *little* and *affins* means *affinity*) because they have little affinity towards the chemical reactions (i.e. they are less reactive).

Functional group : > C - C <

Representation : RH

General formula : C_nH_{2n+2}

e.g. Methane (CH_4), Ethane (C_2H_6).

Homologous series of alkanes :

Alkanes have general formula C_nH_{2n+2} where 'n' is the number of carbon atoms.

n	Name	Molecular formula
1.	Methane	CH ₄
2.	Ethane	C ₂ H ₆
3.	Propane	C ₃ H ₈
4.	Butane	C ₄ H ₁₀
5.	Pentane	C ₅ H ₁₂
6.	Hexane	C ₆ H ₁₄
7.	Heptane	C ₇ H ₁₆
8.	Octane	C ₈ H ₁₈
9.	Nonane	
10.	Decane	$C_{9}H_{20}$ $C_{10}H_{22}$

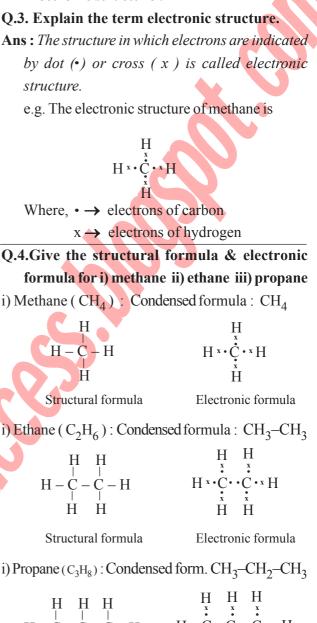

Structural formulae

Q.2. Explain the term structural formula.

Ans : The formula which indicates how the various atoms in a molecule are joined to one another is called structural formula (or graphic formula).
e.g. Structural formula of methane (CH₄) is

$$\begin{array}{c} H\\ H\\ -C\\ -H\\ H\end{array}$$

Electronic structure :

ннн	x x x
H - C - C - C - H	$H \cdot C \cdot C \cdot C \cdot C \cdot x H$
$\begin{array}{ccc} & & \\ \mathrm{H} & \mathrm{H} & \mathrm{H} \end{array}$	и н н н
Structural formula	Electronic formula

Q.5. Explain the structural & molecular formula of methane.

Ans: i) The molecular formula of methane is CH_4 .

ii) Its structural & electronic formulae are

$$\begin{array}{ccc} H & H \\ H - C - H & H^{x} \cdot \dot{C} \cdot x H \\ H & H \end{array}$$

Structural formula

Electronic formula

iii) In methane the carbon atom is joined to four hydrogen atoms by single covalent bonds.

1

- iv) Thus there are four C-H bonds in methane.
- v) Each C–H bond is a covalent bond, formed by sharing of one electron pair between C & H atoms.
- vi) Thus carbon atom gets complete octet and each hydrogen atom gets complete duplet (i.e stable configuration).

Q.6. Explain the structural & electronic formula of ethane.2

Ans : i) Molecular formula of ethane is C_2H_6 .

ii) It's structural & electronic formulae are given below :

$$\begin{array}{cccc} H & H & H & H \\ I & I & I \\ H - C - C - H & H^{x} \cdot C \cdot C \cdot H \\ I & I & I \\ H & H & H \end{array}$$

Structural formula

Electronic formula

- iii) In ethane, the two carbon atoms are joined to each other by a single covalent bond.
- iv) Each carbon is joined with three hydrogen atoms by single covalent bonds.
- v) The C-C bond is a covalent bond formed by the sharing of one electron pair between the two carbon atoms.
- vi) Each C-H bond is also covalent bond formed by sharing of one electron pair between C & H atoms.
- vii) Thus each C- atom gets complete octet & each hydrogen atom gets complete duplet (i.e. stable configurations).
- Q.7. What are the types of carbon atoms in alkanes ?

Ans: There are four types of carbon atoms in alkanes.

i) Primary C-atom :The carbon atom which is attached to only one other carbon atom (or no other carbon atom) is called a primary carbon

 $CH_3 - CH_3$ (Ethane)

 ii) Secondary C-atom : The carbon atom which is attached to two other carbon atoms is called a secondary carbon (2°). e.g.

e.g.

$CH_3 - CH_2 - CH_3$ (Propane)

iii) Tertiary C-atom : The carbon atom which is attached to three other carbon atoms is called tertiary carbon (3°). e.g.

$$CH_3 - CH_3 - CH_3.$$
 (iso-butane)
CH₃

iv) Quaternary C-atom : The carbon atom which is attached too four other carbon atoms is called a quaternary carbon (4°). e.g.

> $H_3C - CH_3$ $H_3C - CH_3$ (neo-pentane) CH_3

Q. 8. What are the types of H-atoms in alkanes? Ans: There are three types of H atoms in alkanes :

i) **Primary H-atom :**

The H-atom which is attached to a primary carbon atom is called primary hydrogen.

e.g. ethane
$$CH_3 - CH_3$$

(In this compound there are six primary H- atoms).

ii) Secondary H-atom :

The H-atom which is attached to the secondary carbon atom is called secondary hydrogen.

e.g. Propane CH_3 — CH_2 — CH_3 (In this compound there are two 2⁰ H- atoms.)

iii) Tertiary H-atom :

The H-atom which is attached to the tertiary carbon atom is called a tertiary hydrogen.

e.g. iso-butane
$$CH_3 - CH_3 - CH_3$$
.

(In this compound there is one tertiary H-atom.)

Straight chain & branched chain alkanes

- Q.9. What are straight and branched chain alkanes ?
- Ans : i) Straight chain alkanes or normal alkanes : The alkanes in which the carbon atoms are joined to one another to form a continuous straight chain without any branching are called strainght chain alkanes.

They are called normal alkanes or n - alkanes. They contain only primary & secondary carbon atoms.

e.g.i) n-butane CH_3 - CH_2 - CH_2 - CH_3 .

ii) n-pentane CH₃-CH₂-CH₂-CH₂-CH₃.

ii) Branched chain alkanes : *The alkanes in which one or more alkyl side chains are attached to the main chain are called as branched chain alkanes.*

These alkanes contain tertiary and / or quaternary carbon atoms in addition to the usual 1° and 2° C-atoms..

Branched chain alkanes are of two types

a) Isoalkanes and b) Neoalkanes.

a) Isoalkanes: The alkane in which a methyl side chain is attached to the next to end carbon of the main chain (i.e. second carbon from the end of the main chain) is called isoalkane.

It contains a tertiary carbon atom. e.g.

i)
$$CH_3$$
- CH_3 - CH_3 . ii) CH_3 - CH_2 - CH_2 - CH_3
 CH_3 CH_3 CH_3
iso-butane iso-pentane

iii) CH₃-CH-CH₂-CH₂-CH₃ iso-hexane CH₂

b) Neoalkanes : The alkane in which two methyl side chains are attached to the next to end carbon of the main chain (i.e.second carbon from the end of the main chain) is called neoalkane.

It contains a quaternary carbon.

e.g.

i)
$$H_3C - CH_3$$

 $-CH_3$
 CH_3
 C

N.B. The prefixes iso and neo are used to designate the branched chain alkanes having six or less number of C – atoms. In naming of the higher alkanes we make the use of IUPAC system.

Q.10. Define and give suitable examples of i) n-alkane ii) iso-alkane iii) neo-alkane...3

Chain isomerism in alkanes

- Q.11. Define & explain the term chain isomerism. OR What do you mean by isomerism ? Explain the same in butane.
- Ans: The compounds having same molecular formula but different structural formulae are called isomers of each other & this phenomenon is called isomerism.

The isomerism in alkanes is due to difference in the structure or nature of the carbon chains therefore it is called chain isomerism.

The first three alkanes (methane, ethane & propane) can not have branching hence they exist only as normal alkanes. The isomerism in alkanes starts from butane onwards.

Butane (C_4H_{10}) can have two types of arrangements of carbon atoms hence it has two chain isomers.

 $CH_3-CH_2-CH_2-CH_3$ $CH_3-CH-CH_3$. n-Butane Isobutane

Hive the chain isome

- Q.12. Give the chain isomers of pentane.3 Ans: Pentane (C_5H_{12}) has three chain isomers as it can have three types of arrangements of C-atoms.
- i) $CH_3-CH_2-CH_2-CH_2-CH_3$ (n-Pentane)

ii)
$$CH_3$$
-CH-CH₂-CH₃ iii) H_3C -CH₃
CH₃ CH_3 CH_3

Isopentane

Neopentane

- **N.B.** The number of isomers of an alkane increases rapidly with increase in number of carbon atoms. e.g. hexane has 5 isomers, heptane has 9, octane 18, decane 75.
- Q.13. Give the structural and condensed formulae of all the isomers of butane and pentane.

- i) Butane (C_4H_{10}): It has 2 isomers. a) n-Butane :
- Structural formula a) Isobutane :

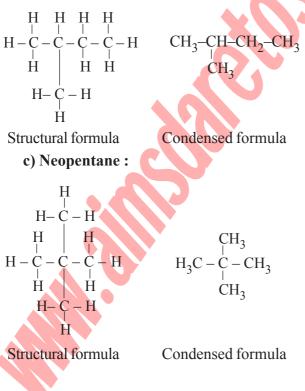

Condensed formula

Structural formula Condensed formula

ii) Pentane (C_5H_{12}): It has 3 isomers. a) n - Pentane :

Structural formula

b) Isopentane :

- Q.14. Give the condensed structural formulae of the normal alkanes containing 6, 7, 8, 9 and 10 carbon atoms.
- i) **n** Pentane (C_5H_{12}): CH₃- CH₂ - CH₂ - CH₂ - CH₂ - CH₃
- ii) n-Hexane(C_6H_{14}): CH₃-CH₂-CH₂-CH₂-CH₂-CH₂-CH₃
- iii) n-Heptane (C_7H_{16}): $CH_3-CH_2-CH_2-CH_2-CH_2-CH_2-CH_3$ or $CH_3-(CH_2)_5-CH_3$
- iv) n- Octane (C_8H_{18}) : CH₃-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₃ or CH₃-(CH₂)₆-CH₃
- v) n-Nonane(C_9H_{20}): CH₃-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH
- vi) n Decane ($C_{10}H_{22}$) : CH₃-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₂-CH₃ or CH₃-(CH₂)₈-CH₃

ALKYL GROUPS

Q.15.Explain the term alkyl group.

Alkyl group is a monovalent group or radical obtained by removing one H-atom from alkanes.

The general formula of alkyl group is C_nH_{2n+1} The name of alkyl group is obtained by replacing the suffix – *ane* of alkane by –*yl*.

RH
$$\xrightarrow{-H}$$
 R–
Alkane Alkyl group
CH₄ $\xrightarrow{-H}$ CH₃–
Methane Methyl

Learn the alkyl groups : A student must memorise the names of alkyl groups and learn to recognise these groups at a glance in whatever way they may be represented.

e.g.

AlkaneAlkyl group1) CH_4 $\xrightarrow{-1^0 H}$ $-CH_3$ MethaneMethyl group	Ans : $CH_3-CH_2-CH_2-CH_3$ n - pentane
2) $C_2H_6 \xrightarrow{-1^0H} -C_2H_5 \text{ or } CH_3 - CH_2 -$ Ethane Ethyl group 3) $CH_3 - CH_2 - CH_3 \xrightarrow{-1^0H} CH_3 - CH_2 - CH_2 -$ Propane n-Propyl	$\xrightarrow{-1^{0} \text{ H}} CH_{3}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{3}$ $\xrightarrow{-2^{0} \text{ H}} CH_{3}-CH-CH_{2}-CH_{2}-CH_{3}$ sec-pentyl or sec-amyl
4) $CH_3-CH_2-CH_3 \xrightarrow{-2^{\circ}H} CH_3-CH_2-CH_2-CH_3$ Propane Isopropyl or CH_3 CH_3 CH 4) $CH_3-CH_2-CH_2-CH_3 \xrightarrow{-1^{\circ}H}$	$CH_{3}-CH-CH_{2}-CH_{3}$ CH_{3} $Isopentane$ $\xrightarrow{-1^{0}H} CH_{3}-CH-CH_{2}-CH_{2}-CH_{2}-CH_{3}$ CH_{3} $Isopentyl or Isoamyl$
n-Butane $CH_{3}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{$	$\xrightarrow{3^{0} \text{H}} CH_{3} \xrightarrow{\text{C}} CH_{2} - CH_{3}.$ CH_{3} $t \text{-pentyl or } t \text{- amyl}$ $CH_{3} \xrightarrow{\text{C}} C_{2}H_{5}$

$\begin{array}{cccc} CH_{3}-CH-CH_{3} & \xrightarrow{3^{9}H} & CH_{3}-C-CH_{3} \\ CH_{3} & CH_{3} & CH_{3} \\ Isobutane & tert.butyl or \\ CH_{3} & C- or & (CH_{3})_{3}C - \\ CH_{3} & C- or & (CH_{3})_{3}C - \\ CH_{3} & C- ot & t-butyl \\ \end{array}$ Q.16.Give the alkyl groups obtained from pentane	 NOMENCLATURE OF ALKANES It is the naming system. There are two methods of nomenclature. i) <i>Common system</i> (or trivial system.) ii) <i>IUPAC system</i> (or systematic names). i) Common system or Trivial system : a) The first four alkanes methane, ethane, propane & butane are called by their common names. b) From fifth alkane the Greek numerals are used to indicate the number of carbon atoms e.g. pent (5), hex (6), hept (7), oct (8), non (9)

and dec (10) etc.

- c) The names of alkanes end with the suffix ane which indicates the saturated hydrocarbons alkanes.
- d) The various isomers of alkanes are denoted by the prefixes like n -, iso & neo-.

Limitations of common system :

Common system can name only three isomers of the alkanes i.e. n - , iso - and neo - .

But as the number of carbon atoms in alkanes increases the number of isomers increases rapidly e.g. there are 5 hexanes, 9 - heptanes, 75 decanes etc.

Common system fails to name all these isomers of higher alkanes. Hence there was a need for some systematic method of nomenclature.

IUPAC system fulfills this need.

IUPAC system : Various committees and commissions of chemists of the world have devised a systematic method of nomenclature. It is called IUPAC system i.e.International Union of Pure & Applied Chemistry.

Rules for IUPAC nomenclature :

i) Longest chain rule : Select the longest continuous carbon chain as the parent alkane and the compound is said to be derivative of this alkane.

Note :

- a) The alkyl groups which are not included in the parent chain are taken as side chains or substituents.
- b) The longest chain may or may not be staight but it should be continuous.
- c) If two different chains have equal length, then the chain having greater number of substituents is taken as parent chain.
- ii) Lowest number rule : Number the carbon atoms in basic chain from the end which is nearer to the side chain.
- iii) **locant :** The position of side chain is indicated by the number of carbon atom to which the side

chain is attached. This number is called locant.

- iv) Lowest set of locants rule : When two or more substituents (i.e. side chains) are present then start the numbering from that end of the parent chain which gives

 a) lowest set of locants and / or
 b) lowest sum of locants.

 But the lowest set of locants rule is preferred over the lowest sum of locants rule.
- v) About side chains or substituents :
 a) When the same side chain is present for two or more times then the prefixes like di, tri, tetra etc are used and their positions are indicated separately by numerals.

b) The names of different side chains are written in alphabetical order (the prefixes di, tri etc are ignored while comparing the substituents).

c) When two side chains are present on the same carbon atom then the number of that carbon must be repeated for each side chain.

- vi) When two different side chains are present at equivalent positions from two ends of a main chain, then the numbering is done in such a way that the alkyl group which comes first in alphabetical order gets lower number.
- vii) In the name, the comma is used to separate the numbers from each other and a hyphen is used to separate a number from the name.The name of last alkyl group and the parent alkane are written as a single word.

Explanation of the rules

This compound is derivative of hexane and ethyl is taken as substituent or side chain, (rule -1). Numbering is started from the left (as shown) so that the locant (i.e. number which indicates position of side chain) is the minimum (rule 2).

2)
$$\stackrel{1}{CH}_{3} - \stackrel{2}{\stackrel{CH}{CH}}_{-} \stackrel{3}{CH}_{2} - \stackrel{CH_{3}}{\stackrel{|_{4}}{C}}_{-} \stackrel{5}{CH}_{3}$$

Counting from left to right. Set of locants : 2, 4, 4 (wrong) Sum of locants : 2+4+4=10

$$\overset{5}{\text{CH}}_{3} - \overset{4}{\overset{\text{CH}}{\underset{|}}_{2}} - \overset{3}{\overset{\text{CH}}{\underset{|}}_{2}} - \overset{C}{\overset{\text{CH}}{\underset{|}}_{2}} - \overset{1}{\overset{\text{CH}}{\underset{|}}_{3}} \\ \overset{1}{\overset{\text{CH}}{\underset{|}}_{3}} - \overset{C}{\overset{\text{CH}}{\underset{|}}_{3}} + \overset{C}{\overset{C}{\underset{|}}_{3}} + \overset{C}{\overset{C}{\underset{|}}_{3$$

Counting from right to left.

Set of locants : 2, 2, 4 (correct) Sum of locants : 2+2+4=8

... This compound is

2,2,4- trimethylpentane (correct name)

2,4,4- trimethylpentane (wrong name)

Alphabetical order rule :

3)
$$\overset{1}{C}H_{3} - \overset{2}{C}H - \overset{3}{C}H_{2} - \overset{4}{C}H - \overset{5}{C}H_{2} - \overset{6}{C}H_{3}$$

 $\overset{1}{C}H_{3} - \overset{1}{C}_{2}H_{5}$

4- Ethyl - 2 - methylhexane (correct name)

2- Methyl - 4 - ethylhexane (wrong name) Lowest set of locants rule : Number the C atoms of the basic chains in such a way that it should give the lowest set of locants and the lowest sum of locants. But in case of dispute, the lowest set of locants rule is given preference over the lowest sum of locants.

4) $\stackrel{1}{CH_{3}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{3}-CH_{3}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{2}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}-CH_{3}$

Set of locants : 2, 6, 7, 8

Sum of locants : 2 + 6 + 7 + 8 = 23In this case the numbering is started from right to left as it gives the lowest set of locants (2,6,7,8), even though it does not give the lowest sum of locants.

2,6,7,8-Tetramethyldecane (correct name) 3,4,5,9-Tetramethyldecane (wrong name) Thus we prefare the lowest set of locants rule over lowest sum of locants rule.

5)
$${}^{1}CH_{3} - {}^{2}CH_{2} - {}^{3}CH_{3} - {}^{4}CH_{3} - {}^{5}CH_{2} - {}^{6}CH_{3}$$

 ${}^{1}CH_{3} - {}^{2}CH_{2} - {}^{6}CH_{3}$

$$\frac{1}{5}$$

 $\overset{\circ}{\operatorname{CH}}_{3} - \overset{\circ}{\operatorname{CH}}_{2} - \overset{\circ}{\operatorname{CH}}_{2} - \overset{\circ}{\operatorname{CH}}_{3} - \overset{\circ}{\operatorname{CH}}_{2} - \overset{\circ}{\operatorname{CH}}_{3}$

Ethyl group at C₃

- **3-Ethyl-4- Methylhexane** (Correct name) **4-**Ethyl-3- Methylhexane (Wrong name) Here counting of the basic chain should be done from left to right so that ethyl gets lower number than methyl (since ethyl comes first in alphabetical order than methyl; rule no. viii). **For complex substituents :** If the side chain is branched then it is named as substituted alkyl group.
- i) The C atom of this group attached to the parent chain is numbered as 1.
- ii) The names of such substituents are written in brackets to avoid any confustion with the numbering of parent chain.

1)
$$\begin{array}{c} \overset{8}{\text{CH}}_{3} \xrightarrow{7} \overset{6}{\text{CH}}_{2} \xrightarrow{6} \overset{5}{\text{CH}}_{2} \xrightarrow{4} \overset{3}{3} \xrightarrow{2} \xrightarrow{2} \xrightarrow{1} \overset{1}{1}^{3} \\ \overset{1}{\text{CH}}_{3} \xrightarrow{-\text{CH}} \xrightarrow{-\text{CH}}_{2} \xrightarrow{-\text{CH}} \xrightarrow{-\text{CH}}_{2} \xrightarrow{-\text{CH}}_{2} \xrightarrow{-\text{CH}}_{3} \xrightarrow{-\text{CH}}$$

2,2,7 - trimethyl-4-(1 - methylethyl) octane

GENERAL METHODS OF PREPARATION

i) From unsaturated hydrocarbons

- ii) Decarboxylation of acids
- iii) From alkyl halides (reduction and Wurtz sysnthesis)

i) Hydrogenation of unsaturated hydrocarbons:

- Q.21.Explain preparation of alkane from hydrogenation of unsaturated hydrocarbons
- **Ans:a) From alkenes :** When alkenes are heated with H_2 gas is presence of catalyst Ni, Pt or Pd at 523K 573K alkanes are obtained.

[or alkenes upon catalytic hydrogenation (H_2/Ni) at 523 K - 573 K give alkanes]. Methane can not be prepared by this method. e.g i) Ethylene (ethene) upon catalytic hydrogenation (H_2/Ni) at 573 K) gives ethane.

$$CH_{2} = CH_{2} + H_{2} \xrightarrow{\text{Ni}} CH_{3} - CH_{3}$$

Ethylene Ethane

- e.g. ii) propylene (propene) upon catalytic hydrogenation (H_2 /Ni at 573K) gives propane.
- $CH_{3}^{-} CH = CH_{2} + H_{2} \xrightarrow{\text{Ni}} CH_{3} CH_{2}^{-} CH_{3}$ Propylene
 Propane
- b) From alkynes : When alkynes are heated with H_2 gas is presence of catalyst Ni, Pt or Pd at 523K - 573K alkanes are obtained. [or alkynes upon catalytic hydrogenation (H_2 /Ni) at 523 K - 573 K give alkanes]. Methane can not be prepared by this method. e.g. i) Acetylene (an alkyne) upon catalytic hydrogenation (H_2 /Ni at 573K) gives ethane.

CH = CH + 2H₂
$$\xrightarrow{\text{Ni}}$$
 CH₃ - CH₃
Acetylene Ethane
e.g. ii) propyne (propene) upon reduction by

hydrogen gas in presence of Ni at 573 K gives propane.

$$\begin{array}{c} \text{CH}_{3}\text{-}\text{C} \equiv \text{CH} + 2\text{H}_{2} \xrightarrow{\text{Ni}} \text{CH}_{3} - \text{CH}_{2} - \text{CH}_{3} \\ \text{Propyne} \end{array} \xrightarrow{\text{Propane}} \text{CH}_{3} - \text{CH}_{2} - \text{CH}_{3} \\ \end{array}$$

Q.22.How will you prepare ethane from i) Ethene ii) Ethyne or

How will you convert :

i) Ethene into ethane

ii) Ethyne into ethane

Q.23. How will you prepare propane from

i) Propene ii) Propyne or

How will you convert : i) Propene into propane

ii) Propyne into propane

ii) By decarboxylation of fatty acids(i.e. carboxylic acids):

Q.24. Explain decarboxylation of carboxylic acids.

Ans: When dry sodium salt of fatty acid is heated with sodalime (NaOH + CaO in 3 : 1 ratio) alkane is obtained.

In this reaction carbon dioxide (CO_2) is eliminated from carboxylic acid therefore the name is decarboxylation.

The product alkane contains one carbon atom less than the starting carboxylic acid.

RCOONa + NaOH $\xrightarrow{\Delta}$ RH + Na₂CO₃ Sodium Sodalime CaO Alkane

e.g i) When sodium acetate is heated with sodalime methane is obtained by decarboxylation.

 $\begin{array}{c} CH_{3}COONa + NaOH \xrightarrow{\Delta} CH_{4} + Na_{2}CO_{3} \\ Sodium \\ acetate \end{array} \xrightarrow{A} CH_{4} + Na_{2}CO_{3} \\ Methane \\ \end{array}$

ii) When sodium propionate is heated with sodalime ethane is obtained by decarboxylation.

 $C_2H_5COONa + NaOH \xrightarrow{\Delta} C_2H_6 + Na_2CO_3$ Sod.propionate Sodalime Ethane

Q.25. How is methane prepared by decarboxylation of carboxylic acid? Or

How is methane prepared from sodium acetate ?

Q.26. How is ethane prepared by decarboxylation of carboxylic acid? Or

How is ethane prepared from sodium propionate?

- iii) From alkyl halides (RX): Alkanes can be prepared from alkyl halides by two methods
 - a) By reduction of RX and
 - b) Wurtz sysnthesis
 - a) By reduction of RX :
- Q.27.How alkanes are prepared by reduction of alkyl halide?

Ans :When alkyl halide is reduced by Zn/HCl acid or Zn/Cu couple in alcohol, alkanes are obtained.

 $\begin{array}{c} RX + 2[H] & \xrightarrow{Zn/HCl \text{ or}} & RH + HX \\ Alkyl halide & Alkane \end{array}$

e.g i) Methane is obtained by reduction of methyl bromide.

 $CH_{3}Br + 2[H] \xrightarrow{Zn/HCl \text{ or}} CH_{4} + HBr$ Methyl bromide Methane

ii) ethane is obtained by reduction of ethyl iodide.

$$C_2H_5I + 2[H] \xrightarrow{Zn/HCl or} C_2H_6 + HI$$

Ethyl iodide Ethane

b) Wurtz Synthesis :

Q.28. Write a note on Wurtz synthesis.2
Ans: When alkyl halide is treated with sodium in dry ether, higher alkanes containing even no. of carbon atoms are obtained.
In this reaction two molecules of alkyl halide

condense together to form a symmetrical alkane containing twice the number of C - atoms than the alkyl group.

- $2RX + 2Na \xrightarrow{\text{Dry ether}} R R + 2NaX$ Alkyl halide Higher alkane
- i) When methyl iodide is treated with sodium in dry ether ethane is obtained.

 $2CH_3I + 2Na \xrightarrow{Dry \text{ ether}} CH_3 - CH_3 + 2NaI$ Methyl iodide

ii) When ethyl iodide is treated with sodium in dry ether n-butane is obtained.

$$2C_2H_5I + 2Na \xrightarrow{\text{Dry ether}} C_2H_5 - C_2H_5 + 2NaI$$

Ethyl iodide n-Butane

Limitations : i) Methane cannot be prepared.

ii) Alkanes containing odd no. of carbon atoms can't be prepared in good yields.

Q.29.Explain Wurtz's reaction with a mixture of different alkyl halides. OR What is action of Na on a mixture of ethyl iodide and methyl iodide ?

Ans: When a mixture of two different alkyl halides is treated with Na in ether a mixture of higher alkanes is obtained, which is difficult to separate.

> In this reaction higher alkanes containing even number of carbon atoms are predominantly formed.

> Hence Wurtz reaction cannot be used to prepare higher alkanes containing odd number of carbon atoms.

e.g. Wurtz reaction with ethyl iodide and methyl iodide gives ethane, propane & butane (ethane and butane are major products).

 $2CH_3I + 2Na \xrightarrow{Dry ether} C_2H_6 + 2NaI$ Methyl iodide Ethane

 $2C_2H_5I + 2Na \xrightarrow{\text{Dry ether}} C_4H_{10} + 2NaI$ Ethyl iodide n-Butane

 $\begin{array}{c} CH_{3}I + C_{2}H_{5}I + 2Na & \xrightarrow{Dry \text{ ether}} & C_{3}H_{8} + 2NaI \\ Methyl & Ethyl & Propane (minor) \\ iodide & iodide \end{array}$

Q.30. How will you convert : i) Ethyl iodide into n-Butane ii) Methyl iodide into ethane?2 3) By reduction of alkyl halide : Q.31. How is ethane prepared from b) Methyl bromide a) Ethylene c) Ethyl iodide d) Acetylene4 Ans: a) Ethylene upon catalytic hydrogenation $(H_2/Ni \text{ at } 573 \text{K})$ give ethane. $CH_2 = CH_2 + H_2 \xrightarrow{Ni} CH_3 - CH_3$ Ethylene Ethane b) From methyl bromide by Wurtz synthesis: $2CH_3Br + 2Na \xrightarrow{Dry ether} C_2H_6 + 2NaBr$ Methyl bromide Ethane c) By reduction of ethyl iodide : $C_2H_5I + 2[H] \xrightarrow{Zn/HCl} C_2H_6 +$ HI Ethyl iodide Ethane d) From acetylene by catalytic hydrogenation. $CH \equiv CH + 2H_2 \xrightarrow{Ni} CH_3 - CH_3$ Ethane Acetylene **CHEMICAL PROPERTIES** i) Halogenation ii) Nitration iii) Pyrolysis iv) Combustion Substitution or replacement reaction : The reaction in which an atom or a group of atoms is replaced by another atom or group is called substitution reaction. Alkanes under go substitution reaction in which H - atom of alkane is replaced by another atom or group. 1) Halogenation of alkanes. The reaction in which H-atom of alkane is replaced by a halogen atom is called as halogenation. Q. 32. Explain chlorination of methane.3 Ans: Alkane reacts with halogen (Cl, or Br,) in presence of diffused sunlight (UV light) or at

high temperature (573 K - 773 K) to form

halogen derivatives of alkanes. In this reaction all the H-atoms of alkane are replaced one by one with halogen atoms. e.g. Methane upon chlorination gives a mixture of methyl chloride, methylene dichloride, chloroform and carbon tetrachloride.

$$CH_{4} + Cl_{2} \xrightarrow{\text{Diffused sun light}} CH_{3}Cl + HCl Methane CH_{3}Cl + Cl_{2} \xrightarrow{\text{Diffused sun light}} CH_{2}Cl_{2} + HCl Methyl Chloride.$$

$$CH_{3}Cl + Cl_{2} \xrightarrow{\text{Diffused sun light}} CH_{2}Cl_{2} + HCl Methyl Chloride.$$

$$CH_{2}Cl_{2} + Cl_{2} \xrightarrow{\text{Diffused sun light}} CHCl_{3} + HCl Methylene dichloride CHCl_{3} + Cl_{2} \xrightarrow{\text{Diffused sun light}} CHCl_{4} + HCl Chloroform$$

$$CHCl_{3} + Cl_{2} \xrightarrow{\text{Diffused sun light}} CCl_{4} + HCl Cl_{4} + HCl Chloroform$$

2) Nitration :

The reaction in which H-atom of alkane is replaced by a nitro group $(-NO_2)$ is called nitration.

Q.33. Explain nitration of alkanes.2 Ans : When alkanes are heated with nitric acid in vapour phase at 673 to 773 K, nitroalkanes are obtained.

e.g. When methane is treated with nitric acid in vapour phase at 723 K,nitromethane is obtained.

 $\begin{array}{rcl} CH_4 & + & HONO_2 \xrightarrow{773 \text{ K}} & CH_3 - NO_2 & + & H_2O \\ \text{Methane Nitric acid} & & \text{Nitro methane} \end{array}$

Q.34. Explain nitration of methane OR

- . How will you convert methane into nitromethane.1
- Q.35.Explain nitration of ethane OR How will you convert ethane into

.....1

Ans : When ethane is treated with nitric acid in vapour phase at 773 K, nitroethane is obtained.

 $\begin{array}{ccc} C_2H_6 + HONO_2 & \xrightarrow{773 \ K} & C_2H_5 \text{-}NO_2 + H_2O. \end{array}$ Ethane Nitric acid Nitroethane

11

nitroethane.

Q.36. Explain nitration of propane.

- OR What is the action of nitric acid on propane at high temperature?2
- Ans : Propane reacts with nitric acid in vapour phase at 773K to form a mixture of nitromethane, nitroethane, 1-nitropropane & 2-nitropropane.

$$CH_3CH_2CH_3 + HNO_3 \xrightarrow{773 K}$$

$$CH_3NO_2 + CH_3CH_2NO_2$$

nitro methane nitro ethane

 $CH_3CH_2CH_2NO_2 + CH_3CHCH_3 + H_2O$ 1-nitropropane

2-nitropropane

N.B. Nitromethane and nitroethane are formed due to breakage of C-C bond in propane at high temperature.

3) Pyrolysis :

Q. 37. Explain pyrolysis.

Ans: It is the thermal decomposition of alkanes in the absence of air to form smaller molecules.

Pyrolysis takes place in two ways

a) Dehydrogenation : It is the fission of C-H bonds in alkane to form alkene and H, gas. As hydrogen gas is lost the reaction is called dehydroganation.

 $\xrightarrow{873K}$ CH₂=CH₂ + H₂ \uparrow CH₂CH₂ Ethane

873 K

CH₃CH₂CH₃ Propane

 $CH_{3}CH=CH_{2}+H_{2}\uparrow$ K/SiO,AlO, Propylene

Ethylene

b) Cracking: It is the fission of C-C bond in alkanes to form a pair of alkane and alkene. e.g. Propane gives a pair of ethylene and methane

CH,CH,CH,

 $CH_2 = CH_2 + CH_4$

- Q.38. What is the action of heat on a) Ethane b) Propane
- Ans: a) Ethane on pyrolysis gives a mixture of ethylene & H₂ gas

CH₃CH₃ $CH_2 = CH_2 + H_2$ (dehydrogenation)

Ethylene

ii) Propane on pyrolysis gives a mixture of products. It undergoes dehydrogenation as well as cracking.

CH₃CH₂CH₃ Propane

Ethane

 $CH_3CH=CH_2 + H_2^{\uparrow}$ Propylene

CH₃CH₂CH₃

$$CH_2 = CH_2 + CH_4$$

Q.39. Explain catalytic cracking with suitable example. Give its advantages.

Ans: When n-butane is heated at 873 K it undergoes (88%) craking to give methane and propene 50 % and ethane and ethene 38 % and 12 % dehydrogenation.

$$CH_{3}CH_{2}CH_{2}CH_{3} \xrightarrow{873 \text{ K}} (\text{SiO}_{2}\text{Al}_{2}\text{O}_{3})$$

n - Butane
$$\overset{12\%}{\longrightarrow} CH_{3}CH = CH CH_{3} + H_{2}$$

but-2-ene
$$\overset{50\%}{\longrightarrow} CH_{3}CH = CH_{2} + CH_{4}$$

propene methane
$$\overset{38\%}{\longrightarrow} CH_{3} = CH_{3} + CH_{4}$$

 \rightarrow CH₂ = CH₂ + CH₃ - CH₃ ethene ethane

Advantages :

a) It requires lower temperature and pressure. b) It gives less amount of methane and carbon

4) Combustion:

Q.40.Explain combustion of alkanes.

Ans: When alkanes are heated in excess of air or oxygen, they burn readily to give CO_2 & H₂O. In this process large amount of heat is evolved. Thus reaction is highly exothermic. Combustion is complete oxidation of alkanes Hence alkanes are used as fuels.

e.g.i) $CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O + 890 \text{ kJ mol}^{-1}$ ii) $C_2H_6 + 3.5O_2 \rightarrow 2CO_2 + 3H_2O + 1580 \text{ kJ mol}^{-1}$

Uses of Alkane :

O.41. Give uses of alkanes2

i) Methane is used for making carbon-black

which is used as black pigment in paints, printing ink, boot polish etc.

- ii) Methane is used as a source of hydrogen gas.
- iii) Methane is used in preparation of a organic compounds like
 e.g. CH₃Cl, CH₃OH (methyl alcohol),
 HCHO(formaldehyde), C₂H₂(acetylene)
- iv) Propane is used as refrigerent i.e. cooling agent.
- v) n-Butane and iso-Butane are liquified under high pressure under the name L.P.G. (liquified petroleum gas). It is used as domestic fuel.
- vi) Petrol, is a mixture of liquid alkanes (iso-octane). It is used as fuel for internal combustion engines.

Q.42. Give the structural formulae and IUPAC names of isomers of a) hexane & b) heptane

Ans: a) Isomers of hexane

- Hexane (C_6H_{14}) has five chain isomersStructureIUPAC name
- i) $CH_3CH_2CH_2CH_2CH_2CH_3$ Hexane (Common name : n-Hexane)
- ii) $CH_{3}CHCH_{2}CH_{2}CH_{3}$ 2-Methylpentane CH₃ (Common name : Isohexane)
- iii) $CH_3CH_2CHCH_2CH_3$ 3-Methylpentane CH₂
- iv) CH₃-CH–CH-CH₃ 2,3-Dimethylbutane CH₃ CH₃
- v) CH_3 -C-CH₂-CH₃ 2,2-Dimethylbutane CH₃ (Common name : Neohexane)

b) Isomers of heptane

- Heptane (C_7H_{16}) has nine chain isomers
- i) $CH_3CH_2CH_2CH_2CH_2CH_2CH_3$ Heptane (Common name : n- heptane)
- ii) CH₃CHCH₂CH₂CH₂CH₂CH₃ CH₃ 2-Methylhexane

(Common name : Isoheptane)

iii) CH₃CH₂CHCH₂CH₂CH₃ 3-Methylhexane CH₃

CH, 2,2-Dimethylpentane iv) CH,CH,CH,C-CH, CH. (Common name : Neoheptane) CH₃ v) CH₂CH₂C-CH₂CH₂ 3,3-Dimethylpentane CH₂ vi) CH₃CH₂CH–CHCH₂, 2,3-Dimethylpentane CH₃CH₃ 2,4-Dimethylpentane vii) CH,CHCH,CHCH, CH₃ CH, CH, viii) $CH_2 - CH - CH_2 2,2,3$ -Trimethylbutane CH,CH, 3-Ethylpentane CH₂-CH₂-CH-CH₂-CH₃ C,H,
